It has long been assumed that the Bahamas were colonized by Ceramic Age peoples who began their expansion into the Caribbean islands from northeastern South America about 500 BC. The widespread occurrence of pottery in the Bahamas (Palmetto Ware), and the timing of initial ‘Lucayan’ settlement in the Bahamas is dated to AD 700-800 (dates that coincide with the Ostionoid and Meillacoid population expansions) have been used to support this assumption. Yet archaeological research conducted since 2016 on Long Island in the central Bahamas is revealing a much different confluence of elements. Instead of large agricultural villages, the archaeological sites on Long Island are small and short-lived with multiple activity areas in the same general location. Lucayan sites are directly on the coast, buried beneath beach sand on the lee shore and backed by a mangrove swamp; or they are eroding from Atlantic coast dunes. Neither location is well suited for intensive agriculture. In addition, special purpose sites are common. Palmetto Ware occurs in low frequencies suggesting it was not the primary method of cooking; and at least three earth ovens, spanning 400 years, have been excavated. This presentation is an overview of recent investigations on Long Island.

[80] *Beyond the Borders of Archaeological Taxonomy: A Ceramic Case Study from the Central Plains*

This paper presents a problematic ceramic taxonomy for the Late Woodland period (AD 500–1000) in the Central plains. The focus is on two archaeological taxonomic designation units: the Sterns Creek phase and the Grasshopper Falls phase. Through the lens of literature review, archival site records, and analysis of material collections curated at the Kansas State Historical Society (KSHS) and the University of Kansas (KU), I present documentation discrepancies, problematic taxonomic units, and identical ceramic assemblages designated as Sterns Creek Ware and Grasshopper Falls Ware. After presenting the evidence, I propose that the two ceramic wares should be consolidated under one name—Sterns Creek Ware—and further comparative analysis is necessary to identify other wares present in Grasshopper Falls phase assemblages. Archaeological taxonomic designation units and artifact typologies are important analytical tools. However, when archaeologists define taxonomic units confined within modern state borders, without adequate reference to existing data and literature, they construct flawed manifestations. In our attempts to make inferences about peoples past activities, especially complex social practices/interactions through material culture, we need to look beyond the borders of archaeological taxonomy and towards comparative syntheses.

[48] *Archaeological, Paleoenvironmental, and Geoarchaeological Investigations of Hall's Cave, Texas*

Hall's Cave, located in central Texas, contains a 4 m thick geological record extending back to 20,000 cal yr B.P. Within these sediments is an archaeological record dating from the historic period to approximately 10,500 cal yr B.P. with living surfaces containing artifacts and animal bones associated with hearths. Over 60 hearth features, including over 40 from recent excavations in 2018, have been identified and 30 have been radiocarbon dated. Below the artifact-bearing layers is a paleontological record extending to 20,000 cal yr B.P. with bison, horse, dire wolf, and saber-toothed cat. In addition to these studies, our team is investigating the paleoenvironmental and paleoclimatic record preserved in the cave sediments through the analysis of preserved DNA with the sediments.

[89] *Research Opportunities in Archaeology at the Fowler Museum at UCLA*

The Fowler Museum Archaeology Collections is the largest repository of Los Angeles history. It has maintained the research materials and excavations of UCLA academics and local researchers since 1941. The collections consist of approximately 1.5 million artifacts ranging from prehistoric to historic with provenances that span the globe. The majority of these items have not been examined since their initial excavation, providing ample research opportunities that have proven fruitful for an array of researchers. A significant amount of this research has culminated in published articles, theses, dissertations, and manuscripts. These publications as well as primary documents are kept with corresponding accessions for future research reference. In addition, the Fowler Museum at UCLA has the original archives of numerous archaeologists including Clement Meighan, Henry B. Nicholson, and Charles Rozaire.

Keller, Angela (Statistical Research, Inc.)

[345] *Directed Movement at Ancient Maya Centers*

Is there a right way to enter a Maya center? A correct order to the viewing and experiencing of the place? How did the physical act of moving through a center inform the understanding of that place, its leaders, oneself? This paper presents the results of several seasons of fieldwork at the Belizean sites of Xunantunich and Actuncan, which was focused on the identification of site access, flow patterns, and plaza use as these illustrate site planning strategies to attract, entertain, and control a large populace. My work has combined extensive structural excavations with rapid systematic data collection, soil chemistry, macro- and micro-artifact analysis, remote sensing, and targeted excavations. One of the guiding themes for this work has been movement. People moving into, out of, and through site centers. By focusing on architecturally directed movement as a problem to be solved, fragmentary plaster floors, unimpressive alignments of stone, subtle soil chemistry variations, and artifact patterning combine to let us see movement as a significant activity in its own right.

[402] *A Tale of Three Substrates: Effects of Trampling on Ostrich Eggshell and Applicability to the Archaeological Record*

Few taphonomic experiments have considered Ostrich eggshell, despite its ubiquity at archaeological sites in Africa and Asia. This experiment seeks to fill some of the gaps in taphonomic knowledge by determining the effect of trampling on ostrich eggshell. Ostrich eggshell fragments were photographed, distributed across the surface of sand, soil, or gravel, and trampled for a period of ten minutes or two hours. To create a significantly robust sample, each

experiment was replicated ten times. The more intense trampling and increasingly compact substrate yielded a higher number of fragments, and lower average length. An increased number of marks were noted after trampling, however, the appearance of these trampling marks were indistinguishable from marks observed on eggshells before trampling. Discoloration of fragments subjected to two hours of trampling was significantly higher, although this result varied between substrates. Comparison with ostrich eggshell recovered at a Middle Stone Age site in South Africa suggests that the surface modification observed was not caused by trampling, because no analogous marks were observed on the trampled assemblages. Further studies should consider additional taphonomic effects, including the effects of trampling on artifacts below the surface.

[46] *Long-Term Puna Landscape Use in the Chanka Heartland of Andahuaylas, Southern Peru*

This poster examines the enduring role that puna landscapes played across time and space in the Andahuaylas region of southern highland Peru. Results from a recent archaeological landscape survey, entitled the Andahuaylas Puna Project, confirms that the expansive puna to the south of the main Chumbao Valley was intensively used and intermittently occupied for over two millennia from the late Formative period through modern times, with the most intensive occupation occurring during the Chanka phase (~AD 1000-1400). The survey of a 40 km² tract of puna (~3600-4400 m.a.s.l.) recorded a range of water sources (e.g., springs, cochas, and bofedales) and 158 archaeological sites, including single and multiple corral structures, residential pastoral sites, cist tombs, chullpas, small ritual enclosures, and paths/roads among others. Taken together, preliminary survey results indicate that the lower puna region in Andahuaylas played a number of important roles for local polities by serving as an economic region for intensive camelid pastoralism, but also as a ritually charged landscape (for the living and the dead) and a corridor/connector between lower valleys (e.g., suni, quechua) and higher puna regions.

[49] *Maine Midden Minder Network: Collaborating to Save a Cultural Resource*

Maine's coastline hosts over 2,000 Native American shell middens. Composed of clam and/or oyster shells, faunal remains, and artifacts, these sites record over four thousand years of cultural and paleoenvironmental information. However, virtually all of these rich archives are eroding in the face of climate change-induced sea level rise and altered weather patterns. The Maine Midden Minder Network is being developed to bring archaeologists, geologists, tribal partners and citizen scientists together to create strategies to assess what remains of these threatened sites, and how to best use limited resources to the recover precious data. Our initial program involves working with conservation organizations to document shell middens on their properties and create volunteer monitoring programs. Additionally, we are creating a website that will allow individual citizen scientists to monitor shell middens near their homes. Information produced by these activities is archived in a dedicated database that is designed to protect site location and land-owner privacy, but allow regional and local analysis of midden destruction.

Located in Utah's northern Uinta Basin, the Cub Creek area of Dinosaur National Monument contains examples of Fremont pithouses, upland roasting features, diverse artifact assemblages, and panels of Classic-Vernal-style Fremont rock art. The Classic Vernal rock art style is characterized by geometric patterns, animals, and heavily stylized anthropomorphic figures in both petroglyph and pictographic formats. Using a robust record of 41 radiocarbon ages, the Fremont pithouses in Cub Creek were built and occupied around 750-1050 CE. Understanding the correlation of the Cub Creek rock art to the dates of pithouse construction could contribute to the understanding of emergent leadership within Fremont society, especially if these results are replicable to other

regional pithouse and rock art sites. With the eventual goal of developing an absolute chronology, in this poster I use relative dating methods to create a timeline that compares the window of pithouse construction in the Cub Creek area of Dinosaur National Monument with the creation of local Classic Vernal rock art. These results have implications for the age and meaning of other rock art and pithouse sites found in the northern Uinta Basin, as well as for the emergence of leadership in transitional agricultural societies.

Kennedy, Jason (Central Michigan University)

[200] *Come for the Harvest, Stay for the Beer: Alcohol Production in an Ubaid Household in Upper Mesopotamia*

In *New Perspectives on Household Archaeology*, Bradley Parker and Catherine Foster urged archaeologists to approach households as a dynamic location of repetitive actions and gestures that shaped the formation of the personal, economic, social, political and ideological trajectories of the community. In his contribution to the volume, Bradley sought to marshal multiple lines of archaeological evidence to provide a comprehensive account of the activities that occurred within an Ubaid household at Kenan Tepe on the Upper Tigris River in southeastern Turkey and explored how these actions were connected to broad changes in social integration and political complexity throughout Greater Mesopotamia during the fifth millennium BCE. In this paper, I will reexamine Bradley's conclusions using new data provided by a use-alteration analysis of the ceramics from the Ubaid household. This analysis has revealed evidence for the household production and consumption of alcohol, most likely beer, during the late 5th millennium BCE. This paper will explore the nature of alcohol production at the site and connect it to the activities identified in Parker's analysis of the structure as well as the social and political relationships formed during the consumption of alcohol at Ubaid Kenan Tepe.

[285] *The Utility of Portable XRF for Preliminary Site Prospection at Contaminated Colonial Period Mining Sites (Puno, Peru)*

Field portable x-ray fluorescence spectrometry (pXRF) has seen an increase in use for testing potentially toxic levels of heavy metals in modern mining and industrial waste sites. Understanding the spatial variation of pollutants in soil is necessary for identifying proper prevention measures for soil contamination and long-term effects on human health. While this technique is popular in modern contexts, it has seen little applicability in archaeological contexts. In this poster, we present the results of a pXRF surface soil survey conducted at the site of Trapiche Itapalluni, a Spanish Colonial silver refining mill (AD 1650-1750) located 15 km southwest of Puno, Peru in the northwestern Lake Titicaca Basin. High levels of mercury (Hg), lead (Pb), and arsenic (As) were identified in surface soils, necessitating the relocation of planned excavation units. Soil contamination results were combined with systematic surface artifact collection to identify activity areas in locations where excavation would have been hazardous. This study highlights the applicability of rapid, in-situ pXRF analysis of surface soils in contaminated industrial archaeology sites to assess: 1) potential effects on human health; 2) relocation of excavation units; and 3) activity areas and site usage, using a combination of surface collection and soil chemistry analyses.

Kennedy Richardson, Karimah (Autry - Historic Southwest Museum - UCR)

[210] *Examining Site Functions and Relationships: The Value of Small Ridgeline Sites on Pimu/Catalina Island*

Several decades of field reconnaissance have identified nearly one thousand archaeological sites on Catalina Island. The relationship between these coastal bluff villages, interior occupations, and smaller ridgeline sites are recognized via pathways, but not fully explored. In our efforts to better understand settlement patterns on this island the Pimu Catalina Island Archaeology Project (PCIAP) has developed a geographic spatial study to test the relationship between ancient occupations and the pathways along ridges that attest to human relationships on the landscape. Here we present findings from our excavations and survey of the coastal bluff sites at CA-LAN-3593, 3594, 3596 and recent radiocarbon assays. This analysis is a benchmark in our efforts towards a new synthesis and analysis of settlement patterns and subsistence practices on Catalina Island.

Kepecs, Susan (University of Wisconsin-Madison)**[198]** *Lies the Spaniards Told*

The Spaniards characterized the northeast corner of Yucatán state as being demographically depleted and possessed of unhealthy terrain and a lack of exploitable minerals. This picture has been perpetuated by historians, who lack independent lines of evidence against which to check it. Yet archaeological information from extensive regional and full-coverage surveys, combined with a close reading “against the grain” of relevant native and Spanish documents, reveals the Spaniards’ claims as fictions aimed at gaining additional lands, labor, and rights to resources as well as covering up Spanish cowardice. By examining multiple strands of evidence I am able to reveal a much different picture of this region in the colonial epoch, with higher population than the written record suggests, very fertile lands, rich mineral resources – and rebellious natives who fought the Spaniards and their scions tooth and nail, essentially driving them out of the area for over three centuries.

Kerchusky, Sarah (University of California, Santa Barbara) and Corina Kellner (Northern Arizona University)**[206]** *Understanding Nasca ‘Trophy Head’ Individuals from the Site of Zorropata in Peru Using Isotopic and Biochemical Methods*

Myriad factors shaped cultural practices such as ‘trophy head’ taking in Andean prehistory. Zorropata, located in the Las Trancas Valley, Nasca, Peru, was a large domestic site with likely ceremonial function occupied relatively continuously from the Late Nasca period (c. AD 450-600) until the early Middle Horizon/Loro period (c. AD 600-1000). Archaeological survey conducted by Katharina Schreiber in the 1990s at Zorropata identified at least one and possibly two adobe compounds that were like structures described by Julio C. Tello at Huaca del Loro, the largest Las Trancas site and local hub dating to the Middle Horizon. At both Huaca del Loro and Zorropata these structures appear to be barbacoa style tombs. Excavations conducted at Zorropata in 2014 recovered eight ‘trophy head’ individuals from the largest cell (Structure 21) of the adobe compound. ‘Trophy head’ individuals were analyzed using isotopic and biochemical data to investigate this practice just prior to and concurrent with Wari influence in the Nasca Region. These individuals shared stylistic similarities with other Nasca samples but also differed in important ways (e.g., the majority were non-local). These results illustrate that the Nasca experience with environmental and sociopolitical challenges differed between valleys within the Southern Nasca Region.

Kerr, Stanley (NV5), Christina Chavez (Sandia Labs) and Toni Goar (NV5)**[259]** *Correlations between Structural Sites and Topographic Features Dating from the Late Developmental to Early Coalition*

During the Developmental period into the Early Coalition, agricultural settlements formed along drainages, such as the Tijeras Arroyo in Coyote Canyon, Arroyo del Coyote, the Rio Grande, the Lower Jemez River, and the Rio Puerco. This change in settlement patterns, along topographic features, near water sources was evidence for the exploitation of different ecological zones, where a variety of resources could be exploited. The valley bottoms and alluvial fans made agriculture possible as water was available, in seeps, rain run-off, and springs. Pit structure occupation along or near water sources through the Late Developmental into the Early Coalition include Dinosaur Rock site, LA 138465, the Pithouse Site, Two Dead Junipers site, Cobble Pueblo, the Bravo Pueblo, the Airport Hamlet, the Sedillo site, Coors Road site, the Denison Site, the second pit structure near Zia Pueblo, Meade Avenue Site, LA 151618, and the Artificial Leg Site 111. Evidence of pithouses and pit structures suggest residential stability

at these locations, suggesting a year-round occupation, but also were located in areas where a variety of resources were available.

Kersel, Morag (DePaul University)

[77] *Big Data and Diplomacy: Aerial Images and U.S. Department of State Cultural Property Bilateral Agreements*

Big data in the form of aerial imagery gathered from drones, satellites, and archival spy images provide an historical time line of change over time of archaeological landscapes. The images of sites negatively affected by agriculture, development, looting, and urban growth are compelling and convincing in their documentation of destruction. Demonstrating the pillage of archaeological sites has never been easier. Any country that can establish that their cultural landscapes and objects are at risk as a result of demand in the United States can request a bilateral agreement under the 1983 Convention on Cultural Property Implementation Act (19 United States Code 2601 et seq). Big data generated from drones are used to offer proof of in-country looting, evidence fulfilling Determination # 1: that the cultural patrimony of the State Party is in jeopardy from the pillage (19 U.S.C. 2602 (A)(1)). This case study will illustrate the power of big data in diplomacy.

[272] *A GIS Predictive Model of Early Archaic Site Locations on the Taos Plateau*

The archaeological record within the recently designated Rio del Norte National Monument is the subject of on-going investigations. This presentation will discuss the use of Geographic Information Systems (GIS) in predicting the locations of Early Archaic sites within the monument, which straddles the Rio Grande on the Taos Plateau in northern New Mexico. GIS is used to explore the relationship between site location and environmental, topographic, and physiographic variables. These data are combined with existing site location data to demonstrate where Early Archaic sites are likely to occur and to determine how the distribution of sites relates to lithic sources on the Plateau. The model addresses questions regarding the availability and distribution of lithic resources in the region, and how the distribution of these resources influences site location. The result is a raster surface that indicates high and low probability areas for Early Archaic site occurrence. The presentation will explore the utility of GIS in predicting site presence by comparing the model results with Early Archaic site locations that were recorded during the 2018 field season near the No Agua Peaks obsidian source within the western portion of the monument.

Keyser, James (Oregon Archaeological Society) and Linea Sundstrom (DayStar Research)

[369] *Ambrose Bierce's Indian Inscriptions: Biographic Art Along the Bozeman Trail*

In 1866 Ambrose Bierce accompanied the Hazen expedition whose tour inspected military outposts in the Department of the Platte. During cartographic work, Bierce recorded two "Indian inscriptions," one petroglyph on the Powder River near Ft. Reno, and an arboglyph on the Yellowstone River upstream from Pompey's Pillar. His recordings are detailed enough that we can decipher these narrative drawings. The petroglyph shows the aftermath of an attack on a lumber wagon, while the arboglyph shows two war expeditions, one against a Mackinaw boat on the Yellowstone River and the other against a group of Metis and their Red River cart.

Keyte, Shawn

[9] *Discovery of A Lost Seminole War Fort: Fort Shackelford*

Fort Shackelford was built in February of 1855 on what is now the Big Cypress Seminole Reservation in South Florida. It was one of several forts built by the U.S. Army used to scout near the Big Cypress and Everglades regions during the U.S. Government's efforts to pressure the Seminoles into leaving the area. In late 1855, the fort was found burned and since then, the location of the fort has been shrouded in mystery. In December of 2017, new evidence was uncovered during excavations that could potentially be remnants of the lost fort. By determining the precise location of Fort Shackelford, it will help the Seminoles tell their story about an important site within their

community.

Khaksar, Somaye and Gilbert Tostevin (University of Minnesota, Twin Cities)

[115] *Is It Only the Blank Size That Matters? The Effect of Edge Segmentation on Lithic Blank Cutting-Edge Efficiency*

Lithic blank/tool efficiency has been the subject of some experimental research in the last two decades. However, most of the research has largely been focused on the general morphology of the edge (straight, convex, or concave), or on some specific characteristic such as angle or the length of the cutting portion. What has not received attention is the small-scale variation in the edge morphology that is created by sharp projections and concavities in the edge and that define what portion of the blank can be used for cutting at any given time. This “segmentation of edge” can turn an otherwise long straight edge into multiple shorter segments. This means blank size, which is usually measured as “the maximum span of the flake parallel to the cutting edge” (Key & Lycett 2014:141) is not sufficient to assess the efficiency of a blank’s cutting edge. Here, we report on an experiment to evaluate the overall effect of segmentation on cutting edge performance with the hypothesis that longer segments are more efficient, in terms of time, than shorter segments. We also attempt to show how the cuts created by flakes with unsegmented edges are different from those whose edges are segmented.

Khalsa, Sant Mukh (CUNY Graduate Center)

[91] *Everyday Objects and the Lived Experience: Inhabiting Gufuskálar, a Late Medieval Icelandic Fishing Station*

Early Icelandic fishing stations are understood primarily through the shifting role of fishing within the Icelandic economy and the importance of fish provisioning within the North Atlantic. Thus, less focus has been placed on studying the lived experiences and domestic lives of people who worked at and inhabited these sites. The 15th-17th century site of Gufuskálar has produced material culture that offers a rare glimpse at the durable everyday objects used by non-elite Icelanders before the Early Modern period. The extensive collection of everyday objects from Gufuskálar – such as hair pins, padlocks, candle holders, cutlery, cooking pots and gaming pieces – gives us insight into the personal and embodied daily lives of inhabitants. This poster will examine the material culture from Gufuskálar to explore tensions between narratives of the economic and the personal at Gufuskálar.

[277] *Archaeological Research on the Ancient Iron Metallurgy in Côte d'Ivoire (2003-2016)*

Since the year 2003, programmed research is carried out on the old iron metallurgy in Ivory Coast. Documentary research, field surveys and archaeological excavations have discovered ancient sites of iron metallurgy from 2003 to 2016. In a large part of the regions of Côte d'Ivoire, sites were discovered, studied then dated. The northern zones (Korhogo, Mbengué, Kaniassa, etc.) and those of the South (the Eotilé Islands, Issia) of Côte d'Ivoire have yielded various remains (extraction wells, reduction furnaces, clinker habitat related to the ancient metallurgy of iron etc.). The dating obtained after excavations on the sites of forest and coastal zones (V-XIIIe centuries) and savannah (X-XXe centuries) are between the fifth and twentieth century. A variety of technical traditions characterize these ancient techniques and show the wealth of these skills. Our objective in this study is to present a summary of the results of this research from 2003 to 2016. The written documentary data, the results of the surveys and the archaeological documents are analysed and allow to have important data.

Kilgore, Gertrude (University of Kentucky)

[371] *Examining Early Maya Public Architecture at Gallon Jug, Belize*

Recent trends in archaeological research in the Maya lowlands focus on developing understandings of the nature of the entangled relationships between urban centers and peripheral populations. The Preclassic origins and development of centralized political authority at the urban center of Chan Chich in northwestern Belize is currently understudied in relation to its surrounding minor centers. During the 2018 field season, the Belize Estates Archaeological Survey Team began the first intensive investigations at the site of Gallon Jug, a minor center located in the northeastern periphery of Chan Chich. Following the distribution patterns of Preclassic material observed in preliminary testing conducted by Guderjan and colleagues (1991), testing uncovered a possible Preclassic structure beneath the western end of the site's final-phase main plaza. This buried monumental platform provides a starting point for considering the form and function of early public architecture at this minor regional center and comparing peripheral public architecture's formal and functional devices to the patterns observed in excavations of early phase architecture in the monumental site core of Chan Chich.

[298] *Petrographic Perspectives on Ceramic Technology and Provenance in Northern Botswana*

Over the last 45 years, Wilmsen, James Denbow, and others have recovered ceramics from nearly thirty excavated sites, in the northern half of Botswana. Together with Phenyio Thebe and Ann Griffiths, Wilmsen has also sampled clays and sands throughout the region, has obtained samples of raw materials, and prepared pastes and pots from multiple village potters. To date, Killick has made qualitative petrographic descriptions of more than 700 thin-sections samples from these materials. This brief presentation provides a selection of our findings. We document some unusual choices of temper (charcoal, bone) and of clay, including a distinct preference in parts of eastern Botswana for preparing pastes directly from weathered granites. Many prehistoric pots in northwestern Botswana were clearly made from clays obtained from the inland Okavango Delta, as they contain spicules from freshwater sponges and/or plant phytoliths. We can also show that some pots were transported for at least 600km. Some of these appear to relate to the southward migration of pastoralists into northwestern Botswana around 200 CE; there was a second migration into this region around 700 CE, this time of metal-using agropastoralists with very different ceramics.

[253] *Genome-wide Ancient DNA from Historical Siberia as a Lens on Yeniseian Population History*

The relevance of ancient DNA to debates in language prehistory is a noteworthy strand in Eurasian archaeogenetic research, where much effort has gone towards relating these data to Indo-European. We relate new genome-wide ancient DNA data from a historical Siberian individual to Yeniseian, an enigmatic and isolated language "microfamily" at the center of numerous controversial proposals in historical linguistics and cultural interaction. Yeniseian's sole surviving representative is Ket, a critically endangered language of Central Siberia's Middle Yenisei region. In sharp contrast to the present-day situation, Russian imperial records, combined with hydronyms and other argued loans and substrate influences in non-Yeniseian languages, indicate that Yeniseian speakers formerly had a much broader presence in the Siberian taiga, further south in the Altai-Sayan region, and perhaps even further afield. The consistency of these proposals with genetics is problematic and faces a major obstacle in the lack of samples from known speakers of Yeniseian languages other than the Kets, who have had complex ongoing interactions with non-Yeniseians such as the Samoyedic Selkups. We underline the special value even of comparatively recent Siberian aDNA samples, orienting our analyses in a broader landscape of concordance, discordance, and uncertainty at the interface of diachronic linguistics and genetics.

Kim, Geon Young

[338] *Latrine Use and Human Waste Management in East Asia: Configurational and Depositional Approach*

Latrines have been excavated in East Asia dating back to the second century BCE. To tackle with the fact that the number of latrines that have been reported does not match with the one of settlement sites, this paper provides possible solutions of detecting a latrine with the configurational approach and the depositional approach. Excavated cesspits, cesspools and flushing type latrines made of bricks and wood, as well as the mortuary pigsties and latrines from Han Dynasties' tombs, suggest possible architecture structures of latrines. Artifacts such as hygiene sticks and wood ash can be used to determine the presence of latrines. Also, the anaerobic condition makes sediment analysis be possible. Considering the geologic condition of this region, some insects, macrobotanical remains, parasites, phosphate, coprostanol, and vivianite can be used as indicators. Latrine structures, in relation with the context concerning the surrounding environment, provide information of latrine use, human excrement and waste management, and reveal people's idea towards latrines and human waste in ancient East Asia.

Kim, Ha Beom (University of Oregon)**[156]** *Examining Recent Archaeological Findings at the Bronze Age Korean Settlement of Jungdo Using an Economic Perspective*

Recent archaeological excavations at the Jungdo site, Chuncheon, Korea have revealed a rare ditch-enclosed Bronze Age settlement in which more than 1,000 pit houses and 100 dolmens were found. As a large-scale complex settlement with evidence of spatial demarcation that divides the site into residential, production, storage, and burial areas, the Jungdo site provides valuable information on the lifeways of inhabitants at Bronze Age settlements and their interactions. The site is therefore very important for the Bronze Age settlement studies in Korea. This study presents the general findings of the archaeological excavation and archaeobotanical analysis at the site since 2013. While preliminary, the study also examines potential economic interactions occurred between Jungdo and other Bronze Age settlements present in the North Han River basin through the use of GIS and other computational analysis.

[156] *Chair***Kim, Lynn (University of Texas at San Antonio)****[46]** *The Materialization of an Inka Colonial Landscape: Exploring the Road Network in the Camata-Carijana Valley*

Colonial encounters with the Inka Empire led to social changes reflected in the landscape. A hallmark of Inka landscapes were their roads. I explore if the road network in the Camata-Carijana Valley materialized broader forms of state or local control through its distribution and construction. In particular, I investigate how the design of road system influenced movement of people and goods through the Valley. The poster focuses on my use of costs path analysis and Tobler Hiking Function to explore the time of travel and the movement of llama caravans. Analysis suggests that the pre-Hispanic road in the Camata-Carijana Valley was designed to (1) connect people from the highlands to the lowlands and (2) move people to the major Inka settlements in the Valley. Indeed, small local settlements were bypassed by the roads; Thus, the road network supported imperial trade and exchange between groups and discouraged (limited) local trade and exchange.

Kimbell, Caroline (University of London), Sara Lunt (The Cusichaca Trust) and David Drew (The Cusichaca Trust)**[306]** *The Cusichaca Archive: History, Contents and Research Potential*

In 1977, Dr Ann Kendall established the Cusichaca Trust, registered in the UK, to oversee her archaeological project work. Today the Cusichaca Archive documents forty continuous years of one of the largest multi-disciplinary projects ever mounted in the Peruvian Andes. Beginning with archaeological excavation in the Cusichaca valley near Machu Picchu, the Trust's involvement expanded to include ethnography, ethno-history, and environmental studies. The Trust pioneered 'Applied Archaeology'—initial archaeological investigation leading to collaboration with local farming communities in the restoration and re-use of pre-Hispanic systems of irrigation canals and agricultural terraces. Success here led to similar commitments across a wider area. The paper will summarize Cusichaca's history and the work of London University's Senate House Library to accession, describe, digitize and secure the long-term legacy of the Trust's work. Most of the manuscripts, typescripts, maps, thousands of photographs, and extensive primary field records remain unexplored and unpublished. The Library has pioneered an approach involving student archivists from Ann Kendall's alma mater University College London, to process and accession the archive, using the records as teaching material and completing the structuring and cataloging using a dedicated Project Archivist before running a competition to provide the records in digital form.

[30] *Soil Differences and Their Implications for Plaza Function and Site Organization at Maax Na, Belize*

In 2016 the Maax Na Archaeology Project systematically tested the soils of two major plazas at Maax Na, a large prehispanic site located in the Three Rivers Region of Belize. Tests in the West Plaza sought to determine whether phosphorus levels there supported its identification as a marketplace during the Late Classic (C.E. 600-850). Similar tests at other sites have suggested that regular, linear distribution of high soil phosphate levels could signal an ancient market area, in conjunction with other marketplace indicators. Sampling of the North Plaza, thought to be the main ceremonial plaza at the site, was aimed at testing this proposition by determining if phosphate levels were consistent or varied across the site. Also of interest were data on heavy metal concentrations, which can signal different activities. Recently completed geochemical analyses of the samples reveals the two plazas had strikingly different chemical signatures, giving new insights into plaza functions and site organization.

[185] *Ontology, Time Travel, and Transformation in the Lower Illinois Valley*

In this paper, we explore the implications of time travel (Holtorf) and ontology (Viveiros de Castro, Latour, Pedersen) for bioarchaeological perspectives of Middle Woodland (Hopewellian) peoples of the lower Illinois River valley (LIV), who occupied this region two millennia ago. Following Pedersen's advice concerning reflexivity, conceptualization and experimentation, we argue that these Hopewellians became primordial beings during both unique and repetitive events that ensured balance across their worlds. We argue that people of all genders assumed ancestral and animal forms in their temporal travels anchored calendric, repetitive and multi-community rituals draped across monumental landscapes. The varied, richly productive landscape offered many potential animal familiars to those who traveled far to acquire shiny obsidian, gleaming copper, or the transparent mica that invited those Hopewellians no longer living to pass into the world below, a parallel universe from which life itself would come again. No less significant were the seasonal gatherings where participants recreated the world, sharing abundance and wisdom as they crossed impermanent boundaries between the cultural and the natural.

[133] *Sea Level Rise, the Chesapeake Bay Bolide, and Managing Threats to Archaeological Sites in Coastal Maryland*

A study commissioned in 2015 by the St. Mary's County, Maryland Historic Preservation Commission sought to measure the impacts of residential and commercial development on the county's archaeological resources. The study's findings revealed minimal impact by development but a stunning threat from sea level rise compounded by the land subsidence caused by a 35-million-year-old meteor event. Because these sites (identified and unidentified) are not threatened by development, resources are limited for documenting and managing them. To address this deficit in the state's low-lying coastal plain, archaeologists might consider two things: one, a return to wide-area surveys using sophisticated GIS-based modeling and two, linking these surveys not only to climate change but to addressing important historical, social, and cultural questions.

[197] *Preserving Oaxacan Foodways in the Face of Conquest: The Seed Bank at Cerro del Convento*

The rich culinary traditions of Oaxaca were both enhanced through and catastrophically disrupted by Spanish incursions during the Colonial Period. However, in spite of many radical transformations in cooking techniques and ingredients, indigenous people of Oaxaca persisted in their use of certain foods and practices. This persistence sometimes required extraordinary effort, especially in times of physical and spiritual insecurity. A specialized storage feature excavated in a rockshelter at Cerro del Convento, in the Sierra Sur region of Oaxaca, represents just such efforts. Remarkably, this one small rock and daub bin contained over 120 different plant taxa in less than one liter of

sediment. We argue that Cerro del Convento was used as both a physical retreat and a location where seeds of treasured food plants, i.e. agricultural futures, were deliberately curated. While seed banking is well represented in the modern world (e.g. Svalbard Global Seed Vault), the Cerro del Convento collection is the first of its kind in Mesoamerica and the richest find to date in the pre-Hispanic and Colonial Americas. The deposit indexes the importance placed on preserving foodways in times of crisis and highlights ingredients and practices of Oaxacan cuisine that persist to this day.

[237] *Recovery of Inadvertent Discoveries along the Lost Coast of the King Range NCA*

Recovery and reburial of inadvertent discoveries of exposed pre-Columbian human remains has repeatedly occurred at a remote archaeological site along the Lost Coast of the King Range National Conservation Area, managed by the Bureau of Land Management-Arcata Field Office. The site is located in a remote area, subject to ocean wave action and seismic activity. It is within a congressionally designated wilderness area, and is accessible only by backpacking. BLM has consulted with the Bear River Band of the Rohnerville Rancheria (BRBRR), the geographically proximal Federally-Recognized Tribe regarded as the Native American representative, and the California State Historic Preservation Office (CA SHPO). These consultations resulted in the completion of a Native American Graves Protection and Repatriation Act (NAGPRA) Plan of Action (POA) and a Treatment Plan. The Section 106 compliance process resulted in a Memorandum of Agreement (MOA) between BLM and CA SHPO (expires October 2019). The BLM CA State Director authorized reburial of recovered remains. An internal BLM funding request for FY19 proposes a data collection project to better understand the erosion rate of the Lost Coast marine terrace and assess the vulnerability of significant cultural resources. The data set will inform a mitigation plan.

[136] *Out of Site, Out of Mind: Women's Hidden Labor and the Making of Modern American Archaeology*

While some work has been done over the past few decades to uncover the roles of female archaeologists who supported their husband's careers with little acknowledgment, less work has been done to explore the diversity of forgotten women's labor that helped support American archaeology since the late 19th century. Institutions such as Harvard's Peabody Museum of Archaeology and Ethnology and the Robert S. Peabody Museum of Archaeology benefited from countless female clerks, stenographers, secretaries, librarians, and other staff. At Harvard University, many archaeology graduate students who had young children benefited from an informal economy of female caregivers that lived on campus as well. Although different in many ways, the 21st century has seen a stark increase in non-tenure track faculty, who account for over 70% of faculty in American universities, or 1.3 million out of 1.8 million professors. Of these 1.3 million professors, it is estimated that between 51% to 61% of contingent faculty are women, who feel the effects of uncertain futures in Higher Education all too well.

[25] *The Community at the Crossroads: Insights into Connectivity from the Tijeras Pueblo Fauna*

Tijeras Pueblo lies at a crossroads. It sits at the junction of two canyons, one north-south and one east-west, and occupies a boundary between two distinct culture areas—the Pueblos to the west and the Plains to the east. This position on the landscape may have created both challenges and opportunities for the residents of Tijeras Pueblo in terms of subsistence. Previous studies of the Tijeras Pueblo fauna have focused on the marginality of Tijeras Canyon for maize agriculture. However, the large number of environmental zones accessible from this spot, as well as the cultural connectivity suggested by the Pueblo's location, would afford residents access to an abundance of wild resources. In this paper, we discuss preliminary results from our analysis of the fauna from Tijeras Pueblo, with a particular focus on what they suggest about cultural connectivity and resource richness.

[184] *Classroom to Camp: Implementation and Assessment of Archaeology K12 Curriculum at a Girl Scouts Camp in Southeastern Utah*

Project Archaeology is a heritage education organization dedicated to teaching scientific and historical inquiry, cultural understanding, and the importance of protecting our nation's rich cultural resources. It is a diverse network of educators that make archaeology education accessible to students and teachers nationwide through high-quality educational materials and professional development. Project Archaeology: Investigating Shelter, its' award-winning curriculum guide, is a complete archaeological investigation that aligns with Common Core and Next Generation Science standards, and is endorsed by the National Council for the Social Studies.

Due to interest in enhancing informal education, Project Archaeology adapted its' Investigating Shelter curriculum for a Girl Scouts archaeology camp. For the past 3 years, the camp was held in Southeastern Utah allowing scouts to visit Ancestral Puebloan sites and learn from Ute and Navajo educators. In an effort to measure implementation effectiveness, pre- and post- tests were administered in association with the June 2018 camp at Bears Ears National Monument. Results of the camp assessments compared with assessments previously administered in classrooms around the country will help to improve future informal education programs.

[247] *Extending Paleoanthropology with the Extended Evolutionary Synthesis*

Discerning the patterns and processes of human origins has been mostly centered on a gene-eye's view of fitness landscapes. This interpretive structure is partially undermined by modern biological thought that emphasizes a more holistic approach to evolution. We suggest that the broader framework of the Extended Evolutionary synthesis allows for a better interpretation of paleoanthropological data. Some scholars have suggested that Niche construction blurs the boundaries between ultimate and proximate drivers of evolution. However, while thinking in terms of proximate and ultimate causation is useful, the two cannot always be separated while discerning relevant processes in ecosystems. In this paper, we emphasize the role of niche construction and suggest its value can be strengthened by firm footing in semiotic theory and the Extended Evolutionary Synthesis. We argue that the niche (and the concept of Umwelt) is a useful way to understand the organism—environment interface and apply this theoretical framework to two specific examples: 1) hominin evolution and 2) the processes of modern human origin. Using new results from aDNA, fossils, and archaeology we show that models which incorporate the Extended Evolutionary Synthesis are better fits for the current data that emphasizes hybridization and the expansion of the human niche.

[302] *The Evolution of Domestication in Cassava Unraveled through Historical Genomics and Archaeobotany*

Cassava ('manioc' or 'yuca' regionally) is a staple food for 800 million people worldwide. It was domesticated in the southwestern Amazon ~7,000 years ago, and archaeobotanical evidence suggests that it dispersed widely, including through Central America, shortly thereafter. In the present day, it is most widely grown in Brazil and throughout sub-Saharan Africa. However, we know surprisingly little about its fundamental biodiversity and the domestication process. Here, we present new genomic data from historical collections which, combined with archaeobotanical records, begin to elucidate the evolution of domestication in cassava.

[346] *Identification of Earthen Construction Techniques in the Casas Grandes Region, Chihuahua, Mexico*

This study compares pre-Columbian earthen construction techniques in three archaeological sites of the Casas Grandes region: Paquimé, Arroyo Seco, and Cueva de la Olla. These sites are found in different geological and geomorphological setting, although they present similar architectural typology. Their construction techniques were examined by archaeometric characterization, such as particle-size analysis, thin-section petrography, X-ray diffraction, and X-ray fluorescence analysis. These analyses were performed on samples from walls of archaeological constructions and samples from local material banks previously identified as potential original material source banks. The study demonstrates the local origin of earthen construction materials, and the techniques particularity for each site, which reflects their adaptation to the local geological and geomorphological context.

[144] *Neanderthals in Porto Selvaggio, Southern Italy*

Porto Selvaggio of southern Italy is where the Uluzzian culture was first identified and documented, providing key insights into the transition of the Middle to the Upper Paleolithic. The area has also yielded evidence of continuous Neanderthal occupations spanning MIS 5-3. Situated in the Natural Park of Porto Selvaggio, several sites were excavated by Brozzati von Lowenstern in 1960's and 70's. As a part of research initiatives at the Museo della Preistoria di Nardò, we began to revisit the artifacts and fauna recovered from these sites. Based on the analysis of

the production sequences and techno-functional classification of the lithics, we document the development of Levallois technique prior to the end of MIS 4 when this lithic technology purportedly emerged in this region. In addition, the reanalysis and correlation of chronostratigraphic, paleoenvironmental, and zooarchaeological data provide us clues into the role that this region played as a possible refugium for Neanderthals during unfavorable climatic conditions.

[300] *Emerging Epicenters and Complementary Centralized and Decentralized Water Management Strategies at Medieval Angkor, Cambodia*

Recent research at Angkor has aggregated over 20 years of archaeological map data, which is providing important new perspectives on the agricultural production system of the polycentric low-density urban complex. Much scholarly attention has been directed towards the functional vs. ritual nature of the huge reservoirs and channels (Van Liere, 1980). However, smaller, community-based agricultural units were likely important components of the agricultural system. In this paper, I trace the chronological and spatial development of two types of settlement patterns: 1) formally-planned dense urban zones that are termed epicenters and 2) lower-density settlement units comprised of temples and associated reservoirs and occupation mounds that are termed temple communities. Building from the work of Evans et al. 2013, this paper argues that groups of non-producers that lived in the epicenters would have been highly dependent on agricultural surplus produced by temple communities utilizing local and state hydraulic features. To determine if new temple communities are built near state-sponsored hydraulic infrastructure, nearest neighbor analysis and point density analysis are conducted. Results suggest that temple communities cluster around state-sponsored hydraulic features.

[82] *From Minerology to Monuments: Place-Making through Personal Ornamentation in Mid-Holocene Turkana, Kenya*

Beads play a prominent role in personal ornamentation in life and death: desired, exploited, and widely traded throughout prehistory. Although manufacture and use provide important social context, evaluating the materials used and their source locations is a crucial component of understanding how these industries arise. This paper features an unusual stone bead industry from Lake Turkana, Kenya associated with the first pastoralists in East Africa 5,000

years ago that rivals the mineralogical complexity of its global counterparts. Excavations at the sites of Lothagam North and Manemanya suggest these were mortuary monuments built by mobile pastoralists people who exploited a number of geological sources extensively to adorn their dead without the direction of dictation of a ruler or state. Stone beads found at these sites, in tandem with previously curated collection from another nearby site, Jarigole, provide contrast to the bead industries that emerge in agricultural and state societies. Through an examination of the mineralogy and sourcing of the beads, we argue this bead making phenomenon represents a significant investment in material elaboration when social values were under renegotiation, with a time, location, and context not currently considered in archaeominerological literature.

[179] *Queer Eye for the Cave Guy: Exploring Non-Normativity in Upper Paleolithic Burials*

Studies of Upper Paleolithic burials in Europe have illuminated several aspects of Upper Paleolithic lifeways, from health and diet, to status and social organization. These studies, while recognizing the rarity of Upper Paleolithic burials, interpret the Upper Paleolithic burial record as inherently normative. However, the intentional burial of people within cave and rockshelters was a non-normative practice. To date, fewer than 100 burials are known from the Upper Paleolithic in Europe. This practice, and the individuals contained within these burials, were not only rare, they were non-normative – they were queer. These buried individuals lived outside what was likely considered “normative” in the Upper Paleolithic, and it is for this reason they were singled out for burial. In this paper, I argue that analyzing these Upper Paleolithic burials through an explicitly queer lens will enhance our understanding of these burials, the individuals contained within them, and issues of Upper Paleolithic identity and embodiment more broadly. These buried individuals were challenging the norms of the Upper Paleolithic, and by analyzing them as radically queer, rather than the more politically and analytically inert “rare”, we can begin to push against our normative understandings of the past.

[285] *Zooarchaeological Analysis of a Guangala Pit at Rio Chico, Ecuador (N4C3-170)*

The Rio Chico site on the central coast of Ecuador was occupied almost continuously for 5000 years (ca. 3500 BCE to 1532 CE) in a region of coastal South America that is heavily influenced by climatic events such as El Niño Southern Oscillation (ENSO). Archaeological records and historical documents written by the Spanish provide evidence that by the Manteño phase (500 to 1532 CE) the coast of Ecuador was inhabited by a maritime culture of long-distance trade merchants who were highly skilled at boat building and ocean navigation. However, the preceding Guangala phase (100 BCE to 800 CE) is less understood. This poster presents the results of a zooarchaeological analysis of a sample of faunal remains from a large Guangala phase pit feature (Feature 733)

excavated by Florida Atlantic University (FAU) field school in 2003. All remains were identified to the class level and a subset of this sample was identified to the family level. These identifications serve as the basis of this analysis. This analysis contributes to an understanding of the subsistence strategies and environmental conditions on the coast of Ecuador during the Guangala phase from which the highly skilled Manteño culture developed.

[389] *Regional Production and Trade of Glazed Ceramics in Medieval Central Asia along the Silk Road*

Analyses by NAA and LA-ICP-MS of 106 ceramics excavated from archaeological sites in southern Kazakhstan has demonstrated local production of lead-glazed ceramics during the Early and Middle Islamic periods in Central Asia. The sherds, including both glazed (n=39) and unglazed ceramics (n=67), were excavated from seven medieval sites dated from the 9th to 15th c. CE and located north of the Tien Shan mountains. Compositional analysis of the ceramic pastes by NAA indicates that there are three distinct compositional groups for the lead-glazed ceramics. Comparison of the glazed ceramic NAA data to more than 1300 previously analyzed ceramics from Southwest Asia, Central Asia, and China indicates both an active local production of lead-glazed ceramics, and trade of specialty and glazed ceramics into the region from Southwest Asia. While the paste composition of the glazed groups is well defined, LA-ICP-MS data of the major, minor, or trace elements of the glazes does not distinguish the same compositional groups. Characterization by SEM-EDS and EMPA of examples of ceramics from the three lead-glazed compositional groups examines the technological variation within and between the locally produced Central Asian and imported Islamic lead-glazed wares.

[249] *Current Perspectives on the Western Stemmed Tradition and Clovis in the Mojave Desert*

This paper summarizes the spatial and temporal distribution, technology, and subsistence patterns of Clovis/fluted and Western Stemmed tradition sites and isolates in the southern Great Basin, particularly the Mojave Desert. Fluted and Western Stemmed Tradition (WST) points/sites occur throughout the Mojave Desert, though WST points (primarily the Lake Mohave and Silver Lake varieties) are more widely distributed and occur in greater numbers than fluted points. Many, but not all, of these points were found near shorelines of now dry lakes. After summarizing the distribution, technology, and subsistence trends at the regional-scale, I consider these same trends at the local-scale using my ongoing research around pluvial Lake Mojave (today's Soda and Silver dry lakes) as a case study. Despite the limitations of a largely surface record, important insights are gained about the lifeways of Paleoindians in the Mojave Desert and, more generally, those in the Intermountain West.

[313] *Ute Ethnographic Cultural Landscapes in Southeast Utah*

The Nuche, or Ute people, have been in their homelands across Colorado and Utah since time immemorial. Southeast Utah formed part of the larger movements of the Ute bands with connections to the area, which in turn formed part of the overall Ute movements across the entire Ute homeland. The cultural landscape of southeast Utah serves as a microcosm of Nuche lifeways as a whole. The Abajos of southeast Utah, for example, not only provide

nourishment of wild animals the Utes hunt, plants they gather, and crops they farm downstream, but also provide spiritual nourishment and cultural continuity. It proves vital then to not only consider specific archaeological sites, but how the entire cultural landscape formed a necessary part of Ute lifeways. A Utah BLM funded ethnographic study is showing the depth and variety of 32 tribes' connections to southeast Utah, but this talk will specifically focus on Numic, both Ute and Southern Paiute, cultural landscapes in southeast Utah. Included in this discussion will be an overview of interdisciplinary ethnographic and archaeological documentation being conducted at a Numic petroglyph site, as well as how tribes and archaeologists can better collaborate to reach mutually beneficial outcomes.

[269] *Innovation, Intensification, and "Maritimeness" 4,500 Years Ago at Chignik, Alaska*

On the south side of the central Alaska Peninsula, close to culture-history's boundary between "Eskimo" and "Aleut," lies Chignik. Most archaeological investigations and explanations in the broader region have emphasized the overwhelming importance of resources derived from the sea. But at Chignik, evidence of a divergent facet of maritime adaptation has been identified, one physically oriented away from the coast and focused on salmon. Recently, large, stratified cultural deposits were incidentally uncovered within the Village of Chignik Lake during infrastructure improvements. These deposits sat below well-known volcanic tephra, yielded diagnostic projectile points and tools, and produced charcoal samples for which AMS dates were generated. These data prove substantial human occupation at Chignik much earlier than previously-confirmed for the region, one that occurred nearly 5,000 years ago and shared some characteristics with the Arctic Small Tool Tradition. This paper explores culture-history, maritime adaptation, and salmon intensification to discuss human adaptation as technological innovation at Chignik, in the broader context of regional Holocene climate models.

[135] *Why Is There No American Convention on the Protection of the Archaeological Heritage?*

The question posed in the paper title will be addressed by presenting arguments for the development and adoption of an American Convention on the Protection of the Archaeological Heritage similar to the existing European convention on heritage protection. Using the European convention as a model, important components of an American convention will be considered, recognizing the unique heritage protection issues faced in the Americas, particularly the multi-cultural heritage of the western hemisphere. It will be argued that an important component of the convention should be positive actions to increase government, corporate and public support for protection of heritage resources by strengthening the concept of "ownership" of these resources by these groups beyond the acknowledged interests of concerned resource professionals including archaeologists, cultural resource managers and museum specialists. Recent considerations of this issue by European heritage professions will be reviewed to support the essential need for this non-professional involvement in heritage protection. Finally, this paper will recommend a potential strategy for developing a draft American Convention on the Protection of the Archaeological

Heritage and moving it toward adoption by governmental entities of the Americas.

[213] *Gallina Ceramics: A Multi-site Pilot Study on the Composition of Gallina Sherds in Thin-Section*

The Gallina (AD 1100-1300) people of northwestern New Mexico produced both Black-on-Gray and utility ware ceramics. Gallina ceramics appear to be produced at the household level with no evidence for specialization. Little is known about Gallina ceramic production practices and few compositional analyses have been conducted. This pilot study examines ceramics in thin-section using Petrography and the Electron Microprobe Analyzer illustrating paste composition from three sites. Results from this analysis suggest the use of grog temper, a practice not yet documented in the Gallina area. Comparing Gallina paste composition across three sites lends insight to similarities and differences in communities of practice.

[208] *Contextualizing Campsites: Survey Results and Comparisons from Two Parajes along El Camino Real de Tierra Adentro*

As part of ongoing projects relating to El Camino Real de Tierra Adentro, NMSU students surveyed the North Fork Paraje, a campsite near a section of the Camino Real in southern New Mexico. These ephemeral sites are generally difficult to locate, with many sites attested to in archival documents still undiscovered, resulting in a general lack of scholarship relating to them. The recent survey supports a conclusion by an earlier study that placed the heaviest period of use for the paraje in the 18th century. Furthermore, during the colonial period, the paraje appears to have been used primarily by travelers moving north from Mexico. Artifact and spatial analyses reveal differences between the North Fork site and the nearby Paraje San Diego, demonstrating the non-uniformity of this site type. These differences reflect the various ways the trail was used and experienced over time.

[36] *Assessing Earth Oven Intensification in the Lower Pecos Canyonlands of Southwest Texas*

Earth oven baking begins in the Lower Pecos Canyonlands of southwest Texas around 10,000 years ago and becomes a prominent component of hunter-gatherer life throughout the Holocene. We know plant baking played an important role within Lower Pecos lifeways because earth oven facilities (EOFs)—the locations where hundreds to thousands of earth ovens were constructed over millennia—are the most common archaeological features in the region. However, given the ubiquity and outwardly invariant nature of Lower Pecos EOFs, little research has been directed at assessing intensification and changes in long-term earth oven use, or evaluating the social impacts of earth oven construction and plant baking. Recent excavations at four rockshelters in Eagle Nest Canyon, a short box-canyon tributary to the Rio Grande, provide an opportunity to address these research issues. Focusing primarily on intensive radiocarbon dating, rigorous stratigraphic documentation, and estimates of the total number of constructed earth ovens, we assess earth oven intensification, long-term use, and the potential social dynamics of earth oven construction within the four rockshelters in Eagle Nest Canyon. These data can be used to address the potential implications for broader regional mobility and landuse studies.

[198] *From Narrative Picture Writing Bands to Pseudo Cartographies. How Native Scribes Invented Powerful New Media after the Conquest*

Scholars have always believed that maps and cartographies did exist in preconquest Mesoamerica. The large amount of early colonial Native maps seems to be evidence for such geographic media. But as yet, no pre-Hispanic lienzos and maps have become known. However, the earliest lienzos do show pre-Hispanic elements in their structure, iconography, and content, albeit in varying degrees. There are many indications that the authors were familiar with prototypes. With the creation of the Lienzo as a modern-looking new medium they were able to integrate mythical and real history known from the pre-Hispanic codices as a process in the flow of time. Transferred to the new medium they do not express any rupture that occurred when the Spaniards arrived and seized power; they rather integrate that event. In the paper, typical cases will be exemplified by the examples of the Codex Vienna, Lienzos Selser II/Coixtlahuaca II and Tlapiltepec from Oaxaca, and other documents. Their central theme is the pre-Hispanic legitimization of power, changing concepts and claims to territory while the media, structure, and style of the documents are subject to change, and reflect the reception habits at the time.

Koepfel, Christopher (US Forest Service) and Doug Stephens (USDA Forest Service)

[75] *Creative Mitigation and Collaborative Outcomes in Section 106 Planning*

Too often the Section 106 process for archaeological historic properties follows a formal checklist, and mitigation of archaeological sites through intensive Phase III excavation is the assumed outcome. However, Phase III excavation may not be the most desired outcome for the people that have deep emotional and spiritual connections to these archaeological resources. Alterations or impacts to sacred sites or cultural resources that represent community cohesion are not mitigatable in the traditional sense, and Phase III excavation would not be desirable. We will present several examples from Federal civil works, transportation, and USDA Forest Service projects of creative mitigation that benefited both the agencies' missions and the interests of consulting parties and Native American tribes. If we include consulting parties and tribes during scoping and project design, rather than wait until later Section 106 or NEPA stages, we can create a collaborative planning process that avoids adverse impacts to important archaeological resources. This enhances the meaning and relevancy of the NHPA-based planning decisions by identifying collaborative, value-added cultural resource stewardship outcomes, while allowing agencies to plan and engage with cultural resources in a less reactive manner.

Koerner, Shannon (Colorado State University, CEMML) and Bretton Giles (Colorado State University, CEMML)

[147] *An Assessment of Central Plains Tradition Ceramic Variation in the Flint Hills Region of the Eastern Plains, USA*

The Central Plains tradition (CPT) encompasses a variety of Late Prehistoric adaptations in the eastern Plains between AD 1100 and 1400. Cultural taxa within the CPT often are defined by certain pottery types within defined areas along the Kansas and Missouri River valleys. The Smoky Hill phase is a CPT taxon for the Flint Hills region in the Kansas River valley. Recent studies of particular Smoky Hill phase sites by the authors in the vicinity of the Fort Riley Military Installation have prompted us to reassess their pottery assemblages and temporal placements. Our studies have uncovered a mix of traits in these CPT ceramic complexes that make it difficult to understand whether certain sites reflect an in-situ development, long-distance influence, population intrusion, or multiples of these factors. This paper assesses some of the variation within CPT pottery in the Flint Hills region with a focus on documenting the composition of these assemblages and how their variability relates to recent radiometric dates for the sites.

Kohanski, Neil (California State University, Los Angeles) and Jeffery Rosa Figueroa (California State University, Los Angeles)

[360] *The Ritual Requirements for Opening a Maya Cave*

In 1966 a cave near Chichen Itza was reported to the Instituto Nacional de Antropología e Historia (INAH) by Maya living in the area. The cave was investigated by Victor Segovia Pinto, after which the sinkhole entrance was filled with rocks. When archaeologists from the Gran Acuífero Maya opened the cave 52 years later, workers on the project demanded that a ritual be performed that would protect the workers and the entire archaeological crew. A mesa or altar was constructed at the site and offerings of atole, liquor, cigarettes, and honey were made. The ritual

specialist purified the area by sprinkling liquor in the four cardinal directions surrounding the cave entrance. In the Maya lowlands, caves are ubiquitous features in the landscape. The ceremony described here reflects the fact that features like caves are deeply embedded in Maya cosmology and that the investigation of such features is considered to hold potential danger. Observations reported by the archaeologists were consistently seen as holding deep magico-religious significance by the Maya.

[18] *Constructing Difference: Defense, Sensory Experience, and Social Difference at a Late Prehispanic Hillfort (Arequipa, Peru)*

The fortified settlement of Auquimarka was one of many hilltop fortifications built during the Late Intermediate Period (1000 – 1450 CE) in the Colca Valley of the southern Peruvian highlands. While most fortifications fell into disuse following Inka expansion into the region, Auquimarka continued to grow and became a modest administrative center. The hilltop promontory location and numerous defensive walls are among the most striking features of the settlement. While crucial for defense, these features were also important in ordering the construction of homes and public spaces and in shaping the sensory experiences of residents as they moved through the settlement. Survey and excavations at the site indicate growing social differentiation between residents over time; differences that were often structured in relation to the settlement's defensive features. Capitalizing on the excellent architectural preservation at the settlement and a high-resolution digital terrain model captured from UAV imagery, this paper examines how social differences were mediated through experiences of visibility and mobility. The long history of occupation at Auquimarka offers insights into how social and political changes brought about by Inka rule were enacted in relation to earlier Late Intermediate Period experiences of war and settlement nucleation.

Kolar, Miriam (Five College Associate)

[315] *John Rick: Archaeoacoustics Maverick*

The research and conservation program directed by Dr. John Rick at Chavín de Huántar, Perú was one of the earliest major archaeological projects to invite and support integrative archaeoacoustics. Since 2008, Chavín archaeoacoustics has been featured in venues and publications across disciplines including archaeology, anthropology, acoustics, audio engineering, ethnomusicology, music archaeology, and the international science community, while simultaneously garnering attention in popular press. Among the driving factors for a sustained and comprehensive archaeoacoustics presence in Chavín archaeology has been Rick's collaborative commitment. Rick's interest in physics-based archaeoacoustics conforms with his archaeometric approach and strategic adaptation of novel technologies, regardless of their field of origin or typical application. Rick is an advocate for customizing digital tools, essential to the archaeometric archaeoacoustics at Chavín, directed by Miriam Kolar. Bringing archaeoacoustics directly into an archaeological research project—and by conducting the first in-situ impulse response measurements of architectural acoustics himself, using a toolkit and procedure developed with colleagues at Stanford's Center for Computer Research in Music and Acoustics (CCRMA)—Rick has demonstrated a commitment to innovative archaeology, and a willingness to work across disciplinary boundaries that typically preclude such collaborations. Archaeoacoustics is novel, and John Rick is one of its maverick early adopters.

Kolb, Benjamin (SUNY Binghamton)**[169]** *Learning to Knap: Apprenticeship Systems in the Early Woodland*

Tools are frequently conceived of as finished products rather than processes in and of themselves. Studying stone tool production allows for greater insight into pre-historic social systems, particularly that of apprenticeship, due to the development of criteria for detecting skill through lithic analysis. This project looks at Herrick Hollow I, a lithic scatter site in Delaware County, New York, in the context of the Meadowood phase of the Early Woodland period of the Northeast. The project includes observations of formal stone tools and debitage analysis in order to determine the presence of skill differential at the site and the possibility of a community of practice surrounding flintknapping. This is put in the larger context of the political economy of the Meadowood and comparative work on apprenticeship and learning.

Kolb, Charles (National Endowment for the Humanities (Retired))**[38]** *In the Beginning: TVP and TMP -- Reflections on the Classic Teotihuacan Period Survey in the Teotihuacan Valley, 1962-1964*

In June 1960, Eric Wolf organized an NSF-sponsored conference of 11 American and Mexican archaeologists held at the University of Chicago to evaluate the status of previous anthropological studies focusing on the Basin of Mexico and to coordinate future research. This led to two analogous long-range plans beginning in 1962. 1) René Millon's Teotihuacan Mapping Project (TMP), based at the University of Rochester, centered on the Classic period ceremonial center at Teotihuacan (ca. 100-650/750 CE) and its surrounding urban area (ca. 20 km²). 2) William Sanders' Teotihuacan Valley Project (TVP), based at The Pennsylvania State University, concentrating on identifying and mapping rural settlements (505 km²) from all time periods (Paleoindian-Colonial), which transformed into the larger Basin of Mexico Project (BMP) with five survey regions (totaling ca. 7,000 km²). The TMP and TVP focused initially on two issues: 1) precisely defining chronological periods and phases by ceramic analyses (pottery, figurines, candeleros, etc.) and 2) field-by-field ground survey using aerial photographs to plot the extent of urban and rural settlement areas. As a Penn State student, I worked on the TVP for my dissertation and was also hired by the TMP and will discuss the ensuing cooperation, competition, and problems.

Kolb, Michael [321] see Balco, William

Kolb, Michael (Metropolitan State University of Denver) and William Balco (University of North Georgia)**[321]** *Never Built in a Day: Contextualizing Urbanism in Iron Age Western Sicily*

The Iron Age was a transformative period in western Sicily, introducing the indigenous Elymian populations to Aegean and Levantine colonists who brought their own languages, crops, technology, materials, social customs, and ritual systems. Concomitant to the arrival of these foreigners was a transformation of indigenous lifeways. We examine this transformation by comparing settlement layout, housing styles, fortification systems, population densities, and the production of pottery, textiles, and agricultural products between the Late Bronze Age and the Iron Age, couched within a theory of urbanization. This transformation is interpreted as the result of local responses to broader social, political, and economic developments coupled with contact and sustained interaction with the newly arrived foreign colonists. Consequently, the Iron Age Elymi represent one case study where local responses partially aligned Elymian populations with their new neighbors, yet maintained elements of their indigenous heritage.

Kolb, Michael [337] see Rosa, Alexander

Kolbenstetter, Marie**[412]** *Politics along the Rivers: An Example from the Gulf of Fonseca, Honduras*

The relationship between environment, politics, and economies has often been observed in the archaeological record. In the Gulf of Fonseca, where archaeological sites concentrate around mangrove swamps, rivers and estuaries; politics were intricately tied to the affordances of riverine systems. Based on the ceramic record of different regional sites, we argue that the location of a site alongside a river offered the possibility to make foreign connections and integrate a site in different economic spheres. In the Gulf area, waterways would have been a

determining factor in establishing political relationships: it seems that sites along the same river often exhibit more similarities in their assemblages than sites located in close proximity from one another. Distance herewith becomes an irrelevant factor in the determination of political affinity; rather riverine systems would have bound or isolated sites to and from economic spheres and barter systems. In return, isolation from sites along the rivers reflects a local political choice to reject foreign influence.

Koller, Jared (Boston University) and Stephen Acabado (University of California, Los Angeles (UCLA))

[408] *Expansion Modeling and Dating the Ifugao Agricultural Terrace Systems Through Volumetric Analysis and Energetic Modeling*

Archaeological dating of agricultural terraces is complicated due to the nature of its technological foundation and use. Various methods have been proposed for dating agricultural features, but the issue of stratigraphic disturbance persists. In this paper, we highlight our work in the UNESCO-listed Ifugao Rice Terraces as a case study to address the limitations of model-free stratigraphy-based dating and also to serve as an example for future energetic studies that utilize 3D volumetric analysis. We present a methodology that incorporates multiple datasets, which include ethnohistorical, ethnographical, and spatial, to establish terrace construction sequence and development over time by assessing the amount of time, energy, and organization that would be required to create the modern landscape through remote sensing image classification and energetic reconstructions within 3D environments. Utilizing archaeological datasets acquired by the Ifugao Archaeological Project from four Ifugao sites and previous archaeological research in the region, we argue that wet-rice cultivation in the highlands of the Philippine Cordilleras is a recent phenomenon that coincided with contact with the Spanish, one that supports the argument that the emergence of wet-rice cultivation in the highland region was an indicator of influx of lowland populations avoiding the Spanish colonization.

Kollmann, Dana

[160] *Hot, Cold, Above and Below: Enhanced Survey Methods in the Detection of Clandestine Graves*

Ground-based methods of searching for clandestine graves and surface remains have been utilized by law enforcement and search and rescue personnel for years. When ground conditions and the technique of search are appropriate for the circumstances of the case, results are often successful. However, weather, terrain, acreage, foliage and efforts to conceal remains are among the factors that can complicate or even hinder the efforts of search teams. This paper explores enhanced methods of searching for human remains, including the use of areal forward infrared looking radar, drone photography and ground penetrating radar.

Kollmann, Dana [160] see Grant, Evelyn

Kolvet, Renee (Independent)

[366] *Characteristics of an Upland Cypro-PPNB Ground Stone Assemblage*

The diverse ground stone assemblage at Ais Giorkis in western Cyprus is comprised of tools typically associated with early Neolithic sites. Certain tool categories however, appear to be underrepresented. The dearth of grinding slabs, querns, large mortars, and handstones (typically associated with food processing) may, in part, be attributed to the site's proximity to the Paphos Forest in the Troodos Mountains, and a possible preference for wooden tools. Other explanations may be gleaned from the archaeobotanical record which alludes to the transport of processed cereals to the site. Answers to these questions will be formulated in concert with other site data.

Komulainen-Dillenburg, Nancy (USACE)**[241]** *USACE St. Paul District Regulatory (Corps) Commitment to Open and Transparent Communication and Consultation with Tribes*

St. Paul District Regulatory (Corps) implemented measures to build upon and improve relationships with our Tribal Nations and ensure open and transparent communication. A multi-year effort occurred in stages to assess tribal concerns and needs, and develop and share tools and materials to address those concerns and needs. The result has been a more transparent, open relationship. Tools and materials shared with Tribes by the Corps Tribal Liaison in 2018 include an online WebMap Viewer and a Shared Communication Protocol. The Shared Communication Protocol contains a Shared Statement of Understanding that commits both the Corps and Tribe to early, open, and transparent communication in a joint effort to preserve and protect historic and cultural resources. The innovative online WebMap Viewer displays pending permit applications within the Corps. This pilot platform is protected by username and password, for use exclusively by Tribes, and does not replace formal consultation; however, the Viewer provides sufficient information about pending permit applications to allow the THPO to quickly identify concerns about potential impacts to significant historic or cultural resources unknown to Corps Cultural Resources Managers.

Konwest, Elizabeth (Indiana University, Bloomington)**[192]** *Rural Exchange Networks in Postclassic Oaxaca*

In 1523, Spanish colonizers, alongside their native allies and African slaves, arrived in Nejapa to find people already relatively accustomed to the social upheaval brought about from foreign entries into their territories. During the Late Postclassic, Zapotec and Aztec armies had followed existing trading routes along the camino real through Nejapa, Oaxaca to reach the resource rich isthmus. This paper will focus on the various trade networks accessed by the residents of the Nejapa valley site of Greater La Amontonada (GLA) while also referencing other Postclassic period sites in the region. Residents of GLA participated in an informal and decentralized, but robust region-wide network to exchange locally produced ceramics. Though imported in extremely limited quantities, local potters also had knowledge of wider Oaxacan and Mesoamerican styles, and considered those "exotic" styles desirable for imitation. The exchange of obsidian and other imported goods contrasts sharply with the ceramics and was much more restricted. Residents of contemporaneous settlements in Nejapa engaged with different networks of traders. Although living in a rural area between larger, more powerful geographic regions, the ceramics and obsidian at GLA demonstrate a people enmeshed into the larger Mesoamerican world.

Kooiman, Susan (Michigan State University)**[291]** *Functioning at Full Capacity: The Role of Pottery in the Woodland Upper Great Lakes*

James Skibo's seminal works on pottery function created a valuable model for assessing the role of pottery in the lives of past peoples. While this approach has broad applicability for ceramic assemblages worldwide, its efficacy has been demonstrated through a series of studies on ancient pottery assemblages from coastal sites in Michigan's Upper Peninsula. Both technical properties of ceramic cooking pots and their associated use-alteration traces, particularly interior carbonization, indicate differences in vessel construction and use by local Middle Woodland (200 BC – AD 500/600) and Late Woodland (AD 500/600 – AD 1600) cooks. Vessel shape, temper size, and patterning of interior carbonized food residues suggest a shift in preferred cooking techniques over time. These alterations may be responsive to environmental shifts, social change, or culinary trends spread from interaction with other groups. Overall increase in vessel size could reflect changes in settlement patterns and socio-ideological interactions but may have also provided a functional cooking advantage. The contributions of this work to Upper Great Lakes archaeology demonstrate the strength and utility of Skibo's framework.

[291] *Chair***Kooistra, Marty****[151]** *Utilizing Cumulative Viewshed Analysis to Explore Virgin Branch Ancestral Pueblo Settlement Choice*

Prehistoric habitation structures located in the Mount Trumbull region of northwest Arizona are constructed across a diverse topographic landscape. Several archaeological site records for the Mt. Trumbull region allude to the exceptional views from habitation structures despite their often non-obtrusive locations. The following study utilizes Geographic Information Systems (GIS); Cumulative Viewshed Analysis (CVA); and site suitability analysis to

facilitate understanding of patterns and relationships among archaeological habitation sites located in this exceptionally diverse landscape. Using CVA, this study endeavors to characterize habitation sites as linked in two ways. The first is geographic. Are habitation sites intervisible? The second means of connection concerns material remains. Do habitation sites share material similarity based on temporal phases? This research seeks to improve current knowledge of Ancestral Pueblo settlement patterns and determine if the geographic location of habitation sites predicts the structure of their material remains; and if so, would this provide evidence for the existence of prehistoric communities? Based on the results from several viewshed analyses, data suggests that the placement of known habitation sites across the landscape significantly differs when compared to sample “non-site” locations suggesting that known habitation sites were constructed in areas of the landscape that favored intervisibility.

Koons, Michele (Denver Museum of Nature & Science) and Mark Mitchell (Paleocultural Research Group)

[17] *Community Archaeology at Magic Mountain, Golden, Colorado*

Nestled in the foothills along Apex Gulch in Golden, CO, Magic Mountain is proclaimed to be one of the most important archaeological sites on Colorado's Front Range. The earliest artifacts date back to 5000 BCE, when the site would have served as camping grounds for mobile hunter-gatherer groups. Later remains, such as ceramics and stone structures, indicate that through time it became a semi-permanent residence that was inhabited until at least 1000 years ago. Although previously explored by archaeologists, in 2016 the Denver Museum of Nature & Science and Paleocultural Research Group initiated a new round of work through a community-based effort. Over the last two seasons (1.5 months total), 133 volunteers helped excavate and give public tours. We served 121 youth from Boys and Girls Clubs and other organizations with programming, and nearly 3,000 people experience hands-on archaeology through public tours. Additionally, we contacted all tribes with historical affiliation with the state and invited them for an organized intertribal day. We had representatives from five different tribes attend over the last two years and communication with many other tribes about the project. This paper will discuss the goals of the project and our work with the various stakeholders.

Koons, Sheila

[403] *The Middle to Upper Paleolithic Site of Abri des Merveilles in Southwestern France: An Assessment of the Integrity and Research Potential of an Historically-Excavated Museum Collection*

As museum shelves buckle under the weight of virtually forgotten boxes of artifacts, many institutions are questioning the future curation of these historically excavated materials. Much of this material is comprised of Paleolithic artifacts excavated during the infancy of American archaeology abroad. This project was undertaken to evaluate the integrity of a prehistoric lithic collection and to examine the efficacy of utilizing the resulting data for larger research questions. It begins with a detailed history of the site of Abri des Merveilles and the prehistoric environmental context within which the site was formed. Abri des Merveilles was one of the few sites in the Vézère Valley containing both Middle and Upper Paleolithic layers of deposition. Thus, a thorough description of this site contributes significantly to the understanding of the distinction between these two periods throughout the region. The most important aspect of this undertaking was the analysis of the Merveilles lithic collection currently in curation at three American museums. The lithic analysis tested the soundness of the site's historically designated cultural layers and elucidated the positive and negative effects of past excavation and curatorial methods. The analysis also provides a comparative data set for future research in the region.

[312] *Ancient Herring DNA from the Burton Acres Shell Midden (45K1437) and Pacific Herring Population Dynamics in the South Salish Sea*

Pacific herring (*Clupea harengus pallasii*) is an important forage fish and staple food of many Northwest Coast indigenous peoples. Archaeological evidence throughout the south Salish Sea extends this ecological relationship

back at least several millennia, but the presence of herring in archaeological deposits is often considered a single-dimensional seasonal indicator of past herring harvest. Modern fisheries studies define multiple herring stocks in the south Salish Sea, and recent genetic analysis of these stocks shed light on important aspects of population diversity and a much richer mosaic of different life histories between herring stocks. An on-going study of ancient DNA from archaeological specimens provides the first direct link between ancient and modern herring populations, including diachronic information over the past ca. 1,000 years at the Burton Acres shell midden on Vashon Island in the south Salish Sea. Our results suggest that Native American fisheries here primarily targeted herring populations spawning in late winter and early spring, although there also were a small number of samples originating from late-spawning populations. The Burton Acres site occupants accessed herring from multiple stocks within the diverse ecological portfolio of herring populations in the south Salish Sea.

Kornfeld, Marcel (PiRL - University of Wyoming)

[329] *Structure and Formation of a Paleoindian Deposit: The Hell Gap Site, Wyoming*

A key question for interpreting both human behavior and the Paleoindian cultural sequence, the two pillars of significance attached to the Hell Gap site, concerns the nature of site formation. This term, however, is ambiguous. Site formation begins when people carrying on daily activities discard and lose objects. Once lost, the objects are subject to various surface geomorphic processes (wind, water, plant and animal behavior) and eventually under conditions of aggradation become buried in the sediment. Objects buried in the sediment, whether originally left by people or brought in by various geomorphic processes, form patterns that may be informative of cultural behaviors, geomorphic processes, and in most if not all cases, both. In this presentation I examine the vertical and horizontal structure of the Hell Gap site at several scales to begin the assessment of Hell Gap site formation.

[18] *Ancient Andean Scalarity*

Scholars of the Andes often assume that the social units they study—residence, community, and region—are monotonically scaled, nested from smaller to larger. This suggests universal correspondences between the analytical and observational objects through which social units are known; hence individual buildings may stand in for households, intermediate social units, or broader publics. Yet this assumption does not hold in Southern Quechua, the language of the Inkas, wherein relevant social units are often non-scalar, or inherently linked to other units: for instance, wasi (sometimes translated as “house structure”) presupposes a larger social unit *llaqta* (a cluster, a hamlet or even a country). Southern Quechua spatial orientation greatly differs from prevailing archaeological models of domestic space and settlement, which suggest scalar gradations in size and function from house, to hamlet, to center and hinterland. How can we analytically model scalarity in Inka social organization, particularly with respect to such units as wasi, *llaqta*, and *ayllu*? Archaeological data from settlements in Cusco, Peru (e.g., Rumiqlqqa, Ollantaytambo) reveal that Inka notions of domestic space were (as today) centered less on scalable physical structures and more on the situated configurations of labor, people, plants, and soils that together defined social units and scales.

Koski-Karell, Daniel

[276] *Tortuga - Haiti's Ile de la Tortue - Prehistoric and Buccaneer Archaeology*

The Ile de la Tortue, Haiti, is perhaps more famously known as Tortuga for its association with the seventeenth century's Buccaneers. It was settled in prehistoric times by multiple cultural groups, given its Spanish name by Columbus, depopulated by enslavement of its indigenous population, settled by English Puritans, liberated by French Huguenots, became a port of ill-repute for Buccaneers, includes multiple shipwreck sites, was developed into French colonial plantations, became a place of relief or death for sickly French soldiers and Napoleon's sister Pauline, liberated again by Haitian revolutionary forces through amphibious invasion, and on and on and on. All in all, it's a pretty interesting place, but not easy to get to and life there is tough. This paper provides a summary of the author's archaeological investigation of the island.

Koster, Anne (ERDC-CERL)

[241] *Impacts to Archaeological Deposits by Heavy Equipment and Protective Site Hardening Techniques*

Heavy equipment, whether from construction, agriculture, or other varied situations, can significantly and negatively affect surface and subsurface archaeological deposits, be it from direct or indirect contact with machinery. In-situ protective "site hardening" techniques have potential to mitigate some of these impacts, if designed appropriately in response to expected types of heavy equipment, and in context with site environmental properties. This paper and presentation will draw from various studies, conducted from experimental work performed by the author as well as examples found in literature, to provide parameters on potential damage from such site impacts. Site environmental parameters will be presented as modifying factors, and various types of equipment will be covered. This paper and presentation will also provide information and insight into in-situ protective "site hardening" strategies that take advantage of the existing environmental properties of each site to preserve and protect from damage in a variety of situations. A range of both bioengineering and land engineering techniques will be covered. Applications relative to heavy equipment impact scenarios will be discussed to provide assessments for potential success of site protection efforts.

Kosyk, Katrina (McGill University)

[374] *Sonic Places: Preliminary Acoustic Analysis in Early Colonial Tepeticpac, Tlaxcala*

Everyday places that bodies inhabit are rarely without sound. Sound has a material impact in structuring the relations between people and their surroundings through the vibrations that occur as a response to an activity or event in a given space and time. The auditory system receives this structured sensory information and rhythmically encodes the body with sound that is specific to the place. The place develops a unique sonic fabric that has the potential to influence how people consciously and unconsciously dwell in a space. I demonstrate how sonic fabrics can be recovered from an archaeological site in the neighbourhood of Cerro Coyotepetl in Tepeticpac, Tlaxcala, established in the 13th-14th centuries and existing at the time of the Spanish conquest. The site is composed of over 40 terraces and two possible centralized plaza areas that would have supported non-elite residences. A primary objective of my research in Tepeticpac is to explore the ways in which the processes that produce sound converge with numerous temporalities and spaces to produce an experience of place. Specifically, I examine how everyday sound making practices contribute to a sonic character that is unique to the space.

[386] *Evaluation of an Impact of Different 3D Surface Scanning Protocols on Sex and Age-at-Death Assessment from Os Coxae in Bioarchaeology*

In the contemporary bioarchaeology and anthropology in general, 3D imaging technologies are being used more frequently. They offer many new possibilities, among which we can mention for instance a possibility of permanent documentation, an easier and faster sharing of data among institutions or new opportunities of data analysis. 3D surface data may be acquired with laser or structured light scanners. The present contribution investigates two important questions: (1) whether data acquired by different scanning devices are comparable and (2) whether potential differences may affect anthropological analyses, such as age-at-death and sex estimation. 3D models of pelvic bones (n=29) were acquired by laser (NextEngine) and structured light (HP 3D Structured Light Scanner PRO 2) scanners. Resulting 3D models from both scanners were subjected to age-at-death (Stoyanova et al., 2017 quantitative method) and sex (DSP 2) analyses. Furthermore, for a small sample (n=5) we created reference surfaces with RedLux Profiler device providing high-quality scans to which the outputs from both scanners were compared using surface deviation and color maps. Our preliminary results suggest that in spite of differences between the two scanners, this fact does not have a significant effect on biological profile estimation.

[255] *Middle Preclassic Chipped Stone Caches at Ceibal and Holtun, Guatemala*

During the late Middle Preclassic period (700-350 B.C.) at Ceibal, common objects in ritual deposits in the public plaza shifted from greenstone celt caches to other artifacts, including obsidian prismatic-blade cores. Like greenstone objects, exhausted polyhedral obsidian cores deposited in cruciform arrangements along the east-west axis of the central E-Group plaza were used as symbols and markers of the center and four cardinal directions within the Maya cosmos. Nevertheless, eccentrics were not part of Preclassic behaviors at Ceibal. In comparison at Holtun Middle Preclassic period caches lack greenstone and focus primarily on obsidian cores, blades, and debitage with additional material including river cobbles and shell, sometimes in ritually charged numbers. Source analysis for the cached obsidian suggests possible restriction of El Chayal obsidian to elite and ritual sectors of the site. Like Ceibal, chipped stone caches at Holtun during the Middle Preclassic period were focused on the E-Group ceremonial plaza.

Kowalski, Jeff (School of Art, Northern Illinois University)**[28]** *Feathered Serpents at Uxmal: Creation, Cosmos, Cosmopolitanism, and Kingship*

At Uxmal, Yucatán, monumental plumed snakes appear in the sculptural program of the Main Ballcourt and Nunnery Quadrangle. These feathered serpents express complex concepts connected to their pan-Mesoamerican role as a demiurge associated with dawning light, life force, and cosmic order emerging from pre-creation watery darkness and chaos. The feathered serpents correlate with other aspects of these structures' plan and iconographic programs that refer to aspects of creation mythology. The appearance of fully-feathered serpents at Uxmal reflects growing political contacts and trade between northern Yucatán and greater Mesoamerica during the Epiclassic/Terminal Classic periods, when regional rulers such as Chan Chaak K'ak'nal Ajaw of Uxmal sought to bolster claims to divinely mandated authority by combining Classic Maya religious imagery with that of the feathered serpents as "Toltec" symbols that emerged at Teotihuacan and were reformulated at Epiclassic/Terminal Classic centers, as well as Tula, Hidalgo and Chichén Itzá. Uxmal's plumed snakes and other creation-related and "Toltec" symbolism represent a specific expression of a broader Mesoamerican ideological template that grounded sociopolitical order and historical events in a divine matrix, linking polity formation and royal dynasties to the creative energy and political authority represented by the feathered serpent.

[57] *Diachronic Patterns in Subsistence at Swan Point, Tanana Valley, Alaska*

Approximately 1000 years ago, the archaeological record of Southcentral and interior Alaska shows a shift toward the increased use of fish caches, semi-subterranean houses, permanent year-round villages, and the appearance of ranked societies. Ultimately, the highly mobile big game hunter-gatherer way of life was supplanted by more intensive resource procurement such as salmon processing. These innovations have caused many researchers to hypothesize a migration of Athabascan-speakers into Alaska, in part because this is when modern Athabascan cultures become archaeologically visible. Since traditional foodways tend to be conservative in cultures, material remains of past meals offer culturally specific information for identifying cultural identities in the archaeological record. A zooarchaeological analysis focused on reconstructing subsistence patterns was undertaken at the Swan Point site in the Shaw Creek Flats, Tanana Valley, to assess whether there were corresponding changes in food preparation which can be used to test whether cultural continuity is reflected in food preparation compared to a migration of new people to interior Alaska.

[253] *Ancient Pathogen Genomes from Pre- and Early Colonial Epidemics in Mesoamerica and the Evolution of Paratyphi C*

Genome wide data from ancient microbes may help to understand mechanisms of pathogen evolution and adaptation for emerging and re-emerging infectious disease. Ancient pathogen genomes provide furthermore the possibility to identify causative agents of past pandemics and therefore elucidate mortality crisis such as the early contact period in the New World. In order to identify the presence of pathogens in past populations we used a novel high-throughput DNA sequence alignment and taxonomic assignment tool MALT (MEGAN ALignment Tool) and were able to identify traces of *Salmonella enterica* DNA in individuals buried in an early contact era epidemic cemetery at Teposcolula-Yucundaa, Oaxaca in Southern Mexico. This cemetery is linked to the 1545–1550 CE epidemic that affected large parts of Mexico, the pathogenic cause of which has been debated for more than a century. We generated genome-wide data from ten individuals for *Salmonella enterica* subsp. *enterica* serovar Paratyphi C, a bacterial cause of enteric fever. We propose *S. Paratyphi C* as a strong candidate for the epidemic population decline during the 1545 outbreak. We furthermore show that the Paratyphi C lineage has been common in the human population for thousands of years and shows strong signs of human adaptation through time.

[183] *Dimensions of Health in the Andes: A Bioarchaeological Investigation of Morbidity Patterns in Mountain Landscapes*

This paper uses a bioarchaeological approach to examine the morbidity profiles of highland communities in the Cusco region of Peru during the centuries that witnessed the rise, florescence, and demise of the Inka Empire (ca. 1300-1550 CE). Through original analysis of human skeletons from the sites of Huanacauri and Matagua and a meta-analysis of skeletal data from other sites in the region, this study seeks to build a preliminary understanding of social and ecological distinctions in this mountain landscape, and how these distinctions engendered or coincided with discernible differences in disease, developmental health, and trauma. Bioarchaeological data are used to examine whether people living in different areas of Cusco experienced the formation and dissolution of the Inka polity in similar ways, or whether there is variation in skeletal markers of health according to ecological setting,

cultural background, social position, or gender. The contextualized bioarchaeological data are used to interrogate many current models of mountain landscapes, which too often generalize human populations by treating them as variables dependent on regional environmental or adaptive economic frameworks, rather than investigating the intertwined local social differences, ecological distinctions, and biocultural attributes that constitute such mountain landscapes and frameworks.

[63] *Reconstructing a Maya Agricultural Wetland on the Rio Bravo Floodplain, Northwestern Belize*

The Birds of Paradise wetlands have been a subject of recent intensive study within Northwestern Belize. We now recognize this fluviokarst wetland has undergone extensive modification of field building and channelization during the Maya Classic (1650-1050 BP) with use possibly extending into the early Maya Postclassic (1050-700 BP). Through many field seasons of study, we have begun to develop a chronosequence for soils and management within this wetland environment as well as an understanding of the form and function of agricultural features in the wetland, including ditched and raised fields, reservoirs, and sacbeob. Geoarchaeological efforts on a sacbe/berm feature along the east side of the wetland suggest that human modification within the system began at least to some extent sometime in the early Classic time period. The eastern margins of the BOP wetland are slightly lower in elevation than the area in the system that has been channelized, and it is possible this berm either acts as feature that serves as a boundary, eastern edge of a catchment, or elevated causeway. This study helps us to refine our understanding of how Maya agriculture and resource extraction within wetland environments either persisted or changed through drought cycles and cultural transitions.

[198] *Crosses, Burned Churches, and Kidnapped Priests: Ambivalent Maya Catholics in 19th-Century British Honduras*

Spanish colonization of New Spain rested upon a pragmatic, yet conflicted, alliance between Cross and Crown. Following independence, many republican and neocolonial governments also relied on the soft power of the Church. In the 19th century, Yucatec Maya religious sentiments appear to have been indelibly shaped by prevailing relations of power. The syncretic religion of the Talking Cross that developed among Santa Cruz Maya rebels during the Caste War of Yucatán (1847-1901) is well known for its militaristic character, and heavy religious fees contributed to the war's outbreak. This presentation considers the less well-known religious practices of other Maya rebel groups of southern Yucatán and British Honduras, who did not revere the Talking Cross. In the 1850s-60s, both the British Honduran and Yucatecan governments used priests as emissaries to encourage political submission by rebels. In British Honduras, priests expressed personal regard, sympathy, and even affection in a way that other representatives of colonial power typically did not. The Janus face of the Catholic church generated extraordinary feelings of ambivalence among the Yucatec Maya, as can be seen in the archaeological and archival materials from San Pedro, wherein examples of devotional crosses contrast with accounts of anti-clerical violence.

Kreindler, Kate

[149] *Having It All in the Field: Families, Inclusivity, Career Development, and Archaeological Fieldwork*

Participation in archaeological fieldwork poses numerous practical challenges. This paper will address some difficulties that arise from the decision to start a family. The choice to have children frequently affects archaeologists working to establish their careers, namely (female) graduate students, junior faculty, and field technicians. Young archaeologists may have small children who are not yet old enough to be separated from a parent or may not have the financial resources to pay for childcare while in the field. Furthermore, many projects do not have, or earmark, funding for childcare, nor do they have the facilities to accommodate participants' families. As a result, many

archaeologists, especially women, who are trying to establish their careers are forced to choose: fieldwork or family. Those who opt to start families may be at a professional disadvantage when they return to the field, due to missed excavation and publication opportunities. This paper will examine how one field project, the Poggio Civitate Archaeological Project, has created an affiliated not-for-profit entity, in part to raise funds that offset the costs of childcare. As a result, the project supports young archaeologists with families, as part of a larger effort to promote inclusivity and early career development in archaeology.

Kretzler, Ian (University of Washington)

[19] *"I Can Tell It Always": Confronting Colonialist Presumptions and Disciplinary Blind Spots through Community-Based Research*

The nineteenth and early twentieth century history of western Oregon is rife with Euro-American presumptions about the trajectory, pace, and nature of Native cultural change. Federal architects of the state's reservation system and, later, reservation agents wrote extensively about Native peoples' ability to throw off traditional lifeways in favor of "civilized" behaviors. Since 2014, two community-based research projects conducted alongside the Confederated Tribes of Grand Ronde Historic Preservation Office have exposed these observations as fragmentary and culturally and politically situated. Analysis of historic maps and recovery of household belongings have revealed the strategies employed by Native families to balance participation in Euro-American economies and continuation of pre-reservation practices and relationships. Furthermore, these projects have highlighted the inadequacy of conventional classification schemes predicted on cultural and temporal homogeneity. The complexity of the reservation material record challenges archaeologists to develop interpretive approaches grounded in Native knowledge systems and community experiences. This paper discusses the issues inherent to recognizing Native presence—in the colonial archive and in the field—and the value of community-based research in crafting nuanced accounts of Native history.

Kreuzwieser, Clare (College of Wooster) and Paul Nick Kardulias (College of Wooster)

[118] *The Elephanta Caves: Avenues for Their Future Preservation in Digital Preservation and Public Outreach*

In this study, I examine how the Elephanta Caves (500 C.E. - 900 C.E.), off the coast of Mumbai, in the Indian state of Maharashtra, can best be preserved in the future. These man-made caves were a place of Shiva and goddess-worship for local Hindus, up until Portuguese contact and occupation in AD 1534-35. Interest in this topic stems from the caves' exposure to destructive forces in the past and present, which are directly and indirectly man-made. Some of these include its location along a fault, pollution from the Mumbai metropolis, tourist traffic, as well as past damage from colonial occupation. I focus specifically on how digital forms of preservation can aid in preserving the integrity of the cave's structure and relief carvings, as well as how tapping into public interest as a resource can help to grow public knowledge as well as garner more extensive protection for this UNESCO World Heritage site. Furthermore the research is a demonstration of the potential of reconstructive drawings in preserving a site as well as helping to create a visualization to place the viewer more perfectly within the time and place the caves occupied in history.

[304] *An Animal Kingdom at Chichen Itza, Yucatan, Mexico*

At the Postclassic Maya city of Chichen Itza, buildings, planned spaces, and imagery blend with the landscape to form meta-narratives. One instance is the Sacred Cenote, a limestone sinkhole that was a major focus of rituals. The cenote rim features frogs/toads carved from the living rock, and at one time sculptures of jaguars and snakes were also there. These animals allude to fertility, rulership, and the night. Ceramics in the nearby temple and fauna that inhabit cenotes echo these concerns and also are associated with watery worlds and death.

Kroonen, Guus (Leiden University) and Rune Iversen**[196]** *The Linguistic Legacy of the Pitted Ware Culture*

The Scandinavian hunter-, fisher- and gatherer-based Pitted Ware culture is chronologically situated in the Neolithic. However, it challenges our traditional view on cultural and social evolution by representing a return to an otherwise abandoned hunter-gatherer lifestyle. In general, the Pitted Ware culture must be seen as an offshoot of the “Sub-Neolithic” societies inhabiting wide parts of northern and northeastern Europe in the fourth and third millennium B.C.E.

Isotopic and aDNA studies have shown that people of the east Swedish Pitted Ware culture, both dietarily and genetically were distinct from the early farmers in this region, the Funnel Beaker culture. Isotopic data shows a marked predominance of seal in the diet, which has given the Pitted Ware people the nickname “Inuit of the Baltic”.

As regards language, it is to be expected that people practicing a Pitted Ware lifestyle spoke a non-Indo-European language. In fact, there is some linguistic evidence that can support this claim. It is conceivable that both the Germanic and Finnish word for “seal” were ultimately borrowed from a language spoken in a Pitted Ware context. Once more, the linguistic evidence turns out to offer important information complementary to that of archaeology and archaeo-genetics.

Krug, Andrew (University of Oklahoma)**[296]** *Reconstructing Shell Trade Corridors in Northwest Mexico*

Questions over the nature of long-distance exchange are central to competing models of socio-political evolution in Northwest Mexico. At Paquimé, the preeminent site in northern Chihuahua, Mexico, from 1250 to 1450 AD, excavations recovered abundant non-local goods, including macaws, copper bells, and nearly four million marine shells. To evaluate the numerous hypotheses of procurement and trade, archaeologists need to understand the possible routes for the purveyors of shell and the eventual distribution of marine shell consumption throughout Northwest Mexico. By mapping the distribution of shell consumption and reconstructing trade corridors archaeologists can better contextualize the social relationships and motives that led to Paquimeños acquiring millions of shells from the Gulf of California. In this study, I perform a least-cost pathway analysis to evaluate possible trade corridors from various locations along the Sonoran coastline. Hot spot analyses are used to demonstrate the distribution of *Olivella*, *Glycymeris*, and *Nassarius* shell artifacts at archaeological sites in Northwest Mexico. Each of these analyses—least-cost and hot spot—are crucial for understanding the distribution and concentration of shell artifacts and defining possible trade corridors that delivered millions of marine shells into the North American Southwest.

Geophysical survey and excavations from 2010–2016 at Lawrenz Gun Club (11CS4), a late pre-Columbian village located in the central Illinois River valley in Illinois, identified 10 mounds, a central plaza, and dozens of structures enclosed within a stout 10 hectare bastioned palisade. Nineteen radiocarbon measurements were taken from single entities of wood charcoal, short-lived plants, and animal bones. A site chronology has been constructed using a Bayesian approach that considers the stratigraphic contexts and feature formation processes. The village was host to hundreds of years of continuous human activity during the Mississippian Period. Mississippian activity at the site is estimated to have begun in cal AD 1005–1160 (95% probability), ended in cal AD 1300–1405 (95% probability), and lasted 150–400 yr (95% probability) in the primary Bayesian model with similar results obtained in two alternative models. The palisade is estimated to have been constructed in cal AD 1150–1225 (95% probability) and was continuously repaired and rebuilt for 15–115 yr (95% probability), probably for 40–85 yr (68% probability). Comparison to other studies demonstrates that the bastioned palisade at Lawrenz was one of the earliest constructed in the midcontinental U.S.

Kruse, Andrea (University of Nebraska- Lincoln)**[147]** *A Great Plains Early Archaic Site Understanding from Lithic Debitage Analysis*

Early Archaic sites on the Great Plains are few in number and often little studied and poorly reported, as they are almost always found in salvage or recover archaeology. Of those early Archaic sites that have been studied rarely has debitage been analysed in detail or fully evaluated for usewear. This presentation describes the lithic assemblage from the Spring Creek (25FT31) site located in southwestern Nebraska. As one of two important early sites in the state, detailed lithic analysis will complement the thorough analysis of faunal remains conducted in the 2000s. This presentation will present the methods used to complete debitage and tool analysis along with low power use-wear technique to better understand the artifacts. GIS-ArcMap was used to better visualise patterns between the lithics and faunal. By using many different methods of analysis along with new digital techniques one can gain better perception of the relationship of the resources procured across the Plains landscape and the Early Archaic hunter-gatherers.

As the nineteenth century dawned in the United States of America, a new approach to the treatment and care of the mentally ill took hold. This movement, known as moral management, championed the delivery of kind treatment to patients within the orderly environment of the asylum, and structured regime designed to draw the insane from unhealthy habits and reinvigorate their self-regulative abilities. This paper examines how patients at two nineteenth- and early-twentieth lunatic asylums—the Western Washington Hospital for the insane in Steilacoom, Washington, and at the Eastern Lunatic Asylum in Williamsburg, Virginia—engaged with elements of the natural world, drawing out a multitude of meanings converged over and diverged around these items. While items derived from the natural world could serve the curative goals and rules of the institution, this class of material culture also offers a key to identifying patients' action and reinforcing the patients voice.

Kuhn, Steven (University of Arizona)**[365]** *Thinking about Spatial Scale and Diversity in Archaeology*

Diversity is fundamentally a scalar phenomenon. Archaeologists have been very attentive to the relationship between sample size and various diversity measures. They have not paid as much attention to the spatial scale of diversity. Ecologists frequently consider diversity at three spatial scales. Alpha diversity refers to richness within patches or sample units. Gamma diversity refers to overall richness within an entire ecosystem or habitat. Beta diversity is a function of the differences among patches. Diversity at different spatial scales is influenced by different ranges of factors. Most of what has been said about diversity in archaeology refers effectively to alpha (within assemblage) diversity. Concepts analogous to beta and gamma diversity could be effectively applied in archaeology. To illustrate the relevance of thinking about diversity at different spatial scales, this paper considers some of the factors affecting alphas, beta, and gamma diversity in material culture, especially stone tools.

Kuijt, Ian [8] see Bursali, Ayse

Kuijt, Ian (University of Notre Dame)**[366]** *Stop the Press!!!: Settlement Hierarchies in the Early Pre-Pottery Neolithic? Not...*

Archaeologists, as with historians, search for patterning, commonalities and order as we seek to explain past human settlement systems. As landscape archaeologists our attempt to reconstruct settlement systems involves connecting the

remains of human behavior, consider regional patterns, and then interpreting these remains on the basis of ethnographically derived models. With varied preservation differences within and between settlements, and poor understanding of the linkages between past human action and the resulting contemporary material footprint, as researchers we are challenged in our attempts to understand the broader picture, and run the risk of imposing, rather than revealing, patterning of the past. In this presentation I return to early arguments (Kuijt 1994) for the existence of socio-political developments and differences in Levant Pre-Pottery Neolithic A period (PPNA) period. There is no doubt that the hamlets of the Southern Levant Pre-Pottery Neolithic A period (PPNA) period serve as an evolutionary transitional moment between small forager camps of the Epipaleolithic and large villages of the later stages of the Pre-Pottery Neolithic. What is now clear is that variation in PPNA settlements, counter to Kuijt (1994), was not linked to socio-political developments and manifest within a regional settlement system.

[338] *Crisis in Geoarchaeological Context: Reassessing Bronze Age 'Collapse' at Palaikastro, Crete, Greece*

Research on social change and 'crisis' demonstrates that both phenomena require analyses of longer-term processes and discrete local processes that need to be evaluated on site-by-site bases (Vigh, 2008; Visacovsky, 2017). The multi-scalar attention required to study crisis and change at individual Bronze Age settlement sites on Crete, Greece, has been recognized in studies of local and regional factors in collapse scenarios for the end of the Neopalatial period (end of LM IB, ca. 1470/1460 BC) (Driessen, 2018). Nevertheless, various narratives of collapse and crisis situations remain debated for Late Bronze Age Minoan, and broader Mediterranean, societies. This paper presents new geoarchaeological evidence from the archaeological settlement of Palaikastro, Crete, and reassesses the tsunami hypothesis proposed in relation to collapse at Palaikastro (cf. Bruins et al., 2008). Combined with evidence from recent tsunami and storm surge research and considerations of broader crisis situations, the results demonstrate the capability of a geoarchaeological approach to understanding the nuanced nature and chronology of change in this complex coastal environment.

[257] *Prosaic Biases: Independent Factors Contributing to the Definition of the Classic and Colonial Archaeological Record of New Mexico, USA*

Archaeological records are knowledge palimpsests of the research agendas responsible for identifying and defining these records. When evaluating the representativeness of these records, biases inherent to the research agendas themselves, ranging from methodological approaches to political considerations, are typically implicated. However, factors independent from research agendas can exert strong forces on the composition of a record. In New Mexico, land ownership, land use, and access for researchers significantly has affected the composition of the record considered for the ancestral and early modern Pueblo Classic and Colonial periods (A.D. 1325-1825). This relatively prosaic source of bias may exert a stronger influence on the how this period is known than research biases, despite being largely unrecognized.

[401] *Community Archaeology and the Production of Space at Punta Laguna, Yucatan, Mexico*

Archaeologists have considered the relationships between the production of space and the production of social inequality in past societies. Those practicing community and other forms of engaged archaeology have also examined the relationships between the production of space and inequality in the present, including at archaeological sites developed for tourism. As others have noted, the creation of such attractions, and particularly eco-archaeological parks, often involves the processes of spatial colonization and spatial commodification, which justify and exacerbate inequality. This presentation suggests and presents a case study – the Punta Laguna archaeological site in the Otoch Ma'ax Yetel Kooch reserve in Yucatan, Mexico – in which the production of an eco-archaeological tourist attraction has empowered an indigenous group and helped ameliorate inequality. Specifically, this presentation argues that those seeking to decolonize archaeological practice can facilitate the indigenous production of archaeological tourist spaces in three ways. Through academic research, archaeologists can expose faulty narratives of spatial colonization and defy erroneous attempts at spatial commodification. Through collaborative, community-based field research, archaeologists can help local groups disseminate their own history and identity to others. And, through public outreach, archaeologists can generate awareness and encourage tourists to patronize spaces owned and operated by local groups.

[326] *Investigating the Population History of Western North America: Implications for the Peopling of the New World*

Western North America has emerged as a key region of focus in studies addressing the migration routes and demographic processes involved in the peopling of the Americas. Archaeological investigations in this region have resulted in the discovery of several of the earliest human skeletons and archaeological sites on the North American continent. Given that this region is critical to understanding early population dynamics, this study investigates 10,000 years of prehistory in western North America where genomic and skeletal research of human remains have been underutilized or attempts to extract ancient DNA were unsuccessful. Using 3D geometric morphometric analyses of ancient human crania from Alaska, British Columbia, California, Nevada and Washington, results demonstrate biological affinities among several ancient populations of western North America. These data support recent genomic research addressing ancient population history

in the region, placing it within the broader context of research focused on prehistoric population dynamics in the Americas.

Kvamme, Kenneth (University of Arkansas)

[128] *Isolating the Principal Dimensions of Settlement*

In regional investigations of settlement location the analyst typically assumes that appropriate variables have been identified—important variables have not been omitted and irrelevant ones have not been included—an assumption not always justified. The identification of a “minimum set” of location requirements is more appropriate for understanding or modeling settlement placements. This can be accomplished through a principal components analysis of a wide collection of variables measured at settlements, but with a twist. By selecting the lowest stable components principal dimensions relevant to settlement may be defined that point to constant relationships in their distributions, maintain consistent values where settlements occur, and which minimize variance by indicating where settlements vary the least in terms of location. High loadings on these components permit their interpretation and define the principal dimensions of settlement. Their mapping, via GIS, offers much insight. These components may also be used as inputs to archaeological location models. An example is offered from historic Northwest Arkansas based on hundreds of farmsteads and historic maps where landform, soils, the hydrologic network, and the cultural landscape define four principal dimensions of settlement.

Kvetina, Petr (Institute of Archaeology Prague, Czech Republic) and Vaclav Hrcir (Faculty of Arts at Charles University, Czech Republic)

[65] *Identification of Post-marital Residence Patterns in Prehistory: A Case from the European Neolithic*

The aim of this contribution is to test hypotheses about the correlation of post-marital residence with several material patterns observed in the archaeological record, namely household floor area, the spatial arrangements of households and type of subsistence. These associations, which were previously revealed in the anthropological literature, are surprisingly strong and have already been used for interpretation of archaeological data, for example, for the pre-Hispanic Maya or the prehistoric Hohokam. The dataset used for our case study dates back to the Neolithic period (5500 – 4900 BC) in the European Temperate Zone (LBK). The method will be based on cross-cultural analysis, controlled for phylogenetic non-independence, that arises through patterns of shared common ancestry. The results will be then confronted with outcomes of other methods, such as genetic, linguistic and strontium isotope analyses.

Kwak, Seungki (Korea National University of Cultural Heritage)

[156] *Subsistence Strategy, Pottery Use, and the Role of Animal Hunting on the Neolithic Korean Peninsula*

One of the main topics of Korean archaeology is understanding of prehistoric subsistence throughout the Neolithic. However, due to the high acidity of sediments that do not favor long-term preservation of organic remains, we still lack critical information related to the subsistence of the prehistoric population of the peninsula. Cooking pots contain well-preserved organic compounds originated from culinary practices. Reconstructing food processing episodes through CSIA (Compound-specific Stable Isotope Analysis) of fatty acid extracted from pottery/sediment matrix can contribute to understand the true nature of the subsistence of prehistoric Korean peninsula.

[147] *Of Hearth and Home: Investigating Site Structure at the Fossil Creek Site, an Early Ceramic Camp in Larimer County, Colorado*

Fossil Creek (5LR13041) is a significant Early Ceramic (Plains Woodland) campsite in northern Colorado. Since 2010, archaeologists from Colorado State University and the University of Northern Colorado periodically conducted controlled surface collection, shovel testing, ground-based remote sensing, and block excavation (70 m²) of this large site. Artifacts recovered span the Late Pleistocene to Late Holocene in age, but are dominated by Early Ceramic era (CE 150-1150) artifacts, including abundant corner-notched arrow points, cord-marked pottery, ground stone, faunal remains, and thermal features. The features consist of heavily oxidized basins and pits filled with ash/charcoal, and on occasion, large quantities of fire altered rock. Radiocarbon dating of macrobotanical remains recovered from feature fill suggests contemporaneity between the features. This presentation focuses on site structure through examination of the spatial distribution of thermal features, ground stone, fire altered rock, and animal remains. Analysis suggests the Fossil Creek site represents a locale of decreased residential mobility linked to intensified food production, perhaps during a period of food stress during the Early Ceramic era.

LaBerge, Michelle (University of Wisconsin-Milwaukee)

[95] *The Heart of the Madder: New Research on an Important Prehistoric Dye Plant*

In recent years, an interest in natural botanical dye sources has prompted new research into the cultivation and processing of prehistoric dye plants in Europe and the Near East. Advances in chemical analyses of ancient European textiles have provided more detailed information about dye plants, which were important sources of color in early textile production. Evidence of dye from domesticated madder root (*Rubia tinctorum*) has been reported in the archaeological record of the European Bronze and Iron Ages in textiles preserved in salt mines, bog sites and elite European burials but the picture of madder usage from the Late Bronze Age into the medieval era is still unclear. The use of other indigenous plants related to madder also complicates this picture. A critical review of the history of research on madder and the evidence for its use in archaeological contexts in Europe, along with an experimental component of the thesis involved growing madder and using madder root as a dye has suggested new paths of research, and "ground-truthed" older data. The preliminary results may shed some light on the distribution of madder through the Iron Age, and may speak to the significance of the color red in European prehistory.

Lacan, Melanie (University at Buffalo)**[301]** *Maritime Mobility during the Western Mediterranean Iron Age*

Research on the topic of seafaring in the western Mediterranean during the Iron Age has often focused on Greek, Etruscan, Roman, and Phoenician activity. By contrast, the maritime endeavors of other coastal populations have largely been ignored. Yet, historical accounts and archaeological evidence indicate that groups living along the French and Iberian coasts may have been more active on the Mediterranean Sea than has previously been reported in the archaeological literature. By exploring the participation of French and Iberian indigenous populations in trade, fishing, and piracy activities thanks to evidence found at coastal sites, this paper aims at rectifying a gap in the literature that has led us to depict these Iron Age communities as passive players within an otherwise dynamic network of social, economic and political exchanges.

Lack, Andrew (EcoPlan Associates, Inc.) and Mary Ownby (Desert Archaeology, Inc., University of Arizona)**[298]** *Memes of Hohokam Pottery: The Spread of Ceramic Traditions from the Middle Gila River, Arizona*

The idea of memes, as coined by Dawkins, originally referred to an element of a culture or behavior that is passed from one individual to another by nongenetic means. It was used to examine how cultural phenomenon replicate, mutate, survive, or become extinct. This has clear applications to ceramic traditions where the cultural behavior is passed from one generation to the next with some changes but also the preservation of specific traits. Using this theoretical framework, without the biological aspects, research analyzes the conditions that allowed particular memes to continue, change, or be rejected.

To illustrate how the concept may be utilized, in combination with ceramic petrography, Hohokam pottery from the greater Phoenix area of Arizona is examined. From earliest times, ceramics made in the middle Gila River valley used readily available micaceous rock temper. Recent examination of pottery from several outlying sites to this core area, indicates a continuing preference for micaceous material over easily accessible volcanic sands for temper. Such a trend indicates, the meme of pottery making with micaceous raw materials continued long-term in the middle Gila area and was spread to other adjacent pottery making groups with ties to the Phoenix area Hohokam.

Lacombe, Laura (Harvard University), Amy Thompson (University of New Mexico), William Fash (Harvard University) and Loa Traxler (University of New Mexico)**[105]** *Digital Methods for Conservation in Underground Archaeological Contexts: A Case Study from the Copan Acropolis*

As site documentation methods become more high-tech and data-heavy, it raises issues of repeatability, access, and expense. In the case of the 3 kilometers of circuitous archaeological tunnels at the Classic Maya site of Copan, Honduras, it was imperative to document them in a manner that would be accurate, efficient, and accessible not only to scholars with expensive resources, but also to technicians and engineers within Honduras. This multidisciplinary team developed a method of three dimensional documentation using a total station that was easily teachable and replicable, allowing for continuity between mapping teams, as this tunnel system was too massive for any one group to complete. The resulting models are less expensive and data-heavy than 3D scans or point clouds, and were adapted specifically for tunnel environments with the overarching goal of informing the creation of a conservation plan for the Copan tunnel network. The color-coding of various kinds of archaeological features visible in the maps, and different kinds of interventions effected on them, enables their utility for conservation to be enhanced. New data can be continuously added to enable conservators as well as site managers an easier means of ascertaining risk and stability in the tunnel system.

Lacy, Kyle**[272]** *An Analysis of No Agua Obsidian*

The No Agua Peaks are a relative understudied obsidian source. An easily accessed and relatively large deposit area, one would expect No Agua obsidian to be frequently used and widely distributed. However, because of the source's high silica content, desirability for and practicality of use of this material is questionable. Using data from a recent survey surrounding portions of the No Agua Peaks and neighboring Cerro del Aire, a comparison of the use of various lithic materials for chipped stone tool production was conducted. Despite its ready availability, even at sites in and around the No Agua Peaks the obsidian appears to have been used only for expedient tools. Formal chipped stone tools were made instead from local dacite, imported Jemez and Los Rechuelos obsidians, and imported cherts regardless of a site's temporal affiliation or

proximity to the Peaks.

[250] *The Role of the Toad in the Middle Horizon Andes: A Chemical and Iconographic Analysis*

Here we present preliminary findings of chemical analyses performed on a Middle Horizon pottery sherd (c. 600-1100 AD). The sherd originates from the capital region of the Wari and has the striking iconographic representation of either a frog or a toad with visual indications of preserved residues. Compound groups will be isolated via esterification and gas chromatography mass spectrometry will identify lipid compounds such as cholesterol, FA16:0, and FA18:0. These compounds can indicate either plant and/or animal products. We will also be using metabolomic techniques to isolate alkaloid and biomarker compounds specific to bufotoxins. We intend to juxtapose the identification of the chemical remains with that of the exterior decoration of the vessel by contextualizing the toad within the corpus of Southern Andean Iconographic Series (SAIS) and Wari sensibility. If bufotoxins are discovered in the clay, it could witness a ritual practice that was integrated into Wari culture much like the iconographic representations of the SAIS. By tracing the two variables in tandem, the chemistry and the iconography, it is hoped that we can shed further light on the cultural processes that fostered one of the first expansive empires in the Andes.

[96] *We Know Who We Are and What Is Needed: Achieving Healing, Harmony and Balance in Ndee Institutions*

Ndee perceptions of the past bear directly on the present. Our institutions—lifeways, worldviews and overall continued well-being—are contingent upon our relationship to the land in the form of access, prayer, offerings, power acquisition and overall reciprocity. Intergenerational, ecological and environmental commitment are essential components to maintain and ensure such relationships. In reference to how archaeology and the ethnohistorical narrative can inform the topic of ancient medicine and healing, our paper will explore the intricate braiding of intergenerational knowledge informing contemporary medicinal and healing practices in Ndee contexts. Such institutional practices are inseparable from management and preservation of Ndee cultural heritage resources. Although archaeological and ethnohistorical evidence can provide useful glimpses into the ancient medicinal and healing practices we feel that such longstanding knowledge systems and practices are innately and intricately engrained within Ndee communities. Although such knowledge is not always called upon, various forms are continually used to heal and provide balance and harmony.

[146] *Morir para renacer: Funerary Rituals of Pregnant Women in Chunhuayum, Yucatan*

The lives of women have been a focus of recent research in Maya Archaeology, finding that they fulfilled important roles as mothers, wives, priestesses, members of the elite and even as rulers. Within each social stratum, women lived diverse identities, however they shared similar biological processes, such as pregnancy, which was ruled by diverse beliefs and natal care practices. This was especially true because of the Mesoamerican belief that the duality of life and death governed women during pregnancy, because at the moment of birth their status was equivalent to that of a warrior. In 2016 as part of the excavations of the Uci Regional Integration Project (UCRIP) at the Chunhuayum site, we found three female funerary contexts deposited in cists built continuously in an apparently domestic structure. Two of the females contained the remains of an unborn child in the pelvis and all the contexts were revisited with evident manipulation of the left extremities and bony segments near the pelvis. Our presentation will interpret the symbolism expressed in the funerary ritual, investigating the status of women as possible dead warriors in childbirth as well as discussing the ritual nature of the domestic unit in which they were buried.

Lambert, Patricia (Utah State University)

[44] *Reinterpreting the Evidence for Violence in Cave 7, Grand Gulch, Utah*

Wetherill's Cave 7 in Grand Gulch, Utah, has long been considered a massacre site, notable in particular for the large number of individuals in the assemblage (~90) and for its temporal placement in the Basketmaker II period. Recent debate concerning these remains has centered around the chronology of burials in the cave, as establishing contemporaneity of the remains is recognized as crucial for interpreting the social context—and specific events—surrounding the formation of the assemblage. In this paper new osteological evidence pertaining to this debate is presented, based on a reexamination of the remains of 74 individuals from Cave 7. These data support the interpretation of high levels of violence at this time and place, but not of a single massacre event involving all or even most of the burial population. That said, 45% of these individuals (59% of men, 36% of women) have some evidence for violent injury, including 24% with perimortem cranial trauma, scalping cut marks, and/or projectile injuries. These data suggest that the Cave 7 population was heavily embattled, and raise important questions about the history of the Cave 7 population and of the social dynamics in the region some 2000 years ago.

Lambert, Spencer (Southern Methodist University)

[57] *Examining Large Game Animal Trade at Two Fremont Sites in Utah*

Strontium isotope analysis has been used by archaeologists to track prehistoric human and animal migrations. Strontium isotope analysis can suggest which large game individuals were obtained locally by prehistoric hunters and which were brought to habitation sites through long-distance hunting or trade. This study explores the potential of using strontium isotope ($^{87}\text{Sr}/^{86}\text{Sr}$) analysis to determine whether the Fremont obtained some non-local large game at habitation sites. The transport of large game by Fremont hunters is examined at two sites: Five Finger Ridge in central Utah and Wolf Village in northern Utah. The results suggest that Fremont hunters obtained at least some large game individuals from areas away from their habitations, potentially through trade.

[417] *Epifluorescence Microscopy of Experimentally Heated Animal Bones: Applications to Archaeological Micromorphology*

Burned bones are an important constituent of the archaeological sedimentary record. Their presence is usually indicative of human activity and may provide information about past human behavior.

In micromorphological thin sections, charred bone fragments may appear as opaque and amorphous, and extremely difficult to distinguish from other organics related to fire activities.

As bones emit a green fluorescence upon irradiation with UV-blue light, epifluorescence microscopy can provide a solution to this problem. To our knowledge, no rigorous studies have ever been performed on fluorescence properties of heat-altered bones in thin sections.

We have experimentally heated animal bones in a muffle furnace under oxidizing conditions at different temperatures between 100 and 700 °C; and subsequently prepared sets of polished samples. We investigated their fluorescence properties with a customized epifluorescence microscope: by attaching a spectrometer to one of the oculars, we could record emission spectra for specific regions in the microscope's field of view, hence objectively describing color.

Our preliminary results show that at each temperature, bone is characterized by a unique emission spectrum, indicative of the heat-induced chemical and structural changes within the bone. Understanding these changes may allow us to interpret archaeological bones in thin sections in new ways.

[24] *Lunar Power in Ancient Maya Cities*

As the sun set on the horizon, ancient city dwellers would have felt the cooler air, heard cicadas' songs, and perhaps tasted a late-night snack. Their vision, however, would have suffered the most as dusk turned to night and some form of illumination was necessary to see others, carry on activities, or get to bed. Once the sun fully set, nature provided another source of light: the moon. Although today most people barely check whether the moon's still up there, ancient Maya closely counted its days, phases, and form. In this paper, we briefly review Maya conceptions of the moon as understood through Classic inscriptions, Postclassic codices, ethnohistoric documents, and ethnographic accounts. Specifically we find that rulers ascended to the throne and dedicated monuments under a growing gibbous moon. We argue that moonlight was linked to authority for Classic Maya kings, both for its illuminating quality and symbolic power. In an urban setting, important rituals would have been conducted during auspicious lunar moments, transforming large open plazas into special ceremonial spaces and fortifying the power of kings.

[162] *The Material Culture of Maroon Communities in the Early Circum-Caribbean*

This paper examines early maroon settlements of the Circum-Caribbean and is based upon original research in a wide assortment of Spanish archives, as well as archaeological investigations of African sites in the Americas. As in Gracia Real

de Santa Teresa de Mose, in Spanish Florida, I find Africans readily adapted certain elements of European and indigenous cultures in their re-created communities, but they also retained at least some from their African homelands, despite the incalculable damage wrought by the slave trade. One maroon community in Colombia created a Christian church served by its own clergy who shared religious authority with an African religious specialist. Others had executioners and exorcised “witches.” Some were led by Kings and Queens, others by war captains, and some featured family dynasties. Spanish priests recorded their visits to maroon communities and at least some basic demographic information on their inhabitants. Spanish maps and military accounts also document some of their building and fortification patterns, while surface collections and excavations yield metal objects such as bracelets, arrow tips, and lance points, as well as slag deposits from their manufacture.

[244] *Youthful Visions of Time and Place: Photovoice Methodology in Three Maya Communities*

Archaeology, and to greater extent academe in the Western world, is evolving from a past couched in the comfort of objective truths and universal knowledge focused on static places and societies. However, now more than ever, there has been a push towards understanding the dynamism that is, and has always been, part of the greater human experience. In seeking new directions of collaboration with Native American groups throughout the Americas, academics are finding new ways of knowing and interpreting the pluralistic realities of lived time and place. Inspired by Sonya Atalya’s concept “Braiding Knowledge”, we as university researchers and grade-school educators of InHerit and the Cultural Heritage, Ecology, and Conservation of Yucatec Cenotes project present “photovoice”— a community-based photographic research initiative. We suggest that this methodological practice is an ideal way to interpret and articulate subjective and therefore truthful understandings of time and place. In this talk, we present those realities in relationship to the cultural patrimony of cenotes (underground water sources) as interpreted through the visions of middle school students from the Yucatec Maya communities of Yalcobá, Cuncunul, and Kaua.

[259] *The Use of Shell Ornaments at Early Agricultural Period Sites in the Tucson Basin*

Recent excavations of Early Agricultural Period (circa 1200BC-AD 50) sites in the Tucson Basin of southern Arizona have produced a number of ornaments of personal adornment manufactured from marine shells that are found in either the Gulf of California or the Pacific coastal region of southern California. Thriving shell ornament manufacturing industries in both California and northern Mexico at La Playa were the likely contributors for the finished items of jewelry that have been recovered. It has been suggested that the origin of some of these ornament forms may be found in the exchange of shell artifacts between the populations from the California coast and the Great Basin region. This suggests that the local inhabitants were active participants in one or more exchange networks, and were intent on maintaining these networks. The ornaments may represent symbols of a connection to a faraway place and people, knowledge and experience as a result of their journey to the Tucson Basin.

Lange, Richard**[191]** *Born to Go Far: Tracing the Footsteps of Frederick W. Lange*

Born in the midst of WWII (December 1944), Frederick William Lange emerged into this world in Madison WI. Soon thereafter, he was in New Mexico, then Texas, then Southern Illinois. His travels would take him to Germany and Russia. Summers he worked in the Southwest, at Nauvoo IL, and in the Michigan Upper Peninsula. College took him back to Wisconsin for undergraduate and graduate work, then to Central America, back to the Midwest (Beloit and ISU), back to Central America, then to CU (Boulder), then to Phoenix and then California...all the while bouncing back and forth to Central America—Costa Rica, Panama, Nicaragua, and El Salvador. In between all of this there were adventures in Canada and in the Caribbean as well. If travel broadens one's horizons, it would be difficult to get much broader than what Fred has achieved. It wasn't just travel, however—he was professionally involved in most all of these venues, learning from them, and creating and contributing to the vast bank of knowledge about the peoples and histories of each of these regions.

Langis-Barsetti, Dominique [321] see Martin, Samuel

Langlie, BrieAnna (Binghamton University)**[287]** *Mapping Terraces, Mapping Agricultural Practice in the Lake Titicaca Basin, Peru*

In the Lake Titicaca basin of southern Peru, agronomic systems were finely tuned over millennia to the high-altitude environment, an ever-oscillating climate, and dynamic cultural regimes. To succeed in these conditions, prehistoric farmers transformed steep hillsides into viable agricultural land by modifying them into massive agricultural terrace complexes. The crops grown, and llamas grazed on these landscapes provided food security for ancient cities just as they continue to provide security for populations living in the region today. However, very little is known about the development of these agricultural terraces. The Altiplano Agriculture and Communities Project (AAP) conducted pedestrian survey during June and July of 2018 to begin to elucidate patterns throughout the region. A drone was used to make three-dimensional models of the terraces to better understand their dimensions and hydrology. Mapping styles of masonry on terrace walls shed light on regional and chronological variation in terraces. We also identified architecture that marked ownership of terrace plots and walls used to manage the vertical movement of livestock. The preliminary results of AAP's 2018 survey provide evidence of the varied labor regimes that built and farmed terraces in the south-central Andes.

Lanoë, François [8] see Soza, Danielle

Lanoë, François (University of Arizona) and Joshua Reuther (University of Alaska Museum of the North)**[10]** *Environmental Change and Human Ecology in Central Alaska during the Early Holocene: Hollembaek's Hill*

Dramatic environmental changes occurred in central Alaska during the Early Holocene as mixed woodlands and grasslands transitioned to boreal forest ecosystems. Despite 80 years of research in this region, we are just beginning to understand how interior Alaskan populations coped with the extinction of the large grazers (bison and elk) that constituted their favored resources, and how caribou became the preferred large mammal resource in the Northern Archaic. Hollembaek's Hill site contains an archaeological occupation dated to 8,000 cal B.P. that provides rare insights into this period of central Alaska's history. The occupation contains numerous faunal remains dominated by elk, which are likely associated with microblades as part of a late Denali component. A large pit was excavated by the site's occupants and may have functioned as a storage pit before being re-used for trash management. This evidence for investment in modification of domestic space suggests the adoption of novel forms of mobility that may have been designed to cope with changes in resource availability, and provides information on economic choices and how they influenced the evolution of material culture.

Lanza, Mariangela (University of Western Australia)

[305] *Roots and Routes of Rock Art: A Kernel Density Analysis of Newly Recorded Rock Art Sites to Understand Human Mobility in the North East Kimberley, Australia*

A large corpus of 1034 rock art sites in Australia's NE Kimberley has recently been recorded within the Kimberley Visions Australian Research Council Linkage Project. Rock art analysis in the Kimberley has often focused on distinctive iconographic signatures to structure images in rigid sequences. This approach is inadequate for the understanding of the complex dynamics behind the diachronic development of different stylistic phases. This presentation follows a different approach by showing the results of a two-step geospatial analysis focused on mobility behaviour with topographic, archaeological and rock art data stored and manipulated as a GIS dataset (ArcMAP 10.5). The first step is identifying the density and directional distribution patterns of motifs. Second is modelling possible travel routes for the spread of figurative rock art conventions. Kernel Density (Spatial Analyst Toolbox) is used to quantify and display clustering/dispersal patterns in the distribution of motifs and figurative conventions, highlight spatial relationships between topographical features and rock art sites, and help re-assess the extent of rock art styles' boundaries. The outcome can provide new insights into human mobility as one of the factors that contributed to the formation of distinctive rock art provinces in a constantly changing natural and cultural landscape.

[199] *Erasing Borders: Integrating the Settlement Hierarchies of Central Belize and the Petén, Guatemala*

Over the last 18 years, the Department of Conservation and Rescue of Prehispanic Archaeological Sites (DECORSIAP) in Guatemala has carried out extensive systematic surveys of the northeast region of Petén, Guatemala in order to better understand the internal and external political dynamics of Naranjo Sa'aal and its hinterland. Transects between Naranjo, Tikal, Yaxhá, and Nakum have helped to elucidate settlement hierarchies of northeastern Petén, though Naranjo's political influence likely extended much further. The northern Guatemalan/Belizean border is host to a swath of unexplored ancient Maya centers that likely fit into this political sphere. In 2005 and 2018, the Valley of Peace Archaeology project visited two large centers near the border that are tentatively classified as intermediate centers, each with ball courts and large temples around the acropolis. This paper integrates these recently identified centers in the social dynamics of the Rio Homul and Mopan Basin using the settlement hierarchies outlined in studies of Tikal, Naranjo, and Yaxhá. We will apply the same survey and mapping strategies already employed by DECORSIAP in order to produce a comprehensive, integrated hierarchy of these river basins that can be applied in future studies.

[75] *Exporting Oil and Gas Landscape-Level Mitigation Programs*

In the ten years since the Bureau of Land Management (BLM) launched its Permian Basin mitigation program in New Mexico, the agency has funded research initiatives worth upwards of \$4.5 million and streamlined its approach to developing oil and gas production in the busiest "oilpatch" in the nation. Why haven't we seen more programs like this one in other places across the country? In this paper, we seek to unpack the "well, but that wouldn't work here" response the Permian Basin program has generated elsewhere in the BLM and among land-managing federal agencies in general. We explore the difficulties of exporting and adapting mitigation programs across agency and jurisdictional lines, we spend a modest amount of time identifying some common impediments to creativity in federal agencies, and we suggest some locations and circumstances where aligning creative mitigation and process simplification might yield some new approaches to cultural resource management.

Larreina-Garcia, David (UPV-EHU: University of the Basque Country) and Juan Antonio Quirós-Castillo (UPV-EHU: University of the Basque Country)

[363] *The Medieval Basque Iron Industry, Cultural Traits in Technological Traditions*

The Basquesmith project investigates ironworking production during Early Medieval times –mostly utilitarian iron implements such as ladles or keys– excavated in rural settlements in the Basque Country (northern Spain), focusing on the characterisation of the manufacture used, the quality of the utensils produced, and the debris generated. The material characterisation and reverse engineering of the technical materials is starting to reveal a complex network between smelters, smiths, consumers and agencies of a lively market in force at least during the 7th-12th centuries AD. While the metallographic study on ~100 items detects a technological tradition in the manufacture of iron implements inherited from the Roman times, the smelting technique seems to be well developed in the area before the arrival of the Roman people and apparently both technological procedures coexisted in time. The reconstruction of the various processes in a relatively small region illustrates a technological adaptation to natural resources and socio-technological contexts, seemingly permeable to external influence but also retaining its own traditions in technical activities.

[20] *The Human-Chicken-Environment Nexus*

The chicken is a relatively recent addition to global cuisine. Unlike cattle, sheep and pigs, which were domesticated 10,000-12,000 years ago, convincing evidence for the domestication of Red Junglefowl, native to Southeast Asia, does not emerge until at 5,000 years ago, at the earliest. Furthermore, multiple strands of evidence suggest that chickens were not domesticated primarily as a source of food but rather for sport and divination. So how did a bird with a restricted native range come to dominate food cultures worldwide, and with what consequences for human-chicken-environmental health?

Against a backdrop of archaeological data, this paper will consider the sustainability of modern day chicken production, providing examples generated through two AHRC-funded projects 'Cultural and Scientific Perceptions of Human-Chicken Interactions' and 'Going Places: Empowering women, enhancing heritage and increasing chicken production in Ethiopia'.

[371] *Excavations at Group I: A Small Residential Household in the Medicinal Trail Hinterlands Community, Northwest Belize*

Group I of the Medicinal Trail Community is a small residential household in the Rio Bravo Conservation and Management Area of northwestern Belize and consists of an eastern shrine and two house mounds on the south and west sides of the courtyard, all situated on an artificial plaza platform. This group is located directly east of the larger and more formally constructed Group B, and is bounded by a steep escarpment to the east and north. Excavations during the 2014-2017 field seasons reveal an at times complicated construction and occupation sequence. Our investigations at the group explored all three structures, the courtyard, and an anomalous feature just below the surface of the courtyard directly in front of the eastern shrine. This poster will summarize and synthesize all of these data to provide an understanding of Group I's function internally and how it articulates with the larger Medicinal Trail Community.

[329] *Folsom and Goshen Technological Organization at Locality I of the Hell Gap Site*

Chipped stone tools and debitage from the Hell Gap site offer evidence of a wide range of activities such as procurement, manufacture, and use of stone tools. Several features with multiple pieces of chipped stone (piles) excavated from the earliest Paleoindian components at Locality I appear to show different production trajectories, suggesting that a wide range of production stages were carried on. Analysis of the assemblages from these features provide insight into the nature of technological organization of the earliest peoples of North America. One feature, although not containing dense and concentrated debitage, includes eight Folsom channel flakes and two broken preforms, representing a fluting location. Additionally the presence of carnivore bone (a wolf vertebrae), turtle carapace, and ochre suggests ritual associated with Folsom fluting. The 1960s Hell Gap investigations delineated a number of stone tool production features (flake piles), but individual specimens could not be assigned to a specific feature for assemblage analysis. The advantage of our excavation protocols is that they allow for the selection of specimens contained in piles. In this presentation I compare several production events from early Paleoindian components.

[278] *From Soil to Society: Local Variability in Inferred Climatic and Environmental Change and Landuse in the Valencian Community, Spain*

Climatic and environmental factors are 'creeping' phenomena with rapid thresholds, and there is a disjuncture between product and best-practice in terms of landuse. The ways in which people engage with their environment are necessarily influenced by the nature of the given region, but the form of that engagement is contingent on cultural and historical specificities. This paper targets these negotiations between small-scale land use practices, increasingly "state"-driven macro-economic systems, and changing environmental conditions within the wider historical narratives of colonial expansion in the ancient western Mediterranean (1st millennium BCE). I use novel environmental data and inferred climatic change to contextualize these "glocal" tensions. In short, this research includes the application of a proxy based on a certain class of lipid biomarkers (GDGTS) for relative changes in temperature and pH from excavated material (here faunal remains); thus providing comparable environmental and climatic datasets from sites themselves, avoiding the ambiguity of using indirect geological archives as indicators). The broader Valencian region boasts a relatively large body of work on Holocene climate as well as long-term archaeological research focused on the development of agriculture and diversified regional economies in South Eastern Spain, and thus serves as the primary case study.

Lassen, Robert (Gault Project at Texas State University) and Sergio Ayala (Gault Project at Texas State University)

[322] *Is Fluting Exclusive to Paleoindians? A Comparison of Paleoindian and Archaic End-Thinning Techniques*

The idea that fluting is a uniquely Paleoindian technological marker for projectile points in the Americas has been considered a given ever since the original Folsom discovery in 1927. While it is true that fluted lanceolate points are reliably diagnostic artifacts of the Paleoindian period, stemmed points from the Archaic period also occasionally exhibit end thinning flake scars that are reminiscent of flutes. In Central Texas, Middle Archaic point types such as Andice/Bell, Bulverde, and Pedernales regularly possess end thinning flake scars that facilitate hafting. This study compares the basal end thinning of Paleoindian points such as Clovis, Folsom, and South American Fluted Fishtail to that of the aforementioned Archaic points. The comparison involves a morphological study utilizing metric variables, as well as a technological study involving replicative flintknapping and an analysis of reduction sequences for the various point types. The results will determine the validity of fluting as a uniquely Paleoindian strategy.

[248] *PEOPLE3k: Demographic Boom and Bust Cycles of Coastal Hunter-gatherers Cycles Track Shifting Upwelling Conditions in Northern Chile*

Extensive archaeological shell middens can be found throughout coastal northern Chile, where they span more than 9,000 years. They contain abundant terrestrial plants and shellfish remains and can often accumulate very quickly and/or episodically. We use multiple radiocarbon dates to measure local radiocarbon deviations (R) between marine and

atmospheric ages along a given stratigraphic horizon. Such estimates are then used to calculate regional marine reservoir departures from the global marine ^{14}C calibration curve (ΔR). Previous research has shown that ΔR estimates can be used to reconstruct local upwelling conditions. A steady increase in upwelling and colder coastal waters drove increased marine productivity along with an almost constant increase in coastal hunter-gatherer populations from 9,300 to 5,500 cal yr BP. Major shifts in upwelling associated with unstable coastal ecosystems drove demographic collapse of coastal hunter-gatherers from 5,500 to 4,700 years ago- with populations declining until c. 2,500 cal yr BP. Our upwelling records shed new light on how the coastal ecosystems of northern Chile have evolved and co-adapted with prehistoric human societies, and show how these changes relate to global climate change, such as the onset and intensification of ENSO over the last 9,000 years.

[133] *Look What Just Washed Up on the Jersey Shore: Climate Change and Its Impacts on Submerged Sites in New Jersey*

Beginning in 2013, the office of the New Jersey State Archaeologist began receiving requests to identify artifacts found along the Atlantic shoreline and the Delaware Bay. While finding artifacts along beaches is not new, the substantial increase both in number and locations of finds can only be attributed to the results of climate change. The frequency and intensity in which these storms occur has contributed to the disturbance and destruction of submerged archaeological sites along the continental shelf. Although without context, these finds provide significant data on potential site locations, site chronology, and potential site preservation. This presentation will document the locations of these finds, identify their chronology, and examine areas of archaeological concern regarding continued climate change and its impact on archaeological sites.

Lau, George (Sainsbury Research Unit, UNIV OF EAST ANGLIA)

[161] *Making Kin out of Stone: Production of Landscape and Collectivity in Ancient Peru*

This presentation details different strands of evidence we have on the organisation and kin-based significances of carved stone monoliths during the late prehispanic period of ancient northern Peru (ca. AD 500-1532). Ethnohistorical documents suggest that it was close kin who carved and erected stone images of esteemed forebears; the images themselves, meanwhile, were referred to as 'brothers' of the prototype. Stony things—crags, boulders, mountains—were also described as tangible remnants of where past kin 'lithified'. Archaeology, meanwhile, shows the close associations between the carved monoliths and funerary cult; they were images of the deceased generally adorning mausolea and necropoli. They are consistent with the idea that production of stone images were the purview of family/lineage groups and centred on important instantiations of esteemed forebears in the landscape. It is argued that late prehispanic groups of Peru's north highlands sought to consolidate collectivity and multiply ancestral presences through their stonework, both within the village setting and through the visible landscape. Engagements with stone during this time of great social and demographic upheaval, was intimately related to the process of 'make kin'.

[83] *Materializing the Incarceration of Japanese Americans during WWII*

The mass removal and imprisonment of over 110,000 people of Japanese descent during WWII relied upon an interconnected infrastructure of materials and technologies. These camps were not spontaneous creations, but the result of

numerous strategies of immigration control and confinement with their own histories of use within the United States. The deployment of these technologies was often governed by economic and political logics, not accounting for the experiential qualities of such decisions. Here I will discuss the various material qualities of the WWII Japanese American incarceration and the subsequent ways in which they were experienced. While archaeological studies have highlighted the physical manifestations of the Japanese American incarceration camps, they often focus on the strategies employed by incarcerated to build new environments and alleviate the traumas of incarceration. Here instead I will step back to examine some of the seemingly benign qualities of these camps which inflicted trauma in the first place. With a focus on these materials, archaeology can help to illuminate the deep and often unnoticed consequences of such decisions and their impacts on those subject to them. This topic is of growing concern as the technologies of removal, mass resettlement, and confinement become increasingly common.

Lauria, Kathryn

[273] *Neanderthal Communities of Care: How & Why Did Non-modern Hominins Care for Victims of Interpersonal Violence?*

Within the constantly evolving field of human origins, researchers are looking for new methods and theories to infer behavior from the paleoanthropological record. Here, Shanidar 3, a Neanderthal specimen with evidence of partially healed sharp force trauma, is examined using the Bioarchaeology of Care approach. Based on a comparison with paleopathological and forensic literature, Shanidar 3's injuries are consistent with sharp force trauma caused by a penetrating object. The severity of Shanidar 3's injuries suggest that healthcare provisioning was required for immediate survival. Furthermore, the relatively high number of extreme injuries which demonstrate healing in the Neanderthal record, referred to as the "rodeo traumatic lesion pattern" due to the high incidence of head and neck trauma, indicates a system of care that was in place for injured members of the species. This paper explores how bioarchaeological theories can be applied to non-modern hominins, such as Shanidar 3, to infer not only violent behaviors among individuals, but the systems of care that were enacted to assist such individuals and ensure their immediate survival.

[117] *Are You a Tool? A Zooarchaeological Analysis of Worked Bone from Wupatki National Monument*

Zooarchaeological analysis provides details on the processes used to create and modify bone artifacts and the potential use of these materials by past peoples. This poster provides the results of faunal analysis, usewear analysis, scanning electron microscopy, and experimental archaeology to examine bone artifacts from Wupatki National Monument. The data collected includes skeletal elements from a range of taxa, assessment of bone working stages, and evidence for bone modification in the form of bone tools, ornaments, and instruments. We elucidate human behaviors tied to these implements to provide a better understanding of bone processing, manufacturing, use, and activities associated therein at Wupatki. This research further contributes to the conversation of bone working for the zooarchaeological community at large in the American Southwest and worldwide.

[254] *Navajo-Gallup Water Supply Project: Best Management Practices Manual*

The Navajo-Gallup Water Supply Project (NGWSP) is a Bureau of Reclamation (Reclamation) sponsored project in northwest New Mexico that will convey water from the San Juan River to Navajo and Jicarilla Apache communities, as well as to the City of Gallup. Reclamation developed a Programmatic Agreement (PA) that prescribes how cultural resources, including numerous archaeological sites, will be considered during project construction. The PA stipulates that a lessons-learned case study or best management practices manual (manual) shall be produced following the completion of construction. Logan Simpson and Parametrix archaeologists and anthropologists have been working with Reclamation and the NGWSP PA consulting parties to develop the first draft of the manual. One of the themes of the manual is to provide guidance on how to meaningfully engage in consultation with Native American tribes so that the perspectives and knowledge of descendant communities are given equal footing to understanding and managing the archaeological resources, traditional cultural properties, and the cultural landscapes being investigated as part of the NGWSP. This paper presents both case studies and recommendations on how tribal participation is critical to archaeological work completed within a National Historic Preservation Act Section 106 context.

[381] *Movin' on Up: Insights into Habitations on the Slopes of Cañon de San Diego, New Mexico*

Archaeology in the Jemez Province of New Mexico has been explored and studied since the late 19th century. High site densities and pueblo complexes are common, but most of the areas suspected to contain pueblo settlements have been thoroughly reconnoitered. These resources are primarily identified within drainage bottoms and atop the numerous mesas between canyons. In 2017, Logan Simpson surveyed 662 acres of steep, heavily incised, and extremely rugged Santa Fe National Forest land on the western slopes of the Cañon de San Diego immediately north of Jemez Springs. The parcels, sandwiched between the Jemez River and the edge of Virgin Mesa, were anticipated by all involved to contain relatively few cultural resources. Instead, 48 new sites were identified, most of which contain standing architecture with intact mortar, including several on slopes greater than 30 percent. Diagnostic artifacts indicate that most sites date from the late Coalition and Classic periods (A.D. 1250–1650), a time that saw rapid population increase in the area and an intensification of villages on mesa tops. This paper discusses results of survey, assesses the spatial and temporal distribution of sites, and provides new insights into the habitation of “less-than-ideal” landforms.

[19] *Belonging, Not Belongings: Thinking beyond the “White Possessive” in the Identification of 19th Century Indigenous Landscapes in New England*

In her recent book, “The White Possessive,” Aileen Moreton-Robinson details the way in which Western Nationhood hinges upon the possession of property. Consequently, the mechanisms by which Indigenous people become “propertyless,” are crucial for the state’s denial of Indigenous sovereignty. For example, in 18th century Massachusetts, the Nipmuc people were identified, traced, archived and legitimized by their ownership of land. Colonial records plot Nipmuc land holdings with care, measuring and quantifying state approved land “grants,” reservations, and holdings in severalty. Nipmuc land sale transactions were highly monitored and subject to state approval. As Nipmuc land holdings dwindle in the late 18th and 19th centuries, so do archival records of Nipmuc presence on the landscape, creating a lasting historical erasure and a discourse of Native “disappearance” despite the continued presence of Nipmuc people in New England. In this paper, I will share some methods I’ve adapted for tracing Nipmuc residence without the assumption of ownership and immediate proximity, revealing tangible locations and traceable routes of dynamic Indigenous communities that existed within, amongst, and in spite of Western landscapes of private property in 19th century New England.

[298] *Petrographic Analysis of Pre-Columbian Pottery From Nevis, Eastern Caribbean*

Prehistoric Amerindians in the Eastern Caribbean often used local materials in the manufacturing of ceramics, and in some cases, transported these as they migrated. Given the ubiquity of ceramics in the Caribbean, they are useful in discerning past movements, and spheres of interaction. However, studies of this nature are scarce in the region. In this paper, we have conducted an exploratory study of pottery from the island of Nevis (northern Lesser Antilles), in a continuation of efforts to understand and define ceramic production, distribution, and use. The Dickenson method of petrography, initially used in Oceania, was implemented on 20 non-diagnostic Late Ceramic Age potsherds from the site of Coconut Walk. These, along with 11 modern sands, were collected and petrographically described. Descriptions focused on sand and matrix characteristics such as composition, size, sorting, and angularity. From descriptions, sherds were categorized into compositional temper groups: group 1(Felsitic) and group 2(Volcanic). Sands were also described and organized into temper groups. Representatives of each temper group, both sherds and sands, were then selected for point-count analysis using the Gazzi-Dickinson method. Results indicate that temper groups match both local geologic description and local modern sands, suggesting a local provenience for pottery production.

[36] *Looking under the Rocks: Geoarchaeological Investigations of Earth Oven Facilities in Various Settings of the Lower Pecos, Texas*

The multi-year Ancient Southwest Texas (ASWT) Project at Texas State University has investigated numerous earth oven facilities (more commonly known as burned rock middens or BRMs) in the Lower Pecos of southwest Texas. The investigated prehistoric sites ranged from large, cavernous rock shelters to subtle overhangs and open-air campsites. Among the many observations made during the excavations was the differing preservation and composition of the BRMs in each of these settings. This presentation discusses these features and summarizes the preliminary geoarchaeological investigations of the BRMs at Skiles Shelter (41VV165), Eagle Cave (41VV167), Horse Trail Shelter (41VV166), and Tractor Terrace (41VV2055).

Lawres, Nathan (University of Florida - Department of Anthropology)

[362] *Relatedness, Circularity, and Place-Centeredness in Belle Glade Artifacts: Reevaluating South Florida Collections from an Ontological Framework*

Museum collections provide a quintessential database for archaeological studies, yet they are often overlooked in favor of new excavations that eventually add to museum collections. While new excavations provide us valuable insight into the communities of the past, reevaluating existing collections can provide us with entirely new interpretations of the past, especially in light of new methodological technologies and new theoretical frameworks. In this paper, I provide a case study on how reevaluating collections with new theories and methods can shed an entirely different light on the past. The Florida Museum of Natural History curates many collections associated with the Belle Glade culture of South Florida. Previous Belle Glade studies have been limited and focused primarily on economics and subsistence. Reevaluating these collections in terms of an ontological framework provides a whole new understanding of the peoples that once dwelled in the Kissimmee-Okeechobee-Everglades watershed.

Layco, Wendy (California State University Los Angeles)

[360] *The Investigation of a Sascabera Near the Las Monjas Complex in Chichen Itza*

Some 75 m southwest of the Las Monjas complex at Chichen Itza and just west of Sacbe No. 7, lie a series of eleven sascabereras that are shown schematically on the Carnegie map. While ceiling collapse has undoubtedly occurred in the millennium since their creation, some, such as Sascabera #2, have an extensive enclosed dark zone space. In Sascabera #2, this can be attributed in part to the leaving of pillars to support the ceiling. A survey of Sascabera #2 recovered a fair number of ceramic sherds indicating post mining activities carried out within the dark zone. The feature was also noteworthy in being the only sascabera where stalactites had formed on the ceiling. Evidence suggests that the Maya may have deliberately excavated sascabereras at the site to function as caves.

LaZar, Miranda (University of New Mexico), Jonathan Dombrosky (University of New Mexico), Emily Jones (University of New Mexico) and Seth Newsome (University of New Mexico)

[260] *Tracking Individual Raptors in the Archaeological Record Using Stable Isotope Analysis: Some Implications for the Study of Ritual Economies in New Mexico*

In this poster, we explore a cost-effective method for tracking artifacts made from individual raptors (or birds of prey) through the use of intra-skeletal variation in $\delta^{13}C$, $\delta^{15}N$, $\delta^{2}H$ in modern samples of Turkey Vultures (*Cathartes aura*) and Golden Eagles (*Aquila chrysaetos*). Current methods of quantification in zooarchaeology, such as the minimum number of individuals (MNI), work to identify individual animals within a site. However, they cannot be applied to quantifying skeletal material from the same individual at different sites. Ancient DNA is one method that allows archaeologists to track individual fauna, but it is expensive. Do individual raptors exhibit distinct stable isotopic signatures because of little to no intra-skeletal variation in $\delta^{13}C$, $\delta^{15}N$, $\delta^{2}H$? Identifying individual fauna in the archaeological record could aid in the reconstruction of regional trade networks and distinguishing potential distribution centers of flutes and whistles in prehispanic New Mexico. Flutes and whistles recovered from Ancestral Pueblo contexts were commonly manufactured from the bones of birds of prey. Tracking individual raptors can lead to better understanding the economic role that flutes and whistles had in the Ancestral Pueblo world.

Lazrus, Paula Kay (St. John's University)**[387]** *Managing Forests in the 19th and Early 20th Century Bovese*

The town of Bova, located in the foothills of the Aspromonte in the province of Reggio Calabria, Italy, once dominated a region rich in forests and woods. Travelers from the 15th – 19th centuries commented upon the rich vegetation. Archival records ranging from tax declarations to legal disputes refer to the presence of trees and forests in locations around the town of Bova. Many of these areas are no longer forested. In this exploration of the tax data and legal disputes over the use of these resources, references to forested areas and to the tending of trees such as oaks and chestnuts are mapped in order to begin analyzing the possible ways in which citizens interacted with these resources. Forests were often used to demarcate limits of neighborhoods as well as for their intrinsic resources, and some were owned or managed by the church or the municipality. Here, an attempt is made to use spatial analysis to better understand these relationships within the Bovan economy of the 19th and early 20th centuries.

Leach, Peter (University of Connecticut; Geophysical Survey Systems, Inc.), David Givens (Jamestown Rediscovery) and Richard Boisvert (NH State Conservation and Rescue Archaeology Program)**[72]** *The Current State and Future Possibilities of Ground-Penetrating Radar in Cultural Resource Management*

Ground-penetrating radar (GPR) is an established prospection method in cultural resource management (CRM), yet despite its contributions its use is not universal. The goal of this presentation is to demonstrate the utility of GPR surveys before and during CRM excavations, and to underscore the need for maximizing the archaeological capabilities of GPR. This talk is organized into two parts. The first presents case studies of typical GPR surveys from CRM contexts, with the goal of exhibiting the various target types encountered with relatively low frequency (350-900MHz) antennas. A major part of this discussion will be the common pitfalls associated with different sites and types of data, and methods for overcoming these issues. Also discussed are best practices for GPR fieldwork and post-processing techniques for archaeological datasets. The latter half will highlight the authors' experimental GPR techniques that employ high-frequency (1600-2700MHz) antennas inside excavation units. Case studies from pre-contact sites in New England and investigation of a historical burial at the Jamestown Colony will reveal the archaeological importance of higher frequency antennas. These high-frequency data are forwarded as a means of 'digital bisection', whereby GPR surveys during excavation provide a new level of real-time mission planning for archaeological efforts.

Leader, George [131] see Dhody, Anna

Leader, George (University of Pennsylvania)**[131]** *Funerary Hardware in 18th and 19th Century Philadelphia: What Can Be Used as an Indication of Wealth from the Arch Street Site?*

The cemetery of the First Baptist Church of Philadelphia (ca. 1702-1859) was excavated in 2017. Almost 500 remains and associated material culture highlight the lives of Philadelphia's early citizens during pre and post-colonial eras. Individual graves offer multiple lines of evidence from which to assign a wealth index within the sample. Variables used in the study include coffin hardware (furniture), lid plaques, lid tacks, escutcheons, and grave goods. The study created a rubric on which to grade each individual graves' wealth based on the presence or absence of such funerary goods. Historical records were then compared to the results to blindly test how the cemetery's sample may represent the congregations' population at the time. This paper presents the results of the analysis and highlights the importance of additional research on coffin hardware and grave goods.

[21] *Please Put It Back: A Non-NAGPRA Case of Reburial*

Due to recent erosion from intensified downpours related to global warming, Wupatki National Monument archaeologists recovered artifacts from an exposed cyst that were about to fall into a newly formed wash. Working with traditionally associated tribes, the monument created an emergency excavation plan and a contingency for the reburial of cyst contents should human remains be encountered. When no human remains were found, the monument accessioned and cataloged the cyst contents, including seven intact pots. Because intact pottery is seldom found outside of a burial context, the monument and its Friend's Group sought to place the items on display. When monument personnel consulted with Hopi elders about the cyst and contents for the exhibit, however, they learned that what they thought was a "pot cache" was something else entirely. This paper discusses the events that led to the eventual reburial of the cyst contents and the resulting lessons learned.

[47] *Climatic Controls on Prehistoric Utah Populations*

Recognizing how climate variability altered the landscape in regards to nutrient availability is a key aspect in reconstructing how prehistoric peoples were able to thrive. Further, understanding how past climate and environmental change affected organisms is important for predicting the role of imminent future climate change on populations today. Previous research found mammal populations during the Holocene fluctuated directly with climate variability in accordance with the availability of edible resources. This study provides a record of climatic controls, particularly precipitation, on past human populations in the Bonneville Basin. Utilizing pollen data from Utah's Blue Lake as a proxy of environment in the Bonneville Basin, and the "dates as data" approach to account for human population, we are able to explore the interplay between climate and human population growth for the past 12000 years. We predict during the Holocene, periods of increased moisture were more conducive to consistent sustainable food sources, and thus human populations would have been able to expand. As predicted, our results indicate a significant correlation between precipitation and population density: when more arid-adapted taxa dominate the pollen record, human population densities are low, and vice versa.

[349] *Female Figurines of the Greater Nicoya Region 500 BCE – 1250 CE*

Female figurines of the Greater Nicoya region feature a 2000-year history of thematic continuity. During the Formative and Classic periods (locally Tempisque and Bagaces periods), figurines were often red-slipped, nude females in a seated, kneeling or standing position with hands on hips; these were occasionally elaborated with black pigment depicting body paint or tattoos. About 800 CE, however, figurines became decorated with polychrome paint consistent with the ceramic tradition of the Postclassic. These polychrome designs often included textiles, which have traditionally been associated with female identity. Despite notable decorative changes, the postures of female figurines continued with only minor changes, suggesting that their primary meaning remained the same diachronically. This paper will discuss the implications of continuity in figurine form and will also explore functional and symbolic significance. Further, we will consider the popular hypothesis that figurines were used in shamanistic practice, and examine a larger implication concerning the prominence of women in indigenous homes and politico-religious roles.

[315] *From the Andes to the Gila: Space, Society and Zooarchaeology in the US Southwest*

This paper is a story in two halves, each inspired by John and his academic legacy. Home to some of the earliest and most impressive ritual architecture in the hemisphere, the Andes has long fostered research into the interchange between social organization and the built environment. The first half of this paper demonstrates the long reach of this research, connecting threads between Andean architectural analyses and the built environment in the American Southwest at a variety of spatial scales. The second half of this paper focuses on the Mimbres-Mogollon region of the Southwestern uplands. A combination of legacy datasets and recently analyzed museum collections provides new insights into the long-term record of human-environment interactions in this region, including the resilience of different animal taxa to human hunting and anthropogenic landscape change at different spatial and temporal scales. Implications for understanding the recursive effects of hunting are linked to John Rick's research on vicuña harvesting in the Andes.

LeCompte, Elise

[362] *The Paper Chase: Legacy Collections' Records*

The analysis of legacy collections is often hampered by documentation that is fragmentary, preserved on obsolete media, or entirely absent. Like the physical material that makes up a legacy collection, the associated documents may be spread across institutions. This may include other museums, educational facilities, government agencies, and private firms. Some of these institutions may include those that do not actually curate the physical objects and specimens, like libraries. This presentation describes the processes used to locate legacy collections documents, as well as the legal and ethical issues related to collections and documents that are shared across institutions. Data management plans are now standard parts of research projects. Though just as necessary, codified plans for the long-term curation of associated documents are far less common. By focusing on the stability and tracking of these crucial collections components, institutions can facilitate better collaboration and research.

[353] *Nomadic Identity: The Origins of a Multiethnic Empire in Mongolia.*

Little is known about the ethnic composition of early nomadic populations in Mongolia. Archaeological and historical research have concentrated on the Xiongnu (209 BC-93 AD) and Mongol (1206-1368) time periods. The period in between is known as the period of disunion, characterized by fragmented states and foreign dynasties. This is a period of political unrest, but there is evidence that many different ethnicities were accepted and incorporated into these states. Five cemeteries from Bulgan, Arkhangai, and Orkhon Aimags were analyzed to determine how many different ethnicities were present. Twelve burials were recorded from the Xianbei (147-234), 15 from the Rouran (330-555), and 15 from the Turkic (555-840) periods. Based on grave architecture, burials artifacts, metric traits, nonmetric traits, developmental defects, and musculoskeletal markers, various ethnicities were assigned to the burials. During the Xianbei period, Xianbei, Ordos, Qidan, and Turkic individuals were identified. At the Rouran cemeteries, Xianbei, Ordos, Qidan, Turkic, Mongol, and Xiongnu individuals were present. The Turkic period cemetery had only Turkic burials. The variability in ethnicities is probably related to differences in political control and national identity. Further analyses incorporating the Xiongnu and Mongol periods may clarify the unusual level of inclusiveness which characterized the resulting Mongol Empire.

[156] *Sustained Farming in the Nam River Valley, South-central Korea, through the Mumun/Bronze to Early Historical Periods*

This research examines agricultural management, particularly raised field farming from the Mumun/Bronze to early historical periods (3400–1600 cal. BP) along the Nam River in south-central Korea. The study of settlements on alluvial flatlands provides crucial information on early agricultural developments around the world. The Nam River basin is an exemplary case, revealing over 1600 features of dwelling structures, burials, altars, and sequences of agricultural fields across the area of 47 hectares. Research questions include how inhabitants constructed the farming fields and manipulated crops, and ways that this affected both environmental and cultural niches. Multiple lines of evidence for the transition to farming include macro- and micro-plant remains and settlement patterns, as well as a close examination of radiocarbon dates. The research evaluates the Neolithic management of economic plants and the transition to a more closely managed construction of farming landscape in a broad East Asian context.

Lee, Hyunsoo (University of Oregon)

[156] *Early-Middle Holocene Resource Use and Niche Construction in Jeju Island, Korea*

Study of various human adaptations and human-environmental dynamics amid Early-Middle Holocene (ca. 11,500-5,000 BP) climate changes has been a noteworthy theme in archaeological research. One of the main questions in this discourse is how occupants in various environments and landscapes have gone through diverse utilizations and interactions with the surrounding resources. Early-Middle Holocene societies in Korea have been often simply defined as hunter-gatherer economies with no existence of plant management, due to dichotomous views between plant gathering and cultivation/agriculture, and between wild versus domesticated plants. The main objective of this research is to develop a niche construction model in Early-Middle Holocene societies based on the case studies of Early-Middle Holocene sites in Jeju, including the Gosanri. Through mainly microbotanical evidence, this study identifies plant species utilized through time and characterizes an early management of anthropogenic species prior to or along with systemic agricultural practice. The study aims to contribute to mapping diverse economic niche constructions, human-environmental dynamics, and sociocultural transitions amid climate changes of the Early-Middle Holocene worldwide.

[2] *Quantitatively and Qualitatively Evaluating the Impact That Palaeoanthropology Makes on the Lives of the Maasai People of Olduvai Gorge, Tanzania*

Tanzania's Olduvai Gorge is a flagship human origins research site, yet less recognised is that the lands surrounding Olduvai are home to the pastoralist Maasai society. Even though scientists have, for over a century, sought to illuminate the shared past of our species in what many regard to be a cradle of humankind, there has seldom been meaningful and lasting collaboration between palaeoanthropologists and the Maasai. We conducted three seasons of ethnographic research within Maasai and palaeoanthropological communities to gain a thorough understanding of the social dynamics of the Olduvai

area and thereafter develop a standardised survey that could substantially capture the experiences of all Maasai who sought to share their thoughts. Our results, which qualitatively and quantitatively delineate daily life within a renowned research site before and after the formation of the Stone Tools, Diet, and Sociality partnership, foreground the impacts that scientific projects have made – and can make – on Maasai communities. This paper emphasises that instead of lending strength to the myth that scientific work is absolutely disengaged from societal matters, palaeoanthropologists can explore the contexts surrounding their field projects to create new policies and practices that cultivate the myriad benefits of engaged archaeological fieldwork.

[156] *Assessing Agricultural Strategies in Prehistoric Korea through Climate and Landscape Models*

Relict fields and archaeobotanical remains from village sites in South Korea indicate intensive agriculture was practiced during the Mumun Period (ca. 1500-200 B.C.). In this paper, we discuss the effects of climate and landscape in the decision-making of Mumun farmers, particularly which crops to plant, at what times, and which locations. Our results are based on complementary models that consider temperature and soils across the Korean peninsula for multiple sites and multiple crops (i.e. millet, barley, rice). More than identifying the presence or absence of domesticates, we argue that our models help explain Mumun Period agricultural strategies such as diversification, specialization, and intensification.

Lee, Rechanda

[150] *'ASHŁ'Ó YÓHOOL'AAH (Learning to Weave): The Cultural Transmission of Technological Style in Navajo Textiles*

Learning is a process that all individuals experience either consciously or unconsciously in a social environment. The process of learning is important to understand because learning develops knowledge and skills that are the foundation of an emerging culture. The significance of understanding how humans learn may guide our understanding in how the learning process affects the patterning of material culture. Archaeologists understand relatively little about the process of learning, how skills are acquired, and how some skills remain unchanged over time. By examining the transmission of traditional knowledge and skill from Master Weaver to apprentice we develop an understanding of the process of learning. The simplistic explanation of understanding how one learns a skill is described as learning by means of participation, observation, and imitation. This research investigates the role of a community of practice and its importance to the passage of learned technological styles as reflected in Navajo textiles. The results of this study provide some insight into the learning and social networks that preserve and keep traditions alive, especially, during times of a changing weaving tradition.

[156] *Technological Transmission between Different Levels of Specialization in Proto-historic NE Asia*

The Proto-historic period (300 B.C. - A.D. 300) in Northeast Asia was a critical time when technological innovations and the fundamental changes of craft-specialization in the ceramic production occurred. From the early 3rd century B.C., ancient Chinese states of Yan, Qin, and Han expanded their influence over Manchuria and the northwestern part of the Korean Peninsula and established sporadic outposts into indigenous territory. The interaction spaces between the Chinese outposts and the surrounding indigenous communities were very important in explaining the transmissions and innovation of ceramic producing technology. This study explores cultural transmission of a bundle of complex technological behaviors from pottery craftspeople who had embodied skills for forming techniques of various standardized ceramic vessels to native practitioners working within a less-specialized context.

[251] *Learning from Loss 2018: Considering Responses to Accelerated Climate Change in Scotland*

In June 2018 interdisciplinary scholars from Scotland and the US convened in Edinburgh to consider action in the face of inevitable loss of coastal and carved stone heritage from accelerated processes related to climate change. The project, "Learning from Loss," was funded by the Scottish Universities Insight Institute with lead partners University of St. Andrews and University of Stirling. The project team included archaeologists, cultural anthropologists, geomorphologists, conservators, and climate scientists from Scotland and the United States. Over 13 days, the project team held pre- and post-visit meetings in Edinburgh and travelled north to 28 select carved stone and coastal sites to consider the question:

“How will Scotland respond to transformation in the historic environment in the face of accelerating impacts of climate change by 2030?” The team considered social and community values, prioritization (how to), responsibilities (decision makers and stakeholders), and actions. Key insights and recommendations are reviewed.

[37] *“Site” (LN-101), Long Island, Bahamas: Beads, Baking, and Burials, but Brief Occupations?*

LN-101 is a multi-component Lucayan site located on the windward coast of Long Island in The Bahamas. The site is situated along sand dunes directly on the beach and is characterized by the presence of earth ovens, evidence of bead manufacture, and associated human burials, with a notable absence of dense midden deposits or features indicative of past structures. In comparison to some Lucayan villages or midden sites, which contain abundant clay artifacts and fauna-rich deposits associated with long-term or persistent site occupations elsewhere within the Bahama Archipelago, Rolling Heads presents a different combination, or “site”, of archaeological finds suggestive of possibly short-term or task-specific occupations focused on the exploitation and use of animal and plant resources. Here we present a synthesis of our ongoing archaeological research, detailing the presence of earth ovens and highlighting recent zooarchaeological, starch, macrobotanical, and seasonality studies. Taken together, our analyses provide perspectives on the Lucayan-environment interactions underlying subsistence practices and landscape use at the site and challenge us to more thoroughly consider the significance of short-term or ephemeral site occupations within greater Lucayan settlement patterns.

[417] *Searching for Clues of Neanderthal Occupation and Mobility in Combustion Structure Residues: A Micromorphological and Biomarker Study of El Salt Unit Xb, Alcoy, Spain*

The Neanderthal lithic and faunal record shows a short-term occupation, high mobility trend throughout Eurasia. Although combustion structures, which are numerous and well preserved in most Middle Paleolithic sites, play a central role in short-term occupations, they have not been sufficiently investigated from a geoarchaeological perspective to explore settlement patterns. This paper examines eleven combustion structures of the Middle Paleolithic site of El Salt (Spain), Unit Xb, with a focus on Neanderthal settlement patterns. The study is conducted using micromorphology, lipid biomarker analysis and compound specific isotope analysis. Results show in situ hearths build on a vegetational surface previously occupied by herbivores, preserved as black layers. Likewise, the results indicate a presence of angiosperms surrounding the occupation

site. Regardless of a high density of overlapping combustion structures, each hearth was built on a surface previously uninhabited by humans, pointing to short stays and therefore a high mobility. Mobility was additionally noted for fuel acquisition through an absence of conifer biomarkers in the fires, despite conifers being identified as a major source of fuel. A microscopic and molecular approach in the study of combustion structures provides insight for our understanding of Neanderthal settlement patterns.

[339] *Maya kosmopolitês (Citizens of the World): Using a Cosmopolitan Approach to Study Trade, Identity and Belonging at Salinas de los Nueve Cerros*

The use of cosmopolitanism as a theoretical framework for conceptualizing belonging in archaeology is derived from the ancient Greek concept kosmopolitês – humans are citizens of the world. Inspired by Halperin, this paper takes up her challenge to consider how “worldly dispositions, values, and identities are held in tension with local and more personalized practices and experiences (2017:351).” Using the theoretical approach of rooted cosmopolitanism, whereby individuals can be situated in both local and worldly identities, this paper explores how aspects of trade interaction influence identity at the site of Salinas de los Nueve Cerros. As a locus for both highland and lowland Maya good transfers, the site is an important node for long-distance good procurement and direct and indirect spheres of influence at the local and interregional levels, which influences its citizens’ external connections, internal organization, and individual senses of belonging at the site.

[347] *Becoming Villagers, Becoming Enslavers: Social Change in Bantu-Speaking Early Villages during the Late Holocene Arid Phase (ca. 1200 BCE. – ca. 100 BCE)*

Recent syntheses incorporating linguistic, archaeological, and paleoclimatic evidence have argued that villages inhabited by Bantu-speaking communities spread from Cameroon to the Lower Congo from about 1200 BCE to 100 BCE. This southward migration was facilitated by an abrupt climatic warming event that expanded savanna-like environments and destructed portions of the Central African rainforest. Particularly between 650 BCE and 70 BCE, these new environmental conditions offered new opportunities and challenges to the newly arrived Bantu-speaking inhabitants, such as the adoption of pearl millet agriculture, the rapid circulation of iron technology, and the growth of population. This presentation discusses how village leaders resorted to slaving and captive-taking strategies to expand their communities in this period of unsettling changes. Based on comparative ethnography and historical linguistics, a re-analysis of four previously proposed lexical reconstructions reveals emerging ideas around alienation, honor, social status, and inter-village conflicts that provide important insights into the ways in which early Bantu speakers created a new logic of dispensability and incorporation in their communities. Lastly, this presentation discusses the implication of this discovery vis-à-vis other streams of evidence and ends by showing how the concepts of slavery created in this period became a lasting tradition in Equatorial Africa.

[300] *Interaction, Change, and Ceramic Variation along Coastal Nakhon Si Thammarat, Thailand, AD 100-1500*

Coastal Nakhon Si Thammarat Province, Thailand, situated along Peninsular Thailand’s eastern facing South China Sea shore, was one of the many vibrant zones of interregional exchange and complexity growth in premodern maritime Southeast Asia. The region’s culture-history, settlement pattern, material culture, and international connections between AD 100 and 1500 have become points of archaeological interest in recent years. Research on its Hindu and Buddhist shrines has identified four distinct periods of local development, and the presence of northern and southern site clusters possibly displaying some political or cultural differentiation between the 5th and 11th centuries and heavier southern occupation after AD 1100. This paper discusses the results of a program of survey and excavation conducted in 2017 at three northern cluster and three southern cluster sites to help advance understanding of premodern coastal Nakhon Si Thammarat’s

organizational development and external engagements. Specifically, it details efforts made to locate, collect, and define variation exhibited within the region's local earthenware assemblages over time. This paper also attempts to interrogate what identified local ceramic patterns suggest about the organization and relations of daily life in premodern coastal Nakhon Si Thammarat and its place in local mobilization of external connection toward local development.

[89] *Identification of Wood Used at Daugherty Cave, WY*

From 1954 to 1957 Dr. Frison excavated Daugherty Cave (48-WA-302). Various perishable artifacts were recovered from the site including moccasins, basketry, cordage, wood, hide and sinew. It is a Late Archaic to Late Prehistoric site on the west side of the Bighorn Mountains in the Northwest Plains. Dr. Frison published on the site in 1968 detailing the artifacts found. Minimal work has been done with the artifacts since housed at the University of Wyoming Archaeological Repository. For this project, I used microscopic wood identification to answer: what types of wood were being used; were materials local or non-local; how this compares to other rock shelters and caves analyzed on the Northwest Plains; were different woodworking techniques used for different wood types; and were different techniques used for different artifacts? Additional information about the site, plants and plant use was obtained from the Rocky Mountain Herbarium Database (RMHS), the Native American Ethnobotany Database and discussions with Dr. George Frison. I was able to create comparisons with analyzed sites in Wyoming and the surrounding area, establish wood resource exploitation, local and/or non-local exploitation and what kind of woodworking techniques were being used at the site and on what object type.

[78] *Pig Management in Neolithic North China: Foddering and Social Change in the Western Liao River Valley*

Recent models for pig domestication in China have suggested that initial domestication was contingent upon millet cultivation, which allowed for foddering through agricultural surplus. For this study, a combination of bulk collagen carbon and nitrogen isotopic analysis and compound specific carbon isotopic analysis are used to infer the extent to which pigs consumed domestic food products in the form of millet and/or household refuse at two key Neolithic sites in Northern China: Xinglonggou and Xinglongwa. Additionally, by sampling pig remains based on both age and sex, food provisioning directed at certain cohorts within the herd can be identified and associated with ethnographically described management strategies. Ethnographic work on pig management--notably from New Guinea--has illustrated that identifying feeding regimes can be useful to distinguishing between intensive and extensive management strategies as well as community involvement in larger social networks and institutions at a regional level. In the context of the origins of agriculture in the Chinese Neolithic, this paper addresses two major lines of research: (1) when and in what context did foddering emerge; and (2) how changes in pig management practices reflect changes in social and economic organization seen during the transition to the Bronze Age.

[398] *Dental Pathology and Paleodiet: Exploring Spatial and Temporal Variability of Ancient Maya Subsistence Practices in Northwestern Belize*

The osteological analysis of skeletal remains provides a unique lens for viewing social behaviors within ancient complex societies at the level of the individual as well as the population. The dentition from skeletal remains can be especially useful for answering questions regarding dietary practices as the consumption of specific foods leave identifiable macroscopic markings on teeth, which preserve well in archaeological contexts. Presented in this paper are the results of an analysis of the observable macroscopic indicators of dental pathology from ancient Maya populations located at three sites in northwestern Belize. Given its prolonged occupation (AD 250 to 1000), this region is ideal for investigating evidence of changes and/or variations within Maya society over time and space. Thus, this research explores the consistencies and variations of food distributions and other patterns of dietary practices across different Maya social groups over a span of 700+ years. The results of this investigation reveal spatial and temporal stability in dental health and thereby diet throughout these ancient Maya populations, concurring with the archaeological and geoarchaeological evidence of dynamic and sustainable agricultural practices in this region.

[64] *New Methods for Duct Exploration and Gallery Discovery at Chavín de Huántar*

Originally the only known underground gallery between Building A and the Circular Plaza of Chavín de Huántar, the Caracoles gallery was long thought by Professor John Rick of Stanford University to be one of multiple chambers due to its three wall ducts, each exiting at an unknown location. This paper illustrates the methods developed for exploring these and

other such ducts, namely the usage of cameras, light arrays, and laser rangefinding equipment with modular poles. During the 2017 field excavation season led by Professor Rick, these techniques resulted in the discovery of a gallery thought sealed since Chavín times, temporarily designated as 'Gallery X.' Using images obtained in this manner, Gallery X was confirmed via comparative photography to be a chamber mirroring the architecture of Caracoles, with Building A's north entrance serving as an axis of symmetry. Two galleries were subsequently discovered in line with this pair (galleries 'three' and 'four'), and during the 2018 season, these techniques were used to gather evidence for the presence of an additional row of four galleries 3.2 meters to the north.

[30] *Making Place: A View from Northwestern Belize*

Ancient Maya places were dynamic assemblages of people, the things that they made and used, and myriad material and immaterial affordances. Unfortunately, a simple enumeration of their components cannot account for the historical valence carried by places. In northwestern Belize, the multi-scalar operation of ritual may help clarify the processes involved. Using the site of Wari Camp as a springboard for discussion, this paper will focus on ritual as "skilled practice" – technology enacted by ruler and ruled to continuously make and remake community and region.

[372] *The Impact of an Emergent Maya Polity on the Domestic Lithic Economy: A Perspective from the Hinterlands of Lower Dover, Belize*

Lithic tool production and use offers a way to understand domestic activities and how they developed in relation to broader socio-political changes. The Late Classic (AD 600-900) Maya polity of Lower Dover, Belize emerged in the midst of a densely occupied landscape, and this transition saw the incorporation of three autonomous communities – Tutu Uitz Na, Floral Park and Barton Ramie – into the polity as urban neighborhoods. The appearance of Lower Dover on the political landscape impacted lithic tool production and exchange at the household and neighborhood levels. By comparing the patterns of tool production and use in these three communities as they transitioned into Late Classic neighborhoods, we examine the ways commoner activities changed at the household and neighborhood level following the emergence of the Lower Dover polity. Preliminary research at the Tutu Uitz Na neighborhood indicates the establishment of a specialized chert workshop following the rise of Lower Dover. This poster builds on this research by comparing established patterns of lithic production and consumption at Tutu Uitz Na with data from the Barton Ramie and Floral Park neighborhoods.

[212] *A Multi-proxy Investigation of Settlement on Pingelap Atoll, Pohnpei State, Federated States of Micronesia*

Pacific atolls are generally regarded as challenging places to live. In addition to being far from other land masses, most have low biodiversity, limited access to freshwater, and are susceptible to extreme weather. However, settlers established residence on atolls in the Micronesian region as early as 2,000 years ago. This paper presents the first major archaeological investigation focused on the atoll of Pingelap and addresses the timing of settlement as well as the ways that people have subsisted over long periods of time in this atoll environment. Located about halfway between the high islands of Pohnpei and Kosrae, Pingelap consists of 1.8 km² of land spread across three islets, with only the largest island, Kahlap, being continually inhabited. Our results indicate that Pingelap has been settled since at least 1550-1700 cal BP, and has likely been continuously inhabited by humans until the present. Zooarchaeological and archaeobotanical work suggest a diet from early habitation heavily reliant on reef fish and shellfish, with plants such as coconut and pandanus also playing a key role. In ethnoarchaeological investigation, local consultants describe farming practices that complement our archaeological understanding on the persistence of atoll settlement.

[409] *Archaeological Prospection Using Aerial Thermography and Quantitative Image Processing Methods*

This paper explores new methods and developments in thermal remote sensing, aerial thermography, for archaeological research. These methods are applied in a pilot study at Picuris Pueblo, NM. Principles of thermal remote sensing that enable subsurface prospection are considered, along with previous investigations in this arena. Expanding upon existing approaches, new quantitative image processing methods for subsurface feature identification are proposed. These methods exploit the enhanced data potential of radiometric thermal data with multitemporal resolution, acquired from a sUAS platform. Using a novel image differencing algorithm, the ephemeral thermal signature of subsurface features is enhanced. Modern machine learning models are applied to the processed thermal imagery to extract the locations of probable subsurface features. Subsurface adobe structures documented during previous investigations are relocated, demonstrating the capability of the proposed methods. Moreover, known features are used as training data for classification of uninvestigated areas of the site, revealing multiple thermal anomalies that may be indicative of additional subsurface architectural features. The image processing methods presented in this study demonstrate the immense potential of thermal remote sensing in archaeology, providing non-destructive approaches for investigating archaeological landscapes.

[197] *Foregrounding Food: Mixtec Cuisine, Identity, and Household Ritual at Late Postclassic Tututepec, Oaxaca*

This paper highlights the results of a recent analysis of macrobotanical remains from commoner households at the Late Postclassic (AD 1100-1522) Mixtec capital of Tututepec. The paleoethnobotanical data is considered in light of archaeological evidence, as well as ethnographic and ethnohistoric data, to investigate the nature of household food production, consumption, and exchange. In addition to reconstructing the local cuisine, we consider the role of foods and plants in household ritual and healing. Furthermore, we examine how food preferences may have figured in the expression of Mixtec identity, and how these preferences impacted decisions concerning how to organize food production and exchange.

Levy, Janet (UNC Charlotte) and Patty Jo Watson (Washington University-St. Louis)**[312]** *Archaeology in the Big Bend of the Green River, KY*

Julie Stein joined the Shell Mound Archaeological Project (SMAP) in western Kentucky in 1977 when Patty Jo Watson and William Marquardt, leaders of the project initiated in 1971, recognized the need to add geoarchaeology to the already interdisciplinary project. I started as a graduate student at Washington University–St. Louis in Fall 1971; and, while not a core member of the research team, I was there, on the ground and in the dirt, from the beginning. Julie and I both took full-time jobs in 1980, in Washington state and North Carolina respectively, and stayed put for the rest of our careers. We each experienced archaeology both in an academic department and in museums, although I was a graduate student working at the National Museum in Copenhagen, while Julie has directed the Burke Museum of Natural History and Culture with great success since 2005. SMAP was the place we became friends, colleagues, and, I think it is fair to say, professionals, mentored especially by Pat Watson. In this presentation, Pat and I would like to share some of the experiences from that project and what was learned from working with Julie.

Lewandowski, David (Logan Simpson)**[346]** *Persistent Places and Settlement Patterns in the Mogollon Highlands: A Case Study along Eagle Creek, Eastern Arizona*

This paper examines settlement patterns and the concept of persistent places and its implications regarding population circulation, community, and identity during the Pithouse and Pueblo period occupations (A.D. 700–1450) within the Eagle Creek area of the Apache-Sitgreaves National Forests (ASNF) in eastern Arizona. Eagle Creek is a perennial stream which flows south from the Mogollon Rim to the Gila River along the border of the ASNF and San Carlos Reservation, immediately east of the Point of Pines cultural region. In this study I focus on survey data to examine site occupation spans and site function to reconstruct persistence, the reuse of sites, population movements, and changes in community location and structure in the Eagle Creek area over time. Changes in the presence and proportions of sourced obsidian and non-local decorated ceramics are also used to discuss the changing external relationships of the prehistoric Eagle Creek residents, which may tell us about changes in shifting identity formation within the area over time, with implications for the adjacent Point of Pines area and greater Mogollon Highlands region.

[346] *Chair***Lewarch, Dennis (Suquamish Tribe)****[22]** *Using Archaeological Training to Help Tribal Communities*

Indigenous communities often lack financial resources, technical skill sets, and expertise in regulatory processes to identify, document, protect, and enhance their cultural patrimony. Well-trained archaeologists are competent in a wide range of skills needed to collaborate and work with indigenous people, thereby allowing indigenous communities to express their own voices regarding their heritage. Archaeological training in areas such as critical thinking, historic research techniques, grant

writing, field procedures, laboratory analysis techniques, data analysis, statistics, GIS, and technical writing is in demand in many tribal communities. Archaeologists can make important contributions to tribal culture, have rewarding careers, and give back tangible benefits to indigenous communities whose heritage has been exploited for decades by anthropologists and archaeologists.

[136] *Arthur C. Parker: Legacies of a Seneca Archaeologist*

Arthur Caswell Parker was one of the first of his kind as an indigenous archaeologist. As a Seneca scientist with roots on the Cattaraugus territory where his grandparents lived, he had a foot in two worlds that may have aided with collaboration and research. However, his career started at a time when the archaeological field was still in its infancy, and many Native American tribes considered archaeological research and collecting practices to be unethical. Although the installation of the NAGPRA legislation moves to improve the discourse between tribes and archaeologists, a strong dichotomy in the rhetoric concerning archaeology in Native American communities remains. Different people will have opposing views on archaeology and Parker himself. In this paper, we aim to bring to light the differing views held by individuals within the Seneca Nation by exploring traditional and modern beliefs. This study delves into contrasting perspectives in regards to Arthur C. Parker and archaeology within the Seneca Nation of Indians.

[271] *Single-Use Heritage: An Archaeological Approach to Plastic Wastes as Places of (Ecological) Shame*

In recent years, archaeologists have been increasingly interested in 'places of shame', i.e. places related to past traumatic, painful, or regrettable human actions. In this paper we argue this concept can be expanded to incorporate sites with negative ecological impact. In particular, the interpretation of places of single-use plastic waste accumulation as contemporary heritage landscapes, or 'wastes as places of shame' can import an ethical load and a responsibility to reflect on behavioural pasts, presents and futures. We suggest that the archaeological treatment and 'heritagisation' of such places has the potential to incite critical self-reflection on plastic consumption and hopefully encourage change in these behaviours. We examine the case of the Sugarloaf Path in Newfoundland (Canada), a hiking trail renowned for its breathtaking views of the North Atlantic coastal landscape. A portion of this path circumvents the landfill that serves the City of St. John's. Windblown plastic waste from the landfill litters the path and surrounding area. This paper presents the preliminary digital mapping of this wastescape – a first step in making a heritage record of this contemporary archaeological place of ecological shame.

Li, Dongdong (Minzu University of China) and Camilla Sturm (New York University)

[361] *Settlement Patterns in the Taojiahu-Xiaocheng Region of Jiangnan Plain China*

The especially early emergence of Neolithic walled towns in the Jiangnan Plain is widely used as an indicator of social complexity. Several models have been suggested to explain the emergence of walled towns: inter-regional conflicts between the Central Plain and the Jiangnan Plain, intra-regional conflicts among walled towns in the Jiangnan Plain, and control of flooding in the Neolithic period. The trajectories of developing social complexity of these earliest walled towns and the relationships that existed among them have not previously been systematically investigated from the perspective of demographic distributions. The full-coverage systematic regional survey presented here included two of the earliest walled towns in the Jiangnan Plain: Taojiahu and Xiaocheng. It was designed to illuminate their social trajectories and by extension those of their counterparts elsewhere in the Jiangnan Plain and areas adjacent to it. The regional survey revealed spatial and temporal variations in the survey area from 3900 BCE to 600 CE. Population distribution patterns were documented for each period in this time span to investigate the dynamic forces behind social and settlement changes.

[416] *Dry-Grinding or Wet-Grinding? Use-Wear Reveals the Grinding Technique Used for Cereal Processing in Early Neolithic Central China*

Different food processing techniques often shed light on the dietary habits and subsistence strategies adopted by prehistoric populations. Studies have shown that grinding cereals into flour took place since the Paleolithic age. Nevertheless, the grinding method employed in the prehistoric periods was often not investigated. This study discovered the different features of use-wear traces associated with dry-grinding and wet-grinding of cereals, which can be used to infer the ancient grinding techniques. By applying this reference baseline to Jiahu, an early Neolithic site which is known for the earliest finding of domesticated rice in the central plain of China, it reveals that dry-grinding rather than wet-grinding was adopted for cereal (including rice) processing 9000 years ago. This kind of grinding technique could have been inherited from the earlier hunter-gatherers, but also could be related to broad-spectrum subsistence strategy adopted at Jiahu. By comparing the properties and ethnographic uses of different plant species, it is also suggested that cereals such as rice was a more sensible choice for dry-grinding process.

[299] *Inscriptions and Technology: Knowledge of the Artisans Who Created China's Terracotta Army*

This study offers a new perspective and combines multidisciplinary methods, with the aim of revealing knowledge and behaviour of the artisans in ancient China. It considers the inscriptions incised, painted, or stamped on the terracotta warriors and their accompanying weapons, and interprets the information they reveal about the artisans and artists who worked for the Qin Empire. In addition, the study investigates technological features associated with the production of both the terracotta warriors and the bronze weapons by comparing and contrasting these two very different kinds of artefacts. Close attention is given to implications about knowledge and behaviour of the artisans and artists who created such a magnificent Terracotta Army for China's First Emperor. The study also plots wider spatial distribution of items across the pit as a whole, in order to understand the operational sequences and workshop organisation required to make the Terracotta Army. The project's logistics during this crucial early phase of empire-building in China are also discussed.

[361] *Rethinking the Variability of Cobble-Tool Industry in South China and Southeast Asia during Late Pleistocene-Holocene Transition*

The lithic industry of South China has been characterized as simple "cobble-tool" industry persisting from early Pleistocene to Holocene and the most representative industry of Southeast Asia was also marked by pebble-tool techno-complex termed Hoabinhian during late Pleistocene-early Holocene. The possible cultural link of the two regions was proposed by some scholars but the technological characteristics and variability within the two industries was elusive. In this paper we conducted technological analysis on a "cobble-tool" industry associated with a bone tool technology from the Luobi Cave, Hainan Island, dated to ca. 11-10 ka and compared it with a well-studied typical Hoabinhian site of Laang Spean in Cambodia. Except a minimum similarity in operational sequence (chaîne opératoire) the major difference has rejected the Luobi Cave as a potential Hoabinhian site, indicating a high originality and a new variability in the tool-kit of modern human groups during late Pleistocene-early Holocene transition in South China and Southeast Asia.

[361] *The Zooarchaeological Analysis of Pre-Zhou Animal Remains from the Zaoshugou Site and the Zaolinhetan Site in Central Shaanxi, China*

This research analyzed animal remains of the late Pre-Zhou culture from two sites of Zaoshugou and Zaolinhetan in present-day central Shaanxi Province in China. The comparison of wild and domestic animal taxa, age profiles for main domestic animals, and sources and types of bone artifacts suggest distinct patterns of animal resource exploitation at the sites, showing different levels of complexity at Zaoshugou and Zaolinhetan. This comparative zooarchaeological research provides new insights into the social and economic development in the historical 'Bin' area on the eve of the collapse of the Shang Dynasty.

[359] *10th Century BC Novelties in the Central Part of Southern Caucasus*

The materials discovered at the Grakliani settlement and necropolis (Eastern Georgia) date from different periods and cover the stratigraphy presented below: 1. The Paleolithic Age with an upper Pleistocene paleontological site; 2. Neolithic; 3. Chalcolithic; 4. Early Bronze Age; 5. Late Bronze/ Early Iron Age; 6. The developed Iron Age (the 8th-6th centuries BC); 7. The 5th-4th centuries BC; 8. The 4th-3rd centuries BC; 9. The 3rd-2nd centuries BC; 10. The 2nd-1st centuries; 11. 3rd-4th centuries AD.

The most important items have been discovered in the layers and buildings of the 11th - 10th centuries BC (loom weights, weights). In the small sanctuary located on the 3rd terrace, two inscriptions from the 10th century BC have been unearthed ["A" -North - Western Semitic(?) and "B"- probably - Aramaic]. "B" inscription is the earliest inscription on the territory of Caucasus and is one of the earliest Aramaic inscriptions in the Near Eastern area, showing very intensive interrelations between Central Caucasus and Near Eastern area.

Lieb, Brad (Chickasaw Nation) and Adam Moody

[9] *Chickasaw Pottery Vessel Form and Function in the Early Historic Period*

This study of Chickasaw pottery vessel forms dating to ca.1700 C.E. explores 268 reconstructed analytical vessels from six okaakinafa' midden pits across two sites (22Le907 and 22Po755) located in and around Tupelo in Lee and Pontotoc counties, Mississippi. Ethnohistorical information, prior research, and oral traditions are gleaned for interpretive information on Chickasaw cuisine and domestic organization. This account of vessel form and function is compared with published studies on other groups and aids interpretation of innovations and traditions in Chickasaw domestic life and adaptation to a rapidly transforming colonial economy.

[367] *A Slow Burning Fuse: Spanish Colonialism, Franciscan Missions, and Pueblo Population Changes in Northern New Mexico*

For nearly half a century, prevailing models of post-Contact Native American demography have held that the appearance of Europeans and Africans in the New World sparked a rapid and catastrophic population decline across North America in the sixteenth century. Recent archaeological investigations in the Pueblo Southwest and elsewhere have questioned this model, suggesting instead that Native American population decline followed a very different trajectory than previous models have suggested. This paper presents archaeological data from ancestral Jemez Pueblo villages and Franciscan mission sites in the Jemez Valley of Northern New Mexico in support of a new model of post-Contact Pueblo population, which raises an entirely new set of questions revolving around contact, colonialism, and indigenous resilience.

[231] *The Study of Indigenous Landscape and Seascape Management Practices in Central California: A Synthesis of Recent Findings*

This paper synthesizes the results of our recent investigation of indigenous landscape and seascape management practices in Central California in ancient and historical times. The project involves a collaborative team of scholars from the Amah Mutsun Tribal Band, Amah Mutsun Land Trust, California State Parks, and the University of California campuses at Berkeley and Santa Cruz who are implementing an inter-disciplinary approach to the study of terrestrial (anthropogenic burning) and coastal management practices using multiple data sets drawn from tribal histories, archaeological and aDNA research, ecological studies, and ethnohistorical sources. The specific goals of the second phase of this project are to provide a better understanding of when people initiated sustained anthropogenic burning and seascape management practices, how they may have modified and developed these practices over time, and to address the scale at which people implemented these practices. These goals are being addressed through the investigation of sites in several study areas along the Santa Cruz Coast that date to Middle Holocene (7000-3000 BP), Late Holocene (3000-500 BP), and Historical times (500-200 BP).

[328] *Lithic Technological Organization at Three Olcott Sites along the Elwha River, Clallam County, Washington*

In western Washington, Olcott sites are generally understood to represent a period of cultural and technological stability that extended through the early Holocene into the middle Holocene. While some researchers have suggested subtle technological evolutionary developments occurred over time, Olcott sites have often been characterized as a consistent or uniform technological pattern. Recent archaeological investigations at three Olcott sites located along the Elwha River (sites 45CA727, 45CA774, and 45CA775) recovered a diverse assemblage of chipped stone tools and debitage that indicate Olcott technological organization was not homogenous between sites. The tool production strategies evidenced by the discarded tools and debitage suggest that individual sites were dominated by varying degrees of biface production and informal core/flake tool production. The implications of the Elwha lithic pattern for regional Olcott land-use are explored.

[389] *The External Connections of the Yingpanshan Site Cluster in Western Sichuan, China*

Previous studies suggest that both painted pottery vessels and certain kinds of cereals, such as millets, were introduced to the Upper Min River from the north due to the expansion of the Neolithic cultures in the upper reaches of the Yellow River, during the fourth millennium BC. By investigating related ceramic samples and human and animal teeth and bones from the Yingpanshan site cluster in the drainage of the Upper Min River, near the border of Sichuan, Gansu, and Qinghai, we further discover that the direction and intensity of influences had changed through time and varied by river valleys. Interactions between the Upper Min River and the Chengdu Plain to the southeast also existed and later, the core-periphery relationship seemingly overturned.

[49] *Paleopollution and Environmental Consequences of Bronze Craft Production during the Shang Periods in Anyang, China*

The aim of this study is to understand the relationship between bronze production and paleopollution during the middle and late Shang periods (1450-1045 BCE) in Anyang. Archaeologists have discovered several bronze workshops operating during these periods. These workshops were located among residential areas, and the long-term bronze production activity at Anyang could have generated hazardous elements that polluted the environment. Since 2016, paleosols have been collected from a wide variety of archaeological contexts and time periods during excavations in Anyang. We apply trace metal analysis and particle size analysis to study the chemical composition and structure of these paleosols. The information recorded in paleosols indicates paleopollution related to bronze production and other human activities.

[246] *The Central Arizona Project and Platform Mounds in Arizona*

This paper will chronicle some of the history of the Federal investment in Big Archaeology for the Central Arizona Project. Specifically, the decisions to support a philosophy of Cultural Research Management, which facilitated a huge contribution to the archaeology of Arizona, and more broadly to the Southwest United States. The CAP construction project snaked its way through homeland territory of the prehistoric Hohokam and Salado affecting many platform mound-centered communities in the Phoenix Basin, Gila Basin, Tucson Basin, and in the Tonto Basin and it is these sites and communities that provided the fruit for informed archaeological research and a significant intellectual contribution to American Archaeology in the late Twentieth Century. The massive CAP archaeological program, from the late 1960s to the 21st Century (50 years and counting), had its own historical roots and I will discuss the relevance of the Bureau of American Ethnology as the intellectual spark for Big Archaeological thinking at the Federal Level, notably late Twentieth Century mitigative archaeology, and the why the furtherance of Big Federally-sponsored Archaeology programs is a logical, necessary, and appropriate model.

Lindauer, Owen and Arley Simon (Arizona State University)

[194] *White, Red, and Plain Wares in the Tonto Basin: Precursor Correlate of Culture Change*

We present a consideration of Roosevelt Black-on-white, recovered from archaeological sites in Arizona's Tonto Basin, as a correlate for Tonto Basin populations' changing exchange relations as well as emulation through production of locally-produced copies of non-local wares. Implications of broad-scale ceramic exchange, population migration, and emulation are considered for the period A.D. 1250 to 1350+ through Tonto Basin white ware, red ware, and plain ware ceramic analysis. We view a marked diversity in white ware technology while maintaining a desired design style as presaging similar trends in other red and plain Tonto Basin wares throughout the Salado temporal sequence. These trends provide evidence of the amalgamation and integration of traditions indigenous to the Tonto Basin, with population in-migration from surrounding areas, as well as influences from regional trade. The ceramic assemblages provide correlates of dynamic changes that led to the intermingling and integration of cultural influences during the development and florescence of the Salado Platform Mound communities.

[253] *The Genetic Prehistory of the Andean Highlands 7,000 Years BP through European Contact*

The peopling of the Andean highlands above 2500m in elevation was a complex process that included cultural, biological and genetic adaptations. Here we present a time series of ancient whole genomes from the Andes of Peru, dating back to 7,000 calendar years before present (BP), and compare them to 64 new genome-wide genetic variation datasets from both high and lowland populations. We infer three significant features: a split between low and high elevation populations 30 that occurred between 9200-8200 BP; a population collapse after European contact that is significantly more severe in South American lowlanders than in highland populations; and evidence for positive selection at genetic loci related to starch digestion and plausibly pathogen resistance after European contact. Importantly, we do not find selective sweep signals related to known components of the human hypoxia response, which may suggest more complex modes of 35 genetic adaptation to high altitude.

Lindquist, Shayna (University of Kentucky)

[158] *Obsidian Production and Consumption Practices at Matacanela*

Matacanela's chipped stone assemblage overwhelmingly is dominated by nonlocal obsidian, including both products and by-products of multiple reductive technologies. Overarching temporal trends and classification of Matacanela's obsidian

assemblage have previously been discussed within the context of the site's general settlement; however, this data has yet to be thoroughly recontextualized within the socio-economic milieu of the site. This paper focuses particularly on the dawn of the Late Classic period at Matacanela. The obsidian data from this period suggests that the people of Matacanela became more engaged in prismatic blade production, though to varying degrees across the site. I make the argument for localized obsidian craft specialization during the Late Classic period and situate this data within concurrent shifts in subsistence strategies and political alignment.

Lindsay, Audrey (Center for Environmental Management of Military Lands [CEMML])

[122] *Fire Effects at the Honda Ridge Rock Art Site, Vandenberg Air Force Base, California*

As California wildfires increase in intensity and frequency across the state, archaeologists and land managers work to update fire management strategies and reassess fire risks to sensitive cultural resources. Existing literature indicates that while some buried archaeological resources are fairly protected, rock art sites are particularly susceptible to wildfire effects. Vandenberg AFB has collaborative pre- and post-fire management plans specific to each rock art site. In September 2016, the Canyon Fire burned approximately 12,742 acres within Vandenberg AFB. High winds and dry conditions swept the fire over the Honda Ridge rock art site, burning the interpretive infrastructure and visibly impacting the northeastern pictograph panel. This poster presents the collaborative observations of fire impacts to the rock art, shares the refined pre- and post-fire management strategies, and demonstrates the resilience of the pictographs and overall rock art site.

[359] *New Solutions to Old Challenges: Methods and Results from Project ArAGATS' Kasakh Valley Archaeological Survey (KVAS) Project, Northwestern Armenia (2015-17)*

The South Caucasus witnessed multiple long-term shifts in settlement systems, social organization, and sociopolitics from the Paleolithic and the close of the Bronze Age. Throughout this long history, local environments and human landscapes served as important material and social contexts through which processes of community (re)production unfolded. However local topographies and historic modifications to the landscape present unique challenges to systematic settlement survey in the South Caucasus. In this paper, we discuss results of the last three seasons of pedestrian survey and test excavations in the upper Kasakh River Valley in northwestern Armenia, which have broadened our understanding of changing land-use and settlement patterns. We also highlight some of our methodological approaches to site documentation such as a mobile GIS system and airborne photogrammetric mapping workflows that were developed to help mitigate survey challenges in the region's heterogeneous landscapes.

Linduff, Katheryn (University of Pittsburgh) and Karen Rubinson

[196] *Horses in Iron Age Steppe Burials: Their Enduring Socio-political Role*

Horses have been a large part of the David Anthony's research interests. Horses also played a significant role in the Pazyryk Culture (4th-3rd centuries BCE), a group of peoples buried in the Altai Mountains, in the region where modern Russia, Mongolia, China and Kazakhstan meet. Horses are regularly deposited in burials associated with the Pazyryk Culture; this practice and its socio-political function is the topic of this paper. Not only are horses the backbone of the mobile and military functioning of these communities, they probably also played a central role in displaying the centralizing power and authority of trade and emerging societal complexity across a vast area in Eastern Eurasia.

Ling, Xue, Zhouyong Sun and Liang Chen

[78] *Strontium Isotopes in Human Teeth as Indicators of Migration in the Warring States Period Sites of Zhaitouhe and Shijiahe*

The sites of ZhaiTouHe and ShiJiaHe are two neatly arranged cemeteries with complicated features. The cemeteries were both discovered in Huangling county, Shaanxi Province, are the first complete Rong people's tombs found in northern Shaanxi, and are closely related to the Wei's culture. In order to reveal migration patterns, strontium isotope analysis was

conducted on human teeth. With the help of some archaeological data and historical literature, the Rong's way of life and the changes in the immigration policy of Qin are also studied, with focus on the process of national fusion during the Warring States Period in northern Shaanxi. The results of the study indicate that both graveyards have some migrants, and the mobility of the population was high. The Rong people's way of living changed after arrival in the Huangling area. At the same time, one sample also indicates how immigration policies changed in the subsequent Qin Dynasty.

[419] *How Many Turkeys Did It Take to Make a Blanket?*

For a thousand years, turkey feather blankets were a standard part of Ancestral Pueblo material culture in the Central Mesa Verde (CMV) area. Investigating the "supply side" of blanket-making includes comparing the number of feathers needed for a blanket with the number of suitable feathers obtainable from an adult turkey. We estimate a one meter square blanket curated at the Edge of the Cedars Museum in Blanding required 12,000 to 14,000 body feathers measuring 5 to 17 cm long. Examination of several wild turkey pelts indicates an adult male has up to 2000 such feathers. If each household made only one new blanket annually, feathers from six or seven turkeys would be required each time. However, the archaeofaunal record doesn't reflect this level of harvesting live birds. We discuss use-lives of the blankets; whether turkeys' regular molts could have been a practical feather source; and if mature feathers could have been selectively picked from live birds. Also discussed are supply side effects when turkeys became a major meat source in the CMV after about CE 1150.

[365] *Solutions to Drift on Small and Isolated Populations*

Due to the effects of drift on small and isolated populations, island environments pose particular evolutionary challenges in the retention of richness and diversity of cultural information. Such variation, however, can have significant fitness consequences particularly when environmental conditions change in an unpredictable fashion: knowledge about past environments may be the key to long-term persistence. Evolutionarily, one would expect successful adaptations to include social mechanisms for maintaining diversity and richness within interacting populations. Factors that can shape the rate of drift across a population include the semantics of the traits as well as spatially structured social networks. Here, we explore how community patterning and interaction impacts the rate of trait retention and extinction. We use our findings to explore how this process might explain aspects of the archaeological record for the prehistoric populations of Rapa Nui (Easter Island, Chile).

Lippert, Dorothy (National Museum of Natural History)

[317] *The Articulation of the Dead; Understanding Expatriation, Materiality and Voice in the Process of Repatriation*

Bioarchaeologists assert the responsibility to give voice to the dead, but the dead exist in many different definitions. As ancestors, they are part of an existing human community, as objects, they are part of a created community of collections. They can also be sources of data for researchers seeking to expand knowledge about human existence. Far from being inert and silent, their nature both constructs and is informed by the emotional landscape of repatriation work. This presentation will consider the materiality of the individuals who are the focus of repatriation and the role of emotion in constructing their identity.

[253] *Ancient Human DNA from Shum Laka (Cameroon) in the Context of African Population History*

We generated genome-wide DNA data from four people buried at the site of Shum Laka in Cameroon between 8000–3000 years ago. One individual carried the deeply divergent Y chromosome haplogroup A00 found at low frequencies among some present-day Niger-Congo speakers, but the genome-wide ancestry profiles for all four individuals are very different from the majority of West Africans today and instead are more similar to West-Central African hunter-gatherers. Thus, despite the geographic proximity of Shum Laka to the hypothesized birthplace of Bantu languages and the temporal range of our samples bookending the initial Bantu expansion, these individuals are not representative of a Bantu source population. We present a phylogenetic model including Shum Laka that features three major radiations within Africa: one phase early in the history of modern humans, one close to the time of the migration giving rise to non-Africans, and one in the past several thousand years. Present-day West Africans and some East Africans, in addition to Central and Southern African hunter-gatherers, retain ancestry from the first phase, which is therefore still represented throughout the majority of human diversity in Africa today.

[363] *From Local to Regional Technological Landscapes – The Mobility of Aeginetan Potters*

This paper stems from a project entitled TRACT (TRAVelling Ceramic Technologies as markers of human mobility in the Aegean), funded through Marie Skłodowska-Curie Actions, which aims to demonstrate that the informed and interdisciplinary study of ancient pottery can shed new light on past human mobility. Our focus is on potters from the island of Aegina, located close to Athens, in the Saronic Gulf, and their mobility along the Euboean Gulf, a convenient water passage to the north, at the end of the Late Bronze Age (ca. 1200 BC).

The macroscopic examination of pottery, focusing on morphological/stylistic and technological features, has been the starting point of our study and the basis for the identification of craftspeople mobility. The subsequent incorporation of ceramic petrology and elemental analysis of a selection of ancient pottery samples, in combination with geological prospection in the studied landscapes and replication experiments, and ethnographic work on modern potters' mobility has contributed to the understanding of the entire technological phenomenon at various spatial scales and with a time perspective. In particular, in this paper we will explore the issue of adaptation of Aeginetan potting tradition to several 'new' landscapes along the coast of the Euboean Gulf.

[363] *Accidental Innovation? Using Isotopic Analysis to Test Possible Iron Production as a By-Product of Advanced Copper Smelting*

The Faynan region of Southern Jordan is one of the largest copper ore deposits in the Levant. These ores were exploited throughout history, and during the Iron Age (ca. 1200-800 BCE), copper production in Faynan reached an industrial scale. However, excavations at Khirbat en-Nahas (an Iron Age smelting center in the region) also discovered iron metal dating to

the 10th-9th centuries BCE in the form of mixed copper-iron chunks and a few iron objects. These iron artifacts were initially interpreted in two ways: 1) as possible evidence for innovative iron production stemming from advanced copper smelting technologies or 2) as waste materials from failed smelts resulting in unworkable copper (and the iron objects as imported). If correct, the former interpretation would have significant implications for understanding the currently enigmatic origins of iron production in the Levant. To address this dichotomy, these iron materials were recently analyzed with mass spectrometry to look for isotopic connections between the raw metal and select artifacts (to determine if the iron objects were produced from the copper-iron chunks). This paper will present preliminary results/interpretations from this analysis and their contributions to understanding the iron in Faynan and iron production in the Levant more generally.

Litschi, Melissa (Southern Illinois University, Carbondale)

[285] *Applicability of Maxent Predictive Modeling in Locating Pre-Hispanic Quarries in the Callejón de Huaylas, Peru*

Stone in the Andes is an integral component of both the natural landscape and of the material expressions of cultural beliefs and practices. Growing evidence from multiple cultures indicates preferences for stone materials from certain sources, which held political, symbolic, and ideological importance. Determining quarry locations is a vital step in analyses of the socio-political implications of material choice and relationships between people and landscape. However, in pre-Inka periods, locating material sources has often relied on pedestrian surveys and interviews with local inhabitants. Using the Recuay as a case study, this project tests the efficacy of Maximum Entropy (Maxent) predictive modeling methods to improve our ability to locate probable source locations prior to in-field surveys. Maxent modeling, commonly applied in ecological models, uses input constraints to identify the distribution of a selected feature with the maximum uncertainty (least amount of bias). Regional geologic, hydraulic, topographic, archaeological, and ethnographic data constrain the model identifying potential sources of analyzed Recuay stone sculptures. This approach will be field-tested in my upcoming dissertation research. This project contributes to the understanding of regional stone sourcing practices and its ties to socio-political negotiations between Recuay communities and to improving methodologies for archaeological survey and sourcing studies.

[147] *Islands on the Plains Revisited: GIS-Based Predictive Models of Playa Use on the Southern High Plains*

Landscape Archaeology is useful in providing a framework for understanding human movements across various environments. Such an approach relates landscapes as they evolved through time to settlement patterns of human groups occupying the area. Cultural behaviors can then be linked to physiographic and topographic features using such an approach. On the Southern High Plains of northwestern Texas and eastern New Mexico on an otherwise seamless terrain, playas are the dominant features on the landscape. These disparate islands were attractive to groups occupying the region as they provided seasonal water and a variety of resources. The relationship throughout the late Quaternary between hunter-gatherer mobility and these basins is explored through GIS predictive modeling. GIS-based data on such features provides a valuable tool to assist in the reconstruction of these landscapes not only spatially but within a temporal scale. More specifically, the goal is to understand the relationship between the development of playa basins and the movement of groups occupying the Southern High Plains during the late Quaternary, particularly during the late Pleistocene and the early Holocene.

Liu, Chin-hsin (California State University Northridge)

[27] *A Bioarchaeological View on Long-Term Development in Prehistoric Central Thailand*

Archaeologically, Metal Age sites in northeast and central Thailand exhibit different patterns in site formation, size, and mortuary practice. With geophysical characteristics of each region in mind, these differences have led to an on-going discussion on, for example, the origin of metallurgy and cultigens, and subsequently, their influence on population interaction and organization. The discussion centers primarily on the internal development vs. external transmission of technology and cultural practices. Over past decades, morphological and chemical analyses of human skeletal remains from prehistoric Thailand have provided significant insight into people's lifeways and by proxy, population histories, land-use variation, and sociocultural development in the region. This paper reviews the bioarchaeological evidence fundamental to the discussion. It utilizes data from a program of isotopic analyses of skeletal remains from multiple, small-scale sites in central Thailand, including a Thailand Archaeometallurgy Project (TAP) site, to evaluate the two perspectives and to provide

an outlook/perspective on pathways for future bioarchaeological research.

[333] *Settlement Configuration and Social Structural Change: An Example of Graphic-Based Spatial Analysis from Kucapungane of Southern Taiwan*

This presentation examines the social structure change revealed by the interpretations of the abandoned settlement layouts through graphic-based spatial analysis for Kucapungane area of southern Taiwan.

Kucapungane Rukai, an Austronesian indigenous tribe in Taiwan, has several abandoned settlements. The Kucapungane people lived in the Old-Kucapungane for the past 600-700 years. However, they were forced to move several places 50 years ago due to government policies and landslides triggered by typhoons. Previous studies of structural change of Kucapungane society was interpreted from ethnographic data majorly. The result of the changes in traditional lifestyle and culture value was forced by government's capitalistic policy. This interpretation becomes a normal perspective for the Kucapungane social structural change. However, applications of spatial technologies in archaeology began in the early 1980s. The graphic-based technologies brought about new research perspectives for social structural change. This study tries to use graphic-based spatial analysis to examine social structure at two Kucapungane settlement configurations (Old-Kucapungane and Tulalekelre), and reconstruct the social structural change process.

The results of this research not only highlight the different interpretations between archaeological and ethnographic data but also demonstrates the potential of comparing these interpretations to better understand social structural change variability of Kucapungane.

[299] *Bronze Age Crucibles in China: A Unique Technological Tradition and Its Cultural Implications*

Most studies of early metallurgy in China have focused on style, manufacturing techniques and alloy compositions of bronze artefacts. In rare circumstances, other sections of the bronze production *Chaîne opératoire* such mining, smelting and metal processing are considered. This research concentrates on early bronze processing crucibles found in a number of Bronze Age workshops in China and showcases the great potential for studying production through these remains. In contrast to other parts of Eurasia, Chinese Bronze Age crucibles were multi-layered and do not show much vitrification on interior surfaces. A few well-preserved examples ones are much taller and bigger than West Asian and European counterparts. The microscopic analyses and experimental reconstruction reveal they were made with specialized silt-rich material. A comparative investigation of crucibles in China, Near East and Europe shed new light on the early spread and localization of metallurgical technology in Eurasia.

[78] *From Tangible Things to Intangible Ideas: The Context of Trans-Regional Movements of Artifacts, Cereal Crops and Animals*

Scholarly interest has been growing in an episode of trans-Eurasian exchange of agricultural systems and tangible material goods in late prehistory. The trans-regional movement of a number of artifacts, cereal crops and animals occurred within a series of transformative process that brought together previously isolated communities across Eurasia, to constitute a new kind of network. This process was at its height during the second/first millennium BC. Much has been discussed relating to the timing and routes of those movements. In this presentation, we focus on the context. In particular, what were the

intangible ideas that might be associated with the movement of tangible things in archaeological evidence. Why was a certain type of technology or idea welcomed in one part of the world but rejected from another?

[416] *The Sense of Order: Contextual Analysis of the Habitus and Social Spaces in Baiyinchanghan Neolithic Site, Northeast China*

The Baiyinchanghan site is one of the most important sites of the Xinglongwa Culture (7,500-6,500 B.P.) in NE China. By employing Pierre Bourdieu's habitus theory, this research explores social relations and cultural ideas by studying occupants' habitus and social spaces. The habitus and social spaces in this site are demonstrated clearly through its well-organized houses, floors and artifacts with different functions placed at specific places. Contextually, habitus in this site forming in daily practice unconsciously is a kind of social norm, which could be called 'a sense of order', in a social context that people encountered with social risks during the hunt-gathering to agriculture transition. The sense of order was strengthened by the importance of digit "three", which was demonstrated by the tripartite classification of many cultural phenomena. The social spaces and habitus may also be related to gender-based labor division. In addition, the differences of social spaces and habitus between Zones A and B, not only could be resulted from distinct economic backgrounds, but also be divided to form two people groups. These differences could be interpreted as their strategy to strengthen the sense of identity in confronting with resource competition.

[90] *No Photos Allowed: Photogrammetry at Los Alamos National Laboratory*

The Cultural Resources program at Los Alamos National Laboratory (LANL) manages nearly 2000 archaeological and historic properties, spanning thousands of years of human history. Due to its remoteness on the Pajarito Plateau, LANL boasts exceptional preservation of many sites. However, archaeologists must contend with an equally singular set of compliance-driven issues, such as back-logged legacy projects, difficulty in accessing sites on an operational national laboratory, and little time to conduct and disseminate research. As using photogrammetry programs to create 3D digital imaging has become an increasingly utilized tool in archaeology, I plan to ascertain if photogrammetry can be more widely used here at LANL to help mitigate some of the above circumstances. Can photogrammetry be implemented into routine site recording and updating in lieu of or to augment the complex sketch mapping process? Would employing photogrammetry techniques support current erosional and long-term monitoring of significant cultural properties? Would having 3D models assist in increasing access and experience of these unique ancestral and historic places for a wider public?

[205] *Have Chert Will Travel: Anisotropic Transportation Cost Models of the Valuable Mill Creek Chert Hoe*

The Mill Creek hoe industry was integral to the political consolidation of Greater Cahokia. Manufactured at the chert quarries in southern Illinois and distributed throughout the Mississippi valley, previous research examined the relationship between Mill Creek hoe abundance and straight-line distance between source and site to produce characteristic fall-off curves. This paper reexamines these distribution patterns in terms of cost-distance, utilizing an anisotropic transportation model which permits both pedestrian and canoe travel and considers costs of moving heavy loads. This paper will expand on earlier work and also present efforts to make the code for this available to other researchers.

Liwosz, Chester (University of Barcelona)

- [43] *Percussive Petroglyphs in the Digital Age: A Mojave Desert Case Study of Virtual Heritage Management for Rock Art Iconography and Phenomenology*

A recent study conducted at select petroglyph landscapes in the Mojave Desert integrated non-invasive multidisciplinary methods with advanced theories, and ethnographically informed understandings of the iconography and experiences of rock art locations. This approach sought to bridge scientific and indigenous ontologies through measuring phenomenological properties of rock art engagements. Research locations and actualistic experiments were documented for visual, spatial, and acoustic properties. Quantifiable data was contextualized in detailed virtual environments. These reconstructed environments aid the application of iconography and neuropsychology theory to inform understandings of oral traditions, in order to elucidate significant and novel new insights regarding Numic social structure, interaction, and religious cosmology. These findings' implications connect the vast Precontact Uto-Aztecan world, from California through Northern Mexico to Mesoamerica, emphasizing elements of religious experience, practice, and symbolism. Zero-impact methods designed to democratize archaeological practice through cost control nonetheless demonstrate the efficacy of digital approaches to heritage management. This paper utilizes aforementioned virtualized spaces to explore voices and songs that emerge from the attribution of other-than-human agency during production of, and subsequent engagement with, rock art contexts. Although oriented towards a humanistic, phenomenological understanding, quantitative measures of this study's approach operate as a framework for undertaking comparable scientific investigations elsewhere.

- [71] *El esfuerzo multidisciplinario de Arqueólogos Sin Fronteras del Mundo Maya Propuesta de un Plan para el Desarrollo de la Arqueología*

En esta presentación se plantean tres cosas: (1) las problemáticas que se relacionan con la disciplina arqueológica en la península de Yucatán; (2) los grupos y sectores que participan en la búsqueda de su solución; (3) las alternativas y soluciones así como el trabajo que en colaboración se viene coordinando. La propuesta es realizada por un grupo multidisciplinario y relacionado a la disciplina arqueológica denominado Arqueólogos Sin Fronteras del Mundo Maya. En el 2016, este grupo conformado por profesionales asociados a la disciplina, se reunieron por primera vez para evidenciar problemáticas que desde su percepción obstaculizaban la arqueología. En el 2017 se reunieron de nuevo en un taller por tres días, para discutir y buscar solución a las problemáticas que afectaban una región en específico en el Norte de Quintana Roo en el municipio del actual Puerto Morelos. Actualmente el grupo se está organizando para la realización de un siguiente taller conformado por sectores y actores relacionados, cuyo esfuerzo coordinado representa desde esta perspectiva la primera piedra que guiará al campo de la disciplina arqueológica, en el desarrollo para el bienestar a través de un plan nacional disciplinario y del mundo Maya.

- [206] *Salud y condiciones de vida de los pobladores prehispánicos de Sondor en los Andes sur centrales de Perú*

El trabajo de investigación tiene como objetivo el estado de salud y condiciones de vida de los habitantes de Sondor, durante el periodo de transición (Intermedio Tardío). El material de estudio procede de contextos funerarios hallados en los trabajos de excavación realizada el 2017, como parte del Proyecto de Investigación Arqueológica Sondor Pacucha, desarrollado en la provincia de Andahuaylas, departamento de Apurímac Perú. El estudio se centra a partir de dos unidades ubicadas en el sector de Muyu Muyu (área de enterramiento) y en el sector de Suyturumi (área domestica), la unidad N° 02 contempla un espacio funerario que alberga un entierro múltiple, mientras que la unidad N° 05 registra un área de vivienda donde se han registrado cinco contextos funerarios que albergan individuos infantiles y adultos. El estudio bioarqueológico parte por determinar el sexo, edad aparente de muerte, estatura, indicadores paleo patológicos y entesopatías mediante el estudio de restos óseos, así mismo se ha registrado indicadores que han dejado huella en huesos y dientes, como lesiones traumáticas y enfermedades. Este conjunto de datos en relación a la edad de muerte y presencia de individuos infantiles nos permite indicar las condiciones precarias de salud de los habitantes de Sondor.

[63] *Papa Was a Rolling Stone: Migration Stories from the Three Rivers Region, NW Belize*

A robust body of literature on ancient Maya migration exists, showcasing their intrinsically mobile nature. Interestingly, while migration inquiries have been conducted in urban centers throughout the ancient Maya world, it is less well understood how people moved around more rural landscapes. For the ancient Maya inhabiting communities in the Three Rivers Region in northwest Belize, population ebbs and flows spanning the Late Preclassic (400 BCE – CE 250) to the Terminal Classic (CE 810 - 900) have been attributed to human migration. This research tests hypotheses related to regional population undulations; establishes a regional strontium isoscape based on local limestone bedrock, soils, and waters; presents data from strontium and oxygen isotopic analyses of human dental enamel from 49 individuals; and investigates migration across multi-scalar communities, highlighting the intersection of regional migration through time and the prevalence of rural migrations.

Lockhart, Anna (Vassar College)

[112] *Comparability of Photogrammetry and Laser Scanners for Generating 3D Surfaces for Archaeological Questions*

Three-dimensional modeling has become an invaluable tool in many areas of archaeology, including bioarchaeological contexts. 3D modeling can increase the scope and scale of many research questions by, for example, allowing for the use of geometric morphometrics to provide high-resolution anatomical information. Unfortunately, rendering 3D surface data has traditionally required expensive equipment, limiting access to many researchers, especially students. Photogrammetry, which converts a series of 2D images into a 3D object, may provide a less expensive alternative for creating 3D models. This study compares the accuracy of 3D cranial models generated using photogrammetry to the physical crania and models derived from a laser scanner. Photogrammetry models were generated from photos taken with Canon Rebel T4i and Agisoft Photoscan software, while the laser scans were produced with NextEngine scanner. Results show high fidelity between the real crania and virtual models. Based on standard craniometric measurements, photogrammetry produced models of similar accuracy to that of the scanner and the crania, with the resulting models deviating < 5% from true cranial measurements. Therefore, in addition to reducing processing time, improving texture resolution, and being easier and less expensive to use, photogrammetry appears to be a reliable alternative for analyzing and disseminating archeological data.

[367] *Crossing the Mississippi: A Landscape of First Encounters*

This research comprises a geospatial analysis of Late Mississippian/Protohistoric cultural landscapes in the Aquixo, Casqui, and Pacaha provinces of present-day Arkansas. A GIS-enabled methodology is used to examine the earliest documentary descriptions of the de Soto entrada via reconstructions and interpretations of contemporaneous physical geography, site distributions, and cultural areas informed by an integrated archeological database.

Lodge, Spencer (Desert National Wildlife Refuge)

[36] *Fire on the Mountain: The Use of Earth Ovens for Agave and Pinyon Processing in the Sheep Range, NV*

Hot-rock technology was an integral aspect of prehistoric life in modern day southern Nevada. The utility of earth oven use is exemplified in the Sheep Range, located 20 miles north of Las Vegas, where more than 200 earth oven facilities have been documented across six vegetative communities. A variety of plant foods were baked throughout the year across this significant landscape, such as agave in the winter-spring, as well as yuccas and green pinyon cones in the late summer to early fall. This paper presents ongoing research of roasting pits (earth ovens) within the Sheep Range, including measurement data indicating more frequent re-use of cooking sites at higher elevations, in addition to new survey data detailing the importance of hot-rock cooking for green-cone pinyon processing.

Loehman, Rachel (US Geological Survey)

[257] *Ecologies of Space and Time: The Shared History of Humans and Fire in the Jemez Mountains, NM*

In the southwestern US humans and ecosystems share a history of fire. An integrated archaeo-ecological framework offers an important interpretive lens for both archaeologists and ecologists. Contemporary ecological patterns and processes that are thought to be 'native' or 'natural' may in fact be highly influenced by past human land use legacies, and profound and persistent, human-driven landscape transformations may affect subsequent land use and settlement practices (i.e., the archaeological record of human-landscape interactions). The Jemez Mountains of central New Mexico provide a landscape laboratory rich in archaeological, ethnographic, and ecological data sets, within which to study the reciprocal, long-term interactions of humans and fire. Evidence from tree-rings, fire scars, and charcoal sediments suggests that prior to the 20th century, southwestern pine forests sustained frequent, low-severity surface fires. During a period of dense occupation in the 13th and 14th centuries, prehistoric land use may have significantly influenced forest structure, fuel properties, ignitions, and thus landscape fire dynamics. Coupled natural-human systems process modeling, used to simulate ecological responses to prehistoric land and resource use, highlights the complexity and extent of prehistoric landscape modifications, and the degree to which contemporary landscapes are shaped by legacies of the past.

[369] *One Tough Act to Follow: A Retrospective of the Archaeological Career of Lawrence L. Loendorf*

This presentation summarizes the remarkable career of Lawrence L. Loendorf, who has conducted cutting edge archaeological research for nearly six decades. As his son, my life follows the arc of Larry's research as an archaeologist from when it formally began in early 1960s through today. Consequently, I am uniquely positioned to comment on his work, which is far too vast to fully encapsulate here, and instead I am only able to present a few highlights. Larry's passion for archaeology has inspired an entire generation of researchers, including myself. He is an award winning educator, and he has been a mentor to many aspiring archaeologists. He has personally helped many people develop successful careers of their own, including a number who were otherwise disadvantaged. His work has contributed greatly to our understanding of Northern Plains prehistory in particular, and to rock art research throughout North America in general. His incredible enthusiasm for understanding and preserving the past continues unabated to this day, and he remains highly engaged as a field and laboratory investigator with his on-going work at Sacred Sites Research, Inc., a non-profit corporation he established.

Loendorf, Lawrence (Retired Albuquerque NM)

[190] *Rock Art Sites in the Permian Basin, New Mexico*

Sacred Sites Research, Inc. and Versar Inc., working in cooperation with the Mescalero Apache Tribe and the Hopi Tribe, recorded and evaluated 17 rock art sites in New Mexico's Permian Basin, a project supported through the Bureau of Land Management programmatic agreement. Sixteen of the sites contain paintings, mostly in shades of red, but some with yellow, black and white figures. One petroglyph site is unusual because it is away from mountains on a flat surface where the figures face up toward the sky. The sites contain images that range from the Archaic through the Historic periods. An especially important site has 30 panels with a range of ages, including several horses and riders. One horse with a conquistador-like rider is accompanied by dogs attacking a pedestrian Indian camp. Overall the sites add considerably to

the knowledge about rock art in the Guadalupe Mountain-Permian Basin region.

[398] *Diet, Identity and Status in Colonial Huamanga (Ayacucho), Peru*

This paper explores ideas of identity and status at the earliest Jesuit church in Ayacucho, Peru (ca. 1605-1767 CE), La Iglesia de la Compañía de Jesús de Huamanga (ICJH). Starting with an exploration of indigenous resistance to Spanish colonialism, this case study uses stable isotopes of carbon and nitrogen as proxies for diet and burial location as a proxy for potential status, to provide further analyses of the daily lives and deaths of the indigenous individuals buried underneath the church floors. Results are complicated. Isotopic values and burial position do not correlate as expected, suggesting that initial hypotheses may be too simple, and that broader discussions of diet and status within the urban context of 17th and 18th century Huamanga are needed to clarify ideas of identity within this community.

Logan, Amanda (Northwestern University)

[347] *Assessing the Impacts of the Atlantic Slave Trade and American Crops on African Agriculture*

Although the Columbian Exchange had a significant impact on local agroecologies, we still know very little about the African side of the exchange. This is particularly complex knot to unravel given that the Atlantic slave trade peaked during those same centuries. Both processes were to have major impacts on human-environment relations and food security in the centuries to follow, though archaeological data on these processes is still extremely limited. In this paper, I consider the relationship between slavery and American crops using archaeological and archaeobotanical data from Banda, Ghana that spans the last six centuries. I evaluate a hypothesis that has been remarkably tenacious in the historical literature: that there was a tradeoff between the introduction of American crops and the siphoning off of human lives and labor from the continent. I argue that this hypothesis is wrong, by outlining the conditions under which maize was adopted and its relationship to food security. Areas depopulated by slave raiding did not turn to maize as a solution. Maize did increase in some areas along the coast, because it was ideally suited to feeding captives, who had little choice over what they ate.

[57] *Hunted or Scavenged?: Investigating Acquisition of Dolphins and Porpoises at the Par-Tee Site Using Zooarchaeology and Ancient DNA Identifications*

The large quantity of archaeological cetacean remains recovered from the Par-Tee site allows insight into the potential hunting of smaller cetaceans. Using the Smithsonian's Department of Vertebrate Zoology Marine Mammal Collection as a comparative, I identified four small cetacean species in the midden: harbor porpoise, Dall's porpoise, bottlenose dolphin, and Pacific white-sided dolphin. To determine whether these small cetaceans were from hunted or stranded individuals, I

compared the archaeological data to modern stranding data and was unable to reject stranding as a possibility for their occurrence in the midden. Analysis of the bones revealed no direct evidence of hunting or other modifications, even though ethnohistoric evidence suggests that hunting of small cetaceans is practiced globally, including on the Northwest Coast. Small cetaceans are oftentimes difficult to identify to species without a large, comprehensive comparative collection due to intraspecies variation and limited interspecies variation, so many zooarchaeological analyses lack a taxonomic identification beyond family. Due to different ecological roles and behaviors, species identification is important for understanding how humans may have potentially obtained this rich food and material resource. Toward this end, I confirm my species designations with ancient DNA and discuss the morphological characters which led to my initial identification.

Lomatewama, Ramson [44] see Natker, Leon

Long, Madison (East Carolina University) and Megan Perry (East Carolina University)

[9] *Bioarchaeological Analysis of a Historic North Carolina Family Cemetery*

The Gause Cemetery at Seaside, located in Sunset Beach, North Carolina, purportedly contains members of a wealthy and influential planter family, the Gause's, who died during the late 18th and early 19th centuries. In 2017, a Gause descendant requested excavation of the cemetery by East Carolina University as part of an extensive genealogical project that will culminate in restoration of the cemetery. During the first season of excavation, three adult individuals were recovered from the cemetery, and excavation in 2018 uncovered five additional graves containing seven individuals. Six out of the seven individuals recovered in 2018 are subadults, one 6-8 years of age, one 7-8 years of age, another 1.5 years old, and three term infants. All individuals at the site display skeletal evidence of childhood non-specific stress indicators, such as linear enamel hypoplasias in the adults and children, and/or periostitis or porotic hyperostosis in the children. This evidence, along with the simultaneous burial of two of the newborns and the 6-8 year old child in the same grave possibly due to a disease epidemic based on historical evidence, suggests that even "elite" 18th and 19th century landowning families experienced childhood frailty in North Carolina.

Longman, Darren (University of Texas at Austin) and John Pohl (UCLA)

[28] *Feathered Serpents of the Oaxacan Isthmus and Pacific Coast, Mexico: Hybridity, Ritualized Environments, and Territorial-Narratives*

Feathered Serpent iconography among Mixtec, Zapotec, Chontal, and Huave ethnic groups of Oaxaca, Mexico indicates that its sociopolitical and religious roles are concomitant with an investment in mythological landscapes and spiritually active ritual environments. Our approach to hybrid serpents draws from multifaceted investigations into images, textiles, manuscripts, rituals, and festivals to determine their impact on territorial-narratives and, more specifically, the social dynamics within and between these ecologically and culturally diverse regions. Further, this paper highlights the cultural variability of Oaxaca's Feathered Serpents both past and present to reshape our perception of composite creatures within terrestrial, celestial, and supernatural realms.

Loomis, Sarah (Harvard University)

[221] *Gendered Figurine Iconography at Los Guachimontones, Jalisco, Mexico*

Gender is one of the primary identity categories that provides structure to the social organization of societies. It sets expectations for the activities, status, presentation, and spatial organization of individuals within a community. This study aims to interrogate the social role of gender in the Teuchitlán tradition of Jalisco, Mexico, through a survey of figurines from the large ceremonial site of Los Guachimontones. For each figurine, the survey will identify material objects and adornments depicted or implied by the representation. These would include vessels, jewelry, clothing, tools, and weapons. After using primary and secondary sexual characteristics to assign a gender to each figure, a statistical analysis will correlate different types of items and activities with gender. This provides a starting point in understanding gender specificity for material objects in the Teuchitlán tradition, which could then be compared in a future study against the material record of a household area at Los Guachimontones. Within this study, the traits used consistently to signal figurine gender can be used to interpret conceptions of masculinity, femininity, and/or androgyny that were prevalent at Los Guachimontones.

[323] *Zooarchaeological Analysis of Fish Remains from the Thousand Spring Site (CA-SNI-11), San Nicolas Island, California*

Archaeological evidence from the California Channel Islands has provided insight on the important role fish played in daily human subsistence practices. San Nicolas Island is home to a rich and diverse marine environment containing the largest kelp forest along the Southern California Bight. This study focuses on fish data from a middle to late Holocene village site. The site is situated on the northwest coast of San Nicolas Island and contains a dense assemblage of ichthyofaunal remains. In this study, we present a fish dataset from the excavated units using standard archaeozoological methods to quantify NISP and MNI. A detailed examination of the ecology of fishes will allow for a comprehensive understanding of human harvesting at this site encompassing discussions of fishing technology and human procurement strategies. Through various statistical calculations, we compare and contrast our results in intra-local and extra-local context. We provide a baseline of human-fish relationships from archaeological data collected from San Nicolas Island and link this data to the functionality and advances in regional fishing technology. By understanding human-fish relationships in a spatial and chronological context, we may begin to explore large-scale patterns of fish harvesting practices along the Southern California Bight.

Lopez, Fermin (From Collaboration to Partnership in Pojoaque-Protecting Ancestral Places) and Bruce Bernstein (Tribal Historic Preservation Officer for Pueblo of)

[311] *Protecting Ancestral Pojoaque Places*

Protecting Pueblo of Pojoaque ancestral sites is a challenge. Inside our exterior boundaries are non-native encroachments. Cultural properties are often located within these checker board properties and more often than not have significant cultural meaning to the Pueblo's culture and history. Tangible and intangible cultural resources are everywhere on our lands and do not stop at today's boundaries. Retaining the history and protecting sites for which we have no access can negatively reflect on the Pueblo's culture and history and can be demeaning to relationships with our non-native neighbors. And sharing our land base with non-native neighbors is increasingly challenging-- Off road and recreational vehicles, horses, hikers, and domesticated grazing animals in the past and present have had significant negative impacts on cultural properties. How do we conserve and protect cultural properties within the exterior boundaries of the Pueblo of Pojoaque while maintaining a good neighbor policy?

Lopez, Kirsten (Oregon State University)

[274] *Theoretical Reflections on Textiles and Environment in the Northern Great Basin*

Textiles are often given short shrift in archaeological research and reporting, due in large part to their rarity and thus limited depth of analysis. Recent studies have demonstrated a variety of new analytical techniques, revealing new potential in archaeological and anthropological textile studies. Unfortunately, over ten years into these developments, few studies have utilized these techniques. Considering theory frames research questions, a shortage of theory directly handling textile materials resource acquisition or manufacture affects the quality and quantity of research into this area. In a recent study using 87/86Sr ratio sourcing techniques, various theoretical concepts around other types of resource acquisition, manufacture, learning and artifact life-history from the likes of Schiffer, Ingold, Hurcombe, and Jolie were used in developing research questions and trajectory. The purpose of this paper is to explore the implications of the study results through these theoretical lenses. The result is creating a middle-range theoretical platform for advanced textile study.

Lopez, Val (Amah Mustun Tribal Band)

[231] *The Importance of Restoring Indigenous Knowledge*

The Creation Story of the Amah Mutsun clearly delineates our traditional territory and asserts our responsibility to take care of Mother Earth and all living things. For thousands of years and many hundreds of generations the Amah Mutsun accumulated knowledge of how to ensure balance in their world. We recognize the importance of prayer and ceremony, that

all living things are our relatives, including the tangible and the intangible, that all plants have a responsibility to provide for a community, and that fire was both a gift and a tool given to us by Creator. Starting in the late 1700s the Amah Mutsun experienced three periods of brutal colonization. All three periods attempted to destroy traditional culture, spirituality, and environments. Today, the Amah Mutsun is working to restore the indigenous knowledge of our ancestors so we can fulfill our sacred obligation to Creator. At first, we resisted working with anthropologists, as we believed they would perpetuate a history of destruction and domination. After many conversations and careful steps forward, we recognize the value of archaeological research in restoring the knowledge of our ancestors. Trust and respect are at the center of our collaboration.

[238] *De Tepeticpac, a Tlaxcallan, a Tlaxcala: el forje del estado tlaxcalteca del Posclásico tardío (1250-1519 d.C.) a la Colonia temprana (1519-1600 d.C.)*

El contacto entre tlaxcaltecas y españoles en 1519 inició un periodo de cambios fundamentales en las relaciones de poder entre los altepemech del altiplano central mesoamericano. Para Tlaxcallan, la alianza representó una oportunidad para sortear los problemas políticos, bélicos y económicos en las cuales se encontraba inmersa la entidad estatal desde el siglo 15, hecho que a la postre les generó el mote de "traidores a la patria" entre los formadores de la nueva República Mexicana del siglo 19. Pero esta no fue la única ocasión que los tlaxcaltecas condujeran una alianza político-militar clave y reestructuraran su forma de gobierno. La historia revela episodios fluctuantes de coaliciones y conflictos entre Tlaxcallan y otras entidades estatales durante sus 250 años de existencia en el Posclásico tardío (1250-1519 d.C.). Este trabajo explora los cambios en las estructuras de poder tlaxcaltecas derivados de alianzas y antagonismos históricos, y sus implicaciones sociopolíticas y teóricas. Se analizan datos históricos y arqueológicos sobre la transición de un gobierno basado en un líder único, a un gobierno colectivo multiétnico formado por varios líderes con intereses contrastantes, hasta su transformación en un gobierno colectivo sincretizado con el sistema de dominio español en la colonia temprana (1519-1600 d.C.).

[304] *Dressed to Kill: Richly Adorned Animals in the Offerings of the Great Temple of Tenochtitlan*

Over the course of four decades, the Templo Mayor Project (1978–2018) of Mexico's National Institute of Anthropology and History (INAH) has excavated more than two hundred offerings in the area corresponding to Tenochtitlan's sacred precinct. These rich Mexica deposits from the fourteenth, fifteenth, and sixteenth centuries contained an unusual diversity of mineral, floral, faunal, and human remains in addition to large quantities of cultural objects. Prominent among the offerings are the vestiges of tens of thousands of animals representing more than five hundred species, including a particularly interesting set of carnivorous mammals and birds of prey that were sacrificed in ritual ceremonies and buried inside temples and under plaza floors. The corpses of these animals were adorned with all sorts of insignia and ornaments (e.g., earpieces, nosepieces, necklaces, pectorals, anklets) made of gold, copper, wood, turquoise, greenstone, shell, and other precious materials. This presentation will analyze the archaeological contexts of such offerings and will study the symbolism of the animals in light of native pictography and sixteenth-century descriptions.

López Mazz, José (Universidad de la República, Uruguay) and Rocío López Cabral (Department of Anthropology, University of Florida)

[393] *The Presence of Groups of Amazonian Cultural Matrix in the La Plata River*

The Amazon has traditionally been seen as the scenery for different original human experiences. In recent years, research has allowed us to improve our knowledge of the territorial and cultural dynamics of Amazonian groups in South America. In this context, the spatial analysis of ceramic traditions allows us to know and recognize the dispersion of groups of Arawak and Guaraní matrix towards places as distant as the La Plata river. These episodes of human migration seem to have begun about 2000 years ago BP, and they allow us to recognize precise cultural matrices, diverse archaeological contexts and reliable chronologies. This work presents information on the Guaraní cultural tradition, based on the survey of presence of ceramic material attributed to this group. The diverse contexts in which this material has been recorded are analyzed, as well as the cultural dynamics in which it could be involved. The relevance that the La Plata river has within a wide sphere of cultural interaction that links the Southern Cone of South America with Amazonia is also discussed.

[349] *Las Figurillas “Cerro de García”: Usos y Significación*

Las figurillas conocidas originalmente con el término genérico de “Cerro de García”, se ubican cronológicamente entre los años 600 a 900 d.C. y son consideradas como una evidencia de interacción intra e interregional por su amplia distribución en el Occidente de México. Sin embargo, a pesar de la importancia que se les ha otorgado, son pocas las excavaciones controladas que refieran su presencia y permitan realizar un análisis antropológico de las mismas, a partir de sus contextos de producción, distribución, uso y deposición, especialmente porque dichas figurillas se convirtieron en imágenes performativas que proyectaron los valores sociales y los sistemas simbólicos en la subjetividad de los individuos mediante los diferentes códigos que las conforman. El objetivo de esta ponencia no sólo se centrará en su producción y distribución, sino en la forma en que se usaron como parte de distintos procesos rituales que estructuraron a los sujetos sociales vía la internalización de esquemas y valores básicos, a partir de las excavaciones realizadas en el valle de Colima, el centro y los Altos de Jalisco.

[352] *The History of the Fox Farm Experiment and Its Ramifications for Understanding the Origins of Domesticated Animals*

Domestic and wild animals are distinguished primarily by behavioral changes difficult to discern in archaeological remains. Domestication syndrome describes the suite of behavioral and morphological changes proposed to consistently accompany domestication, including skeletal changes. It is largely based on an experiment in directed evolution in farmed foxes, which showed that selection for tameness resulted in other traits such as spotted coats, floppy ears, curly tails, loss of seasonality, and shorter muzzles. Here, we describe why the findings of the farm fox experiment are more complicated than widely assumed. While it achieved changes in fox behavior, these changes are not sufficient to clearly classify the foxes as domesticated. Furthermore, many of the traits classically cited as appearing in the foxes differ in significant ways from traits identified in domestic animals, while others appeared generations before the experiment began, when the foxes were bred for farming. The theory of a domestication syndrome in mammals is based primarily on dogs, with the fox-farm experiment providing crucial empirical evidence. With the fox data offering little support for the existence of such a syndrome, its use in archaeological studies should be re-examined.

Loren, Diana (Peabody Museum, Harvard University)

[15] *Body Histories, Historical Bodies: Adornment, Culture and Identity through Time*

The body is so many things simultaneously. It is an historical object, a site of experience and violence, a set of behaviors, and is both material and metaphysical. We cannot conceive of history without bodies. Bodily adornments add further nuances that are personal, symbolic, political, situational, and multifaceted; tied to taste, emulation, production, and consumption. Current research on bodies and their adornments draw out details of how sexuality, health, status, gender, desire, and identity were situated on and in the body, even in deep history. Recognizing that the body is constituted through history, in this paper I draw out broad themes of clothing, personal adornment, and embodiment over time, especially

regarding relationships among bodies, experiences, representation and history.

Lorenz, Carol (San Juan College) and David Preston (San Juan College)

[203] *Anomalous Floor 2 Features in the Point Pueblo Great Kiva*

During the 2016 and 2018 seasons, excavators found more than 150 features in Floor 2 of the eastern half of the Great Kiva at Point Pueblo. Of these, 99 were east of the eastern vault complex. Features were lined with clay or adobe, demonstrated eight different shapes, and many contained artifacts. One large horseshoe-shaped (90+ cm) feature was due east; 20 features were connected to it directly or indirectly via 17 underground tunnels. This presentation provides a plan view of the eastern half of the Great Kiva with a detailed view of the horseshoe-shaped feature and its associated features, a basic analysis of artifact types found in the different feature shapes, and some possible explanations for this unusual find.

[383] *Interpreting Identities: An Ahegemonic Archaeological Approach*

Mulch'en Witz (glossed 'Hill of Many Caves') is located in northwestern Belize within the periphery of the ancient Maya site of La Milpa. Preliminary investigations have recorded a high concentration of chultuns associated to architectural features and groups and, thus far, all cultural material dates to the Late Classic period (CE 600-800). Human skeletal material was encountered in Chultun 3, a small boot-shaped chultun located northwest of a Plaza Plan 2 group. An individual appears to have been placed on the stairs that lead into the main chamber, although s/he was later disturbed when the capstone was dislodged prior to excavation. The burial within a chultun along with the artifacts associated with this individual present challenges for conventional interpretation. This paper discusses how an ahegemonic archaeological approach might be useful to better contextualize the study and present a more accurate representation of this ancient Maya individual.

[252] *High Elevation Petroglyphs along the South Carolina/North Carolina State Line*

Long Ridge Road is the most complicated of 20 high elevation sites with similar-looking circular and meandering petroglyphs along the South Carolina/North Carolina state line. With the aid of drone photography a minimum number of 1,043 petroglyph motifs were recorded. Based on motif style and stratigraphy the site most likely dates to the Middle to Late Woodland periods. Like other petroglyph sites in the region it is located beside an old trail that connects the valley bottoms with prominent mountain tops. Also, petroglyphs are concentrated on the steepest portion of the exposed bedrock pavement.

[88] *Archaeology and the Green Power Initiative: Reconciling Large Renewable Energy Development Projects and the Protection of Cultural Resources*

The development of utility scale renewable energy projects is a necessity to curtail our environmental footprint. The utilization of solar and wind power sources to provide stable, affordable, and ethically sound alternatives to the resource extraction-based energy production practices of yesterday is quickly sweeping the American landscape. However, with these developments, large undeveloped areas in rural settings are subject to substantial soil impacts, as well as viewshed impacts, and characteristic change of the landscape. The approach by many state historic preservation offices has been

similar in some respects, but not standardized to include an accepted set of best practices. To better evaluate cultural resources caught in the wake of energy development for each development type, the discussion of current approaches should be undertaken. This study evaluates direct and indirect impacts of both solar and wind facilities in mountainous terrain and explores a set of best practices to evaluate those impacts to provide developers with the best possible data to avoid impacts to cultural resources.

Lovata, Troy (University of New Mexico)

[193] *Chicanx in the Wilderness: Tree Graffiti and Perceptions of People and Place*

This paper examines how historic and modern tree graffiti left by Chicanx and Latinx in Wyoming, Colorado, and New Mexico impact understanding both these peoples and the wild lands they inhabit/ed. Archaeologists have been at the forefront of countering ideas that graffiti is primarily a modern phenomenon of urban decay with studies that bring forth concepts of resistance and empowerment pushed back into prehistory and across wild places worldwide. Graffiti carved into trees by different modern and historic peoples is prevalent in North America. Graffiti on aspen trees is especially common in the Western United States and is often linked to Chicanx and Latinx sheepherders, laborers, and recreationalists. That such graffiti is often found in wild lands and legally defined wilderness areas has long put it under the purview of, and generated interest among, archaeologists. But the presence of Chicanx in these wild places also challenges long held assumptions about both what wilderness means and who Chicanx are. Artifacts of Chicanx in the wilderness both expand what it means to be Chicanx and problematize the idea that wilderness is, to quote the American Wilderness Act of 1964, "...where man himself is a visitor who does not remain."

[254] *Middle Archaic Period Subsistence and Resource Use Practices in the Chuska Valley, New Mexico*

The recent discovery and investigation of a Middle Archaic period campsite in the southern Chuska Valley has provided substantial insight into the relative importance of various plant and animal resources to the mobile inhabitants of the San Juan Basin region. Data generated from the analysis of macro- and micro-botanical remains recovered from structural and thermal features and ground stone surfaces suggests the site's inhabitants were processing a diverse assortment of local and non-local plants for consumption, while procuring numerous other species for use as structural posts or fuel sources. Pollen, phytolith, and macrofloral analyses all point to use of pine nuts, while macrofloral analysis lends insight into use of various other native plant resources. The faunal assemblage is dominated by small mammals, suggesting a focus on acquiring locally available animals for use as a protein source; however, at least a limited commitment to obtaining large mammals and possibly long-distance hunting is exhibited by the presence of medium-sized artiodactyl remains at the site. Results from botanical and faunal analyses, along with additional observations concerning lithic raw material procurement and tool-making strategies, architecture, and overall site formation processes, provide valuable information about a poorly understood time period in the San Juan Basin.

[330] *Hermann Berendt and Charles Rau: Notes on the Origin of Maya Archaeological Collections during the 19th Century*

The study of correspondence, field notes, catalogs and other archival documents has contributed important information to understand the history of some of the first Maya archaeological collections in the United States and Europe. The field and lab work developed by pioneering explorers and researchers, such as Hermann Berendt (1817-1878) and Charles Rau (1826-1887), among others, contributed to the establishment of the methodological foundations of the archaeological

discipline with the application of a systematic methodology of classification and study of diverse materials coming from the Maya region. The collaboration established with prominent local figures, such as the Yucatecan bishop Crescencio Carrillo y Ancona or the collector Florentino Jimeno, allowed them to be part of the circle of intellectuals who promoted the study of languages, antiquities and the formation of collections dedicated to archaeological research. This is the case of the first collections of Maya artifacts acquired by the Peabody Museum of Archaeology and Ethnology and the Smithsonian Institution of Washington, whose study will allow us to rescue unpublished information about the sites explored during the second half of the 19th century and their material legacy.

[412] *Mapping of Ancient Managua, Nicaragua using GIS*

Settlement patterns within Central America can lead to a better understanding of the political and social complexity of the region. Although this method has been extensively used across archaeological regions, Nicaraguan archaeology can benefit from this settlement analysis because of the inclusion of a GIS-based systematic approach. This paper will outline some of the broader context of the Nicaraguan state of Managua surrounding the 5th century site of Chiquilistagua, and relies on an archaeological database of site locations compiled from public reports, publications, and surface surveys. By looking at the intra-regional dynamics of site location and political organization, we can make a first attempt at reconstructing of the political and social context of the region of Managua surrounding the site of Chiquilistagua.

Lozada, Maria (University of Chicago), Danielle Kurin and Emmanuel Gómez

[185] *Andean Indigenous Bodies: Methodological Approaches to Past Perceptions of the Body*

Any attempt to understand indigenous anatomy and perceptions of the body from an emic perspective in the Andes is a challenging endeavor, beginning with basic definitions that differ substantially from Western traditions. Furthermore, definitions changed across space and time throughout Andean prehistory, making it difficult to discuss the topic in a unified, monolithic manner. In the Andes, there are a variety of ontological data on this subject. These are based on ethnohistorical, linguistic, ethnographic, materiality and phenomenological studies that provide insights into an emic view of the Andean worldview, including perceptions of the body. In this paper, we present bioarchaeological case studies from different parts of the Andes as well as a study of Quechua terminology that illustrate the unique view and treatment of the "body" in this part of the world. In addition, we provide methodological recommendations in osteological research that need to be followed in an effort to provide a more nuanced interpretation of past worldviews anchored in the body.

[406] *New Insights into Teotihuacan's Year Sign Headdress and Its Olmec Origins*

This study will explore the origin and meaning of the Teotihuacan's year sign headdress and its connection to the Storm God (Tlaloc). Several scholars have noted the first appearance of the year sign worn by the Storm God starting from the Early Classic period at Teotihuacan. Evidence suggests a fair amount of interaction between Teotihuacan and other parts of Mesoamerica, which can be noted especially with the presence of the Teotihuacan year sign found at several different locations. The presence of the Teotihuacan year sign appears at several Maya sites, within the Mixtec region, and has also been noted in the Borgia codex. The year sign has its roots in Teotihuacan and is often worn as a headdress by Tlaloc which notes its agricultural significance with maize. I argue that the origin of the Teotihuacan year sign headdress can be traced back to the Olmec of the Formative Period. This is clearly seen through a study of the iconography of the Teotihuacan Storm God vessels from the Preclassic period found at Teotihuacan. I argue that the year sign headdress worn

by the Storm God is a Teotihuacan impersonation of the Olmec maize deity.

[47] *Using Fish Remains from Paisley Caves, Oregon to Explore Hunter-Gatherer Lifeways and Lake Level History in the Chewaucan Basin over the Past 14,000+ Calendar Years*

Paisley Caves holds some of the earliest evidence for human occupation in North America. The site's fish remains have received only limited attention before now. Our pilot study sought to assess the potential for using a sample of the fish remains to help reconstruct lake level history, better understand regional paleoenvironments, and gain insights on forager adaptations over the ~14,000 years of human occupation. Besides morphological analysis (and body size estimates), aDNA and C/O isotopes were studied. Recent reconstruction of Pleistocene lake history provided a framework for developing expectations of fish response. An age-depth model was created from 109 radiocarbon dates. A total of 3,342 fish remains from 6 test units were identified. Tui chub (*Siphateles bicolor*) dominates with small frequencies of rainbow/redband trout (*Oncorhynchus mykiss*) present. When grouped by climate interval, measures of overall fish abundance, salmonid abundance, and tui chub body size are largely consistent with expectations of lake levels for the Bølling/Allerød, Early, Mid, and Late Holocene, but not for the Younger Dryas. A sample of 32 tui chub bones revealed a similar correspondence for expected water conditions from $\delta^{13}\text{C}_{\text{org}}$ and $\delta^{18}\text{O}_{\text{org}}$ isotope values.

[366] *Filling the Envelope: a History of Archaeobotanical Research in Cyprus*

Since the first experiments with the method of flotation in 1962, the sub-discipline of archaeobotany (paleoethnobotany) has developed and revolutionized our understanding of the origins and spread of agricultural systems worldwide. The history of modern archaeobotanical methods on the island of Cyprus has its roots in the 1970s with evidence from Neolithic Dhali-Agridhi, followed not long after by Khirokitia-Vounoi and Cape Andreas-Kastros. These early publications are testament to the role the island's archaeological community has played in the early development of the sub-discipline. The expanding dataset of Cypriot charred macro-botanical remains has not only transformed our understanding of the origins and spread of Near Eastern crop agriculture but has led to new research questions on early Cypriot subsistence strategies. Summarizing nearly 50 years of archaeobotany on the island highlights the key players and how they have questioned our understanding of the past, focusing on the key role the sub-discipline will have in Cypriot archaeological studies going forward.

[168] *Faunal Exploitation Practices at Three Malabar Period Sites in the Fox Lake Sanctuary in Brevard County, Florida*

Three Malabar Period Sites, Hunter's Camp (8BR2508), Palm Hammock (8BR2509), and Xavier's Knoll (8BR2510), were excavated in the Fox Lake Sanctuary in Brevard County, Florida. Faunal assemblages recovered from general excavation units and features were examined to learn more about Malabar faunal exploitation strategies and subsistence patterns. Sampling methods utilized at the site allowed for a more complete perspective on subsistence strategies. The main objectives of this study were to determine the seasonality of the sites and to compare the subsistence strategies between the three sites by determining species diversity, and the relative abundance of marine vs. freshwater species and aquatic vs. terrestrial species. In addition, this poster aims to determine if these sites were habitation sites or satellite-processing

sites, and this is accomplished by comparing the faunal assemblages of these sites to contemporaneous sites located to the north and south. The data collected suggests that the people of these sites incorporated turtle and both marine and freshwater species of fish and shellfish, almost to the exclusion of all other species, into the subsistence economy.

[193] *Where No Mestiza Has Gone Before: Brokering Colonialism, Ethnogenesis, and Gendered Landscapes in Alta California, 1775-1845*

The triple consciousness that is the Afro-Mestiza or Mestizo experience conjures nationalism, racialization, and ethnicity and thereby, the ongoing negotiation of identity on the Spanish and Mexican borderlands frontier. Where archaeology and historical studies are concerned, the effort to interrogate the lives of mestiza women within such contested landscapes is necessarily fraught. The entanglements of such liminal frontiers necessarily impact identity, material cultures, and their corollary forms of social expression. This paper therefore explores theoretical models of colonialism, historic and gendered landscapes, and processes of ethnogenesis and identity formations whose enduring character underpin the archaeology of Chicanismo in California and the West. We present a microscale genealogical analysis of successive generations of the Arballo lineage spanning 18th and 19th century Spanish and Mexican social formations and material cultures. The women under scrutiny constitute Alta California's earliest Spanish colonial families, including Feliciano Arballo, María Ignacia López, and sisters Josefa and Ramona Carrillo. In the final analysis, this paper explores the lives of mestiza women on the Spanish frontier, particularly insofar as how such women served as both domestic partners and colonial cultural agents in the negotiation of indigenous alliances.

[155] *Changing the Picture – 1000 Hectare High Resolution Magnetometry on the Protected Zone of a World Heritage Site at Avebury, UK*

Avebury and Stonehenge, two iconic prehistoric sites in the heart of England, both listed on UNESCO's list of world heritage have undergone intensive research during the past century. Nevertheless, evolving technologies open access to new data on a landscape scale, thus adding more and surprising information helping to reach out beyond the state of the art. A joint international team has investigated the area between Windmill hill and Silbury hill around the henge monument at Avebury. More than 1000 hectares have been covered so far and a resolution of 12.5 cm. These big data have already helped to change the overall picture of the use of the landscape from early Neolithic times until the medieval period. The process of inclusion of already existing monuments into the landscape pattern, respect for existing monuments of religious character by later occupation will be explained during this presentation.

[34] *A Combined Bayesian and Zooarchaeological Approach to Understanding Local Histories of Socio-ecological Adaptation in Southwestern Florida, USA*

We present current research at the Pineland Site Complex (8LL33, etc.), a large shell midden-mound site in southwestern Florida occupied by the Calusa from around AD 50 up to historic contact. This well-preserved and well-studied archaeological site provides new insights into the relationship between subsistence practices of populations living along the Gulf Coast and the onset of the Little Ice Age (AD 1250-1850). In this paper we combine Bayesian statistical analyses of radiocarbon dates with zooarchaeological analyses of a recently excavated water-logged midden to provide a high-resolution view of what changes occurred during the Little Ice Age. Our research illustrates the potential of Bayesian analysis of multiple radiocarbon dates in combination with zooarchaeological analysis to provide insight into the relationship between the analyzed contexts and the larger site and environmental histories. Such micro-scale temporal perspectives are necessary in order to provide more detailed understanding of variations that occur within complex socio-ecological systems such as these.

[308] *Women's Networks and the Foundations of Mississippian Politics*

Mississippian societies were undoubtedly underwritten by networks of kin, clan, and other social relationships that are difficult to discern in the archaeological record. Structures of social networks provide contexts for social, political, and economic institutions and serve as conduits through which these institutions are generated, transformed, and maintained. We argue that a social network approach is uniquely appropriate to address themes of social relatedness in the archaeological record. We draw on continental, regional, local, and intra-community datasets to explore the social networks through which Mississippian peoples of Southern Appalachia forged identities, fostered communities, and mediated uncertainty. We focus in particular on a ceramic dataset from eastern Tennessee derived from whole vessels found in 79 burial contexts across 18 communities. We apply formal network analyses to dimensions of ceramic production and style to highlight both inter- and intra-community relationships indicated by distinct communities of practice and social signals. In doing so, we explore the social diversity among Mississippian communities and patterns of kinship that would have underwritten political institutions. These realms of social relatedness likely were solidified through women's networks and political participation, yet served as durable foundations of Mississippian sociopolitics more broadly.

[357] *Digging the Tucson–Ajo Highway: Eight Years of Transportation-Funded Archaeology along Arizona State Route 86 and New Perspectives on Eastern Papaguerian Prehistory*

The eastern Papaguería, a region of south-central Arizona, has historically not been the subject of intensive archaeological study due to its agricultural marginality, sparsity of large village sites, and lack of development that would prompt compliance-driven archaeology. Excavations sponsored by the Arizona Department of Transportation and Federal Highway Administration along Arizona State Route 86 between 2010 and 2018 have yielded some of the only available subsurface data pertaining to small sites in the area between the Tucson Basin and Western Papaguería. Portions of twenty-five sites were investigated; this paper presents a summary of the results. Late Archaic components were identified at some sites. The sites yielded evidence important to understanding mortuary practice in the period between A.D. 150 and 1450, including the first definitive evidence for cremation in the region and the existence of a cairn-burial complex that may have roots in the Archaic period. Previous interpretations of the region's prehistoric occupation have suggested temporary or transient use for seasonal resource procurement by the Hohokam occupants of adjacent riverine valleys. This concept is reassessed using the new data to suggest long term and/or more permanent occupation is likely to have characterized human settlement of the region during prehistory.

[415] *The Edible and Incredible Hare*

Zooarchaeological applications of the Prey Choice Model (PCM) are often based on the assumption that prey body-size is a robust proxy for prey rank and post-encounter return rate. In zooarchaeological assemblages, co-variation in the abundances of large and small-sized prey are often viewed as reflecting changes in foraging efficiency and are usually attributed to depressed encounter rates with large-sized and high ranked prey. But ethnographic and experimental studies show that hunting technology and techniques can greatly alter the efficiency and failure rates of hunting different prey. Using empirical data from several different ethnographic and ethnohistoric sources we show different hunting techniques used to procure leporids can be more reliable and productive than hunting certain large game. In the case of hares, noncaloric currencies such as sociopolitical gains and the thermal properties of hides may have also incentivized hunting these prey. We present archeological data from sites in the Bonneville Basin of western North America spanning the Holocene that show that leporids were more frequently targeted than larger-sized and presumably high ranked game, even when the latter were abundant on the landscape.

Lycett, Mark (University of Pennsylvania) and Phillip Leckman (Statistical Research, Inc.)**[84]** *'The Shape which all that which is Settled has is that of a Cross': Negotiating Inscription and Experience in the Sacred Landscapes of 17th Century New Mexico*

In the emergent social geography of empire, Franciscan missions were agents of spatial production as well as colonial establishment. Their foundation, form, and operation instantiated claims to and about society, dominion, and the culmination of history. These claims were forged within an already extant, meaningful, and ritually significant landscape defined by the dynamic experience of the region's Pueblo inhabitants and marked by a nested complex of ceremonially resonant features. Missionaries inscribed their own image of sacrality upon Puebloan ceremonial geographies, as embodied in distinct physical markers radiating out from the mission and its associated architectural complex. This paper explores these contingent and contested sacral landscapes through an examination of recent archaeological research in the Middle Rio Grande valley, with a focus on the Galisteo and Albuquerque-Belen basins.

[47] *Vertebrate Response to Little Ice Age Climate Change in the Ohio River Valley*

This paper examines vertebrate species from Fort Ancient archaeological sites in the Ohio River Valley, which date to the Little Ice Age. They are compared to vertebrate species from archaeological sites, which predate the Little Ice Age and from modern contexts. The results of this comparison suggest that vertebrate species exhibited individual responses to climate change. The distribution of some species remained unchanged while others, such as bison exhibited dramatic changes in their bio-geographic ranges.

[269] *Exploring the Function and Adaptive Context of Paleo-Arctic Projectile Points*

This paper presents the results of a large-scale experimental archaeology project investigating variability in the projectile point technologies of Upper Paleolithic Siberia and late Pleistocene/early Holocene eastern Beringia. A series of 36 projectile points (12 lanceolate bifaces; 12 composite slotted caribou antler points inset with chert microblades; 12 unslotted caribou bone points) reflective of the morphological variability observed in the Beringian archaeological record were created and tested as components of three weapon systems (atlatl and dart; hand-thrusted spear; bow and arrow) using an actualistic target. The use wear patterns generated by these controlled launches were documented macro- and microscopically, then compared to use wear observed on projectile technologies from archaeological assemblages across Beringia. Examining the range of morphological, technological, and functional variation observed in these projectile technologies tests hypotheses proposed to explain why radically different projectile technologies co-occur in the late Pleistocene/early Holocene Siberian and Alaskan archaeological records. Understanding the functions of these important artifacts can inform on the significance of assemblage variability in Siberia and Alaska, adaptive response to resource fluctuations, and landscape use across the region and through time. Ultimately, these experiments have significant implications regarding the colonization of Beringia and the Americas.

[21] *To Curate or Not to Curate: Legal, Ethical, and Practical Considerations at the Arizona State Museum*

The Arizona State Museum (ASM), at the University of Arizona, is the oldest and largest museum of anthropology in the southwestern United States and the largest and busiest non-federal archaeological repository in the country. ASM, as the state's official archaeological repository, is required to accept collections recovered from state, county, and municipal lands in Arizona. In deciding whether to accept other collections, ASM personnel must consider each offer in the context of the institution's legal mandates, the ethical principles that guide the fields of archaeology and museology, and the practical realities of space and funding. In this paper, the decision-making process at ASM is described and illustrated using examples of collections accepted and collections declined. ASM personnel strive for clarity and consistency in such processes by prioritizing optional acquisitions based on the institution's mission, its collecting focus, a collection's (or an object's) research potential, and ASM's ability to provide appropriate care and access in perpetuity.

[74] *Historical Ecology and Archaeometallurgy on the 5th and 6th century Osaka Plain*

Extensive excavation records and legacy materials provide ample opportunities for novel research in Japan. This project seeks to open and demonstrate new avenues of inquiry using legacy data and previously excavated materials related to well-studied topics by linking environmental change to the production of iron implements, a major topic in Kofun Period research. While paleoenvironmental data are regularly collected from Japanese excavations, environmental perspectives are rarely explicitly foregrounded in narratives of the Kofun Period, which usually focus on issues of political economy. Specifically, this project uses paleoenvironmental data published from the 1980s onward in conjunction with archaeometallurgical analyses of previously excavated objects to examine human impacts and management of the forest landscape during the middle and late Kofun Period Osaka Plain. This presentation focuses on analyses of forging slags excavated from the Ogata site in Kashiwara City and the Mori site in Katano City to clarify changes in forging practices over this time period, and ties them to landscape management practices and human impacts through a chaîne opératoire approach. These analyses indicate changes in fuel use as widespread changes in local vegetation occurred.

[217] *Ritual Deposits within the Eastern Pyramidal Structure at Group D, Xunantunich – Belize*

Between the 2012-2016 field seasons, the Mopan Valley Preclassic Project conducted investigations of an eastern pyramidal structure (Str D-6) at Group D, Xunantunich. Group D is a sacbe terminus architectural group which is connected to Xunantunich's main plaza. The location of the sacbe suggests that Group D was part of an important ritual circuit. Over 5 field seasons, we have refined our understanding of the group's chronology and role within Xunantunich. During the course of excavations, several burials, ceramic deposits, and eccentric caches were discovered. Within this paper, we will discuss the architecture of structure D-6 as well as the analyses of materials within deposits and preliminary analyses of skeletal remains. Finally, we discuss how these deposits can help identify the group's overall function.

[361] *Human Behavior or Environmental Change: Zooarchaeological Research on Shell Midden Sites at Guanglu Island, China*

The zooarchaeological research on Xiaozhushan, Menhou and Wujiacun shell midden sites, which are located in Guanglu island, provides empirical materials to understand the transformation of animal resources acquisition patterns from fishing-hunting economy to livestock way. This paper analyses the reasons for the appearance of wild and domestic animals in Guanglu island and the internal relation between animal resources acquisition patterns and animal population structure. We consider that human behavior caused profound influences on the animal population as prehistoric people landed on this island about 7000 years ago.

[299] *The Mind of an Artisan in Early China: A Museum Collection Study*

This study aims to investigate the different ways artisans in early China (up to the 3rd century) learned their crafts, in order to better understand how certain types of artifacts such as pottery and bronze were made, and how new styles and designs emerged. In early China, craftsmanship was usually inherited through familial traditions or learned inside state workshops,

where skills and technologies were passed down in a relatively consistent and standardized way. However, new styles and designs also came into being. What might have motivated artisans to innovate or to follow convention, and where did they derive new inspiration? How did the style of a type of objects evolve over time? How were the skills and designs transferred among different mediums? What role did material agency play? This study intends to identify traces and types of learning of ancient artisans and to shed light on the interaction between artisans, material, and objects by examining artifacts from the Chinese collection at the Royal Ontario Museum (ROM).

[211] *Insights into Rock Art Pigment Provenance and Microenvironment at Ashlu Rockshelter, British Columbia, Canada*

Advances in microanalytical methodologies enable archaeologists to examine characteristics of rock art pigment and surrounding microenvironment to nanoscale resolution. The information gleaned through microanalysis is valuable for reconstructing archaeopigment preparation technologies and provenance, and to evaluate the condition and stability of rock art features. We present the results of a multi-method investigation of a mid-elevation, seasonally occupied rockshelter on the slopes of Nepti'il. The site dates to 1410-1460 cal BP with extensive rock art panels and is in the center of Squamish Nation Territory, British Columbia (Canada). Using a combination of techniques including SEM-EDS, XRD, and Raman spectroscopy, we have determined characteristics of paint preparation and stability, post-depositional alteration of pigment layers, and important micro-karstic features at the interface between rock substrate and panel. Moreover, we compare the elemental and mineralogical characteristics of the pigment to a database of previously analyzed local and non-local pigment sources and artifacts, and identify a probable candidate for the source of the raw materials used to make paint. We discuss the significance of our results in comparison to the other forms of material culture excavated from the site.

[186] *A Space for Living and Dying: The Life-History of Kharaneh IV Structures*

The built environment delineates space for daily actions and important moments. Separating the occupants from the external world, walls can create barriers between the outside or can build communities within them. Recent excavations of two structures at Kharaneh IV, an Epipalaeolithic site in Eastern Jordan, provides a window into the life-history of the community by reconstructing the life-history of the buildings. Kharaneh IV's large size and dense artifact deposits indicate that it was a hunter-gatherer aggregation locale during occupation and a focal point for regional interaction. Situated at the edge of an extinct wetland, the inhabitants of Kharaneh IV used the structures for everyday actions and important rites of passage. In this presentation, we explore the life-history of the two structures, assessing changes in the use of space over time, to understand the changing lives of the people who aggregated at Kharaneh IV.

- [147] *The Role of Geomorphology and GIS in the Identification of Paleoindian Archaeological Sites at Yellowstone Lake, Wyoming, U.S.A.*

We discuss the role of geomorphology in identifying early Paleoindian archaeological sites at North America's highest-elevation natural lake, Yellowstone Lake, Wyoming. Prior research proposed geomorphological models for the ages of Yellowstone Lake paleoshorelines that mark former lake levels after Late Pleistocene glacial retreat. Based on results of 10 years of archaeological research at the lake, we confirm the accuracy of these paleoshoreline models and present a geographic-information-systems (GIS) predictive model for Paleoindian site locations. Results of an archaeological survey for Paleoindian sites along ancient shores of the northeastern portion of Yellowstone Lake indicate that the GIS and the paleoshoreline models are robust Paleoindian site location predictors.

- [347] *The Span of 'Slavery': Considering Systems of Domination and Labour in the Lake Chad Basin*

"The kings of the Sudan sell their people for no reason, and quite apart from any wars..." (Ahmad al-Ya'kūbī). The Lake Chad Basin was one of the anchor points of the trans-Saharan slave trade, through the millennium after al-Ya'kūbī wrote about the rulers of Kanem in the 9th century AD. This region had no equivalent to the gold-fields of West Africa, so that the trafficking of enslaved humans plays a central role in analyses of state development. However, the term 'slavery' seems inadequate to describe the variety of systems of domination and coercion historically subsumed under that rubric in the region: chattel and war slavery, sexual enslavement and forced marriage, capture and forced labour in egalitarian communities, and so on. This complexity continues to the present day, where rural groups say that children are periodically kidnapped for house labour and where the depredations of the Boko Haram insurgency have led them to be labelled hamaji, 'slave raiders'. This paper will consider material and historical evidence for the span of 'slavery' in the Lake Chad Basin, and particularly whether one explanatory model fits these varied phenomena.

MacFarland, Kathryn (School of Anthropology, University of Arizona)

- [127] *Analyzing Similarity of Animal Style Art in Iron Age North Central Eurasia: A New Way to Study Continental Expression of Religious Symbolism*

Animal Style Art (ASA), an iconographic style expressed on monuments and material culture, is a geographically widespread phenomenon in north central Eurasia during the Iron Age (ca. 1,000 BCE – 100 CE). ASA analyses usually focus on stylistic difference or similarity. This poster reports an artifact-focused macro-scale (continental) study of ASA (n = 4,633 catalog lots), breaking down the elements of the style itself to holistically assess inter-regional expression. This discussion begins with an analysis of the diversity of the object types and associated proveniences included in this study, identifying limiting factors of inferences made from this dataset, assessed with Simpson's Diversity Index (Lyman 2008). The Raup Crick Index of Similarity (Raup and Crick 1979) is utilized to compare potentially similar occurrences of decorative attributes (i.e., stylistic elements as well as graphical content) common to two regions. A Geographic Information System is used to graphically illustrate the similarity score and give further context to inferred inter-regional relationships. This approach results in identification of a religious landscape among ten regions to varying degrees throughout the Iron Age. The methodology and line of inquiry described in this research reinvigorates study of ASA, a continental-scale iconographic phenomenon, and symbolic studies in general.

- [2] *Women's Territorialities within Indigenous Societies in Brazil: Past Discourses, Present Relations*

The aim of this paper is to contribute to a still scarce reflection on the practices, their effects and meanings, of women within indigenous and traditional societies in their territorial processes, from interdisciplinary and collaborative perspectives. This research is sought to consolidate an already existing network of collaboration between historians, archaeologists, anthropologists, and indigenous and riverine women in an attempt to understand the practices, roles and processes of identification/recognition and representation conquered and attributed to indigenous women particularly in the contexts of training, use and maintenance of their territories. For the development of this research I will use three methodological approaches: the compilation and writing of biographies of women; analysis of ethnoarchaeological research data; and the systematization of archaeological, historical and ethnographic data published related to women and their relationship with

territoriality processes. The development of this research aims at diminishing the invisibility of women in historical, pre-colonial, colonial and present-day narratives in the Brazilian context, as opposed to their constant presence in myths and their importance in the forms of organization, leadership and indigenous social representation from the European conquest to the present day, particularly in territorial management, agriculture and the struggle for land.

[81] *Contacts before "Contact". Comments about the Interaction between Nomads and Sedentary Societies in Northern Mexico Desert Highlands*

This paper presents an analysis of the contacts process between sedentary farmers and nomadic groups who inhabited the Mesoamerican Northern Frontier, before the XVI Century. Archaeological previous research suggested that villages standing on the northern mesoamerican frontier, were used as outposts for contain nomadic raiders. However, we lack of data for support such conceptions. Besides, other studies underestimate the capabilities of nomadic groups for promote extraregional contacts. The contact studies might help us in to get a better understanding of changes developed in northern frontiers societies during the classic and postclassic period. Some of the consequences could affect the hunter gatherers organizational composition, the mobility, and the adoption of storage technology, and ancillary crops. Here I present the result of a recent study carried out in the Zacatecas highland deserts. The research analyzed open air camps, sherds, sediments, starch grains, and landscape, with the aim to assess and contrast the ideas expressed before. We hope contribute to increase our knowledge about the effects of interaction in hunter gatherer societies in northern Mexico before the Contact with Spanish and European societies.

[368] *The La Prele Mammoth Site: A Clovis Mammoth Site with an Associated Campsite, Converse County, Wyoming*

One of the biggest sticking points in the ongoing debate about Clovis subsistence is the small sample size of human killed extinct megafauna. While just over a dozen terminal Pleistocene megafauna kill sites have been identified in North America, there are only two cases where campsites have been found in association with butchered extinct megafauna remains. The La Prele Mammoth site (48CO1401) is an approximately 13,000 year old Clovis site which contains the remains of a single Columbian mammoth (*Mammuthus columbi*). Recent excavations at the site have identified at least two hearth-centered areas associated with the mammoth processing area. These associated activity areas are consistent with domestic spaces as they contain a diverse tool assemblage, butchered bison remains, ocher, a bone bead, and bone needles. In the New World, domestic spaces have never been found in such close proximity to extinct megafauna remains. The identification of a campsite associated with proboscidean remains has implications for understanding cooperation and other activities which took place during megafauna butchery at the end of the last Ice Age.

[309] *Regional Variation in Preclassic Maya Household Ritual and Social Organization: Investigations at the Karinel Group, Ceibal*

Recent investigations at the Karinel Group, an early residential area at Ceibal, Guatemala, show that the roles household rituals played in the development of complex societies varied across the Maya lowlands during the Middle Preclassic period (c. 1000-350 BC). In northern Belize, rituals focused on ancestors increased social inequality among kin groups, beginning around the transition to sedentism. In other parts of the lowlands, including Ceibal, rituals on circular platforms constructed horizontal relationships within communities, counteracting public rituals carried out by a small number of specialists. At Ceibal, notable for its early ceremonial plaza and its connections to Chiapas and the Gulf Coast, household rituals had little in common with public ceremonies until the transition to the Late Preclassic period. At that point, across the lowlands, domestic ritual practices became more centralized and elite households became more involved in public ceremonies.

[300] *Water Management in the Land of the Terribly Hot: A Hydrological Study of the Bagan Settlement Zone*

Located along the Ayeyarwady river, in the dry-zone of Upper Myanmar, is an area once described as "the land of the terribly hot", a land where the Classical Burmese capital of Bagan (11th to 14th centuries CE) is found. Home to over 4,000 monuments, a large and diverse population lived within the mixed urban-rural settlement zone. This paper will address how this successful city supported such a large population. While the monarchy controlled six major production enclaves across their kingdom, only a limited number of studies have addressed the local production capacity of this region. When considering the agricultural potential of this area, the question of water management comes to the forefront. Dominating this arid landscape is the Thetsoe-Taung range, a large string of mountains 11 km southeast of Bagan. Located at the base of this range is the Mya Kan reservoir, an important nexus for the dispersal of water across the Bagan settlement zone. In this paper, the water management strategy implemented across Thetsoe-Taung range will be discussed. Research will draw on the survey of numerous reservoirs, canals, and modified catchment zones. A preliminary understanding of this important water source, which ultimately supported the Bagan settlement, will be presented.

[368] *Archaeology and Stable Isotope Ecology of the Passenger Pigeon: Tracing the Prehistory of an Extinct Bird*

The passenger pigeon, once the most abundant bird in the world, became extinct barely a hundred years ago. It has been assumed that the passenger pigeon was equally abundant prior to the European colonization of North America, but some have argued that the bird was nowhere near as common in prehistory. Because so much of what is known is based on historical records and anecdotal accounts, a central problem is the lack of knowledge regarding the ecology and behavior of this species and the extent to which passenger pigeons were used by prehistoric Native Americans. We review the paleontological and archaeological record of the passenger pigeon and its interactions with humans throughout the United States and Canada. We also report the results of stable isotope analyses of passenger pigeon bones that provide additional information on their ecology and migratory behavior, as well as Native American seasonal subsistence patterns.

[269] *Farms of Hunters: Medieval Norse Settlement, Land- and Sea-Use in Low Arctic Greenland*

The Norse that settled in Greenland between c. AD 985-1450 depended greatly on the harvesting of local to regional Arctic marine resources for both subsistence and overseas trade. However, the mechanics and organization around this important marine economy have only left a limited imprint in the archaeological record, which is dominated by evidence of terrestrial farm- and shieling activities. The Winter is Coming Project (WiCP) considers long-term Norse settlement, organization, and land- and sea use in environmentally marginal parts of the Greenland settlements. Initial findings suggest that the Norse living in such areas managed by adjusting their farming and land use setup, and by relying on advantageous access to Arctic marine resources, i.e. becoming "marine farms." The study highlights the benefits of applying a social-ecological systems perspective across varying spatiotemporal scales, from single feature to regional settlement patterns. Only by asking "where, when, and for whom?" can we begin to explain complex, long-term human-ecodynamics, resilience, and sustainability in the past.

[129] *Creative Problem-Solving for Unconventional Conditions: Archaeological Recovery of a WWII Aircraft Crash Site, Ko'olau Mountain Range, Island of O'ahu, State of Hawaii, U.S.A.*

Conventional archaeological sites, with their relatively level topography and wide-open spaces to accommodate excavations, are not typically encountered by the Defense POW/MIA Accounting Agency (DPAA) Archaeologist. The majority of sites encountered by DPAA field scientists are better defined as unconventional, due to the extreme climatic conditions, steep terrain, as well as the often austere and remoteness of location. During the summer of 2016, recovery operations occurred at one such unconventional site: a WWII aircraft crash nestled high in Ko'olau Mountain Range, Island of O'ahu, State of Hawaii. This crash site is but one of the many examples of unconventional archaeological sites that are common to DPAA field activities. Extreme conditions experienced during this recovery include steep slopes, active waterways, extreme weather, helicopter support coordination, excavated soil management and processing challenges, all of which were performed in accordance with strict environmental protection requirements. Challenging sites such as this require DPAA field scientists to creatively problem-solve, relying upon strong applied archaeological method. This recovery operation illustrates the delicate balance achieved by DPAA field scientists in their pursuit of potential evidence at sites that do not meet the norm, while maintaining the high-scientific standard expected by the Agency.

Magargal, Kate [8] see Parker, Ashley

Magargal, Kate (University of Utah)

[35] *How Firewood Access Structures Settlement Patterns*

In desert environments resources are typically distributed heterogeneously. This variability required prehistoric humans to evaluate trade-offs over accessing spatially distinct patches. A potentially important and largely unexplored resource in these trade-offs is firewood. This work examines the distribution of archaeological sites along the watershed of the Dolores River of southwestern Colorado and southeastern Utah. Coupling a novel extension of the ideal free distribution model with

new archaeological survey data, I examine how the distribution of sites varies with inferred access to firewood, and other critical resources, including water and food. The results illustrate that foragers experience a spatially-imposed trade-off when optimizing settlement locations. The implications of this under-explored issue are addressed and future directions for research are discussed.

[129] *The Intersection of Multiple Conflicts: The Excavation of an F-4C Crash Site in the Midst of the Dien Bien Phu Battlefield*

Between 2014 and 2017, archaeologists with the Defense POW/MIA Accounting Agency (DPAA) excavated an active rice paddy in northwest Vietnam in search of two missing U.S. service members from the Vietnam War. The incident aircraft, an F-4C, was shot down on March 15, 1966 near the town of Dien Bien Phu. During the excavations, DPAA archaeologists recovered evidence of the incident aircraft and osseous remains, but they also unearthed evidence of trenches and barbed wire associated with a prior engagement that occurred in 1954. During the French IndoChina War, French and Viet Minh forces fought for control of this remote outpost. The siege lasted for almost two months before General Giap overran and defeated the French forces. The recovery efforts conducted by DPAA produced evidence reflecting both events, representing the intersection of multiple conflicts that occurred just over a decade apart. Using historic imagery and topographic mapping, Site VM-02293 was deconstructed to examine the relationships between the later aircraft crash event and the earlier battlefield landscape. The results supported the initial association of the osseous materials with the aircraft crash event. Ultimately, through additional forensic analyses, the osseous remains were positively identified as both missing American individuals.

[67] *The Role of Isometric Scaling on Stone Projectile Point Durability: An Experimental Assessment*

The experimental study of stone projectile points created via flintknapping has shed light on issues of culture, penetration, durability, aerodynamics, resharpening, among several other topics. Here, we present an experiment that systematically assesses the role that isometric scaling, i.e., size, plays in stone point durability. Thirty obsidian projectile points were knapped by M. Eren, all virtually identical in shape, but differing in size. All thirty were hafted onto arrow shafts in an identical manner and shot in the controlled ballistics range of Kent State's Eren Laboratory for Prehistoric and Experimental Archaeology. Frequency of breakage, amount of breakage, shaft damage, and impact scar morphometrics were all recorded and compared against the recorded size of the point.

Mahan, Chase [89] see Van Etten, Heidi

Mahan, Chase**[218]** *Sourcing a State: A Systematic Survey and Statistical Analysis of Wyoming Archaeological Assemblages of Lithic Raw Materials*

This pilot study will systematize the spatial distribution of lithic raw materials in Wyoming by using statistical methods. It revisits decades of curated assemblages from the University of Wyoming Archaeological Repository and places them on the geological landscape using GIS and cluster analyses. Through a systematic sampling strategy of the lithic raw materials within the collections, localities throughout Wyoming are tested to gain a greater understanding of this complex lithic landscape. Operating under the assumption materials common in lithic assemblages are more likely to occur close to site than rare materials, this study informs our understanding of how hunter-gatherers procured raw materials. Prehistoric peoples effectively acted as field geologists, collecting and curating raw material on the landscape. This preliminary analysis uses qualitative macroscopic attributes of numerous samples from across Wyoming and the substantial sample size allows for meaningful statistical analyses such as cluster analysis. Using the La Prele Mammoth site's lithic assemblage as a case study to test these methods reveals the utility of sourcing lithic artifacts, particularly in the Intermountain West where there is abundant lithic diversity with discontinuous source areas. It is an endeavor well overdue in a state with great geological diversity.

Mahar, Ginessa (University of Florida) and Kenneth Sassaman (University of Florida)**[70]** *Stop Seeing Like a State: Relational Complexity among Small-Scale Societies of Gulf Coastal Florida (Who Routinely Gathered in Large Numbers)*

Interventions of modern nation-states in the affairs of "underdeveloped" nations often fail for imposing standard categories on highly variable and historically situated local practices. The same might be said about scholarship on "complex" hunter-gatherers. Rather than oversimplifying by imposing order vis-à-vis state-level criteria (e.g., institutions of government, social stratification, religion, subsistence), archaeologists have the opportunity to investigate organizational variation beyond social categorization. Doing so requires a logic based in "relational complexity," a logic akin to heterarchy in its transient qualities and to a network in its multisited qualities. Beyond that, relational complexity invites consideration of nonhuman agents and nonlinear temporalities. In this regard, there are no complex hunter-gatherers as much as there are complex relationships of communities to other times, places, beings, and forces. To demonstrate such an approach, we look to a case study on the shores of the North Florida Gulf Coast, where large, temporary gatherings were structured synchronistically, involving the coordination of labor, specialized technologies, and the movements of persons, non-human agents, and celestial bodies within a ritually charged landscape. Rather than being a category or trait list, complexity was practiced by historically oriented, future minded, small-scale human societies.

Maher, Lisa (University of California Berkeley)**[186]** *Built Environments of Epipalaeolithic Southwest Asia: A Life History of Place*

A place is structured and given meaning through human experiences at both individual and group levels. Places are created through repeated human action and made tangible in the landscape by material culture. These places become part of a built environment, marked by daily routines or habitus. At the 20,000-year-old aggregation site of Kharaneh IV in Jordan, the remains of several recently excavated hut structures provides insight into the creation and maintenance of place. Exploration of the life histories of these structures, including their construction, maintenance, and the organization and differential use of space is provided by a microstratigraphic analyses of their deposits and associated material culture. In-depth study of the traces of human activities—as activity areas, taskscapes, life histories, object and sediment (or even place) biographies—left behind by daily practices yield high-resolution data on these structures as economically, socially and symbolically-charged spaces and provide insight into how people organized their world, creating a life history of place, or 'storied landscape'. At Kharaneh IV the life histories of hut structures, as told by pairing geoarchaeological (micromorphological) and artifact datasets, provide a glimpse into the lives woven into and around these places as integral to the construction of hunter-gatherer communities.

[251] *Geo-referenced Spatial Data Analyses on Coastal Erosion Sites: The Final 3D Examination of the Pictish Smithy at the Site of Swandro, Orkney Islands*

Coastal erosion sites contain the same complexity as any other sites, however, the sequences are often truncated and the recovery conditions require adaptive approaches. During the summer of 2018, the excavation of Structure 3, the 'Pictish Smithy', concluded. Here we present the final report on the 3D spatial analyses of Structure 3. Data was collected using a total station and PenMap, photogrammetry, and 3D laser scanning focusing on artifact and soil residue (XRF) locations and distributions as well as structural elements. Using GIS to explore the varied spatial relationships of this complex deposition sequence, this paper presents the final results of the micro-analysis of a single Late Iron Age structure and the potential for future integrated, on-site spatial management.

Mahoney, Gosia (University of Nebraska - Lincoln), Paul Hanson (University Of Nebraska - Lincoln) and Dawn Bringelson (Midwest Archeological Center)

[45] *Understanding Archaeology in the Dunes: OSL Dating of the Tolleston Beach at Indiana Dunes National Lakeshore and Its Implications for Interpreting the Archaeological Record*

The puzzling scarcity of archaeological sites on the Tolleston Beach at Indiana Dunes National Lakeshore prompted an investigation into the development of this dune field in an attempt to determine whether the distribution of known archaeological sites is governed by ancient human behaviors, or influenced by its dune setting, which can affect site preservation and discoverability. In order to accurately understand patterns of past human occupation, it is important to know the timing and extent of dune reactivation, specifically, whether it was frequent enough to influence settlement patterns in the past or if it was extensive enough to disturb archaeological deposits later on. Soil samples collected from shovel test pits and from vibracores on the crests of two compound parabolic dunes were dated using Optically Stimulated Luminescence to refine the chronology of the Tolleston, determine the age of near surface deposits (those accessible to archaeologists using standard field methods), and to evaluate the validity of applying those methods in this environment. The benefits and challenges of using OSL dating in archaeological contexts are also discussed.

Mahoney, Maureen (Seminole Tribe of Florida THPO), Dave Scheidecker (Seminole Tribe of Florida) and Paul Backhouse (Seminole Tribe of Florida)

[19] *Distrust Thy Neighbor: Examining Reservation Period Camps through Tribal Archaeology and Story Mapping*

The most recent history of the Seminole Tribe of Florida (STOF) and its settlement on Federal Trust land is little understood. Settling onto the various reservations in the 1930s, community members organized the layout and location of their camps based on sociohistorical beliefs stemming from a distrust of their new American neighbors counterbalanced by the need to rely on reservation period infrastructure and access to commodities and services. These historic settlements are noticeable in the bottles, tin cans, and other remnant artifacts, but contain a much more powerful history with the addition of oral histories of the community members that took part in these early reservation settlements. Noting the shifts in camp location and organization over a broad period tells a story of important community functions and the evolution of the reservations. The various locational and content changes of these settlements are recorded by the Tribal Historic Preservation Office (THPO), who then uses Geographic Information Systems (GIS) to draw together the oral history and archaeological information in the telling of these important stories.

Mahoney, Meredith

[262] *Mapping Lithic Surface Scatters with Drones*

Combining traditional archaeological methods such as pedestrian survey with unmanned aerial vehicle (drone) mapping creates an opportunity for efficient data capture and analysis of the scale and spatial arrangement of archaeological sites. This poster presents a cost-effective approach to surveying and mapping surface scatters and illustrates how the application of this method at a Great Bend Aspect settlement site in Arkansas City, Kansas informs our understanding of domestic and agricultural space across the site. I also discuss how the process and results of this project each generate powerful opportunities to engage the public on the issues of site stewardship and looting.

Mahoney, Nancy (Montana State University)**[184]** *Stewardship and Community Outreach on the High Plains*

This paper assesses the present and historical role of outreach and collaboration with collectors in Montana. Understanding the historical context of interactions between professional archaeologists, amateurs, tribes, and the public is an essential foundation for the creation of effective education programs that achieve meaningful archaeological learning. This presentation will pay particular attention to the distinction between archaeological practice and outreach education as it pertains to public versus private lands in Montana.

Maigret, MaryAnne (National Park Service), Lori Miculka (National Park Service) and Erin Coward (National Park Service)**[46]** *Managing an Eroding Coastal Site at Pu'uhonua o Hōnaunau National Historical Park*

Perched sand deposits and pocket beaches dot the shoreline at Pu'uhonua o Hōnaunau National Historical Park on the island of Hawai'i. Keone'ele Cove, situated along the northern boundary of the park, is a key part of the cultural landscape where Hawai'i's ruling class landed canoes and hosted gatherings, and where native Hawaiians continue these practices in ceremonies and park programs. Since the 1960s, the park has managed coastal erosion through limited beach nourishment and small-scale erosion control devices, and preservation of historic masonry seawalls. Archeological excavations in 2008 and 2009, as well as post-tsunami recovery work in 2011, confirm the presence of a mostly well-preserved cultural deposit in the sands of Keone'ele Cove. C14 samples yielded dates from as early as 1650 AD. Although the site is protected from visitor disturbance, it continues to be affected by erosion; impairment of this resource is a great concern. A combined cultural/natural resources study will formalize monitoring at the site to include photogrammetry, continued ground-based LiDAR scanning with comparative mapping, investigation of overall sand budget and sediment transfer dynamics, and propose both short-term and longer term strategies for stabilizing and preserving this important site.

Mailler, Mary and Spencer Mitchell (UC Santa Barbara)**[114]** *Satellite Imagery and Esri's ArcGIS Pro's Georeferencing Tools Confirm Arkansas City, Kansas Is the Locale of Etzanoa, a Historic Site Visited by Spanish Explorer, Juan Oñate, in 1601*

Using Esri's ArcGIS Pro's georeferencing tools to rubber-sheet a historic native map to satellite imagery confirms Dr. Donald J. Blakeslee's findings (2018) regarding a site located near the mouth of the Walnut River, in Arkansas City, Kansas. The site is likely the native town, Etzanoa, a settlement of the Ancestral Wichita and Affiliated Tribes visited by the Spanish explorer, Juan Oñate, in 1601. After rotating the Miguel Map 90-degrees clockwise and after applying Esri's georeferencing tools to adjust its scale, we determined its major geographic features aligned closely to those featured in satellite imagery taken of the Walnut and Arkansas Rivers of Kansas and Oklahoma respectively. Further, a second map of the area contemporary with the Miguel Map produced by the royal Spanish cartographer Enrique Martinez, when assessed with the same Esri georeferencing tools and satellite imagery, also supports Blakeslee's proposed location of Etzanoa and other nearby associated sites as dispersed along the Walnut and Arkansas Rivers. Upon a final review of the alignments between the maps and the corresponding satellite imagery, we concur; the proposed site for Etzanoa as Arkansas City, Kansas, near the mouth of the Walnut River is well supported.

Maitland, Brian (Fort Lewis College)**[8]** *Molecular Characterization of Pine Pitch on Treated Water Vessels in the Four Corners Region*

The use of pitch to coat historic water vessels represents the complex relationships between indigenous peoples and native plants in the American Southwest. Chemical analyses and comparisons were conducted with the intention of sourcing the pitch coating to a specific conifer species. Ponderosa (*Pinus ponderosa*) and Piñon (*Pinus edulis*), two species of the Pineaceae family, are the most common materials in the region for water vessel application. In order to distinguish these two species and other conifers that could have been used for the sealant, we compared raw materials with samples of pitch

coatings taken from historic water vessels and analyzed them via gas chromatography-mass spectrometry (GC-MS). The results allowed us to identify key molecular differences in the 46 pitch samples and identify similarities between the 14 taken from treated baskets. The results of the GC-MS analysis were then compared to eight pitch samples harvested from local trees, to identify past coating processes. The comparisons resulted in the species level identification of the pitch used for treating water vessels in the Four Corners Region. The preliminary results of the GC-MS analysis have led to a consistent molecular footprint for the applied pitch across multiple cultures of the Southwest.

[262] *Testing Geophysical Anomalies Using In Situ Shallow Subsurface Spectroscopy and Soil Magnetic Susceptibility Analysis*

In 2015 the National Park Service's Archaeological Prospection Workshop was held at the Tobias Site (14RC8). Students and instructors evaluated the site using a variety of non-invasive prospection methods ranging from landscape-level LiDAR analysis to high sample density subsurface geophysical survey. The evaluation identified buried features and patterning within the site along with previously unknown components of the site. In 2016 geophysical anomalies identified during the workshop were tested using a Veris Technologies P4000 instrument which obtains soil spectra in the visible/near infrared region (350-2250 nm), electrical conductivity, and insertion pressure. The P4000 is a mobile probe that is pressed down into the soil up to a 1-meter depth. A 3-D array of spectra is obtained on a north-south and east-west grid. Representative soil cores were also collected during the study for chemical and magnetic susceptibility analysis. This poster will present the spectral, magnetic and chemical results by combining the data using chemometric analysis, which will correlate these data sets and use them to build a 3-D model of buried archaeological features.

[39] *Experimental Investigation of Primary Copper Smelting in Central Michoacan*

Copper was the main metal produced and worked in Mesoamerica, but data for pre-modern primary production and processing remain elusive. Systematic research at Itziparätzico, a Late Postclassic location in Central Michoacán, Mexico, has located evidence of copper production areas where significant amounts of smelting slags were found. Mineralogical and chemical investigations of slag samples indicate that the production activities carried out at the site involved primary chalcopyrite smelting, and revealed a sophisticated smelting method, possibly involving the use of furnaces properly designed and built to provide reducing conditions during the refinement of copper ores. The present work discusses recent research involving experimental smelting of copper ore (chalcopyrite) and the ensuing production of slag, followed by a comparison between the microstructural, mineralogical, and chemical characteristics of the archaeometallurgical finds and the experimental residues. A set of experimentally produced samples, have been chemically characterized using electron probe microanalysis (EPMA). The results obtained thus so far yield bornite + pyrrhotite during roasting and Cu droplets in a glassy matrix of olivine + glass during smelting, similar to the features found in archaeological slags. This research will allow the development of a model for the Late Postclassic Tarascan process of copper production.

[17] *Long Days Journey into Night: Collaboration and Research on The Navajo Reservation*

Since the late 1800's starting with Washington Matthew, The Navajo People, (Dine') have been asked to share their traditional stories and life styles. Research was never collaborative and always reinterpreted by others to suit their world views. Archaeology, ethnography and medical research was at the mercy of the person collecting the data and their personal views of how the data fit the academic norm. That changed in the Navajo Nation in the early 1990s. The Navajo

Nation Council created the Navajo Historic Preservation Department, and the Navajo Human Health Review Board (aka the Institutional Review Board, IRB) both decisions influenced how research was conducted within the exterior boundaries of the Navajo reservation. Two projects were initiated, the first a coal mine expansion that interrupted archaeology, and the second the protection of a sacred site on the Navajo Reservation claimed by the Hopi Tribe. Both projects showcased collaboration, community involvement, and most importantly the views and beliefs of the Dine.

[76] *Textile Tools and Technologies from the Postclassic Huasteca: Artistic and Archaeological Evidence*

During the Postclassic period, the Huasteca region along the northeastern Gulf Coast was an important producer of textiles made of zapupe (the local name for ixtle, that is, agave or yucca plant fibers) and especially cotton as evidenced in early colonial manuscripts, such as the Codex Mendoza and Los Lienzos de Tuxpan. Although to-date no significant Postclassic textiles from the Huasteca have been found archaeologically, this paper examines the visual representations of textiles and knotted strings that are parts of garments (like belts or armbands) in sculptures, murals, shell ornaments, and codices. This artistic evidence will be systematically analyzed to identify types of garments, patterns and ornamentations of textiles, and styles of knots. We will also examine the archaeological context from new excavations in the southern Huasteca, especially spindle whorls and organic materials. The analysis of the size of spindle whorls may indicate what fibers were used. Moreover, these archaeological remains will be compared to textile tools found in other parts of the Huasteca. We argue that the artistic and archaeological record supports sixteenth-century historical evidence that the Huasteca was a significant textile producer that increased production to fulfill the tribute demands of the Triple Alliance.

[169] *Alliance Formation & Social Signaling: Village Interaction among the Monongahela*

A general trend among many societies has been the growth of political complexes, and thereby alliance formation. New studies on the Monongahela culture, such as those undertaken by Dr. William Johnson and David Anderson (2002), seek to define the growing political complexity of the Monongahela during the Late Monongahela period (A.D. 1580-1635). This research expands on their ideas and Dr. John Nass's that the Monongahela, during the Late Monongahela period, were not just growing in political complexities within sites, but that they were also forming alliances across multiple sites. This study seeks to understand how scalloped lip ceramics and charnel houses can provide the key data to examine the formation of alliances and village interactions. The data used for this study is constructed through the analysis of scalloped lip ceramics that appear in Monongahela sites during that period. Using the concept of social signaling to show how scalloped lip ceramics, Charnel houses and evidence of the associated feasting and social inequality, may be used as an indicator of alliance formation. Spatial analysis of the data will be used to create a broad picture of village interactions during the Late Monongahela period, including a statistical analysis.

[184] *Building a Stronger Network: Assessing and Reconfiguring a National Archaeology Curricula Delivery Program*

Project Archaeology, a national archaeology education program, relies on a diverse network of educators, museum professionals, and archaeologists certified as Master Teachers. Master Teachers provide nationwide professional development on the implementation of Project Archaeology's curricula. Master Teachers are trained through a weeklong program in Bozeman, Montana, called Project Archaeology Leadership Academy (PALA). The application process for PALA is highly competitive and participants receive food, lodging, and a travel stipend to attend. In return, participants agree to employ a good-faith effort to offer professional development once a year for four years. Offering professional development helps fulfill Project Archaeology's mission, distributes high-quality archaeology educational materials, and ensures the sustainability of the organization. In 2018, a voluntary survey was conducted of participants from every PALA class. The survey evaluated programmatic effectiveness, strengths, weaknesses, and inquired about any suggested changes. The results will be used to make modifications to the application process, training procedures, graduate incentives, and support offered to graduates. These changes will help ensure that Project Archaeology is as effective and efficient as possible while remaining on the forefront of archaeology education.

[54] *Archaeological Identifiers of Cultural Affiliation: The Case of the Middle Horizon(?) Site of Sonay, Peru*

The site of Sonay in the Camana Valley of southern coastal Peru was originally identified as a Wari-affiliated site, based on the close architectural similarities of its major structure to other Wari imperial sites. The two original radiocarbon dates from below the structure suggested an occupation at the very end of the Middle Horizon, long after it is thought influence from major Wari centers had disappeared. The lack of diagnostic ceramics confused the original interpretations, though the limited excavations were thought to be the cause of this issue. A later date for the structure, also from beneath the floor, suggested a Late Intermediate Period date. This paper will consider the problem of dating sites on architectural versus radiometric means, and come to a resolution of when this site was actually occupied, and by whom.

[312] *Revisiting Julie K. Stein's "Archaeological Sediments in Cultural Environments": The Nexus Between Lithostratigraphy and Geoarchaeological Research in the Great Plains and Central Lowlands, USA*

In her seminal 2001 book chapter, *Archaeological Sediments in Cultural Contexts*, Julie Stein emphasized that identifying and characterizing sedimentary deposits at archaeological sites is crucial to understanding the geologic context of the cultural deposits as well as site formation processes. Archaeologists have taken heed of Julie's advice and broadened their interest from just the artifacts to include the depositional history of the artifacts. This approach requires an interpretation of the history for all sediment comprising each deposit, including the sediment source, transport agent, depositional environment, and post-depositional alterations (especially soil formation). In this paper, the application of lithostratigraphy in geoarchaeological research is offered as a powerful tool for interpreting the depositional history of sediments and artifacts, and for determining where cultural deposits are likely to occur in buried contexts. Quaternary-age lithostratigraphic units are easily recognized and defined in the field on the basis of observable sediment characteristics, such as color, texture and carbonate morphology. Examples of geoarchaeological studies that employed lithostratigraphy at the site-specific and regional scale in the Great Plains and Central Lowlands are presented.

[347] *Maritime Archaeology and Slavery in Mauritius: Le Coureur Shipwreck*

Analyzing slavery through the lens of shipwrecks makes a significant contribution to the understanding of labor migration. However, beyond the labor diaspora, there are social dynamics that can be view through maritime heritage. The 'vessel', the ship itself, was a vehicle of culture contact and the study of the artefacts found in the shipwreck can give us significant information on the life at sea, and the relationships on-board. As a result, maritime archaeology provides evidence for the movement of people, while narrating the voyage into slavery, and what captives endured during this terrible transformation. Mauritius is a very special case study. The presence of an extraordinary number of wrecks, over 800, demonstrates the great potential of this island. Especially notable is the investigation of Le Coureur shipwreck, a lugger built in 1818 in Grand Port and sunk in 1821 with a cargo of about 100 slaves from Zanzibar. The sinking of Le Coureur off the Mauritian coast marks the true ending of the slave trade to this island. Accordingly, exploring the social, craft, and biographical aspects of this shipwreck contributes important new evidence and helps contextualize the period of slavery in this part of Africa.

[419] *From North America to Europe: Preliminary Biomolecular Results Regarding the Transatlantic History of the Turkey*

While there is a growing body of studies on turkey domestication and use in North America, many questions remain unanswered regarding its introduction to Europe and its subsequent breeding. Which populations of turkeys were imported in Europe and when? How fast did they spread in the Old World? How did they integrate the pre-existing breeding economy? Through the application of a set of biomolecular approaches (archaeogenomics, peptide mass fingerprinting (ZooMS) and stable isotopes), this presentation explores the challenges in understanding the transatlantic history of the turkey. According to historical accounts, the turkeys were imported to Spain, from Mexico or Central America, in 1511. Through the mitochondrial DNA analysis of archaeological turkey bones dated from the 16th to 19th century, we evaluate the relationship between European turkeys and the different American populations to pinpoint their geographic origin. Stable isotopes from bone collagen allow us to identify a shift in turkey diet, consistent with their adaptation to the European poultry husbandry system. Finally, we highlight the difficulty of turkey bone identification in European assemblages due to the presence of different galliforms of similar size and introduce the use of ZooMS to improve species identification.

Mankel, Magda

[421] *Walking the Migrant Trail: Mobilizing Landscape to Contest Border Enforcement Policies and Negotiate the Boundaries of Social Belonging*

This paper presents an archaeological ethnography of the Migrant Trail and a very recent past associated with the militarization of the U.S.-Mexico border. Composed primarily of U.S. citizens, the Migrant Trail is a seven-day walk that protests U.S. immigration and border enforcement policies and commemorates migrants who died in their attempt to cross the Sonoran Desert. Using a critical heritage studies perspective, I explore what role landscape plays in remembering migrants, coming to terms with violent government policies, and re-bordering the boundaries of social belonging as they apply to migrants. Understanding how members of receiving democratic societies mobilize landscape to negotiate the meaning of national boundaries and protest violence is crucial if we are to work towards a more just future.

[168] *There Were Pots After All: Production and Use of Ceramic Vessels in the Upper Laurentian Region of Québec, Canada*

Nomadic hunter-gatherer populations of the Eastern Subarctic were once thought to have largely rejected or ignored pottery technology. The archaeological recovery of ceramics at several sites north of the St. Lawrence Lowlands over the past few

decades has passed the status of anecdotal finds and seriously challenges this assumption. Questions remain, however, about the origins, production and use of these containers. Here we present recent ceramic data collected in the Upper Laurentian region of Québec (Canada) combining typological, technological, and organic residue analysis. This is part of a larger research project investigating how Northern Algonquin populations negotiated their identities through foods and foodways in the face of intergroup contacts and technological innovations.

Manne, Tiina (University of Queensland)

[415] *Risky Business? Prey Choice in Pleistocene and Holocene Northern Australia*

Although archaeofaunal assemblages from northern Australia are limited, records indicate an early adoption of “broad-spectrum” diets. Inland, key prey items consist of small- to medium-sized mammals and reptiles, with large kangaroos being exploited less frequently. On the coast, shellfish, fish and marine turtles are featured alongside smaller-sized terrestrial prey. Published ethnographic data from the Western Desert has previously noted that prey size does not adequately predict rank, and that pursuit costs appear to play a more important role. Large kangaroos, for example, were viewed as a particularly risky enterprise, especially when suitable technology for capture had been left at home. In this paper, I examine new data from Pleistocene and Holocene faunal assemblages from northern Australia, and explore how animal behaviour may have affected prey rank.

[75] *An Overview of Historic Preservation and Cultural Resource Law and Practice: Moving Beyond the Limitations of the Regulatory Environment*

The development of preservation laws and regulations spawned a new era and direction for the understanding of human culture. In the United States, the field of cultural resource management and the associated regulatory environment transformed the research fields of archaeology and historic preservation from explorations of the human past to mitigations of potential impacts to the human past. Once spawned by economic collapse with the great depression, WPA citizen archaeologists have been supplanted by Government and Tribal Preservation Officers and the rise of Cultural Resource Management firms to facilitate the implementation and execution of National and localized laws and regulations. With the subsequent increase in social and economic stability, the intersection between environmental and preservation laws have forced many research archaeologists and historians to the forefront of the rapid expansion of the human footprint across the United States. It is up to us to leverage the interdisciplinary aspects, laws, ethics, and practices to ensure we continue to preserve, understand, and document our shared human heritage for future generations.

[73] *Radiocarbon and Historical Archaeology in Iroquoia: Bringing Near-Calendar Dating Precision to Iroquoian Chronology with Radiocarbon – Methods, Issues and Potential*

This paper outlines the aims and methods of the Dating Iroquoia project by which we propose to achieve calendar chronological precision from radiocarbon for Iroquoian sites at, or better than, the level of individual settlement spans – i.e. calendar resolution at the level of approximately one to two decades. The focus is on careful sample selection, high-resolution radiocarbon dating, and then deploying suitable analytical approaches – especially appropriate Bayesian chronological modelling. Some case studies from initial work are presented and worked through which demonstrate issues and the potential: both in terms of independently evaluating (and quantifying) assumed temporal site sequences based on typological criteria, and in terms of supporting or questioning existing dates (and thus underlying assumptions). A

radiocarbon-based time frame for Iroquoia indicates a new history and a need to re-evaluate a number of existing assumptions.

[18] *Contrasting Use of Space among Neighbors: Puna versus Quechua/Suni Residential Settlements of the Rapayán/Tantamayo Region during the LIP*

Late Intermediate settlements in the Rapayán/Tantamayo region are distributed in two main ecological zones: quechua/suni between 2500 to 3900 m.a.s.l. and puna above 4000 m.a.s.l. The majority of residential sites occupy the quechua/suni ecological zone. These settlements display a fairly homogeneous architectural distribution with one or two multi-story buildings in the upper section, several individually organized house structures in the center, and a number of small chullpas in the lower-end. The puna settlements, on the other hand, consist mainly of fortified sites with no or just few house structures. A handful of them however were densely populated. The 22 hectares puna residential site of Winak for instance, displays similar architectural types as those observed in the quechua/suni residential settlements, but their spatial arrangement on the site differs markedly. For example, the houses are organized in groups around common patios, the chullpas are in the center of the settlement and delimited by a massive wall, and the multi-story buildings are in the lower part of the site. In this presentation, I discuss the social, political and ideological implications of these distinct spatial architectural layouts among quecha/suni and puna residential settlements.

Mantilla Oliveros, Johana Caterina

[421] *Contesting Dispossession. Marronage's Mobility and the Emergence of a Landscape, 17th and 18th Century, Colombia*

Access to land is still a problem in Latin America and the Caribbean (as well as other places, mostly located in the global South). In that context, the landscapes and our analysis of them are directly crossed by power relations, conflict, the creation of borders, contestation of hierarchies, etc. The current landscape of the maroon community of San Basilio de Palenque and its surroundings, at the north coast of Colombia is full of historical and present marks of contestation. Its inhabitants (black communities, mestizos and indigenous) have been suffering for centuries the different types of displacement and dispossession. In this paper, I will present some of the results of my doctoral research related to the Maroon's mobility and the reshaping of the landscape in 17th and 18th centuries. I will argue that despite the many attempts of the Spaniards, the Maroons gained access and controlled the land successfully. Finally, I will offer some additional considerations regarding the political dimension of our interpretation of landscapes. This case shows that those "scars" are not "in the past" but "in the present", re-shaping lives, memories and still offering possibilities of contestation for the actual inhabitants of the region.

[419] *Fox Farm, a Large Fort Ancient Village in Mason County, Kentucky: Evidence of Turkey (Meleagris gallopavo) Management?*

Investigations of wild turkey (*Meleagris gallopavo*) remains from archaeological sites in Central America and the American Southwest have generated new data about the management and domestication of this species. We applied the methods used in those studies to our analysis of a large sample of wild turkey bones recovered from Middle to Late Fort Ancient (A.D. 1300-1650) deposits at Fox Farm (15MS1), a large, intensively occupied Fort Ancient farming village situated on an interior ridgetop in northern Kentucky. Our study seeks to understand how and why the residents of Fox Farm lived in this setting for such a long time. Our data show that site residents were taking immature turkeys and egg-laying females. Unlike at most sites, however, where relatively equal numbers of males and females are present, the Fox Farm assemblage contains twice as many males as females. These patterns are discussed with respect to what insights they reveal about the potential management of turkeys by Fort Ancient people. Evidence for turkey management would fit into a broader emerging model of the active management of key natural resources in the area surrounding the Fox Farm site.

Marean, Curtis (Arizona State University)**[368]** *A Model of the Extinct Palaeo-Agulhas Plain Ecosystem in Southernmost Africa*

Unlike some regions, Africa was not subject to massive and abrupt mammalian extinction events in the Late Quaternary, but some African regions were subject to abrupt extinctions of small numbers of species. The coast of South Africa records such an extinction event near the Pleistocene and Holocene boundary. These extinct species were all adapted to grassland environments and the fossil assemblages in the Pleistocene suggest a dominance by grassland species. However, this region today is the well-known Greater Cape Floristic Region (GCFR), a shrub-land ecosystem, and it does not currently contain appropriate grasslands for these species. Offshore and currently under water was a plain once exposed by lowered sea levels, and our research group has defined this as an ancient ecosystem we call the Palaeo-Agulhas Plains. This was the primary habitat for these extinct species, and the favored hunting grounds for the humans inhabiting the many well-known archaeological sites that have been excavated here. Our research group has conducted a wide range of multi-disciplinary studies that together allow us to build a model of this now submerged ecosystem, and here we summarize that model and contextualize this small-scale extinction event more broadly within the overall extinction of this ancient ecosystem.

Mariani, Guido S. [195] see Zerboni, Andrea

Marin-Aguilera, Beatriz (University of Cambridge)**[421]** *Colonial Borderlands and Conflicting Landscapes in Colonial Chile*

Chile was the most important and complex borderland of the Spanish Empire (1550–1818), in which colonial power and indigenous resistance were contested over centuries. Control over this frontier was of vital importance for the Spaniards because the main Pacific harbour was located there. The indigenous people, known as Reche-Mapuche, defeated the Incas and were never conquered. The Spaniards struggled as well to subjugate them, and eventually conceded their independence upon the acknowledgement of the Spanish King. Since Chile, and particularly Valdivia, gave access to the Pacific, many European powers tried to conquer the Reche-Mapuche people, among them the Dutch and the British. However, their attempts were similarly unsuccessful. Removed from the empire's core, the Reche-Mapuche communities shaped a very dynamic and productive colonial borderland that also functioned as a material crossroad between the Spaniards, the Dutch, the British, and other local communities. This paper explores the continuous reshaping of colonial landscapes through political and social struggles in the area of Valdivia, as well as the indigenous responses to new hierarchies and colonial warfare between the 16th and 18th centuries.

Marino, Marc (University of Arkansas), Lane Fargher (Centro de Investigación y de Estudios Avanzados de), Nathan Meissner (University of Southern Mississippi) and John K. Millhauser (North Carolina State University)**[68]** *The Organization of Prismatic Blade Production at Late Postclassic Tlaxcallan, Central Mexico*

Systems of craft production and exchange in Mesoamerica are often correlated with the socio-political circumstances in

which they formed, and such discussions are frequently applied to the organization of lithic industries, including the production of prismatic blades. Systems correlated with direct or centralized distribution networks are associated with reciprocity and redistribution, while decentralized devices are associated with more commercial mechanisms influenced by the forces of supply and demand. Other axes of variation are introduced to this model if elites or political agents in preindustrial economies sought to control or regulate commercial systems. In this paper we model elite and non-elite influence in the production and exchange of lithic goods by examining if relatively 'faceless' factors like commercial systems played key roles in mobilizing goods for exchange or consumption, or if factors oriented more towards reinforcing social relationships, such as reciprocity or redistribution, affected the production or consumption of lithic tools. We address this question using a dataset of roughly 19,000 lithic tools, flakes, and debitage recovered from Late Postclassic Tlaxcallan, Central Mexico (AD 1450-1521). We compare both public and private spaces, and also examine households of varying status to ascertain the organization of prismatic blade production in Prehispanic Tlaxcallan.

[252] *Using High Quality Structure from Motion 3D Models for Petroglyph Visualization*

Structure from motion (SfM) photogrammetry models can be used to visualize petroglyphs that are otherwise difficult to see in photographs. Three techniques require a high-quality model that has captured the surface geometry in the point cloud and mesh. 1) Online and free software permit viewing a model surface with user-controlled oblique illumination. 2) Free Meshlab provides a powerful tool, radiance scaling, that produces false color and/or gray-scale images based upon surface curvature. 3) Another technique, which I have called "Digital Rubbing", uses free CloudCompare to produce an image based upon local differences between the point cloud and a generalized fit to the surface.

[410] *City of the Centipede, Part 1: Context, Boundaries, Community Organization, and Land-Use at El Perú-Waka', Petén, Guatemala*

Part I of II. The Waka' Archaeological Project (PAW) has conducted over a decade of archaeological investigations documenting the modification, layout, use, and chronology of monumental and residential landscapes of the Classic lowland city of El Perú-Waka'. These papers will evaluate current theoretical and methodological perspectives of ancient Classic Maya urbanism based on fifteen years of excavation and survey at El Perú-Waka'. Contextualized by the recent LiDAR survey of the region, Part I will identify the major landscape features that define Waka' urban core and present preliminary summaries of its settlement and land-use patterns. While El Perú-Waka' was a "typical" Classic Maya city in many ways, the PAW and LiDAR settlement and archaeological data reveal a distinctly "local" pattern of urbanization, landscape modification, and political history.

Markens, Robert and Cira Martínez López (Instituto Nacional de Antropología e Historia)**[197]** *Nourishing the Ancestors among the Zapotecs, Valley of Oaxaca*

From 500 BCE onwards, religion in the Valley of Oaxaca was organized in part as an ancestor cult as materialized by the appearance of household tombs in the archaeological record. Heads of households were laid to rest for a number of generations with offerings consisting most often of ceramic vessels, which in domestic contexts were used to serve food and liquid. Nourishing the souls on their journey to and residence in the underworld was basic to Zapotec worldview whereby the spirits of family member were perceived to act as intermediaries between the living and the supernatural. This paper considers the material and symbolic dimension of nourishing the ancestors by looking at the food remains recovered from tombs, mortuary practices recorded in the ethnographic literature and contemporary practices among traditional communities in the Valley of Oaxaca.

Markert, Patricia (Binghamton University)**[264]** *Main Street and the Central Square: An Examination of Spatial Decision-Making and the Frontier Narrative in the Alsatian Towns of Texas*

This paper examines the role of spatial decisions in acts of community place-making and identity construction on the built landscape. In particular, I look at these decisions within the broader context of the making and re-making of frontiers – plural in the sense that a frontier is never simply a boundary or geographic location, but a set of contested and constantly constructed ideas about space, progress, and nation-building. The research discussed here examines spatial decision-making in two Texas towns of Alsatian and German migrants, both of which emerged in the 1840s from an effort by the Republic of Texas to settle and secure the contested lands to the west of San Antonio. The towns share similar origins within a frontier narrative but have made divergent decisions about their town plans, access to resources, and approaches to heritage through time. As a result, the residents of the towns have created, challenged, or maintained ideas of the frontier in different ways. In this paper, I draw from oral history, historical and contemporary maps, and archaeological maps to discuss how these decisions about organizing space on the built landscape correspond to broader narratives about identity and belonging, from Alsace to the American West.

[264] *Chair***Markham, Adam (Union of Concerned Scientists)****[251]** *Responding to Climate Change Threats to Archaeology through the World Heritage Convention*

Climate change is the fastest growing threat to World Heritage properties, including archaeological sites, worldwide. Warming temperatures, sea level rise, coastal erosion, permafrost thaw, drought, worsening wildfires and more intense rainstorms, hurricanes and typhoons are putting hundreds of thousands of archaeological sites at risk, including many World Heritage properties such as Neolithic Orkney (Scotland), Tasmanian Wilderness (Australia), Mesa Verde (USA) and Kujataa Greenland (Denmark). When the World Heritage Convention was signed in 1972, there was no hint that climate change would become the threat that it has since proved to be. Now however, there is a need to update the convention's policies to address climate change and promote effective responses to reduce climate impacts and increase resilience. There is also an urgent need to develop a rapid assessment climate vulnerability methodology which can be used for all World Heritage sites – both cultural and natural.

[251] *Discussant***Markle, Elizabeth (New Mexico State University), Shannon Cowell (New Mexico State University) and Esmeralda Ferrales (New Mexico State University)****[88]** *Recreation, Rockshelters, and Resource Management*

In the summer of 2018, New Mexico State University (NMSU) staff and students surveyed 120 acres on the Organ Mountains-Desert Peaks National Monument. The New Mexico Bureau of Land Management (BLM), which manages this monument, provided funding for this project. The survey occurred in seven high-priority parcels near Bishop's Cap, where frequent recreational visitation poses threats to cultural resources. Previous investigations identified rockshelter occupations dating to the Archaic and Formative period, and collections from those projects included very early maize varieties. This survey re-visited and recorded 10 sites and recorded 15 new sites, ranging in date from 1500 BC to AD 1954. Many of the

sites were negatively impacted by modern visitors. NMSU has made recommendations to the BLM about how best to manage these sites, and what kinds of research opportunities can be pursued in the future.

Marks, Jonathan (UNC-Charlotte)

[247] *On the Origin of Cultures*

As an analytic category, a culture shares many of the same difficulties that a species has in biology: notably, fuzzy boundaries, temporal instability, and extensive substructuring, which render it difficult to define adequately and comprehensively. Nevertheless, the symbolic world or semiotic matrix that any human learns and inhabits can be quite different from one partaken by other people elsewhere, and this is conveniently designated as culture. While there has been considerable speculation on the evolutionary origin and adaptive value of culture as a human mental capacity, there has been little discussion of the evolutionary meaning of another of its salient features: its diversity. Is there an evolutionary benefit to a species speaking different languages, for example, rather than just one? Further, how can we project cultural diversity back to the Paleolithic: Does a similarity of tool type imply a common language or belief system; and if not, then what are the implications for understanding ancient human life? Is culture monophyletic or is cultural diversity primordial, and if the latter, how can we reconstruct early human society?

[152] *Sourcing Etendeka Dolerites in the Stone Age of Namibia*

Basalts and dolomites, associated with the Etendeka Large Igneous Province (ELIP), in northwestern Namibia, often make up the bulk of lithic raw materials present in archaeological assemblages from the region. Different igneous formations within the ELIP can readily be distinguished from one another by various geochemical means, but their huge geographic extent and complex networks of exposures forces us to consider various spatial scales of geochemical variability in inferring patterns of human activities from sourcing data. At the site of Erb Tanks Rockshelter in the Central Namib desert, dolerite in assemblages, dated ca. 17-19 ka BP, derives, exclusively, from sources distributed in a band along the Welwitschia Lineament Structure (WLS), while dolerite from later phases (ca. 8-12 ka BP), can be linked to a variety of likely sources in the ELIP. Combining these patterns from sourcing data with technological analyses, suggest shifts in the spatial scale and diversity of human land use and foraging practices in the region, from a more bounded inland/upland pattern (17-19 ka), to a wider-ranging pattern centered in the coastal deserts (8-12 ka).

Markussen, Christine, Ian Hough (Flagstaff Area National Monuments) and Blayne Brown (EnviroSystems Management, Inc.)

[259] *Photogrammetric Mapping at Three Sites in Wupatki National Monument*

In the fall of 2017, EnviroSystems Management, Inc. conducted architectural mapping of three sites at Wupatki National Monument, part of Flagstaff Area National Monuments, Coconino County, Arizona. The Monument required scaled planimetric drawings and cross-sections of standing architecture at WS323/Small Tower, WS1027/Cloud House, and WS1762/Coyote Water. These sites are located in the backcountry of the Monument which is also a wilderness study area prohibiting the use of drones for mapping purposes. The standing structures were more than 2-meters-high in some cases generating complications for safe placement of a 3D laser scanner. As an alternative to aerial imagery, laser scanning, and traditional field mapping techniques photogrammetric methods were employed to create a 3D model of the structures at each site. These models were created in AgiSoft PhotoScan Professional and converted into georeferenced orthophotographs. Scaled drawings were completed using ESRI ArcGIS. In addition to plan maps, cross-sections of standing structures were made using digital elevation models derived from the 3D models in ESRI ArcScene. A total of 25 masonry structures consisting of habitation rooms and associated features were mapped at the three sites. The work resulted in a cost-effective alternative to drone mapping and laser scanning for standing architecture.

Marquardt, William [9] see Walker, Karen

Marquardt, William

[70] *Are the Calusa Unique? Environmental Stewardship and Historical Contingency in the Pacific Northwest and Southwest Florida*

Coastal societies of the northern Pacific and southwestern Florida were once thought anomalous because they achieved sociopolitical complexity without agriculture. The Calusa are often cited as especially unusual, or as the “pinnacle” of complexity among fisher-gatherer-hunters because they achieved a tributary, state-like political formation by post-contact times. In this paper I re-evaluate such comparisons between the two coastal regions in terms of natural-resource stewardship, collective action, food production and processing, and the emergence of complexity. I argue that environmental characteristics, climatic fluctuations, and historical contingencies were major factors leading to the contrasts between southwest Florida and northern Pacific coastal societies.

Marquardt, William (University of New Mexico, United States Forest Service)

[380] *Toys or Totems? Exploring Ritual and Play in the Middle Rio Grande*

Miniature vessels are generally placed into one of three categories by archaeologists; children’s toys, ritual offerings, or test pots to assess clay quality. Previous studies in the Southwest have explored these small bowls and jars as introductory entries to the potter’s craft, made by small hands under the tutelage – or in emulation – of their elders (Crown 2014; Kamp 2001; Stinson 2004). A number of these vessels frequently show up in ritual or burial deposits, suggesting that at least some of these vessels may not be used strictly as child’s toys. This pilot study explores a sample of 110 of these vessels from Pottery Mound, a Pueblo IV site in central New Mexico, to better understand work, play, and ritual in the late Prehispanic Southwest. A multivariate approach incorporating fingerprint ridge density, qualitative analysis, and spatial context is utilized to better understand the purpose these vessels may have served in the past. Preliminary analysis reveals a statistically significant relationship between the context in which miniature vessels are located and the probable age of the artisan. Vessels likely made by children tend to occur in midden deposits, while those made by adults occur more frequently in rooms or ritual spaces.

[360] *A Closer Look at the Use of Cueva de Sangre through Skeletal Remains*

The use of caves is a part of an essential role in Maya cosmology and ideology. The Petexbatún Regional Cave Survey identified 22 caves and over 11 kilometers of cave passages between 1990 through 1993 at Dos Pilas, Guatemala. This study reexamines 205 human remains collected from Cueva de Sangre. Previous studies (Minjares, 2003) of the Cueva de Sangre skeletal material argue the site was used for the disposal of bodies based on the condition of the remains and their location within the cave. This seems to overlook the sacred role of caves and their use in numerous ritual practices. New data collected by this study identifies trauma and pathologies, allowing us to revisit the question of the cave’s use by the ancient Maya.

[352] *Whose Donkey? Domestication and Variability*

Morphological, genetic, ethnographic and behavioral research on domestication has provided a basis for understanding variability in the process of donkey domestication. It is clear that the lack of herd-based sociality among wild relatives of the donkey and people’s reliance on donkeys for transport create distinctive pathways for domestication of these animals. Here I explore dimensions of variability in the selection processes operating on donkeys in space and time. Donkey domestication has diverse geographic and cultural roots within Africa and Asia, and had different trajectories within pastoral and urban communities. Donkeys became fundamental to life among historic mobile communities in Iran and Afghanistan as well as Africa. They were used in Bronze Age trade routes of southwest Asia. What role, if any, did they play along the

Himalaya range and the Proto-Silk Route? In Africa, how did donkeys become incorporated into the varied communities that developed as pastoralism spread from northeast to eastern Africa? Unlike dogs or horses there has been little intensive selection of donkeys until modern times. Long term gene flow and highly variable selection patterns make domestication of donkeys an extreme example that contributes to thinking about animal domestication broadly.

[110] *Microbiological Significance of Fermented Beverages: Reconstructing the Health and Nutrition of Ancient Agriculturalists*

Approximately 60 percent of all our antibiotics come from streptomycetes, a filamentous soil bacterium. Over 30 years ago, the first evidence of deliberate antibiotic use was among Sudanese Nubian agriculturalists through the consumption of beer that contained tetracycline. The range of archaeological research since the Nubian findings show the profound role of fermented grains in ancient agricultural subsistence patterns. The production of fermented beverages is a near-universal practice in both ancient and modern cultures. Brewed beverages are valuable sources of calories, B-vitamins, and proteins. In Ethiopia, a honey wine, T'ej, has been consumed for centuries and is among the oldest fermented brews still consumed by modern populations. T'ej fermentation relies on the microorganisms present in the fermentation containers but is unique in requiring the addition of gesho (*Rhamnus prinoides*). Furthermore, T'ej contains both alpha-amylase and beta-amylase enzymes - yeasts produce the latter while bacteria tend to produce the former. This study provides a biocultural perspective by reviewing the archaeological and historical evidence of consuming fermented beverages throughout the world. The implications for understanding the role that consuming fermented beverages played in health, social life and, socioeconomic relations remain fundamental to understanding paleonutrition in ancient societies.

[359] *Building Bronze Age Populations of the South Caucasus: Preliminary Bioarchaeological Results from the Kasakh Valley Archaeological Survey*

Bioarchaeological analysis of human remains excavated by Project ArAGATS in the Tsaghkahovit Plain, Armenia has allowed for a unique view onto Bronze Age life and has offered a glimpse into the lived experience of populations constituting early complex polities. Analysis of comparative collections from Horom and other sites in Armenia have yielded important contextual information for population level trends. Most notably, there is high incidence of cranial trauma in Late Bronze Age and Iron I populations, suggesting practices of violence that affected a significant portion of the population. However, small sample sizes and the incomplete nature of the collections and excavated remains has limited the scope of analysis. Our knowledge of social experiences and relationships has thus remained narrow. The 2016-17 excavation of Bronze and Iron Age tombs in the neighboring Kasakh Valley has added new information on the social aspects and rituals of mortuary practices, while the analysis of human remains has offered insight into previously underrepresented portions of the population, namely women and children. Combined, the analysis of mortuary practices and bioarchaeology allow for new perspectives on lived experience in the Bronze Age South Caucasus.

Marsteller, Sara (Arizona State University)

[183] *A Bioarchaeological Approach to the Social Construction of Community Identities in Mountain Landscapes*

The Huarochirí Manuscript has made legendary the social relationships of pre-Columbian groups inhabiting the Andean mountain landscape that ascends steeply from the present-day coastal capital city of Lima, Peru, to the high-altitude Huarochirí Province. In this famous collection of ethnohistoric narratives, authored in the indigenous Quechua language, the group identities of the highland Checa storytellers and neighboring coastal Yunca populations are portrayed as antagonistic, yet simultaneously intricately intertwined. Archaeological investigations of these relationships, however, have focused extensively on locating a boundary between the two groups. The current paper demonstrates how a bioarchaeological approach that engages social theories of community formation and examines multiple social practices simultaneously can elucidate the complex nature of social interactions across mountain landscapes. Focusing on the middle Rimac Valley site of Rinconada Alta, where highland groups are reported to have replaced lowland groups, new mortuary contextual data are combined with previously published isotopic reconstructions of dietary and mobility practices and compared to those from the coastally located Armatambo site to shed light on community formation processes in this potentially contested area. Results suggest that mortuary rituals served as a means to reinforce social ties and promote solidarity among diverse community members.

[185] *Pueblo Warriors, Witches and Cannibals: Indigenous Concepts of Corporeality and the Bioarchaeological Record*

In Pueblo oral tradition, a persistent narrative exists regarding malevolent forces that commit transgressions while inhabiting the corporeal bodies of community members. Referred to as witches (although this is not a term Pueblo people would use) they bring about crop failures through droughts, and they cause famine, sickness and death. Once a witch has been identified and accused, punishment ensues. Execution of witches was common and the physical bodies needed to be completely annihilated through breakage, cutting, reduction and burning. The dangerous process of rendering witches powerless is carried out by warriors who must align with and transform themselves into supernatural beings. Afterward, they must then go through a labored body ritual to cleanse themselves. Witches can never be completely defeated and they are always a persistent threat. Incorporating a more emic perspective regarding factors that contribute to ontological insecurity can provide a rich context within which to interpret the ways that bodies are employed in an attempt to rectify dangerous transgressive forces. Prior research employing western notions about mortuary behavior regarding broken and damaged bones mistakenly interpreted them to represent only cannibalism.

[323] *Theoretically Based Investigations of the Paleo-Indian Occupation of Grass Valley, Nevada*

The nature of human use of the central Great Basin during the Pleistocene-Holocene Transition (PHT) remains unclear. Ongoing archaeological research in Grass Valley, Nevada, focuses on understanding foraging behavior in changing PHT landscapes through expectations of Human Behavioral Ecology and geoarchaeological investigations for defining the extent of wetland habitats and potential for "old dirt". Results document a widespread paleosol in Grass Valley, predating Mazama tephra and representing an interlude of landscape stability within the climatic variability of the PHT. Both surface and subsurface archaeological materials suggest use of a variety of riparian, marsh, and upland habitats associated with desiccating Pleistocene Lake Gilbert. Findings call for a reconsideration of earlier archaeological research in Grass Valley and provide a greater understanding of PHT occupations in the central Great Basin.

[321] *Investigating Copper Ingot Production in the Bronze Age Mediterranean Using 3D Technologies*

The 1960 excavation of the Late Bronze Age (ca. 1200 BC) shipwreck at Cape Gelidonya, on the southwestern coast of Turkey, revealed a ca. 1.2 ton cargo of copper ingots and tools. The metal cargo is defined by its great diversity, yet the ingot assemblage is predominantly Cypriot in origin while the tool metal derives from sources across the Mediterranean region. A sample of 200 copper ingots and ingot fragments from the ship's cargo were selected for 3D digital reconstruction using photogrammetry and structured light scanning. The presence of two ingot types, oxhide and bun-shaped ingots, reflects a degree of standardization but significant variation within these types challenge traditional models of their production. 3D scans of the ingots helped to reveal fine surface details related to their production and transport. Measurements, including volumes and profiles, are used to determine quantitatively the variation among the ingot types. The size and shape of the ingots may suggest various traditions of production, reflecting diachronic and/or synchronic differences of origin in a single assemblage not unlike metal hoards known to terrestrial sites. This is an important first step in identifying the organization of the production and exchange of these goods in the eastern Mediterranean.

Martin, Simon (University of Pennsylvania Museum)

[199] *Politics of the Borderlands: An Epigraphic History*

The region now divided by the national boundaries of Belize and Guatemala was once home to a broad range of political entities. Noticeably, large centers with monumental inscriptions in the western and southern portions contrast with smaller and far less textually verbose sites in the Belize Valley. Although this makes for a clouded and imbalanced historical context, the evidence we have for the political dynamics between these two styles of institution through the seventh, eighth, and ninth centuries can play a critical role in understanding important cultural and social developments through this time. Even if many issues remain unresolved, the key contribution of historical archaeology lies in its ability to generate new questions for each of its two component epistemologies—the textual reflecting on the material and vice versa.

Martin-Apostolatos, Gwendolyn (University of Missouri, Columbia)**[9]** *The High Cost of Living: Death and Social Identity of Missouri's Historic Columbia Cemetery*

The gravestones of Missouri's historic Columbia Cemetery demonstrate the evolving social identity of the population of Columbia, MO. These stone artifacts display information that reflects the mortuary values of the residents of this city, spanning more than a century. This study resulted in a database of local historic mortuary monuments documenting their demographic, morphological, materialistic, and stylistic characteristics. These traits were examined and evaluated in order to track the gravestone choice trends for the early inhabitants of Columbia, MO, specifically the first century after the founding of the city. With the passage of time the grave markers in Columbia, MO have reflected changing preferences from tall, statuesque limestone and marble monuments to more moderate granite headstones. The epitaph has gone out of style while the use of a uniting family headstone has soared in popularity. Overall this Midwestern town has had a decline in the use of elaborate monument use when memorializing the dead. These results point to shifting views on death within this community.

[255] *An Interpretative Framework and Description of Ritualized Obsidian from Caracol, Belize*

Ceremonial life at Caracol, Belize can be assessed through a technological and contextual analysis of ritualized obsidian objects. These items are typically termed "obsidian eccentrics", although "ritualized obsidian" more specifically enables a usable and socially interpretive framework based on archaeological context that relies less on symbolism for interpretation. Analyzing the obsidian contextually emphasizes historically important materials and associated crafting, exchange, and depositional practices. While we describe some obsidian as being ritualized as opposed to being quotidian, our primary purpose here is to describe the morphology, chronology, and spatial extent of ritualized obsidian at Caracol, Belize from the Late Preclassic through Terminal Classic Periods (ca 300 BC – AD 900). Towards this end, we present information on some 35 years of standardized excavation data to demonstrate the patterned ways obsidian was crafted into ritualized forms that were then deployed in important cyclical events that transcended our traditional interpretation based on social stratification and on ancient Maya household wealth or status.

[103] *Social Interaction and Exchange Networks in Eastern Honduras: Late Classic-Early Postclassic Period (AD 600-1000)*

Ceramics have been the most reliable indicator of social interactions in eastern Honduras. However, these material indicators have also been described sometimes as being rather homogeneous throughout the region. On the other hand, some scholars point out intraregional variations regarding eastern Honduran ceramic assemblages and what they represent in terms of intra and interregional interactions. It has also been argued that in both eastern and northeastern Honduras no great number of commodities was mobilized through interregional exchanges with west-central regions of the country,

especially regarding obsidian procurement. Little has been said about commodity exchange among ancient communities within eastern Honduras. Based on ceramic and obsidian evidence, this paper will explore and re-examine interregional interactions within eastern Honduras, focusing on sites with similar and—apparently—late and short occupations (around AD 600-1000), namely: the Talgua Drainage, the Telica and Culmi Valleys in eastern Honduras and the Jamastran Valley in southeastern Honduras. An overview of these social trajectories from eastern Honduras is pertinent considering recent finds in the northeastern area, which highlight complex exchange networks in the region during the Late Classic and Early Post-Classic Periods.

[364] *Distributional Archaeology in the Steppes on North Patagonia (Río Negro Province, Argentina)*

One of the most important legacies of Dr. L.A. Borrero to the archeology of Patagonia has been the application of distributional approaches. The objective of this paper is to present preliminary results obtained from the application of this approach to a recently investigated area lacking prior archaeological research: the plains located between the middle Colorado and Negro rivers (Río Negro province). This arid-semiarid landscape is characterized by xeric vegetal communities of the monte shrub elements. The predominant plateau-like relief is interrupted by high ancient geomorphic surfaces and dry lakes. Systematic surface sampling reveals: a) an overwhelming predominance of lithic materials with very little representation of pottery and absence of fauna, and b) that the highest concentration of materials is located around dry lakes.

No chronological dates of any kind have been obtained so far but based on material culture (pottery) a minimal chronology of the late Holocene is estimated. Whether hunter-gatherer societies used this interfluvial space as a transit area between the valleys and /or if was used in a more stable residential manner are hypotheses that will be tested in this work.

Martinez, Jupiter (INAH-Sonora)

[16] *The Cocospera Valley in the Prehistoric, Protohistoric and Misión Period: A Corridor of Cultural Exchange?*

There is a western geographical gap between the Trincheras and Hohokam archaeological traditions in the State of Sonora, Mexico. This area is the Cocospera Valley where the prehistoric sites have artifacts from Trincheras, Hohokam and Casas Grandes traditions. In the early mission period time the written records suggest this valley as a maximum boundary between O'tham and Athabaskan bands with a strong record of violence. In terms of density, presence and absence material culture and architectural patterns a cultural corridor can be suggested as a prehistoric and historic phenomenon.

Martinez, Kailey (New Mexico State University)

[263] *Resource Use and Sustainability of the Gila's South Diamond Creek Pueblo*

The Gila National Forest and Gila Wilderness are the names ascribed to rich mountainous land spanning between western New Mexico and eastern Arizona. This land was once home to the people of the Mimbres culture. The environments within the Gila vary due to different altitudes and precipitation, which also effect the types and amount of ecological resources, such as vegetation and prey species, available in those areas. The location of the Mimbres settlements, and the size of the settlement itself, would have greatly affected how the people were interacting with their surrounding ecology. Students, professors, and volunteers of New Mexico State University have spent two seasons excavating South Diamond Creek Pueblo, a four-room Mimbres habitation site located in the Northern Mimbres Region. In using preliminary data from zooarchaeological and isotopic analysis, this presentation will display how site locality and size could lead to differing patterns of resource usage and sustainability between South Diamond Creek Pueblo and larger, contemporaneous Mimbres villages.

[406] *Reflecting on the History and Use of Rectangular Obsidian "Mirrors" from Central Mexico: Reinterpreting Old Museum Collections*

This paper highlights the relevance and potential of collections-based research through a case study of rectangular obsidian "mirrors" from Central Mexico, typically associated with the Aztec, housed at the Smithsonian Institution, National Museum of the American Indian (NMAI). To date these highly polished obsidian objects are found exclusively in museum contexts, and classified as "mirrors," however most recent research indicates that they are colonial objects that were most likely commissioned by the Spanish and used for various purposes. Spanish accounts imply that such objects were crafted by native flint knappers, however a general analysis of the morphology and the manufacture of obsidian mirrors has yet to be accomplished. Additionally, Spanish chroniclers indicate multiple obsidian crafting communities located near major obsidian sources. Raw material provenance studies could therefore reveal if there were multiple communities involved in the manufacture of rectangular obsidian mirrors, or if this art was exclusively practiced at one specific area still to be identified. This presentation focuses on six rectangular, highly polished obsidian objects from NMAI's collections previously interpreted as "mirrors," and will discuss their manufacture through techno-morphological analysis, the significance of raw material provenance, their potential functions, and why this specific material was chosen.

[350] *The Transformation of Long-Term Anthropological and Archaeological Engagements in Communities: Cases from Southern Manabi Province*

For the past 20 years, we have conducted research along the Ecuadorian coast in the province of Manabí. Over time, our work has evolved from that of strictly scientific issues to the incorporation of local community-based participatory research models. As other anthropologists have discovered, a continuous commitment with a research site leads to new and deeper forms of anthropological engagement with communities. These new modes of collaboration are simultaneously fruitful, practical, and precarious. In this paper, we present an evaluation of our work within the communities of southern Manabí Province and the consequent transformation of our relations with the inhabitants of the sector.

[192] *Costumbres funerarias en la época del contacto en la Huasteca Potosina*

El contexto funerario de una mujer adulta nos muestra que, dentro de las conductas funerarias presentes entre las élites de Tamtoc, era tradicional ataviar al individuo con lujosos bienes procedentes de muy diversas regiones. Las costumbres funerarias y el estudio sobre el origen de los objetos de este ajuar nos permiten respaldar la idea de que la sociedad urbana de Tamtoc, al menos durante el periodo Posclásico (900 a 1521 d.C.) y hasta el contacto con los españoles, era una sociedad compleja, fuertemente jerarquizada que formó parte de la amplia red de interacción en la Costa del Golfo por donde circularon productos suntuarios de regiones tan distantes como Arizona, E.U.A., el Océano Pacífico o la región del Motagua en Guatemala. También nos sugiere, de alguna manera, como esta intensa red de interacción prehispánica fue utilizada inmediatamente por los conquistadores españoles para sus propios intereses.

[270] *O'na Tök: A Zoque Center in Western Chiapas, México*

In June of 2016, the archaeological site designated O'na Tök was recorded as a primary center in the western portion of the

Central Depression of Chiapas, Mexico. Preliminary studies of cultural material recovered on the surface and test pits suggest the Zoque of O'na Tök participated in an exchange network with contemporary centers during the Early Preclassic until the Postclassic, with a peak period during the Middle Preclassic and Late Classic. The public architecture seems to share similar features with other contemporaneous sites in the surrounding area such as Ocozocoautla-Cerro de Ombligo and Chiapa de Corzo. However, evidence suggests the center was not built based on the designed layout of La Venta, an architectural configuration theorized to have been emulated by other Middle Preclassic centers throughout the region, nor does the site reveal an E-Group pattern, possibly indicating the center played a distinct role in the region. Based on the layout of the center, the geographic position, the variety of obsidian sources recovered, and various types of pottery represented at the site, we propose that the occupants of O'na Tök played a significant role, possibly as a regional trade center during the Preclassic and Late Classic period.

[68] *El papel del suelo en la conformación del contexto arqueológico en el área de El Fuerte en la antigua Tlaxcallan*

Este trabajo de investigación se desarrolló en el actual estado de Tlaxcala en un área denominada “El Fuerte”, que formó parte del Estado tlaxcalteca en época prehispánica, y se inserta dentro del “Proyecto Arqueológico del Tlaxcallan. Hogares, Terrazas y Gobernanza en el Posclásico Tardío”. El presente trabajo es un acercamiento a la conformación del contexto arqueológico y la relación con su medio ambiente, entendiendo el papel que juega el suelo en esta conformación, pero también analizando la formación, composición y transformaciones, tanto antrópicas como naturales que el suelo ha sufrido a lo largo del tiempo. Este estudio se desarrolló a través de la aplicación de algunas técnicas de las geociencias, en específico de análisis físico-químicos y de la micromorfología; que proporcionaron datos para la elaboración de un enfoque que permitió conocer en qué suelo se construyó el sitio, los materiales que fueron utilizados y las transformaciones a las que fueron sometidos estos materiales por los humanos de la sociedad prehispánica que habitaron el área; así como la posterior degradación, reutilización y transformación de los mismos, que contribuyeron a la formación del contexto arqueológico.

[307] *Ethnoarchaeological Survey in Santo Domingo Tonaltepec, Oaxaca*

The Tonaltepec Ethnoarchaeological Project focused on one of the few surviving pottery-producing communities in the Mixteca Alta region of Oaxaca. The project investigated whether Tonaltepec's contemporary tradition of pottery production can be traced back to prehispanic times. To do this, we conducted ethnographic research and video recordings with modern potters, along with a full coverage archaeological survey in the municipal territory. The survey not only recorded all archaeological evidence of ancient human activity and habitation, but also the location of clay and temper sources used in contemporary pottery production. The ethnographic and archaeological data recovered provide insights on the social organization and processes of pottery production and their role in influencing settlement patterns in the area. These data also provide information on the construction and abandonment of agricultural terraces and the spatial relationship between the raw material sources and the location of potters' households. Finally, Tonaltepec was the site of a violent conflict with a neighboring community in the early twentieth century, which resulted in the sudden abandonment of numerous households. This specific historical context paired with our survey results allows us to test models of settlement abandonment and their material correlates.

[375] *Evidence of Early Human Occupation at "Cueva de los Hacheros", Michoacán*

In 2016, Dr. Jose Luis Punzo-Díaz attended to a complaint from the municipality of Turicato regarding the rockshelter Cueva de los Hacheros. As part of Proyecto de Arqueología y Paisaje del Área Centro Sur de Michoacán, the site was excavated. During excavations, the project discovered evidence of multiple periods of human occupation separated by different strata showing that the site was in use over a long period of time. The lower levels excavated demonstrated an aceramic context and artifacts found include arrowheads, stone spear points, human and faunal remains. The superior levels yielded pre-Classic materials including ceramic vessels, lithics, faunal and human remains with associated grave goods and shell ornaments. This poster focuses on the lithics from the aceramic layer, especially the stone arrowheads and stone spear points that are morphologically similar to other points found in early prehistoric sites in the southwestern U.S. and in northern and central México. Radiocarbon dates (12,000 B.P. and 11,000 B.P) determined that the site was in use in the late Pleistocene and early Holocene. The context and our analysis of the lithics and associated debitage suggest that the site may have been a lithic workshop and hunter-gatherer camp.

[175] *Identifying Signatures of Selection in Archaeological Sequences*

Both neutral drift and selection cause the frequencies of artefact types in archaeological sequences to vary over time. Discriminating between these two processes, based on a time series of artefacts from a site or region, is often important for answering archaeological questions. However, archaeologists have few tools available for detecting if there is a significant signal of selection for a specific artefact type over time. We draw on recent work in population genetics to explore statistical methods for detecting selection in archaeological assemblages. Here we present an archaeological application of the frequency increment test (FIT), which rejects neutrality if the distribution of normalized artefact-type-frequency increments exhibits a mean that deviates significantly from zero.

[314] *Evaluating Precolumbian Contact between Ecuador and Costa Rica: A Ceramic Approach*

Archaeologists have long noted similarities in ceramic technologies and traditions between Costa Rica and Ecuador. These are relevant for models of culture change, whether the result of direct interactions or parallel cultural processes in the emergence of social complexity. We test the alternatives of direct, long-distance contact along the Pacific coast or traditions that are parallel but independent. To date, assertions of relationships have been based upon inductive observations of similar ceramic traits such as polychrome fine-paste wares. However, the possibility that these were the result of direct, long-distance contact has yet to be tested through a systematic evaluation of specific hypotheses based upon contextualized evidence. In this paper, we focus upon archaeological data from the Pacific coasts of Costa Rica and Ecuador during the period of ca. 200 – 1200 CE as a means for testing whether, when, and how ceramic styles and technology of southern Greater Nicoya during the Bagaces and Silencio Periods were either directly or indirectly related to that of the Guangala ceramic phase of coastal Ecuador. Our analysis draws upon data from style, design, and iconographic data.

[232] *Foodways and Identity in the Great Lakes: Investigating Western Basin Tradition Food Production Using Starch Grain and Macrobotanical Analysis.*

Recent excavations at the early Late Woodland (A.D. 1,000-1,300) Western Basin Tradition Arkona sites have called into question our conceptualization of Algonquian food production, landscape construction, and mobility in southwestern-most Ontario. Isotopic analyses have also revealed a vast underestimation of the amount of maize consumed by WBT peoples at this time, likely a reflection of the limited excavation and botanical analyses undertaken at these sites. This paper will present the results of paleoethnobotanical analyses including macrobotanical identification from flotation at the Arkona sites, as well as starch grain analysis of dental calculus from the nearby Lucier site. This paper will examine WBT food production and consumption practices as compared with their maize-bean-squash cultivating Iroquoian neighbors. New data suggests previous culture-historical models have created a false dichotomy between WBT 'hunter-gatherer' subsistence strategies and Iroquoian farmers. This paper will take a more nuanced approach to WBT identity as created through complex food production practices occurring at the periphery of Iroquoian territory and influence to provide more meaningful cross-cultural comparisons of foodways during the early Late Woodland period.

Matadamas Gomora, Diego (Tulane University) and Angel González López (University of California, Riverside)

[202] *Considerations Regarding the Sculptures Commonly Called "Standard-Bearers"*

Many images in the iconographic corpus from Pre-Hispanic Basin of Mexico belong to forms which were created and reproduced either in codices, mural painting, ceramics, and sculpture. Some examples are the attires of deities, specific icons used to represent natural elements, like rain, comets, even the Sun, and corporal postures used to communicate the identity of a character as well as the activities it performs. In the specific case of stone sculpture, the posture of "standard bearer" was commonly represented. In it, the character appears erect with its feet together, one or both arms flexed; the hands have one or two perforations, usually recognized as the hole to insert the bearer. Nevertheless, a detailed analysis shows that these sculptures were created to represent a broad range of characters, like deities or warriors, which will be the focus of the present paper. This kind of representations are also common in the Puebla-Tlaxcala Valley, and the Gulf Coast, and very rare in other macroregional areas like West Mexico, the Mixteca and the Maya area, revealing an interaction between these zones based on sharing ideological and iconographic elements, and conforming similar artistic styles during

Late Postclassic.

Matheny, Deanne

[420] *Montezuma Village Revisited*

Montezuma Village, located in San Juan County, Utah, was a large prehistoric Ancestral Puebloan community center. Although the village was visited by explorers and archaeologists in the late nineteenth and early twentieth centuries, the first effort at documenting the entire village was in the early 1960s by Ray Matheny. Parts of the village were inhabited at least from Pueblo I through Pueblo III times. Despite significant damage from human and natural forces, substantial areas of the village remain available for study. Most of the village is on private land with one section on BLM land. Recent investigations at the village revealed more about its extent, layout, and occupation. Residue and soil studies were also carried out. The village has two great houses; one is a Chaco-era, multi-story structure with a compact footprint, a steep vertical back wall and at least three depressions. Its presence reflects participation in the widespread Chaco great house system. Many village structures appear to be late Pueblo II period, single-unit or multiple-unit pueblos. Recent investigations contribute to a better understanding of the dynamic role Montezuma Village played as an important community center near the northern frontier of the great house system.

Matheny, Ray, Winston Hurst and Joel Janetski (Brigham Young University)

[420] *An Introduction to the Archaeology of Montezuma Canyon, San Juan County, Utah*

Montezuma Canyon is a large entrenched north to south drainage in southeastern San Juan County, Utah. Significant tributary canyons join it along its course to the San Juan River. Our focus here is the canyon segment from near the head down to the Navajo Nation border. There are a few records of early explorers and archaeologists in the canyon, but in the early 1960s archaeological investigations began in earnest as Ray Matheny, then a Brigham Young University (BYU) graduate student, conducted a Master's thesis survey. The canyon's great archaeological potential was revealed by the sites documented, including Montezuma Village and Coal Bed Village, both large, complex settlements. As a BYU faculty member in the late 1960s to late 1970s, Matheny conducted annual field schools in the canyon. In the 1980s Joel Janetski continued BYU's interest in the canyon as he directed field schools focused on Nancy Patterson Village and its environs. Recent BYU-affiliated work in the canyon, including a field school at Coal Bed Village conducted by James Allison, is offering new perspectives. Prior and recent investigations provide a wealth of data to explore research questions about the Ancestral Puebloan occupation of the canyon and that of later groups.

[104] *Public Archaeology at Kathio National Historic Landmark: Structure and Archaeobotany of a Burned Earthlodge*

Kathio National Historic Landmark, in east-central Minnesota, is an important place within the ancestral homeland of the Dakota Nation. Petaga Point (21ML11) is one of the contributing sites within the landmark, and excavations there in the

1960s were a primary source for the Woodland Tradition ceramic sequence of the Mille Lacs locality. Elden Johnson excavated a burned semi-subterranean house feature in 1967, describing it as one in a cluster of five or more. In 2006, we found what appeared to be one of the houses, and investigated it over the next decade in a series of public archaeology projects through the annual Kathio Archaeology Day event. We excavated one 1x1 meter unit each year, forming a cumulative block. We found remnants of undocumented archaeological units, but also intact portions of the house with a burn layer of charred material, and stratigraphy indicating that the structure was an earthlodge. The program was designed as a “public watching” event. One archaeologist conducted the excavation while another interpreted the research process and findings to visitors. Botanical remains include wood from the structure of the house, seasonal foods indicating mid-summer, and potentially medicinal plants. Geophysics indicated a network of footpaths within the village.

Mathers, Clay (The Coronado Institute)

[162] *Persistent, Multiscalar Disentanglement: Native-Spanish Trajectories in Early Historic New Mexico*

What began in 1540 with sustained, lethal confrontations between Southern Tiwa pueblo communities and the conquista campaign of Vázquez de Coronado, set in motion a history of relations in New Mexico regularly punctuated by acts of Native independence and disengagement, and by Spanish policies and countermeasures to establish colonial peace and authority. As one of the most densely populated and economically advantaged regions in the American Southwest, Southern Tiwa territory (Tiguex) was critical to the success of the colonial project in northern New Spain. Seen first by Spaniards as a possible resource extraction zone and for its encomienda potential, Tiguex later became a region to be definitively restructured and marginalized. Decoupling from the Spanish colonial project therefore not only had its origins at the earliest stages of contact, but was a Native-Spanish tendency maintained – in varying degrees – for nearly 150 years. This paper argues that significant, material aspects of disentanglement can be seen throughout Early Historic New Mexico, and at the scale of individuals, communities, regions, and inter-regional territories. Furthermore, it emphasizes the importance of tracing the deep history of these historical patterns, their long-term trajectories, and the role played by diverse colonial actors in different, multiscalar contexts.

Mathiowetz, Michael (Independent scholar)

[243] *The Casas Grandes Flower World and its Antecedents in Northwest Mesoamerica and the U.S. Southwest*

One of the key issues in the study of the Flower World complex is determining the chronology and nature of its transmission from Mesoamerica to the U.S. Southwest. Scholars contend that the most clear material culture and symbolic evidence indicates that the Flower World was present in the Southwest to a limited degree among the Chaco Canyon and Mimbres cultures after AD 1000 with few antecedents. Others suggest much earlier dates in the Southwest, perhaps corresponding with the onset of maize agriculture. Evidence from language studies offers insight, but clarity as to the origins and antiquity of this complex is needed. This presentation provides a macroregional analysis of the historical dynamics of the Flower World ideology encompassing northwest Mesoamerica, northern Mexico, and the greater U.S. Southwest. I propose that key tenets of Flower World symbolism appear with the Xochipilli complex in the Aztatlán region of west Mexico around AD 850/900. With expanding interaction networks linked to ritual economies, Mimbres and Chaco cultures adopted elements of the Flower World. By AD 1200/1300, a pronounced manifestation of this ideology took form in the Casas Grandes culture at Paquimé. This complex spread more extensively across the Southwest thereafter during the Pueblo IV period.

[385] *Reinterpreting State Shifts Using Legacy Data: Colonialism and Zooarchaeological Assemblages in Southern Arizona*

Complex systems approaches to archaeological interpretation are well-established in the discipline and offer important ways for studying change over various scales. Large datasets and regional syntheses invite new applications of complex systems

to archaeological data. At the same time, indigenous and postcolonial perspectives have increasingly become foundational to project planning, data collection, and interpretation. Despite the importance of these two approaches to contemporary archaeology, researchers seldom interpret complex systems concepts and methods through indigenous ontological frameworks. The lack of substantial dialogue between these theoretical approaches results in uncritical applications of complexity theory which inadvertently reinforce scripts of settler colonialism. This paper reviews legacy faunal data from southern Arizona to challenge the prehistoric/historic break often used in the interpretation of archaeological materials. This case study of data reinterpretation examines how careful data sharing and indigenous perspectives can inform interpretations of state shifts in complex systems and colonialism.

[110] *Anthracological Analyses of the Iron Age Shell Middens Complex at Praia da Rocha, Inhambane, Mozambique*

In 2016, our teams carried out survey and excavation field work in the Inhambane Province, located in southern coastal Mozambique. At Praia da Rocha we have identified several previously unknown shell middens dated to the regional Iron Age (c. 700 BP). All sites are located within few hundred meters of each other and only one (Praia da Rocha 1) was, so far, excavated, revealing not only dense concentrations of shells, charcoals and potsherds, but also a human burial. This poster presents the taxonomic identification of charcoals coming from five of these shell middens and to compare them, with the goal of drawing a characterization of the acquisition of wood for fuel during the Iron Age in coastal Mozambique. Charcoals were recovered individually or by sieving at Praia da Rocha 1 and from bulk sediment samples collected from exposed profiles at each one of the other sites. They were analyzed using standard methods of light microscopy, considering features of the three main sections of charcoals: transverse, longitudinal tangential and longitudinal radial. Results revealed similar woody taxa across all shell middens, with a greater diversity of woody taxa associated with the human burial at Praia da Rocha 1.

[402] *A Tale of Tongan Chickens*

Lapita peoples transported a number of animal species in their colonizing canoes as they settled the islands of the Pacific. Included among the domesticated animals introduced by Lapita peoples were chickens (*Gallus gallus*). Later, Polynesians also transported chickens as they settled many of the islands of the Polynesian Triangle. The discovery of pre-Columbian archaeological chicken bones recovered from the site of El Arenal, on the south-central coast of Chile, has been the topic of significant debate. Ancient DNA and isotope data of these remains indicate that chickens were likely introduced by Polynesian voyagers and thus provide clear evidence of pre-Columbian Polynesian contact with South America. It has been suggested, however, that the DNA sequences obtained may have been the result of modern chicken DNA contamination in laboratory reagents. Recently obtained complete mitogenome data from early Tongan chicken bones will be presented and discussed in terms of debates regarding the origins and the timing of Pacific chicken introductions and evidence of prehistoric Polynesian contact with South America.

Matson, R.G. (Univ of British Columbia) and William Lipe (Washington State University)**[313]** *Setting the Stage: The Landscape Archaeology of the Cedar Mesa Basketmaker II*

During the Basketmaker II (BM II) many of the features that characterize succeeding Puebloan cultures were developed. There are two main BM II agricultural adaptations--the earlier canyon floodwater farming and the later mesa-top dry-farming. On Cedar Mesa, the earlier form is best known from the Turkey Pen site in Grand Gulch and the later adaptation from mesa-top surveys and excavations. The canyon adaptation (ca. 100 BC to ca. AD 150) is tentatively named the Turkey Pen Phase. The mesa-top form dates to AD 200-400 and has been named the Grand Gulch Phase. Some of the major cultural landscape features and basic settlement organization that characterize later Northern San Juan Pueblo cultures were first developed in the expansionary Grand Gulch Phase. We review aspects of the Cedar Mesa BM II and discuss how the cultural landscapes created in that period have implications for the later Puebloan cultures across the northern Colorado Plateau.

Matsumoto, Yuichi and Eisei Tsurumi (University of Tokyo)**[306]** *From Kotosh to Pacopampa: Sixty-Years of Japanese Investigations on the Andean Formative*

From the excavations at Kotosh during the 1960's, the University of Tokyo school of Andean Archaeology has consistently carried out large-scale archaeological researches focusing mainly on the Formative Period of the central Andes. All the archaeologists participated in the excavations, from the first ones by University of Tokyo Scientific Expedition at the site of Kotosh till the current Pacopampa Archaeological Project by the National Museum of Ethnology team, continue to share a principal research theme, the formation process of early Andean Civilizations. Their researches can be characterized by multi-year and large-scale excavations focusing on a single ceremonial center such as Kotosh, Huacaloma, Kuntur Wasi, and Pacopampa, and cooperative public activities with local communities for the practical use of archaeological sites as cultural patrimony. The former has resulted in establishing fine-grained site chronologies while the latter produced a site museum co-managed by archaeologists and local populations. In this paper, the authors will summarize the sixty-year history of their researches on the Andean Formative in chronological order and consider their legacies to Andean archaeology both in research methodology and public activities.

Mattioli, Tommaso [369] see Diaz-Andreu, Margarita

Mattson, Hannah (University of New Mexico)**[245]** *Directional Color Schemes at Chaco Canyon: Quaternary Patterns in Ornaments and Minerals from Kiva Offerings*

The placement of colorful ornaments, marine shell, and minerals in discrete ritual deposits is a long-lived practice in the Ancestral Pueblo region. This tradition is exemplified in Chaco Canyon, where numerous ceremonial deposits comprised of such objects have been documented in kivas and other rooms within great houses. These materials display patterned variation in their distribution and co-occurrence in structured contexts, suggesting that they held symbolic significance. In this paper, I explore the hypothesis that the past meanings of ornaments and minerals in Chacoan kiva offerings may be linked to cosmological associations between specific colors and world quarters/directional quadrants. Color-directional schemes are common in traditional societies worldwide, and quaternary systems (those including four directions, each with a different color association) are particularly widespread among ethnographically documented North American groups, including the Pueblos. I also consider evidence for color circuit directionality (clockwise/counterclockwise) and changes in

offering contents over time.

[395] *The Castles in Communities Model: An Integrative Approach to a Field School, Research Project and Community Collaborative in Ireland*

Castles in Communities: Medieval Ireland Past to Present (CIC) is a multi-year project in Ballintober, County Roscommon, Ireland, with a trifold identity of an archaeological and anthropological field school, a research project focused on medieval Ireland, and a community collaborative focused on heritage preservation and celebration. The underlying premise of CIC is that the construction of knowledge about the past and its use as heritage today is best served through both excavation and ethnography, and with a firm commitment to the ethics, methods and theoretical implications of community-engaged archaeology. After four field seasons, CIC is beginning to see the results of our integrated model, and specifically how our work is being integrated into the construction and utilization of a local heritage narrative, a narrative which took center stage in Ballintober's 2018 bid for the national Pride of Place competition, and a narrative which is emerging as a potentially attractive one in tourism initiatives such as Ireland's Hidden Heartland. This paper will share highlights of our model along with some of the successes and challenges to date of our integrated and community-centered approach.

[111] *The Langobards in Italy? A Look at Migration in Vicenza Using Oxygen Stable Isotope Analysis*

At the end of the Great Germanic Migrations in AD 568, Langobards from Pannonia entered and occupied 2/3 of the Italian peninsula. It is unclear how large these migrations were, as historical documents exaggerate mass movements; however, conservative estimates suggest they made up 8% of the Italian population. This research identified migrants in two 7th century AD Italian cemeteries from Vicenza, Dueville and Sovizzo, which contain evidence of the Langobard occupation. Oxygen stable isotope analysis was performed on 60 individual tooth enamel samples, and converted to drinking water using well established equations. The results indicate that 33% of the individuals from Dueville and 40% from Sovizzo have oxygen values outside the local range, for a total of 37%. Interestingly, the oxygen values for those considered non-local are enriched, potentially indicating Byzantine migrants from the coast, or from North Africa, with one individual having values suggestive of the Pannonian region. This is not surprising given migration and mobility throughout Italy has been established for centuries. The lack of identifiable Langobards in this study could be due to the generation of Langobards in the cemeteries, or it is comprised of the local population under Langobard rule.

[296] *Explorations East of Paquimé*

Since 1994, the Instituto Nacional de Antropología e Historia has conducted archaeological surveys and excavations in the river valleys and drainages in the Casas Grandes region east of Paquimé in northern Chihuahua. Sites from the Archaic through the terminal Casas Grandes periods were found and recorded. Spanish Colonial artifacts from Camino Real traffic were also noted at some places. Surface collections were made as well as occasional testing or recovery of exposed human remains. Sites recorded or studied include campsites, open-air sites, farmsteads, and villages. Evidence for localized pottery production and turquoise processing was examined in detail at several sites. There are indications that sites along the Rio Carmen were politically independence from Paquimé but that a trade relationship existed. An overview of findings is presented.

[127] *The Effect of Climate Change on the Niche Space of North American Proboscideans*

Most researchers agree that the extinction events of North American megafauna, including proboscideans, occurred approximately 13,000 years ago. The reason for the demise of these creatures, in particular proboscideans such as mammoth and mastodon, is a matter of debate. There are three accepted general hypotheses explaining the extinction of these North American megafauna: (1) human over-hunting (2) climate change leading to a reduced niche, or (3) a combination of climate change and human over-hunting. While two of the three hypotheses invoke climate and environmental change as a factor impacting proboscidean extinctions, how climate change might have affected the suitability of the proboscideans' environments remains unclear. Here, using archaeological and paleontological location data and paleoenvironmental reconstructions of key environmental variables, we reconstruct and examine the niche space occupied by North American proboscideans and investigate the effects of climate-variable changes on niche space fluctuations between 30,000 and 10,000 years ago. Studying the impact of climate change on the proboscidean niche should facilitate parsing the non-human effects on their disappearance, and increase focus on the effects that human hunting might have had on these mammal extinctions.

[198] *From the Canopy to the Caye: Two of Britain's Colonial Ventures in Nineteenth-Century Belize*

During the nineteenth century, Latin America was a hotbed of trade and commerce driven principally by extractive industries such as agriculture and hardwood collection. Such ventures required large injections of capital into the creation and maintenance of productive landscapes as well as for hiring, housing, and feeding the workers who provided labor. Our presentation will explore two such sites in Belize: Lamanai, an inland site, which is located in northwestern Belize and San Pedro Town, located off the coast of Belize on Ambergris Caye. During the nineteenth century British colonists established settlements at these sites: at Lamanai, to plant sugar cane and harvest hardwoods and on Ambergris Caye to cultivate coconuts. Along with wild fauna, chicken, beef, and bottled, canned, or barreled products such as soda water, salted pork, and potted meat, the residents of nineteenth-century Lamanai and San Pedro Town were also active consumers of tobacco and bottled alcoholic beverages. In addition, earned labor money was used to purchase bottled medicines, health and hygiene products (e.g. chamber pots), and wearable objects such as buttons and boot heels. We compare and contrast these two contemporary sites, situated in different landscapes, but both within the Latin American, British colonial-industrial complex.

[304] *Quail in the Religious Life of the Ancient Nahuas*

In documentary sources recording Nahuatl culture of the Late Postclassic period, a bird called zollin, identified as a quail (*Cyrtonyx montezumae*) is especially prominent. Indeed, these small birds were often chosen to be sacrificed before the divine effigies and, in some cases, to be consumed during ritual events. Despite the significant role played by quail in Nahuatl social and religious life, this bird has been neglected in the study of central Mexican cultures. This paper focuses on the symbolism of quail in rituals of the ancient Nahuas, including their physical characteristics and their representation in the codices, as well as their role in religious life. This paper analyzes the rites involving quail, the divinities and the associated characters, as well as the specific contexts. Finally, this research explores the relationship between this data and archaeological evidence documenting fauna discovered by the Templo Mayor Project and the Urban Archeology Program,

in Mexico City.

[297] *Working Towards Collaboration: a Model of Interaction between Archaeology Professionals and Avocationalists*

Avocationalists are a valuable asset for museum curators and collection analysts. Budget-strapped institutions can benefit from a structured program of volunteers trained to clean, sort, analyze, and catalog artifacts for inclusion into museum collections. From an existing strained relationship, archaeology lab managers and volunteers in Oklahoma have developed a working program that has significantly reduced a backlog of artifacts collected through the years. Our presentation examines the experience of artifact processing from an avocationalist's point of view. We will discuss strategies that resulted in meaningful accomplishments for our state archaeology labs as well as rewarding experiences for the volunteers involved.

[79] *Contributions of a Three-K'atun Archaeologist to Theorizing the Classic Maya Past*

Theory—the workhorse of evidence—is a powerful engine that can revolutionize understanding or create a huge misstep. To theorize the past is to generalize principles and processes of human practice that surpass cultural boundaries. By participating in these larger networks of meaning, theorists hope to link the specific with the general in a truly resonant fashion. But the meaning(s) of material remains for peoples of the past remain(s) an elusive thing, which by no means is made more transparent by past use of a written script. A strong contribution of Stephen Houston's scholarship lay in deftly amplifying theoretical frameworks that resonate with Maya materials. The implications of this scholarship for our understanding of a range of material remains from hieroglyphic texts to LiDAR imagery is considered. A Maya archaeologist who came of age during the golden years of the decipherment, Houston's social contextualization of Classic Maya southern lowland royalty defies comparison as does the career of this remarkable scholar who is both humanist and social scientist.

[279] *Subverting Forced Confinement? Methodological Approaches to Re-peopling Archaeological Studies of Institutions*

Archaeological studies of institutions have had varying degrees of success in moving beyond the intentions of their builders - and their often-imposed material culture - to understand how the inhabitants lived in and experienced them. Our overarching interest in analyzing, recording and interpreting material remains can sometimes prevent us from moving beyond the 'stuff' to actually grapple with the experiences of institutions as concepts. I argue we should attempt to record the negotiations between structure and agency; subversion and compliance in order to figure out how they co-existed rather than focus solely on material remains. This paper will use the case-study of a largely extant Magdalene Laundry in Dublin,

Ireland, to explore how we can utilize an archaeological sensibility while incorporating the testimonies of surviving inhabitants into our recording of these places. In particular, this paper will discuss both the benefits and drawbacks encountered in utilizing site-responsive oral testimonies with elderly, former inhabitants of religious-run institutions. It will conclude there is a need to consider how we include the experiences of forced inhabitants as not only providing insights into how these places actually functioned but also as a social justice imperative.

McAuliffe, Richard (Texas State University), Stephen Black (Texas State University) and Raymond Mauldin (Center for Archaeological Research, University of)

[36] *Central Texas Plant Baking*

Burned rock middens, large accumulations of thermally fractured stone and charred earth representing earth oven facilities, are ubiquitous in the hunter-gatherer archaeological record of Central Texas, upon and near the Edwards Plateau. The subject of study for over a century, work in the late 1990s and early 2000s compiled radiocarbon dates from these features suggesting their use began as early as 9000 cal BP, but may not have peaked until between 800 and 1000 cal BP. This paper updates those earlier studies through the addition of radiocarbon dates run over the past 15 years and summarizes what has been learned about the underlying technology and the targeted resources. Our review suggests that while the processing of a variety of resources likely contributed to burned rock midden accumulation over their roughly 8000-year use trajectory in Central Texas, in most cases these features served to bake a narrow range of plants to satisfy mainly dietary concerns. Evidence of subsistence, technology, and dating are used to synthesize an understanding of these plant baking facilities in Central Texas.

McBride, Kevin (University of Connecticut)

[72] *The Utility of Metal Detector Surveys in CRM*

Metal detectors are rarely employed in CRM research yet their utility in locating historic sites of low visibility and artifact density have been effectively demonstrated in Battlefield Archaeology studies. This paper will argue for the importance and utility of metal detector surveys in CRM through several case studies that compare the results obtained from shovel test pit surveys followed by metal detector surveys. These examples indicate that shovel test pit surveys, even at 5-meter intervals, are completely ineffective in locating more ephemeral seventeenth and eighteenth century Native- and Euro-American domestic sites.

[9] *Chronological Composition Variation of White Glass Beads from Plains and Midwest Sites*

Small drawn white beads are ubiquitous throughout archaeological sites in the United States but historically provided little chronological information due to their uniform appearance. Portable X-ray fluorescence provides a nondestructive means of determining relative amounts of elements used in glass bead opacifying agents. This study tested the chemical composition of 490 drawn white glass beads from Plains and Midwest archaeological sites with known dates from the 17th-19th centuries. Each bead was tested Bruker Tracer III-V portable XRF under vacuum with a 12mil Al, 1mil Ti, 1mil Cu filter, and the resulting spectra were analyzed with Bayesian statistics then normalized relative to the machine's rhodium backscatter. The study found the beads from early 1600s sites were lead and tin-rich. Beads from the late 1600s to late 1700s sites were antimony-rich with low lead in beads <4mm and varying levels of lead in beads > 4mm. Early 1800s sites had antimony-rich and arsenic-rich beads. In late 1800s sites, beads >4mm had high levels of lead and antimony while only arsenic-rich variant was found in beads <4mm. Understanding and identifying chronological patterns in the chemical composition of opacifiers in otherwise indistinguishable beads may assist dating objects and sites.

McCafferty, Geoffrey (University of Calgary)

[28] *Feathery Serpents of the Greater Nicoya Region*

Polychrome pottery from the Greater Nicoya region of Central America prominently features 'feathery serpents' that have been associated with the Mixteca-Puebla tradition of greater Mesoamerica. A closer look at the variety of 'feathery serpents' has discriminated between more Borgia-like images and others that are less prototypical, including features such as legs

and shield patterns on the back. Feathered serpents have been at the core of debates over whether or not the Greater Nicoya region should be considered part of the Mesoamerican culture area. Recent excavations have refined the chronology of Greater Nicoya polychromes, especially in Pacific Nicaragua, such that these so-called "Mixteca-Puebla" diagnostics now pre-date polychromes from central Mexico. This paper will muddy the waters of how we define "Mesoamerica," at least for the Postclassic period, with suggestions about the importance of religious and economic interconnectedness, and the directionality of cultural influences.

[412] *Religious Practices of Pre-Columbian Pacific Nicaragua*

Colonial period ethnohistorical sources recorded the religious practices of the Contact period Nicarao of Pacific Nicaragua, including a pantheon of deities, use of a ritual calendar, and other ceremonies. These were closely affiliated with the religion of Nahua central Mexico, linked to the purported migration of Nahuat-speakers into the region in the final centuries prior to European contact. Relatively little information, however, was provided about the religious practices of other ethnic groups in the cultural mosaic of Postclassic Nicaragua, and no historical sources are available for earlier time periods. This paper will summarize what can be gleaned from archaeological evidence from the 2000 years of pre-Columbian prehistory, with particular reference to mortuary practices, ceramic figurines, iconography, stone sculpture, and petroglyphs. The implication based on these data is for an animistic/shamanistic religion without recognizable 'deities,' a spirituality tied to natural elements, at least for societies pre-dating the alleged Mexican migrations.

[41] *The Ethnogeology of Sedimentation and Land Formation in the Lower Mississippi Delta of Plaquemines Parish, Louisiana*

The Lower Mississippi Delta is one of the most dynamic geological landscapes in world, experiencing a complex mix of alluvial sedimentation and coastal erosion. Additionally, both historic and prehistoric human populations have been drawn to this region by virtue of the extreme productivity of the estuarine environments created by the interactions between freshwater and saltwater ecosystems. Consequently, human societies have developed a range of adaptive solutions for dealing with the physiographic and ecological challenges of living in such a geologically and ecologically dynamic location. Our paper looks at the activities of modern fishing communities in lower Plaquemines Parish, Louisiana, and documents the sophisticated perspectives of this population in understanding the geological and ecological processes related to alluvial sedimentation, coastal erosion, and the balance of freshwater and saltwater environments. These modern ethnographic observations also are relevant to developing ethnoarchaeological analogies about impermanent coastal and riverine settlement dynamics and subsistence. We pay particular attention to the results of recent crevasses along the natural levees of the Mississippi and the effects of human-made sediment diversion projects in forming new land surfaces. Finally, we offer some thoughts on prehistoric settlement systems based on the knowledge of modern fishing communities in the region.

[112] *Three-Dimensional Modeling Applications for Cultural Preservation*

Three-dimensional modeling of archaeological sites has been used in scholarly papers as well as in museum displays to illustrate the original appearance of the archaeological site. In addition to these valuable applications, three-dimensional modeling of partially-excavated or no-longer-standing archaeological architecture has significant value to the field of cultural preservation. This project focuses on a portion of the partially excavated Piedras Marcadas Pueblo, located in the Albuquerque Open Space. Using architectural modeling programs such as SketchUp, the Pueblo was partially reconstructed with two-foot tall interior and exterior walls that were known to exist. The three-dimensional rendering of this floor plan can help inform further excavations and interpretations. Further work on this project will entail interpreting features of the Pueblo that no longer physically exist, using stylistic and structural information from similar Pueblos such as Zuni Pueblo and Taos Pueblo. The goal of this poster is to illustrate the value of undertaking this process. Digitally rendering the site from known features enables us to preserve the site from typical erosional forces, as well as provide a foundation with which to interpret what the site may have looked like in its original form.

McCarthy, Andrew (University of Edinburgh and CSN)

[366] *Signs of Shared Identity: Neolithic Incised Stones in Cyprus and Beyond*

Enigmatic incised stones dating to the Aceramic and early Ceramic Neolithic periods indicate an element of persistent shared material culture between Cyprus and the Levant in spite of cultural trajectories and material culture assemblages that were beginning to diverge from one another. The stratigraphic sequence at the site of Prasteio-Mesorotsos in the west of Cyprus is examined here showing moments of continuity and change between these periods. This site will be looked at in the wider context of Cyprus and the Near East and the incised stones found at Mesorotsos will be discussed in relation to the PPNB and Khirikitian periods and the emergence of the Ceramic Neolithic. The development of an increasingly substantial settlement at Prasteio-Mesorotsos, coupled with the sensitive material culture expressions that were shared between settlements, indicate that an independent Cypriot identity was beginning to emerge that relied increasingly less on interaction with the mainland and more on negotiating territory in Cyprus itself.

McCarthy, Katherine

[406] *An Empire of Water and Stone: Aztec Kingship and Sacred Landscapes*

My project will center around the Acuecuexco Aqueduct Relief (also referred to as the Ahuitzotl's Aqueduct Relief) and its implications as a monument celebrating a public works project by an Aztec emperor. Only one other comparable example is known to date: the Chapultepec carving of Montezuma II. Although the later carving has received significantly more attention in the scholarship, both works remain open for further study and interpretation. Neither have been fully analyzed as public works projects connected to the influx of water to the capital city. Due to the incredible value of water to the physical and cultural stability of the empire, I hope to build off of Barbara Mundy's studies on water in the Aztec Empire to fully understand the significance of these monuments to the city and the image of the rulers they portray. I will also seek to follow the monuments throughout history in a trans-conquest study, connecting the ancient propaganda through the colonial period into its modern manifestations. This paper will aim to shine a light on these monuments and contextualize their roles as public monuments and negotiating points between Aztec kingship and sacred landscape.

McCarthy, Melissa (California State University, Sacramento)

[172] *Dental Health and Activity Indicators in the Burials from the Godet Cemetery*

Sint Eustatius (Statia) is a Dutch Caribbean island with historical evidence of three main cultural groups: native people, people of African descent and people of European descent. As a hub of 18th century trade for various colonial powers, Statia is an important location for using archaeological and forensic bioarchaeological analyses to study globalism and colonialism. Examination of the dentition from burials from an 18th century cemetery excavated between 2012 and 2018 was conducted to explore dental health and activity patterns of individuals interred in this cemetery. Teeth from both adults and subadults, likely of African ancestry, were available for analysis. This study employs evidence from dental caries, enamel attrition, dental calculus, and enamel defects to assess dental health and diet. Activity indicators, such as antemortem chipping and wear facets, were also documented. Despite belonging to an enslaved and/or marginalized

population, dental health during childhood and adulthood was relatively good. Chipping on the facial surface of some anterior teeth suggests the use of teeth for grasping hard objects, such as straight pins. The presence of pipe facets paired with the biological ages of some individuals indicate they were younger tobacco smokers.

McCarty, Sue (James Madison University)

[267] *Killed Pots and Running Herds: Late Neolithic Halaf Phenomenon Ritual Practice at Kazane Höyük, Southeastern Turkey*

Unlike the Pre-Pottery Neolithic of the Fertile Crescent, the Late Neolithic Halaf phenomenon (5,900-5,350 Cal. B.C.E.) in southeastern Turkey, northern Syria and Iraq is not well known for costly activities that can be linked to symbolic ritual behavior, as seen at sites like the earlier Göbekli Tepe. Although it produced a rich corpus of ceramic motifs, stamp seals, and tokens incorporating naturalistic figures, there are no public ritual structures. Expressions of spiritual practice are limited to a varied array of mortuary styles and clay figurines. The following talk explores symbolic behavior and ritual practice from the largest known site of the Halaf phenomenon, Kazane Höyük, in southeastern Turkey. In particular, it shows that activities that may be linked to ritual are incorporated into personal, household-level decisions and practices. Material evidence for systems of belief in the excavated materials from Kazane does not strongly support unequal access to prestige or ritual resources, nor does it suggest a preference for investing community-wide labor into the construction or creation of ritual objects or structures. Like evidence for Halaf social inequality in general, ritual practice at Kazane does not follow trends consistent with incipient vertical hierarchies in later periods, including the following 'Ubaid.

McCauley, Brea (Simon Fraser University)

[2] *Upper Paleolithic Handprints with Missing Fingers: An Ethnological Perspective*

Handprints with missing fingers occur at a number of Upper Palaeolithic rock art sites in Europe. It has been argued that they represent hand signals or a counting system, but there are reasons to believe that they were actually produced by individuals whose fingers had been amputated. Here, we report a cross-cultural study that was designed to shed light on this phenomenon. We identified 121 societies from Africa, Asia, the Americas, and Oceania that engaged in finger amputation at the time of ethnographic data collection, and we were able to distinguish ten different finger amputation practices within this sample. When the contexts and what we know about the participants are taken into account, the scenario that best fits the incomplete handprints is removal of fingers during life in order to appeal for supernatural assistance. This has interesting implications for social life in the Upper Palaeolithic, for traumatic religious rituals have been found to foster strong interpersonal bonds among group members and hostility towards members of other groups.

[258] *Isotopic Analysis of Dietary Variation at Casas Grandes, Mexico*

Stable isotope analysis of prehistoric human remains has complemented other dietary reconstruction techniques for many years. It provides biologically-based data that allow an examination of what was actually consumed. Using 70 individuals from Paquimé and 14 from the nearby Convento site, we examine whether bone collagen $\delta^{13}\text{C}$ and $\delta^{15}\text{N}$ values are correlated with estimated sex, age, time period, non-local origin, and status at prehistoric Casas Grandes. Although outlier values are identifiable, the only significant difference is between $\delta^{13}\text{C}$ values from the Viejo (700-1200 CE) and Medio periods (1200-1450 CE). We explain this as the influence of a C4 and CAM isotopic environment, which result in low isotopic variation for most diets. The significant difference between the earlier and later period mean $\delta^{13}\text{C}$ values is attributed to an increase in the consumption of maize or animals that consumed C4 or CAM plants during the Medio. Stable nitrogen isotope values remain relatively constant throughout, making it difficult to detect changes in trophic level using stable isotope values. This study presents the largest dietary stable isotope data set from the Casas Grandes region. The results show that isotopic methods of detecting dietary variation are best used in conjunction with other archaeological evidence.

McConnell, Joseph

[322] *Evaluating "Folsom" Points in the Blackwater Draw Museum's Calvin Smith Collection*

Folsom projectile points are housed and displayed by museums around the country, but many are donated by collectors without the accompaniment of information documenting their original archaeological context. As a result, questions surrounding their authenticity hamper their ability to contribute to collections-based archaeological research of the Folsom time period. This poster presents the results of a technological and morphological analysis of Folsom points recovered from a variety of secure archaeological contexts. Observations of fundamental characteristics present in this dataset were used to evaluate the authenticity of a collection of projectile points donated to Eastern New Mexico University's Blackwater Draw Museum and Curation facility that were labeled as "Folsom points". The goal of this research is to provide the museum with an empirical investigation that may validate reference to the artifacts as "Folsom" and their inclusion into Folsom-era research, and generate a method for authentication that may be useful for other institutions across the country.

McCool, Weston (University of California at Santa Barbara) and Joan Coltrain (University of Utah)

[286] *Using Trauma Distributions, Victim Profiles, and Differential Scavenging to Infer Characteristics of Prehistoric Warfare: A Case Study from the Peruvian Late Intermediate Period (AD 1000–1450)*

Non-state warfare has the potential to effect myriad aspects of people's lives. The last several decades of archaeological research have revealed that conflict has shaped much our evolutionary history and regional population trajectories. Despite the importance of prehistoric warfare, it remains a substantial challenge to elucidate the basic characteristics of conflict. Frequency, predictability, and mortality all play critical roles in influencing the impacts of warfare. An understanding of the basic nature of warfare in particular regions can permit more formal expectations regarding how conflict effects human populations. It may also allow a more in-depth understanding of the behavioral pathways by which conflict leads to compromised health and changing social systems. Osteology can provide methodological inferences into warfare's character by revealing who the victims of conflict are, the ways in which they were harmed, and the possible locations where victims were killed. This poster showcases five osteological tests to reveal the salient characteristics of non-state warfare using a Late Intermediate period population from the Nasca highlands of Peru as a case study.

McCormack, Valerie and Kary Stackelbeck (University of Oklahoma)**[75]** *Creative Mitigation to Counter Resource Losses from the Lake Cumberland Drawdown, Kentucky*

In early 2007, signs of a dam failure triggered the U.S. Army Corps of Engineers to implement an emergency drawdown of Lake Cumberland in south – central Kentucky. Reducing the water elevation by 10 feet caused 1400 miles of shoreline to be exposed. While the emergency prevented a life-safety catastrophe, the drawdown created a new erosion zone and exposed archaeological sites to looters. The results of conventional archaeological surveys revealed damage to sites that called for “after-the-fact” mitigation. Alternative and creative mitigation became a necessary approach for USACE to meet its obligations under the National Historic Preservation Act. This paper will discuss the creative brainstorming among USACE, the Kentucky State Historic Preservation Officer, and tribes that led to three alternative mitigation measures aimed at educational outreach, raising public awareness, and staff training. The paper will discuss problems experienced during the implementation and assess the success of each measure. Finally, we will present lessons learned for others considering alternative mitigation.

McCormick, David (Yale University), Zachary Hruby (Northern Kentucky University), Olivia Navarro-Farr (The College of Wooster), Michelle Rich (Dallas Museum of Art) and Keith Eppich (Tyler Junior College)**[255]** *The Symbolism and Technology of Classic Maya Tomb Debitage from El Peru-Waka*

Obsidian blades and related debitage from four elite tombs recently excavated at El Peru-Waka have the potential to answer the question of why and how the ancient Maya placed this material above, around, and sometimes within the burial chambers of the Classic Maya elite. We explore how this debitage may have been considered a ceremonial class of lithic rather than what archaeologists might typically consider nothing more than manufacturing waste. Special attention is paid to the detailed technological analyses of obsidians from four distinct tomb contexts; the first analysis of its kind.

McCoy, Mark (Southern Methodist University)**[316]** *Setting the Agenda for the Next Phase in Obsidian Studies in Aotearoa (New Zealand)*

Studies of obsidian artifacts from sites across Aotearoa (New Zealand) in the 1960s-80s, were critical to identifying a major decrease in mobility, just prior to the onset of endemic warfare, marked by the construction of thousands of fortifications by the ancestors of Māori. Unfortunately, initial enthusiasm was followed by stagnation in research. A number of factors are implicated in the sluggish rate of novel findings, including: a lack of faith in the reliability of geochemistry-based source assignments; small sample sizes; poor spatial-temporal controls; and failure to publish primary data on artifacts. Over the past decade, we have seen a resurgence of research with the adoption of pXRF. We now have reliable source assignments and lithic technology data on thousands of individual artifacts. Our interdisciplinary research group has used this data to model social networks as a window in to the origins of Māori society. This new chapter in obsidian studies brings with it new and lingering issues, likely common to other regions, that must be overcome: what to do with legacy data; how to combine data to create appropriate spatial-temporal units; and how to visualize the complex links between communities evident in social network analyses.

McCoy, Mark [408] see Johnson, Adam

McCrackan, Jennifer, Nick Poister, Charles P. Jackson (New Mexico State University) and Eric Weaver (National Park Service)**[381]** *Nature and Culture, Fire and Ice: The Caves of El Malpais National Monument*

Cave surveys and archaeological inventories conducted over the course of six months of over 40 caves at El Malpais National Monument have revealed both ritualistic and utilitarian purposes. Located in northwestern New Mexico, the monument, largely composed of multiple lava fields is within the larger Zuni-Bandera volcanic flow. Hundreds of recorded archaeological sites ranging from prehistoric campsites and stone circles to elaborate Chacoan-style greathouses and kivas have been identified within the monument. There are over 300 recorded lava tubes, consisting of unique microclimates, habitats, geological features, and are valuable sources for other climatic, natural, and cultural data. These caves, in particular those containing perennial ice, host an array of rock alignments, pottery and lithic scatters, were utilized for water collection, refrigeration, and ritualistic uses. Looking at the larger archaeological picture, there is a clear connection between many cave and surface sites, and a difference in cave usage practices depending on where a site is in the park. The region

is steeped in native creation legends and a rich archaeological history that is little understood as to how it directly relates to the park's geological and cultural landscapes, the caves, and the nearby sacred site of Mount Taylor.

McCray, Brian (Vanderbilt University)

[98] *To Wear or to Trade: Analyzing Bone Pendant Artifacts from the Peruvian Montaña*

In the montaña, the forested eastern slopes and adjacent upper Amazon, inhabitants were involved in regional and interregional trade networks connecting the Andes and Amazon. Given that material correlates for often ephemeral lowland goods are difficult to recover archaeologically worked bone artifacts are an important piece of data indexing lowland connections. Border intermediaries in the Ecuadorian montaña used strings of shell beads, sometimes called carato, to facilitate exchange, and bone adornments are used as part of lowland garb in modern rituals invoking relations between these regions. This paper reports worked bone artifacts from the lower montaña archaeological site of Wimba, in Amazonas province, Peru, occupied during the Late Intermediate Period and Late Horizon (ca AD 1000-1530). These materials are conceived both as worked bone adornments, and as circulated objects within exchange networks. Understanding the diversity in shape, size and material of these artifacts and those found at neighboring sites has implications for the prehistory of the montaña and the nature of cultural exchange at this ecological interface. This research interrogates how bone artifacts reflect a conversation between local and nonlocal value systems and contextualizes them within new understandings of alterity as structuring social interaction in the Andes and Amazon.

McDaid, Chris (US Army, Fort Eustis, VA)

[133] *Monitoring and Managing Eroding Archaeological Resources*

Fort Eustis is an approximately 8,000 acre peninsula bound by the Warwick and James rivers in Virginia's Tidewater region. There are 234 identified archaeological sites on Fort Eustis that range in age from 10,000 BCE to the early twentieth century. In 2010 the Fort Eustis Cultural Resources Management Program began an archaeological site monitoring program. The data from that effort indicated that erosion along the rivers and creeks was a significant threat to the archaeological record of Fort Eustis. An analysis of the monitoring results identified thirty-one sites that warranted having management strategies developed. The resulting study has been the basis for a program of temporary stabilization, National Register of Historic Places evaluations, and more permanent shoreline stabilization. This paper will address how the Fort Eustis Cultural Resources Management Program is developing a methodology to determine which sites warrant protection in place, which warrant data recovery, and which warrant no protective measures.

McDonald, Josephine (University of Western Australia)

[305] *Pahranagat Patterned Bodies and Big Horn Sheep*

The Lincoln County Rock Art Areas of Critical Environmental Concern (ACEC) Inventory Project in Nevada focused on the rock art from the Mount Irish, Shooting Gallery and Pahroc ACECs. All three of these areas form part of a distinctive style region within the Great Basin. This is defined by the presence of the Patterned Bodied and Solid Bodied Figures which were first identified by Heizer and Hester in the 1970s. These distinctive anthropomorphic forms are found within a larger assemblage which is dominated by bighorn sheep and geometric forms. The large dataset accumulated during the Lincoln County project mobilised significant legacy data as well as created an archaeological context for this important rock art province. Stylistic analyses conducted within the three ACECs has been augmented by the inclusion of several additional site complexes which also contain these distinctive motif forms. This paper discusses the chronological and spatial implications of these anthropomorphic motifs within the local region and Great Basin more generally.

McDonough, Katelyn (Department of Anthropology, Texas A&M University)

[249] *The Western Stemmed Tradition During the Younger Dryas: The Newest Evidence from Connley Caves, Oregon*

Recent excavations at the Paisley and Connley Caves have uncovered coeval Younger Dryas occupations with different but complementary Western Stemmed Tradition artifact assemblages. Whereas the perishable artifact assemblage at Paisley Caves provides important health and subsistence data, the large lithic assemblage at Connley Caves has the potential to provide substantial insights into Western Stemmed lithic technology. This paper discusses the newest evidence from Connley Caves 4 and 5, where various styles of Western Stemmed projectile points and a diversity of other tools have been found in association with directly dated cultural features. In addition, spatial distributions of lithic and osseous tools hint at possible activity areas, and hearth features inform about subsistence. Data from the Paisley and Connley Caves sharpen our understanding of a previously uncertain record of human occupation in the Northern Great Basin during the Younger Dryas, suggesting that human populations were probably larger and more widespread than traditionally recognized.

[314] *Reevaluating an Offering Cache from Isla La Plata, Ecuador*

From the Middle Formative onwards, La Plata Island was gradually incorporated into developing local and regional networks of exchange along the Pacific littoral of Ecuador. The island also became the focus of increasing ritual activity evidenced in the material remains of offerings made on the coastal bluffs and at the principal landing point at Drake's Bay. Here a multi-component deposit at Site OM-LP-PL 14 is comprised of successive deposits of worked stone plaques, ceramic figurines, marine shell and other exotic materials. Using comparative data from Salango and other sites, this paper undertakes a re-evaluation of the chronology and content of the offering sequence and its changing relationship to the cultures of the adjacent continental mainland.

[409] *Mapping the Maya Hinterlands: A LiDAR-Derived Approach to Identify Small-Scale Features in Northwestern Belize*

This paper will discuss the processes and methods of relief visualization of LiDAR-derived digital elevation models (DEM's) and classification of secondary data to identify archaeological remains on the Maya landscape in northwestern Belize. The basis of the research explores various GIS and cartographic techniques to visualize topographical relief. Graphic terrain maps assist archaeologists with predictive settlement patterns. The Relief Visualization Toolbox (RVT 1.3) aids to visualize raster DEM datasets in the predictive identification and interpretation of small-scale archaeological features. This dataset and methodology can be utilized to answer questions of population estimates, mobility costs, and effectiveness of ancient technological agricultural systems.

McGovern, Thomas[31] *Chair***McGrath, Alyssa (University of Notre Dame) and Mark Golitko (University of Notre Dame)**[126] *Chemical and Mineralogical Examination of Surface Encrustations on Middle Bronze Age Pottery from Békés 103, Eastern Hungary*

Ceramic sherds found at Békés 103, a primarily Middle Bronze Age cemetery on the Great Hungarian Plain, are often covered in a dense white concretion that must be removed before restoration and study of the vessels commences. These white concretions complicate further study of ceramic provenance and residue analysis at the site. We use a combination of pXRF, EPMA, FTIR, and LA-ICP-MS on ceramics and soil samples taken in association with these vessels to understand the composition of these concretions and how sherds have interacted with their burial environment. Hypothesized sources include cremated bone and post-burial uptake of soil phosphate. Knowledge of the chemical composition of these surface concretions will allow further study of how the burial environment of the Békés 103 ceramics impacts their paste composition.

McGrath, James (University of Iowa)[110] *Colorimetric Analysis of the PP5-6 Ochre*

This poster presents the results of recent colorimetric analyses of the archaeological ochres from Pinnacle Point 5-6 (PP5-6), Western Cape Province, South Africa. Ochre colors are derived from digital photographs of streak plates and quantified in CIE L*a*b* color space. Results presented here indicate that the vast majority of ochres from this site produce red hued streaks, with some variation in streak hues and chromas throughout the PP5-6 sequence. These results are discussed in light of recent arguments for Late Pleistocene color-based selection preferences and color-influencing taphonomic processes.

McGuire, Randall (Binghamton University)[83] *What Can Archaeology Tell Us about Refugees and Forced Immigration?*

The authors in this session use archaeological methods to analyze refugees and forced migrations. We seek to better understand the material ramifications of migration in the lives of individuals. We wish to understand the tangible, material consequences of migration at a human scale. The papers in the session spring from historical archaeology and the archaeology of the contemporary. We study the experiences of refugees and immigrants as a material process. We use archaeology to find detail in the seeming chaos of migration in the past and the present. Our studies reveal the complex relationship that the material shares with social relations, meaning, and agency. The study of mute, ancient artifacts forced archaeologists to develop techniques to understand the human condition without discursive evidence. We use these techniques to provide a distinctive perspective on migration that integrates archaeological methods with history and ethnography. An emphasis on the human condition and a commitment to making the exotic familiar and the familiar exotic makes this archaeology intensely anthropological and differentiates it from most histories. Ultimately, we recognize the political nature of archaeology, explicitly advocate for communities, and seek help those communities to address contemporary issues and/or create usable pasts.

McIntosh, Brandon (Washington State University) and Andrew Duff (Washington State University)**[419]** *Investigating Turkey Husbandry on the Chacoan Frontier: Stable Isotope Results from Three Pueblo II Great House Communities in West Central New Mexico*

Growing research in animal domestication in the prehistoric western hemisphere has revealed a complex relationship between humans and the only originally domesticated animal in North America, the turkey (*Meleagris gallopavo*). Research suggests reasons for turkey management ranged from the use of their feathers in ritual to their value as significant protein resources during/after the transition from foraging to food production in North America. Reasons for managing turkeys varied cross-culturally, and its timing appears to vary across space. Therefore, additional research is required if we are to fully understand the role of turkeys in North American cultural evolution. Questions remain regarding when and where turkey domestication was practiced across the Southwest. This paper provides additional insight by presenting stable isotope analysis of turkey remains from Cox Ranch, Largo Gap, and Cerro Pomo pueblos on the western frontier of the Chacoan world in west central New Mexico. The level to which turkeys there relied on human caretakers for sustenance reveals their value at a time when food production was firmly established as a mode of subsistence. The results of this study expands our understanding of turkey husbandry in the Southwest specifically, and the complexity of food production in North America generally.

McKee, Arlo [36] see Lawrence, Ken

McKee, Brian (University of Arizona)**[373]** *The Archaeology of Indigo Production in Morazán, El Salvador*

The production of indigo dye dominated the economy of El Salvador for over 250 years, from the late sixteenth century decline of the cacao and balsam industries to the mid-nineteenth-century rise of coffee production. The Proyecto del Inventario de los Sitios Arqueológicos del Departamento de Morazán documented five indigo works (obrajes de añil) in 2015 and 2016 in the northeastern Salvadoran department of Morazán. Although obrajes have been recorded elsewhere in El Salvador, none had previously been investigated in Morazán. This poster reviews the history of indigo production in El Salvador. The technology of indigo agriculture and indigo dye production are examined with particular attention to features that would be archaeologically visible. A model is constructed to evaluate the identification of archaeological sites as obrajes, including a detailed examination of the Morazán sites, presenting evidence to assess whether or not they were localities of indigo production. Productive avenues of future research are proposed, and the rebirth of indigo production in recent decades and its role in modern textiles and its potential for tourism are examined.

McKenna, Morgan (Idaho State University), Gabriel Wrobel (Michigan State University), Amy Michael (University of New Hampshire), Amy S. Commendador (Idaho Museum of Natural History) and Patricia McAnany (University of North Carolina)**[370]** *Understanding the Diet of Late to Terminal Classic Period Maya Groups in the Sibun River Valley, Belize, through Food Web Reconstruction*

A stable isotope based dietary study, coupled with previously collected zooarchaeological and botanical data, expands our understanding of ancient Maya dietary variation in the Late and Terminal Classic periods in the Sibun River Valley of central Belize. A food web was created based on the analysis of stable carbon and nitrogen isotope ratios in plants and animals native to the study area (including white-tailed deer, brocket deer, turkey, parrotfish, and peccary). Comparison of this web to isotopic data derived from bone collagen and carbonate samples of human skeletal material representing ~50 individuals from three different Sibun sites is incorporated within a probabilistic model for the types of foods eaten and their relative proportion within the diet. The data shows variation in $\delta^{13}\text{C}$ and $\delta^{15}\text{N}$ values between the sites, suggesting differences in diet related to differences in geography and perhaps social status.

McKenzie, Emily (University of Alabama), Taylor Puckett (University of Alabama), Lawford Hatcher (University of Alabama) and Katherine Chiou (University of Alabama)**[370]** *What's in a Seed?: Identifying Archaeological Chili Pepper Remains from Mesoamerica*

The chili pepper (*Capsicum* spp.) has cemented its place in ancient and modern Mesoamerica as a fixture in medicine, ritual, and cuisine. The timing and context of its domestication which began around 10,000 years BP, however, remains unclear. To address this, we conducted morphometric analyses of a diverse array of modern seeds from multiple species of wild and domesticated Mexican chilies and used that data to create a basis for identification and comparison of species and

varieties within the genus *Capsicum*. This methodology was then applied to the identification and study of archaeological seeds from multiple sites within the Mesoamerican region spanning thousands of years. From this analysis, we can document the diversity of chili peppers across time and space within the region and gain clearer insight into its impact on the lives of ancient peoples, as well as how patterns of its domestication are interwoven within—and influenced—by greater political, social, and cultural changes.

[242] *Salt in the Classic Maya Economy: The Paynes Creek Salt Works, Belize*

Although submerged by sea-level rise and invisible in the modern landscape, briquetage and wooden posts of salt kitchens at underwater sites at the Paynes Creek Salt Works, Belize provide a model for salt production elsewhere in the Maya area where wooden buildings have not preserved. The basic unit of production at the salt works was surplus household production. In addition to being a biological necessity and flavor enhancer, salt was valuable as a storable commodity in the form of salt cakes. Salt cakes were made in standard sizes for marketplace trade as currency equivalencies as occurred historically at salt springs in the Maya highlands. Salt was transported by canoe to inland marketplaces during the Classic period (A.D. 300-900). A wooden canoe paddle, several fragments, and a wooden canoe document boat travel.

[239] *Ritual Traces and the Challenges of Detecting Late Precontact Rituals at Midewin National Tallgrass Prairie, IL*

Ethnographic accounts of indigenous communities throughout the United States illustrate the many ways that ritual activities were deeply embedded into everyday life. However, moving to the American Midwestern archaeological record, treatments of ritual are typically limited to large, ceremonial sites and these everyday rituals remain overlooked. This paper explores the traces of ritual activities and complex challenges of detecting them at a 17th century village, Middle Grant Creek, at Midewin National Tallgrass Prairie in northern Illinois. Since 2016, excavations have focused on refilled, subterranean storage features. These features have produced unusual artifacts, including marine shell, painted pottery, and, perhaps unique to this site, red painted freshwater mussel shells. Alongside these data, thermal drone imaging detected a 28m, sub-rounded hexagonal enclosure, interpreted as a potential earthwork associated with ritual activities, possibly part of the Midewin rite. However, the archaeological signature of this enclosure has not yet been detected in our recent excavations. Combined, these data provide only glimpses of ritual activity at this village. This paper discusses the challenges of neither overstating nor understating the archaeological evidence of ritual at this late precontact site, and how, by adopting an integrated, comprehensive perspective, we can begin to address these challenges.

[188] *Promoting an Archaeological Perspective in Repatriation, Consultation, National Monuments, and Data Science*

Keith Kintigh is having quite a career in archaeology. I use the active voice because, as those of us who work with Keith well know, he's not finished yet! Throughout his career, Kintigh has promoted the benefits and values of an archaeological perspective steadfastly. Since the 1980s, Kintigh has played important roles in the development and implementation of the Native American Graves Protection and Repatriation Act (NAGPRA). He was among the drafters and negotiators of this important law and represented the archaeological profession in monitoring federal agencies as they undertook NAGPRA-related activities and developed programs. During the Clinton Administration, Kintigh advised Secretary of the Interior Bruce Babbitt on his plan for the National Monuments established or expended by President Clinton. Most recently, Kintigh is leading professional efforts to improve archaeological research through the development of a digital data management infrastructure. Through his own collaborative research, publications, and other activities Kintigh is urging heightened professional attention to the effective use of digital data and professional practices that ensure the long-term preservation for future uses of archaeological data.

[243] *The Flowery Places of the Copan Maya and the Species They Used to Create Them*

Clues to the creation of flower-laden spaces in ancient Maya temples, tombs, and palaces lie on the floors of the best-preserved of these structures. The Copan Acropolis has proved to be a particularly good site for the recovery of well-preserved pollen grains from flowers that adorned ritual spaces. Scholars have described temple spaces as thick with the odor of burned copal, pine, and offerings, but added to this was the fresh and heady fragrance of greenery and blooming buds, imparting a fecund perfume to the areas of ritual supplication. These botanical offerings and adornments were undoubtedly tied to mythical associations, as they are today in modern Maya ritual houses. Analysis of pollen from sediment cores, and macroremains from middens, aided in the interpretation of ritual botanical materials, emphasizing the importance of understanding the complete ecological context of a community in the interpretation of species commonly found in ritual spaces. Few archaeological projects in the Maya area take floor samples for pollen analysis from buried temples and tombs. As this paper will demonstrate, this is a tremendous loss regarding our understanding of ancient Maya ritual practice.

[44] *Itamu umumi yooya' ökiwni ('We will arrive as rain to you'): Evidence of Historical Relationships among Western Basketmaker, Fremont, and Hopi People*

Noel Morss (1931) and researchers into the 1990s defined Fremont Culture in terms of the "Anasazi," leaving unanswered the question of the ethnic and linguistic identity of the Formative Era Fremont people. This paper expands upon the findings of two recent studies: (1) Eastern Basketmakers (EBM) were Kiowa-speakers (Ortman and McNeil 2017) and (2) Western Basketmakers (WBM) were mainly Hopi-speakers (McNeil and Shaul 2018). In this paper, we argue that migrating Hopi-speaking farmers interacted with Kiowa- and Tiwan-speaking farmers in the Colorado-Utah borderlands. The supporting evidence includes: the exchange of loanwords between Tanoan (Kiowa, Tiwan) and Hopi speakers; the mixture of EBM II and WBM II archaeological material at Basketmaker II sites; and the blending of EBM and WBM variants of San Juan Anthropomorphic rock art styles. Finally, the paper examines a subtype of the Classic Vernal rock art style believed to be ancestral to historic Hopi Katsinas, agriculture, and rain-making rites.

[110] *Does Exposure to Heat Alter Stable Isotope Values of Ostrich Eggshell?*

Archaeological sites in Africa and Asia often contain large amounts of eggshell fragments from ostriches (*Struthio* spp.), indicating that these birds and their eggs were a valuable source of protein and calories for hunter-gatherers. Despite their abundance, however, ostrich eggshell (OES) remains understudied. Stable isotopic values preserved in archaeological OES can provide significant data regarding paleoclimates (Carbon, Nitrogen, and Oxygen) and human foraging ranges (Strontium). The Middle and Later Stone Age site of Varsche River 003 (VR003; South Africa) has produced OES from all contexts; however, like many comparable sites, much of the OES, especially in the older layers, has been burned to some extent. The physical nature of OES can endure with integrity; the crystalline matrix is as strong as tooth enamel and can provide a time-capsule-like effect, securing mineral isotopes without degradation over time. Isotopes from the organic portion of OES (collagen) may not react in the same way as the mineral portion, and an understanding of how heat effects the isotopic values of OES is vital for sample selection to ensure reliable data. Using modern OES that has been exposed to varying degrees of heat, this study explores if heat alters stable isotope values of ostrich eggshell.

[115] *Can Firing Position of WWII Soldiers Be Determined by Shell Scatters? Preliminary Data from Experimental Archaeology*

This poster describes results from an experiment designed to determine if there is consistency in the shell scatter patterns of the Colt 1911, Thompson M1A1 Submachine Gun, M1 Carbine and M1 Garand, all common weapons of the American World War II Soldier. Forensic Ballistic evidence has proven to be a valid method of inquiry when determining the movements of the individual during battle. This experiment endeavors to take the understanding beyond just movement to the firing position (kneeling, standing, prone etc.) of an individual soldier and to understand if this position can be determined in an archaeological context from the shell scatter pattern in the weapons listed above. The experiment conducted was limited in scope to determine the potential of this type of research and consisted of firing full clips of each weapon in firing positions described by period training manuals and films. The weapons and ammunition were consistent with the military weapons of the period. The resulting shell scatters were mapped to determine the correlation between shooting position and the position of the shells. The preliminary results of the limited experiment are presented here as well as recommendations for continuing the research.

[136] *Start the Presses? John Alden Mason as Mesoamericanist and a Reluctant New Deal Archaeologist in the 1930s*

What lessons does incomplete, delayed, or lack of publishing hold for archaeologists working in the field today? During the 1930s (and after), J. Alden Mason was a curator at the Penn Museum in Philadelphia, and is possibly best known for his work during that time at the site of Piedras Negras in northwestern Guatemala and his inviting of Tatiana Proskouriakoff to this site. Her work with Maya hieroglyphics from this site was integral to the recognition that Maya glyphs reflected historical events. Yet, the excavations at Piedras Negras in the 1930s were not published until 2005, preventing other scholars from building on this work. Delayed publication—one after his death—is not only Mason's archaeological "sin." Many foundational projects are lacking field records and missing artifacts. Acknowledging this history should be part of revising archaeological knowledge and teaching the ethics of our often destructive investigations.

[407] *Links between Maya Green and Maya Blue at Mayapán, Yucatan, Mexico*

Elaborately decorated and painted objects, most typically murals and incense burners, were a central part of the religious and cultural life at the Postclassic period Maya capital of Mayapán. These objects required great skill to produce and requisite control over a variety of materials, including plaster, pottery, and the pigments used as colorants. One commonly used pigment was Maya Blue, a hybrid mineral-organic pigment produced by mixing palygorskite clays with indigo, and heat treating. Previously, we have documented the use of Maya Blue at Mayapán, and here we present new data about the phases present in the blues and greens used at Mayapán, as well as how these different colors were produced, using Raman spectroscopy, electron microscopy, and experimental replication. These new data offer insight into the relationship between the Maya Blue and Maya Green, and technical aspects of pigment production by the city's artists.

[194] *From Upper to Lower Santan: Platform Mound Community Organization within the Santan Canal System in the Middle Gila River Valley*

Recent and extensive Data Recovery investigations have been completed at sites along the prehistoric Santan Canal system in the Middle Gila River Valley, including both the Upper Santan and Lower Santan Platform mound communities. This work is being conducted by the Gila River Indian Community Cultural Resource Management Program as part of the Pima-Maricopa Irrigation Project. These investigations have substantially improved our understanding of settlement organization within the Santan area, including the temporal and spatial distribution of habitation areas. In contrast with nearby area such as the Tonto Basin, the late Classic inhabitants in the Santan area did not densely aggregate and instead remained in comparatively small (4 to 5 room) and dispersed settlements. While numerous Preclassic rooms are present in the immediate proximity of the two mound precincts, the nearest late Classic habitation areas are more than 0.5 kilometer away from either mound, and most settlement locations are 1 to 3 kilometers distant. This presentation explores the implications of this patterning, as well as other regional differences within the Hohokam area.

[210] *Were Large Mammal Limb Bones Processed to Extract Marrow and Render Grease at the Danielson Ranch site (CA-VEN-395)?*

Danielson Ranch (CA-VEN-395) is a multi-component site containing both significant prehistoric shell midden deposits and a historical ranch complex. CA-VEN-395 consists of five discrete loci dated to between 2690 and 860 cal BP, with the most recent occupation as late as 290-60 cal BP. Excavation revealed vertebrate faunal remains representing specimens from five animal classes (Aves, Mammalia, Reptilia, Chondrichthyes, Actinopterygii), but consisted primarily of small and large terrestrial mammals. A majority of the identifiable elements were from the skulls, feet, and vertebrae of these animals, leaving limb bones grossly underrepresented. Recent studies on bone fragmentation, however, have revealed the importance of undifferentiated bones in archaeological assemblages as evidence of marrow and grease extraction or their transformation into other artifacts (e.g., bone gorges). For this study, we used body part representation, bone size class, and fragmentation patterns to confirm that people at the site were processing limb bone to extract marrow and render grease. Our results have implications for quantifying zooarchaeological remains and expanding interpretations of their patterns in the archaeological record.

Medrano, Angélica María

[367] *The Weapons of the Mixton War (1541-1542)*

The weapons used during the Conquest of Mexico have been described in ethnohistorical sources, both in documents written by the soldiers and in codices. The primary weapons described are steel swords, crossbows, cannons and the arquebus. From the Mixton War of 1540-1542, military material culture has been recovered from one of the battlefields: the Peñol of Nochistlan identified in the site archaeological El Tuiche, where vestiges of Spanish weapons consist of crossbow boltheads and arquebus shot. Regarding indigenous warriors' weapons, the use of bow and arrow, darts and macuahuitl are considered. The physical evidence of these weapons are projectile points and bifacial and obsidian blades; however, these artifacts may be linked to other daily activities. At the Peñol de Nochistlán/El Tuiche more than a hundred lithic artifacts were found in surface and buried contexts, so the question arises: are these lithic artifacts from indigenous weapons of the Indian allies, or their enemy?

This paper will discuss the analysis of these materials, taking into account their typology, spatial distribution and contexts, in particular the lithic artifacts collected in the contexts where the crossbow boltheads and arquebus shot were found.

[394] *Early Postclassic Copper Objects from the Lower Rio Verde Valley, Oaxaca, Mexico*

Some of the earliest examples of metallurgy in Mesoamerica come from sites in the West Mexican region where metalworking, especially of copper objects, was introduced by Ecuadorian traders in the 600s-700s C.E. The recent discovery of copper items including bells and hammered copper sheets from Early Postclassic contexts (800-1100 C.E.) in the Lower Rio Verde Valley, Oaxaca, indicates that people living further south along the Pacific coast were also able to access copper items, at a period earlier than was previously thought. This paper presents the Early Postclassic copper items from the Lower Rio Verde Valley and situates them within the context of early Mesoamerican metalworking, as well as within local and regional trade networks.

Meeks, Scott (Tennessee Valley Archaeological Research), Jacob Lulewicz (Washington University, St. Louis), Shawn Patch (New South Associates), Kevin Smith (Middle Tennessee State University) and Lynne Sullivan (University of Tennessee, Knoxville)

[348] *Middle Cumberland to Dallas: Constructing Peace in the Valley*

Based on artifact styles, regional archaeologists in the 1940s first proposed movement of Mississippian people from the Middle Cumberland Region to the Great Valley of East Tennessee. Lacking absolute dating techniques, these researchers had limited understanding of the timing or contemporaneity of the archaeological phases they were defining in these regions. High-precision dates both from older collections and new excavations now are making it possible to refine chronologies in both regions and to align observed cultural changes. By 1300 CE, the people of the Middle Cumberland region were on the move, a migration related at least in part to climatic instability including multiple drought episodes, resulting in a depopulation known as the Vacant Quarter. Beginning the 1200s CE, dramatic change from an apparent in situ Early Mississippian development in East Tennessee included rapid building of fortifications and changes in settlement patterns, mortuary practices, architecture, and pottery styles. We review these changes in the context of chronology, climate data, and cultural change in the greater region.

Mehmetaj, Haxhi [42] see Galaty, Michael

Mehta, Jayur [97] see Ostahowski, Brian

Mehta, Jayur (Florida State University) and Christopher Rodning (Tulane University)**[348]** *Environment, Climate, and Mississippian Origins in the Lower Mississippi Valley and the Mississippi River Delta*

The Lower Mississippi Valley (LMV) and Mississippi River Delta (MRD) are dramatically impacted by long-term and seasonal fluctuations in water levels, storm cycles, and flooding. In both regions, unpredictable storm events, upstream changes in water flow, and increased water salinity (as well as a host of other factors) led to environmental changes that influenced the development of Mississippian societies during the last 500 years before European contact. Mississippian societies are defined by a suite of cultural characteristics such as wall-trench architecture, reliance on specific lithic material sources, shell-tempered pottery, and maize agriculture. These traits appear at different times in the LMV and MRD, and in some cases, they were associated with large-scale ecosystems changes such as transitions from forests to parklands and grasslands, a process which was likely exacerbated by anthropogenic fires. Considering these coupled paleoenvironmental and archaeological datasets, this paper evaluates features of Mississippian societies in the LMV and MRD, the chronology of their appearance in these areas, and comparisons and contrasts between the LMV and MRD and other hearths of Mississippian development across the Eastern Woodlands. This research strives to correlate long-term patterns of climatic and environmental change with the development of Mississippian societies and responses to European contact.

Meier, Jacqueline [415] see Morin, Eugene

Meierhoff, James (University of Illinois at Chicago)**[198]** *350 Years after the Conquest: British Influences on a Multiethnic Refugee Maya Community*

In the late-nineteenth century, Maya refugees fleeing the violence of the Caste War of Yucatan (1847-1901) briefly reoccupied the ancient Maya ruins of Tikal. Unlike the numerous Yucatec refugee communities established to the east in British Honduras, those who settled at Tikal combined with Lacandon Maya, and later Ladinos from Lake Petén Itza to form a small, multiethnic village in the sparsely occupied Petén jungle of northern Guatemala. This paper discusses the analysis of the mass-produced exotic consumer goods brought to Central America from the port at Belize which found their way into the homes deep in the Petén jungle at Tikal. Also included is a discussion on what the villagers may have been trading to obtain the copious foreign made products. This Petén assemblage demonstrates that different patterns of consumer choice were practiced at Tikal in regards to the eastern Yucatec refugee villages. These new patterns of consumerism coincided with an easing of ethnic markers, and facilitated a blending of ethnic identities at Tikal; a phenomenon which may have parallels in modern refugee behavior.

Meiggs, David [144] see Carvalho, Milena

Meindl, Richard (Kent State University) and Michelle Bebbler (Kent State University)**[365]** *The Diversity of Old Copper Culture Projectile Points*

The Old Copper Culture (OCC) (4000-1000 B.C.) of the Lake Superior Region of North America features a wide variety of utilitarian tools manufactured from native copper. Here, we assess the technological diversity of copper projectile points found in the region spanning Wisconsin, Michigan, and Minnesota U.S.A., as well as artifacts found in Ontario, Quebec, and Manitoba, Canada. A sample of over 300 spear points was classified using paradigmatic classification, from which estimates of diversity were calculated for the OCC heartland and periphery. Our analysis provides insight into lesser known aspects of the Old Copper Complex such as the presence of localized variants, technical specialization, and knowledge transmission, while elucidating the ways in which Archaic groups at the periphery of the OCC heartland may have deviated from the core area. Diversity research on copper tools can clarify not only social and cultural patterns, but also may offer insight into ecological and environmental constraints on copper point form during the Archaic period.

Meinekat, Sarah (University of Tübingen), Christopher Miller (University of Tübingen), Emily Milton (Michigan State University) and Kurt Rademaker (Michigan State University)**[45]** *Quebrada Jaguay-280 (QJ-280) under the Microscope: A Geoarchaeological Investigation of the Site Formation and Anthropogenic Features at a Peruvian Coastal Site*

Some of the earliest evidence for human settlement of Peru comes from lowland sites along the arid Pacific coast. Localities at Huaca Prieta, Quebrada Tacahuay, and Quebrada Jaguay demonstrate that during the Terminal Pleistocene, people had

settled the coast and had incorporated marine resources into their subsistence strategy. Excavations led by Daniel Sandweiss at QJ-280 in the 1990s identified basal dates from the Terminal Pleistocene. QJ-280 contains numerous formal stone tools and lithic debitage, along with features related to house structures and a rich assemblage of marine faunal remains. However, only little is known about the site use, seasonality, and taphonomic processes. In the summer of 2017, QJ-280 was re-excavated to improve the chronology, illuminate its relation to highland sites, and to understand the site's formation and life history. Here, we present the first results from the geoarchaeological investigation of QJ-280, combining high-resolution micromorphology and GIS data. This approach allows us to understand, visualize, and contextualize features – such as house floors, combustion features, and post-holes – to an extent that is impossible to reach by conventional archaeological techniques alone.

Meissner, Nathan [68] see Marino, Marc

Meissner, Nathan (University of Southern Mississippi)

[199] *The Porous Boundary: Understanding Late Postclassic Belize-Petén Interactions through Lithic Technology*

The Late Postclassic and Early Contact Periods (A.D. 1400-1697) of central Petén and western Belize are typically characterized by intensive interaction and migration during a time of shifting geo-political divisions. One of the divisions in Belize known as Dzuluinikob (loosely, “foreign people”) remains enigmatic in terms of archaeological research, and contacts with Petén are poorly understood. This paper examines various sociopolitical identities across the Petén-Belize border from a technological perspective that includes elements of vertical (generational) and horizontal (contact-related) transfer in lithic technology. Data interpretations suggest not only differences in resource acquisition and production, but also in the use-life of stone tools during a time of known interaction, conflict, and population movements among groups. In addition to marked differences between the two subregions, research reveals unexpected technological similarities between Belize and historic Lacandon populations in Chiapas that could indicate a secondary western movement or technological sharing among groups. Such information adds to our understanding of fluid boundaries of Late Postclassic polities from perspective that is often ignored.

[409] *A Demography of Materials: High Resolution Multispectral Photogrammetry in Theory and Practice*

The recent availability of small multispectral sensors small enough to equip on unmanned aerial systems (UASs) now allows archaeologists to survey the landscape at increasingly finer resolutions (10-20 cm) with topographic and compositional data. While at present the number of published archaeological studies using UAS-equipped multispectral cameras is small, there is a consensus that the resulting data products are capable of detecting certain buried features. Nevertheless, despite the number of methodological and theoretical considerations associated with data available at final scales the basic principles and forms of analysis reported thus far are identical to those performed at broader scales of analysis and do not exploit the full swath of additional information higher-resolution data can provide. At the heart of the issue is the Modifiable Areal Unit Problem (MAUP) applied to spatial resolution. The MAUP describes the phenomenon where the same analyses lead to diverging results depending on the scale and boundaries by which data is aggregated. Using data from different parts of Mesoamerica, I present a novel community-based spectral analysis method avoid the MAUP by considering the proximal and ultimate mechanisms that allow archaeological features to be visible in multispectral imagery and their theoretical and methodological implications.

Melgar, Emiliano (Museo del Templo Mayor-INAH)**[192]** *Unveiling the Artisan Secrets of the Lapidary Goods from the Great Temple of the Aztecs*

Recent studies have demonstrated that the cultural provenance and diversity of the goods found in the offerings from the Sacred Precinct of Tenochtitlan are more complex than the archaeologists thought, overlapping their acquisition by tribute, exchange, war prizes, or looting. In the case of the lapidary objects, the majority of prior researchers divided their cultural provenance by their visual characteristics, especially the iconography, without comparing the raw materials, the technology, and the possibility of emulation of styles. In this paper, we present the mineralogical identification of new stones and geological sources with the employment of EDS, p-XRF and Micro-Raman Spectroscopy; and the traceological analysis of them with experimental archaeology and SEM. As a result, we confirm the presence of different lapidary traditions, unveiling some craft secrets of these items, detecting new styles and relics unreported by other researchers, and the existence of emulations of specific prestige goods. These studies allowed us to discuss their local or foreign origins, and improve their cultural affiliation and provenance. Finally, we compared these results with other lapidary assemblages, in order to discuss their place of production.

[192] *Chair***Melton, Mallory (University of California Santa Barbara) and Matthew Biver (University of California Santa Barbara)****[356]** *New Starch Grain Results and a Synthetic Approach to Foodways at Quilcapampa La Antigua*

The mundane and commensal foodways of Wari and Wari-influenced peoples is a burgeoning area of interest that has the potential to illuminate various aspects of Wari identity. The Middle Horizon period was a particularly turbulent time in terms of identity politics. The establishment of Wari satellite colonies created new locations of culture contact and active negotiation between colonizer and indigenous, resulting in a multitude of interactions throughout the Empire. This paper reports on the identification of starch grains collected from manos and ceramic cooking/serving wares from Quilcapampa (AD 600-850), a Wari-affiliated Middle Horizon period (AD 600-1000) village located in the hyper-arid environment of the Sigwas Valley, Arequipa, Peru. In addition to presenting new starch grain results from artifact residues, we integrate microbotanical and macrobotanical results, a type of synthetic approach that is unprecedented for the region and time period. Collectively, microbotanical and macrobotanical identifications shed new light on food processing practices and spatial organization of activities in this Wari-affiliated village.

Menchego, Timothy**[342]** *Discussant***Mendel, Catherine, Deanna Grimstead (The Ohio State University), Joan Coltrain (University of Utah), Harlan McCaffery (Eastern New Mexico University) and Tiffany Rawlings (State University of New York College at Brockport)****[419]** *Persistence in Turkey Husbandry Practices in the Southwest and Four Corners Region: The Isotopic and Ethnohistorical Evidence*

aDNA analysis reveals an independent domestication event of Turkey (*Meleagris gallopavo*) occurred in the Southwestern United States between 200 BC—AD 500. While this event was distinct from the domestication of turkey within the Mesoamerican world approximately 2000 years ago, we still know little about turkey husbandry within prehistoric agricultural groups from the Southwest and Four Corners Region, USA. Our research applies carbon and nitrogen isotope analyses to a sample of archaeological turkey bones from the Tohatchi Flats region of the Chuska Mountains, New Mexico, USA. To contextualize these samples, we compare them to wild modern turkey isotope data and previously published archaeological turkey isotope analyses. Results strongly resemble ethnohistorical accounts of these regions, where diverse practices would result in varying stable isotope ratios, including the capture and integration of young wild turkeys, taking wild eggs for flock hens to raise, “penning” in kitchens, “penning” in coops, free ranging, and tethering. Notably, archaeological turkey samples display distinct patterning through time (Basket Maker III – Pueblo III), which is reflective of the varied ways turkeys were tended to ethnohistorical accounts and suggests significant variation in husbandry practices and perhaps the shifting meaning of turkeys within Puebloan societies.

[314] *Jade, Scepters, and Seats of Power: Symbols of Authority on the Central American Coast, 300 BC-AD 300*

This paper documents a widespread shift during the period from 300 BC-AD 300 toward symbolism associated with authority and rulership along the Pacific coast, throughout the region spanning between southern Chiapas and the Nicoya Peninsula of Costa Rica. During this period, several notable changes in burial patterns, status-affirming objects, and iconographic motifs occurred, suggesting that inequality became more institutionalized among Pacific coastal cultures. This paper addresses some of these common motifs and practices associated with authority while addressing the regional diversity in the application of these themes. Specifically, this paper addresses four classes of artifacts discovered in burials and other elite contexts dating to 300 BC-AD 300. These objects, including Usulután pottery, jade ornaments, zoomorphic scepters, and “seats of power,” illustrate shared concepts of political authority.

[33] *Assessing Shellfish Discard for Discerning between Field Processing or Residential Relocation in the Subtropical Pacific Coast of South America*

Variability in site structure and shellfish assemblages from hunter-gatherer sites in the Pacific coast of Los Vilos (31°50'S, South America) has been attributed to changes in field processing decisions across the Holocene. However, these changes have not been evaluated considering explicit models. Prey choice and central place foraging models predict which resources to exploit and how would be the best way to transport them, respectively. This paper will combine them to explore the variability of shellfish assemblages at three time periods (12,000-9,000, 8,000-4,000 and 4,000-2,000 cal BP) in which residential and logistical organization alternated over coastal land use decisions. Differences are particularly observable on the treatment of the loco (*Concholepas concholepas*), an abalone-type mollusk with the largest size and higher meat yields on this coast. Other shellfish, like bivalves and less productive gastropods, are recorded only at residential sites at different points in time, which indicates that they were not subjected to field processing. Finally, the exploitation of higher variability, including low-ranking specimens between 4,000-2,000 cal BP, may be explained by a major shift in the use of coastal environments including a more active foraging role of children when residential sites were located closest to the shoreline.

[375] *Tarascan Experimental Metallurgical Technology*

In pre-Hispanic Michoacán, the use of metals such as copper, silver, gold, and some of their alloys is indisputable. Whether for everyday use, ornamental and prestigious use, or even for a warlike purpose, the metallic tools allowed the former inhabitants of the state to achieve a hegemony over the region, reaching a high status that came to rival its neighbors in the Basin of Mexico. However, with the passing of the centuries, the metallurgical techniques and processes which were used for the transformation of the ores rich in these materials and the manufacture of the articles were lost or modified and mixed with Spanish techniques. That is why the need arises to try to recover this knowledge, using the help of methodological tools such as ethnography, the analysis of operational chains, and experimental archeology. This experimental work will try to reproduce an operational chain from the transformation of metal-rich ore to different finished objects, such as axes, rattles, tweezers, figurines and needles. This work is based on different historical and ethnographic sources because, in the region, there are copper foundry workshops that keep some reminiscences of techniques as well as different adapted goldsmithing techniques.

Mendez Bauer, Maria Belen (Universidad Nacional Autónoma de México)**[303]** *Under the Hills: Archaeology of the Quetzaltenango Valley*

In prehispanic times the tops of the mountains and volcanoes were used as natural markers of geographical spaces; many of these points served as referents in the construction of cultural landscapes based on the sacred. The valley of Quetzaltenango, in western Guatemala, is surrounded by ten prominent hills and volcanoes. In addition, the western highlands has more references in colonial literature to land titles than other areas. In this paper, the history written in ancient documents and the Popol Vuh are taken up, to locate the Postclassic populations of the area and their relationship to their landscape. Special emphasis is put on the conflict reported between Mam and K'iche'ib in the north of the valley in the Ostuncalco area, which began in the early Postclassic period and continued until 1785. During this time, a spring of water was being disputed, which, besides being considered a natural limit, had a symbolic charge. This study exemplifies the close relationship between landscape, history and archaeology.

Mendoza, Rubén (CSU Monterey Bay)**[193]** *Conjuring the Archaeology of Aztlan - Through the Looking Glass and Material Lens of the Chicana/o Counterculture, 1976-2018*

With a pedigree firmly rooted in the evolution of the American automobile, lowriders trace their origins to the low-slung custom cruisers and social clubs of the 1930s and 40s. In effect, Mexican immigrants of that time were drawn to mutual aid societies in their quest for identity, kinship, camaraderie, and support. This thereby fueled the rise of lowriders and lowrider automobiles and the pop-cultural milieu of the time. Such youth-oriented social formations proved timely manifestations of the changing Chicana/o countercultural landscape of the 1950s through 1990s. The Hispanic towns and barrios of the American Southwest set the stage for the resurgence of the legendary Aztlan, deemed an ancestral crucible for the Chicano/a social movements of the 1960s. Drawing on a 40-year corpus of visual and documentary materials collected via participant observations and urban archaeological surveys undertaken in El Paso, Texas, Phoenix and Tucson, Arizona, Denver, Colorado, and Los Angeles, Delano, and Bakersfield, California; this illustrated presentation reviews findings from a decades-long program of urban archaeology, modern material cultures, and ethnohistory undertaken to monitor and evaluate the material cultural correlates identified with the proliferation of Chicana/o countercultural identities spanning lowriders, pintos, spooks, sprayheads, tecatos, clikas, homeboys and girls.

Variation in ceramic design elements often informs two different kinds of stories—first, about the intentional and conscious displays on the part of the potters, and second, about the habits and unintended consequences of learned traditions in communities of practice. This poster investigates ceramic stylistic patterning at Békés 103, a Bronze Age (late second millennium BC) cemetery on the Great Hungarian Plain in the Eastern part of Hungary. We document specific design elements (such as bosses, channels, nodes, and prows) among the vessels and compare them to assemblages from three Bronze Age sites within 15 km of the cemetery known from previous surface collections. Our aim was to look for similarities and differences between sites in the width, height, and depth of design elements, a form of variation created as the unintended consequence of learned traditions. We find both evidence of likely unintended differences between potting communities, in addition to conscious differences in motif use between assemblages, a pattern probably informed by the identities and conscious decisions of potters.

[417] *Chemical Diagenesis of Charcoal and Charred Organic Material in South African Middle Stone Age Rockshelter Sites*

Several South African Middle Stone Age (MSA) sites contain deposits rich in anthropogenic materials whose preservation was impacted by extreme burial environments. The specific chemistries of the burial environments are evidenced by dissolution of archaeological materials and/or precipitation of secondary minerals. In sites such as Elands Bay Cave and Klasies River Mouth, charcoal and fragments of charred organic materials also appear to undergo structural changes and in some cases are partially or fully replaced by secondary carbonate and phosphate minerals. These changes have been identified in microscopic remains present in micromorphological samples using organic petrology, micro-FTIR, micro-XRD and micro-XRF. The chemical diagenesis has negatively impacted the recovery of organic materials using traditional methods (e.g. flotation, sieving), yet the microcontextual analyses reveal a rich organic record at these sites.

[110] *Applying Simple Magnetic Depth Estimation Techniques to Archaeo-geophysics*

Magnetometry is probably the most widely used archaeo-geophysical technique in the world, despite its major drawback of an absence of depth information to an anomalous source. Many users, novices in particular, are under the impression that magnetometry does not or cannot provide depth information. Yet, depth estimation techniques are commonly utilized in geologic studies. This study applies multiple depth estimation techniques to modeled and real-world data collected at an archaeological test site and from multiple sites in Tennessee. They include the half-width rules and multi-height gradient techniques. As current archaeo-geophysical software is not capable of depth estimation procedures, these advanced methods were coded in the Python programming language to yield processing software that has been made available to other users. The potential benefits of deriving depth information to magnetic sources is discussed in the context of testing a variety of anthropological and archaeological hypotheses.

[32] *Microremains on Stone (Tools): Discriminating Function-Related from Natural Residues*

Plant microremains from stone tools speak to ancient hominin behaviour if genuinely related to usage. Residues, however, attach to rock surfaces naturally. My objectives are to identify pathways for microremain adherence prior to and after burial; study residue abundance in relation to petrography, microstructure, and rock topography; and analyse spatial relationships. My methods are: recovery of 40 stones from natural setting; petrography and analysis of coatings and micro-fractures; GIS analysis; residue extraction, density separation, microscopy, and taxonomy; and quantification. The results indicate that cobbles show coating and recrystallization. Residue is trapped through accretion of biogenic materials. Kernel density estimation of residues and nearest neighbour analysis detect scatters of randomly dispersed accumulations. Microplant residues include phytoliths (52%), starch granules (32%), as well as palynomorphs, diatoms, and spicules (16%). Rocks from the subsoil yielded phytoliths (55%), starches (41%), and other particles (4%). Starch increases in subsoils, diatoms are more frequent on the surface, while palynomorphs are a major component in subsurface rocks. Phytolith and starch morphotypes differ in surface versus buried cobbles. A comparison between these rock residues and freestanding microremains from surrounding soils also exhibited variations.

Meredith, Clayton (University of New Mexico) and Keith M. Prufer (University of New Mexico)**[174]** *Forager Mobility Patterns in Southern Belize: Preliminary Results from a Holocene-Length Record*

Despite considerable research on mobility patterns of the Classic Lowland Maya, the mobility of pre-ceramic foragers is understudied. Elsewhere, logistical mobility strategies have been documented for archaeological and ethnographic forager populations in tropical forest biomes. Most often these strategies are related to seasonally variable resource availability. Given the seasonal distribution of precipitation in the Southern Maya Lowlands, long-range seasonal mobility centered on resource acquisition is a possible response to predictable variation in resource availability. We present strontium and oxygen isotope analysis of tooth enamel of Paleoindian, Archaic, and agriculturalist burials excavated at Mayahak Cab Pek, Saki Tzul, and Tzib'te Yux rockshelters to examine mobility patterns across stages of life-history. Our results suggest that long-distance mobility, though apparent over decadal scales, did not occur as a seasonal activity during the Archaic or Paleoindian periods. These results have implications for interpretation of foraging strategies, raw material trading, and population interactions throughout Mesoamerica among pre-agricultural populations.

Merkle, Ann and Michael Frachetti (Washington University in St. Louis)**[101]** *Mobility and Highland Medieval Urbanism of the Nomadic Qarakhanids (9th-11th c. CE, Uzbekistan)*

Recent discoveries of a series of highland urban sites (located over 2000m elevation) in the Pamir foothills of Uzbekistan inspire a full reconsideration of the political and economic organization of the Qarakhanid Khaganate and their relationship to both lowland and highland cities. The Qarakhanids controlled Central Asia from the 9th-12th c. CE, yet their archaeological signature remains limited and biased toward agricultural settings. Here we present recent archaeological data from their highland urban settings, illustrating a previously undocumented model for "nomadic" highland urbanism and its impact on the trade and political structure of the medieval Silk Road.

Merkle, Ann [183] see Bullion, Elissa

Merrill, Michael (Arizona State University)**[396]** *A Methodology for Comparing and Evaluating Seriation Algorithms Applied to Archaeological Data*

According to recent literature, correspondence analysis is the method of choice for frequency seriation. However, this does not consider the effects of data heterogeneity or typology on the orderings produced by this method. This relates to a more fundamental issue of how to evaluate the effects of heterogeneity and typology on seriation results, as well as how to determine which of a set of seriation algorithms produces the more likely seriation ordering on a particular data set, and if so, why? In this paper we present a new methodological framework that: (1) identifies which parts of a data set are amenable to seriation, (2) identifies the likely number of minimally heterogeneous components in a data set in a way that is sensitive to emic distinctions, and (3) operationalizes a Bayesian stochastic seriation model to evaluate which of a set of seriation algorithms produces the more likely ordering on a given data set. When this new framework is applied to heterogeneous mortuary data set from a coastal Chumash village in southern California, the results suggest that correspondence analysis does not produce a likely seriation ordering.

Merriman, Christopher (University of New Mexico)**[187]** *Paleoindian Settlement and Mobility in the Northern Jornada del Muerto*

The Northern Jornada del Muerto in Socorro County, New Mexico has long been known for its extensive Clovis and Folsom occupations. In addition to early Paleoindian techno-complexes, the Plainview/Goshen/Belen and Cody complexes are also well represented. This is mostly due to the work of Robert H. Weber, Ph.D. geologist and avocational archaeologist. For fifty years he discovered, mapped, documented, and collected artifacts from sites across Socorro and Catron Counties, and in 2008 the artifacts, notes, and maps in his collection were donated to the Museum of Indian Arts and Culture in Santa Fe. The assemblage of over 750 Paleoindian projectile points and preforms from dozens of sites across the Northern Jornada del Muerto basin provides an excellent opportunity to examine diachronic change in a broad range of Late Pleistocene-Early Holocene hunter-gatherer behaviors. After providing an overview of the Weber Collection this presentation will discuss variation in settlement and mobility patterns across Paleoindian techno-complexes.

Merriman, Christopher [219] see Dennehy, Timothy

Merritt, Stephen (University of Alabama at Birmingham)**[402]** *Cut Mark Size Does Not Change during Butchery: Implications for Reconstructing Tool Use and Carcass Processing*

Animal carcass butchery occurs when technological factors (tool attributes) and butchery behavior (distinct actions like defleshing, disarticulation) intersect with animal anatomy (morphology of musculoskeletal tissues or regions), and potentially encodes information about these contexts via bone surface modifications. This study examines cut mark cross-sectional width and depth change during a sequence of experimental butchery trials. It addresses whether cut mark size reflects dulling tool edges and whether mark size supports inferences about the sequence of carcass parts defleshed with the same tool. An experienced butcher used one replicated chert flake or bifacial core to deflesh the forelimb, hindlimb and pelvis from one side of a cow carcass. The order of carcass segment defleshing was systematically varied across eight trials. Cut mark samples from limb midshafts and pelvic rami produced by each tool were compared with a repeated measures ANOVA model. Analysis suggests similar patterns for each tool type: cut mark width is greater in the third segment than the second, and cut mark depth is similar throughout the defleshing sequence. Without robust differences in cut mark cross-sectional size across the butchery sequence, it is premature to interpret tool use life and the carcass part consumption sequence from archaeological cut marks.

Mesia-Montenegro, Christian (Universidad Científica del Sur)**[315]** *Evolutionary Dynamics during the Central Andes Formative: Modelling Power and Inequality through Religion*

An essentialist view of the Central Andes Andean Formative would characterize social formations of this period as religious centered ones in which the organized religion played a central role in the emergence and maintenance of centers as a social force that would bring cohesion and satisfaction to those affiliated with such centers (sensu Durkheim). Au contraire in this paper I would like to model a different explanation bringing together Weberian idealism and Marxist materialism as evolutionary categories that adequately explain power and inequality through religion as a filter, driving selection units for the survival and reproduction of those who held power. Religion was a crafted tool orchestrated by authorities in order to hold privileges, being the real conundrum to convince those who did not power about the need to maintain power and inequality relations as such and even normal. This model will be framed under Universal Darwinism theory. Special attention will be put in the Middle and Late Formative sub periods, using data available from ceramics, iconography and monumental architecture.

Messenger, Phyllis (University of Minnesota)**[135]** *Archaeologists' Role in New Approaches to Heritage Studies and Heritage Protection*

If conceptions of heritage are based on a community's shared values, then it should follow that protection of heritage assets would also be built on those shared values. However, we live in an imperfect world of diverse, often competing stakeholders who assign different values to heritage. Nevertheless, archaeologists and other heritage professionals are developing new interdisciplinary approaches to teaching and learning about heritage in respectful, inclusive, and socially engaged ways that can contribute to greater understanding of the importance of heritage protection. This presentation offers case studies in

which heritage professionals incorporate values considerations, civic engagement opportunities, and stakeholder perspectives in their interdisciplinary teaching and practice. New opportunities for knowledge sharing about heritage protection, laws, and enforcement emerge through interdisciplinary teaching and learning; critical thinking skills lead to more complicated and inclusive understandings of community heritage. Students and early career professionals are putting these learnings into practice. In turn, their understanding of heritage protection issues influences their interactions with community and descendant stakeholders, as well as with law enforcement and land management professionals. This presentation reflects on how new approaches to teaching and learning in heritage studies can contribute to the goal of heritage protection and preservation.

[25] *Health and Resource Distribution at Tijeras Pueblo*

Tijeras Pueblo is a Pueblo IV site in Central New Mexico located on a natural travel route between the Western Great Plains and the Rio Grande Valley, which likely facilitated frequent contact between different cultural groups. This study addresses two interconnected research goals: first, to examine burial and skeletal data for indicators of distinct cultural units within the site, and second, to test whether membership in such units affects the access to nutritional resources and therefore the health of an individual. Using geographic information systems (GIS), I define spatial units based on the distribution of burials within the site. Osteological data - including age, sex, skeletal non-metric traits and health indicators – as well as burial data and spatial information, then serve to examine the interrelatedness between spatial units, phenetic groups, and burial

practices, in order to assess the cultural significance of those spatial units. Data are drawn from a sample of 55 individuals of varied demographic composition from known burial contexts excavated during the 1970s in Tijeras Pueblo. Results from these analyses are interpreted with special attention to the site's location in a border area of the Ancestral Puebloan World.

Meyer, Lauren (Vanishing Treasures Program, National Park Service)

[85] *Preserving Our Vanishing Treasures: 20 Years of Collaboration, Community Building, Traditional Craft and Conservation Science*

The Vanishing Treasures Program of the National Park Service is a multi-regional effort that supports the preservation of cultural heritage in the Western United States; facilitates the perpetuation of traditional skills through staff-, youth- and partner-focused training; and promotes connections between culturally associated communities and places of their heritage. Comprised of a network of NPS preservation experts and partners, VT strives to address critical preservation needs using both traditional and modern approaches.

For over 20 years, Vanishing Treasures has been working to preserve some of the most significant and fragile cultural heritage in the western United States. Beginning in the 1990's as a grassroots effort to address deficiencies in staffing and funding needed to effectively preserve cultural heritage extant in parks in the arid west, and expanding in the 2010's to support this work across three regions of the National Park Service, VT has been a model of collaboration, adaptation, partnership, and action. This session will focus on introducing the VT Program, as will it provide an overview of the impact that the program has had over the course of its existence on parks, staff, partners, and, most importantly, the resources that we preserve and protect.

Meyer, William (Villa Maria College) and Kristen Barnett (Bates College)

[136] *Does the Archaeology Curriculum Condemn Us to Repeat the Sins of the Past?*

Despite the early prominence of indigenous archaeologists like Arthur and "Birdie" Parker, Native practitioners remain a minority in the discipline. This exacerbates an already vexed relationship between archaeologists and Native peoples. Tensions flare in cases like that of Kennewick Man / The Ancient One, highlighting disagreements about what forms of knowledge matter; how such knowledge is produced; and what relationships link us to past peoples. Similar tensions emerge in the anecdotes of indigenous archaeologists, who describe existential discomforts, structures of privilege/oppression, and compromised academic and field situations. Small wonder that so few Native students are drawn to major in archaeology today. While many of the proposals offered in "Teaching Archaeology in the Twenty-First Century" (2000) might alleviate these tensions, changes to the standard archaeology curriculum have appeared only slowly and inconsistently. Further, in recognizing the interests of descendant communities as distinct from those of the archaeologist, even these initiatives risk implying that Native people cannot be archaeologists. If we wish to avoid the sins of the past, to overcome educational inequalities in the communities where we work, and to honor the SAA's published commitment to diversity in the discipline, we must imagine a curriculum that attracts and includes Native students.

[76] *Shells, Drills, and Lithic Tools: Indirect Evidence of Textile Production at a Mississippian Frontier*

Textiles served as symbols of status and ideological belief systems in Southeastern Mississippian chiefdoms. They also were markers of identity. Remains of fabric are not often found in the Southeast, due to poor preservation in the region. Those that have been analyzed reveal that a range of colors was used to indicate status and that fabrics were often decorated with ornaments. The evidence of textile production in the Southeast should therefore also include evidence of dyeing fabrics and production of ornaments. Such ornaments likely included shells, as seen on fabrics at sites like Cahokia. The 14th century Mississippian frontier Carter Robinson site in southwestern Virginia contains some evidence of textile production but more substantial evidence of fabric dyeing and ornament production. This includes the presence of over dozens of shell beads showing all stages and multiple methods of bead production, two kilograms of modified gastropod shell, dozens of drills and lithic tools, and possible evidence of mordants for dyes. Specifically, the shell appears modified to more easily sew onto fabric. This paper will present this evidence and specifically examine how the dyeing and ornamenting

of textiles functioned within a frontier hierarchical economy.

[56] *Comparison by Non-Metrical Traits of Xaltocan's Shrine vs. Teotihuacan in Mexico by Using a Non-metric Multidimensional Scaling Method*

There is little information about the biological diversity of the populations that inhabited the Basin of Mexico. In this work we focused on showing the phenotypic differences between 118 skulls of the Xaltocan sanctuary and 44 adult skulls from Teotihuacan. It is not clear how this variability relates to ethnic diversity because ethnicity and biology are not always correlated. However, given that the smaller settlements in the region during the Classic and Epiclassic periods had relatively low populations, the biological distances between individuals can help us to understand the population dynamics of the region. For phenotype differentiation, we use non-metrical traits (NMT) since they are well related with genotypes and are easiest to measure, even for incomplete skulls. We undertake an analysis by non-metric multidimensional scaling analysis (nMDS) for the Euclidean distances of the NMT.

[119] *Adapting Project Archaeology Curriculum in Southern New Mexico*

The purpose of this poster is to develop an educational curriculum on archaeology to be used for a K-12 audience by adapting an existing program, put forward by the BLM, Project Archaeology. This new curriculum, "The Archaeology of Home," seeks to engage the public within southern New Mexico and to convey the value of stewardship and preservation. The area of focus will be the Organ Mountains-Desert Peaks National Monument. The information gathered at the sites of Peña Blanca and Soledad Canyon will be employed and incorporated into an educational program. Specifically, the resources used will focus on the archaeology of home – the rock shelters at Peña Blanca and the rock house at Soledad Canyon. Additionally, the adapted modules will be test driven and evaluated with the help of the Anthropology groups on campus. Development of educational programs are important because there is a need and a responsibility to transfer scholarship from within the professional sphere to the public. Stewardship is the responsibility of everyone and that means the involvement of the educators, like those for K-12, is important, even imperative, to the improved protection and continued preservation of natural and cultural resources, particularly threatened ones like the rock shelter.

[301] *Exploring the Engagement, Imagination, and Alignment of Potters and their Practices in Neolithic S. Calabria, Italy*

In this presentation we use the results of a raw materials survey, replicative experiments in the field and the laboratory, and physicochemical and mineralogical analyses of local geological clays and archaeological ceramics from the sites of Umbro Neolithic and Penitenzeria in Southern Calabria, Italy to ask 3 questions: 1) How did Early-Middle Neolithic (ca. 5700-5000 BC cal.) 'communities of potting practice' engage with their taskscapes; 2) how did they imagine themselves as parts of broader temporal and spatial patterns; and 3) how did they align their practices with those of other communities locally and regionally to fit within broader structures? By investigating these questions, we can explore how local, mundane actions could shape and be shaped by social life, how power relations could be negotiated in small, politically non-hierarchical societies, how these locally grounded practices could be connected with larger regional processes, as well as how continuity and change could co-exist.

[199] *Identifying Late Classic Political, Economic, and Cultural Affiliations at Pacbitun, Belize*

For the ancient Maya of Pacbitun, the onset of the Late Classic period (AD 550-800) signifies a time of exponential site growth and heightened prosperity. While this florescence is evident in the archaeological record, recent studies have begun to demonstrate that this affluence was accompanied by significant political, economic, and sociocultural change. Situated beyond the southern boundary of the Belize River Valley, Pacbitun culturally identifies with this region but likely enjoyed a significant amount of political autonomy. However, caught between the Late Classic combatant kingdoms of Naranjo and Caracol, Pacbitun and the sites of the Belize Valley would have been subject to incorporation and/or subordination. Interestingly, recent investigations of Plaza A and the residential courtyards at Pacbitun not only indicate an intensified relationship with the Belize Valley during the Late Classic period but may also allude to affiliations with one of the aforementioned kingdoms. Moreover, an analysis of skeletal remains and associated grave furniture seemingly implies an even broader influential sphere at this time. Through an examination of ideological alterations to ritual and mortuary practices and an assessment of foreign trade goods from distant sources, the authors attempt to interpret political affiliations and autonomy at the site of Pacbitun.

Mickel, Allison (Lehigh University)

[77] *The Proximity of Communities to the Expanse of Big Data*

While members of the communities living near or on archaeological sites have frequently been hired around the world to dig on archaeological excavations, they have very rarely participated in the recording or documentation of those excavations. They have played even less of a role in designing the structures of either paper or electronic data management systems. In this paper, I examine the effect of this long-term exclusion using Çatalhöyük, Turkey as a case study. I argue that many of the long-term debates in digital archaeology, particularly considering the comparability versus the customization of data collected, acquire new valences when the interests and knowledge of local community members are taken into account. I maintain that in many ways, the advancements toward big data approaches in archaeology make it more difficult than ever for local communities to articulate their relationships and perspectives on archaeological material. Proximity, defined in many different ways, underlies the way that local communities think and speak about archaeological assemblages, and I illustrate the ways in which these proximities are at odds with the expansive view that "big archaeology" enables.

Micon, Jonathan (University of Georgia), Jennifer Birch (University of Georgia) and Louis Lesage (Huron-Wendat Nation)

[308] *Kinship, Clanship, and the Incorporation of Newcomers in Northern Iroquoian Society*

In this paper, we consider how institutions of social relatedness played crucial roles in Huron-Wendat society and how categories of biological and fictive kinship (e.g., lineages, clans, nations) structured processes of social integration, political affiliation, and adoption. We argue that flexibility in categories of social relatedness conferred an adaptive benefit on Iroquoian societies during the late precontact and early contact eras. We then use this framework to analyze data related to the relocation of populations from the St. Lawrence valley and their incorporation into neighboring communities and Nations during the late fifteenth and sixteenth centuries. Data on the distributions and frequencies of characteristic St. Lawrence Iroquoian artifacts on village sites in Ontario, Canada are utilized to infer the scale of population movement and processes of incorporation. We argue that the circumstances governing population movement worked in concert with institutions of social relatedness to facilitate the integration of St. Lawrence newcomers into Huron-Wendat social and settlement structures. As such, we argue that interpretive frameworks that explicitly incorporate categories and institutions of relatedness with traditional material culture analyses can shed new light on the incorporation of newcomers into middle-range societies.

[401] *Community Archaeology in Practice: Great Bay Archaeological Survey*

For the last three years, the Great Bay Archaeological Survey has excavated frontier contact period (1620-1750 AD) garrisons within the Oyster River watershed. These early reinforced New Hampshire homesteads are rare finds in New

England archaeology. The success of this research relies on treating community volunteers as equal contributors. Archaeologists cannot be the sole voice of local histories. This project works to actively decenter the expert/community divide long extant in the discipline by actively centering the public not just in involvement but in interpretation as well. Public archaeology and community engagement are buzzwords in conversations around the future of the field. We know we must have real buy-in from the broader public to remain relevant. GBAS offers one example of a way to actualize this, being a project that functions with a distribution of voice and power. This paper explores our approach to distributing voice and power, the strengths of our approach as well as pitfalls we have encountered that may inform other archaeologists engaging in community-centered archaeology.

[304] *Animal Imagery in the Postclassic Yearbearer Pages of the Codex Borgia*

Animals are prominent in annual rituals performed at the end of the year, as seen on page 49-52 of the Codex Borgia. Animals attacking each other and scenes of struggle involving animals and anthropomorphic gods are related to sequences in the yearbearer cycle that define the Calendar Round. Yearbearer ceremonies are featured in these directional almanacs form a cosmogram of time and space. Four birds perched on trees represent the four cardinal direction associated with four yearbearers that form a sequence of 52 years. Another set of trees shows scenes of sacrifice involving animals, but in the last yearbearer page human sacrifice is featured instead, an interesting variation that relates to ethnohistorical accounts. Other manuscripts in the Borgia Group show interesting parallels, including birds and directional trees associated with four different sets of yearbearers, and scenes of conflict between animals and deities. This patterning suggests that animals played an important role in yearbearer ceremonies performed at yearend, a liminal time of transition in the festival calendar of central Mexico.

[120] *Recording the NDVI of Sagebrush with the Use of a UAS in Relation to Sites at Lowry Pueblo*

Archaeological sites in the American Southwest are known to have indicator plants associated with these sites. At times these plants are used as 'site indicators', such as Wolfberry (*Lycium pallidum*) (Yarnell 1965). In addition, there is an anecdotal belief that archaeological sites in the Southwest can be identified by locating healthy, dense clusters of sagebrush. In order to test this hypothesis, I used an unmanned aerial system (UAS) (more commonly known as a drone) equipped with a multispectral camera (Fig. 1) to collect vegetation health and site location data at the Lowry Pueblo Community in Southwestern Colorado.

[195] *A Geoarchaeological Study of Site Formation Processes at Arma Veirana, A Palaeolithic Cave in Liguria, Italy*

Arma Veirana is a cave situated along the steep flanks of the Neva river valley, ca. 14 km from the modern-day Mediterranean coast in the mountainous interior of Liguria. The cave formed tectonically within marble, schist and other metamorphic rocks and presents a large but relatively short cavity. Excavations since 2015, conducted by a team of researchers from the USA, Canada, Italy and Germany, have uncovered several meters of deposits dated to both the Middle and Upper Paleolithic. Geoarchaeological investigations at the site indicate that the entrance to the cave has

suffered from periods of extensive rock fall and portions of the Paleolithic deposits have been subsequently eroded. However, micromorphological analysis shows that a significant portion of the cave's infilling is intact and in situ. Furthermore, micromorphology indicates that humans contributed to the accumulation of sediment within the site, notably in the form of combustion residues within the Middle Paleolithic layer "the Black Mousterian."

[35] *Fire on the Mountain: Colonizing South Appalachia in the Early Holocene*

We use the Ideal Free Distribution from Behavioral Ecology as a null model to interpret the distribution of previously recorded archaeological sites in the Tennessee and Duck River Valleys in central Tennessee from the appearance of Clovis sites in the terminal Pleistocene through the Early Holocene (~13,250 – 8,880 cal yr BP). We hypothesized that the distribution of Clovis sites would be skewed towards lower elevations, and then subsequent populations would spread to higher elevations over the course of the Younger Dryas and Early Holocene as boreal forests were replaced by mixed hardwood, deciduous forests. Our results are consistent with other studies that have proposed that the Cumberland Plateau and the Appalachian Highlands were not intensively occupied until well after the disappearance of the Clovis culture. Using data provided by the Digital Index of North American Archaeology, we expand our analysis to the entirety of the Tennessee River Valley to explore the colonization of the South Appalachian Mountain in the American Southeast.

[420] *Three Kiva Pueblo Revisited*

Three Kiva Pueblo Revisited

In 1969, the BYU Field School of Archaeology began intensive excavations at site 42Sa863, Three Kiva Pueblo, in Montezuma Canyon, San Juan County, Utah. Four seasons of field-work, including analysis of architecture, ceramics, lithics, and various artifact materials were reported in a 1974 graduate thesis. Three occupational components represented by successive building constructions are apparent at Three Kiva Pueblo. A total of fourteen rooms and three kivas were delineated. All but two rooms were excavated. A trash mound containing voluminous cultural material and burials was located southeast of the main house structure. West of the house mound is an additional shallow mound representing a ramada area which was utilized by peoples from all three component occupations. The site was occupied, modified or abandoned, and reoccupied, perhaps seasonally, from late Pueblo I to late Pueblo III times. In 1972 the site was stabilized, and no additional excavation has continued. This report is a revisit and update with consideration for continuing research in Montezuma Canyon and other sites in the northern San Juan area.

[205] *Temporal Changes in Wall Trench Structures at the Upper Mississippian Village of Noble-Wieting, McLean County, Illinois*

This presentation provides an overview of recent excavations at the Noble-Wieting village in McLean County, Illinois. Noble-Wieting is a nearly six-acre Langford Tradition mound and village site along the Kickapoo Creek, far from the Langford core along the upper Illinois River. The site has long been known for its unique geographic position as well as the association between Langford and Mississippian pottery. Recent excavations in the northern portion of the site, guided by geophysical data, revealed two partially superimposed wall trench structures. Excavated wall trenches and other features revealed information about above ground architecture, burning episodes, construction sequence, as well as continuity and change in the structure through the rebuild. Overall, the houses share some similarities with other Langford structures but also sheds light on unique architectural elements at Noble-Wieting, which likely represent material signatures of ethnogenesis at this multi-ethnic frontier community.

[401] *Sugpiaq/Alutiiq History and Community Archaeology in Old Harbor, Kodiak Island, Alaska*

Russian colonial expansion into Alaska dramatically altered indigenous communities and landscapes. Motivated by valuable pelts and the desire to compete with other European powers, Russian fur traders crossed the North Pacific, constructing their first American settlement in 1784 near the modern village of Old Harbor on the Kodiak archipelago. Lacking the knowledge and technology to hunt sea otters, Russians relied on the conscripted labor of indigenous Sugpiaq/Alutiiq men to gather these furs. Similarly, Russians depended on Sugpiaq/Alutiiq women for their knowledge of local resources, fur processing, and qayaq cover production. Sugpiaq/Alutiiq people responded to the changes in politics, economics and environment strategically and situationally. In this talk, I consider current understandings of these changes based on ethnohistoric and archaeological evidence and present the results of a pilot archaeological survey of historic Sugpiaq/Alutiiq sites from throughout the period of Russian colonization (1784-1867 CE) in the region around Old Harbor. I discuss expectations for how research at these sites can illuminate daily negotiations of subsistence, gender and labor within a landscape of pervasive but shifting Russian power and interests, and Sugpiaq/Alutiiq resistance and persistence. I also discuss plans for a community archaeology project as integral to the investigation of these changing relationships.

[280] *Lidar Vegetation Analysis and Ground Truthing Efficacy at the Maya Archaeological Site of El Palmar, Mexico*

An essential component of analyzing lidar data is adapting them to the researcher's specific environmental situation, including the effects of local vegetation types on the identification of archaeological features. Doing so, can refine estimates of existing structures in non-surveyed areas and inform improved ground survey strategies in the future. At the Maya site of El Palmar, Mexico, we conducted a ground-truthing survey of different vegetation types associated with features initially digitized using a 94 km² lidar image and those newly discovered during fieldwork. These data were then compared to raster images developed to model vegetative cover based on factors such as vegetation height, density, and ground point returns. While the majority of vegetation types presented few obstacles to visibility in our case, we found that the most problematic types of cover were easily identified from the Lidar image itself. These results allowed us not only to evaluate the validity of raster vegetation models but also to compare methods for identifying less accurate areas of the Lidar image, creating more efficient survey plans that do not require time-consuming analyses of point-cloud datasets.

[254] *The Architecture of the Navajo-Gallup Water Supply Project*

Architecture is an intimate element of material culture, and was employed by hunter-gatherers, farmers, and pastoralists for thousands of years throughout the Navajo-Gallup project area. The way in which individuals constructed and organized space within these structures are specific to different cultures, time periods, and functions. This paper summarizes architectural units excavated in the San Juan Basin as part of the Navajo-Gallup Water Supply Project over the last 6 years, including Archaic, Basketmaker, Pueblo, and Navajo components. These architectural types are summarized and placed in a larger context of other architectural units known to exist in the region.

[79] *Bonampak Will Never Be Finished: Some Remarks in Honor of Steve Houston*

One might think that the 2013 publication of Miller and Brittenham on Bonampak would have closed discussion of these paintings for a few years. But the complexity and richness of the subject continues to yield both details and to add to the big picture of the three-room program of late 8th century Maya paintings in ways that extend the work of both that book and of

the work of Stephen Houston, who has published extensively on the subject for over thirty years. For example, through additional review of the battle in Room 2, it is now possible to see that the battle scene in Room 2 encompasses a stepped pyramid, previously unrecognized, large enough to be a dominant visual feature but represented at a scale with respect to human actors that is more diminished than the depiction of the pyramid—and its dramatic dancers—in Room 3. Additionally, the continuing scientific work on Maya pigments makes it possible to speculate on the possible meanings that the color juxtapositions in the paintings may have had.

[115] *Post-Depositional Ridge Rounding on Banded Ironstone and the Condition of the Fauresmith Artifacts at Bestwood, South Africa*

Transitional lithics have the potential to inform researchers about innovation during significant periods of human evolution. The Fauresmith, an Early Stone Age (ESA) to Middle Stone Age (MSA) transitional industry in South Africa, is marked by the appearance of blade technology and composite tools alongside continuing traditions of large cutting tools. This transitional period coincides with the evolution of advanced Homo species during the Middle Pleistocene. However, one of the difficulties in interpreting transitional assemblages is determining if they are a cohesive lithic tradition or a mixture of early and late assemblages. Using the Fauresmith site of Bestwood, South Africa, as a case study, this research explores post-depositional traces on lithic artifacts to understand formation processes at transitional sites. Using banded ironstone collected from the Kuruman Hills near Bestwood, experimentally produced tools underwent tumbling experiments to document stages of ridge rounding. Using two types of microscopy, fresh ridges were measured before experimentation and documented again after tumbling, allowing the creation of a wear rating system for banded ironstone. This system was then applied to over 200 artifacts from Bestwood. The results of this condition analysis of Bestwood artifacts from multiple areas of the site are presented here.

[379] *Early Childhood Diet during the Bronze Age Eastern Zhou Dynasty (China): Evidence from Stable Isotope Analysis*

Diet and health are deeply intertwined, and childhood is a critical period where nutrition can have significant short- and long-term effects on the growing individual. Breastfeeding, weaning, and childhood dietary habits are culturally-mediated practices, and how a developing body is fed is a critical cultural experience with biological consequences. Stable isotope analysis of human teeth is one method to study childhood dietary patterns, with new techniques allowing for fine-grained dietary histories of individuals over different windows of time during youth. Previous research on the Eastern Zhou Dynasty (Bronze Age China) identified differences in dietary and health patterns between adult females and males, interpreted as the emergence of male-biased inequality during this time period. To fully understand the development of this pattern of sex-based dietary difference it is crucial to investigate infant and child feeding practices, as nutritional differences may have consequential effects on health outcomes later in life. We studied a sub-set of the same Eastern Zhou individuals' teeth using an incremental dentin sampling approach, with small sections of dentine collagen analyzed for carbon and nitrogen stable isotope data. Here we present the results of this study including analysis of breast-feeding, weaning, and childhood dietary patterns.

[84] *Bringing the Landscape Home: The Materiality of Placemaking and Pilgrimage in Jornada Mogollon Settlement*

Among prehispanic and historic societies of the American Southwest and Mesoamerica, mountains and caves had multivalent metaphorical and symbolic meanings relating to underworld, ancestors, water, and emergence. Mountains and caves are featured among origin and emergence myths and many contemporary Pueblo societies regard themselves as relationally constituted through such ideational landscapes. Symbolic and metaphorical representations were painted, carved, and modeled in many media, creating iconographic engagements with such beliefs. Other means of engagement with sacred landscapes include placemaking via shrines and rock art. Yet another critical form of engagement, one that is often overlooked, concerns the small material representations of sacred landscapes that were acquired during visits or pilgrimage journeys and transported back to settlements. These take the form of bundled associations of fossils, crystals, pigments, and speleothem often found in ritual depositional contexts. The bundled associations convey bundled meanings,

forming material links between ritual spaces in settlements and the surrounding landscapes. These objects reference the “pieces of places” described by Bradley, whereby material objects retain the significance of their origins and come to represent those locations on the landscape. This paper examines these macroscale material linkages between sacred landscapes, placemaking, pilgrimage, and constructed spaces.

[371] *Connecting Communities: Materiality of Everyday Life along the Sacbe*

This poster offers an introduction to the Proyecto Sacbe Yaxuna-Coba, which is concerned with understanding how social and material life changed for people living along the longest causeway in the ancient Maya world. Up until now, much of the research on Maya sacbeob has focused on the morphology and spatial layout of these monumental features. This project, however, builds upon a growing emphasis in anthropological archaeology of peopling the past (Robin 2003), by critically shifting the frame of analysis away from the materiality of the road itself to looking at changes in the materiality of everyday life after a road transforms the socio-spatial landscape. Systematic archaeological investigations and scientific analyses of households situated at each end of the Yaxuna-Coba causeway provide an ideal opportunity to examine the significance and implications of sacbeob for the everyday life of ancient Maya people. In this poster, I present some preliminary findings from investigations of households at the Yaxuna end of the causeway, specifically looking at change over time in construction practices, domestic spatial organization, domestic burials, and shell crafting.

[330] *Post-Classic Canal Excavations at Yaxnohcah, Mexico*

Yaxnohcah is a large site in Campeche, Mexico with evidence of continual occupation from the early Middle Preclassic into the Postclassic. In 2014, the Yaxnohcah Archaeological Project commissioned a high resolution lidar scan of the region,

which has allowed for accurate modeling of surface hydrology and significantly contributed to our understanding of hydrological landscape modification at the site. One feature of particular interest was an irregularly shaped, deeply etched canal located in the Bajo Tomatal, just south of the narrow drainage that connects it with the Bajo Laberinto. In 2017 and 2018, we modeled and analysed the hydrology of the Canal, which, along with associated-complimentary fieldwork, has provided insight into the extent and purpose of the feature. Our excavations show that, while the canal may originally have been a natural feature, it was extensively modified, with clear evidence for considerable refurbishment during the Post-Classic and data suggesting an earlier date for initial construction. Furthermore, the modelling indicates that the canal was used as a control mechanism for redirecting and buffering waterflow between the El Laberinto and the Tomatal Bajos. This control would have significantly augmented the agricultural viability of the surrounding area.

[38] *Slow Violence and Environmental Inequality in the Valley of Mexico*

The Valley of Mexico project was unprecedented in its documentation of demographic, social, and environmental processes over millennia. Nevertheless, its findings are limited because participants did not systematically collect archaeological data about settlements after the Spanish Conquest. Although the Conquest was an unprecedented event, its aftermath was shaped by long-term process with deep historical roots. This paper reexamines the value of project data to understand the post-Conquest world in light of 'slow violence,' a term that Rob Nixon coined to call out the temporal and environmental dimensions of structural violence. If structural violence denotes covert and sanctioned inequality, slow violence denotes gradual and accretive changes to structures of violence, especially the unequal consequences of environmental degradation. This paper asks to what extent the project's data document pre-Conquest processes of slow violence and how these processes affected the aftermath of the Conquest. For answers, I compare pre-Conquest trends in settlement patterns, resource exploitation, and environmental change with evidence of the persistence of settlements after the Conquest. In so doing, I find that even decades after the completion of the Valley of Mexico project, the data remain vital as empirical evidence against which new theories can be evaluated.

[259] *cyberSW: A Data Synthesis and Knowledge Discovery System for Long-Term Interdisciplinary Research on Southwest Social Change*

A major challenge in using archaeological data at large, regional scales is that information is not digitally curated or synthesized beyond individual projects. A number of recent synthesis projects in the U.S. Southwest show the great potential of these data for addressing important social science questions such as: What promotes the success or failure of some societies? How does migration transform social identities and create new social structures? And, what are the relationships between environmental and social changes? We are building on these prior projects to produce an online system that will allow users at different levels of expertise and access to view, analyze, and export data on past societies in the Southwest to address these and many other questions. The online analytical tools will allow individuals to conduct their own analyses, whether they are tribal members interested in their history, land managers responsible for public interpretation, students learning data manipulation and display, or social scientists grappling with the long-term questions about the human past. A Citizen Science component for registered volunteers will allow a bigger community to participate in transformative science.

[401] *Archaeologist-Collector Collaborations in the San Luis Valley: A Case Study*

This research project explores the ways in which the professional world of archaeology clashes with collectors, and how understanding both domains is vital to furthering knowledge of the past. By combining methods of collaboration as well as ethnohistory and field methodologies, professionals and other stewards of the past can retro-actively document sites through private collections and collection stories. This project serves as a case study for this type of collaboration working specifically in the San Luis Valley. In partnership with a private collector, four new sites on the Baca National Wildlife Refuge were recorded. When, as in this case, collectors are “responsible, responsive stewards”, according to the language and ethical standards set forth by the SAA Archaeologist-Collector Collaboration Interest Group, they prove to be integral partners in the discipline. By developing methodology and opening communication lines between professionals and other ethical stewards of the past, we can learn so much more about the past.

Mills, Rebekah (Barnard College, Columbia University)

[411] *Conserving a Castle: The Connection between Archeology and Preservation in Making History Accessible*

Nestled in the hidden heartlands of Roscommon, Ireland is Ballintober Castle. Ballintober Castle and its surrounding deserted village are the site of an archeological field school, Castles in Communities. As the field school progresses into its fifth year, castle conservation becomes more important for continuing archeological work and maintaining the cultural significance of Ballintober Castle. Both conservation and archeological work are important as the modern town of Ballintober views the castle as an essential site for tourism and local heritage. One goal of conservation for the local community is to connect Ballintober Castle with surrounding cultural sites along the Suck Valley Way. The Suck Valley Way Initiative has created hiking trails and canoeing for an active way to experience history. Conservation would allow visitors access to see inside Ballintober Castle instead of just walking past. Connecting Ballintober Castle to the Suck Valley Way would help paint the picture of the historical landscape, showing the importance of the current archeology and history of the site with modern day economic and community interests of tourism and historic preservation. This paper will demonstrate the importance of conservation for Ballintober Castle serving as a place of cultural heritage and connection to the past.

[194] *An Analysis of the Polvorón Phase Lithic Assemblage from the Mesa Grande Platform Mound in the Phoenix Basin*

The Polvorón phase (ca. A.D. 1350–1500), which occurred after the Hohokam Classic Period, was a time of cultural paradigm shifts. There are cultural continuities with the preceding Civano phase, like the use of Salado Polychromes, but people during the Polvorón practiced different cultural traditions, most notably the construction of jacal-like pithouses through compound architecture, and the cessation of large-scale canal irrigation in favor of a mix of small-scale agricultural production and wild resource procurement. Recent excavations at Mesa Grande allow for a renewed effort to understand this understudied phase in the Hohokam cultural sequence. Here, we investigate if the Polvorón phase occupants migrated into the area when the platform mound at Mesa Grande fell into disuse. To assess where they came from, we performed formal and metrical analysis on the chipped stone assemblage, including an EDXRF analysis of the obsidian. Based on these data, we suggest that although the Polvorón phase occupants may have come from outside the region, the obsidian comes from sources that were previously used during the Civano phase like Saucedo Mountains and Los Vidrios. Therefore, while there is discontinuity in Hohokam material culture during the Polvorón, there was also continuity.

Milton, Emily (Michigan State University) and Joshua Schwartz (Northern Illinois University)**[116]** *Not Something to Grind Your Teeth Over: Experimental Mounting of Enamel for Stable Isotopic and Microscopic Analysis*

While preparing a set of zooarchaeological materials for microscopic and high-resolution stable isotopic studies, we found ourselves gritting our teeth to produce a set of mounts that met the standards for the intended lab analyses. Our target specimens were camelid teeth from the Terminal Pleistocene levels of Cuncaicha, a highland rockshelter in Southern Peru. These teeth are long and slender, making them difficult to fit into 2.5 centimeter epoxy rounds. As archaeological materials are rare and irreplaceable, it was essential to begin practicing with a set of modern samples to determine the best approaches. Here we present what we discovered which includes our framework of possible pre-destruction curation practices, such as imaging and modeling the specimens. We then explore various methods for preparing mounts to ultimately reveal minimalist techniques for maximum preservation. The intent of this poster is to help others forego nail-biting frustration by demonstrating how to bridge the gap between cutting-edge approaches and diligent conservation.

Minnis, Paul (University of Oklahoma) and Michael Whalen (University of Tulsa)**[36]** *Power Cooking...Or Not*

The Paquimé-centered tradition is one of the most influential communities in northwestern Chihuahua and U.S. Southwest (NW/SW). We have argued that food production and preparation was central to this polity. Some of best evidence of this are earthen ovens, one of which is likely the largest in the NW/SW. Based on previous research and data we have accumulated through survey and excavation, we consider how the use of these ovens related to community practices.

Minor, Elizabeth (Wellesley College)**[401]** *Digital Engagement Strategies Using Location-Based Gaming in Community-Based Participatory Archaeology*

Gamification offers participatory experiences for diverse communities to engage with archaeological research. In informal and formal learning situations, undergraduate students used the location-based mobile game platform ARIS Field Day to create narratives that play through the process of excavation, addressing questions of the ethics of collecting, and gathering community input on excavation strategies. For example, the Wellesley College Hall Archaeology Project incorporated digital engagement strategies to facilitate undergraduate participation in our community-based historical excavation. While building our research plan for exploring the site of a women's dormitory fire from 1914, community members were invited to share their perspectives through games built by students. This iterative process is meant to build inclusive conversations about how today's diverse community reflects on differences and continuities with a privileged past. As formal course assignments, undergraduates designed location-based games that explore ancient Egyptian and Sudanese archaeology and other cultural heritage issues, several with multi-lingual versions with the goal of connecting international audiences. These games and engagement strategies will be used to plan future community-based participatory research in the field in Sudan.

Mires, Ann Marie**[160]** *Unearthing the Truth: Exhumation of a Catholic priest to establish paternity*

A niche is opening for Forensic Archaeologists to assist in establishing paternity to Catholic priests through exhumation. In June 2018, I was contacted by Jim Graham who for 25 years has tried to prove that he is the son of a deceased Catholic priest after being presented with an obituary and told the man could be his biological father. Although his quest may appear unique, Graham is one of thousands of people who claim they were fathered by Catholic priests. Despite compilation of extensive records indicating this priest was his father, the church refused to give confirmation. Early 2018, Graham obtained permission to exhume and extract the DNA samples to establish paternity. This is the first case of its kind and will set a precedence. FAR, Forensic Archaeology Recovery, was able to provide assistance. Families cannot conduct this type of testing or submit samples without being a lawyer or doctor to jury the case from the field to the laboratory. Following best practice for extraction and submission of DNA samples, we were successful in establishing paternity in this case. This case will provide an opportunity for Forensic Archaeologists to provide technical assistance and provide quality assurance for families.

[257] *Discussant***Miroff, Laurie and Nina Versaggi (Public Archaeology Facility)****[297]** *Community Archaeology at the Trowel's Edge*

The Public Archaeology Facility's Community Archaeology Program (CAP) provides non-archaeologists with an opportunity to participate in archaeological field research projects. CAP participants experience the discovery of artifacts at the "trowel's edge" and follow the journey of an item through processing to interpretation of the people connected to these discoveries. Our goal is to educate individuals about the presence of a rich and fascinating past in their own communities and buried under their feet. Joining professionally supervised projects, even for a week, provides participants with the thrill of discovering objects used by everyday people hundreds and thousands of years ago. Making a connection to people through artifacts builds a deeper understanding of the past, but also an empathy for preservation through both local and national advocacy. CAP offers programs custom designed for the interests and abilities of adults, teens, and children. CAP operates under that principles that the heritage story embedded in an artifact is worthy of our respect and protection, and that an educated and engaged public is more likely to support the preservation of this heritage. This paper will illustrate the principles on which CAP is based with discussion of the successes and challenges of this program.

Miron, Rose (National Native American Boarding School Healing Coalition) and Christine McCleave (National Native American Boarding School Healing Coalition)**[294]** *Data Sovereignty in Archaeological and Anthropological Research*

While collaboration has started to become an expected part of research with Native communities, prioritizing the needs and wants of Native communities has yet to be normalized within academic research. In this session, we will discuss how principles of "data sovereignty" might be applied to archaeological and anthropological research and how the National Native American Boarding School Healing Coalition (NABS) has implemented these principles in our research around repatriation and the location of the remains of children who died at U.S. Indian boarding schools. Data sovereignty means that indigenous nations have the right to determine how their "data" is collected, stored, shared, and interpreted. While we don't always think of material objects or the remains of ancestors as "data," these items carry knowledge, and Native nations should decide how this information is managed. Sometimes, the decisions indigenous nations make about data run contrary to what scholars expect or what is beneficial to their careers. For these situations in particular, it is crucial that academic fields adopt best practices where Native nations define their own wants and needs. We will discuss what the development of such principles might look like and how this has guided NABS research.

Miron Marvan, Esteban**[105]** *Maya Archaeological Heritage: Ethical and Methodological Challenges from the Mexican Practice of the Discipline*

The practice of Mexican and Maya archaeology is yet to be affected by the postcolonial dialogues in the anglophone world that have discussed the terms of engagement between archaeologists and indigenous communities. Mexico is constitutionally conceived of as a multicultural nation, but the collective rights of indigenous communities are obscured under the predominance of individual rights and a single collective national identity. The contemporary Maya use languages that can be traced back to the Classic monument's hieroglyphs, and their presence as a descendant community is implied

in anthropological, national, and touristic discourses. Nonetheless, there is a serious lack of reflexivity about power relations and an ethic of responsibility for our own anthropological representations. In addition, there is a paradox created by the constitutional right that grants indigenous self-determination, and federal dominance in the managing of archaeological heritage, which is constituted by the indigenous material past. This paper will describe the relationship between archaeology and indigenous Maya communities in Mexico and, in particular, in the Palenque region. Possible paths to engage in dialog with native communities about the construction of their local histories will be discussed.

[248] *Modeling Climate, Ocean Productivity and Human Population Dynamics on the North Pacific Rim*

We explore human population trends for several maritime regions around the North Pacific Rim over the last several thousand years. These data show correlated but oscillating patterns of populations from the eastern to the western Pacific. Two alternative models explain the patterns of population peaks and crashes over the past 2500 years. The first model considers possible "bottom-up" causes, assuming that population crashes followed subsistence failure tied to long-interval, climate derived ecological regime shifts. Proxy data on changes in climate, ocean productivity and Pacific salmon returns over the past 5,000 appear to correspond with changes in past human population size on adjacent coastlines, even when the populations in question are not focused on salmon as their major resource. The second model explores the role of expanding commodities markets in the destabilization of North Pacific populations.

[159] *Having Reservations: A Discussion on Recognizing the Dynamic Qualities of "Food" within Archaeological Contexts from the pre-Columbian Caribbean*

Food is a biological necessity, but it is also created and used through culturally defined practices and perceptions, including capture, cultivation, and/or collection, preparation, consumption, disposal, and even secondary deposition. This paper challenges us to think more critically about how we identify, categorize, and interpret the dynamic qualities of "food" within pre-Columbian archaeological contexts. Specifically, we discuss ongoing zooarchaeological analyses of faunal assemblages from MC-6 (Turks & Caicos Islands) and research from En Bas Saline (Haiti) to examine how animal-based food use and accessibility, at two later Ceramic Age sites, played roles in creating contexts of social practice and expression. We consider faunal patterns in terms of site layout (e.g., features, ceremonial architecture, and middens) and explore the ways in which animal-based food was important to ceremonial activities and community dynamics that transpired across diverse physical and culture landscapes. Moreover, we highlight zooarchaeological methodologies to study the archaeology of food, while acknowledging inherent difficulties.

[114] *Modeling Barrow Landscapes Using QGIS*

The visible commemoration of individuals in early medieval Scotland marks a big change in burial practice, with the shift to inhumation under burial mounds. The barrows, demonstrations of identity and power, are not just located in the landscape but interwoven and embedded within it. This poster presents recent research to recreate and understand the setting of the barrow cemeteries. Streams, rivers and areas of marshy ground are recreated using QGIS landscape modelling, historic mapping and digital terrain models (DTMs). These new projected landscapes give insight into the siting of the barrows and

signals of belief.

Mitchell, Peter

[82] *Settling Madagascar: When Did People First Colonize the World's Largest Island?*

Madagascar constitutes a major anomaly in the history of human colonization: 400 km from the African mainland, but with a population whose culture, language, and genes derive substantially from Indonesia, more than 7000 km away. Recently, the argument has gained ground that the island was settled (perhaps from Africa) significantly earlier than the first widespread archaeologically visible traces of human presence in the late first millennium AD. If true, this has important implications for the antiquity of trans-Indian Ocean contacts, the navigational skills of late Holocene Africans, the timing and causation of megafaunal extinctions, and the overall impact of people on Madagascar's ecology. Building on work by Anderson et al. (2018), this paper assesses the published archaeological and palaeoenvironmental basis for this proposition. Applying well-established criteria for dating and evaluating claims of human activity in comparable situations (pre-Clovis sites in the Americas; Polynesian settlement of New Zealand and Remote Oceania), it concludes that there is no compelling evidence that people were present on Madagascar before the mid-first millennium AD. Such a 'short' chronology fits much better with the wider pattern of Indian Ocean contacts currently available.

[371] *Building a Frontier? Preliminary Investigations into a Late Preclassic Maya Triadic Temple Group*

For the ancient Maya, the second century B.C. was a period of growth and consolidation; populations boomed, and a common set of cultural ideas spread across the Maya Lowlands. This expansion of ideas is evident in the widespread presence of chicanel ceramics, the spread of a unified Late Preclassic figural style found on mural and carved monuments, and in the construction of a common set of architectural forms. In the upper Belize River Valley, the adoption of these ideas is evident in the rapid construction of a major center at Actuncan, Belize that conforms to each of these cultural forms. This poster reports on preliminary investigations into the Triadic Temple group at Actuncan, Belize. Drawing on these data, I propose that Actuncan formed a cultural frontier, reflecting the furthest adoption of this full suite of ideas into the Belize River drainage. The broader implications of this frontier for Preclassic regional political processes will be discussed.

[74] *Collapse, or Drastic Socio-cultural Transformation?: Some Cases from Japanese Prehistory*

This paper proposes to redefine 'collapse' as a type of human responses to changes that happen to the (variously perceived, experienced and utilized) environment in which we live. It is argued that the phenomena commonly termed as 'collapses', such as the disintegration of settlement systems and the disappearance of monumental constructions, can be understood as the material consequences of changes in the way people organize their lives by spatio-temporarily structuring their activities and communications. The argument is to be verified with some examples from Japanese prehistory which show that people actively responded to drastic environmental/social changes by utilizing material culture items (including their own body) in creatively different manners from before, that, on the surface, made the changes recognized in archaeological evidence 'look like' collapses.

[184] *Kids and Excavations: Affordances and Constraints*

In 2016, fourth graders from an elementary school excavated four square meters of their playground over two days of school in anticipation of construction and complete replacement of the landscaping. The students had experienced some instruction with Project Archaeology: Investigating Shelter prior to the excavation. The excavation was supervised by two professional archaeologists and the students were assisted in the field by several other volunteer archaeologists. A short "lab" session allowed the students to examine the artifacts more closely and make some inferences about their origins and uses. Following the excavations, students completed a formative learning assessment probe about their experience. I interviewed some of the students, individually and in two focus groups, asking them to elaborate on their written responses. Results show that students certainly enjoyed the experience and will probably remember it for a very long time. Two full days of school is a lot of time taken away from other instruction and I question the value of excavations versus high-quality classroom instruction.

[43] *Seeing Is Believing: The Documentation of Rock Art*

This presentation examines traditional, contemporary, and experimental methods of illustration and photography in rock art recording. Addressed accordingly are the processes and problems unique to pictographs (painted) and petroglyphs (pecked) parietal imagery, superimposition and dating. As a rock art researcher, photographer, and artist, many examples will be drawn from my fieldwork; specifically contemporary methods utilizing panoramic photography and an experimental photographic technique employing solarization filters. The presentation concludes with a discussion of how the act of hand-drawing rock art images creates a powerful scenario to intimately connect with the acts of past agents, as well as the potential opportunity to envision more dynamic interpretive frameworks in rock art studies.

Mollenhauer, Jillian (Metropolitan State University of Denver)

[28] *Reconsidering the Feathered Serpent in Mesoamerica's Formative Period*

Studies of feathered serpent imagery during Mesoamerica's Formative Period range widely in their conclusions, with little agreement about the parameters of inquiry, associated iconographic conventions, or even what constitutes a "feathered" serpent. Images of serpentine creatures have been alternately described as Avian Serpents, Sky Serpents, Winged Serpents, and Plumed or Feathered Serpents. Some scholars would equate the feathered serpent with the crocodilian Olmec Dragon, while others view them as two separate entities. Confusion and disagreement regarding definitions and iconographic categories have resulted in a lack of consensus over whether feathered serpents appeared at all during the Formative period. Additionally, the presence or absence of feathered serpents during this period has been variously used to argue for greater or lesser continuities of political and religious ideology between Formative peoples and their Classic and Postclassic successors, as well as greater or lesser levels of cross-cultural connection between contemporaneous Formative societies. In light of these wide-ranging disparities, this paper will examine what we are truly asking (and

assuming) when we search for feathered serpents in Formative iconography. How might a reconsideration of the purpose, scope, and limitations of such inquiries bring the beliefs and practices of the Formative period into clearer focus?

[199] *Boundaries of the Past as Viewed through the Fences of Today: Shifting Methods of Archaeological Inquiry in the Southern Maya Lowlands*

An exploration of how modern borders of different kinds have influenced, and sometimes impeded, our understanding of ancient borders and territories. The Guatemala-Belize border has ramifications in terms of the ways in which scholars interact and how the archaeology is accomplished, including through differing rules and general philosophies of the governing bodies in the two areas. The modern border drawn around the archaeological site of Ucanal in Guatemala greatly impacts how we study it today in terms of remote sensing, including both LiDAR and photogrammetry, and how the place is considered within the larger ancient regional sphere. Official, protected areas are covered by jungle cover, while the farthest extents of the ancient site exist beyond this border and have been converted to grazing land. The two environments have what amounts to an arbitrary dividing line but necessitate vastly different approaches of inquiry.

[347] *Demographic Change and the Trans-Atlantic Slave Trade in West Africa: An Example from the Abomey Plateau, Bénin*

Demographic historians have posited dramatic population decline across West Africa in the era of the slave trade, the cumulative effects of endemic warfare and the large scale population drain resulting from the export of enslaved peoples to the New World. At the same time, anthropological models for the organization of slavery within Africa have emphasized the quintessential value of captives within African political systems based on “wealth-in-people” rather than “wealth-in-goods”. These two models are largely incompatible. Indeed, how do we explain the rapid rise in the export of human beings over the course of the 17th and 18th centuries, if political authority in this period depended fundamentally on absorbing such captives into extant polities? Recent archaeological survey on the Abomey Plateau, political heartland of the slave trading Kingdom of Dahomey, reveals a period of rapid population growth in the early years of the colonial encounter in the 16th and 17th centuries AD, followed by population decline and settlement nucleation in the 18th Century. This paper outlines this evidence in light of the demographic history of the Slave Coast, and considers an alternative hypothesis for the origins of the trans-Atlantic slave trade in West Africa.

Montenegro, Alvaro**[378]** *Adding Navigating Capabilities to a Deterministic Computer Model of Ocean Voyaging*

Since pioneering efforts in the 1970's, computer models that simulate vessel displacement have contributed useful information to the debate around several historical and archaeological problems. Existing models can be separated into two categories. In stochastic models, wind and current values are based on a probabilistic description of these parameters. Deterministic models make direct use of observed or simulated winds and currents. Stochastic models have the advantage of allowing an infinite number of experiments but, in contrast to deterministic ones, ignore the fact that winds and currents are correlated in both space and time. Here I describe the first implementation of navigational capabilities in a frequently adopted deterministic model. Powered movement comes in two forms: 1) paddling/rowing, where vessel displacement is a function of drift due to currents and wind plus movement toward a target at a fixed speed; and 2) sailing, in which boats still move toward a target, but with speed determined by the wind and direction of movement restricted by limits on the vessel's ability to sail against the wind. The new capabilities are demonstrated on simulated trips aimed at evaluating the impacts of the El Niño-Southern Oscillation (ENSO) cycle on coastal trips between Mexico and Ecuador.

Montero, Gabriela (University of Kentucky)**[373]** *Postclassic Communities and Colonial Reconfigurations in the Eastern Lower Papaloapan Basin, Veracruz, Mexico*

Previous investigations in the region known as the Eastern Lower Papaloapan Basin, in the state of Veracruz, Mexico, have proposed the existence of a "Postclassic Paradox" in which Late Postclassic prehispanic communities identified in 16th century historic documents cannot be identified archaeologically. In this poster, I expand on this idea and propose that the Postclassic Paradox is rather a result of our partial interpretation of colonial documents together with recent and misleading changes in the names of local communities, and not a true lack of archaeological evidence. Through the analysis of maps and documents analyzed at the Archivo General de la Nación in Mexico City, I come up with new ideas for the location of possible Postclassic communities that were immersed in the new colonial political and economic landscapes.

Montero, Laurene [194] see Bostwick, Todd

Monterrosa Desruelles, Herve**[192]** *A Few Considerations Regarding Jade Circulation during the Aztec Period*

It is well a known fact among researchers that the only confirmed jade deposits in Mesoamerica are found in the middle Motagua Valley in Guatemala. This gem's brightest shades of green were the most appreciated among Mesoamerican people, yet, barely three hundred objects made with emerald green jadeite were recovered from the Great Temple of Tenochtitlan. Since it was the more important hegemonic center of the Mexican Highlands during the Late Postclassic (1350-1521 a. D.), the lack of this stone within the sacred enclosure of the Aztec capital is particularly striking. Previous technological studies established that almost the entirety of the objects were made in the Maya area, while only two were crafted according to imperial standards. This leads us to reconsider the origins of these jades, their possible trade routes and which groups had control of this precious goods. Did the Mexica obtained jade as raw material, were they elaborated by contemporaneous Maya groups or were they relics from ancient times?

Montgomery, Lindsay (University of Arizona)**[421]** *Contested Cartographies: Landscapes of Power, Adaptation, and Persistence on the Rosebud Reservation*

In 1878, the Rosebud agency moved to its contemporary location at the junction of Rosebud Creek and the south fork of the White River. Over the course of the next decade, members of the Sincangu (Brulé) Sioux led by the charismatic headmen Spotted Tail came to settle within the reservation. While the reservation's boundaries were a product of American directives, indigenous perceptions of identity and practices of place making intimately shaped the formation of this landscape. Following the long-standing practice of aggregating along waterways, Sincangu leaders strategically placed their encampments near the creeks and river tributaries that flowed across the reservation. Drawing on historic photographs, ethnographic objects, and archival documents, this paper will discuss the various ways in which Sincangu encampments became strategic sites for the exercise of colonial power in the form of ration issue houses, day schools, and churches. These places and associated routes of travel also became important arenas of contestation and adaptation as well as sites for the persistence of indigenous social practices. Ultimately, this discussion challenges the static binary categories of

traditional-progressive and acculturation-survival which have often structured scholarly discussions of Native people during the late-nineteenth and twentieth centuries.

[250] *Death in the City: Huari Urban Tombs*

After declaring tombs to be absent from the Patipampa archaeological record on the basis of our 2017 excavations, this presentation discusses two mortuary contexts discovered at the Middle Horizon (AD 600-1000) site of Patipampa in the capital city of Huari. Excavated during our 2018 field season, both tombs are severely looted, but each context displays important spatial and depositional features. This analysis focuses on understanding the relationship between mortuary practices and Huari urban residential space and social organization. I will describe each mortuary context, the associated materials, and relationship to architectural spaces within the Patipampa residential sector. I use these preliminary findings to explore similarities and differences between mortuary spaces elsewhere at Huari and other Middle Horizon Wari settlements in order to consider what Wari dead contributed to the world of the living.

Montgomery, Shane (Cornerstone Environmental)

[280] *The Treasure You Seek Will Not Be the Treasure You Find: Bushing the Path between Expected and Observed at Las Cuevas*

Over the past decade, aerial lidar (Light Detection and Ranging) technology has transformed understanding of prehistoric landscape modifications throughout the Maya Lowlands, including the Late Classic (A.D. 700—900) center of Las Cuevas. The site, situated on the southeastern edge of the Vaca Plateau in western Belize, is not immense, but is distinguished from others within the region by a cave system that runs directly below the main plaza. The peculiar nature of Las Cuevas suggests the site functioned in a ritually-focused manner compared to contemporaneous centers within the Vaca Plateau, such as the major polity of Caracol. This emphasis may have impacted the density, distribution, and layout of ancient Maya households in the surrounding area. The previous two seasons of the LCAr settlement and cave survey were conducted to determine the accuracy and precision of remotely-detected structures and karstic features. Through this research, we sought to understand the spatial relationship of these locales to the distinctive center built around the prominent cave system. This paper presents initial survey results from the 2017—2018 field seasons and discusses the capabilities and potential disadvantages of utilizing lidar-derived data for population and other settlement models within the Maya Lowlands.

LA 1697 is a small site located on the Rio Pecos near the village of El Pueblo, New Mexico. Although the site was initially registered with the state's Archaeological Records Management Section (ARMS) in 1978, no other research was conducted on the site until 2016. Over the course of several field sessions during the 2016-2017 school year, a survey and limited excavation were conducted at the site for the purposes of trying to identify the period of occupation for the site and the cultural affiliation of its occupants. An analysis of the lithic and ceramic assemblages recorded at the site has yielded some preliminary results regarding potential trade interactions and the possible cultural affiliation for the site's occupants, while the location of the site itself provides information on Developmental-Coalition Period (1080-1300 A.D.) pueblo site locations along the Rio Pecos prior to the construction and occupation of Pecos Pueblo.

Montoya Mar, Francisco and Maby Medrano Enríquez (Universidad Autónoma de Zacatecas)**[367]** *Santiago Apostol in the Conquest of Nueva Galicia and the Fiesta de los Tastoanes*

Festivals and religious beliefs in contemporary Mexico are the product of a cultural synthesis between the Mesoamerican religion and Christianity. In this presentation we expose the survival of a battle scene between Spaniards and indigenous tribes represented in a patronal feast known as Los Tastoanes, in which one of the main protagonists is Santiago Apostol, who is exalted as a warrior, paladin, leader and saint conqueror of Nueva Galicia. Currently, this festival is performed on July 25 in various towns in the metropolitan area of the city of Guadalajara in the state of Jalisco and in four municipal capitals of the state of Zacatecas (located in the Juchipila Canyon). The choreography, the costumes, the masks, the music, and the musicians are different in each of the places where the patronal feast is represented; nevertheless, in all of these the presence of Santo Santiago is protagonist during the staging. At first, the festival of Los Tastoanes was limited to the staging of a battle, but over the years and differently has accumulated a variety of elements such as the drama of the passion of Christ, of the pastorelas and the dances of Moors and Christians.

Moody, Adam [9] see Lieb, Brad

Mook, Margaret [404] see Scarry, C. Margaret

Mooney, Dawn Elise (Museum of Archaeology, University of Stavanger)**[91]** *Imagined Forests: Woodlands and Wood Resources in Medieval Icelandic Literary, Documentary and Archaeological Sources*

Medieval literary sources describe the Icelandic landscape when the first settlers arrived as 'forested from the mountains to the shores'. It had previously been thought that the island was rapidly deforested after settlement, but recent research gives a much more nuanced picture of woodland history. It is becoming clear that while woodland declined in some regions, other woodland areas were preserved, especially for the production of charcoal for high-status farms. This poster compares archaeological, palaeoenvironmental, historical and literary sources to discuss how Icelandic wood resources were used and managed, both physically and in terms their perception by the saga writers and their audiences. Data from analyses of wood charcoal and wooden artefacts are used to interrogate literary depictions of wood resources, which provide a view of the settlement-era Icelandic landscape as seen through the lens of the elites who produced them. Of particular interest are recurring tropes, such as the (imagined?) dense woodlands of Iceland at the time of settlement, and the import of timber from Norway. Through comparing saga descriptions of wood to archaeological data and to historical sources, this poster examines how the stories told by these diverse archives diverge from one another, and why this might be.

Mooney, Natalie**[295]** *Magnolia Grove: A Comparative Study of Plantation Landscape and Architecture*

Magnolia Grove is a nineteenth-century town house property in Greensboro, Alabama. It functioned as a largely self-sufficient farming operation with around 25 acres of land and multiple slaves living and working on site. Because of these features, Magnolia Grove was used as a case study in comparison with other plantation landscapes. In short, this project is a comparative, regional study that looks at the built landscape through the comparison of possible landscape patterns of

plantations concentrated within the Deep South, particularly Alabama. Through the analysis of Magnolia Grove's built landscape, associated artifacts, and features such as swept yards, previously established regional artifact patterns were used to compare contemporary components at Magnolia Grove. This project argues that plantation landscapes were formed through a variety and synthesis of processes such as environmental and individual autonomy of both slave and master to form a unique plantation that is at once similar to other regions, but also different due to various factors that rely upon the individual population at that plantation.

Moonkham, Piyawit

[333] *Institutionalized a Sacred Place: Social Logic and Transformation of Space in an Early Northern Thai Cultural Landscape*

Early archaeological sites of Wiang Nong Lom and Chiang Saen in Northern Thailand appear to have a variety of their spatial pattern than the sites in the later periods (late 14th century). Although temples were constructed follow the state-sponsored Buddhist ideology, some building patterns in many early archaeological sites vary from location to location, illustrating different kinds of spatial orientations. The main hall of the temple is the primary space for monks and laypeople to hold activities together. Archaeological evidence indicates two types of the temples' main hall, one with walls and one without walls. The main hall that appears without walls also found a significant number of community's buildings associated with it, such as wells and kilns. This type of hall also appears to have more public engagement. This paper aims to examine how the spatial pattern differences and changes, between the halls without walls (open spaces) and ones with walls (closed spaces), reflect on the social patterns and relationships and impact on the transformation and communal notions of space. This paper wishes to offer another interpretation of how physical landscape plays a role in communal patterns of spaces, and vice versa, in both early and recent communities.

[122] *Geoarchaeological Investigations at White Pond, Elgin, SC*

The White Pond Human Paleoecology Project is a collaborative effort between multiple institutions and researchers to study the geology, archaeology, and paleoecology of White Pond in South Carolina. Building on the seminal work of Watts (1980), this research seeks to: 1) derive the broader geologic context of the age and origin of White Pond and its fringing sediments containing the archaeological record; 2) delineate and correlate the lacustrine paleoenvironmental and terrestrial archaeological records through integrated studies of litho- and biostratigraphy, geochronology, and archaeostratigraphy; and 3) conjoin the correlated paleoenvironmental and archaeological records in systemic, human behavioral terms (human paleoecology). Archaeological excavations at White Pond over two field seasons have revealed stratified sequences from Late Paleoindian Dalton to Woodland occupations buried within 1 meter of colluvial sand. Here we present preliminary field data, results of luminescence dating, granulometry, and sediment geochemistry. Implications for geochronology and site formation processes are discussed along with directions for future work.

Moore, Christopher (University of Indianapolis), Richard Jefferies (University of Kentucky) and Elizabeth Straub (University of Kentucky)

[145] *Shells and Sherds: Insights into the Historical Landscapes and Mission Period Site Distributions on Sapelo Island, Georgia*

Site 9Mc23, located at the north end of Sapelo Island, Georgia, is a multicomponent Late Archaic through Spanish Mission period site marked by numerous shell rings, piles, lenses, and pits. The adjacent marsh provided abundant shell, which the site's first inhabitants utilized to construct three monumental shell rings. These features continued to influence site organization throughout the Woodland and Late Precontact periods. Survey data indicate that the focus of settlement shifted during the 17th century Mission period, with a cluster of midden piles at Site 9Mc23 likely representing the Guale mission town of Sapala, while another cluster at Site 9Mc501 to the north may represent a refugee community. This paper examines the spatial patterning of shell at these sites and the changing use of the landscape over time.

[97] *The Inglehame Farm Site (40WM342): A Preliminary Assessment of Mississippian Settlement in the Little Harpeth River Watershed, Tennessee*

Initial grading activity in 2003 for a proposed cul-de-sac within the Inglehame Farm subdivision in northern Williamson County uncovered several Mississippian period stone-box graves. Subsequent archaeological investigations in 2004 recorded structures, refuse-filled pits, and additional stone-box graves associated with an intact Mississippian period village. A reanalysis of the ceramic assemblage denoted two distinct Mississippian components. The first was an early occupation (estimated AD 1000-1100) defined by shell-tempered cordmarked ceramics. The vast majority of ceramics, however, supported a primary site occupation between the mid-13th and mid-15th centuries. An AMS date of 430 +/- 30 BP (AD 1440 to 1455 at one-sigma) raises the possibility that Inglehame Farm represents one of the last Mississippian sites to exist in the Harpeth River drainage, and likely the entire Middle Cumberland Region (Moore et al. 2006), prior to widespread depopulation of the study area.

Moore, Roger

[203] *The Sterling Site: A Preliminary Study of the Lithic Assemblage of a Bonito Phase Pueblo Community*

The Sterling Site is an Ancestral Puebloan structure with related features located in the San Juan River watershed near Farmington, New Mexico. The site was excavated in the early 1970's by the Archaeological Society of New Mexico under the direction of Dr. Cynthia Irwin-Williams. The focus of this paper is the lithic assemblage recovered from the excavated rooms and other features of the site. The general composition of the assemblage will be discussed in relation to lithic materials and their sources, technological characteristics of the assemblage and character of the tools present. Comparisons will be made with other nearby sites of the same general Classic Bonito phase in this part of the San Juan basin.

Moore, Savanna (Student Conservation Association - National Park Service)

[124] *Bonita Canyon: A Chronology of Prehistoric Occupation and Predictive Analysis of Archaic Sites*

One of the goals of the Student Conservation Association (SCA) is to develop the next generation of conservation leaders. While the focus is often on natural resources, cultural resources, as a nonrenewable resource, have, until recently, been neglected. Chiricahua NM has been partnering with the SCA to unravel these archaeological mysteries and develop a cultural resource management program for the park. One of those projects has been to analyze the prehistoric occupation within Bonita Canyon, the largest canyon within the Monument and the center of much archaeological research over the last 35 years. Such overviews of the archaeology in the area are lacking; as such, this synthesis will provide a strong grounding for future land management decisions. This poster focuses on the results of that synthesis, which included building an inductive predictive model with ArcGIS to predict additional high-likelihood areas on the Monument for prehistoric occupation.

[354] *Contrast and Connection in a Colonial-Era Hawaiian Hinterland: A Study of Nineteenth-Century Households on the Nā Pali Coast, Kaua'i Island*

While researchers once considered the residents of hinterlands as the passive recipients of social and cultural influence, scholars have increasingly reframed these regions as dynamic zones of innovation and creative adaptation. Hinterlands

have often been mentioned in investigations of indigenous sites in the context of European colonialism. Still, little attention has been paid to the dynamics of social transformation in remote areas of colonial-era Polynesia, including Hawai'i. While the Nā Pali Coast of Kaua'i Island, Hawai'i, was nominally incorporated into the Kaua'i kingdom, in the period after European contact shifts in settlement patterns and modes of transportation rendered this region increasingly isolated. My research investigates how trajectories of household-level social and material transformation in this remote area differed from those more central areas of Hawai'i. Preliminary results suggest that residents of the Nā Pali Coast maintained many familiar domestic practices throughout the nineteenth century, perhaps intentionally choosing to situate themselves on the margins of Hawai'i's emerging market economy. These practices included pursuits such as small-scale farming and fishing and household-level craft production. Despite the persistence of such established routines, however, artifacts from residential contexts suggest that residents of the Nā Pali Coast maintained deep connections to Hawai'i as a whole.

[253] *An Archaeogenetic Approach to Studying the Demographic History of Rome*

From shipwrecks to monuments, coins to mosaics, the Aeneid to the Satyricon, classicists, archeologists, and historians draw on a range of media to study ancient Rome. As a new media to study the past, ancient genomes provide direct insight into the demographic histories of Rome's inhabitants. This talk highlights our team's interdisciplinary approach to analyzing new genomic evidence in dialogue with existing archaeological and historical narratives of ancient Rome. We discuss cases in which ancient sources, such as contemporary histories, monumental inscriptions, and ancient Mediterranean trade routes, have been instrumental in understanding the genetic structure of the Roman population in our study. In collaboration with geneticists and archaeologists, we have worked to add a genetic dimension to this well-studied time period and region. As archaeogenetic approaches become increasingly common across disciplines, we present an integrative project that we hope will be a useful framework for studying demographic changes in historical populations.

Moral, Enrique (Universitat Pompeu Fabra)

[2] *The Seraglio of the Great Turk: Ethnosexual and Engendered Violences in the Mariana Islands*

After the arrival of a group of Hispanic Jesuits to the Mariana Islands in 1668, an ethnosexual conflict emerged between the colonists and the local communities (the Chamorros). After that conflict, Chamorro communities were relocated in new villages, the so-called reducciones, under the close surveillance of the Spanish colonial powers. This reduction brought about deep changes on natives' and colonists' gender and sexual standards during the first half of the 18th century. The new social order in the colony resulted in an increase of sexual violence exercised against Chamorro girls and women, who were enclosed in residential schools from childhood until they were married. In this presentation, I analyze the matrix of domination that emerged in the Marianas and the ways in which it shaped, and was shaped by, different spaces, such as the church, the school, and even the Governor's palace.

Morales, Anthony (California State University, Los Angeles)

[323] *Rose Valley Site (CA-INY-1799): Applying an Interdisciplinary Approach to a Western Great Basin Paleoindian Site*

In 2017, California State University, Los Angeles, began a multi-year investigation of the Rose Valley Site (CA-INY-1799). As an enhancement of our archaeological methodology, my study has emphasized an interdisciplinary approach that incorporates geological research and geospatial technologies. This includes the use of geostatistical analyses, extensive subsurface soil sampling, and the utilization of drones for topographical surveying and detailed mapping. Utilizing this approach, the resultant maps and datasets were used to identify statistically significant patterns amongst the spatial distribution of artifacts and aid in the reconstruction of the natural and cultural depositional processes at this highly significant site.

[191] *Greater Nicoya from an Ancient Molecular Perspective*

Recent technological advances have allowed us to explore ancient molecules such as DNA. A successful recovery of ancient mitochondrial genomes from Greater Nicoya has showed the presence of the haplogroup B2d in a small group of samples (n=3) from the archaeological site named Jícaro, in the Bay of Culebra, Greater Nicoya. What does this mean? Besides representing the most complete ancient genetic data ever recovered in Central America, these results need to be contextualized in the Central American region. This study presents a deeper analysis exploring ancient and modern genetics data which is necessary for discussing potential connections and population movements in the Greater Nicoya area. Additionally, new data resulting from the analysis of ancient DNA from dental calculus of two Greater Nicoyan archeological sites, Jícaro and La Cascabel, will be presented. This second part will explore the ancient microbiome and possible health conditions of these Nicoyan ancient individuals which will enlighten the interactions between these past groups with their environment and complement genetics data with a more holistic view.

[56] *Between Two Empires: Conflict and Community during the Epiclassic Period in the Northern Basin of Mexico*

The Epiclassic period (ca. 650-900 CE) in the Basin of Mexico is considered a time of social, cultural, political, and economic transformation and re-organization. Most perspectives stress that, after the collapse of the major state system centered at Teotihuacan, regional population declined and new groups migrated into the region. The political landscape appears to have been de-centralized and largely unstable, marked by a constellation of competitive polities. In the northern Basin of Mexico and southern Mezquital Valley, archaeologists argue that these competitive relationships would eventually lead to the formation of the Toltec state during the Early Postclassic period (ca. 900-1200 CE), centered in Tula. This paper examines this trajectory through the lens of several seasons of intensive excavations at the hilltop center of Los Mogotes, located between the Basin of Mexico and the Mezquital Valley. This research provides important data on the interactions between household strategies, landscape modification, community formation, and regional political and economic relationships. We examine several lines of evidence that suggest that the inhabitants of Los Mogotes were embroiled in regional conflict. We consider how conflict both developed and changed as well as how such political and economic conditions influenced the nature of everyday life.

[72] *The Science in Small Business: A Small Business's Process and Problems with Archeological Science Techniques*

Quality Services, Inc. is a small business in Rapid City, SD. Since 2013, we have added GPR, terrestrial LiDAR, 3D scanning and drone photography to our services, but have not had success in using them on a consistent basis. Three obstacles are present: skilled employee retention, convincing clients of the benefits and competition for low cost services that include these methods.

Recent projects for the City of Deadwood have shown the importance of using multiple types of archeological sciences to both preserve artifacts and add to the greater body of knowledge. While QSI has offered both GPR and LiDAR, the City has remained committed to what has worked in the past: construction monitoring.

To promote these techniques in our region, we encourage employee presentations and articles to showcase potential for clients. QSI also volunteers services for local non-profits, again to promote the capabilities of both the technology and our company.

Overall, CRM projects that incorporate archeological sciences should be shared and published more in order to highlight both the need and benefit to clients. However, until regulatory agencies begin to acknowledge the science as an integral part of the process it's unlikely to become commonplace.

[197] *Archaic Period MRG-6 and the Deep Culinary Roots of Oaxacan Cuisine*

The rich cuisine of contemporary Oaxaca sprouted from deep roots. Archaic Period plant remains recovered from the MRG-6 rockshelter enhance prior work at Guila Naquitz and grant us insight into some of the managed and wild food plants still used in contemporary Oaxacan dishes. Over 70 different botanical taxa were identified from samples excavated at this site. Residues of several food plants were recovered-- including guaje, cactus tuna, various agaves, squash, amaranth, and goosefoot— indicating the deep history of some of these present-day ingredients. However, other Archaic food ingredients, such as acorns, hackberry, and wild grasses, have since fallen out of favor in canonical Oaxacan cuisine, demonstrating the dynamic nature of food over time. Moreover, microbotanical residues extracted from lithic artifacts show the early uses of certain tools in food preparation that have since been replaced by metal analogues. The MRG-6 rockshelter represents a place where a number of early culinary activities took place, from cutting wild bean plants with chert scrapers to disposing hard cactus seeds after meals. Through these botanical and artefactual residues, we see an early version of Oaxacan cuisine that dynamically transformed over centuries into the UNESCO intangible heritage recognized today.

[364] *Luis Alberto Borrero South-North Drift, Multiple Markers for the Archaeology of Tierra del Fuego and the Fuegian Archipelago (52°-56° S)*

The contributions and influence of Luis Borrero started with his early work at Tierra del Fuego and then surpassed multiple barriers –including the Strait of Magellan- as he developed an outstanding biogeographic perspective and the leading model for the peopling of Fuego-Patagonia. Thus all research programs for Tierra del Fuego have his mark in numerous ways; this influence has gone beyond several generations of archaeologists. We discuss some of these many contributions and select our favorites throughout more than 25 years of research collaboration with the Chilean archaeological teams of Tierra del Fuego and the Fuegian archipelago. The role of regional taphonomy, the assessment of continuities and discontinuities of the archaeological record, the analysis of technological and raw material procurement strategies, and different chronological scales from the Holocene to ethnohistoric and ethnographic records are discussed. Recent work conducted at Navarino and Capitan Aracena Islands and the Almirantazgo Fjord, taking Luis Borrero-mind and body-from the grasslands of the northern steppe of Tierra del Fuego to the hyper-humid forests of the southwestern channels are presented.

[186] *Architecture and Human Behavior at a Folsom Period Residential Camp*

The Mountaineer Folsom site, located in the Southern Rocky Mountains of Colorado, USA, contains evidence of at least four substantial habitation structures occupied over the course of at least one winter residence. The structures required significant energetic investment in their construction and were made of stacked stone foundations with an aspen-pole supported superstructure. Analysis of artifact assemblages and spatial patterning both inside and outside the structures suggests that different types of activities took place in the different structures, and that they were part of a functionally integrated, contemporaneously occupied community. This site offers a rare glimpse at social structure and behavior not seen in other more common types of sites in the Folsom archaeological record.

[186] *Experimental Construction of Hunter-Gatherer Residential Features, Mobility, and the Costs of Occupying "Persistent Places"*

Temporal and caloric costs associated with building common hunter-gatherer residential features – housefloors, housepits, storage pits, rock rings, and various types of wickiups – are presented based on experimental construction of these types of features. For subsurface features, excavation rates and associated labor costs are consistent regardless of feature type, soil type, or feature size. Labor costs for surface features are largely dependent on feature size, complexity, and availability of raw materials. In total, the per-family costs of building a single-family hunter-gatherer residential base are just under one eight-hour day and approximately 2500 kcal per person. Combined, these data indicate relatively low costs are associated with hunter-gatherer investments in persistent places and in residential facilities made from locally-available resources. Implied by the study is that initial use of a place might reduce the costs of and thus encourage subsequent reoccupations and that raw material availability may have played as much of a role in decisions about when to move as density and distribution of subsistence resources.

Morgan, Kelly (Lakota Consulting LLC)

[147] *The Significance of Stone Features on the Northern Plains: Criteria A-D and Other Issues*

The complex set of interrelated stone circles on the northern Great Plains and where literally hundreds of thousands of stone circles exist as marks on the ground left by those who came before us and our direct ancestors are a trifecta of multi-

component, multi-generational, multi-nation site complexes. These stone circles arise in singular patterns and large interrelated complexes. The contention of our traditional practitioners is that these sites are specific in use and application to the religious and cultural practices of those who placed them there so long ago. As they date to the late prehistoric, Late Archaic, and possibly into the Middle Archaic the oral traditions and religious practices of many nations tell of their use and application to our cultural life ways. There are some of these stone circles which were for the purpose of securing a tipi. Some stone circles can be associated with hearth features. Many more of the stone circles have an interconnected religious and spiritual use that is still known to the traditional practitioners of tribal groups. There are specific reasons why there are few artifacts associated with stone circles. These and other factors have impacted the protection and interpretation of stone circles.

[246] *Akimel O'Odham Traditional Knowledge Regarding Platform Mounds*

Platform mounds play a prominent role in the Akimel O'Odham creation story, but few archaeologists have considered the implications of this knowledge. The story names each of the mound leaders along the middle Gila River, and provides specific descriptions of the special abilities they possessed. The story also describes how Elder Brother, the primary deity of the O'Odham, attacked and defeated each of the mound leaders with the help of people who previously lived in the area. The close correspondences between this story and the archaeological record strongly suggest that the creation story can't be a myth or fiction that was invented by the O'Odham. For example, the conquest story does not include reference to the many other large prehistoric sites that are present along the middle Gila, and instead only references the late Classic period platform mound locations that are known by archaeologists today. We suggest that researchers will gain valuable insight into Platform Mound communities if they more fully consider the implications of the Akimel O'Odham understanding of these settlements.

[12] *Spatial Database to Spatial Knowledgebase: Predictive Modeling Challenges and Opportunities Across Time Space and Scale*

Geospatial modeling of landscapes for predictive scientific research and hypothesis testing in archaeology has become an important approach in cultural resource management. This poster demonstrates the challenges and opportunities with using predictive geospatial modeling in cultural resource management on Federal lands. The GIS-based analysis of natural and cultural resources within the boundaries of the Francis Marion and Sumter National Forests will allow for reflection on survey methodologies over the last 40 years, reconsider some of the standard approaches to the use of extant data sources, and expand on our current understanding of contemporary landscape modification through time. These studies contribute to the growing reliance on quantitative geospatial modeling in the social sciences and how these practices may better address future challenges of protecting cultural resources.

[258] *Rock Art, Cognition, and Embodied Ontologies*

In the past few decades, increasing attention toward the study of rock art in the archaeological community has resulted in new approaches to this sub-discipline. Through various research projects, a number of archaeologists have begun to consider what kinds of questions can be examined through the study of rock art and different methods of approaching rock art analysis which can contribute to the archaeological analysis of past societies. This paper seeks to explore another method of studying rock art by analyzing the spatial placement and co-occurrence of rock art motifs in relation to the ontologies of past societies, which no doubt differed from our own views of the world. The research examines the frequency of motif occurrence in rock art from two separate Hohokam sites, and compares possible patterns of motif re-occurrence and spatial co-occurrence based on quantitative analytical methods. Analysis of gathered data focuses on the spatial placement of artistic imagery in relation to embodiment of ontological categories. This paper incorporates theoretical models from cognitive archaeology, cognitive psychology, and neuroscience to provide a comprehensive discussion of how the Hohokam depicted their world, as they saw it, through their rock art.

Morris, Sarah (Department of Anthropology, Texas State University) and Britt Bousman (Department of Anthropology, Texas State University)

[338] *Paleolandscape Reconstruction Using Geoproxy Evidence at Erfkroon, a Middle to Later Stone Age Occupation in South Africa's Continental Interior*

Erfkroon is situated in South Africa's Modder River Valley and is known for its well-stratified fluvial landscape and archaeologically rich terrace systems. The Orangia terrace is the subject of ongoing investigations because it is characterized by abundant in situ alluvial deposits containing Middle and Later Stone Age artifact assemblages in context with Quaternary fauna. The formation's accessible geology and highly visible archaeology allows for the study of Quaternary environments associated with human occupations in the continental interior. Unraveling the depositional history responsible for terrace formation at Erfkroon the subject of ongoing debate. Two competing hypotheses, the Tooth and Lyons (2013) Accretionary Sedimentation Model and Bousman and Brink's (2015) Allostratigraphy Hypothesis, offer possible explanations but each with unique paleoenvironmental implications. The purpose of this study is to elucidate the validity of each hypothesis by combining geological profile description with high-resolution testing of bulk sediment samples. Methods include FTIR, magnetic susceptibility, grain-size, and micromorphological analysis of sediment thin sections to characterize weathering processes and sedimentation trends forming the Orangia terrace over time. Preliminary results corroborate the Allostratigraphy Hypothesis and provide detailed descriptions of soil formation events indicative of stable landscapes once supporting MSA and LSA occupations spanning 30,000 years.

Morrison, Alex (International Archaeological Research Institute)**[29]** *A Synthesis of Windward Oahu Archaeology*

Steve Athens legacy has provided archaeologists working within a historic preservation context a reminder of the numerous opportunities available to conduct research within a cultural resource management setting. This paper argues that not only does historic preservation provide a plethora of funding but also offers a long-term regional perspective for those of us committed to compliance work in a single region. To illustrate these points a synthesis of windward Oahu archaeology is provided largely based on historic preservation reports and projects conducted in the region over the last three decades. The presentation concludes with a discussion of the benefits and pitfalls of undertaking applied research within a cultural resource management setting.

Morrison, Alex [29] see Rieth, Timothy

Morrison, Blythe (Northern Arizona University)**[419]** *Examining Turkey Husbandry in the Northern Southwest Using Legacy Museum Collections*

In this paper, I examine some of the details of turkey husbandry by analyzing avian remains and associated material culture, including feathers and cordage. The North American turkey (*Meleagris gallopavo* spp.) has had a significant and enduring presence in many of the ancient communities of North and Central America. In the literature of the American Southwest, turkeys are often relegated to subsistence categories without a great deal of contextual evidence. These assumptions have had a lasting influence on the understanding of turkeys in the ancient past. Although turkeys were present throughout the Puebloan occupation of the northern Southwest, they were not consistently utilized as food, except during periods of significant social change. Legacy materials housed in museum collections provide insight into turkey keeping methods and how they transformed as a result of environmental and cultural dynamics. Drawing from a sample of sites on the Colorado Plateau, I examine factors influencing the preservation of turkey remains and illustrate how these details may help guide our understandings to a more context-based discussion about subsistence and husbandry.

Morrison, Heather (Canyon de Chelly National Monument) and Victoria Ramirez**[88]** *Standardizing Condition Monitoring at Antelope House*

Located in Canyon de Chelly National Monument (CACH), Antelope House is one of the most recognized precontact architectural sites on the Navajo Nation, consisting of 93 rooms, 7 kivas, and 10 structures. Many of these rooms and their associated architectural features are noticeably deteriorating, made evident by masonry failures as well as significant mortar and plaster loss. Site monitoring procedures have varied significantly over the past two decades, resulting in inconsistencies in photography and documentation. In 2018, the National Park Service (NPS) updated the condition monitoring program from the Antelope House Monitoring Plan (2002). The updated plan maintains the same goals of the Antelope House Monitoring Plan (2002), but the format, terminology, and process of describing conditions have changed. The procedure includes photographing the walls, floor and fill of each room, assessing their condition, and ranking the most at-risk elements. This project allows the NPS to evaluate Antelope House's deterioration rates since 2002 and it standardizes long term monitoring procedures at the site. In addition, the documentation will help to inform a forthcoming first-order structural stability assessment by providing updated information on site elements that may be contributing to structural issues.

[113] *Digitizing Previously-Recorded Archaeological Survey Areas on a Budget: How Technical Illustrations in Inkscape Are Advancing the Field*

This research aims to examine nuances between site ranking, placement, and correlations to environmental zones in northwestern Belize. This study used a variety of technological tools such as Inkscape, a Scalable Vector Graphics (.svg) software and ArcGIS to provide in-depth analyses of the dynamic interactions of the ancient Maya at the household level. Scalable Vector Graphics configurations make the digitization processes in GIS seamless for modeling needs. The bulk of the maps and data were collected in the 1993 and 1994 field seasons by Dr. Hugh Robichaux at the Programme for Belize Archaeology Project (PFBAP) in preparation for his dissertation. Recently acquired light detection and ranging (LiDAR) data within the project area have provided a new window into the approach of digitization in archaeology. By utilizing Inkscape (.svg) and ArcGIS for technically illustrating his maps of excavations, settlement patterns, and ecological zones, we will be able to add this newly-enhanced data to a PFBAP GIS geodatabase which will stimulate collaboration, and data sharing among regional specialists.

Moseley, Michael, Susan deFrance (University of Florida), Patrick Ryan Williams (Field Museum of Natural History) and Donna Nash (University of North Carolina-Greensboro)

[306] *Cerros, Keros, Cuerpos, y Mas! 37 Years of Programa Contisuyo Research in Southern Peru*

In 1980 the Pritzker family, major shareholders in Southern Peru Copper Corporation (SPCC), contacted Michael Moseley then a Curator at the Field Museum of Natural History inquiring about establishing a research program in the Moquegua region of southern Peru. Rich in archaeological sites, little systematic research had been completed in Moquegua at that time. In 1981 with the help of Peruvian soldiers and archaeologists, including Garth Bawden, Chip Stanish, and Paul Goldstein, researchers began site survey and building the basic chronology of the region. From these early beginnings and with ongoing support from SPCC (now Southern Copper) developed Programa Contisuyo, one of the longest enduring research programs in the Andes, now in its 37th year. In addition to providing in-kind support for multiple research projects, Southern built and maintains an excellent museum with collections storage and research space. We highlight some of the transformative archaeology of the Programa including one of the largest historical archaeology projects in Peru, Inca and LIP research, the Middle Horizon Wari and Tiwanaku settlements as well as their local antecedents, and the cultures that flourished after their collapse, and the rich record of coastal settlement dating from the Late Pleistocene through the colonial period.

Moses, Sharon (Northern Arizona University)

[131] *Putting a Face on History: Using Forensic Facial Reconstructions and Imagery in the Arch Street Project*

This paper will discuss the application of forensic art and 3-D facial reconstruction (in clay) that was conducted on selected skull replicas made from the Arch Street salvage cemetery site. These reconstructions help to "put a face" on the people who lived in Philadelphia between the 18th to mid-19th century and humanize them. Historical archaeology often provides the historical context of a group of people, utilizing material artifacts as well as archival resources so that we can better understand the communities and their times. But too often the people who lived in the past remain amorphous, snapshots from distant times, and we find it difficult to relate to them in a meaningful way. Three dimensional reconstructions and imagery show us their humanity and enrich our appreciation for the story they provide. This presentation provides a view of four individuals whose faces can speak to us after their voices have been silenced for over 170 years.

Moss, Jeremy (National Park Service) and Colleen Phillipone (NPS Hydrologist)**[85]** *Moisture Monitoring Studies of Adobe Walls at Pecos NHP, New Mexico*

In 2014 cultural resource staff at Pecos NHP began a moisture monitoring program to understand the movement of moisture within adobe walls and to study the effects of preservation treatments. The program uses moisture volume and soil moisture potential sensors in two adobe test walls and within a large original wall of the 18th century Spanish Colonial church to understand moisture infiltration and the effects of different preservation treatments, especially the use of amended adobe veneers as shelter coats protecting original 17th and 18th century adobe walls. Precipitation events are tied to the moisture data through the use of real-time weather stations and NOAA weather data on site. This presentation will discuss the last four years of data collection and how the results inform preservation decision making and monitoring.

Moss, Madonna (University of Oregon)**[34]** *What Ancient DNA Can Reveal about the Ubiquitous Fish of the Northwest Coast: Salmon, Herring, and Rockfish*

Fisheries are of fundamental importance to Indigenous peoples of the Pacific Northwest of North America today and in the past. This presentation summarizes what ancient DNA has revealed/is revealing about Indigenous use of salmon, herring, and rockfish from different archaeological contexts along the Northwest Coast. In the case of salmon and rockfish, the main objective is species identification, with each species having different life histories and habitat preferences that shed light on human behavior and cultural practices. In the case of Pacific herring, the objective has been to document genetic diversity in a single species and compare ancient herring populations to those extant today. The larger goals of these projects are to understand the long-term historical ecologies of these fishes, and how archaeological data can illuminate pre-industrial patterns of fishing and fish processing. Understanding the genetics of pre-industrial fish may also inform management of the fish and fisheries to insure their survival into the future.

Tambo Colorado is one of the most impressive Inca sites on the coast of Peru. Its mural paintings have drawn attention and yet, little is known about it, in particular about its pre-Inca occupation and its possible re-occupation after the Spanish invasion. Moreover, the Pisco Valley has been neglected by researchers and is believed to have known no independent socio-political development through its history. As in other regions of the Andes, the Late Intermediate Period and the transition into the Inca empire remains quite unclear. In this context, how is it possible to study the transition from one local polity to the Inca Empire? This paper will explore how to study transitions from one power to another with little information about material culture and the socio-political development of the local region. By understanding the role of Tambo Colorado in the Pisco valley and the regional context previous to the Inca conquest, it will be possible to apprehend the socio-political changes that occurred at a local and regional scale during the transitions from a local polity to the Inca empire and later during the early Spanish occupation.

Mountjoy, Joseph (Universidad de Guadalajara, México) and Jill Rhodes (independent researcher)**[314]** *The Curious Pacific Coast Distribution of Tightly Wrapped Bundle Burials in the Middle Formative*

Highly unusual tightly wrapped bundle burials of previously cleaned and carefully arranged disarticulated human bones dating to the Middle Formative have been discovered by archaeologists at three sites in western Jalisco, Mexico, one site on the Pacific coastal plain in far northern Sinaloa, Mexico and eroding out of the Pacific Coast in northwestern Costa Rica. We describe these discoveries and discuss some possible implications for the study of long-range Pre-Hispanic contacts along the Pacific coastal corridor of Mesoamerica.

[285] *Contextualizing a Middle Archaic Component at the Cajamarca Site of Callacpuma in the Northern Peruvian Andes*

The northern Peruvian Andes is a traditionally understudied region in terms of the Andean Archaic and foraging/hunting societies in general. Our knowledge of the lithic periods in the north comes from disparate project reports and a very limited number of previous academic projects. Recent fieldwork at the site of Callacpuma in the Cajamarca Basin recovered two examples of laurel leaf shaped projectile points. These point types have elsewhere been associated with the Middle Archaic Period (4200 – 6000 BC). At Callacpuma, they may represent at least the intermittent use of valley bottom resources by mobile groups whose archaeological evidence has often come from higher elevation puna/paramo zones outside the valley. Here we contextualize these finds within the 250 hectare site of Callacpuma, the northern Andes, and the broader laurel leaf point tradition in the Andes.

[27] *Old Bones, New Data: Pigs and Dogs from Prehistoric Non Pa Wai, Lopburi Province, Central Thailand in a Regional Context*

In the 1980s and 1990s, excavations by the Thailand Archaeometallurgy Project (TAP) at prehistoric Non Pa Wai in the Khao Wong Prachan Valley of central Thailand produced a large assemblage of animal bones. These include many pig and dog bones that provide evidence for management for food. Since their initial analysis, excavations at comparably-aged sites elsewhere including Man Bac and An Son, Vietnam, and Ban Non Wat, Thailand, have provided comparative contexts to examine dietary breadth and subsistence from a regional perspective across mainland Southeast Asia. DNA research into origins and relationships between domestic animals provide another source of data for amplifying understanding of human migrations in shaping regional history. These analytical opportunities enlarge our understanding of the variability in animal husbandry strategies as subsistence articulates with other facets of the domestic economy, such as agriculture and craft production. Representative assemblages from comparable sites elsewhere in mainland Southeast Asia allow us to examine animal husbandry on multiple scales.

[302] *Domestication and the Extended Evolutionary Synthesis*

In the past decade, a growing group of biologists, ecologists, and anthropologists have proposed a paradigm-shifting revision to the modern synthesis of evolutionary theory: the extended evolutionary synthesis (EES). The EES seeks to foreground developmental plasticity, epigenomics, and niche construction as evolutionary drivers. The EES is helping domestication theorists stop “talking past each other in a crowded room,” and has the potential to revolutionize our

understanding of the origins of agriculture by shifting our focus away from fixed traits and mechanical reactions and onto flexible responses – by both plants and people. The capacity of crop progenitors to immediately respond to cultivation may have been a key factor that determined which species were domesticated, and effected how that process unfolded. Culture, with its ability to encode complex bodies of ecological knowledge, can be fully integrated into evolutionary explanations of the origins of agriculture via the extended phenotype and ecological inheritance. Beyond anthropology, EES informed studies of domesticates and their progenitors are the best way to answer important unresolved questions in evolutionary biology about how and why genetic assimilation occurs. However, pursuing any of these lines of inquiry requires a revival and expansion of experimental and ethnoarchaeological approaches to domestication studies.

[200] *Legacies in the Landscape: Borderland Processes in the Upper Moche Valley of Peru*

Frontier landscapes are complex and dynamic zones often comprising multiple cultural, economic, political, demographic, and geographic boundaries. Bradley J. Parker's (2006) Borderland Matrix model endeavors towards a systematic and process-focused study of frontier landscapes and the bundles of boundaries that compose them. The present work builds off of this model with data from a full-coverage pedestrian survey of the Upper Moche Valley of Peru. Beginning as a geographic and demographic boundary between the highlands and coast, this region served nearly a millennium-long tenure as the eastern political boundary of the southern Moche political tradition (AD 200-900) and subsequently the Chimú Empire (AD 900-1470). From a settlement perspective, findings suggest that coastal people and polities were often bound together in both time and space on this frontier. Traces of Chimú political authority frequently echo or co-opt the physical legacies—monuments and settlements alike—left in the landscape by the Moche. These data are explored in comparison to Parker's (2006) "Tigris Borderlands" case-study with a focus on process and differing trajectories of borderland creation and transformation.

Mulvihill, Timothy [367] see Lockhart, Jami

Mundy, Barbara (Fordham University, New York)**[238]** *Paper Matters: Cultural Change in Post-Conquest Mexico*

Paper-making was an indigenous technology of great historical depth; on the eve of Conquest, thousands of reams of paper were brought into the imperial capital of Tenochtitlan, where it was used for a host of bureaucratic and ritual purposes. Yet a generation or two after the conquest, indigenous scribes were using costly imported European paper with frequency. European paper can be thought of as a disruptive agent, upsetting indigenous practices of paper production and use. Like many technologies, paper was one interlocked element of a larger technological bundle that included inks, pens, sizing, and practices of writing, drawing, and painting--the change in one element occasioned changes or modifications in all others. Despite its importance, paper has attracted little attention as in discussions of conquest and cultural change. In this talk, through a close examination of the bundled technology of which paper was a part, I will show how and when "conquest" and "invasion" registered in the material world, and when it did not, as a way of arriving at a better model of the impact of the marquee historical events of 1519-21 in the lives of things, and relatedly, on people.

Research at the Cosma Archaeological Complex since 2014 has revealed two multi-tiered mounds with architecture relating to the Kotosh-Mito tradition. Carbon dates from the earliest components in Cosma have dated several ritual structures to between 2900-2400 BCE, well into the early Late Preceramic Period. At least eight separate exclusive ritual structures were documented within the two mounds, one of these rooms exhibiting "traditional Mito features" such as the sunken floor, wall niches, and central fire feature. Additional hearths were also documented inside rooms and away from the customary centralized burning locale typical of Kotosh-Mito ritual. Paired with these hearths were activities taking place inside and outside of structures that produced large ash lenses. Materials recovered within these burning episodes include *Spondylus* and other marine remains, burnt camelid and deer bones, and lithic artifacts. This paper will discuss not only the location, characteristics, and elements associated with these hearths, but also touch upon the contrasting elements of the formalized central hearths versus informal hearths and ash lenses utilized during the Late Preceramic in Cosma.

[181] *Chair*

Munro, Natalie (University of Connecticut) and Elic Weitzel (University of Connecticut)**[35]** *The Ideal Free Distribution, Population Packing, and the Forager to Producer Transition in the Southern Levant*

Using predictions derived from the ideal free distribution, we test the hypothesis that the forager to farmer transition in the southern Levant emerged from a context of increased population packing. By constructing population size estimates derived from radiocarbon date frequencies and modeling changes in occupied site suitability through time, we estimate human population density in ecological zones of varying quality. We then compare the population densities in these zones with zooarchaeological relative taxonomic abundance data estimates of foraging efficiency. An inverse relationship between human population and foraging efficiency suggests that the adoption of agriculture was related to population packing rather than the motivation to settle down in "affluent habitats."

Munro-Harrison, Thomas (RMIT University)**[14]** *Indigeneity, Identity and Survivance through Ongoing Cultural Practices*

Through this project I aim to document the ways in which Indigenous artists exercise self-determination in expressing identity through creative means. A complex and significant issue is evident in the depiction of Indigenous Australians within the media which continue to stereotype or ignore Aboriginal perspectives requiring ongoing consideration and critique. I am interested in exploring the ways in which Indigenous artists 'speak back' to such destructive colonizing processes, I will explore these various forms of speaking back, and of resisting ongoing forms of colonization in contemporary everyday life in my work as a Wiradjuri Graphic Designer. Through the development of a graphic novel, I will continue to explore my own meaning-making and identity in ways that demonstrate the ongoing survivance, resurgence and modernity of my Wiradjuri culture. By exploring the works of and consulting with fellow Indigenous cultural practitioners, I seek to gain insights from legitimate primary sources of cultural practice, helping me to consider the ways in which Indigenous peoples draw from their own cultural foundations, whilst reflecting and building on the ways this occurs through my own practice.

Munson, Jessica (Lycoming College), Andrés Mejía Ramón (Penn State University) and Lorena Paiz Aragon (Altar de Sacrificios Archaeological Project)**[113]** *New Methods of Mound Detection in the Maya Lowlands: UAV Survey and Settlement Mapping at Altar de Sacrificios, Petén, Guatemala*

Over the last decade, the use of lidar has dramatically changed our understanding of the size and extent of ancient settlements in the Maya lowlands. This technology, however, has yielded equivocal results in secondary-forest growth and recently deforested environments. In these settings, unmanned aerial vehicle (UAV) surveys facilitate a more effective and efficient methodology for generating high-resolution imagery to identify archaeological and geomorphological features of interest as well as monitor site destruction. In this poster, we present the results of recent UAV surveys conducted in a 20 km² study area surrounding the site of Altar de Sacrificios in southwest Petén, Guatemala. Results from the survey and total station mapping have documented extensive low-density settlement dispersed along the Pasión Salinas, and Usumacinta rivers far beyond previous estimates of the city's size. The high-resolution digital elevation model generated from these images also captures geomorphological features that help us interpret the relationship between the ancient settlement and relic river courses. Lastly, we also use multitemporal images to quantify deforestation over the last five decades and mound erosion due to recent mechanized plowing. This presentation addresses the implications of these results and highlights the application of regional UAV survey methodology in the Maya lowlands.

Munson, Jessica [127] see Scholnick, Jonathan

Munson, Marit (Trent University)**[245]** *Pigments and Paints in the Ancestral Pueblo Southwest*

Archaeologists working in the Southwest have consistently recovered examples of prepared paints, and the pigments used to make them, during excavation. These materials are usually present in relatively small quantities, though, so they tend to get noted in field reports and then lost within the archaeological literature. In this paper, I consider the distribution of pigments and prepared paints in the Ancestral Pueblo Southwest, drawing on excavation and field reports from the late 1800s through the present day. Taken together, these records indicate that pigments and prepared paints were both ubiquitous and highly valued in the Southwest, occurring frequently in burial contexts from Basketmaker sites up to early

historic villages such as Hawikku and Awatovi. The literature also suggests that there is considerable continuity between ethnographically documented paint recipes, including a complicated copper resinate made from malachite and pinyon pitch, and paints prepared as much as a thousand years ago in Chaco Canyon.

[406] *Early Urbanism and Intermediate-Scale Social Interaction in Formative Central Mexico: Ritual Practice and Socio-spatial Organization at Tlalancaleca, Puebla*

Tlalancaleca was one of the largest settlements before the rise of Teotihuacan in Central Mexico. Our ongoing research indicates large-scale urban transformations in the transition from the Middle to Late Formative period. Tlalancaleca during the later Formative is characterized by a multi-centric spatial organization consisting of multiple monumental architectural complexes of different scales. This spatial configuration was not shared by contemporaneous Formative urban centers in Central Mexico, where a principal pyramid-plaza complex constituted the civic-ceremonial core. Our excavations at intermediate-scale complexes at Tlalancaleca have revealed possible feasting assemblages that show some similarities and differences in ritual practices between different complexes. In this paper, we will discuss the implications of varying ritual practices at intermediate-scale architectural complexes for understanding the nature of social integration and differentiation at Tlalancaleca during the Terminal Formative (ca. 100 BC-AD 250). We will contextualize Tlalancaleca's urban transformations in the broader sociopolitical processes in Central Mexico and discuss the significance of intermediate-scale social interaction for urban development.

[191] *The Barranca Site: A Multiscalar Analysis*

The research project "Precolumbian social change in San Ramón de Alajuela, Costa Rica" deepens in the reconstruction of the trajectory of pre-Columbian social change in San Ramón de Alajuela and its surroundings. The research has been carried out in two stages, one regional (2007-2011) and the other on a settlement scale. In the present stage (2012-2017) the functional nature of the pre-Columbian settlement Barranca, San Ramón, Alajuela has been explored. Barranca, located in San Ramón, is a particularly interesting case in the region, first because of its complex architecture which, "presents features similar to those of Guayabo de Turrialba" and includes cobblestones and mounds of earth surrounded by rings of boulders; it is also located among the three villages that had the most use in ceremonial festive activities and, additionally, it is among the pre-Columbian villages that had greater material access to exchange with the north Pacific region of Greater Nicoya. All of the above led to the formulation of the following question: Why did a third-level village present a high investment of work in architectural features, together with a regional specialization in terms of festive and ritual activities and considerable interregional exchange?

Muro, Luis (Stanford University)

[315] *Building a Huaca: Micro-chronological study of Huaca La Capilla-San José de Moro and Its Implications in the Late Moche Absolute Chronology (AD 700-850)*

In the past few decades, Moche huacas have been the object of intense archaeological excavations. The study of the formal characteristics of these constructions has produced relevant information about their appearance and function as well as their importance in the religious life of the ancient Moche. Nonetheless, little attention has been given to the study of the temporal dynamics of formation and transformation of these constructions. This paper presents radiometric data recently obtained from Huaca La Capilla, a monumental adobe construction located within the Moche cemetery of San José de Moro, in northern Peru. By using a micro-chronological approach, I reconstruct the multiple events that gave shape to this huaca, and discuss their relationships with the ever-changing deathscape of San José de Moro in Late Moche times. Inspired by John Rick's contributions to the Andean chronology, I argue that in order to better elucidate the dynamics that gave shape to the Moche phenomenon, we should move away from chrono-typological perspectives under which we equate ceramic styles to chronological phases. Instead, I suggest that the constant renovations in the Moche buildings can

be more effective temporal indicators to trace the transformations in the political and religious arenas of the Moche world.

[395] *Preservation, Education and Outreach: Conservation at the Corral Redondo Project*

The summer of 2018 marked the first season of the Corral Redondo Project, a multidisciplinary project that aims to identify the function of this site which seems to have had a ritual purpose for both the Wari and the Inca (AD 600-1550). Though the site had been previously excavated, and subsequently looted since its discovery in 1943, archaeologists and specialists employed various scientific techniques in order to understand the significance of Corral Redondo and its role in the broader context of the Churunga Valley (south coast area of Peru) where it is located. The project, which was run as a field school, incorporated three components: excavation, survey and conservation. In this paper, the work undertaken by the conservation team will be described, focusing on the treatment of objects in the Museo Escolar Miguel Grau, which houses material recovered from the area. The process for the preservation of these artifacts will be discussed with an emphasis on how these activities were incorporated into a conservation module within the field school. Community outreach was integral to the project's goals and implementation. Activities undertaken to engage with community members about the work undertaken and the development of the museum will also be presented.

[20] *Shifting Baselines of the British Hare Goddess(es?)*

Studies of past religions tend to fall into one of two camps: tightly-focused empirical examinations of a particular religious culture, or wide-ranging phenomenological studies divorced from any local context. Little scholarship engages with the middle ground of *longue durée* development in particular phenomena within the same geographic region or ecological niche. This interdisciplinary paper seeks to prove the value of just such an approach by examining the worship of female beings that negotiated the relationships between humans, animals, and their shared environment. Employing archaeological and textual evidence, it studies three female beings associated with hares in the British Isles: an anonymous Romano-British figure, the Anglo-Saxon goddess *Ēostre* – whose name shares an etymological root with “Easter” and its lagomorph attendants – and the medieval Welsh *St. Melangell*. It proposes that these figures display different semantic centres but nonetheless show remarkable continuity in their secondary characteristics. This is used to argue that the temporally-local concerns of each society found expression in “the same” figure of the British Hare Goddess, whose origins and “meaning” is today frequently discussed on online internet fora – perhaps reflecting the Digital Age’s own anxieties regarding the flow and reliability of information.

[11] *An Analysis of Fetal Remains Discovered in a New York Privy*

The remains of a thirty-six week old fetus were uncovered during the excavation of a privy on the Sargent Street site located in Cohoes, New York. Discovered in a 19th century town inhabited with textiles mill workers and their families, the skeleton was fragmentary and consisted of only four long bones. The context of these remains are unique and represents one of only

three such cases in the United States, giving rise to inquiries of the circumstances that could have surrounded this abnormal burial. The recovery of these remains provides opportunity to explore 19th century attitudes towards this period of life. This archaeological context is thought to be a concealment of a fetus that resulted from illicit behavior or a burial of a miscarriage/premature birth, though possible explanations also include abortion and infanticide. Through previously published data on such themes, we will explore the different ideas of how children were valued at this point in history and analyze different explanations for the placement of these remains.

[261] *Camping and Hot-Rock Cooking: Hunter-Gatherer Land Use across the Southwest Pecos Slopes*

Understanding changes in mobility and subsistence practices among Jornada Mogollon hunter-gatherer groups remains a substantial research issue. Residents across the Permian Basin largely maintained a hunting-and-gathering cultural adaption throughout prehistoric times, although some segment of the local population practiced cultivation during the Late Formative period. The Southwest Pecos Slopes reflects transitional vegetation community that interfaces between succulent-rich uplands and mesquite-dominated lowlands. Available resources, such as lithic raw materials and edible plants, are scarce within this region; however, numerous small sites related to resource-processing and cooking activities persist across the area. The BLM Carlsbad Field Office requested an evaluation of existing site and feature typologies, to explore the potential for deriving more-meaningful behavioral interpretations regarding prehistoric use of region. This investigation aimed to better understand local patterns of lithic-raw-material-sources, procurement, reduction, transport, use, and discard, in addition to examining temporal and spatial trends in the prehistoric occupation across the region in relation to mobility patterns. The combination of these detailed studies were used to elucidate the function and chronological placement of small sites, and enhance the BLM's ability to manage sites within the developing region, especially in regard

to understanding issues of site eligibility and research potential.

[274] *Trek Up the River: A Cobble Tool Technology as Clue to Interior California's Antiquity*

An early quartzite cobble lithic technology is evidenced by a multi-site pattern of datasets including waste cores and tools with highly patinated flake scars on remains deeply embedded in the natural desert pavement of the Pleistocene shorelines along the Lower Colorado River (LCR). Reduction technology is represented at Vista del Lago (CA-SBr-1456) located near Havasu Landing, California. The distribution pattern of multiple similar sites along the western shoreline of the LCR and Gulf of California (eastern shoreline of Baja California) was reported by Malcolm J. Rogers in 1939. These scattered sites are considered as a potential connecting link between interior California to a submerged ~ 12,700-year-old pre-Clovis paleo-coastal cobble tool dataset found off the Baja peninsula and reported by Matthew DesLauriers at Cedros Island in 2017. The presence or absence of a statistical typological, technological, and chronological correlation between the various cobble sites (with datasets available for study) is considered using Optically Stimulated Thermoluminescence (OST), XRF, and relative dating of pertinent Pleistocene shoreline benches. A corollary early technology along the inland shoreline would support the extension of a Paleocoastal peopling into interior regions via the Gulf of California and the Lower Colorado River channel.

[134] *Bethel Cemetery: Photogrammetric Field Methods in Burial Excavation*

During the summer of 2018, cultural resource management professionals, in collaboration with local universities, relocated a nineteenth-century cemetery from an urban setting, as a component of planned infrastructure expansion by the Indianapolis International Airport. Project managers chose to employ SfM photogrammetry to document excavated burials, which provided project researchers tools necessary for bioarchaeological study. Project directors devised a methodology for the digital mapping of human burials prior to fieldwork, however, team members faced unexpected challenges necessitating modification to established procedures and protocols. By the close of fieldwork, the photogrammetry team had digitally recorded and reconstructed 3D models of over three-hundred exhumations and developed a clear understanding of which practices were suitable to the variability in field settings, and those that revealed themselves to be impractical. This paper describes the problems encountered during the 3D mapping of excavations at Bethel cemetery, how the photogrammetry team adapted to variability in field environments for photocapture, and offers photogrammetric protocols recommended for adoption by practitioners and academics as standard practice in the archaeological excavation of human remains.

[209] *Hunter-Gatherer Intensification and Long-Term Demography: A SW Wyoming Case Study*

The intensification of production by human groups has occurred at various times around the globe. Intensification correlates with increases in population size, increased labor investment in food production, and decreased residential mobility; the opposite (de-intensification) correlates with decreases in population size, decreased labor investments in food production, and increased residential mobility. The exact causes that lead human groups to intensify/de-intensify are not always easily understood; potential factors include climate change, resource availability, and changes in social order. Using Southwest Wyoming as a case study, we construct datasets from archaeological sites dating to the Early to Mid-Holocene and use them to evaluate a model of intensification based on climate and investments in place-based infrastructure. The results of our analysis are important for developing a theory for better understanding the factors that lead human groups to intensify/de-intensify, which can be applied to other archaeological case studies.

[371] *Reconstructing Shifting Patterns of Ritual Practices and Ceremonial Authority at the Emergent Late Classic Maya Polity of Lower Dover, Belize*

The Maya polity of Lower Dover arose in the Late Classic (AD 600-900) period in the Belize River Valley. During its rise, the center incorporated three small communities with autonomous local elites as neighborhoods with co-opted intermediate elite heads beneath an apical political regime. This situation provides archaeologists with a before-and-after perspective on how the emergence of a polity changed the rituals and ceremonial activities of a broader populace and speaks to intermediate elite agency and autonomy as they became subordinate to a new royal political system. Commoners were directed in the rapid creation of the civic-ceremonial center and subsequent large public gatherings in the centralized Lower Dover plazas. But how did this change pre-existing patterns of veneration at domestic and local elite venues? Traditional perspectives on Maya ruling strategies implicate ceremonial power as being central to the political power of kings, does this mean that the rise of an apical regime undercut or appropriated the pre-existing ceremonial role of hinterland elites? This poster examines the relationship between ceremonial practices and political control from a commoner and intermediate elite perspective. Data pertaining to ceremony comes from settlement survey and the excavation of elite and commoner contexts.

[250] *A Microscopic Analysis of Inclusion Size in Middle Horizon 1 Ceramics from Huari*

Huari, the capital of an Andean conquest state during the Middle Horizon, contains ceramics of a multitude of local and foreign styles. While these styles have generally been defined by their outer appearances, it is still unclear whether they can also be distinguished according to their pastes. A group of 132 ceramics of five Middle Horizon styles- Huarpa, Nasca, Chakipampa, Ocros, and Nievería- were collected as part of the 2017 Prehistoria Urbana de Huari excavations for analysis. This research, building upon previous work by Andean archaeologist Luz Antonio, analyzes the pastes of these ceramics using a digital microscope and categorizes them based on inclusion size. It was determined that there are statistically significant differences in the distribution of inclusion sizes between Huarpa, Nasca, and Nievería (listed in order of descending size), while Ocros and Chakipampa could not be distinguished according to inclusion size. The overlap between the Huarpa and Nasca distributions, however, eliminates this characteristic as a predictive tool.

[46] *Landscape Ecology, GIS and Faunal Abundances in Ancestral Puebloan Sites in the San Juan River Basin*

The abundance of faunal remains in archaeological sites is generally associated with the availability of those fauna on the

landscape. However, over time, the spatial variability in faunal abundances could change due to environmental or anthropogenic factors. In the American Southwest, the occurrence and abundance of artiodactyls and lagomorphs varies spatially, especially during the Pueblo periods. There are two competing hypotheses to explain these patterns. Either the landscape supported different types of fauna or the faunal composition is the result of anthropogenic harvest pressure. To evaluate the role of landscape in the distribution of fauna, we use methods developed in landscape ecology and biogeography to describe the realized niche of lagomorphs and artiodactyls in the San Juan River basin. We expect that if landscape is the driving factor in faunal abundances, we should see distinct landscapes associated with each species.

[392] *An Assessment of the Intrinsic Water Content to Understanding Obsidian Hydration: A Case Study of Paleolithic Obsidian from the Shirataki Region in Hokkaido, Japan*

Among the various factors that potentially affect the obsidian hydration rates, intrinsic water content of obsidian has been considered a significant factor. Despite this understanding, variation in water content even within the geochemically identical provenance of obsidian makes us difficult to evaluate the effect of water content on obsidian hydration rates. Given this problem, we attempt to measure the intrinsic water content of obsidian from the geochemically identical samples from an Upper Paleolithic assemblage of a single prehistoric site in the Shirataki region, known as the largest obsidian outcrop in Hokkaido, northern Japan. Because of the consistency in the other potential factors (burial conditions, date of the assemblage, obsidian provenance) among the samples, the measured difference in hydration bands can be explained by variation in the intrinsic water content. The results of this case study will provide implications to the relationship between intrinsic water content and hydration rates for prehistoric obsidian both in the Old and New Worlds.

[212] *Geomorphological Development and Implications for Human Settlement of Southern Yap, Western Caroline Islands*

Human population dispersals across Remote Oceania were some of the most remarkable long-distance voyages in history. Recent collaborative research focused on the timing, drivers, and complexities of these voyages has led to an increased understanding of these movements, but many questions still remain unanswered. This is especially true for Yap, a group of four small islands in the northwest tropical Pacific. Multiple and conflicting lines of evidence provide a broad chronological range for when Yap was first colonized (sometime between ca. 3300-2000 BP), with the earliest dates essentially coeval with the other nearby archipelagoes. To address this issue, we present results from recent archaeological research from Gilman municipality in southern Yap. A suite of new archaeological and non-cultural radiocarbon dates has now extended the earliest date of human settlement by around 400 years and shed important new light on Late Holocene geomorphological development of southern Yap. Results from this study provide a guide to identifying where pre-2400 cal BP sites on Yap may be located.

[253] *The Genomic Formation of Central and South Asia*

This paper serves as an example of how ancient DNA (aDNA) data can provide new insight into large-scale population transformations of archaeological cultures. The details of population transformation through time in Central and South Asia have been unclear due to the lack of aDNA. To address this gap, we generated genome-wide data from 500 ancient individuals and 200 new radiocarbon dates, from present day eastern Iran, Turan, Kazakhstan, and South Asia. We document population transformations from the Mesolithic that occurred on the Steppe, as well as in Turan, that ultimately give rise to large urban settlements in the Bronze Age, as part of the Sintashta and Bactria Margiana Archeological Complexes (BMAC). Sequencing of a large number of individuals from multiple archaeological sites in these locations shows that the inhabitants of these places were often genetically heterogeneous and included migrants from other locations. Of particular importance are outlier BMAC individuals that we believe to be from the Indus Valley Civilization, whose ancestry provides the single largest contribution to South Asia today. Finally, we show how Steppe ancestry linked Europe and South Asia in the Bronze Age, providing a mechanism for spreading Indo-European languages across much of Eurasia.

Nash, Brendan (University of Michigan)

[110] *Neural Nets for Style: A Method for the Examination of Material Culture Variation*

The cause of morphological variation in material culture has long been debated. This investigation into archaic projectile point variation from the Gault site in central Texas looks through the lens of social learning to suggest that different teaching and learning strategies represent the root cause of variation. These strategies may in turn reflect part of the social function of the items being made. Specifically, some of these objects may serve the purpose of signaling information to other people, while other forms may simply be utilitarian with no symbolic value. It is proposed that projectile point forms that show relatively less variation may represent objects with a symbolic purpose. The chronologically controlled forms are quantified into ideational units by training an artificial neural network to recognize patterns in the morphological data. These patterns can be compared to the data of each individual specimen in the groups to determine a level of intra-group variability for each group relative to each other group. It is hypothesized that the variation among these groups will display a bimodal distribution with one mode representing a group with a symbolic aspect, while the others is simply utilitarian.

[133] *Climate Change Impacts on Archaeological Sites of the Middle Atlantic Uplands (U.S.)*

At first glance, the archaeological resources of the uplands of the North American Middle Atlantic region are much less vulnerable to the impacts of climate change than are tidal or coastal sites. However, as the impacts of climate change become more pronounced, archaeological sites of the uplands -- including settings in the Appalachian Mountains, foothills and Piedmont plateau -- are subject to a different set of impacts associated with forest cover and slope: drought and high winds that create conditions for frequent wildfires; and extreme precipitation events that lead to severe erosion, flash flooding, or rapid mass wasting. This paper considers examples of such events in recent years and argues that the fragile stratigraphy of upland sites is further compromised by climate change-related extreme weather and fire occurrences. Soil deflation, in particular, creates lagged surfaces where once stratigraphically-separated cultural horizons collapse into each other. The limited amount of field work undertaken in the uplands relative to the lowlands magnifies the loss.

Nash, Donna (UNCG)**[290]** *Getting to the Point: Wari Obsidian Distribution in Southern Peru*

Recent geochemical studies in the Andes have shown that obsidian was moved over long distances throughout prehistory. Yet as Burger et al. (2000) suggested, the mobilization of obsidian during the Middle Horizon was unparalleled in quantity and scope. In this poster, I consider the relationship between lithic source, reduction technique, and the nature of obsidian distribution to Wari-affiliated enclaves. I review the available data from several sites and use examples from Cerro Baúl and Cerro Mejía to illustrate the general reduction sequence of curated obsidian tools. I suggest that the classic Wari obsidian laurel leaf point is a diagnostic form because it is a product of the distribution of preforms, rather than the circulation of nodules, as well as a somewhat standardized process of obsidian reduction. I consider how the manner of distribution and reduction may have impacted the use of obsidian in Wari provinces and how it might be used to distinguish between communities receiving obsidian through imperial channels versus those engaging in direct procurement.

Nash, Robert (Desert West Environmental, LLC)**[57]** *Settlement-Subsistence Strategies and Economic Stress among the Sevier Desert Fremont*

Archaeological investigations at four Fremont sites in the Sevier Desert indicate settlement-subsistence strategies changed after AD 1000, shifting from short-term processing camps associated with logistical exploitation of resources to residential occupation and intensive processing of rabbits. These changes may have resulted from population growth and economic stress, which forced an expanding sedentary farming population into less desirable locations until final abandonment of the region around AD 1220. The findings presented in this paper are consistent with other research suggesting population growth and resource depression occurred during the Late Fremont period, and provides important insight to prehistoric adaptations in the Sevier Desert during this time.

Nash, Stephen (Denver Museum of Nature & Science), Michele Koons (Denver Museum of Nature & Science), Melissa Bechhoefer (Denver Museum of Nature & Science), Krista Barry (Denver Museum of Nature & Science) and Sarah Carlson (Denver Museum of Nature & Science)**[89]** *Enhancing Preservation and Access to Archaeological Collections at the Denver Museum of Nature & Science*

The Denver Museum of Nature & Science (DMNS) Archaeology Collection represents an important, yet underutilized, cross-section of ancient material culture from around the world. The collection contains more than 72,000 objects, yet its contents are unknown to the vast majority of potentially interested people and communities. In 2014, DMNS opened a new state-of-the-art collections facility. In 2017, we obtained a National Endowment for the Humanities grant for \$300K to move, organize and rehouse the Archaeology Collection. We are currently constructing archival mounts for all objects, taking reference photos for the online Imu database, and reorganizing the collections by culture area in the new space. The reorganization effort will improve accessibility for scholars, students, source communities, and the general public that in turn will facilitate humanities projects and research, cultural resilience, and scientific discovery. This poster will highlight some of our most important collections, some of the research projects facilitated by the new collection space and workshop, and our process of rehousing.

Nathan, Smiti (Johns Hopkins University)**[232]** *Dugongs, Dromedaries, and Domesticates: Disentangling Diverse Diets in Bronze Age Southeast Arabia*

The Bronze Age (ca. 3100 – 1250 BCE) in southeast Arabia is a period of major social and economic changes. In general, several aspects of the southeastern Arabian Bronze Age diverge from patterns occurring in neighboring areas, making it an interesting focal point of study. In terms of subsistence strategies, agriculture arrived over a millennium later than in major Near East centers. While major Near Eastern urban centers did engage in other subsistence strategies (e.g., pastoralism), the diversity and intensity of the non-agrarian pursuits are often obscured. This paper disentangles the archaeological

evidence demonstrating diverse diets in Southeast Arabia that harnessed pastoralism, hunting, foraging, fishing, and agriculture.

Natker, Leon (Research Associate) and Ramson Lomatewama (Hopi Tribe)

[44] *Katsinam, Clouds, and Kivas: Evidence for the Origins of the Katsina Culture*

Katsinam are an iconic symbol of the Native American southwest, but the origin of the religion, sometimes referred to as the Katsina cult, has been elusive. In this paper I review earlier research on the origin of the Katsina culture and the conclusions these researchers came to, taking into account the theoretical constructs and assumptions these earlier researchers used. I review more recent research that explores imagery on ceramics, rock art, and kiva murals, and the movement of trade goods containing these images, coupled with research on Puebloan oral history. This includes current research on migrations and landscapes, and their association with aspects of the Katsina culture. Finally, I use this evidence to support the hypothesis that the Katsina culture is an indigenous creation of the Ancestral Puebloan Southwest which dates back at least as far as the Pueblo II period, and that our conception of the Puebloan world needs to be expanded northward to include the Fremont area in order to fully explore the ancestral beginnings of Katsinam and Puebloan ritual practices.

[403] *The Magdalenian-Azilian Transition: Contributions from the Rocher de l'Impératrice Rock-shelter (Brittany, France)*

Succeeding the Magdalenian, the Azilian is one of the last techno-complexes of the Western Europe Upper Paleolithic. This period is characterized by major socio-cultural changes illustrated by techno-economic but also symbolic changes. One of the most famous elements of this process is the abandonment of naturalistic figurative art on portable pieces or on cave walls in the Magdalenian in favor of exclusive abstract expression on small pebbles. The development of these new concepts remains an important mystery of European Prehistory. The discovery of the Early Azilian site of Le Rocher de l'Impératrice (Plougastel-Daoulas, France) brings new essential evidence in order to investigate this key moment of European Prehistory. If the rich lithic assemblage collected in this small rock-shelter clearly shows the development of Azilian concepts, an exceptional artistic corpus suggests a clear iconographic continuity with the Magdalenian. This presentation develops new information about the "azilianization" process and its timing. We also argue that a culture is not a package and that whatever the origin of the change, various elements of a same cultural system do not necessarily react with the same timing.

[339] *A Cosmopolitan Queen: K'loomte' K'abel's Place on the Ancient Maya World Stage*

Our session chairs rightfully encourage us to reconsider the complexity of ancient Mesoamerica and the worldliness of its inhabitants from all walks of life. We are tasked with examining the myriad ways in which these peoples understood themselves and their place(s) in these interconnected realms by seeking this information in the archaeological record. The funerary offerings associated with Waka's Late Classic Queen K'loomte' K'abel reveal how she utilized her mortuary tableau to eloquently convey her cosmopolitanism. The assemblage, at first view, is striking for the similarity of certain key pieces to Calakmul's Tomb 4, believed to house the remains of Yuknoom Yich'ak K'ak. This is not surprising as she would have sought to identify herself unequivocally as a Kaanul regent. But her afterlife arrangement and the clues legible therein demonstrate she intended to do more than merely signal her kinship affiliation with Kaanul. She simultaneously established

herself as a politician with ties to a broad network of far-flung polities, even hearkening to Teotihuacan. She therefore promotes herself as a queen with a strong legacy of cosmopolitanism at Waka', which we believe was understood as such by generations of its citizens.

[331] *Tales of Extinction: Natives in the Narratives of Early Colonial Panama, Historical Representations, and Archaeology*

Previous historical and archaeological narratives on colonial Panama emphasize the annihilation of indigenous communities after European conquest. Although the Spanish occupation in Panama had devastating consequences on the local population through epidemic diseases, war, and slavery, the documentary evidence provides insights on different ways local populations negotiated and adapted to their new situation. Inspired by postcolonial debates that introduced the notions of agency into archaeology, this paper explores indigenous responses to colonial occupation in Panama using sixteenth and seventeenth-century documents. This revision of documentary evidence brings forth different native strategies that have gone unnoticed both in historical and archaeological interpretations. In this paper, I will discuss the problem of historical representations and the impact of these narratives on the colonial Panamanian period archaeological research.

[85] *Integrated Approach to Ruins Stabilization at Tuzigoot National Monument*

In 1998, Tuzigoot National Monument, through the Vanishing Treasures Program, set forth on a program of complex ruins stabilization at Tuzigoot pueblo (AD 1125 – 1400) that endures to this day. While some of the original stabilization methodology has remained constant from its earliest iterations, there has been an evolution in the process in which the work is now accomplished. Much of this is due to the interdisciplinary and multi-cultural approach that the current NPS staff uses to stabilize Tuzigoot pueblo and the lessons that have been learned along the way. Working together, archeologists, Preservation Masons, and interns work in concert to stabilize the pueblo through their unique perspectives, beliefs, and abilities. The integrated use of accepted stabilization practices, experimental learning, and traditional knowledge has melded together to provide a comprehensive and successful effort in ruins stewardship and preservation at Tuzigoot National Monument.

[346] *The Bajada Canals of the Safford Basin, Southeastern Arizona: Excellence in Prehistoric Engineering*

Exceptionally well-engineered prehistoric canals have been disclosed near the city of Safford, Arizona. Within an area of roughly 450 square kilometers, 12 distinct canal systems, comprised of 41 canals, have been identified originating in the bajada (foothills) of the Pinaleño Mountains. Conveying water from mountain runoff and springs, the longest canal is about 13 kilometers, and the total length of all systems exceeds 125 kilometers. While a few canals may date as early as ca. A.D. 1100, the vast majority date between ca. A.D. 1250 and A.D. 1450 and appear to be the constructs of northern Kayenta migrants. These features represent the second largest assemblage of canal systems in the American Southwest, and, while

smaller in size and total length than the Phoenix area Hohokam canal systems, they exhibit engineering sophistication not found in the Hohokam systems. Unique engineering features include: canal portions being literally "hung" on mesa sides to render routes largely independent of local landscape; sophisticated inter-drainage watershed crossings; counter flowing canals to resolve terrain issues; and a significant 80 m long aqueduct. These canals have expanded the knowledge of prehistoric water management engineering and agricultural intensification in the American Southwest.

Neff, Hector (California State University-Long Beach)

[33] *Holocene Human Adaptations on the Pacific Coast of Central America*

Holocene human adaptations to the Pacific coast of southern Mesoamerica and Central America are documented at a number of locations from southern Mexico to Panama. Evidence comes from Archaic-Period shell mounds, Early Formative sites at the edge of dry land behind the mangrove forests, and cores that have sampled littoral zone sediments. Review of this evidence indicates that human activities played a key role in lower-coastal geomorphological evolution. First, anthropogenic deforestation of the interior coastal plain and uplands starting in the early Holocene accelerated sediment delivery to the lower coast, providing raw material for building barrier beaches that protected developing wetlands. By shortly after 2000 cal BC, these processes had created rich wetland zones that attracted colonization by early pottery-using people during the Initial Early Formative period. By the end of the Early Formative, around 1000 cal BC, exploitation of the estuarine zone in some locations had shifted to intensive use of mangrove wood to fuel salt production. Absence of pollen in levels corresponding to the Middle through Terminal Formative in some cores suggests that intensification of salt production led to deforestation and desiccation of mangrove forest sediments, as littoral zones focused more and more on specialized craft-production activities.

[21] *To Collect or Not to Collect: That Is the Question ...But Where Is the Point?*

Many land managing agencies have policies that forbid the collection of artifacts during archaeological survey and, even under controlled situations, as determined to be an "Adverse Effect" under Section 106 compliance interpretations. The main rationale is that removal destroys the contextual information of the artifact in relation to the rest of the site. This paper argues that such "non-collecting policies" are short-sighted and do not "protect" artifacts from unauthorized removal. In these days of technology, when sub-meter GPS instruments and other tools are available to pinpoint the location of artifacts, we submit that not collecting artifacts with important information potential is actually deleterious to the archaeological record. This point will be made by a case study from the Coconino National Forest in northern Arizona that illustrates the excuse "if I don't pick it up, someone else will," is a correct assumption, and that surface collections, properly documented, provide useful information that justifies their collection and curation for present and future research.

Neff, Louis (US Forest Service) and Samuel Connell (Foothill College)

[256] *From Las Brisas to the World: The Genesis of a Periphery-Core Perspective under the Tutelage of Pat Urban and Ed Schortman*

This paper explores the influences of Pat and Ed's methods and theories on two friends who first met and worked together in 1990 at the archaeological site of Las Brisas in the Naco Valley, Honduras. Without the incredible opportunities, methodological grounding, and theoretical approach provided by Pat and Ed, our careers could have languished under core-periphery ideologies and structures. While doing archaeological research in far flung places like Belize, Ecuador, Ireland, and the North American Southwest, we almost always found ourselves in places with labels like peripheral, provincial, hinterland, and boundary. Yet the people that lived in these places clearly had sociocultural and socioeconomic complexity, as well as worthy interactions with their neighbors. These realities are diminished by the core-periphery perspective and accompanying terms. Not to worry though, the formative grounding we received from Pat and Ed came to the rescue. They gave us the theoretical space, critical eye, and creativity to articulate different and better interpretations of past lifeways where causality and orientation are not unidirectional from a core.

[195] *Strategies and Tools for Managing Change. What Lithic Artefacts Tell about Neandertals and First Anatomically Modern Humans in Liguria*

Liguria is an arch of land overlooking the Mediterranean Sea, with mountain areas, very rare coastal planes and steeply sloping valleys. In spite of this peculiar orography this region represented an important passageway between France and central-northern Italy, allowing the diffusion of human groups, ideas, artefacts and raw materials through ridge routes. The presence in this area of important sites chronologically referable to the late Middle Palaeolithic (Mousterian) and to the early Upper Palaeolithic (Proto-Aurignacian) allows us to investigate some cultural and economic dynamics that have characterized this long and complex historical phase. The geological characteristics of this territory and of the surrounding areas are moreover very specific, with a large variety of lithotypes concentrated in a large territories, thus allowing a privileged glimpse into the movements and use of the different raw materials. Based on data gathered we will try to reconstruct the dynamics about AMH spreading in the Mediterranean area, underlying how Liguria represents a key territory for a correct understanding of the behavioural and migratory processes that have characterized Middle-to-Upper Palaeolithic transition in Europe.

[175] *How Can Behavioral Ecology and the Analysis of Archaeological Spatial Structure Help Identify Inequality among Enslaved Households at Monticello?*

For decades archaeologists have used optimization models to puzzle out how artifacts served the fitness interests of their makers and users. This paper offers a simple optimization model to clarify how selective pressures (e.g. household size and occupation span) shape the maintenance of space on domestic sites and archaeological spatial structure. It outlines an R-based workflow for the analysis of one aspect of spatial structure, artifact size sorting, including measurement and visualization of variation in size sorting within and among sites. The workflow facilitates the measurement of variation in size sorting among households occupied by enslaved agricultural laborers at Monticello Plantation (Virginia, USA). The model highlights selective pressures that might be responsible for this variation, and facilitates the construction of alternative explanations and the search for independent evidence that can be used to evaluate them. The result is the identification of unanticipated inequality among households, driven by variation in the probability their members could count on residence at the site from one year to the next.

[245] *Sacred Colors and Materials: The Life Histories of Ancestral Pueblo Jewelry*

The inextricable combination of color and raw material was the most fundamental characteristic of Ancestral Pueblo jewelry. For white and shell, blue-green and turquoise, and black and various types of stone, the color and the material each had diverse sets of sacred meanings that gave ornaments their value. Together, this symbolic content was abundant, repetitive, and more than representational. At the most profound level, a piece of jewelry was spiritually alive, whether it was worn or deposited intact, broken, or as production debris in ritual offerings. This paper examines the conjunction of Ancestral Pueblo jewelry colors, raw materials, symbolism, and animism from the perspective of artifact life history. Our purpose is to demonstrate that the sacred meanings and embodied spirits of different color/raw material combinations strengthened and expanded during each successive stage in an ornament's life cycle. Recognizing that not all jewelry passed through all stages, we begin with raw materials, then continue through craft production and bodily adornment, and end with ritual deposition.

[364] *A Biogeographic Approach to Hunter-Gatherer Dispersion Constraints in Northern Patagonia*

The Northwest Patagonia late Holocene human occupation was almost a “barrier” against farmer dispersion, at least during the last 1500 years BP. The causes for this remain unclear and are still debated, but environment, human demography, and resource stress are among the most accepted explanations. In this presentation, we use a biogeographic approach to discuss different ideas about how demography, environment, human subsistence, mobility, and procurement strategies could explain the persistence of hunter-gatherer strategies in northwest Patagonia. We use different lines of evidence that include zooarchaeology, stable isotope on human bone, radiocarbon trends, obsidian provenience, and pottery from the Monte and Patagonia deserts. Contrary to our expectations, significant differences in the record show a discrete range that do not clearly overlap human occupation in both deserts.

[306] *The Diverse Legacies of the Viru Project*

In 1946 a group of North American archaeologists with Andean experience, undertook a program of research in the Viru Valley, designed to supplement Rafael Larco Hoyle’s seriated sequence of ceramic styles based on vessels from graves and purchased collections. The Viru Project research program included systematic settlement survey, analysis of surface ceramic collections and stratigraphic excavation intended to create a cultural history from the advent of ceramics to the Inka occupation. Huaca Prieta, a large preceramic mound in the Chicama Valley was also excavated. The investigations of the Viru Project established the cultural and social background to Larco’s ceramic seriation with few exceptions. The results set a benchmark for future research utilizing multiple archaeological strategies. The close congruence perceived between the Viru results and Larco’s seriation for North Coast ceramics endured for the next 50 years. Revisions have come only in the past 15 years from site-specific investigations of chronology and sociopolitical complexity within the Viru Valley.

[318] *Pottery and Fire-Cracked Rock Use-Alteration: Assessing the Impact of James M. Skibo*

James M. Skibo’s pioneering work developing the methods and theory of ceramic use-alteration analysis has allowed archaeologists to make new range of inferences from one of the most broadly available classes of artifacts, utilitarian ceramics. His ethnoarchaeological and experimental work has brought about a new appreciation for the performance characteristics of artifacts and how their interactions with humans left physical traces behind. Use-alteration analysis is now commonplace and while most studies tend to focus on ceramics, Skibo’s use-alteration analysis is relevant to other classes of artifacts. We apply it to the investigation of rocks used as heating elements. In this paper, we describe a range of attributes with the goal of helping researchers identify use-alteration patterns on fire-cracked rocks from sites worldwide. Particularly, this paper discusses the impact of James Skibo in our own academic trajectory and how his pottery use-alteration studies have influenced our research of fire-cracked rocks from Late Archaic sites in the Great Lakes region,

pottery from Southern Brazil, and Peruvian cooking vessels.

[384] *'Least Talked About Among Men?': The Verbal and Spatial Rhetoric of Women's Roles in Classical Athens (ca.450-350BCE)*

In this paper I argue that comparing views derived from texts and material culture highlights the conscious manipulation of both media by their creators in order to communicate specific messages. I suggest that an awareness of this kind of manipulation has a vital role to play, not only in the interpretation of textual sources (as is often recognised), but also of archaeological ones (which is more rarely acknowledged). As a demonstration of this point I focus on the debate concerning the roles played by women in Classical Athens, building on previous interpretations of both the textual and the archaeological evidence.

[401] *Finding Solace: Recovering Human Cremations from the Ashes of a Firestorm*

On October 9, 2017, a firestorm swept through northern California. Eventually reaching over 180,000-acres, the wildfire destroyed more than 8,400 buildings and killed 42 people. Thousands of families lost their homes and all their possessions. In many instances, the cremated remains of previously deceased family members were stored in urns within the home. A canine forensic team and volunteer crew of archaeologists banded together in an attempt to recover cremains lost during the firestorm. This paper tells the story of our recovery effort and describes how archaeology can be used to help those affected by natural disaster.

Newman, Sarah (University of Vermont)

[79] *Beheading Bugs and Spearing Stags: Depictions of Animal Sacrifice in Mesoamerica*

The practice of human sacrifice is one of the defining traits of ancient Mesoamerica, at least according to the modern imagination. But painted objects, carvings, and codices reveal that nonhuman animals often served as sacrificial victims as well. Were some classes or species of animals ritually killed more often than others? Were certain animals killed in

particular ways? In what social, symbolic, and/or spatial contexts did animal sacrifice take place? Are temporal and regional variations discernible? This paper attempts to answer these questions and to probe the meaning of animal sacrifice for relationships between humans and their nonhuman counterparts in ancient Mesoamerica.

[174] *A Common Analytical Language: Compound-Specific Isotope Analysis as a Means for Collaboration between Archaeology and Ecology*

Archaeologists first embraced stable isotope analysis decades ago and have used this tool to study many aspects of human ecology, including diet, movement patterns, and the domestication of plants and animals (to name a few). In comparison to bulk tissue isotope analysis, technological advances in the analysis of individual compounds such as amino and fatty acids provide a relatively untouched analytical frontier for archaeologists interested in human ecology and nutrition. In addition, the flora and fauna present in archaeological sites offer a rich and unique source of information for historical ecologists interested in assessing how human activities have influenced energy flow in food webs and the prehistoric ecology of animals that now live in relict populations because of historic over-exploitation. This paper will review the basic biochemistry required to interpret compound-specific isotope data, the analytical methods used to produce such data, as well as some of the recent approaches that have been developed to study energy flow in food webs, trophic ecology, and human ecophysiology and nutrition. This common analytical language creates ample opportunities for collaboration between archaeologists and ecologists to work on important questions in human history, plant and animal historical ecology, and conservation biology.

[80] *Plains and Mountain Settlement Systems Change During the Earliest Holocene at the Sisters Hill Paleoindian Site (48JO314)*

The Sisters Hill Paleoindian site is located between the Bighorn Mountains and the High Plains of the Powder River Basin in northern Wyoming, two regions with largely distinct ecologies and chipped stone raw material sources. Accordingly, the site is an ideal place to research the causes of settlement system shifts between the mountains and plains. Previously known for its Hell Gap component (ca. 11,000 cal BP), recent excavations at Sisters Hill discovered at least two later components, including one associated with the Cody complex (ca. 10,900 cal BP) and one slightly later (ca. 9,500 cal BP). In this study, we compare lithic raw material use and faunal constituents between the three Paleoindian components at Sisters Hill, situate them within a paleoenvironmental context, and discuss changes in Paleoindian plains and mountain settlement systems during the earliest Holocene. We find that the site's earliest inhabitants made greater use locally-procured resources from the foothills of the Bighorns, while later occupations made greater use of the Powder River Basin interior. The shift from a foothills-mountain to a plains-focused settlement system occurs after significant environmental reorganization between the Hell Gap and Cody occupations and coincides with landscape stabilization characterized by low energy alluvial aggradation.

Ngandali, Yoli (University of Washington)**[211]** *Communities of Art Practices on the Lower Columbia River: Technical Photography Using Infrared, UV, and Visible Light*

Recovered from strata, stolen, sold off to feed their families, gifted, or commissioned for museum display Lower Columbia River or Chinookan carved stone effigies and artifacts are currently scattered across numerous collections and repositories. Previous analyses of Chinookan art styles have been limited to classifying motif attributes, but this research provides a diachronic analysis of the relationship between material culture and technology. Primarily focused on carved and painted groundstone pieces, I employed a chaîne opératoire approach and technical photographic techniques to examine the production process. I utilized a suite of digital, multispectral, and false-color imaging tools to detect evidence of use-wear, carving, and paint deterioration over time. By controlling and manipulating color-band distributions of the electromagnetic spectrum (ultraviolet 300-400nm, visible 400-750nm, and infrared 750nm-1mm), I observed a variation in absorbed, reflected, and re-emitted luminescence. My results indicate that light penetrates the object depending on the wavelength and absorbance of the material. Results also suggest that faint ochres and carving, not easily observable on basaltic stone, reveal diagnostic patterns of modification and technological style. These data concerning the production process contribute to the study of object biographies and shared technological knowledge among communities of practice along the Lower Columbia River.

Nicholas, George (Simon Fraser University)**[244]** *Converging or Contradictory Ways of Knowing: Assessing the Scientific Nature of Traditional Knowledge in Archaeological Contexts*

Traditional knowledge (TK) has become a familiar element of ethnobiology and anthropology but only recently has it gained the attention of the "harder" sciences (e.g., archaeology, biology, climatology). However, many archaeologists have an uneasy alliance with TK and Indigenous oral histories. On the one hand, these sources are valued when they support or supplement archaeological evidence, but when the situation is reversed and TK challenges scientific or historical "truths," then its utility is questioned. I discuss examples of convergence and contradiction between archaeological and Indigenous Knowledge systems. I then argue that engagement with Indigenous knowledge can actually improve archaeological endeavors in two ways: 1) a commitment to objectivity requires that we increase diversity of ideas we explore; and 2) alternative explanations of observed phenomena can push us toward unanticipated insights.

Nichols, Deborah (Dartmouth College)**[38]** *The Evolution of a Revolution: "The Basin of Mexico: Ecological Processes in the Evolution of a Civilization."*

Before the 1960s, books about ancient urbanism and cities often included no references to the prehispanic Americas. V. Gordon Childe's "urban revolution" was conceived as a phenomenon of the "Old World" as the "cradle of civilization." Landmark projects in Central Mexico: the Basin of Mexico settlement pattern surveys, the Teotihuacan Mapping Project, and I.N.A.H.'s Special Project revolutionized understanding Teotihuacan and prehispanic Mesoamerica and how archaeologists study urbanism. The social context of the practice of archaeology also was important. I consider this "urban revolution" from two perspectives. What were the origins and development of prehispanic cities in the Basin of Mexico. How has modern scholarship, especially regional/landscape archaeology shaped understanding the urban transformation of the region.

Nicholson, Christopher**[47]** *Changes to the Western Eurasian Hominin Climate Niche*

The climate niches that early modern humans and our earlier hominin ancestors inhabited have undergone major changes over time. This study documents climate niche expansions, contractions, and stationarity across four time periods (Last Interglacial, Last Glacial Maximum, Mid-Holocene, and 1950–2000) in western Eurasia. Using spatially gridded global climate model data and site locations for each time period, I track how groups shifted their climate niches by comparing climate data from archaeological sites across time and to current western Eurasian cities. I document each time periods' realized niche breadth, overlap, position, and variance with their overall fundamental niche. Results indicate that as global temperatures cooled from the Last Interglacial to Last Glacial Maximum, human populations expanded their climate niche breadth beyond that of earlier Neanderthal groups and shifted their niche toward regions that had less seasonal variation. Conversely, Mid-Holocene humans, who saw the proliferation of both agriculture and population, contracted their realized climate niche space. The changes to climate niche space illustrates how hominins have evolved the capacity to shift our niche through modifications to our subsistence strategy and adaptations to overall climatic conditions.

Nicolas, Richard (University of Wisconsin- Madison)**[115]** *The Ancient Lingling-O: Understanding Jade Stone Manufacture through Experimental Drilling and Scanning Electron Microscope Analysis*

The aim of this project is to understand the processes of jade stone manufacture of the Lingling-o, an ancient jade ornamental artifact found in Southeast Asia. As a favored body decoration in prehistoric societies, its distribution through a sea-based trade network in South China Sea, and the manufacture of jade stone materials influence the development of technological industries in Taiwan, China, Vietnam, and the Philippines during the Neolithic and Bronze-Iron Age. Considering the nature of jade artifacts from known archaeological sites, this experiment aims to reconstruct technological inventions by remanufacturing the circular disk blanks use in making lingling-o by way of experimental drilling and Scanning Electron Microscope (SEM) analysis in order to further understand behavioral processes and material resource procurement. Analyzing the stages of production allows characterization of craft specialization and the evolution of industries along with their socio-political strategies.

Nicolay, Scott (University of California, Merced)**[411]** *Cold Cases and Forgotten Caves: Reconstructing the Provenience of Unique Artifacts from the Greater Southwest*

Museum collections contain many unique objects from the Greater Southwest that lack complete provenience, especially items from caves and other shrines. These sites often served the region's inhabitants as both offertory locations and the terminal repositories for ceremonial objects, resulting in enormous and well-preserved assemblages, many composed primarily of perishable items otherwise rare in the archaeological record. Unfortunately, due to extensive looting that began in the nineteenth century, no archaeologist ever observed an intact cave shrine, and most researchers today believe the potential for such sites to yield new data has been exhausted by multiple cycles of looting, vandalism, and excavation. Artifacts without provenience, no matter how spectacular or appealing to museumgoers, rarely become the subjects of archaeological study. Conversely, other artifacts and even entire collections from identifiable sites have gone missing. Although most archaeologists consider these to be "lost causes," it is sometimes possible to extend or even complete the chain of provenience. This paper reports progress in multiple cases, and demonstrates how these efforts can enhance our knowledge of the archaeological record even when we cannot fully reestablish provenience. This knowledge may apply to other sites and hold special value for tribes working to preserve their cultural heritage.

Nielsen, Michael (Ilisimatusearfik University of Greenland)**[91]** *New Interpretations of Medieval Norse Artifacts from the Tasikuluulik (Vatnahverfi) Area, South Greenland*

The goal in this Master's Thesis is to collect and systematize data from eight medieval Norse sites in the Tasikuluulik peninsula and use these data to compare with past interpretations regarding the use and purpose of these Norse sites. In past research projects, the eight sites under investigation have each been interpreted as representing different types of medieval Norse farms or shielings. Recently, different fields within the natural sciences have provided new knowledge on the use of the environment around, and consequently the function of, these sites. However, no one has been investigating the artifacts to try to establish building functions in these sites. Data for the thesis has been collected from catalogs,

publications, and from the collections in National Museums of Greenland and Denmark. Each artifact now has some level of information depending on who found the object and of the time of the excavation. An important part of this investigation was to improve information on individual objects' in order to improve 19th, 20th and 21st century recordings. The task was difficult and often the way from excavation to the Museum storage could have been a not so easy task.

[127] *Climate Change and the Foraging-Farming Transition on the Great Plains*

The foraging lifestyle persisted as the major human subsistence strategy worldwide for most of the human career. With notable exceptions, this way of life was eventually replaced by a subsistence base complemented and often dominated by cultivated foods. Archaeologists have proposed several hypotheses to explain this foraging-farming transition. One hypothesis is that climatically induced decreases in foraging risk might have functioned as a causal factor underlying this transition. However, the effects of climate change on the foraging risk of prehistoric populations are difficult to operationalize and evaluate. This study provides a methodology to test the hypothesis that climate change had an effect on increased foraging risk and was a causal factor of a foraging-farming transition. To evaluate this hypothesis, we use a sample of nearly 2,500 archaeological components from the North American Great Plains, where the widespread adoption of cultigens increased during the Plains Woodland period (2500-1150 BP). Using distribution models of prey-species, archaeological diet data, and paleoenvironmental proxies, this study reconstructs the paleoenvironment, assesses the availability of prehistoric resources, and compares expected to observed diets. Results of this research allow for a better understanding of the effects of climate change on the foraging strategies of Great Plains populations.

Nims, Reno (University of Auckland)**[212]** *Overcoming Variability in Zooarchaeological Data Quality*

Numerous paleoclimate proxies from Aotearoa New Zealand indicate the Little Ice Age (ca. 1450 – 1900 CE) caused marked changes in local conditions that could have affected the productivity of marine fisheries. Considering the critical relationships that have always existed between fisheries and Māori economic, social, and spiritual life, any changes in fisheries productivity would have had wide-ranging effects on people's lives. However, the variable data qualities of fishbone datasets from the northern North Island severely challenge any analysis of fisheries change in the past. Reported assemblages in this region show little consistency in identification methods, units of quantification, or recovery practices, while only a few report the necessary metadata for assessing sampling biases or processes of post-depositional destruction. In this poster, I explore an approach to meta-analysis of dissimilar assemblages by comparing like with like (i.e. assemblages with similar taphonomic histories), and then drawing conclusions from the similarities and differences that can be observed across each comparison in an attempt to address the question 'How did climate change affect Māori fisheries in northern Aotearoa New Zealand?'

Niquette, Richard**[45]** *Site Formation Processes at the Spring Valley Site (23CT389), Ozark National Scenic Riverways, Southeast Missouri*

The Spring Valley site (23CT389) is a stratified, multicomponent site associated with a co-alluvial fan in the Ozark National Scenic Riverways, southeast Missouri. Temporally diagnostic bifaces indicate components dating from the Middle Paleolithic to the Middle Archaic periods (ca. 10,800-5,500 14C yr BP). A detailed study of site formation process at 23CT389 included (1) description of soils and sediments, (2) particle-size analysis, (3) coefficient of linear extensibility, (4) radiocarbon dating, (5) limited refit analysis, (6) limited debitage analysis, and (7) three-dimensional spatial analysis of piece-plotted artifacts. Results indicate some mixing of artifacts, particularly translocation of smaller artifacts such as debitage under 1/2" in size. However, larger materials, such as bifaces, have maintained some vertical and horizontal integrity. Also, a Dalton and an Early Archaic occupation surface are well defined in the stratigraphic sequence.

Nissen, Zachary (Northwestern University)**[331]** *Community Archaeology and (Post)Colonial Identities in Northernmost Belize*

This paper investigates the "who/what" that constitutes "the local community" in engaged community archaeologies. It will do so by discussing community events organized by the Aventura Archaeology Project, as well as preliminary ethnographic and oral historical work I have conducted in the San Joaquin Village and Corozal Town areas of northernmost Belize. This paper seeks to further community archaeology's commitment to being self-reflexive in practice by offering a critical perspective on the desire to directly link the distant "Maya" past to local communities in the present. Due to long histories of colonialism and imperialism, the answer to the above question is and should be biologically, socially, and politically complicated, rather than easy and straightforward. I will show that "the local community" for whom engagement events are designed are not a single homogenous group of people with one shared history. I argue that an engaged archaeology in (post)colonial contexts must be aware and maintain a critical perspective on the long-term and often violent histories that brought into being contemporary communities. Finally, I will discuss how this awareness of variations in local community identities/histories provides new ground through which locals can collaborate in and engage with archaeological narratives of the distant past.

[331] *Chair***Nivens, Joelle****[95]** *Early Aurignacian Symbolic Technologies: Assessing the Relationship between Personal Ornaments and Coloring Materials in SW France*

The Castel-Merle Valley (Dordogne, France) bears three of the most important Aurignacian (40-28 ka) sites: the Abris Blanchard, Castanet, and de la Souquette. Together, these sites offer strong evidence for the shifting social dynamics reflected in the period's characteristic innovations. The best explored of this evidence are their atypically large and diverse personal ornament collections that suggest they were shell 'markets' (Taborin, 1992) and specialized bead production centers (White, 1989; Heckel 2015). An overlooked feature of these sites, however, are their equally outsized coloring material assemblages. The few references engaging this record relegate them to bead production byproducts, stockpiles of polishing abrasives. Yet, despite extensive experimentation on iron oxides' other utilitarian properties, the polishing

hypothesis has not been rigorously investigated obscuring the relationship between the coloring materials and personal ornaments. This paper addresses these gaps by first reviewing experiments testing the local ferruginous materials polishing abilities. Combined with previous studies, this study models the properties that promote or preclude coloring materials' utilitarian roles. These properties are then compared to the results of spatial, colorimetric, and geochemical analyses of Castel-Merle's materials. The findings disrupt the *a priori* connection between polishing and coloring materials and instead implicate a wide range of activities.

Niwa, Takafumi, Yosuke Higuchi (Ashiyagamosato) and Hidehiro Shingo (Ashiyagamosato)

[299] *Experimental Archaeological Research on Reconstructing Shang-Zhou Clay Molds*

This study reconstructed manufacturing technologies of Chinese bronze artifacts by performing a "contrastive manufacturing experiment." This approach called for creating identical casting figures using several manufacturing processes and conditions. One factor contributing to the appearance and development of Shang-Zhou Bronze artifacts is the existence of high quality mold soil in China. We conducted a contrastive casting experiment that was aimed at comparing the function of 'stripe-shaped' patterns found at the bottom of Shang-western Zhou bronze vessels by using a single layer structure mold with high temperature firing. The mold used differed from those in traditional Japanese casting. As a result of casting experiment, stripe-shaped engraved lines on mold resulted in "U-shaped" lines on casting bronze surface. In this presentation we discuss the reasons for this phenomenon.

Noack Myers, Kelsey

[385] *Respecting the Past and Protecting the Future: Strategies for Implementing Digital Best Practices in Historical Archaeology Research on Military Installations*

In Cultural Resources Management, many archaeological survey projects are undertaken through contract services provided to regional federal clients with large-scale resource evaluation needs. In the case of military properties, each installation maintains SOPs and curatorial operations to serve the needs of their unique CRM department. While modern military and government security may exist at the forefront of on-the-ground practice at these locations, the historical research and archaeological data related to historic and precolonial communities and individuals that once resided on these properties should be handled with equal sensitivity. This paper examines practical digital strategies implemented at military installation sites in the southeastern United States to protect the legacy of those who lived in the past as well as those who are working to protect sites for the future, through the processes of resource evaluation, management, and interpretation for the public.

[88] *The Risks and Benefits of Working with Private Collections: Lessons from the COADS Project*

Privately held collections are an endangered part of the archaeological record that the SAA's "Principles of Archaeological Ethics" directs us preserve. The Central Ohio Archaeological Digitization Survey (COADS) is undertaking the documentation of dozens of private collections in central Ohio. By September 2018 it recorded over 15,000 artifacts and added over 300 new sites to the official records. Along the way, COADS staff have learned several lessons that can be generalized to other efforts to work with private collections of various documentary quality. Persistent issues include the vagaries of memory, disparities in artifacts labels, and problems presented by purchased artifacts and their relation to personally collected materials. With these issues, we are still able to make valuable contributions to collective knowledge about the pattern and persistence of prehistoric activity in our region. Like the issues, these benefits are also generalizable to any other effort of similar aims and scope.

Noldner, Lara (University of Iowa Office of the State Archaeologist), Brennan Dolan (Iowa Department of Transportation) and Janee Becker (Indiana University of Pennsylvania)

[120] *Cultural Resource Protection in Iowa Using Hand-Held LiDAR Technology*

A primary focus of cultural resource protection in Iowa is on prehistorically constructed burial mounds and other earthworks that are important to Native communities, past and present. This involves monitoring the condition of these earthworks and considering all potential impacts given their location and landowner maintenance strategies. This poster summarizes an example of the application of hand-held light detecting and ranging (LiDAR) technology to our preservation efforts. The Iowa Department of Transportation's Office of Location and Environment and the University of Iowa Office of the State Archaeologist conducted a LiDAR survey of previously recorded site 13WA28, which consists of four Woodland-period conical mounds. The data showed subtleties in mound form resulting from construction and environmental impacts not readily visible to the naked eye. Mound size and shape can be more accurately quantified with three-dimensional data as opposed to the traditional method of measuring mound diameter and height. LiDAR survey data allows for evaluation of subtle changes over time with a high degree of accuracy, and can also detect more subtle mounds that would otherwise be missed using other traditional assessments. Future earthwork studies should use this technology to improve our understanding of change over time and our stewardship practices.

Noll, Christopher (Archaeological and Historical Services, EWU)

[328] *A Perspective on Olcott from the Banks of the Elwha River, Clallam County, Washington*

Olcott sites, representing human presence during the early-to-middle Holocene, have been defined throughout western Washington on the basis of a few key attributes: lanceolate projectile points, the use of relatively coarse-grained crystalline volcanic rock for the majority of the tools, and the position of artifacts within B-horizon soils. The focus on these attributes emphasizes the similarity of Olcott sites. The lack of abundant faunal remains, charcoal, and intact features is frequently invoked as limiting factors for refined understanding of this early period in the Puget Sound. Recent analysis of three sites (45CA727, 45CA774, and 45CA775) along the Elwha River on Washington's Olympic Peninsula presented the opportunity to explore sub-regional variation in Olcott occupations. This analysis yielded questions about human population movements, adaptive strategies, and technological stability over time. The artifact assemblages suggest that new approaches to Olcott analysis could provide new insights about a cultural tradition that appears relatively unchanged for thousands of years.

[85] *The Origins of the National Park Service's Vanishing Treasures Program*

In the mid-1990s, the National Park Service sought to upgrade its architectural preservation programs at about 40 arid-lands parks, which were facing the loss of significant numbers of retiring preservation craftsmen who had been working to preserve resources since the 1960s and 1970s. In addition, the cultural resources of the Southwest were deteriorating at a rate that outstripped the traditional available funding allocation. The Vanishing Treasures (VT) program was designed to augment the existing level of stewardship resources by adding emergency project funding and training new personnel, mostly at the park/monument level. As the VT program took flight, staff selected from among the NPS parks viewed it as a bridge from reaction to proaction. Tactics included the hiring and training of new permanent preservation workers and developing standards and guidelines that also applied new technology and new skills in addition to making traditional brick-and-mortar repairs.

Nordine, Kelsey**[168]** *Preliminary Results from Paleoethnobotanical Analysis of Pit Features at the Morton Village Site (11F2), Central Illinois*

This paper presents the preliminary results of paleoethnobotanical analysis of flotation samples from 38 external pit features from the Morton Village Site (11F2), located in the Central Illinois River Valley (CIRV). Previous research at Morton Village provides strong evidence that the village was occupied contemporaneously by both Mississippian and Oneota groups living together as a multicultural community. Pit features analyzed were established as Oneota, Mississippian, or mixed use based on ceramic types present in the pits. Twelve Oneota, fourteen Mississippian (four of which may come from an earlier Mississippian occupation of the site, pending radiocarbon dating), and twelve mixed use pit features were analyzed. Plant macroremains are catalogued and quantified using standard paleoethnobotanical devices, such as density, ubiquity, and diversity measures of species present. Morphometric analysis of maize macroremains was also performed to attempt to examine diversity in maize farming at the site. This preliminary report presents data relevant to understanding foodways and diet at Morton Village.

Norman, Lauren (University of Kansas)**[186]** *Early Thule Inuit Architecture in the Arctic: An Anchor in Migration and Movement*

During and for a few hundred years after the Thule Inuit migration around AD 1200, early Thule groups in the North American Arctic established village sites in new locations where they maintained a similarity in ceremonial architecture, house form, and division of space, despite the variability of resources and vast distances between them. This form changed in many areas after the early Thule period, demonstrating that people did adapt their built environment to new regions, but chose to maintain the original house form for a while. This paper highlights the similarity in form across the Arctic using domestic and ceremonial plans from Alaska to Greenland. I also examine the use of space using faunal data from two houses, one from Alaska, near the start of the migration, and one from the central Canadian Arctic, near the middle of the migration. Despite differences in resources, faunal spatial patterning shows broad similarities across both houses, indicating that people used the house spaces in similar ways. This paper argues that people maintained ceremonial structures, dwelling form, and use of space during the early Thule Inuit period as an anchor to a broader culture in a period of major movement and change.

Norman, Neil (William and Mary)**[347]** *New Neighbors/Nearest Neighbors: Slavery, Displacement, and Belonging along the West African Coast*

During the Atlantic Period, Kingdoms along the West African Coast swelled as traders, emissaries, and farmers moved to palatial capitals. As these groups freely poured into West African cities, African kings added war captives and enslaved individuals to the urban mix. Elite Africans were reliant on enslaved and attached labor for monumental construction efforts, agricultural efforts, and sustained regional warfare. This paper considers settlement data from the Hueda Kingdom (ca. 1650-1727 AD) that speaks to such a rapid urban expansion associated with the Trans-Atlantic Slave Trade. It uses ethnoarchaeological evidences to interpret the uneven and nonsequential nature of Huedan settlement system. It argues that some of the latest settlement in the kingdom was at the center of the settlement system and it considers this unusual settlement pattern in terms of the reliance on enslaved labor and belonging to a place.

Norman, Neil [391] see Bassett, Madeleine

Norman, Scotti (Vanderbilt University)**[179]** *The Gender(ed) Revolution: Female Priests and the Mary Magdalenas of the 16th Century Taki Onqoy Movement (Ayacucho, Peru)*

Interpretations of past identities have until recently often been considered in dichotomous binaries, in which individuals are either male or female, peasant or elite, ritual specialist or commoner. With the application of queer theory to archaeological analyses over the past decade, these "normative" understandings have been challenged, and scholars have recognized the fluidity and entanglement of identity. In the 1560s revitalization movement known as Taki Onqoy (quechua: "dancing sickness"), women were the majority of participants, making up nearly two-thirds of all named takiongos. Contrary to classical interpretations of men as the agentive actors in times of exaggerated cultural change, these female takiongos danced, preached, and intentionally took the names of Mary Magdalena and other Catholic saints in order to shift between

participants and spiritual leaders and promote religious revitalization. In this paper, I suggest that women played an integral role in challenging Catholic evangelization through their group participation in Taki Onqoy. Specifically, by taking on identities of female Catholic saints, women were able to both affirm the power of the Catholic Church, while simultaneously subverting this power through leading indigenous rituals and instructing followers to return to their pre-Hispanic worship practices and beliefs.

Norris, James (Kent State University - The Eren Lab) and Metin Eren (Kent State University - The Eren Lab)

[51] *Early- and Middle-Stage Fluted Stone Tool Bases: Further Evidence They Are Not Diagnostic of Clovis*

Goodson Rockshelter in Oklahoma has provided strong chronometric evidence that early- and middle-stage fluted stone tool bases found there date to the Late Archaic. These results further indicate that such specimens are not necessarily diagnostic of the Clovis culture. Here, we present additional evidence that early- and middle-stage fluted bases do not automatically indicate a Clovis presence. The assemblage from the Fox Lake area in Northeast Ohio consists of 228 tools, including eight early- and middle-stage fluted bifaces. However, of the 20 diagnostic projectile points can all be assigned to Holocene (Early Archaic to the Late Prehistoric), and none to the Pleistocene. Until chronometric assessments of age can be conducted in the Fox Lake area, the most parsimonious explanation for this pattern is that these early- and middle-stage fluted bifaces are Holocene in age, and thus not affiliated with the Clovis culture.

[319] *Dietary and Environmental Implications of Animal Use in the Okeechobee Basin Area of Florida*

In order to gain a better understanding of the faunal diet composition of Native Americans in south-central Florida, an examination was conducted to determine which types of animals appeared most frequently within tree island assemblages. Of the faunal remains examined from a 2016 excavation, all were identified to at least an animal's taxonomic order, although identification to the species level was usually not possible due to the fragmentary nature of the sample. This information was compared with radiocarbon data to determine changes to diet through time as well as with oral histories from Seminole community members in order to compare stated dietary preferences with prehistoric evidence. This study determined the most prominent animal types present in the assemblage and identified whether there were fluctuations in animal composition present throughout time that could indicate a changing environment and differential resource availability and exploitation. Understanding the environmental changes through time and their impacts on subsistence patterns demonstrate the ways in which tree island inhabitants reacted to environmental changes.

To know and to name bodies and their parts, bioarchaeologists rely on intimate encounters with material traces. At times, they closely examine the “same” objects, yet see quite different things. Understanding such difference is usually treated epistemologically. People have alternative vantage points on the same reality, and divergent interpretations are explained in terms of training, experience, or social position. Attending to difference using an epistemological approach tends to focus on the “knower” rather than the “known.” Alternatively, an ontological approach involves shifting our focus from the knower to the material traces themselves and the multiple forms they can take. Rather than simply bringing different perspectives to “an object,” these things are more active and in flux, enacted and altered in ecologies of people, objects, ideas, and practices. If the question “What entity?” is raised, then the ontological answer would be, in the words of Annemarie Mol (2002), “a slightly different one each time.” To consider these malleable matters, I follow the proliferation of “cancer” from the Spring Street Presbyterian Church vaults (ca. 1820-1850) in Manhattan. By exploring the struggles involved in making many things one, I trace this “disease” through historic landscapes, archival records, specialists’ laboratories, and the peer-review process.

Novotny, Anna [81] see Wells, E. Christian

Novotny, Anna (Texas Tech University)**[353]** *Cooperation and Resilience at the Ancient Maya Site of Chan, Belize*

In ancient complex societies, unique social strata had differential access to food resources and likely relied on different food procurement strategies to meet their needs. This paper explores the extent to which cooperation was part of that strategy for the ancient Maya farmers of the Chan site, located in the Belize River Valley of west-central Belize, through possible changes in diet over 1800 years. In the Late Classic period (AD 750-900), the Maya lowlands were beginning to experience an intense and prolonged drought that contributed to significant sociopolitical reorganization. Artifacts recovered from the Chan site center dating to the Late Classic period originated far beyond the Belize Valley. The Chan farmers were reaching beyond their valley home to procure resources. To more fully understand the nature of these interactions, this study investigates diet at Chan over its 1800-year history through stable isotope analysis. Changes over long timespans illustrate the extent to which Chan successfully buffered its residents against sociopolitical and environmental fluctuations through economic cooperation with communities outside the Belize Valley. Results suggest remarkable stability in diet over Chan’s deep history, which has important implications for how small-scale stakeholders negotiate large-scale environmental and social change.

Novotny, Claire (Kenyon College), Anna Novotny (Texas Tech University) and Leigh Anne Ellison (Digital Antiquity, tDAR)**[256]** *Lessons That Can't Be Taught: Applying Anthropology in Honduras and Beyond*

After participating in the Kenyon-Honduras Program as a volunteer in the spring of 2004, I decided to apply to Master’s programs in anthropology, and I used the word “applied” to describe my experience in Honduras. Pat gently pointed out that their research was not technically “applied archaeology,” since that suggested public outreach and education. Though she was obviously correct, what I could not yet articulate was how living and working in a rural hamlet in northwestern Honduras had illustrated to me in sharp relief the social context of archaeological fieldwork. In Cofradia and Pueblo Nuevo, daily interactions with workmen, children, shopkeepers, bus drivers, and cooks taught students to treat people, regardless of background, with empathy and respect. For this honorary session, we will show more clearly how Pat and Ed’s program instilled the principles of public engagement in their students, who have gone on to conduct applied work in archaeology, cultural anthropology, museum studies, public history, and in places beyond academia. By encouraging identity formation in their mentoring, Pat and Ed gave students the profound opportunity to develop a sense of their relationship to the world by living and working closely with people in Honduras.

Nowak, Jesse (University of Oklahoma)**[45]** *Testing the (Disappearing) Waters: A Preliminary Assessment of the Sedimentary Record of Lake Jackson, Florida*

Recent coring at the Lake Jackson Aquatic Preserve in Northwest Florida investigated the current sediment and stratigraphic integrity in order to assess the research potential of the area for exploring associated cultural events from the Mississippian Period (AD 1050 - 1500). The lake is a unique karst formation with sinkholes that cause dramatic drydown events, and on its southern shore rests the largest Mississippian mound site in the region—8Le1, or Okeeheepkee. Once collected, the cores were subject to various physical and chemical sediment measures including density, grain size, clay content and carbon to nitrogen ratios. We also obtained AMS radiocarbon dates to derive chronological control. We currently do not have any paleolimnological data from the lake and are unaware if modern anthropogenic impacts (e.g., dredging) have left any stratigraphic resources intact. This poster presents results from these exploratory studies and their implications for further research into the relationships between Lake Jackson, regional paleoenvironmental conditions, and associated human occupations.

Nowakowski, Joshua (California State University, Chico)**[66]** *Analysis of Obsidian Procurement from the Wurlitzer Site, Butte County, California*

This presentation will show the results of XRF testing of obsidian artifacts from the Wurlitzer site in Butte County, California. The purpose of this testing is to create a better context from which to understand the site. Previous research has focused primarily on creating a chronology of the site using radiocarbon dating, point typologies, and comparison to other sites in the region. Radiocarbon dates from lower levels at the site were dated to 2480 BC, while upper levels were dated to 1416 AD (Johnson 2005). While a general chronology of the site is understood, little is known about settlement patterns. As a result, x-ray fluorescence spectrometry (XRF) was run on 1,130 artifacts (207 points, 53 bifaces, 3 cores, and 867 flakes) to determine the raw material sources. This sample represents all obsidian artifacts cataloged in the digital database that could be located in the collection. Metrics were also taken on each artifact tested to attempt to find a relationship between flake or tool type and obsidian procurement. Combining previously studied chronological markers with interpretations regarding mobility creates a more dynamic cultural pattern that more accurately reflects the ever-shifting cultural boundaries of the region.

Nowell, April (Univ of Victoria-Dept of Anth)**[15]** *From Trinkets to Privileged Artifacts: The Transition in Our Understanding of Paleolithic Personal Ornaments*

Among Paleolithic archaeologists, there is general consensus that body adornments are important for exploring the origins of cognitive, artistic and symbolic behavior from an evolutionary perspective. This view contrasts with how Palaeolithic ornaments were perceived during most of the twentieth century when they were rarely considered in debates concerning human evolution, art and symbolism. In this paper, we explore this shift in the understanding of beads, pendants and other similar artifacts and discuss epistemological challenges posed by the current revalorization of personal ornaments.

Nowell, Sarah (University of Georgia)**[211]** *Feature Content Analysis: Comparing Trends in Tool Use and Storage Strategies at Bridge River (EeRI-4), British Columbia*

Analysis of household storage strategies at the Bridge River Village in the British Columbia interior during the late prehistoric period has shown that there is potential to gain a better understanding of the accumulation of social capital at the household level. This poster incorporates feature content analysis of tools and raw materials from a series of household occupational surfaces at Housepit 54. Analysis of the use-lives household tools can serve to better define ambiguities in spatial analyses that have attempted to determine the presence and nature of activities reflective of efforts at accumulating social capital. Lithic raw material analysis demonstrates variation in access and household production of tools over time. While demographic, ecological, and dietary trends are better understood, a more focused examination of both lithic and faunal tools found in features will provide a better understanding of lifeways in this household as well as a strong proxy for

household cooperation that can be applicable to larger scale studies aimed at understanding collective action and other regional phenomena.

[270] *Emerging Perspectives: A New Cross-Contextual Analysis of the Niche Monument Corpus*

Preclassic niche monuments, found from Guatemala to Chiapas to Veracruz, portray anthropomorphic figures emerging from a high-relief cavity. Presently there is no extant study of niche monuments that assembles the entire corpus and situates them within a broader matrix of exchange via trade, interaction and linguistics. In this paper, I will present my analysis of the corpus of niche monuments and their context, as well as their geographic and chronological qualities (when available), in order to interpret the ways in which these monuments functioned within the larger matrix of sociopolitical exchange during the Preclassic period. Once I have gathered the corpus I will perform an iconographic analysis of the monuments within the corpus. These analyses will hopefully provide greater insight into the Middle Preclassic-Late Preclassic transition.

[364] *Living in/Visiting Andean Dead Ends: Measuring the Intensity of Human Land Use at the Fringes of the Northern Ice Field*

Luis Borrero's conception of the occupation of Andean dead ends is a pivotal framework for the study of western valleys of Patagonia. Main circulation routes, most likely located at the east of this region, made western valleys to be marginally occupied, possibly in a seasonal basis and a complementary fashion, hence less intensely visited. Yet, these areas are highly sensitive to changes in mobility and land use, and thus are informative of human processes on broader spatial scales. The human occupation of the Andes of Patagonia is still understudied. When considering such areas, the sector bounded by the General Carrera and Cochrane lakes and the Northern Ice field stands as a remarkable example of dead end. Our main goal is to study human occupation and environmental interactions by addressing large temporal and spatial scales and focusing on the assessment of occupational redundancy, variability in technology and subsistence, and the changes in mobility strategies. This research project seeks an understanding of human-environmental dynamics to unveil the occupation of this "dead end" in the context of the broader region. FONDECYT 1180306.

Núñez-Cortés, Yajaira (University at Albany-SUNY)

[330] *Exploring the Social and Political Dynamics of Power Centers in Central Pacific Costa Rica*

The Central Pacific region is one of the least explored areas of Costa Rican archaeology. Recent research conducted at Lomas Entierros and Sardinal sites allow us to contribute to the understanding of the history of occupation in the area, but also to consider the emergence, occupation and abandonment of prominent political centers inhabited during AD 300-1500. While Lomas Entierros, in the lower Tárcoles basin, had a long and permanent occupation for over a millennium, Sardinal was only occupied for 500 years, after which another complex site, Pozo Azul, became the primary center of the Parrita river basin. Both rivers were main entrances to the chiefdoms located in the Central Valley of Costa Rica and were the communication and trading routes during this time. It is not clear yet which factors may have shifted the social and economic dynamics in the region, but we consider the interest in foreign objects, warfare over territory and resources, changes on economic or subsistence activities, etc. We present preliminary results based on household data from both sites to study the result of political and economic fluctuations on household economies as well as the possible variables that boosted social change in these important political centers.

[34] *"A feast of meat, a day of sociability": Examining Patterns in Turkey Management in the Cibola Region, AD 1150-1400*

Recent genetic and isotopic studies highlight important variations in the nature, timing, and intensity of domesticated turkey (*Meleagris gallopavo*) management practices across the northern U.S. Southwest. While a degree of intensification in turkey production has been associated with widespread settlement aggregation in the 13th and 14th centuries, recent work suggests not all of these turkeys were primarily maize-fed. This paper presents results of the stable isotopic analysis of 40 turkey and lagomorph specimens from Pueblo III and IV period (AD 1150-1400) settlements in the Cibola region of west-central New Mexico. There have been no previous studies of turkey paleodiets in the Cibola region, despite having measures of relative turkey abundance that are comparable to the northern San Juan. The results of our study indicate a widespread practice of keeping captive turkeys that were fed large quantities of maize, even in areas where abundant wild turkey populations might be expected. In contrast with patterns of turkey intensification reported from other areas of the northern Southwest, increased turkey production in the Cibola region—perhaps in association with communal feasting—fits into a larger pattern of simultaneous increases in artiodactyl and turkey procurement, production, and use in the late 13th century.

[108] *Lost Landscapes of the Kawarthas: Investigating Inundated Archaeological Sites Using Integrated Methods*

The Kawartha lakes region of south-central Ontario is a region dominated by water bodies and rivers, where humans are known to have lived at least since 12,000 years ago (only shortly after the retreat of glaciers from the region). Since this time, water levels within the region have changed dramatically as a result of various geophysical, climatological, and human induced phenomena, leaving modern water level at a maximum high-stand. While it is acknowledged within the local archaeological community that these hydrological dynamics would have resulted in the inundation of much of the region's past terrestrial and culturally active landscapes, cultural research into the region's lakes and waterbodies have to date been very few and limited in scale. The subject of this presentation is a master's-level research project assessing the cultural significance of the inundated landscapes around an island within Pigeon Lake of the Kawartha Lakes region, known as Jacob Island. Using a series of integrated methods including bathymetric modeling, shoreline/ecological reconstruction, and in-water-visual artefact survey, the goals of this research relate to illuminating the nature of the Kawartha Lakes Region's underwater archaeological record and associating specific cultural occupations and land-use strategies with various regions of Jacob island's inundated landscapes.

[327] *Re-examining Site 48PA551 in Sunlight Basin, Northwest Wyoming: The Faunal Remains from the 2018 Field Season*

Site 48PA551, located in the Sunlight Basin of Northwest Wyoming, is widely accepted as a winter camp dated to the Middle Archaic period. In the original excavation, researchers initially identified one consistent occupation layer, dated to ca. 3800-4400 radiocarbon years B.P and associated with the McKean Complex. New research, however, indicates that there are actually two periods of McKean occupation. Consequently, we now recognize site wide temporal and spatial variability in subsistence behavior as measured using faunal remains. This poster focuses specifically on variation in hunting, butchery, and transport of ungulates drawing on multiple data sets including taxonomic diversity, element representation, and taphonomic patterns. Results offer implications regarding relationships between subsistence strategies and occupational stability.

[125] *100 Years Later: Georeferencing Early Maps and Present Day Field Work at the Site of Nuri, Sudan*

Nuri, a UNESCO World Heritage site, in northern Sudan is the primary burial site for the Nubian Pharaohs beginning with Taharqa of the 25th Dynasty. Thoroughly looted in antiquity, the site was excavated by George Reisner, Director of the Harvard University-Boston Museum of Fine Arts Egyptian Expedition, during the years 1916-1918, with final mapping and back-filling taking place in 1920. A detailed map of the locations and plan views of 56 pyramids and an additional 16 tombs, along with detailed plan views and sections of all of the features, were published by Dows Dunham in 1955. The University of Arizona Egyptian Expedition in collaboration with Pima Community College initiated field work at Nuri in 2018 to assess what remains of the site - excavated and unexcavated - and to bring modern excavation and mapping methods to bear. In this poster we will discuss our assessment of the accuracy of the early plan maps, our attempts to georeference the early maps, the establishment of mapping points for use during the 2018 season and beyond, the overall results of our mapping objectives, and our future goals for the site.

[186] *Five Seasons with the Dukha: House Structure among Nomadic Herders*

Houses are common structures, and the importance and distinction of domestic space has been researched a great detail through ethnography. Yet, how these common structures shape the spatial behavior of residents is often not clearly articulated. This is a particular concern for ephemeral structures that are all too common in hunter-gatherer archaeology. In the absence of clear demarcations of interior space, discard patterns associated with hearths have provided a means of identifying the presence of a house, but what else can be said about this built environment? Our five-year study of Dukha

reindeer herders of northern Mongolia provides quantitative observations of how house structures influence human spatial behavior. In total, we have nearly 5,000 internal observations of individuals documenting identity, activity, and objects used. This dataset demonstrates the structured nature of spatial behavior within the household. We explore both physical and social factors influencing where people situate themselves within the context of the house design and layout. The loci of activities observed provide a new archaeological tool to investigate the influences of the built environment on human behavior.

O'Brien, Michael (Texas A&M–San Antonio)

[247] *Genes, Culture, and the Archaeological Record*

As archaeology increasingly turns to explanatory models of cultural evolution based on a Darwinian perspective, three processes—dual inheritance, cultural transmission, and, more recently, niche construction—have assumed prominent positions. Until the early 1980s, the behavioral sciences tended to draw a sharp distinction between biologically based behavioral traits and cultural traits, the former being a reflection of one's genotype and the latter the result of learning. Things began to change in the 1970s and early 1980s, beginning with the mathematical-modeling work of Cavalli-Sforza and Feldman, who not only modeled the differential transmission of genes between generations but also incorporated cultural information into the analysis, which allowed the evolution of the two systems to be mutually dependent. Their work was followed by that of Boyd and Richerson, who laid a foundation for what they labeled "dual-inheritance theory," one important component of which was their emphasis on kinds of learning. Niche construction theory added a third dimension. It views niche construction as an evolutionary process—an initiator of evolutionary change rather than merely the end product of earlier selection. Understanding the interplay between genes and culture and their role in shaping and reshaping human behavior is the ultimate goal of archaeology.

[396] *Memory and Resilience after the Collapse of the Wari Empire: Analysis from the Remains of Home and Funerary Contexts*

During the last 5 years a team of researchers from the National University of San Cristobal de Huamanga has been carrying out archaeological research in the sectors of Vegachayuq Moqo, Capillapata, Chupapata, and Cerro San Cristobal in the capital of the Wari Empire. The results obtained show an occupation sequence from the Huarpa period (emergence of the empire) to the collapse of the Wari civilization, unveiling different types of architecture associated with cultural materials that has allowed definition of the functionality and abandonment processes. The finding of collective burials inside funeral chambers, in graves dug at a shallow depth, as well as within architectural spaces of the Wari era (mausoleums) have been increasing during the last field seasons. These burials do not correspond to the Wari era, but to a later period linked to the cultural manifestations of the Late Intermediate period that in the region of the southern highlands, are known as the Chankas.

Ochoa Castillo, Patricia**[349]** *The Context of Tlatilco Figurines*

Analysis around anthropomorphic figurines found in prehispanic sites have been diverse, nevertheless the intrigue and confusion among their interpretations are still remaining. Fortunately figurines typologies for the Mesoamerican Formative are useful to locate them chronologically, likewise spatially, although there is still the need to study them in relation to their context. In the Formative site of Tlatilco, located in Central Mexico, many clay figurines have been obtained through four season excavations. In those around 500 burials were explored, with their associated offering, bell-shaped pits, among other elements, and in which it is very common to find figurines. To understand the use and significance of the figurines among their society, it is essential to focus this study especially on those pieces that come from safe archaeological contexts, using the field information, as well as the archaeological material available.

[230] *Discussant***Ochoa-Winemiller, Virginia (New Jersey City University), Terance Winemiller (Auburn University Montgomery), William J. Three-dimensional multi-line laser scanning reproduces highly accurate models that preserve measurable characteristics of portable artifacts such as figurines, whistles, stamps, and molds. Metrological analyses are revealing valuable information about manufacturing techniques, the crafter's tool kit, the function of these artifacts, and the extent of interaction and cultural borrowing that existed in the Northern Maya Lowlands during the Classic Period. Analyses of a sample of mold-made and modeled artifacts recovered from the site of Calakmul, Mexico are discussed to infer function, craftsmanship, tools used in the manufacturing process, as well as the extent of shared representations and ideas circulating through long distance networks.

O'Connell, James (University of Utah) and Jim Allen (La Trobe University)**[35]** *Why So Low So Long? Constraints on Human Population Growth in Late Pleistocene Sahul*

Human populations in Sahul (Pleistocene Australia-New Guinea) probably numbered in the tens of thousands, two orders of magnitude below the 3-4 million estimated at time of European contact. They were also more patchily distributed than simple hypotheses grounded in an ideal free distribution model would lead one to expect. This situation persisted until the Middle Holocene, 40,000 years post-arrival, when sharp population growth and dispersal to previously uninhabited areas suddenly ensued. Factors potentially responsible for this history are identified and discussed.

O'Connor, John (University of Oregon)**[354]** *Recent Investigations at Western Raiatea*

The island of Raiatea in the Leeward Society Islands of French Polynesia is viewed as a central place for the initial colonization of East Polynesia and the dispersal of pre-contact voyaging populations to distantly located islands of the Pacific Ocean. This history is embedded in the oral traditions of Pacific Island peoples and supported by archaeological research throughout the region. Archaeological investigation at the megalithic Marae Tainuu on the west coast of Raiatea furthers regional knowledge related to concepts of centrality in settlement patterns and regional networks of human interaction. Subsurface testing at Marae Tainuu has revealed faunal and artifactual evidence of circumscribed behavioral patterns consistent with expectations of hierarchical social structures. The relation of Marae Tainuu to the surrounding anthropological landscape supports the marae as a sociopolitical center for western Raiatea, and the marae still serves in this capacity today. However, the regional prominence of Marae Tainuu may be compared to the political centers at Opoa that held a position of central importance for inter-island political alliances and regional voyaging. Continuing work at Raiatea will contribute to understandings of local human-environmental interactions and the greater role of local cultural trajectories in regional social networks.

Odegaard, Nancy and Kelsey Hanson (School of Anthropology, University of Arizona)**[245]** *The Technology of Capturing Color: Complementary Analyses of Pigment Cakes and Chalks*

The brilliant range of colors seen on painted media in the U.S. Southwest represents only one stage in an intricate sequence required to make paint. Capturing color from the natural world, harnessing it into a palette, and incorporating it into the material cultural repertoire represents a skillset with deep roots. The ability to make a good paint requires knowledge of geologic sources, processing, and application techniques that is severely understudied. While much attention is afforded to painted objects, less has been done to consider the pigment cakes or chalks that are prepared in advance of painting objects. Pigment specimens reflect the initial stages of combining pigments with binders and a liquid vehicle. Few have ventured to investigate the diversity of semi-prepared materials needed for a paint recipe. Despite their perceived rarity, decades of archaeological recovery have resulted in a large assemblage. This paper summarizes the results of the analysis of over 400 specimens recovered from across the U.S. Southwest. A combination of analytical techniques including microscopy, XRF, FTIR, Raman spectroscopy were employed to investigate the colors represented in semi-processed pigment specimens, the results of which shed light on the spatial, temporal, and technological diversity of approaches to capturing color.

Odess, Daniel (National Park Service)**[135]** *Rethinking Site Significance to Improve Preservation and Protection*

The archaeological record is under attack. Whether from willful destruction at the hands of religious extremists, vandalism aimed at destroying the heritage of minority populations, looting for fun and profit, development in the name of progress, ill-considered agency actions, or climate-driven fire and erosion, the tangible remains of our collective history are suffering death by a thousand cuts. The problem is global: despite our efforts, these cuts occur every day and in every nation. In many areas, efforts to address this problem are plagued by a lack of priority-driven focus that leads to an inability to participate effectively in planning processes. Simply put, we have difficulty setting priorities for protection and preservation because we cannot agree upon and articulate what is most important. As a result, project proponents and resource managers are unable to avoid damaging resources efficiently within their broader planning efforts. Until we can agree upon and effectively communicate significance-based priorities for preservation, effective resource stewardship will remain an elusive goal. This paper discusses how we might begin to rethink our approach to significance to incorporate archaeological resources into landscape-scale (big picture) conservation planning and design.

ODonnabhain, Barra (University College Cork, Ireland)**[157]** *Plus ça Change: Archaeology and Incarceration*

The Spike Island Male Convict Depot opened in 1847 at the height of the Great Famine in Ireland as part of the colonial government's response to the rise in 'criminality' that accompanied mass starvation. The site has a global reach, not just because it was an embarkation point in the transportation of convicts around the world but also because of its critical role in the emergence of the 'Irish System' that was to influence the development of modern prison systems internationally. Archaeology has shed light on the quotidian in the Victorian Convict Depot that closed in 1883: from artefactual evidence of coping strategies adopted by convicts to bioarchaeological evidence of the impact of institutionalisation on their bodies. The island became a prison again in 1985 and has become a heritage destination since the closure of this institution in 2004. Heritage tourism narratives contrast the two regimes, highlighting the injustice that lay at the heart of the Victorian regime but shying away from discussion of the roles that social exclusion, inequality and race continue to play in determining who is imprisoned today. The archaeology of 19th century incarceration begs uncomfortable questions about the carceral regimes of the present.

[110] *Indicators of Skeletal Stress in a Small Skeletal Sample Spanning the Holocene in the Maya Mountains of Belize*

The Bladen Paleoindian and Archaic archaeological Project (BPAAP) is an ongoing research endeavor focused on excavations from two rock shelters in the Maya Mountains of southern Belize: Maya Hak Cab Pek, and Saki Tzul. Continued use of these rock shelters from the Late Pleistocene to the collapse of Mayan civilization has resulted in a unique perspective on biological variation in Mesoamerica during this time. This study examines differential stress experiences in a small sample (n=16) of human skeletal remains dating between 8270–2265 years B.P. Here, we examine prevalence of non-specific indicators of stress (cribra orbitalia(CO) and porotic hyperostosis(PH)) in conjunction with aDNA to better understand stress differentials between individuals from different migratory waves and with different subsistence strategies. Of these, 9.09% have CO and 50% have PH; this higher incidence of PH is a result in keeping with other studies. Overall, few individuals exhibit stress indicators despite reflecting ~6000 years of ecological and social change. Despite the small sample size, these remains represent an important avenue for the exploration of differences in stress and diet in members of various haplogroups throughout the Holocene.

[296] *Patterns of Migration at Paquimé: Insights from Isotopic and Demographic Data*

Interregional interaction has factored prominently in debates about the origin and cultural trajectory of Paquimé since the site was first excavated six decades ago. In this paper, we use a bioarchaeological approach to reconstruct the structure and scale of migration at Paquimé to better understand who migrated to the site, their motivations for doing so, and the impacts that interregional interaction had on this prehistoric community. Strontium and oxygen isotope results indicate that ~68% of non-local individuals moved to Paquimé from within the Casas Grandes region, while ~32% migrated from neighboring regions. The immigrants consisted of men, women, and children, which suggests that migration likely occurred within social or kin-based units. Our multi-tissue sampling strategy revealed that most immigrants from outside the Casas Grandes region moved multiple times during life, particularly those from the American Southwest. There is also compelling evidence for the practice of captive taking. We conclude by discussing potential push and pull factors, as well as how place of origin may have impacted power, status, and authority structures at Paquimé.

Ogaz, Andrea (California State University, Los Angeles)

[323] *Revisiting the Archaeology of Dry Lake Cave, California (CA-INY-1898)*

In 1950, University of California, Los Angeles (UCLA) graduate student Georgiana Guthrie excavated Dry Lake Cave (CA-INY-1898). Located in Inyo County, California, the rock shelter is near Little Lake, the Stahl site, the Rose Spring site, and the Borden site. Dry Lake Cave is an east-facing basalt rock shelter that overlooks Rose Valley, providing occupants with a broad view of the valley floor. Guthrie led excavations at Dry Lake Cave while also investigating the Stahl Site, but did not

complete analysis of the artifacts recovered from the rock shelter. Her original field notes have been preserved at UCLA along with the unanalyzed collection. The assemblage includes projectile points and other chipped stone tools, ground stone, shell beads, faunal remains, basketry fragments, and other perishables. Diagnostic artifacts suggest Rose Spring and Late Prehistoric occupations. This poster will serve as a preliminary report on Guthrie's investigation and will address functional use of the site and its possible relationship to other sites in the valley with similar chronology.

[233] *Inca Stone Sources, Quarrying, and Transport*

Stone was fundamental to building Cuzco and there was significant variability in the sources and sizes of stones employed. To understand the history of construction, we must take into account relationships with the people and resources of the wider region, which impacted where the stones originated and how they were worked, transported, and used. Changes in the choice of stone depended partly on how the properties of the material relate to building techniques, but perhaps more important were the socio-politics of Inca access to labor and resources and the political and religious significance attached to specific sources. We discuss research into identifying the geological sources of Cuzco building stones via pXRF and petrography, which involved characterizing stone from multiple quarry sites in the region and matching that to the geochemistry of Cuzco's building stones. We argue there were several phases of development that can be distinguished by the choice of stone and the sizes of building blocks. These changes in stone use tie the development of Cuzco into that of the Inca royal estates and the expansion of Inca political dominance in the region, giving us significant insights into the chronology of the construction of Cuzco.

[249] *The View from the Trenches: Tying Paleoenvironment to Archaeology at Rimrock Draw Rockshelter (35HA3855)*

The 2018 fieldwork emphasized trench excavation across the relict stream channel directly in front of the rockshelter. Sedimentary deposits comprise a well-stratified, five-part sequence of bedrock basalt overlain by a gravel bed of rounded cobbles and boulders; dark gray blocky to massive cienega (marsh) clays covered by a layer of primary Mazama tephra overlain by reworked Mazama; and finally, two meters of eolian sediments. Four obsidian flakes were collected in the basal gravels and one in cienega clays during stratigraphic profiling. Bison tooth enamel was found at the contact between bedrock and the basal gravels. Four samples were AMS 14C dated, including bison enamel (bioapatite carbonate) from the basal gravels and humate samples from the top, middle, and bottom of the cienega deposit. In the rockshelter, bison and camelid tooth enamel were AMS 14C dated for comparison with enamel from the trench. Archaeobotanical and lithic artifact data are summarized to highlight the paleoenvironmental relationship between the channel and rockshelter. Collectively, these data indicate strong stream discharge at 13,000 CAL BP, when WST human occupations occurred at the site before and after what is defined as Clovis elsewhere in the United States.

[268] *On the Role of Bifacial Points in the Construction of Past Identities and Boundaries in Southeastern and Southern Brazil during the Holocene*

Archaeological sites presenting bifacial points dated from the Holocene are common in southern and southeastern Brazil. Our studies have pointed out that the morphological and technological diversity of these bifacial points was much greater than it had been postulated in the past, indicating the presence of potential past boundaries and territories. However, no tests of the relationship between raw materials and point shapes have been performed so far. We aim to explore the relationship between raw material and the shape of bifacial points from southern and southeastern Brazil to better understand whether the morphological variation observed among points from different regions could be a consequence of

the differential availability of raw material or of different cultural norms. According to the theoretical expectations and heuristic models of style and function proposed by Dunnell (1978), our hypotheses is that stem morphology indicates choices made by the human groups and, ultimately, is a reflection of possible past cultural boundaries and group identities. The analysis of 1492 bifacial points from southern and southeastern Brazil shows that points from different regions present a predominant stem morphology, regardless of raw material type, supporting our initial hypothesis.

[198] *Shifting Colonial Narratives at the Edge of the Spanish Colony: 15th-17th Century Maya Archaeology at Progreso Lagoon, Belize*

There is no question that colonialism in the Americas brought huge and unanticipated changes for both European and Indigenous peoples. Yet Indigenous people often contextualized colonial efforts within their own worldview, or ontology, even as they interacted with European people, things, and colonial structures. This was perhaps most true at the edges of colonies, where European supervision was minimal, and Indigenous lifeways were allowed to continue. This paper draws on colonial period research at Progreso Lagoon, Belize, to suggest that Maya and Spanish actors along the Belize frontier had fundamentally different understandings of colonial events. I argue that we can use archaeology and ethnohistory to deconstruct Eurocentric narratives of colonialism, and to re-envision the colonial experience through a Mayacentric worldview.

[336] *Literacy, Toys, and Social Roles: Childrearing and Subject Making on the 19th Century Wisconsin Frontier*

The "lead rush" initiated a mass migration of Euro-American miners, military officers, and government agents to the southwestern Wisconsin territory during the first half of the nineteenth century. Likely implementing prospecting methods developed by indigenous Meskwaki and Ho-Chunk peoples, multiethnic mining communities emerged in areas such as Gratiots Grove. Several of these populations included Euro-American women and children. These women were often responsible for instructing and enforcing what was viewed as proper behaviors and performance in their children, a task often employed through guided practice with appropriate forms of material culture. This paper will specifically explore educational materials associated with Sarah and Henry Gratiot and their affluent Euro-American family who were commissioned by the United States government as agents to the Ho-Chunk nation from 1825 to 1836. Presence of educational materials and toys suggests that the Gratiot children were taught culturally appropriate forms of play and social engagement that were used to invoke and maintain familial, communal, and national bonds through shared communicative and habitual practices. These objects also visually separated the Gratiot family from the larger mining and indigenous communities of the surrounding area and associated the family with emerging conceptions of whiteness and prosperity in the United States.

[159] *Food for the Soul & Well-being: Ruminations about the Other Face of Ancient Plant Remains*

This paper makes the case for a greater concerted effort in archaeobotany to give equal standing to the domain of 'food' for the soul and spirit, that is, useful/edible plants for the well-being of the individual and the community in the past. All too often, the emphasis falls into concerns of staple food as a nutrient requirement and as part of agricultural and landscape studies. The presentation presents examples of the centrality of 'food for the soul' among contemporary groups (Orinoco Basin & Caribbean), followed by a review of the archaeobotanical evidence for the Caribbean, concluding with some suggestions for future avenues of research.

[252] *A Walk Around Tsankawi Mesa: Applying Written in Rock Preservation Principles to the Pajarito Plateau Rock Art*

SAA is comprised of many educators and a special interest group that conducts research on rock art. The emphasis now is to raise awareness regarding cultural sensitivity of rock art panels, including protection and preservation. That Pueblo people think of rock art panels as part of their cultural heritage, is not a new concept. What may not be obvious to mainstream researchers is how to maintain respect for that sensitivity and preservation. In the project *Written in Rock* conducted by the National Museum of American Indian in 2012-13, participants practiced sharing cultural heritage of rock art panels with partners from Azerbaijan who shared their cultural heritage with Pueblo participants. The experience of sharing cultural heritage between two international groups gave Pueblo participants insights into how they might share it with interested groups of people in the United States. This presentation shares with current researchers and educators some of our most important lessons learned.

Olsen, Sandra and Khan

[252] *Depictions of Human Trophies in Arabian Rock Art*

The ritualistic use of various detached human body parts is a circumglobal phenomenon that has been documented for cultures extending backward through time for millennia. Its symbolic purposes are diverse, but war trophies and ancestor worship are two of the most common. Artists' depictions of displays of human body parts occur in numerous media, including stone sculptures and bas relief, ceramic vessels, carved shells, Plains Indian ledger art and more. Here we document decapitated heads and detached arms illustrated in Arabian petroglyphs on boulders. The images of human heads uncharacteristically incorporate facial features, and it is possible to determine that the removal of the arms left the scapula attached to the forelimbs. A possible weapon is shown in one grouping. A Neolithic figure of a man waving a severed arm over his head on a rock art panel at the Shuwaymis locality sheds light on an ancient activity incorporating human limbs. The man is accompanied by three dogs and faces a bezoar goat.

[32] *The Middle Stone Age Record in Egypt and Sudan: Implications for Out of Africa 2*

Africa is the continent of origin for *Homo sapiens* and thus is the source for human colonization of the Old (and eventually New) World. Out of Africa 2 (anatomically, then behaviorally, modern humans) is supported archaeologically by African stone artifact industries found outside of Africa. Two routes widely acknowledged are along the Nile Valley corridor into the Levant and the Southern Route across the Bab al-Mandeb Strait from Eritrea/Djibouti to Yemen. What, however, is the on-the-ground data within Africa along these probable routes out of Africa? This talk discusses the Middle Stone Age stone artifact record from two northeastern African regions—high desert middle Egypt near Abydos and low desert northern Sudan in the upper 4th Cataract region. The Abydos Survey for Paleolithic Sites (Egypt) and the Bioarchaeology of Nubia Expedition (Sudan) survey datasets are used to examine the diversity of the record along the Nile Valley corridor route, including Middle Stone Age technologies, stone raw materials, and spatial distributions of materials. Assessed are the potential implications of this “trace evidence” for moving out of Africa during the MSA, and whether such “trace evidence” is sufficient to address the questions we ask about prehistoric out of Africa migrations.

[37] *The Continuing Archaeological Investigations on the Northeast Coast of San Salvador Island, Bahamas*

Youngstown State University archaeologists have conducted research on San Salvador Island since 1995, initially under the direction of Gary Fry and, later, of Thomas Delvaux and Matt O'Mansky. This research has focused on three sites on the east side of the island: the North Storr's Lake site (SS-4), the Fresh Lake site (SS-7), and the Dim Bay site (SS-5). Extensive excavations have been conducted at both SS-4 and SS-7 while work at SS-5 is in the early stages. Despite the relative proximity of these three sites to one another, each is distinct in function. SS-4, the only one of the sites for which radiocarbon dates have been obtained, was clearly a habitation site. Preliminary research at SS-5 indicates that that site was likely a temporary campsite, based on its exposed location and paucity of artifacts. The nature of SS-7 is more ambiguous with abundant shell beads and other artifacts recovered but no clear evidence of long-term occupation. In this presentation, we describe the settings of these three sites and compare the distribution of artifacts as we continue to refine our understanding of the pre-contact occupation of San Salvador.

[39] *Tools Fit for a Queen: Interdisciplinary Study of a Set of Ancient Maya Weaving Implements*

This paper reviews our interdisciplinary study examining a set of carved deer bones comprising what appears to be a weaving or sewing kit for an ancient Maya royal woman bearing the Sa' emblem glyph associated with Naranjo. This set, acquired by a private collector and donated to the Los Angeles County Museum of Art (LACMA), includes small bone needles and longer tools with carved finials and incised texts; some are identified as puutz' (weaving or sewing needle) for a royal woman. Although they form a unique set, their forms, images, and inscriptions share features with other carved bones-- including weaving tools-- from other ancient Maya and broader Mesoamerican contexts, and they have analogues with contemporary weaving implements. Our preliminary research combines art historical and epigraphic study with faunal analysis and analytical methods (such as portable X-Ray Fluorescence [pXRF], digital microscopy, InfraRed imaging, and

Scanning Electron Microscopy [SEM] of molds from the surface of the bones). These techniques are used to identify materials and look for evidence of production methods (e.g. tool marks) and use wear. Comparing these objects to artifacts excavated by archaeologists can help in reconstructing crucial information about these and other pieces in museum collections without archaeological context.

[77] *Not Going There: Seeing, Depicting and Interpreting Archaeological Topography through Digital Media*

This paper explores a tension in field practice and interpretation in landscape archaeology. Digital 3D topographic data have proliferated, and the increasing availability of lidar DTMs are transforming the practice of archaeological topographic interpretation. As a toolkit for interpretation tailored to this digital medium is being developed, powerful ways of looking at digital topography have emerged, drawing on scientific data visualization and enhancement techniques. However, these advances do not directly translate to new approaches to interpretation and communication, for example by delimiting inter-related features. In contrast, archaeological survey of earthworks, particularly in the British tradition, draws on over 100 years of practice. This approach has archaeological experience, field observation and visual representation at its core. There are clear synergies between traditional field-based approaches to earthworks and the analytical tools and visualisations afforded by digital 3D environments. How then can we adapt our practices to develop 'digital fieldwork skills' for topographic interpretation and communication in a digital environment? This paper explores connections between our visual engagement with the landscape through traditional archaeological earthwork surveys in the field and entirely digital engagements through visualizing remotely sensed 3D data, and proposes a new methodology for digital fieldwork practice in archaeological topographic interpretation.

[115] *Phytolith Analysis of Experimental Fires: Insights into the Prehistory of Fire*

The Cooking Hypothesis suggests the morphological changes in the Homo lineage, including larger brains, were due to incorporating controlled combustion to cook food. Most archaeological evidence for fire comes from cave sites, which are less likely to be exposed to post-depositional processes (e.g. wind and water) that can destroy combustion evidence. Yet the majority of Early Pleistocene archaeological sites are in open-air contexts. Multi-proxy evidence is necessary for studying fire in open air contexts because of the equifinality between multiple types of combustion. Phytolith and chemical analyses are particularly useful proxies for studying controlled fire. To develop inferences of behavior from phytolith data requires extensive experimentation to provide expectations regarding the frequency and distribution of phytoliths in high intensity localized fires. We look at evidence left by modern experimental fires in a floodplain environment, similar to the environment at FxJj20 AB, a potential locality of hominin fire use in the Okote Mbr (~1.5 Ma) of the Koobi Fora Fm (northern Kenya). Preliminary results confirm that sediment inside the fire contains the highest concentration of burnt phytoliths versus outside the fire and prevailing wind direction may explain the presence of burnt phytoliths outside the fire.

[306] *Italian Contributions to Andean Archaeology (1962-2018): An Unknown History*

Unlike other European countries, Italian archaeological research in the Americas started only after the Second World War. Nevertheless, links between Italy and Latin America are much older: in the mid-nineteenth century individual scholars of the caliber of Antonio Raimondi (1826-1890) had carried out important expeditions in the Andes mapping numerous archaeological sites. But historically, Italian institutions have focused on the large national archaeological heritage, paying little attention to foreign archaeology, except with a few exceptions. The insignificant Italian colonial history has not fomented research abroad, and the period of fascism has contributed even more to the isolation of the "bel paese". Since the post-war period, the situation has changed. Thanks to the research funded, albeit in a limited way, by public institutions often supported by the Italian Ministry of Foreign Affairs, some long-lasting missions have taken place (mainly in Peru and Bolivia). This presentation will highlight the distinctive features of the Italian archaeological research methodology applied to Andean cases, starting from the Italian Archaeological Mission in Cajamarquilla (1962-1971) up to current investigation programmes.

[71] *Un caso de estudio sustentable en Puerto Morelos: Recursos arqueológicos y naturales en tierras bajas mayas del norte La Riviera Maya*

La ciudad de Puerto Morelos, Quintana Roo se ha convertido recientemente en un municipio y se esfuerza por promover el turismo sostenible en función de sus activos naturales y culturales y evitar el turismo de masas que ha afectado a otras partes de la Riviera Maya. Como municipio nuevo, tiene la posibilidad de configurar la política desde un lienzo relativamente vacío. Recientemente realizamos un estudio que incluyó la recopilación de datos sobre las diferentes perspectivas de las partes interesadas clave a través de entrevistas y encuestas cualitativas para comprender si los puntos de vista de los diseñadores de políticas, las ONG, los turistas, etc., estaban alineados entre sí, así como con un marco de gestión sostenible. Nuestros hallazgos indican que existe una desconexión significativa entre los legisladores y otras

instituciones federales y los que típicamente administran sitios culturales. Nuestros hallazgos también indican que los turistas valoran mucho el turismo social y ecológicamente responsable. Con un plan de gestión de recursos eficaz el turismo puede ser más sostenible y, al mismo tiempo, comercializable para los usuarios.

[10] *Marine Foragers at the Top of the World: Zooarchaeological Analysis of a Thule Period Small Site at Uivvaq, Alaska*

The Thule period is significant as a predecessor to modern Inupiat culture, and yet understanding Thule life remains partial to the selectiveness of archaeological investigations. Much of the Alaskan Thule period research has focused on large settlements along the northwest coast (e.g. Point Hope, Walakpa, and Utqiagvik). Smaller sites, such as the Uivvaq village site have not been extensively explored and provide deeper insights into the lifeways of early Alaskans. The predominant focus of research on Thule period sites is whaling technology, which minimizes the importance of other terrestrial and marine resources. However, initial interpretations of subsistence at the Uivvaq site indicate that seals, birds, and caribou were economically important. The tendency of arctic faunal assemblages to contain predominantly seal bones is interesting, given that subsistence research has focused on the Thule practice of whale hunting. The results of this analysis provide data to assess whether variation existed between large sites and the small, satellite settlements as well as further understanding the use of animal resources by Thule period communities. The Uivvaq site will demonstrate that the smaller, year-round Thule sites have the same types of activities and similar faunal assemblages as the larger communities.

[405] *Reutilization of Olmec Monuments during the Classic Period in the Gulf Coast of México*

After excavating Gulf Coast archaeological sites, Alfonso Medellín Zenil affirmed that Olmec monuments were carved during the Late Classic period (600-900 AD). He made this statement two decades after the second round table of the Mexican anthropology society, in which scholars agreed on placing the Olmec culture in the Preclassic period, based on stratigraphical excavations. The archaeological data recovered to date from Gulf Coast sites strongly support the placement of the Olmec culture between the years 1400 and 400 BC. Of course, Medellín Zenil was aware of these facts; however, he continued claiming that the Olmecs were a Classic culture. The evidence he used to defend his hypothesis was the association of many Olmec monuments with classic period materials in sites such as Laguna de los Cerros and San Martín Pajapan. Despite scholars rejected Medellín Zenil's hypothesis, nobody has made the effort of explaining the association of Olmec moments with Classic ceramic materials. In this paper, I will address this issue through an analysis of Medellín Zenil excavations and the depositional context of other Olmec monuments. I will argue that the evidence provided by Medellín Zenil suggests the reutilization of Olmec monuments during the Classic period.

[37] *Lucayan Stone Celts: A Preliminary Overview of Style and Typology*

Exotic hard stone materials (e.g., jadeites, cherts, basalts) and artefacts were imported into the entirely limestone Lucayan archipelago (The Bahamas/Turks and Caicos Islands) post-AD 700, to fulfil both functional and ceremonial needs. Many of these pieces were removed from their original contexts during the 19th/early 20th centuries, when commercial guano mining and early amateur and archaeological investigations brought artefacts to light; some of these eventually entered museum collections. Project SIBA (Stone Interchanges in the Bahama Archipelago) provides a comprehensive overview of Lucayan materials in international museum collections, spanning both seemingly functional artefacts (celts) to stone pendants and carvings that defy simple classification. This paper highlights some of the stylistically unique artefacts to emerge as part of this research, alongside a preliminary overview of the range of celts, adzes and chisels, charting their shape and size, and exploring their varied purposes.

Osterholtz, Anna (Mississippi State University/Cobb Institute of Archaeology)

[366] *Becoming Cypriot: Identity Formation, Negotiation and Renegotiation on Bronze Age Cyprus*

Work on Cypriot identity has a long history, beginning with the identification of the first Cypriots during the Neolithic. This presentation continues on in the direction begun by Alan Simmons at Ais Giorkis of examining physical remains to understand what it meant to become Cypriot; here I examine the role of interaction and trade in developing, negotiating and renegotiating Cypriot identity in the Bronze Age. Multiple lines of evidence are examined, including mortuary locations, particularly near administrative or storage areas and the analysis of human remains from six sites throughout the island spanning from the Early through Late Bronze Age. By examining these remains from a model of migration and integration as opposed to colonization with enforced social change, we begin to see the creation of a third-space. Cypriot identity can be seen as a product of integration of newcomers and local populations, a blending of traditions and cultures to create a vibrant and resilient Cypriot identity.

[365] *Managing the Effects of Climate Change and Foraging Risk through Dietary Portfolio Diversity, an Example from 13,000 years of Human-Environment Interactions on the Great Plains of North America*

Food security and risk management are prominent contemporary global challenges, with ~795 million people undernourished worldwide. Climate change is projected to affect the availability, accessibility and stability of food sources, further exacerbating global malnutrition, but this is not a novel human challenge. Food security risk management in the face of climate change was crucial to the survival of ancestral foragers and farmers throughout human evolution. Though fundamental to human survival, little is known about the effects of climate change on foraging-risk management strategies of small-scale societies. To this end, we introduce the concept of "Dietary Portfolios", an optimization technique to model the use of resource diversity as a bet-hedging strategy to manage foraging-risk. As a case study, we investigated the effect of climate change and foraging risk on dietary portfolios of ~2,500 components from the North American Great Plains and adjacent regions. Prehistorically, this area saw heavy reliance on big-game hunting, and delayed horticulture adoption, compared to other North American regions. Results of observed to expected portfolio comparisons across space and time, track variations in foraging and resource risk, providing insight into climate change-related impacts on human-animal-plant interactions over the last 13,000 years.

[198] *Mirrors of Time: Figurines in the New World Order*

Small ceramic figurines are ubiquitous in the preconquest central highlands of Mexico and are seemingly tied to household ritual. The arrival of the Spanish caused immense change at some levels, some reflected in these small objects. Archaeological evidence shows figurines briefly transitioning, but their reappearance is as decorative objects reflecting consumption of new, sometimes hybrid style. We examine this transformation through collections of excavated figurines from Mexico City, Otumba, and Patzcuaro (Michoacan), among others, with comparisons to such sources as Christoph Weiditz's *Trachtenbuch* (1529) to present some reflections of new order in the post-conquest sixteenth and seventeenth centuries.

Ott, Aaron (University of Central Florida)

[406] *Aztec Twin-Temple Pyramids as Evidence for State Religion through Shared Architecture and Symbolology*

Twin-temple pyramids of the Late Postclassic in Central Mexico became a distinct symbol of Aztec ideology. Nowhere is this demonstrated more than with Templo Mayor, the Great Temple of Tenochtitlán, the capital city of the Aztec empire. The deities worshiped and rituals conducted at Templo Mayor made it a beacon of ideological identity for the Mexica-Aztec, both in religious belief and national dominance. The very aspects that made it so symbolically significant would also carry over to the other temples of similar construction outside the capital city. This paper identifies aspects of state religion, invokes ethnographic analogy from Medieval Catholicism, and demonstrates those same traits in Postclassic Central Mexico. By examining the shared architectural features between Templo Mayor and nearby pyramids in cities under Aztec control, such as twin-temple design, shared sculpture and orientation, their contribution to the state religion in place at the time becomes clear. This then offers a method for showing state religion in new areas under investigation.

[352] *The Archaeology and Ancient Genomics of Early Horse Domestication: Not as Simple as Once Thought!*

The earliest unambiguous evidence for equine husbandry relates to the Eneolithic Botai Culture of Northern Kazakhstan, circa. 5,500 years ago. However, whilst recent archaeological investigations and ancient genomics have added further weight to the case for domesticity and husbandry, it is now apparent that Botai horses are not the principal ancestor of modern domestic horses, but instead are the direct ancestors of the Przewalski's horse. This paper presents both the archaeological and genomic lines of evidence for this finding and investigates its implications for the story of horse domestication. A key lesson for domestication studies in general is the recognition that many lineages, once important in the past, can largely be replaced. Simplistic assumptions cannot be made about past domestication events by merely projecting back from the present.

[238] *Copper Buckles and Comal Battens: Clothing Indigenous Conquerors at 16th Century Coyotepetl, Tepeticpac, Tlaxcala*

In October of 1519, the fiercely independent Tlaxcallan state first sent Indigenous warriors to aid Hernán Cortés in his conquest efforts. Such military aid, common for more than a decade, established a community of people who identified as Indigenous conquerors and Spanish allies. Documents such as the cabildo records demonstrate that by the mid-16th century, Indigenous peoples in Tlaxcala had forged a thriving community, though they remained subjects of the Spanish crown. This presentation explores the process of creative appropriation and invention as Indigenous Tlaxcalans negotiated their roles within this entangled social context. I draw on recent excavations of a 16th century house in the Coyotepetl neighborhood of Tepeticpac, one of four señoríos that formed the capital of Tlaxcallan in the late pre-Hispanic period. I focus on archaeological evidence for the production and consumption of textiles and clothing, including not only the mundane and omnipresent spindle whorl, but also the more striking finds of a copper buckle that likely formed part of a sword belt and weaving battens worked out of ceramic comals or griddles. Together, these objects reveal both predictable and surprising colonial practices and shed light on the complexity of Indigenous attire and identity in 16th century Tlaxcala.

[72] *Ceramic Petrography as a Service for CRM Firms and Beyond*

Ceramic petrography is best known as a highly specialized skill employed by certain ceramic researchers within academic institutions. The results of this method are utilized to understand the broader culture that produced the pottery studied. However, both the technique and the holistic interpretation of the data are also used for cultural resource management projects. For the past eight years such an approach has been employed at Desert Archaeology, Inc., which builds on over 30 years of advanced petrographic analysis of pottery and sands by this company in the US Southwest. The ability to hire a specialist petrographer on a project by project basis has been beneficial to other CRM firms, non-profit research groups, and academics. This is because of the time and study required to become a proficient ceramic petrographer so that training a new person for each research program is not always feasible. The result has been analysis of ceramic material throughout the greater Southwest leading to cross-cultural perceptions of pottery production and distribution. This combines the typically academic emphasis on broad pattern identification with CRM's greater access to material benefiting both while highlighting the importance of scientific methods within archaeology.

[146] *The Effects of Households and Labor Requirements on Intracommunity Boundary Formation, Settlement Choices, and Neighborhood Functions in Modern and Prehistoric Communities*

Cooperation is essential to labor networks in low-density agricultural societies. Household or neighborhood heads must learn to identify, select, and monitor raw materials, and estimate harvest times and transport costs. In addition, kin related groups must nurture allegiances to attract and reciprocate for labor to build houses, farm, and for other communal duties. In this paper we explore how households and other collective groups maintain intracommunity boundaries by drawing on four data sets: Geospatial distributions of households and multihousehold labor-sharing clusters from Santa Cruz (SC), a modern, Maya speaking community; full-year ethnographic time allocation data relating to labor activities and networks in SC; energy calculations on costs, derived from GPS-tracks associated with the management of forest products in SC; geospatial and archaeological studies of ancient households, neighborhoods, districts, and natural resources near the Classic Maya center Uxbenka. We develop analogies between modern and prehistoric communities to illustrate mechanisms for forming and maintaining boundaries. We expect that observed modern and inferred ancient labor networks would be distributed similarly across the landscape, with positive spatial correlations relative to access to water, farmland, transportation routes, minerals, plants and animals.

[81] *Contextualizing Ritual Violence: Kinship, Ethnicity, and Human Sacrifice in Epiclassic Central Mexico*

Ritual violence has a long time-depth within Mesoamerica. While archaeologists and ethnohistorians have studied the political and cosmological significance of this practice extensively, less is understood about how or why particular individuals were targeted for sacrifice. This study investigates how the perception of social difference contributed to the selection of sacrificial victims at the central Mexican shrine site of Non-Grid 4, where 173 individuals were interred. The site dates to the Epiclassic (600-900 CE) period, a time of dramatic political upheaval and social reorganization. In such a volatile geopolitical climate, aspects of individuals' social identities—including their biological kinship affiliations and ethnicities—could have acted as powerful indicators of social difference that culminated in violence. Multi-scalar biodistance analyses are used to reconstruct patterns of biological relatedness among sacrificial victims, as well as between sacrificial victims and pre-extant populations within greater Mesoamerica, including central, northern, and western Mexico. This research not only improves understandings of ritual violence within ancient Mesoamerica, but also contributes more broadly to anthropological knowledge about the social context of violence by examining the interaction between specific social identities such as biological kinship and ethnicity, complex social processes like migration and demographic change, and instances of mass violence.

[236] *Periurbanism in the Casma State: Preliminary Observations from the Olivar Archaeological Complex*

The Casma State played a major role in north-central coastal social and political developments in the Middle Horizon and Late Intermediate Period, circa AD 1000-1400. El Purgatorio served as the capital for much of that time, providing a central

location for a dense population, intensive production activities, and collective rituals at a variety of scales. But El Purgatorio was no isolated urban center, it was the primary among many settlements lining virtually all segments of the rocky Andean foothills of both branches of the Casma Valley. So, what was the relationship of El Purgatorio to surrounding settlements? This paper provides preliminary observations and interpretations of site layout, architecture, and surface artifacts as seen from satellite imagery and informal, non-invasive pedestrian observation of the El Olivar Archaeological Complex. The Complex includes the sites of Tucushuaman, Cahuacucho, Templo Olivar, and Cerro Olivar. Drawing upon baseline models developed at El Purgatorio, the architecture, function, and probable occupation histories of these sites are hypothesized. The significance of these hypothetical conclusions for understanding Casma State formation, administration, and social life is proposed. And future methods for evaluating these hypotheses are presented.

[122] *Partners for Archaeological Site Stewardship*

Prehistorical and historical resources are irreplaceable. When they are damaged or destroyed, we lose the information and connections that they offer about past cultures. Increased development and recreational activities have increased the public exposure to sites. These population pressures also present opportunities for preservation efforts through public participation in site stewardship programs. Across the country, public agencies sponsor volunteer site stewardship programs to help protect known sites. In these programs, volunteers regularly visit and report on conditions at assigned sites, which alerts organizations about vandalism, erosion, or other problems before more damage is done. In 2018, the Partners for Archaeological Site Stewardship surveyed site stewardship programs in all parts of the country. By sharing information, tools, and resources, site stewardship programs help each other become more effective and efficient. By collaborating, they can better compete at the national level for financial support. This poster reports some of the challenges and successes of different site stewardship programs, describes the variety of ways that the public helps protect cultural resources in different communities, and presents initiatives that will help make preservation of sites more successful in the future.

[247] *Measuring Lithic Complexity from the Lower Paleolithic through the Late Holocene*

The extended evolutionary synthesis emphasizes the importance of understanding how the interaction of biological and cultural inheritance systems have shaped human evolution. Within the animal kingdom, modern humans possess a unique ability to transmit and maintain complex cultural traditions (Tennie et al. 2009). When this capacity for cumulative culture appears in the hominin lineage remains unclear. Previous research suggests the complexity of stone tool traditions increased exponentially from the Oldowan onwards (Perreault et al. 2013; Stout 2011), with a marked increase during the Middle Paleolithic. But these studies focus on a small sample of sites and tool-making techniques, and do not include Holocene material. Here, we measure the complexity of a large sample of stone tool traditions spanning the entire archaeological record from the lower Paleolithic through the Holocene. We use two methods to measure cultural complexity: a coarse measure of complexity (applied to 217 assemblages), and a second more fine grained measure (applied to 27 assemblages). Preliminary results suggest a gradual increase in complexity from the Oldowan through the Late Holocene, with far more complex technologies arising in the past ~300 thousand years.

[387] *Feasting with the Dead: Preliminary Analysis of Faunal Remains at the Put Dragulina Roman Cemetery*

Put Dragulina, a Roman cemetery site dating between 100 AD and 300 AD, was excavated as part of rescue projects during 2011 and 2017 in Trogir, Croatia. At least 84 individual graves were excavated with associated burial goods. Along with the recovery of human remains, over 250 fragments of animal bone were recovered. This poster presents the identification and analysis of ovicaprines, cattle, and equid remains as possible remnants of feasting activities associated with mortuary practices based on postmortem alterations. The presence of cut marks on the distal and proximal portion of the bones suggest that the remains were processed and consumed. In association with the human burials, it is suggested that the postmortem alterations, alongside the presence of fragmented burned bone, are indicators that mortuary feasting processes were occurring at this Roman cemetery site.

[296] *Casas Grandes Culture in the Sierra Madre of Sonora*

This presentation will summarize results from ongoing research on the late prehistoric period of the Sonoran Sierra Madre. Thus far, investigations focused on the Sahuaripa and Fronteras valleys. These valleys are approximately equidistant from Paquimé at 185 and 165 km, respectively. In the Fronteras valley, there is substantial ceramic and architectural evidence that several sites maintained strong connections to the Casas Grandes system. In the Sahuaripa valley, there is evidence of periodic exchange in the form of rare Casas Grandes ceramics. The presence of appreciable amounts of marine shell indicates the Sahuaripa area potentially participated in the Casas Grandes economic system. Similar to previous research in the Sierra Madre, both valleys present substantial local variation. We argue the differential viability of economic connections—established trade routes—and variability in the saliency of Casas Grandes ideological content contributed to the resulting uneven patchwork of Casas Grandes influence in the Sonoran Sierra Madre. This spatially discontinuous pattern suggests high local autonomy in which local communities, or their leaders, selected the domains and strength of interaction with Casas Grandes institutions.

[409] *Hidden Structures, Ground Penetrating RADAR, and the Demography of El Mirador*

The Preclassic El Mirador polity collapsed around 150 C.E. One focus of explanations of El Mirador's collapse is anthropogenic changes to Basin ecology, centered on 1) population growth and agricultural overexploitation; and 2) conspicuous consumption of stucco for elite construction. Reliable estimates of population are essential for evaluating these hypotheses. LiDAR revolutionized our ability to identify and count surface structures, but questions concerning 'hidden structures' remain. A variety of hidden structures exists at El Mirador. They are a common feature of Late Classic patios, and have been encountered in several open contexts. Some include formal cut-stone foundations. Others are less regular concentrations of unworked stones. We tested the efficacy of Ground Penetrating RADAR for identifying hidden structures at El Mirador in 2018. The area covered by GPR, approximately 40x50m, was equivalent to 125 4x4m test units. Twelve anomalies were identified as possible hidden structures. Eight were ground truthed using 1x2m excavations. Three of eight yielded evidence of hidden structures. Additionally, two 4x4m control excavations as failed to yield evidence of hidden structures. Though remote techniques like GPR are imperfect, they represent our only practical means of estimating the prevalence of hidden structure at El Mirador and other Maya sites.

[77] *Geospatial "Big Data" in Archaeology and the Enduring Challenge of Anthropological Significance*

Archaeology has always been in the realm of "Big Data". Every site, feature and artifact holds a myriad of attributes that can be qualitatively and quantitatively recorded. While a near endless amount can be measured, the challenge has been identifying data that are actually connected to past human behavior that is of anthropological significance. This challenge remains in today's new geospatial digital horizon of "Big Data". While the ever-expanding suite of geospatial technologies provide a plethora of data on potential past human landscape use, we still must ask if we are using these data to bring about new, anthropologically salient, insights into past human behavior. Here, we explore our own advances and shortcomings in terms of navigating this challenge in our work on precontact food storage features. We critically examine our use of unmanned aerial vehicles (UAS) with lidar to characterize microtopography of precontact storage pits in the Great Lakes. We explore how such remote sensing can best be integrated with theoretically-grounded geospatial analyses to examine environmental impacts of past societies on existing forests. Finally, we examine graph theory as a means to advance insights into not just current spatial distributions of past sites but actual past socioeconomic developments and connections.

[94] *Green Stone Pendants of the Florida Middle Archaic: Trade and Lithic Ornament Construction as Evidence for Early Social Difference*

Little Salt Spring mortuary pond is located in south central Sarasota County, Florida. It has been the subject of numerous significant discoveries that have challenged our understanding of the earliest occupations of the Americas. Two green stone pendants recovered from the basin, and dated to the Middle Archaic period (700-500 BP) also test current models of trade and lithic use for the time period. Provenance analysis conducted previously have sourced the stones to the southern Appalachian Piedmont of the United States nearly 650km away from the Little Salt Spring sinkhole. This paper will review evidence of trade routes and lithic ornament construction to argue that these two pendants may represent the earliest form of jewelry associated with emergent social stratification in the Middle Archaic period. New trade and crafting practices signal cultural innovation in this region and suggest that the reification of individuals could now be expressed through trade items and technological complexity.

Palmiotto, Andrea [129] see Magoon, Dane

Palomo Mijangos, Juan Manuel (University of Arizona)**[309]** *Diet, Migration and Social Changes: The Preclassic Burials of Ceibal*

The Ceibal-Petexbatun Archaeological Project uncovered 43 burials with a minimum number of 58 individuals that date from the Middle Preclassic to the Protoclassic period (ca. 700 BC-AD 200). These remains have the potential to provide valuable insight into the processes of political centralization and social inequalities in the Maya lowlands. By analyzing stable isotopes contained in ancient human remains, two specific questions will be explored: 1) How were social inequality and political centralization reflected in dietary practice? 2) How were changes in social inequality and political centralization associated with migrants and external relations during the Preclassic period? To address these questions, this presentation will discuss the preliminary results of a multi-isotopic analysis made on 43 burials from Ceibal. Carbon and nitrogen isotopic data will be used to examine whether changes in social inequality and political centralization were accompanied by those in the diet during the Preclassic period. Oxygen, strontium, and lead data will be analyzed to test whether Ceibal attracted more migrants or there were more hostile external relations during the periods of growing political centralization and social inequality.

Palonka, Radoslaw, Vincent MacMillan (Canyons of the Ancients National Monument), Katarzyna Ciomek (Jagiellonian University in Kraków) and Magdalena Lewandowska (Jagiellonian University in Kraków)**[190]** *Cultural Landscapes and Migrations in Sandstone Canyon, Southwestern Colorado through Pueblo and Ute Rock Art*

Sandstone Canyon, located within the Canyons of the Ancients National Monument in southwestern Colorado, is one of the biggest canyons of the area. Since 2014 four sites with large rock art panels, previously unknown, have been found in the area. Depictions of rock art at these sites have been initially dated from around the third/fifth century A.D. to the thirteenth century A.D. (Pueblo and possibly Fremont cultures) and to the appearance of the ancestors of the Ute Indians in this area. The petroglyphs depict mostly single geometric motifs and other symbols like the bear paw, individual figures of people and animals, and extended scenes that include fighting and also hunting of large animals, mostly deer, bison, and bighorn sheep.

This paper will answer questions of the chronology and cultural affiliations of particular rock art panels, and shed new light on settlement continuity and change, including migrations from one region to another by farming Pueblo societies, as well as hunter-gatherer Ute societies and later Euro-American explorers, settlers, and cowboys passing through the canyon with cattle at the turn of nineteenth and twentieth century and who left their initials, names, and dates on almost every panel of rock art.

Palus, Emily (Bureau of Land Management)**[237]** *Yes! You Can Still Dig, but, Please Plan Ahead. NAGPRA Section 3 New Discoveries in Land Management*

Vast, but not vacant, the 256 million acres of public lands managed by the Bureau of Land Management offer an incredible laboratory for archaeological research with 400+ academic and CRM permittees annually conducting thousands of surveys and hundreds of excavation projects. BLM manages these lands for multiple-uses to benefit the American people, so cultural resource projects are often for land-use compliance, but also academic research. Archaeologists have recorded 390,000 sites on just 10 percent of these lands; most are associated with Native American cultures. With high frequencies of cultural sites and increasing land-use, discoveries of Native American human remains and cultural items are inevitable, and often foreseeable. Section 3 of NAGPRA affirms tribal rights to inform land management and to custody of their ancestors and cultural property, prescribing to land managers specific planning and response procedures, and emphasizing tribal consultation. This paper demystifies "Section 3" responsibilities, identifying critical steps for archaeologists in planning projects, including coordinating—but not entangling—NHPA "Section 106" compliance and ARPA requirements, what to do upon discovery, and how to avoid suspending a project. By respectfully navigating the legal processes, there is opportunity to 'balance' or rather support archaeological research goals and uphold tribal rights.

[237] *Chair***Panczak, Taylor (Michigan State University) and Kurt Rademaker (Michigan State University)****[268]** *Exploring Inter-zonal Connections through a Constructed Projectile Point Typology from Cuncaicha Rockshelter*

Cuncaicha rockshelter, Carhun-Ruan, and Pampa Colorada are parts of an early inter-zonal settlement system located in southern Peru. Cuncaicha and Carhun-Ruan are multi-component highland rockshelters, with initial occupations dating respectively to the Terminal Pleistocene and Early Holocene. Early to Late Holocene sites at Pampa Colorada on the

Pacific coast contain projectile points made of highland Alca obsidian. Highland and coastal sites share common usage of additional raw-material resources from intermediate elevations. In addition, these sites have similar projectile point styles but have yet to be tested for relatedness. Because Cuncaicha is one of the best dated highland sites in South America and excavations have yielded over 1000 projectile points, I was able to construct a lithic typology to examine the nature of this shared inter-zonal material culture. Types were assigned and tested using morphological characteristics, metric data, and geometric morphometrics. Photogrammetric techniques were then used to create 3D models of over 200 projectile points from the highland and coastal sites. The 3D models were digitally archived to be easily accessible to other researchers. This digital archive and typology, which includes fishtail projectile points, will be useful for other archaeologists working in the Andes and along the coast of Peru.

[19] *Documenting Persistence: The Archaeological Paper Trail of Indigenous Residence in Marin County, California, 1579-1934*

As part of our broader efforts to document patterns of Native American residence in the nineteenth century, we examined the documentary record associated with nearly 900 archaeological sites in Marin County, California. This paper trail begins with the first regional surveys conducted during the early 1900s, which focused exclusively on detailing the area's precontact deposits. Archaeologists' attention to more recent materials and sites grew slowly over the course of the twentieth century, along with the increasing temporal classification of sites into prehistoric, protohistoric, and historic periods. Our findings reveal the shortcomings of this traditional site recording system. In many records, mass produced consumer goods were simply dismissed or assumed to have been deposited by white settlers. In other cases, items typically viewed by archaeologists as evidence of postcontact indigenous occupation were absent, but continued site use is indicated by radiocarbon or obsidian hydration dates. In assessing sites occupied by indigenous people from the late sixteenth through the mid-twentieth centuries, we discuss how the use of multiple lines of evidence—including temporally diagnostic artifacts, chronometric dating techniques, and historical documentation—may help illuminate subtle but widespread patterns of native residence that have been obscured by essentialist assumptions about indigenous culture change.

[128] *How Precise Are My Survey Data? GNSS Receivers Test and Comparison*

Archaeological surveys using GNSS receivers (Global Navigation Satellite System) to register artefact location generally state the accuracy of used devices, but rarely discuss the precision of resulting data. In other words, we have an idea of how “true” individual points are, but not as much regarding the statistical variability of groups of points. Yet, the later information is critical in assessing how confidently artefact clusters can be interpreted on surveyed archaeological sites. With this question in mind, we designed an experiment using four different GNSS receivers with various price ranges and advertised accuracy. This experiment was carried out in a way to (1) compare these devices in field-like conditions and (2) document how their precision holds up at different spatial and temporal scales of data collection. Is the variability stable through time while retaking the same group of points hour after hour and how does this variability affect spatial relation between points? This poster will set out how the experiment was implemented as well as showing the visual and statistical results of our comparison.

[47] *Determining the Impact of Major Storm Events on Ancient Peoples of Coastal Florida*

For this project, I assess the potential effects that periods of increased storm frequency and intensity may have had on the lives and behaviors of ancient coastal Florida populations. Using sediment grain size analysis, storm periods were retrodicted and organized into regional storm chronologies for 5 lake bed sediment cores within the East and Central, Northwest, and North Peninsular Gulf Coast archaeological regions of the Florida coast. The storm periods were identified by signatures of increased particle size and platykurtic particle size distribution. The storm periods were then dated using a linear regression of radiocarbon dates taken at varying depths of the sediment core. The storm period chronology generated for each sediment core was compared alongside radiocarbon dates taken from across coastal Florida archaeological sites, which were used to infer periods of occupation for the individual sites, and for the archaeological region as a whole. Initial investigations show correlations between periods of increased storminess and periods of settlement abandonment. These correlations may aid in explaining the causes of settlement abandonment at these sites and reinforces the utility of particle grain size analysis for retrodicting ancient climate.

Parditka, Györgyi (University of Michigan)

[267] *New Identities and Changing Funerary Practices in the Mid–Late 2nd Millennium BC in the Carpathian Basin*

The transition from Middle to Late Bronze Age (ca. 1600 – 1300 BC) in the Carpathian Basin encompassed a broad range of changes in material culture, settlement, and societal organization. While the narratives have somewhat shifted from the traditional model that primarily associated these changes with the arrival of the Tumulus culture population, and described them as rather abrupt events, several aspects of the underlying processes and the transition itself are still unclear. This paper addresses questions about the trajectory of changes in social practices and social identities at the dawn of a new era in a specific cultural context. As a case study, it focuses on the changes that happened in the Tisza-Maros confluence area from about 1700 to 1300 BC. More specifically, it is evaluating some of the changes that the Early-Middle Bronze Age Maros polity's mortuary traditions went through and the changes that appeared shortly after the Maros era, using a Late Bronze Age cemetery, Tápé, as a point of reference. This study evaluates whether the observed patterns indicate a gradual or abrupt change at the end of the Middle Bronze Age, and the kind of social transformations that the observed changes

may imply.

[122] *Community Engagement in Archaeology through Photogrammetry*

Photogrammetry is a rapidly-evolving technology that is applicable to a wide array of archaeological contexts and reconstructions. Researchers affiliated with the Proyecto Arqueológico Waka' (PAW) at the site of El Perú-Waka', Petén, Guatemala, initiated a program of photogrammetric recording of stelae during the 2018 season. In this process, a series of photos of an object are entered into Agisoft PhotoScan software to create 3D models. The process can create models of not only small, portable objects but also entire buildings. These models are used to create drawings of the monuments and may be used to produce replicas. Photogrammetry has the potential to advance discovery and make information more accessible to both the academic community and the modern Maya populations who live in or near areas of excavation. This presentation focuses on El Perú's Stela 44 which dates to AD 564 and was found in the site's primary civic-ceremonial structure, M13-1. In this poster we review the application of photogrammetry to this monument, consider preliminary results of investigation, and possibilities for future developments including community engagement through creation of signage and stela replication.

[32] *The Msikaba Red Sand Dunes: Middle Pleistocene Lithic Technological Variability in Pondoland, South Africa*

The Msikaba Red Sand Dunes along South Africa's Pondoland coast are a recently discovered open-air site complex that documents Middle Pleistocene lithic technological and morphological change. The deposit comprises ancient dune surfaces stacked over time with repeated sea-level highstand events. Initial excavations and surface collections document in situ lithics comprising large bifaces, prepared cores, large blade production as well as a novel small bladelet and flake component. We also document a large groundstone and anvil assemblage in the same horizon as the site's other lithic components. OSL dating provides minimum ages for the deposits making this one of the few well-dated open-air coastal Middle Pleistocene archaeological sites in Africa. Here, we provide the results of ongoing lithic analyses and further details on the assemblage's structure and taphonomy that will be the focus of future fine-scale archaeological analyses at the site. This study highlights the significance of the early Middle Pleistocene in Africa for understanding behavioral variability and the evolution of our genus.

[110] *Characterizing Argentinian Quartzite and Polish 'Chocolate' Flint for Sourcing Studies*

The application of reflectance spectroscopy in sourcing studies of quartzite and flint illustrates the broad potential that the technique has in helping us explain human behavior using lithic provenance data. An ongoing line of research is to characterize tool stone used by prehistoric peoples in order to source artifacts back to known deposits. The large amount of visual, mineral, and chemical variability present in chert, flint, and quartzite is often problematic when identifying source. Geologic samples from multiple quartzite quarries in Argentina and 'chocolate' flint quarries in Poland are characterized using their atomic and molecular bond composition. Both examples demonstrate the future application of reflectance spectroscopy in provenance research where artifacts are sourced back to individual quarry sites or deposits on the landscape. The data will directly lead to a greater understanding of hunter-gatherer groups in South America and Mesolithic/Neolithic groups in Eastern Europe.

[389] *Change in Mobility and Site Occupation during the Late Pleistocene in Korea*

Stone artifact assemblages can be an important source of information about hunter-gatherer mobility and subsistence, according to behavioral ecological theory that links technological changes to environmental adaptation. We examined stone artifacts from 28 sites in South Korea to investigate technological innovations during the Late Pleistocene and their relationship to environmental changes. We hypothesized that hunter-gatherers should move more frequently and further in order to adapt to the changed environment, so their tools became more portable and efficient, as indicated by decreases in the size of both individual tools and toolkit, and increases in function and utility. We use optimality models, especially the central place model and the patch choice model, to interpret changes in stone artifact attributes such as size, cortex ratio, retouch intensity, retouched edge ratio, and ratio of retouched pieces to discarded artifacts. We also calculate the Minimum Number of Artifacts (MNA) and Lithic Volumetric Densities (LVD) values to investigate toolkit size, diversity, and complexity for insights into patterns of mobility and site occupation. We discuss the implications of our results for understanding technological innovation as a means of risk reduction strategy for environmental change.

[156] *Subsistence Economy and Paleoenvironment of Neolithic Islanders in Jeju, Korea*

The subsistence economy of the Neolithic Period in Korea mainly consisted of hunting, fishing, gathering, and farming. However, there are also regional and chronological variations, which can be understood through the detailed study of lithic and bone tools and the analysis of archaeological sites' landscape and their paleoenvironment. This study analyzes patterns of change in the lithic and bone tool assemblages and the physical landscapes of the Neolithic archaeological sites in Jeju Island, Korea. Recent geological data are also included for analysis of Jeju's paleoenvironment. The study discusses implications for the subsistence economy of the prehistoric Neolithic people in Jeju, who lived in a unique island setting with the challenges posed by the paleoenvironment and its changes.

Park, Jiyoung

[361] *The Three Settlement Patterns of the Southern Korean Peninsula in the Proto-Three Kingdoms Period*

Settlement sites have been regarded as important data reflecting social and political complexities and organization. Consequently, settlement archaeology of the Proto-Three Kingdoms period in the Southern Korean peninsula has focused on the typological classification of settlements according to a typical hierarchical model to explain the boundaries and the socio-political organization of small polities. Difficulties in establishing chronology, however, have made previous studies focused on a single-region scale for examining each local polity. Despite the importance of the results of the previous

research, there have been some limitations to investigating the time of profound socio-political transformation when over 50 small states interacted each other through wars, population movements, trades in the southern Korean Peninsula. To explain this dynamic situation, a broad-scale spatial analysis of settlement patterns and inter-regional comparisons with new methodology are clearly necessary. According to recent analyses of settlement and population distribution, three regions of the Southern Korean peninsula in the Proto-Three Kingdoms period clearly showed different site and population distributions, and they imply quite different social, political, and economic situations. There is a need to diversify the model to explain settlement patterns and their social organizations.

[8] *Tend or Travel? Examining Constraints of Traditional Pinus monophylla Harvest in Western Nevada*

Pine nuts from the single leaf pinyon (*Pinus monophylla*) were a critical resource for prehistoric populations across the Great Basin, and they maintain significant economic and social value for many who continue traditional collecting practices today. However, with limited access to and control over ancestral lands, contemporary populations are unable to carry out traditional land management practices such as coppicing, burning, and irrigating, which limits the productivity of local groves and requires long distance travel to locate patches that are worth collecting. Here we report quantitative ethnographic data on pine nut harvesting returns collected in collaboration with Northern Paiute communities in Nevada. The results illustrate that the reliable exploitation of pine nuts requires either investing in local groves or extensive travel and transport. This research has direct implications for archaeological interpretations of pine nut collecting, and for collaborative management between Tribal communities and federal land managers.

[219] *The Tzimin Jades of Paso del Macho: Description and Analysis of a Middle Preclassic Maya Plaza Offering*

Jade tadpole spoons and clamshell pendants represent some of the most symbolically charged items of wealth and power in formative Mesoamerica. The Tzimin jades are a newly discovered cache of these items from the Middle Preclassic (900 BC—350 BC) Maya village of Paso del Macho that offer additional context for assessing the function and significance of jade adornments during this time. Based on material characteristics, the timing of the deposition, and their location, these items are associated with cosmogenesis, the Middle Preclassic fertility complex, and the formation of early cooperative social compacts for the agricultural pioneers of the Puuc region.

[370] *Nuancing the Maya Feast: A Reexamination of the Function of Ceramic Feasting Assemblages*

Feasting is a commonly cited interpretation across the Maya area for middens which include large quantities of ceramics and animal bones. This poster takes a closer look at previously published Maya feasting contexts by further examining the functional make up of their ceramic assemblages. By moving beyond the standard open/closed or serving/storage functional terms, it is possible to attain a finer grained interpretation of the activities that lead to the composition of each feasting assemblage. Comparison with recently excavated feasting middens and elite household middens from the site of La Corona, Petén, Guatemala provides greater nuance to the current understanding of Maya feasts and facilitates breaking the broad heading of 'feast' into smaller more socially meaningful categories.

[120] *New Alternatives to Terrestrial Laser Scanning: The Case of Poorly-Lit Features and Sites*

3D modeling is an integral part of many archaeology projects. Photo-based 3D modeling using Structure from Motion and Multiview Stereo (SfM/MVS) algorithms is widely used. SfM/MVS requires minimal field gear and can produce very high-quality output: Agisoft's PhotoScan Professional® is the most popular commercial implementation of SfM/MVS. Adequate illumination is a major consideration for SfM/MVS, however, especially in remote or rugged field settings where it is impractical to provide supplemental lighting. Such locales include poorly-lit caves and semi-subterranean rock shelters. Terrestrial Laser Scanning (TLS) is a proven alternative to SfM/MVS in these settings, but TLS units are bulky, heavy, and very expensive. Prior work includes infrared cave imaging using Microsoft's Kinect® video game controller as a depth-mapping sensor. While smaller, lighter, and far cheaper than TLS, a Kinect-based system nonetheless requires a laptop computer for the scanning software, and 115v AC electrical power. New lightweight, self-powered, alternatives to TLS (and the Kinect) including Google and Sony's smartphone-based systems, Scanse Sweep®, and the moderately expensive DotProduct DPI-8X® compact handheld scanner are evaluated as possible alternatives.

[232] *Cuisine on the Harappan Frontier: Regional Cooking Vessels in Harappan Gujarat*

During the 3rd and 2nd millennium BCE, the western Indian state of Gujarat was home to a regional expression of Harappan culture known as the Sorath Harappans. This cultural group was composed of a network of farmers, herders, and craftsmen that subsided on an economy based on cattle herding and the farming of summer crops. Unlike the core regions of the Harappan culture that relied on the cultivation of winter crops such as barley and wheat, archaeobotanical evidence from several Sorath Harappan sites in Gujarat revealed a preference for small seed cereals, primarily millets. Additionally, these settlements produced a distinctive corpus of ceramic vessels. This paper explores one subset of the Sorath ceramic assemblage: cooking and storage vessels. While there are parallels between classical Indus vessel forms and those of the Sorath Harappans, this class of vessels are wholly Sorath in character. This paper analyzes the macrostructural and microstructural aspects of these Sorath Harappan vessels in order to understand how two intertwined industries, agricultural and ceramic production, contributed to the local food culture.

[37] *Lucayan Burials in the Bahama Archipelago*

The first archaeological evidence for the native peoples of the Bahama archipelago was found in dry caves, many of which were excavated for cave earth to fertilize agricultural fields. Human remains were found in some of these caves, but in such small numbers it was thought this could not have been the only location in which the Lucayans interred their dead. The use of SCUBA for pleasure and scientific purposes has led to a dramatic increase in the investigations of underwater caves, caverns and sink holes. As a result, human remains have increasingly been found throughout the archipelago leading to the assumption that the Lucayans buried their dead only in the caves (dry and submerged) throughout the Bahama Archipelago. However, recent discoveries in Long Island along with previous discoveries in Abaco and Middle Caicos have revealed burials in open-air environments. This presentation is an overview of all known burial sites in the Bahama Archipelago and gives an update on the analysis of these remains. We will also discuss the similarities and differences between dry cave, submerged and open-air burials. We conclude with some thoughts on the cultural significance on the various types of burials.

[134] *3D or 2-1/2D? Comparing 3D Photogrammetry and Reflectance Transformation Imaging*

3D photogrammetry, creating digital 3D models using multiple photographs, has become a popular tool for documenting, analyzing and sharing archaeological artifacts and sites. In some cases, though, Reflectance Transformation Imaging (RTI) can be a useful complementary documentation/analysis technique, perhaps even superior for some artifacts and uses. RTI generates digital virtual lighting models of surfaces using multiple photographs taken at different lighting angles, which can be thought of as “2-1/2D” information. Examples of optimal use cases for each technique will be discussed and compared.

Paxton, Merideth

[304] *The New Year Pages of the Dresden Codex and the Concept of Co-essence*

The Dresden Codex is a Postclassic Maya document that is thought to have originated in the Yucatán Peninsula. The opossum figures in the panels at the tops of its section on the New Year (pages 25-28) are associated with the uayeb, the five nameless, unlucky days that mark the ends of the 365-day haabs. A glyph in the accompanying text, T572, was first read as the logograph WAY, a reference to the uayeb. Then, it became linked with T539 through study of such Classic period Southern Lowland monuments as Lintel 14 at Yaxchilán. This established that T539 is another logograph read as WAY (or UAY), with the meaning of co-essence. Thus, T572 came to be regarded as the codical variant of T539. Subsequent scholarly attention has focused on the latter sense, although the anthropomorphic opossums are now also described as naguals. The present research reexamines the symbolism underlying these invented creatures in the New Year pages and analyzes the use of T572 in that passage and in the general corpus of Maya hieroglyphic writing. I argue that co-essence is indeed the best classificatory term for the opossums and that the connection of T572 with the uayeb merits greater emphasis.

[271] *Moche Valley Ancient Settlement Survey (MVASS): Assessing Archaeological Heritage Destruction and Land-Use in Peru's Lower Moche Valley*

“I’m sure it’s all gone by now...”, these were the words of Dr. Michael Moseley, director of the Chan Chan-Moche Valley Project (CCMVP) from 1969-1974, in reference to the 420 archaeological sites that were originally registered in the lower portion of the Moche Valley. This statement highlights the need for a comprehensive regional study of archaeological heritage landscapes and land-use in Peru’s Lower Moche Valley. The Moche Valley is unique in terms of the visual intersectionality of past and present landscapes, and the overlapping presence of nearly 2,000 years of urbanism and agricultural intensification represented by the Moche, Chimú, Inca, Spanish colonial, and modern built environments. However, the existence of these various heritage sites, and the knowledge gleaned from them, has been slowly undercut. Globalization, environmental disasters, urbanization, and a push to modernize Peru throughout the 20th century have resulted in today’s contemporary land-use patterns and practices, as well as the destruction of (and damage to) thousands of archaeological sites. As part of the Moche Valley Ancient Settlement Survey (MVASS) project, a selection of CCMVP sites were systematically ground-truthed to assess archaeological heritage destruction on the landscape. This paper

presents the preliminary results of research conducted during the summer 2018 field season.

[209] *Technological Investment and Subsistence Strategy Flexibility within the Uinta Basin Fremont*

The Cub Creek area of Dinosaur National Monument has a Fremont occupation spanning from AD 300-1350 that shows variable reliance on maize agriculture depending on environmental conditions. Settlement data indicate a stable upland occupation throughout the sequence characterized by ~120 roasting features, but an intensive lowland pithouse occupation that lasted for only 300 years. Groundstone technology in these two settings is primary evidence of changing investments in maize agriculture. Upland occupations indicate maize stone boiling and expedient groundstone technology. In contrast, the lowland pithouse occupation yields formalized groundstone technology and ceramics. The shift in technological artifact suites during this period of intensification leads to the question: does increasing maize reliance drive investment in higher up-front-cost technologies with greater processing efficiency? I investigate these technological transitions by comparing the relative grinding surface areas of groundstone artifacts from the upland and lowland occupations within Cub Creek. I will determine whether there are discrete statistical differences in the processing efficiencies between the two technological suites and whether this transition corresponds with the local intensification pattern. Discrete technological transitions can illustrate changing reliance on wild and agricultural resources through time to formulate a broader picture of subsistence strategy flexibility practiced by the Fremont inhabitants.

[350] *El Secuestro del "Tesoro de Huataviro": Cuando la Comunidad Manda*

En las últimas décadas se ha incrementado el interés de los arqueólogos por estrechar los vínculos con las comunidades locales. La participación de la comunidad adquiere cada vez más fuerza, y su voz empieza a tener un mayor espacio crítico sobre el rol que la arqueología juega en la sociedad. A pesar de ello, cabe también resaltar que, en los discursos que se manejan a nivel académico, generalmente, se visualiza a los arqueólogos como las personas que marcan los ejes de interacción con la comunidad. No obstante, en un hecho inusual ocurrido a mediados de 2009 podemos analizar un caso distinto. El descubrimiento de un rico ajuar funerario durante la apertura de una vía en la parroquia San Antonio de Ibarra, en el norte del Ecuador; propició un proceso de diálogo y negociaciones entre la comunidad del barrio Moras y el Instituto Nacional de Patrimonio Cultural. El presente trabajo expone un caso muy singular, en el cuál la comunidad local estableció mecanismos de presión a las entidades gubernamentales para propiciar una investigación arqueológica bajo sus propias condiciones.

[125] *A Look at the Artifact Assemblage from the Dairy Site Marana, Arizona*

Pima Community College recently partnered with local cultural resource management firm, Tierra Right of Way Services, Ltd. to aid in a data recovery project involving the Dairy Site (AZ AA:12:285[ASM]). The Dairy Site is a prominent multi-component site in Marana, Arizona dating from the Agua Caliente Phase (A.D. 50-450) into the Canada del Oro Phase (A.D. 750-850). It was first recorded by the Arizona State Museum in 1982 and has since been the location for various data recovery and testing projects. Students assisted with the cleaning, analysis, and curation preparation of a wide variety of artifacts from the 5-month long excavation project. The professional laboratory work was an opportunity for Pima Community College students to process over 40,000 artifacts from an important archaeological site in the Tucson Basin. Artifacts include, but are not limited to, sherds, whole vessels and reconstructable vessels, ceramic figurines, lithic flakes and debitage, projectile points, ground stone effigies, manos, metates, censers, palettes, turquoise, shell, basketry remains, and charred organic remains. This poster will discuss the various artifacts, their relation to the Dairy Site, and their greater

importance in Southwest archaeology in the United States.

Peart, Daniel (The Ohio State University), Deanna Grimstead (The Ohio State University) and Catherine Mendel

[419] *There and Back Again: A Foragers-Farmers Model of Turkey Domestication (Part I)*

The human-domesticate relationship has long been a focus of archaeologists, and advances in archaeological science have revealed the dynamics of husbandry practices. But why domesticate? Evolutionary ecology suggests expanding human populations, depressed habitats, and the need to produce more food are potential reasons for adoption, but the timing, nature, and decision-making processes of this transition remain unclear. Focusing on the turkey (*Meleagris gallopavo*) we ask: why fodder, if hunting wild turkeys provides a comparable source of meat? Drawing on the central place foraging model, we hypothesize that distance of wild turkey procurement is an important factor in transitioning to domesticates. Results demonstrate that turkey hunting remains energetically profitable, even when round trip travel distances are ~100km, but the energetic cost required to provision domesticated turkeys are high. In order for the domesticated bird to produce net caloric gains that outweigh returns from hunting, only ~15% maize-foddering costs can be expended prior to slaughter at full body weight. This comparison suggests that domesticates should only be adopted when local and non-local habitats are extremely depleted, and/or non-caloric currencies are optimized. Ethnohistorical and ecological data are used to explore several currencies optimized during domestication.

[408] *Soil and Water Management in the South Kohala Field System, Hawai'i Island*

The South Kohala Field System (SKFS), Hawai'i Island, is a network of contoured and sloping field borders first constructed in the prehistoric period but utilized into the 19th century. Many features are located below the 750 mm rainfall isohyet, the lower boundary for rainfed agriculture in Hawai'i. In order to sustain agriculture in this environment, Hawaiians built 'auwai (irrigation ditches) and modified existing drainages to make water accessible throughout the field system. This paper focuses on the portion of the SKFS located in the ahupua'a of Kawaihae 1 and 2, which contain a dense network of dryland features. Using geospatial and geoarchaeological methods, I analyze the distribution of features in, chronology of, and nutrient variability across the field system. These data are used to assess the sustainability of the SKFS from its initial phases of building through later periods of expansion. Additionally, we are partnering with the Kailapa Community Association, which includes members of the descendant community of Kawaihae 1. The KCA is currently planning for the restoration of agriculture into the dryland terraces. These historical data will assist the KCA in targeting areas of the field system that could be sustainably restored as rainfed or irrigated plots today.

[89] *The Archaeological Repository of Colorado State University: Expanding Opportunities for Accessibility and Research*

Colorado State University is one of many universities and museums with extensive collections of archaeological material. Each institution has unique and noteworthy collections with material specific to the region and to the research interests of faculty and curators. The opportunities for research are abundant, as many collections remain untouched since original investigation. However, most researchers and students are unaware of the treasures that lie within our repositories. How do we increase the visibility and accessibility of these collections? How do we encourage future research? The Department of Anthropology at CSU recently began to address this issue. First, the Department hired an Archaeological Collections Coordinator to manage the organization, preservation, access, and outreach of their collections. Organization is key to accessibility and having a person dedicated to this task is crucial. The other piece to the puzzle is having a champion for the collection. Ideally, this champion (professor and/or curator) will have in-depth knowledge of the material, work in the region, and encourage others to use the collections. CSU is beginning to test this model and we will share our challenges and successes to date and highlight several of the research opportunities within our own collection.

[236] *Los Casma del Sur: Interpreting Domestic Activities at the Southern border of the Casma Polity.*

The archaeological research conducted at the El Campanario site, located in Peru's Huarmey Valley, is oriented towards understanding Casma household production and consumption, which has resulted in the identification of various activities linked to pottery production, spinning, and food preparation. While El Campanario was occupied over different periods, absolute dating place the domestic areas between AD 1151 and 1280, which indicates the site's occupation during the Late Intermediate Period. Possible episodes of rainfall associated with El Niño could have caused the abandonment of these domestic areas at the site. The analysis of pottery sherds shows that the production of ceramic vessels occurred at the household level, whereby potters relied on local raw materials. The most common material in the manufacture of textile was cotton, which was locally produced; however, the presence of cotton-wool and wool textiles indicates the use of alternative materials and a possible long distant exchange with highland communities. Although, it is been argued that the Casma was a centralized state, data from El Campanario suggest that the inhabitants maintained their independence and probably created a separate cultural identity.

[287] *The Effect of Imperial Conquest on Regional Settlement Patterns: A Case Study from the Peruvian South Coast between ca. 1000–1532 CE*

Archaeological research clearly demonstrates that imperial expansions have significant effects on regional settlement patterns. One region where imperial conquests affected social life is the Peruvian south coast. During the Late Intermediate Period (LIP, ca. 1000–1450 CE), the region was controlled by localized polities such as the Chíncha and Huarco. With the expansion of the Inka empire and the beginning of the Late Horizon (LH, ca. 1450–1532 CE), these local polities either submitted to Inka hegemony or were otherwise incorporated into the empire. This shift in power should be reflected in settlement patterns across the south coast as people dispersed, aggregated, or moved to adapt to life under Inka rule. While previous archaeological research in the region has traditionally focused on a single site or valley, this analysis casts a wider net in order to explore macro-regional patterns by synthesizing decades of survey data concerning the LIP and LH in the Cañete, Topará, Chíncha, and Pisco Valleys. This exploration forms the foundation of a developing geospatial analysis that examines how and why settlement patterns on the south coast shifted after Inka expansion.

[257] *Theory and Anecdotes: A Student Retrospective of Ann F. Ramenofsky's New Mexico Research*

Ann F. Ramenofsky arrived in New Mexico in 1990 and in the following decades has influenced many careers. Beginning with her archaeological projects in the Upper Chama to her final archaeological research project at the Pueblo of San Marcos her insistence on methodological and intellectual rigor has contributed to undergraduate Honors Thesis, PhD dissertations and published works. While Dr. Ramenofsky's influence is obvious in these projects, what is not as well known is her light-hearted relationship with her students. This paper explores some of these unknown stories and events.

Perales, Manuel

[18] *Where Are the Cinchecona? Mortuary Architecture and Socio-political Organization in Jauja, Peru, during the Late Intermediate Period*

The Late Intermediate period constitutes a time of important changes in the life of pre-colonial Andean societies, including new mechanisms for the construction of power and authority. In the case of the Yanamarca valley in Jauja, central highlands of Peru, previous investigations have indicated that its inhabitants organized themselves in weakly institutionalized and politically unstable chiefdoms, in spite of having large human agglomerations. In this sense, following recent approaches, this paper proposes that these human groups experienced alternative forms of complexity, of a corporate and stable nature, in which local leaders known in the written sources as cinchecona stood out. For this purpose, a study of the mortuary architecture present in sites of the region is developed, which usually has not been considered in the studies developed by other researchers.

Peres, Tanya (Florida State University)**[415]** *Making Archaic Snaileries out of Shell Heaps: Human Behaviors and Ecological Niches*

Global evidence for human consumption and management of gastropods predates the Neolithic Revolution - the period noted for independent experimentation and domestication of terrestrial plants and animals. Archaeological data indicates that gastropods, terrestrial and aquatic, were vital resources for Holocene human communities. This phenomenon is not limited to one region. The consumption of aquatic snails is documented from archaeological sites in Mesoamerica, Japan, and China, while the consumption of land snails is well-documented in the Iberian Peninsula, circum-Mediterranean area, Africa, and North and South America. These studies show the temporal depth and spatial breadth of humans' knowledge of, and interaction with, different species of snails. Along interior rivers of the American Southeast, evidence for the exploitation of freshwater gastropods (small game) appear in archaeological sites dating from approximately 7000 to 1000 cal BC. We bring together multiple lines of data to test the hypothesis that the freshwater gastropod deposits (snaileries) along the Cumberland River in the American Southeast were the outcome of human behaviors that ultimately resulted in the construction of ecological niches favorable for humans and snails.

[171] *Chair***Perez, Daniel (University of Nevada, Las Vegas)****[151]** *Substance and Subsistence: A Use-Wear Analysis on Ground Stone from the Virgin Branch Puebloan Region*

Archaeological investigations pertaining to the upland zone of the Virgin Branch Puebloan region—namely, the Colorado Plateaus—have historically been limited in both number and scope. Recent expeditions to various sites on the Grand Canyon-Parashant National Monument, however, have helped expand the archaeological record of the area—contributing a greater depth of knowledge concerning Virgin Branch Puebloan culture occupation of the area in late prehistory. The framework for the present study comprises excavation data from recent expeditions to several sites on the Shivwits Plateau of northern Arizona, conducted by the University of Nevada, Las Vegas from 2012 to 2014. This paper presents a use-wear analysis on ground stone recovered from four Pueblo-period habitation sites (To'tsa, Bart, Lava Ridge, and Coyote). Both use-wear analysis results and provenience information frame a discussion on implications of this study on Virgin Branch Puebloan subsistence, economy, and potential exchange relationships during the Pueblo II-III periods.

[317] *Toward a Bioarchaeology of Social Change: Moving Beyond the Myth of Scientific Neutrality*

In his article, *Bioarchaeology as Anthropology* (2003:27), George Armelagos noted that, “scientists’ perceptions of their discipline clearly influence how they frame their research agenda.” This paper will illustrate how all such agendas are politicized. To engage with violence in the past from the safety of your labs and computer screens is nothing more than to tell a fable with the hopes that it might be true and heard by others in their labs in front of their screens. Violence is visceral and real. Why should a mother who wails about her child’s brains being sprayed across her body care about the abstraction of our discipline? We must confront the myth that the science of bioarchaeology can be apolitical. We must move beyond being engaged intellectuals in the public sphere. We must recognize that, until our work affects policy, we are, at best, intellectual distractions and, at worst, self-serving academic elites. Doing this work requires confidence in our possibilities. Enough self-preoccupation. The possibilities for bioarchaeology are greater than what we are doing. This paper explores the current and future possibilities of a bioarchaeology that can affect social change.

Perez Rodriguez, Veronica (University at Albany, SUNY)**[58]** *Sustainable Urbanism in the Mixteca Alta: Was There Ever Such a Thing?*

Researchers that study pre-Hispanic urbanism in the Mixteca Alta often remark that the region today is eroded and sparsely populated. Places that in the past supported urban populations in the tens of thousands today seem to struggle to sustain a few hundred. Some have called this the Mixtec paradox. Research on the early city of Cerro Jazmín has reconstructed the settlement's history of occupation (300 BC-AD 300), depopulation (AD 300-1300), and later reoccupation (AD 1300-1500). A geomorphic survey of the area surrounding Cerro Jazmín identified a well-developed soil horizon dating to AD 1100 and we initially thought that it was the result of successful land management from the city's Classic and Early Postclassic-period population (AD 300-1100). Recent excavations have revealed that the population of Cerro Jazmín decreased after AD 300 and it remained that way until AD 1300, thus suggesting that the soil horizon was perhaps the result of the area's depopulation. Was Cerro Jazmín ever a sustainable settlement? As we work to identify successful, ancient land use practices that might provide current Mixtec communities with ideas on how their lands can again sustain thousands, we use a localized approach to make our research relevant.

Over the past two summers at the archaeological excavation of Etzana we used a Leica P40 scanner to create 3-D models of the excavation units. The accuracy of the measurements is + 1 mm. It is possible to take measurements of features and object from the model. The scanner has some limitations for recording deep excavations, and a novel method for overcoming them is discussed.

Perreault, Charles [247] see Paige, Jonathan

Perreault, Charles (Arizona State University)**[247]** *A Macroarchaeology Approach: How Can Archaeology Make Novel and Useful Contributions to Evolutionary Theory?*

The quality of the archaeological record limits the range of evolutionary research questions archaeologists can ask. The Extended Evolutionary Synthesis mostly describes micro-scale phenomena that unfold at the hierarchical level of the individual and over very short time scales. This means that most of these processes are underdetermined by the archaeological record, with its resolution and sampling intervals that are typically in the order of 10^2 - 10^3 years. Archaeologists can overcome these limitations and make novel and useful contributions to evolutionary theory and behavioral sciences in general by replacing the search for micro-scale phenomena with a search for macro-scale patterns in the global archaeological record. Macro-scale processes operate at a hierarchical level well above that of the individual. They cannot be seen within the span of a human lifetime but become visible when looked from an observation window thousands of years long and thousands of kilometers wide. The archaeological record has the scope necessary to detect macro-scale phenomena because it can provide samples that are large enough to cancel out the noise generated by micro-scale examples. Here I lay out what a macroarchaeology program looks like and provide examples of the approach.

Perri, Angela (Durham University)

[368] *Stark Variation: New Insights into Dire Wolves and Their Interactions with Humans*

Dire wolves are an iconic extinct Pleistocene species in the Americas and their interactions with humans at Paleoindian sites has been largely unknown. Here we explore potential interactions between dire wolves and Paleoindians at sites in the San Pedro Valley, Arizona. We also present new radiocarbon dates and the results of our ancient DNA analysis, which reveals a surprising phylogeny for dire wolves. We discuss what this taxonomy may mean for dire wolf paleoecology in the Americas and their interactions with newly-arrived human hunters.

Perry, Jennifer (CSU Channel Islands) and Mikael Fauvelle (University of California, San Diego)

[70] *Inter-island Material Conveyance and Exchange on California's Channel Islands*

Most discussions of exchange relating to California's eight Channel Islands have been framed in terms of island-mainland interactions, of which the Chumash people of the four northern islands have been the primary focus. Less consideration has been given to the Tongva of the four southern islands as well as inter-island and intra-island networks throughout the archipelago. Inter-island and intra-island studies of material conveyance allow us to evaluate this topic more holistically, by being inclusive of both the Chumash and Tongva as well as the roles that smaller islands, such as Santa Barbara Island, and more marginal environments have played in supporting permanent populations on the larger islands. We consider the inter-island distribution of major lithic materials and artifact types throughout the Channel Islands because of their durability, desirability through time, and sourcing possibilities, with emphasis placed on evidence of material conveyance between the southern islands. The distribution and type of non-local objects, which includes ceremonial ones such as stone effigies and pipes, also allows for a fuller consideration of ritual and value-added items as facilitators, products, and archaeological evidence of inter-island and intra-island interaction.

[317] *Uniting the Archaeological Body: The Bioarchaeological Investigation of Human Remains and Mortuary Behaviors*

Bioarchaeology has the unique power to deeply investigate mortuary space not only to identify lived experiences from human remains but also to illuminate elements of mortuary ritual. However, these two aspects of bioarchaeology still remain conceptually separated: one is biological and the other socio-cultural, one is scientific and the other theoretical, one is lab-based, the other is field-based. To move the discipline forward, scholars need to unite these two halves of the archaeological body through recognizing their dual role as arenas for expressing social identity, economic status, commemoration, and the reality of death. This paper explores how the human body and the mortuary context share biological, representational, and material foundations (Sofaer 2006) and how an integrated investigation of the material

nature of the corpse and behaviors associated with its treatment generate a multifaceted, nuanced view of ancient communities and their social and cultural processes.

Perry, Richard

[395] *Public Archaeology as a Gateway towards a Revisionist History*

Government archeologists work in geographic areas that are associated with their agency's mission and projects. By law, the government agency's archeologist is required to consider all cultural entities that may be adversely affected by the project. This permits a more objective approach to the use of archeology as a tool that provides information that can correct the historical record and identify the cultural identity and contributions of ethnic groups that are often overlooked or are dismissed as being irrelevant. Such use of archaeological data can then facilitate the formulation of historical justice on behalf of the disenfranchised. Two examples of historical justice being addressed as a result of federal construction projects are the focus of this paper. The examples are the well-publicized colonial era African burial ground that was excavated during earth-moving activities for a General Services Administration government building in Manhattan, and the Mexican Potters of the Rincon Townsite in Riverside County, California that was excavated for the expansion of Prado Dam on the Santa Ana River.

Person, Dylan (University of Nevada, Las Vegas)

[346] *The Flow of Lithic Production: Debitage Analysis in the Mogollon Highlands, AD550-1000*

The Late Pithouse Period (AD550-1000) was a time of significant material development and social change in the Mogollon region of southwestern New Mexico. Intensive research has been devoted to explaining these changes. These approaches have resulted in a wealth of data concerning architecture, site layout, ceramic design, and incipient hierarchical social structures. What has not been examined in detail are lithic debitage assemblages. This is due to the difficulties inherent in applying non-functional theoretical lenses to lithic technologies as well as the minimal stylistic expression commonly seen in expedient lithic artifacts. In this paper I present analysis results from two Mogollon pithouse sites, the Harris Village (LA1867) and the La Gila Encantada site (LA113467). I synthesize this data taking into account regional stone sources, production methods, and differential material use in lithic technological systems. These lines of inquiry provide behavioral inferences about Mogollon debitage patterns and their implications for regional technological identity.

[76] *Tools Present and Tools Absent in Textile-Intensive Mortuary Contexts: The Paracas Case*

In most of the world ancient fabrics are not preserved, though much can be learned about garment systems, surface design and production techniques through tools, accessories and contemporary imagery. The Andean desert coast and mortuary traditions provide extraordinary conditions for textile preservation, but we have much to learn about how they were made. Women's burials from Inka and other late prehistoric contexts frequently include baskets of spindles and llama bone picks,

but loom parts and tools for non-loomed techniques are seldom preserved. Some 1500 years earlier, distinct mortuary traditions from Ocucaje and the Paracas site (c. 250 BCE – 150 CE) include and exclude different types of textile tools, reminding us that mortuary ritual is a locus of norms and choices quite distinct from the practices of daily life. The textiles included in each mortuary tradition provide a different sphere of information, as their forms imply the presence of tools that are yet to be recovered or identified, as well as a complex chain of materials, practices and relationships of production. Replication studies open paths for further research on the techniques and processes that create both textiles and social networks.

[72] *The Bethel Cemetery Relocation Project: Academic Collaboration, Archaeological Science, and CRM*

The Bethel Cemetery project combined the best of what the CRM and University communities have to offer, while documenting, exhuming, and relocating over 500 graves from a 19th century cemetery in Indianapolis, IN on an aggressive schedule. Over 30 professionals from the University of Indianapolis and IUPUI were employed by Cardno to execute the field work given faculty and students' expertise in photogrammetry, bioarchaeology, and human osteology. Structure from motion (SfM) photogrammetry was utilized to document a majority of the burials once exposed via standard excavation practices, resulting in highly accurate documentation, improved efficiency over traditional field mapping techniques, and research-quality, three-dimensional models. Subsequently, the two universities collaborated to complete the osteological analysis of the human remains. Beyond the report that is in preparation, at least four master's theses will be produced, and the compiled photogrammetry and osteological databases will allow for further research for years to come. The protocols developed have allowed for more in-depth research and technological benefit than is the norm for CRM projects. Meanwhile, the relationships established and techniques developed will last well beyond the current project and provide a multitude of benefits for all stakeholders moving forward.

[211] *Willamette Valley Project: Recreating the Landscape of the Willamette Valley through GIS Mapping of Historic Documents*

The Willamette Valley Projects (WVP) has been partnering with Colorado State University Center for Environmental Management of Military Lands (CEMML) to create a GIS database of historic properties on the WVP lands, which include the Willamette River Basin 13 dams and their associated lakes or reservoirs. Existing USACE documentation exists from all phases of dam construction through design drawings, dam construction photos, historic aerial imagery, real estate transactions, relocation contracts, and microfiche documents. This data was provided to CSU for georeferencing and digitizing to create a GIS database of historic properties in the WVP. While the individual files can be helpful, compiling them in GIS allows for greater analysis and a further understanding of their relevance to other data, such as LiDAR and elevation to assess impacts to historic resources. As the information is digitized, field visits check the accuracy of the GIS data and confirm the presence of additional historic sites. The most helpful data were pre-dam aerial imagery, engineered drawings of road and railroad relocations, and proposed reservoir clearing maps. In addition to discovering historic features, the GIS data identifies areas that have been heavily disturbed, which assists with environmental and cultural consultations for future projects.

Phelps, Danielle (University of Arizona)

[52] *The Spatial Distribution of Late Eighteenth Dynasty Tombs in the Valley of the Kings, Egypt*

The Valley of the Kings was the royal necropolis of the New Kingdom in ancient Egypt. The types of tombs found in the Valley include the larger royal tombs, small-chambered tombs, and pit tombs. It is suggested that the location of the small-chambered tombs in the Valley followed the tradition set forth during the Old and Middle Kingdoms when smaller tombs were located next to larger more substantial royal tombs. Evidence also suggests that the early kings of the Eighteenth Dynasty created their own family necropolis inside of the Valley of the Kings. Tutankhamun, the antepenultimate ruler of the Eighteenth Dynasty (c. 1550-1290 BCE), was buried in a repurposed small-chambered tomb (KV 62). KV 62 is also part of collection of small-chambered tombs that all date to the post-Amarna Period. Through the application of Geographic Information Systems, this paper will investigate the spatial distribution of the post-Amarna Period tombs to determine if they follow the earlier precedence of creating a family necropolis within the Valley of the Kings and if one larger royal tomb may have joined the others together. This paper will provide insight into the mortuary ritual landscape of the late Eighteenth Dynasty.

[25] *Rescuing Collections from Us: The Tijeras Pueblo Story*

Most of the archaeological collections from Tijeras Pueblo were submitted to the Maxwell Museum of Anthropology, University of New Mexico. As was typical at the time, the collections were stored in a warehouse, using non-archival materials, with only minimal records about what was stored where. Beginning in 2004 a massive effort, driven mostly by volunteer labor, led to the complete reorganization of the Tijeras Pueblo collections at the museum, and storage in a vastly improved space. This effort resulted in renewed research on Tijeras Pueblo, along with other public benefits. The history of the Tijeras Pueblo collections is a reminder that the project isn't completed until the collections are actively cared for and ready for use.

Phillips, Emily (University of Cincinnati)

[261] *Investigating the Spatial and Behavioral Factors that Influence Regional Lithic Assemblage Variability*

Lithic scatters are commonly the most abundant site type recorded in regional archaeological surveys. Paradoxically, lithic scatters are widely considered typologically homogeneous and are typically classified as limited-activity sites. These practices have contributed to the view that lithic scatters are of limited research value in understanding the origins and formation histories of regional archaeological records. To illustrate their unappreciated interpretive potential, I report the results of recent lithic-scatter investigations in the Upper Basin of northern Arizona, which have revealed significant inter-

site differences in assemblage composition (ratios of debitage, tools, and cores), formal variability of debitage assemblages (measured by maximum flake area), and artifact density. In addition, I explore the hypothesis that masonry-structure proximity influenced lithic-scatter variability. By analyzing differences in the aforementioned variables between lithic scatters and masonry structures, I anticipate, for example, that higher proportions of unifacially retouched pieces will occur at masonry structures, whereas assemblage-level values of maximum flake area will decrease in lithic scatters that are located at increasingly greater distances from the nearest masonry structure. Overall, the goal of this project is to showcase an unbiased approach that incorporates the lithic scatter in regional models of technological production and assemblage formation.

Phillips, Laura and Erin Younger

[312] *Making Voices Heard: Archaeology as Community Engagement*

In the Pacific Northwest today, the professional expectation is that archaeology and community are, or at least should be, intertwined. While collaboration and cooperation are not always easy, past projects spearheaded by Dr. Julie Stein, curator and now executive director, at the Burke Museum of Natural History and Culture in Seattle, highlight the importance of establishing long-term relationships. For over 25 years, these projects provide examples of commitment to public outreach, tribal oversight and collaborative exhibitions to connect archaeological insights with community knowledge.

Phillips, Lori (Washington State University), Erin Thornton (Washington State University) and Eleanor Harrison-Buck (University of New Hampshire)

[370] *Testing the Efficacy of Sulfur Isotopes from the Maya Site of Chulub*

Stable isotope analysis of carbon ($^{13}\text{C}/^{12}\text{C}$) and nitrogen ($^{15}\text{N}/^{14}\text{N}$) are often used to reconstruct ancient Maya diets. While these two isotopes provide us with a broad understanding of past subsistence practices, carbon and nitrogen are limited in their ability to differentiate freshwater and terrestrial based diets. Similar problems exist in other areas of the world and sulfur ($^{34}\text{S}/^{32}\text{S}$) stable isotopes have shown promise in separating the two. To determine the feasibility of this isotope's use in the Maya region, we tested the carbon, nitrogen, and sulfur composition of terrestrial and freshwater animal remains from the Classic to Postclassic (AD 800-1200) transitional site of Chulub, Belize. This site provides the ideal setting for testing sulfur's utility because of its location within the Western Lagoon Wetlands, which provides a wide assortment of terrestrial and freshwater species that were available to the ancient Maya.

Phillips, Susan (Pitzer College)

[157] *Radical Stratigraphy: A Century of Los Angeles Graffiti*

For the past 100 years, an alternative written record has been tied to the underbelly of Los Angeles' built environment. The urban infrastructure of railroads, bridges, storm drain tunnels, harbors, and paved rivers houses a vernacular history inscribed mostly on concrete with rocks, chalk, charcoal, pencil, and sometimes railroad tar. Combining elements of ethnography and archaeology, my work examines several phenomenological aspects of graffiti: its deeply sited nature, its radical condensation, and its indexical tie to absent authors. As Los Angeles' urban landscapes developed over the course of a century, groups as diverse as hobos, children, gay men, and blue collar workers have used graffiti to craft a radical stratigraphy that upends conventional ways of writing history. As illicit material representations, graffiti marks cement ties between landscape, cultural memory, and social life. A new point of theoretical transfer between archaeology and cultural anthropology, the analysis of graffiti provides new fodder for the archaeological turn within anthropology (Dawdy 2010), and for continued attention to the excavation of the present and recent past (González-Ruibal 2008). Graffiti creates alternative narratives about chronology and categorization, and about how people create knowledge in place.

[115] *Prehistoric Weapon Perimortem Damage Documentation*

In the 2016 – 2017 academic year a Humboldt State University Anthropology Graduate Student recreated a macuahuitl, a wooden club with obsidian blades, and used it on two pig heads for a use-wear analysis of the obsidian. The pig heads were partially de-fleshed and frozen to be added to the university's zooarchaeology collection. This allowed for the opportunity for documentation of damage by a prehistoric weapon in a controlled environment. To date, there is not a comparative database that catalogs the damage to bone of ancient remains caused by prehistoric weapons. This prevents archaeologists from determining with certainty the weapon that was used at, or near, the time of death from ancient remains. By using the damaged remains of experiments that involved reconstructions of prehistoric weapons, this project examines the possibility of creating a database of perimortem damage by prehistoric weapons based on region and culture.

Picas, Mathieu (University of Barcelona) and Margarita Diaz-Andreu (ICREA/University of Barcelona)

[105] *Local Interpretations about Maya Pre-Hispanic Heritage: The Case of Tulum*

Cultural heritage is a social construction that allows groups of different character to appropriate culturally or politically ancient sites by attaching symbolism to them. In Mexico, the use by the state of archaeological remains for the construction of a homogeneous national identity has been marked by the management of many sites since the late 1930s. The official discourse on these sites emphasizes scientific research and promotes cultural tourism on the basis of historic and aesthetic values. This discourse contrasts with the local uses of the archaeological remains, a use that is underscored by social and sacred values. This presentation will focus on Pre-Hispanic structures, locally known as *múulo'ob* or mounds. The *múulo'ob* are considered by the local Maya to be the dwelling places of supernatural entities such as guardians and ancestors whom are considerate to the owners of the land. The Maya's territoriality includes, therefore, a particular connection to the remains which is reflected in the agricultural cycle, social practices, and oral tradition. We will explore different ways of local communities' interaction with archaeological sites in central Quintana Roo paying particular attention to the alternative values that they raise, especially in the case of the archaeological site of Tulum.

[407] *An Empirical Analysis of Highland-Lowland Interaction in the Aztatlán Tradition*

The Aztatlán tradition constituted the primary economic and cultural development during the Early/Middle Postclassic (AD 900-1350) in west Mexico. Though politically decentralized, this culture was rooted on the Pacific coastal plain and featured vast trade networks. Located 100 km inland, the Etzatlán Basin is the westernmost lake basin in the Jalisco altiplano. This area likely played a critical role in the movement of goods throughout the Aztatlán network, despite being peripheral to the cultural core. Through these mercantile relationships, the transmission of Aztatlán cultural concepts likely overlapped with existing local traditions, thus creating cultural affinity while retaining a measure of sociopolitical and economic autonomy. Most Aztatlán scholarship has focused on the characterization of Aztatlán culture, yet the specifics of regional interactions have rarely been empirically addressed. In this study, geochemical analyses reveal that Etzatlán-area obsidian was a key lithic resource in coastal economies. Geospatial analyses also indicate that the most cost efficient pathways from the coast to central Mexico align with multiple Etzatlán sites. Even within the Etzatlán Basin, differential access to these networks is evident in obsidian production and usage patterns between sites. These results demonstrate the importance of obsidian networks in the expansion of the Aztatlán culture.

[297] *Outreach, Education, and Archaeological Collections: Public Archaeology at the Office of the Wyoming State Archaeologist*

The Office of the Wyoming State Archaeologist (OWSA) has become increasingly focused on implementing public outreach initiatives to more effectively engage Wyoming's citizenry in archaeological investigations and collections care. Our office manages the University of Wyoming Archaeological Repository, and the incorporation of our educational collection in our outreach efforts have had a demonstrable impact on our ability to more effectively engage with interested publics. Archaeological investigations benefit from the inclusion of a wide range of stakeholders in the identification, investigation, interpretation, and preservation of these resources. As a public agency conducting archaeology, it is incumbent upon us to include interested individuals in the archaeological process; more effectively connecting participants to their local history and shared cultural heritage. The active inclusion of a wide range of individuals in the archaeological process serves to make our office, the work we do, and the archaeological record more relevant in today's world. This paper will highlight recent public outreach initiatives undertaken by OWSA including archaeology fairs, a program involving high school students in archaeological digs, and a new Avocational Archaeology Training Program, and discuss the challenges and benefits of each.

[154] *Earth House, Chum and Reindeer Shed: Ethnoarchaeological Research on Household and Settlement Organization of Mobile Hunter-Fisher-Reindeer Herders in Western Siberia*

The Taz Selkup are a Siberian indigenous group of hunters, fishers and reindeer herders in the northern taiga between Ob' and Yenisei. In the 17th and 18th centuries they have migrated north from Tomsk region, and in the new territory have preserved their nomadic ways until today. The adaptation to the new environment and its effects on material and immaterial

culture, language and self-perception are of great interest from an anthropological point of view. Ethnoarchaeological research of a Russian-German team among the Taz Selkup investigates the effects of that migration into the new environment on material and immaterial, and the archaeological visibility of these processes, with special attention to the effects of the uptake of reindeer husbandry into the lifeways. Fieldwork focuses on temporary settlements, shedding light on patterns of site location, dwelling types and the interconnections with the requirements of a subsistence economy including the seasonal cycle of reindeer keeping. By comparing ethnographic information and excavation results from winter earth houses, conical tents (chums) and lighter rectangular tent structure, detailed insights into household organization, material patterns and their archaeological foot print are gained. Special systematic attention is paid to what cannot be seen with archaeological methods.

Pigott, Michelle (Tulane University) and Christopher Rodning (Tulane University)

[239] *Archaeology of Ritual in Cherokee Towns of the Southern Appalachians*

Ritual and ceremonialism were important domains of practice through which Cherokee peoples of the southern Appalachians maintained cultural identities during the aftermath of European contact in the Americas, and through which Cherokee towns responded to the opportunities and challenges associated with European exploration, colonization, trade, diplomacy, and violence. Written accounts and maps associated with Spanish exploration and English trading activities offer clues about Cherokee town locations, and basic characteristics of Cherokee economy, political organization, social dynamics, and religion. Written accounts of Cherokee oral tradition, as recorded in the 1700s and 1800s, also lend insight into Cherokee religion and ritual. This paper relates these forms of ethnohistoric evidence to archaeological evidence about earthen mounds, public architecture and cycles of building and rebuilding public structures known as townhouses, production and circulation of marine shell beads and pendants with engraved iconography, mortuary practices, and smoking, including smoking associated with calumet ceremonialism.

[27] *The Technology of Metallurgy and Evolving Views of Its Development in Prehistoric Thailand*

In the archaeology of prehistoric Thailand, the sub-field of archaeometallurgy has undergone numerous changes in established perceptions, both anthropologically and technologically. This paper introduces the Symposium and overviews recent shifts that characterize how metallurgy in Thailand has come to be understood today. These shifts include evidence that copper-based metallurgy appeared in the late 2nd millennium BCE and that large-scale copper mining and massive production proceeded over subsequent centuries at the community level at a cluster of settlements centered in the ore-rich Khao Wong Prachan Valley, in sites excavated by the Thailand Archaeometallurgy Project (TAP). Smelting may have been carried out by kin-related groups that practiced their craft aggregated closely with other such groups. At these sites there are few markers of an elite-focused control of the local industry that, it is argued, developed within a heterarchical, socio-political context with only sparse evidence of emerging social complexity until later prehistory. Analytical evidence supports the premise that Valley products, copper ingots, and other goods (e.g. shell bangles) were being distributed widely along established exchange networks. Thus, this production center offers an example of how metallurgical developments can be understood elsewhere in MSEA.

[365] *Spatial and Temporal Diversity in Stable Isotope Studies of Archaeological Material*

While identifying and defining diversity in material culture studies, bioarchaeological assemblages, and site distribution has long been de rigueur, the advent and development of stable isotope analysis in archaeology since the publication of

Leonard & Jones' seminal 1989 volume provides yet another layer of complexity in archaeological interpretation. This paper reviews some of the primary developments in stable isotope analysis in archaeology over the last 30 years, and considers the role of this technique in advancing our understanding of variability both across space and through time in coupled human-natural systems, whether the context be the Old World Paleolithic or North American Paleoindian.

[36] *Roasting Pit Mounds of the Verde Valley, Central Arizona: New Implications for Yavapai/Apache Archaeology*

Excavations in the Verde Valley of central Arizona have documented the use of roasting pits for food processing from Archaic to modern times. The most obvious evidence for this can be seen in the large mounds of burned earth and fire-cracked rocks that dot the Valley. Over 90 such mounds have been recorded, but only a few have been excavated. These large mounds are attributed to the Yavapai and Apache, primarily for the processing of agave, and indicate a different technology and associated social behavior than that of the Valley's earlier inhabitants, the Sinagua. Sinagua roasting pits are much smaller, and indicate limited use by a small number of people. Yavapai /Apache roasting pits are much larger and represent industrial-size processing by larger social groups over much longer time spans. C-14 dates from recent excavations challenge current interpretations of when the Yavapai/Apache are recognized in the Valley and their relationship with the Sinagua. This paper will summarize the results of these excavations and implications for understanding the late prehistoric period in the Verde Valley.

[317] *Ethics, Professionalism, and Qualifications in Bioarchaeology and Forensic Anthropology*

Bioarchaeology and forensic anthropology both primarily deal with the analysis of human skeletal remains and employ similar methods for osteological analysis. However, over the past several decades, both subfields have become increasingly specialized with unique procedural and analytical goals. This divergence means that training in one subfield does not translate to competency in the other. Bioarchaeology requires a thorough understanding of both biocultural adaptation and archaeological theory, in addition to archaeological methods and data. Forensic anthropology on the other hand, requires extensive knowledge of laboratory procedures, accreditation, proper case documentation, legal standards (e.g., Daubert), expert witness testimony, and how to navigate within the medicolegal system.

We have argued elsewhere (Passalacqua and Pilloud 2018) that working outside one's expertise is unprofessional and can extend to a breach of ethics. It is therefore important to identify qualifications of both subfields to ensure that practitioners are working as ethical professionals; yet currently, there is little guidance on what qualifies someone to practice bioarchaeology or forensic anthropology. This presentation will outline the current qualifications for forensic anthropology, and suggest future directions for both fields in order to establish a set of qualifications for the professional practice of each discipline.

[55] *An Isotopic Study of Dietary Diversity in Formative Period Ancachi, Atacama Desert, Northern Chile*

Stable isotope analysis has been used to reconstruct the dietary patterns of individuals recovered from archaeological sites. Given the centrality of food to human social interaction, dietary insights provide a window into the inner-workings of past societies. In the present instance, stable isotope analysis, when coupled with multi-source mixture modeling, permits an enhanced understanding of the economic and social relationships that bound together Formative Period (1000 BC - AD 400) populations and individuals in northern Chile's Atacama Desert. This work specifically focuses on 29 individuals recovered near the modern town of Quillagua at the cemetery of Ancachi (02QU175). This cemetery is associated with a logistical settlement on the Loa River at a frontier between coastal and inland/highland populations during the Formative Period. We present here a reconstruction of the dietary variation in the Ancachi individuals obtained by isotopic composition analysis of bone collagen and hydroxyapatite. These data were compared with a robust database of available foods, contemporary individuals from throughout the region, and the exceptional preservation of the hyper arid Atacama. Ultimately, the results speak to the ways in which economic exchange promoted the development of new diets and lifeways during a time of burgeoning economic, social, and cultural change.

[257] *What Unit Is a Degree?*

Upon receiving your doctorate, you are expected to become a contributing member of your field, as an academic or as a professional. But what kind of unit is a "field" and what use is a degree in a particular field if you never participate in that field? In this paper I explore the ways in which studying and working with Dr. Ann Ramenofsky and others at UNM in pursuit of my doctorate in Archaeology has contributed to my professional success in diverse fields outside of Archaeology. Along the way I explore the value of a holistic degree as a complement to focused technical degrees in project planning and execution, and highlight the importance of the doctoral degree as a "knowledge creation license".

Pinta, Elie (Université Paris 1 Panthéon-Sorbonne / UMR 8096)

[91] *Norse Exploitation of Wooden Resources in North America: Determining Wood Provenance Using Isotopic Analysis*

From historic sources we know the inhabitants of the North Atlantic islands relied on importations of timber from Northern Europe in order to supplement their resource deficit. In the case of the Greenland Settlements, we know Norse Greenlanders organized expeditions to North American shores where they acquired timber and other items. It is likely that a certain amount of wooden materials used in the Greenland Settlements came from the forested areas of Markland and Vinland. Isotopic analysis has proven useful in archaeology for sourcing materials such as bones, textiles, or metal objects. The success of isotopic studies depends on the principle that variation in environmental conditions (i.e., the proportions of elemental isotopes present in the soil, air, and water) becomes engrained in the composition of natural resources that humans either ingest or harvest for use. Previous studies have illustrated that strontium (Sr) isotopes can be used to determine the provenance of wooden materials. The potential for assigning provenance to wooden artifacts using isotopic analysis, therefore, is high and can provide us with the data necessary to differentiate among artifacts crafted in similar environments or production areas, and to establish their provenance based on modern reference samples of known origin.

[181] *No Hearth, No Problem: A Multidisciplinary Exploration of Ceremonial Architecture at Two Late Preceramic Sites in the Norte Chico Region*

Multi-elemental analytical techniques like X-Ray Fluorescence have been employed to determine the use of space through residues left behind from human activities. In addition, methodologies primarily used in other disciplines such as pollen analysis or micromorphology can illuminate the archaeological record in ways that traditional methods cannot. This paper presents the results of innovative analytical techniques used to identify and analyze small-scale ceremonial architecture at the Late Preceramic sites of Huaricanga and Caballete in the Fortaleza Valley of Peru. The results of this project allow us to reconstruct the ritual practices that took place within these ancient structures and shed light on an early form of South American religion.

[80] *24 Years Down & 24 to Go: Lessons Learned and New Research Directions for the Gunnison Basin (CO)-based Rocky Mountain Paleoindian Research Program*

From 1999 to 2013, members of the Rocky Mountain Paleoindian Research Program (RMPRP) conducted extensive survey and numerous test excavations of very ancient sites in the Gunnison Basin, southwestern Colorado. During that period, researchers learned much about the timing of initial human use of the Basin and how land-use changed between the first human forays into the region ca. 11,000 rcybp and the onset of the Archaic era ca. 8,000 rcybp. After a several-year hiatus to tie up research loose ends and to synthesize what the team learned in its initial two-dozen years of research, RMPRP personnel are preparing now to return to the field in summer 2019. This paper summarizes archaeological questions answered in its first two dozen years of work, then pivots to outline the many new questions that have arisen in that same time period—questions that will drive RMPRP field research going forward.

[296] *An Evaluation of Type Definitions for Viejo Period Red-on-brown Pottery*

We recently began a long-term research program focused on identifying and excavating Viejo Period settlements in the near vicinity of the massive, latter Medio Period settlement known as Paquimé (ca. A.D. 12-1450) in Chihuahua, Mexico. We have located previously unrecorded Viejo sites and completed limited excavation at one of them. A persistent difficulty during this early endeavor has been identification of red-on-brown painted sherds to typological definitions as described by Charles Di Peso and his colleagues. We contend that the published type descriptions are not effective for identifying sherds at the type level. At this time, we have simply categorized Viejo painted sherds as “red-on-brown.” Moreover, as we and others have discussed, the Viejo period phase designations are flawed. Researchers should be cognizant of these deficiencies when contemplating the roots of Paquimé.

Piven, Alex (Utah State University) and Elizabeth Lynch (University of Wyoming)**[329]** *Hell Gap in 3D: Visualizing the Past on the Great Plains*

Research at Hell Gap has incorporated a number of technological innovations since investigations began at the site in the early 1960s. Recent advances in digital techniques have spurred the rise of digital documentation and analysis in the field. Low-cost yet high-quality photogrammetric softwares such as Agisoft Photoscan have become powerful, non-invasive tools for data collection and presentation. This poster presents the rise of digital data collection at Hell Gap and the methodology used to create 3D models based on in situ artifacts and faunal remains. The scope of digital documentation at Hell Gap aims to explore the ways photogrammetric modeling and 3D imaging can be integrated into analytical techniques and in fostering public engagement.

Platt, Sarah (Syracuse University)**[362]** *Artifact Boxes and Cans of Worms; Navigating the 87 Church Street Legacy Collections*

The collections excavated in the 1970s at 87 Church Street in downtown Charleston, South Carolina play a crucial role as part of a repertoire of sites deployed to understand Charleston as a critical urban center and waypoint in the eighteenth-century American southeast. However, a full site report does not exist for these early excavations, and research remains unfinished nearly fifty years later. Although archaeologist Elaine Herold and her volunteers carefully counted and meticulously labeled each artifact with provenience information, they then cataloged and curated the collection by class and type. Along with its sheer size, this classification decision renders the collection exceedingly difficult to use in modern context-based systems of analysis. Through her dissertation the author has returned to these collections with new research questions. In the process of opening long sealed artifact boxes and revisiting old catalog cards new strategies and quick, often unexpected, pivots in approach were required to make sense of this large and frequently unwieldy collection. The result was a process not unlike the challenges of any field excavation. This paper considers these challenges, and demonstrates that with the right sets of strategies and questions old collections can produce exceedingly valuable new insights.

Plattner, Paige and Meradeth Snow (University of Montana)**[253]** *Ancient DNA Analysis of Orton Quarry*

The Orton Quarry site is a Late Prehistoric ossuary along the coast of Lake Erie in Pennsylvania. In March 1991, heavy-equipment operators accidentally destroyed a majority of the site before archeologists arrived. Since the excavation very little had been published on the Orton Quarry site, it's importance or its original inhabitants. One of the primary objectives of this project is to change that. By extracting and analyzing the mtDNA using the Dabney et al. (2013) protocol and standard aDNA contamination avoidance protocol, we have obtained valuable data on the site's genetic ancestry. Ancient DNA from the seven samples were isolated and amplified for the hypervariable region of the mtDNA mitogenome. Following this, the whole mitogenome for the individuals (n=7). Haplogroups were assigned and the resulting sequences were compared to a relevant dataset from the surrounding region to gauge population relatedness and shared derived mutations. Despite the small sample size, comparing the data from these individuals through haplogroup and haplotype data from the Great Lakes region, this research has expanded our knowledge of the Orton Quarry Ossuary, the genetic data for the Great Lakes region as well as grown our genetic understanding of ancient mitochondrial DNA in North America.

Platz, Lorelei and Carrie Dennett**[298]** *Pre-Columbian Pottery Production in Greater Nicoya: A Cross-Regional Analysis*

Spanning northwest Costa Rica and the Isthmus of Rivas in Pacific Nicaragua, the Greater Nicoya archaeological region has been historically interpreted as a cohesive language and culture area ('primordially' Chibchan but shifting to

Mesoamerican post-AD 800). Since the 1980s, however, researchers have begun to increasingly challenge this long-presumed 'cultural cohesion.' Ongoing analytical reconstruction and refinement of pre-Columbian ceramic economy in Greater Nicoya continues to validate this challenge, suggesting instead that Pacific Nicaraguan potters participated in a sphere of cultural practices and traditions distinct from potting communities in neighbouring Costa Rica. Through the lens of ceramic petrography, we seek to demonstrate the different sociocultural attitudes and normative strategies related to resource procurement, paste preparation techniques, technological innovation, and the transmission of technology and tradition across time and space. Two temporally distinct case studies are reviewed that highlight cross-regional differences in Greater Nicoya including the import, manufacture, distribution and consumption of Usulután-style negative resist wares from approximately AD 1 to 500 and later white-slipped 'Nicoya Polychrome' styles from roughly AD 800-1300. These case studies show the power of ceramic petrography to refine complementary analytical techniques (INAA), articulate pre-Columbian potting practices, and inform archaeologists on socioculturally charged aspects of the broader ceramic economy.

[35] *Defining Suitability in Mixed Pastoral-Agricultural Societies: A Case Study from Bactria in Northern Afghanistan*

This paper explores the concept of suitability as a guiding parameter for applications of the Ideal Free/Despotic Distribution (IFD/IDD) in cases of mixed pastoral and agricultural economies. We briefly review recent archaeological survey data and research from Central Asia to contextualize how pastoral societies intersect and complement agricultural societies and discuss how suitability can be generally defined for a region and time period given the different requirements and environmental constraints of these different subsistence strategies. While pastoralism is inherently a more mobile and less archaeological visible lifestyle, recent research has demonstrated the interdependencies between pastoralist and agricultural societies, such that suitability parameters of agricultural settlements may be influenced by parameters necessary for pastoral strategies. Drawing on legacy diachronic survey data from ancient Bactria, located in Central Asia, we consider the efficacy of a singular definition of suitability for explaining shifts in settlement pattern occurring across various periods of sociopolitical control and organization. We conclude that agriculturally-relevant parameters alone fail to sufficiently model changes in settlement pattern, as predicted by the IFD/IDD, and proxies of suitability must take into consideration parameters relevant to pastoralism as well.

[26] *Moving Beyond: Using Methods of Assessing Holocene Environmental Change in Northwestern Guyana*

To assess Holocene dietary changes we conducted isotopic analysis of human and faunal remains from seven shell mounds in Northwestern Guyana. We used stable carbon ^{13}C and oxygen ^{18}O isotope compositions data to assess the degree of dietary constancy as a proxy for determining the likelihood of there being any significant changes in the Archaic/Holocene environment that would have influenced resources in the Northwest. Using ^{13}C and ^{18}O data, we have demonstrated some degree of constancy in the availability of C3 plants during the past several thousand years—though we note an increasing reliance on such plants beginning in the Early Holocene. We also document warming intervals during the Early Holocene which appear to correlate with dry periods known elsewhere in the central Amazon during this period. While our data support long-term perpetuation of what may be thought of as relatively modern forest conditions, we conclude that in at least the Early Holocene there may have been more open canopy—a condition that may well have seen prehistoric peoples moving to a range of seasonally available resources.

[70] *Selfish for Shellfish, or Magnanimous about Mollusks? The Transformation of Cooperation across the First Millennium CE at Crystal River and Roberts Island, Florida, USA*

Blanton and Fargher (2016) critique evolutionary theorists for the assumption that cooperation was a single evolutionary hurdle; even if our species overcame such an obstacle in our distant evolutionary development, it is simplistic to assume that cooperation and collective action have been unchanged around the world over the last 100,000 or more years. Too little attention has been devoted to how cooperation and collective action may change under particular ecological and historical circumstances. Recent research at the Crystal River and Roberts Island sites, on the Gulf Coast of peninsular Florida, suggests changes in the scale and intensity of cooperation in subsistence production over the first millennium CE, as reflected in faunal remains (including oxygen isotope studies of shellfish) and subsistence technology. Specifically, in early phases, the scale of cooperation may have been broad in terms of the number of people or productive groups integrated, but the intensity of cooperation in subsistence endeavors was probably relatively limited. Later, there appears to have been a reduction in the social scale of cooperation, but productive groups began cooperating more intensively.

[30] *Bioarchaeology in the Northern Three Rivers Region of Belize: Teaching and Research Trajectories in a Bioarchaeological Field School*

As archaeologists have long recognized, the research on human skeletal remains by bioarchaeologists and physical anthropologists provides invaluable information on individual and population histories. The sample of 250 human skeletal remains, currently curated at the Maya Research Program (MRP) facilities in Northern Belize, is a font of data about life in the Three Rivers Region from 250-1000 CE. A collection of this size allows for various research questions to be asked on a larger scale than is typical in much of the Maya Lowlands. This paper will showcase the MRP collection and data derived from it by the authors and students enrolled in the MRP annual bioarchaeological field school. Projects include paleodemography, health and disease, biological affinity within single and multiple mortuary contexts, metric analyses, social status, migration, social organization, and conservation. Special attention will be paid to current and future research trajectories in relationship to the ethics and practice of teaching a field school on extant prehistoric remains.

[222] *A Fabric-Impressed Potsherd from San Andrés, Tabasco, Mexico*

Despite over a century of intense research, little has been published on the non-durable technology of the Olmecs. This is due to the "tyranny" of preservation, which strongly biases the archaeological record in most areas toward durable artifacts. Recent analysis of a probably accidentally impressed potsherd from San Andrés, within the urban polity of La Venta, indicates the production of at least one type of finely woven textile/basketry and suggests the existence of a highly sophisticated Olmec textile/basketry industry, based in part on the cultivation of cotton. The technology of the impressed specimen is presented, and the possible implications of this analysis are elaborated.

Poirier, Marcela (Purdue University)

[223] *Decolonizing the Past & Education: Expanding the Classroom and Using Archaeology to Transform the Way History Is Taught. Chavín De Huántar – Perú: A Case Example*

Representations of the past outside of academia are based--to a certain degree--on archaeological or historical investigations; however, they are often outdated and/or manipulated. This has the worrisome ability to disenfranchise Indigenous peoples from their history. As public archaeologists that critique and study knowledge production and consumption from archaeological work, it is our responsibility to create and ensure responsible education outreach. My research explores different ways archaeologists can effectively engage in decolonized educational projects in communities living near archaeological sites. During my 12-month research in Perú, I collaborated with archaeologists, educators, and community members to co-teach a Summer Camp for elementary school children in Chavín de Huántar. We expanded the classroom by taking them to the archaeological site and museum, engaging with these locations in different ways, as well as exploring different archaeological artifacts such as ceramics, bones, and musical instruments. We also provided children with lessons from the past--not typically addressed--such as the environment and humans' impact on it, gender, oral histories, and folk stories. In this paper I will discuss this Summer Camp and the lessons learned. In addition, I will provide suggestions for engaging with local communities in archaeological and historical education efforts.

[264] *Dendrochronology of Historic Structures Associated with the Acequia de San Jose de la Cienega in San Fidel, NM*

A grant was secured from the New Mexico Archaeological Council to conduct dendrochronological studies of a number of structures near the village of San Fidel, New Mexico. Dendrochronological samples were obtained from a breached and abandoned reservoir dam, a partially standing abandoned adobe residence, and an occupied adobe residence. Cut dates were determined from the samples from the dam and the occupied residence. The data from this research is being used to help support precedence dates in the adjudication of water rights for the Acequia de San Jose de la Cienega, the agricultural irrigation ditch that serves the San Fidel community.

Polkowski, Pawel (Poznan Archaeological Museum)

[52] *Rock Art Research in Dakhleh Oasis, Egypt: Content, Methods, and Interpretations*

Situated some 350 km from the Nile Valley, Dakhleh Oasis is considered one of the largest rock art complexes in Egypt. The petroglyphs found there were executed in various periods, beginning from the Early Holocene, through Pharaonic times, towards modernity. Often being located in the same areas, they constitute large palimpsests witnessing a long history of the Oasis. In shaping its landscape rock art production has always played an important role. In this paper I describe some of the research questions raised by the ongoing scientific project of the Petroglyph Unit. Basing on fieldwork conducted in the central part of the Oasis, distribution of various rock art traditions and categories will be presented and analyzed with respect to the ancient routes crossing the area, their landscape setting, and their potential functions and significance. I also touch upon the problem of palimpsestic nature of Dakhleh rock art which can be manifested in frequent superimpositions. In this respect, particularly important are these panels which contain prehistoric depictions covered by or juxtaposed with Pharaonic imagery. Appropriation of older petroglyphs and their re-interpretation may indicate an idea of intentional transformation of landscape in post-prehistoric era.

[200] *The House Next Door*

The attention devoted to households and houses in archaeology over the last few decades has brought with it a welcome emphasis on small-scale domestic practices and the rhythms of daily life. But houses are not only constructed and lived in – they are also abandoned and reused in various ways. I will focus on these latter aspects, drawing on recent excavations at the small, early Chalcolithic site of Monjukli Depe in southern Turkmenistan. The site is characterized by a dense sequence of domestic architecture that reveals remarkable similarities in plan and layout but also an array of abandonment and post-occupation uses of houses that speak to the practices of those still living “next door.”

[260] *Fauna at the HO Bar Site: A Mogollon Early Pithouse Period Site*

At the HO-Bar Site, identifiable faunal bones are very low given the almost 30 cubic meters excavated in 1979. Indeed, most of the faunal remains are fragments (ratio of 3.0 grams of fragments to 1.0 gram NISP). The species and NISP will be presented, and there will be discussion of why there are so many fragments.

Pop, Cornel (Max Planck Institute for Evolutionary Anthropology; Columbia College)

[92] *Lithics3D: An R Package for Lithic Analysis*

An increasing number of studies are demonstrating the advantages and potential of 3D data acquisition and analysis techniques for documenting and understanding drivers of morphological variability in lithic assemblages. Applications of 3D geometric morphometrics, for instance, are challenging and refining traditional classifications and promise to open new windows into artifact life histories. More broadly, 3D scans document the full geometry of artifacts and allow for potentially automated (and hence fully replicable) quantification of important aspects of variability that have heretofore been impractical or impossible to measure or document manually with meaningful precision and/or low inter-observer error. Notwithstanding the advantages of 3D techniques, however, they come at the cost of substantially increased complexity and added expense, and there is a distinct lack of publicly available software designed specifically to work with 3D lithic data, limiting applications. This presentation introduces Lithics3D, an open-source R package for automatic and semi-automatic processing and analysis of 3D lithic scans, highlighting its potential applications and future development directions. The package is the result of an ongoing effort that has already been successfully applied in a series of publications. The main high-level features include automatic surface segmentation, artifact orientation, edge angle measurements, thickness mapping, and more.

Pope, Carly

[407] *A Ceramic Analysis of Coconut Walk Unslipped and Its Implications for Late Classic Maya Salt Production in Coastal Belize*

During the Late Classic period, ca. 600-900 AD, there is evidence for industrial-scale salt production and export of salt from small coastal sites in Belize to the larger inland Maya centers. The mechanisms and processes involved in this brief but intense period of production are yet poorly understood, particularly with regard to ancient technologies at work. Coconut Walk unslipped ceramics, a pottery type with a wide distribution and far-flung analogous types along the coast, are thought to have been used in this salt production. Geochemical and petrographic analyses of 58 Coconut Walk unslipped sherds from three sites – Marco Gonzalez and Santa Cruz on Ambergris Cay, and Watson's Island at Colson Point, in the Stann Creek district – have provided new data concerning the provenance and technology of this complex process. This study

indicates that this pottery is the result of an expedient, locally-produced technology. In defining both this ceramic category and delineating petrographic groups, quartz has been integral. Mono- and polycrystalline quartz from different geological sources has been identified within CWU pastes, and can provide data concerning the production, function, and technology of these vessels.

Pope, Melody

[136] *Glenn A. Black and the Lessons of Big Site/Big Science Archaeology*

Large-scale excavations in the first half of the 20th century, like those conducted by Glenn Black at Angel Mounds, were a means to deliver archaeology from its antiquarian roots to legitimate scientific practice. Though this transformation led to innovative methods, amassed collections of unprecedented size and scale, and created foundational knowledge, the past and peoples who occupied it became increasingly objectified, as we struggle with today in arenas of NAGPRA, curation, and archaeological practice. How does archaeology on such an expansive scale remove from history the very people whose past lives and places it interrogated and memorialized in a national historic landmark? Were other social inequities set in motion through labor relations and institutional politics by early large-scale archaeology projects and their legacies? Would discourse and archaeological practice today be different had this big site/big science approach been more inclusive and sensitive to tribal concerns? Through correspondence, institutional papers, and field records, this paper explores these questions in order to offer solutions to ways archaeologists and tribal groups can come to terms with the unintended consequences of past archaeologies and mediate present challenges.

[380] *Cedar Mesa Architecture: Analysis of Earthen Mortars, Decorated Plasters, and an Intact Wood Roof at Bare Ladder Ruin, Natural Bridges National Monument, Utah*

People of the southwestern United States traditionally used earthen materials for building and architectural embellishment. Examples include pointing stone and earthen unit masonry; layering floors and roofs; fabricating architectural features such as mealing bins, fire hearths, and nichos, and; plastering surfaces to protect them from weather and as a ground for painted and incised designs. Though these mortars and plasters differ in terms of material components and the contexts in which they were used, they share characteristics that provide evidence about how materials were selected, processed, and applied. This presentation focuses on the characterization of ancient earthen plasters and mortars in Structure 14 at Bare Ladder Ruin, which was constructed and used between c.1142 -1216. Our analysis, conducted through the University of New Mexico's Department of Anthropology, the Institute for Meteoritics, and the Colorado Plateau Cooperative Ecosystems Study Unit, clearly supports the idea that materials for earthen construction were specifically selected and then modified to suit the unique site conditions and physical properties required for specific architectural uses. In addition, we will discuss the construction and structural analysis of the intact wood-framed roof on the Mesa Verde-style kiva, and how the analysis informed our recommendations for its long-term preservation.

[390] *Carbon Enamel Isotopes as Proxy for Dietary Changes in the Omo-Turkana Basin between 2 and 1.4 Ma*

Despite the numerous hominin fossils found in the Omo-Turkana Basin dating to between 2.0 and 1.4 Ma., a resolved understanding of their dietary ecology has been challenging due to limited research on similar patterns in contemporaneous large mammals. In this study, we use a sample (n = 390) of enamel $\delta^{13}\text{C}$ values of six Bovidae, Suidae, and Equidae taxa as proxies of their diets. We focused on hyper-grazing taxa due to the highly specific dietary niche. These samples were

assigned locational classifications based on their relationship to the reconstructed depositional center of the basin during this period. Based on their spatial relationship with the center of the Basin, fossils from Ileret, Koobi Fora, and West Turkana were designated as axial, while those from Karari are referred to as marginal. Between 1.87 and 1.56 Ma, Alcelaphine bovids and *Metridiochoerus* in the margin have more depleted $\delta^{13}\text{C}$ values compared to the axis. These depleted values indicate that margin was likely less conducive towards C4 vegetation despite the elevated indicators of C4 plants in the axial regions of our analyses. Further $\delta^{13}\text{C}$ studies of the basin would provide a more nuanced understanding of the relationship between paleogeography and heterogeneity within the broader paleoecosystem.

[259] *First Impressions of the Mesa Verde North Escarpment*

The Mesa Verde region in southwestern Colorado has been intensively surveyed and excavated over the past century, resulting in the identification of over 4,000 archaeological sites on the Mesa Verde cuesta and over 5,000 sites in the Great Sage Plain to its north. Directly abutting the northern cliff face of the Mesa Verde cuesta lays the Mesa Verde North Escarpment, a series of talus slopes that extend from the cuesta down into the valley below. Despite the thorough research history of this area's surrounding regions and its location in what was the most densely populated portion of the prehistoric northern Southwest, the Mesa Verde North Escarpment itself has been relatively ignored. In the summer of 2018, we began a systematic study of the extent of Ancestral Pueblo occupation on the escarpment using drone imaging and pedestrian survey in conjunction with the BLM Tres Rios Field Office. This poster presents the results of that fieldwork effort, offers preliminary occupation estimates through time, and considers the implications of these results for future fieldwork efforts.

[367] *Reappraisal of Evidence for the Pueblo Revolt Village Located in the Villa of Santa Fe, 1680 to 1697*

For one hundred years archaeologists and historians have speculated about the location, size, and layout of the Pueblo Revolt village built on top of the Palace of the Governors following the expulsion of Spanish colonists and priests from New Mexico in August 1680. Few researchers have integrated archaeological data into their hypothetical models. This omission has resulted in a lack of concordance between their models and what is known about Puebloan building conventions from that time. The approach in my presentation integrates excavation data from the Palace of the Governors, historical accounts by Spanish observers, Puebloan scholar interpretations of Spanish accounts, and excavation data from Puebloan villages in the Galisteo Basin where Spanish missions were established prior to the Pueblo Revolt. Using these cross-cultural and cross-disciplinary data sources, I evaluate previous hypothetical models for the Pueblo Revolt village, and then present two alternative models. Finally, I consider the level of coordinated effort and organization required to build and populate the village in light of the Pan-Pueblo phenomena that exemplified that seventeen-year period.

Poston, Victoria and María Belen Mendez Bauer (UNAM)

[309] *Excavations at Tiradero*

The site of Tiradero is located next to the San Pedro River, a tributary of the Usumacinta River, in Tabasco, Mexico and contains evidence of occupation during the Late Preclassic and Terminal Classic periods. At the site, a Middle Formative Chiapas E-Group pattern is consistent with those found in Chiapas de Corzo, Ceibal, and other Maya sites, but differs from the pattern of the earlier Preclassic site of Aguada Fénix only a short distance away. During the past two seasons, the Middle Usumacinta Archaeological Project has conducted excavations in the E-Group plaza to discern temporality, as well as mapping to distinguish the boundaries of the site. The ceramic sequence and construction episodes have revealed a Late Preclassic occupation followed by possible abandonment and subsequent reoccupation during the Terminal Classic as Heinrich Berlin reported in 1953. This paper will outline the work done at Tiradero and how continuing seasons seek to elucidate social changes and human-environment interactions along the Usumacinta River especially during the Preclassic

period.

[195] *First Insights on Proto-Aurignacian Subsistence Behaviors at Riparo Bombrini (Liguria, Italy)*

Located in the Balzi Rossi Paleolithic site complex, Riparo Bombrini documents the oldest Proto-Aurignacian occupations in Liguria, Italy along with the neighboring site of Riparo Mochi. Bombrini itself is the sole site to have been entirely excavated and documented with modern archaeological methods. This makes it a key site to document subsistence behaviors characterizing the arrival of modern humans in western Europe. Unfortunately, the faunal remains have been badly fragmented by diverse taphonomic agents at Riparo Bombrini, the most damaging being the use of dynamite during the construction of the Genova-Marseille railway bisecting the site during the mid-nineteenth century. Given the extensive fragmentation and the near absence of morphologically identifiable bones (<1% identifiable), the ZooMS (Zooarchaeology by Mass Spectrometry) has emerged as an essential tool to supplement traditional zooarchaeological analysis when bones are mass sampled (hundreds of bone fragments). We present results of the first complete faunal analysis conducted on both Proto-Aurignacian layers at Bombrini (A1 and A2), which integrate taphonomy, zooarchaeology and ZooMS. Subsistence behaviors are then compared between both layers and confronted to the environmental and climatic contexts in which they unfolded. Finally, the results are integrated within behavioral reconstructions from the archaeological material already available, notably lithics.

Potter, James (PaleoWest Archaeology)

[254] *Recent Investigations of the Los Rayos – Red Willow Chacoan Landscape*

The Los Rayos-Red Willow Chacoan landscape, east of Tohatchi, New Mexico, consists of the Los Rayos great kiva and at least seven surrounding small-house sites, the Red Willow Chacoan great house and associated great kiva and at least seven surrounding small-house sites, and a Chacoan road connecting the Los Rayos great kiva and the Red Willow great house. The Navajo-Gallup Water Supply project right-of-way extends through the Los Rayos road, about halfway between the great house and the great kiva. As a result, PaleoWest conducted excavations and a geomorphological study in the affected portion of the road and non-destructive investigations at both the great house and great kiva, including mapping, surface pottery analysis, and drone-based imaging. This paper presents the results of those analyses and investigations, including an expansion and reconfiguration of site maps, a refinement of the chronology of site and landscape components, aerial imaging of the sites and surrounding landscape, and 3D models of standing architecture.

[369] *Making the Walls Talk: Rock Art and Memory in the American Southwest*

Over the past few decades, memory has become a topic of prominence in archaeological research. While iconography has long been seen as revealing social practices of the past, rock art has typically been neglected in memory-related literature, a gap in scholarship that is particularly notable in the American Southwest, where hundreds of thousands of rock art images have been recorded. In this paper, I synthesize iconographic, geospatial, and ethnographic evidence to understand the ways that memory is visible in rock art at Baird's Chevelon Steps, an Ancestral Puebloan site in northeastern Arizona documented by the Arizona Archaeological Society and the Rock Art Ranch Field School. I argue that the rock art practices performed at this site, particularly those related to engagement with and manipulation of ancestral imagery, offer insights into how the sites' residents incorporated the past into their ongoing process of identity formation. By integrating multiple lines of evidence, archaeologists can productively interpret the ways that memory is embedded in and facilitated by rock art and advance our understandings of the relationship between memory and identity in the Southwest.

[37] *SIBA: Stone Interchanges within the Bahama Archipelago*

This paper presents results from Project SIBA, an Arts and Humanities Research Council funded project that aims to: 1) characterise the regional social networks that bound the Lucayan archipelago to the wider Caribbean region, and; 2) provide an understanding of the creation and maintenance of indigenous exchange networks. The development of the pre-colonial socio-political networks of the Bahama archipelago is reconstructed through the geochemical, isotopic, stylistic and iconographic analysis of 300 stone artefacts now held in museum collections. Identification of the provenance of the raw materials exploited by source region is combined with a reappraisal of the distinctive canon of Lucayan material culture in order to explore the relationships between people and the stone they worked, exchanged and valued. These relationships are embedded in a complex network of times and places that can be explored through relative chronologies established for the archipelago and geographic models of seafaring voyages.

Powell, Lindsay and Zachary Hruby

[103] *The Obsidian of Postclassic Rio Amarillo: A Shift in Population or Technology?*

The rather diminutive site of Rio Amarillo, located to the north of the Copan city center, is well known as a subsidiary site that was somehow involved in the movement of goods between the Motagua and Copan Valleys. After the collapse of the Copan Dynasty, large civic-ceremonial structures were abandoned and the people that remained, or perhaps moved to Rio Amarillo, formed new living areas in defensible hilltop positions. After examining the obsidian from Platform 9 at Site 5, the northern portion of Rio Amarillo, we discovered that there was a difference in technology from the Late Classic sites in the area. There was little evidence of prismatic blade production, but a great increase in bifacial point manufacture. There were also a relatively large number of obsidians imported from Mexican sources, such as Pachuca, Ucareo, and Otumba. We explore the possibility that there may have been a non-Maya group occupying Postclassic Rio Amarillo, as well as the economic impacts of dynastic collapse and diaspora.

[181] *Early Ritual and Public Hearths in the Casma Valley, Peru*

Around 1500 BC, the complex society of the Sechin Alto polity of the Casma Valley, Peru produced a wide variety of architectural forms ranging from large platform mounds to small single room dwellings. Hearths used for public or ritual purposes are frequently associated with some of these architectural forms. These hearths range from ventilated hearths set within small roofed buildings that could hold very few people, to open-air hearths set within large open plazas that served as the foci of public activities for hundreds of people. Clearly, these special hearths played an important role in a variety of social settings that reflect the complex nature of the society that built and used these features.

[125] *Community Matters: Enhancing Student Learning Opportunities through the Development of Community Partnerships*

Undergraduate archaeology students traditionally have few opportunities to gain meaningful archaeological field and/or research experience while pursuing academic goals such as degrees or certificates. This lack of opportunity can negatively impact students' success in the next stage of their careers. To support student success, Pima Community College's (PCC's) Centre for Archaeological Field Training actively develops community partnerships which provide additional opportunities to enhance student learning. Through community partnerships, students can participate in a wide variety of local and international projects which provide unique educational opportunities and invaluable field and research experience. Partnerships are also mutually beneficial. Our community partners benefit by gaining access to the resources of PCC's Archaeology Centre; by drawing from a student labor pool to assist them in completing projects on-time and on-budget; and by helping to develop the local student workforce for future archaeological employment opportunities within the community.

[249] *Exploring Open-Air Western Stemmed Sites in the Harney Basin, Oregon: A Technological and Chronological Analysis*

Western Stemmed Tradition (WST) studies in the Great Basin often emphasize results from cave or rockshelter sites; however, these sites present a very specific occupation type. Studying open-air sites provides a different line of evidence used to expand interpretations of WST lithic technology and subsistence. Several Paleoindian open-air sites with buried WST components have been discovered in the Harney Basin, Oregon, including Weed Lake Ditch, Nials, and Biting Fly; however, initial efforts by the University of Nevada Reno (UNR) in the late 1990s and early 2000s to precisely date these sites were unsuccessful. Since 2017, the Center for the Study of the First Americans has begun efforts to reinvestigate these sites with the goal of establishing their ages, as well as describing and interpreting the geoarchaeological and lithic materials. The research presented here focuses on Weed Lake Ditch (35HA341/35HA342), from which seven Haskett points, six crescents, a bone needle, a stone pendant, a bone bead preform, over forty bifaces and other non-diagnostic tools, and thousands of pieces of debitage and bone were recovered from buried deposits. New radiocarbon dates and lithic technological analysis will be presented as a way to further explore the WST in Oregon.

[268] *An Application of Surovell's Behavioral Ecology Models of Site Occupation Length in the Peruvian Andes*

In his monograph, *Toward a Behavioral Ecology of Lithic Technology* (2009), Todd Surovell models mathematically the economics of prehistoric hunter-gatherers' production, use, and discard of lithic technologies. Although we see great potential in these models to extend our understanding of hunter-gatherer mobility patterns and landscape use, they have received little empirical testing in the decade since publication. Here, we apply one subset of his models—those that use proportions of the lithic assemblage to estimate site occupation length—in a diachronic study of two stratified, multi-component prehistoric rockshelters of the Peruvian highlands, Cuncaicha and Carhun Ruán. In an extension of Surovell's work, we propose new ways of operationalizing some variables, such as "lithic surplus," outlined in the original text and discuss the role that post-depositional processes might play in complicating these measurements. An extremely high-altitude site (4480 masl) with a Terminal Pleistocene fishtail component, Cuncaicha rockshelter is uniquely placed to benefit

from an evaluation of occupation length, adding another line of evidence to ongoing debates regarding residential vs. logistical use of high-altitude environments during the initial phases of human colonization of South America.

Pratt, William (Texas State University)

[320] *Materials Preparation and Procurement at Cochasquí as Indicators of Social Organization*

Excavations at earthen pyramid sites in northern Ecuador have documented the presence of unique circular baked-earth floors atop the pyramids which have been interpreted to be a marker of the especially sacred nature of the structure. Yet little is known about the process by which these floors are produced and fired or the societies that built them. Recent excavations at the archaeological site of Cochasquí have revealed that, in addition to these baked floors, a number of earthen materials composing the pyramids were manipulated in a variety of ways. Rather than being the product of least-cost procurement, many of the materials were brought from various locations at some distances across the landscape. The way in which these materials appear to have been processed and incorporated into the construction can ultimately provide clues to the technical and symbolic reasons that the architects included them in construction of the pyramids. Understanding the vagaries of material procurement and processing may help explain the organization of the society that built these massive structures and how their unique makeup affects the composition of the surrounding landscape seen at Cochasquí and other pyramid sites across the north.

[408] *Applications of Geospatial Technologies in Known Archaeological Landscapes: Re-examining the Archaeological Settlement Pattern of Falefa Valley*

The development and present nature of landscape archaeology in the Pacific owes much to the pioneering work of Janet Davidson and Roger Green in Falefa Valley, Upolu, Sāmoa. This research, completed in the absence of modern geospatial technology, not only demonstrated the potential of landscape-scale investigations in Polynesia but also laid the foundation for Sāmoan archaeology more generally by constructing an initial chronology and documenting the variation of the archaeological record in the region. This paper builds on the work of Davidson and Green by presenting results of renewed research in Falefa Valley that has taken advantage of modern geospatial technology. Access to a commercial lidar dataset has allowed a re-imagining of the Falefa landscape, identifying large-scale spatial patterns of land use and informing the use of pedestrian survey techniques. We describe and illustrate patterns of food production not previously documented and discuss the implications that these patterns might have on our understanding of Sāmoan settlement and subsistence.

[239] *Scrambles, Potlatches, and Feasts: the Archaeology of Public Rituals amongst the St'át'imc People of Interior British Columbia*

Public sharing of food and gifts remains important to St'át'imc communities of interior British Columbia today despite decades of prohibition by Canadian authorities. The archaeological record offers evidence that public events involving large scale food preparation and sharing were commonly practiced at least since ca. 1300 years ago. Yet, we have little understanding of variation in how such events were developed and operated. We know even less about the social dimensions of public rituals involving sharing of food and goods. This paper explores the archaeology of food-related public ritual (feasting) and related activities (e.g. potlatching) in the Middle Fraser Canyon of British Columbia. Drawing data from the Bell, Bridge River, and Keatley Creek sites, we assess (1) variation in time and space in the nature of such rituals; (2) potential socio-economic and political explanations for variation; and (3) relationships between historical and contemporary practice.

[22] *Archaeology as a Public Good: the Summer Field School Program at Clarion University of Pennsylvania*

During the past twenty years, the anthropology program at Clarion University, a small public university in rural western Pennsylvania, participated in a partnership with the Heritage Program of the Allegheny National Forest focused on the excavation of archaeological sites within the boundaries of the National Forest. This partnership linked undergraduates participating in summer archaeological field schools to high school students enrolled in an outreach program. It formed a collaboration of these students with county, state, and federal officials in a shared project to retrieve and preserve knowledge of past lives. Besides learning basic excavation techniques, undergraduates, many of whom were first generation in college, learned leadership skills, techniques for public outreach, mentoring practices, and a variety of critical thinking skills. Paired with extensive laboratory experience, graduates pursued careers in CRM, museum studies, and heritage programs with state and federal governments. The project exposed landowners to the field of archaeology and created an avenue for them to claim the heritage of their communities. It provided the federal government with knowledge of its cultural resources and a means to connect to both the university and surrounding communities.

[189] *Four Down, 6,000 to Go: Processing and Researching the (not) St. Joseph's Cemetery Site Legacy Collection*

Archaeological legacy collections found in museums and repositories across the nation continue to present challenging and intriguing research opportunities. Basic processing of artifacts and field notes within these older collections can itself feel like an excavation and the slow process of addressing an institution's backlog can be daunting. The University of New Mexico's Maxwell Museum of Anthropology's (MMA) backlog remains in over 6,000 boxes and although thousands have been processed, the smaller historic collections are often given a backseat to larger prehistoric collections. This case study looks at a recently processed historical archaeological collection, LA 49791, housed at MMA in Albuquerque, New Mexico. In a combined effort by staff, graduate students, and volunteers, this holistic study combines artifact analysis and archival research, in concert with bioarchaeological techniques to reclaim contextual integrity for eleven nineteenth century burials and their artifacts. While the sample is small, the individuals buried at this cemetery can give biohistorical insight into others who might remain interred there as well as highlight the research potential that hides within legacy collections.

[64] *An Agent-Based Disaster Model: Marginality, Decision-Making, and Novel Resource Exploitation during ENSO Flooding Events in Chicama, Peru*

Ecological disasters are often argued to be forces of large-scale societal change, including the primary causes of major cultural collapses. This concept is reevaluated in light of the recent 2016-2017 El Niño Southern Oscillation (ENSO), which

provides an opportunity to examine the ways in which this event affects the landscape. Through integration of remote sensing, historical, and archaeological survey data in the Chicama Valley of northern Peru, we investigate a first iteration agent-based agroecosystem simulation as a method of testing how social actors managed resources during disasters associated with warm (El Niño) ENSO phases. Of particular interest are inland water sources and ephemeral vegetation, resources that may be less important during times of plenty but act as invaluable buffers during environmental disasters and also serve as proxies for crop cycles. ABM techniques allow us to define ecological constraints and decision-making criteria of agents, to explore how past communities would have adapted to unforeseen scenarios such as flooding of rivers and canals. Using these methods, we suggest survival strategies that may have allowed social groups to exploit diverse resources and develop novel subsistence strategies, adapt to new circumstances, and avoid destruction.

[84] *Place as Reference: Metonymy in Pueblo Landscapes*

For contemporary Pueblo people in the American Southwest, land, history, and religion are inextricably entwined. Historical events and religious beliefs manifest on the land at different physical and conceptual scales. Over time, places come to represent larger landscapes or philosophical concepts, effectively becoming metonyms for such spaces and ideas. We suggest that metonymy provides a compelling theoretical framework for understanding complex relationships between people, places, and beliefs over time. Drawing on examples that represent both built environments and natural landmarks, we examine how history, religious beliefs, and identity are metonymized at places important to members of the Hopi Tribe and Pueblo of Jemez. This form of recalling and reproducing knowledge adds to the many forms of traditional history that sustain Pueblo identity and culture.

Prieto, Gabriel [55] see Sutter, Richard

Prieto, Gabriel and Feren Castillo

[200] *Becoming Moche in Huanchaco: The Impact of Moche Politics, Economy and Religion in the Fishermen Households at Pampa la Cruz, AD 500-650*

The archaeological research at Pampa la Cruz, a residential fishing settlement occupied between 350 cal. BC and 650 cal AD and located on the shoreline at the mouth of the Moche valley, is providing new insights on the impact made by Moche political organization at the household level. The investigations are revealing the impact of the material culture produced by specialists at the site of Moche as well as the effect of that material culture on the private lives of the fishermen residents at Pampa la Cruz. Current evidence suggest that domestic rituals changed from the intimacy of fishermen families to incorporate new rituals using Moche-like paraphernalia. On the other hand, there seems to be a more restricted capacity of the households to accumulate surplus based on a comparison of storage facilities during the Moche presence of the site and previous occupations. These and other variables are explored at a broader level to measure how political, economic, and religious power had an impact at the household level and explore how local families dealt with these changes and the maintenance of their own identities and social trajectories.

Primeau, Kristy (NYS DEC)

[114] *Methodological Improvements in Landscape Archaeoacoustics: Exploring the Effects of Vegetation and Ground Cover*

Recent development in the field of landscape archaeoacoustics has resulted in improved GIS-based soundshed modeling solutions, however, it has also led to the identification of several limitations of these tools. Foremost among these limitations

is the lack of reliable modeling capability to explore the effects of vegetation attenuation or variable ground cover types on audibility. While these limitations do not impact the study of archaeoacoustics in fairly homogenous landscapes, use of these tools in a landscape of ecotones can result in the production of audibility maps and models which do not reflect the ecological and anthropogenic variation in sonorous environments. This study describes the current state of soundshed modeling; provides a detailed examination of the challenges and tools available to model vegetation attenuation, variable ground cover types, and other impacts to acoustic transmission paths; and explores solutions to these obstacles. The results of this analysis will be discussed in relation to the "Soundshed Analysis Toolbox" (presented in Primeau and Witt 2018), written in Python script for use in ArcGIS. Ultimately, this research will be used to improve the toolbox allowing landscape scale soundshed modeling to be applied to a vast array of site locations.

[407] *By the Sea Shore: Examining the Prehistoric Shell Industry of the Rio Grande Delta*

In North America the archaeologically defined prehistoric culture of the Rio Grande Delta is essentially unknown outside of the state of Texas. Even within Texas the culture of the Rio Grande Delta is poorly understood. Adding to this obscurity is the lack of cross-border communication or collaboration between researchers regarding the material culture of the area. This absence of awareness is unfortunate considering the potential for new understanding the area offers. Though the Rio Grande Delta is a marginal environment, the people of the area exploited the rich marine resources available to them in economically and socially significant ways. The Delta peoples maintained a thriving shell industry, creating a wide assortment of tools and ornaments that dominate the material record. This shell industry enabled the Delta inhabitants to maintain ties with surrounding groups, including the Huasteca farther south along the Gulf Coast. Based on an analysis of the A. E. Anderson Collection housed at the Texas Archeological Research Laboratory, in this paper I will examine the central role of the shell industry to gain a greater understanding of the lifeways and cultural dynamics of the prehistoric Rio Grande Delta.

Proctor, Lucas (University of Connecticut)

[404] *Fanning the Flames of Complexity: Archaeobotanical Approaches to the Study of Fuel Economies at Late Chalcolithic Sites in Northern Mesopotamia*

The burning of fuel resources for the heating and lighting homes, preparing food and craft goods, and eliminating waste is an essential daily domestic practice on par with the acquisition of food and shelter. With the emergence of socioeconomically complex societies in Northern Mesopotamia during the Late Chalcolithic, ever greater resources would have been necessary to fuel expanding craft production and support growing populations in increasingly urban settlements. People living in these societies would have had to balance increasing pressure on their access to fuel resources with adequately provisioning their hearths with fuel on a daily basis. Here, we combine archaeobotanical, anthracological, and dung spherulite analyses of two Late Chalcolithic sites, Surezha (Iraqi Kurdistan) and Tell Zeidan (Syria), in order to investigate the social, economic, and environmental factors underpinning fuel use choices at the onset of socioeconomic complexity. The identification and relative contribution of fuel resources within hearths and refuse deposits speak to both local resource availability and the economic and social organization of domestic activities and craft production in the Late Chalcolithic. Results from these sites document different fuel choices for ovens, hearths, and pyrotechnic features, suggesting a preference for specific fuels based on the activities being performed.

Proctor, Terren (Vanderbilt University)

[206] *Quicksilver and Cruelty: Violence at the Santa Bárbara Mining Encampment in Huancavelica, Peru*

The colonization of the Americas by the Spanish presents a unique context for exploring structural violence. The rapacious extractivism practiced by the colonizers led to the immeasurable destruction of indigenous communities, particularly those working as tributary labor. At the nexus of the colonial mining industry were the mercury mines of Santa Bárbara in Huancavelica, Peru, which operated from the 16th to the 18th century. From these veins, the Spanish extracted mercury for

the refinement of silver for export; this metal was collected by Andean laborers in deplorable conditions for little pay. Bioarchaeological analysis of human remains excavated in 2018 has yielded evidence of extensive violence perpetrated and experienced by the indigenous laborers of the colonial mining economy. Individuals recovered at the site were interred in communal pits after exhumation. These individuals (n=148) show high levels of cranial trauma resulting from interpersonal violence among the community of laborers. I argue that this is indicative of the quotidian experience of the structural violence of the empire. The lifeways of the Santa Bárbara miners and their families were not only lives of labor and hardship, but also of violence, resulting from oppressive institutional policies, and manifesting in everyday interactions.

Proebsting, Eric (Thomas Jefferson's Poplar Forest)

[58] *Exploring Sustainability and the Realities of Plantation Agriculture at Thomas Jefferson's Poplar Forest*

Over the past thirty years, landscape archaeology has been used to study Thomas Jefferson's retreat home and plantation located in Bedford County, Virginia. A goal of this work has been to cultivate a deeper understanding of the individuals who lived and labored on Poplar Forest plantation as well as how their households were connected with the broader world in which they lived. Among other things, this interdisciplinary work has developed detailed understandings of the property's environmental history, extending from the Native American occupation of the property through the 20th century. This includes a special focus on details related to the lives of the enslaved African Americans who lived on the property from colonial settlement through emancipation. While the destructive nature of plantation agriculture and the harsh system that supported it were clearly unsustainable; the historical archaeology and ecology of Poplar Forest and the surrounding community also reveals instances of continuity and resiliency amidst the steady flow of change overtime. These and other topics pertinent to the concept of sustainability may be discussed in the future along a new parkway entrance road at Poplar Forest, designed to bring visitors through historic plantation fields, woodlands, and wetlands before arriving at Jefferson's retreat.

[8] *Toward a Nim (Mono) Archeology*

This poster is a collaboration in an attempt to create a new archeology rooted in a Native American tradition of the people who created the archeological deposits, based in a Nim sense of time, space and values. Archeologists must get away from the artificial concept of sites, which divides rather than looks for interconnections. We must show respect for artifacts not as objects, but imbued with the spirit of those that made them. We need to look at landscapes and land uses. Our chronologies must be rooted in Native American time rather than Western European categories. Lastly we need to create an archeology that embraces Native values. Their past can never fully be understood outside of their frameworks.

[153] *Ethnoornithological and Genomic Perspectives on Royal Hawaiian Featherwork*

Hawaiian featherwork constitutes a treasured element of Hawaiian cultural heritage. Feather artefacts curated in museums today were acquired between the late 18th and the early 20th centuries and it is clear that their production required thousands of feathers sourced from Hawaiian forest birds. Many of these bird species are currently either in decline or extinct, but the extent to which featherwork manufacture contributed to this remains uncertain. We hypothesize that the sacred status of Hawaiian forest birds allowed for feather harvesting to occur in a sustainable manner. We are investigating this using a non-invasive, museum collection-based approach (counts of feathers, extrapolation to total birds exploited). Furthermore, we are employing genomic methods (target DNA capture, high-throughput sequencing) to learn more about the histories of these artefacts. For the genomic work, we make use of contemporary samples for the extant species, museum specimens from the 19th and 20th centuries, as well as the unique source of DNA that are loose feathers from the artefacts themselves. We create a population genomic framework within which data from cape feathers can be placed – to provide clues regarding provenances of feathers used in 'ahu'ula as well as to confirm species identities of the birds used.

[14] *Archaeology and Comics: Cons, Concerns, and Creativity*

Popular culture is important for gauging how archaeology is understood by the public. It allows us to evaluate what aspects of our discipline the public finds interesting and what the public misunderstands, despite a wealth of academic and scientific knowledge. This paper will focus on how archaeology as a discipline, and as a source of information or inspiration, is explored in comic books written by non-archaeologists. It will draw from comics as source materials themselves, reviews of comics by archaeologists, and personal experiences doing outreach at comic conventions, in the form of panels which combine laypeople with professionals, to discuss topics of anthropological and historical significance. These are an important way that archaeologists can both explain more about the discipline, illustrate the past, and correct misconceptions about the field, as a science, and about our knowledge of what the past was like. Additionally, the work will demonstrate the importance of collaborations between creators and archaeologists that can work to create accurate and fun pieces of entertainment. Establishing a good balance of fact to fiction is difficult but can create a rewarding and worthwhile product that works to promote modern ideas about archaeology and an accurate knowledge of the past.

[198] *The Peal of Domination at San Bernabé, Petén, Guatemala*

In 1718, Bishop Juan Gómez de Pareda, the 20th bishop of Yucatan, consecrated a number of bells destined for churches in what is now Petén, Guatemala. At least two of these bells swung in the San Bernabé mission church. The mission was established on the western end of the Tayasal peninsula in Petén, Guatemala a little over a decade after the conquest of Nojpeten, the Itza capital in 1697. Bells herald important rites, daily cycles, and other events but they were also instruments of policia cristiana—of Christian practice. Of course, they were not the only instruments of conversion in colonial period churches. Churches were literal road maps toward salvation and heavenly Jerusalem. However, bells were certainly the loudest and the most penetrating. The current paper considers how bells and other symbols acted as objects of disciple in the context of colonial Petén.

[296] *Revisiting the Mesoamerican Materials from Paquimé*

Beginning with the first investigations in Paquimé, one of the most important issues that archaeologists have identified was the site's apparently intimate relationship with Mesoamerica. This idea is supported by relatively abundant copper objects, as well as ceramic remains from southern sites and other items such as parrots, macaws, and possibly cacao. In this paper we will present the materials found in Paquimé with a southern provenience, analyzing and contextualizing them as to possible places of origin and time frames, in order to better quantify and orientate the Mesoamerican presence in Paquimé.

[259] *Timelapse Photographic Documentation of Archaeoastronomical Sites*

Horseshoe Mesa (WS834) in the Ancestral Puebloan Crack-in-Rock Community of Wupatki National Monument, Arizona, has three petroglyph panels that mark important solar events. Timelapse cameras documented the daily patterns of these interactions from September 2016 to March 2018 at two of the panels. Panel 39 uses carefully placed petroglyph elements to interact with a winter solstice shadow and a summer solstice sunray. Ethnographic sources, design layout, and association with other panels are considered in evaluating how the panel was created, the information that it would have conveyed to contemporary viewers, and its contribution to archaeoastronomical research in the Southwest.

Purdon, Donald (Eastern New Mexico University)

[261] *Projectile Point Variation at Fresnal Rock Shelter*

Typological classifications of stone projectile points are often used as diagnostic indicators of cultural occupations and chronological sequences at archaeological sites across North America. However, many of these typological traditions are only applicable to a particular region where they were first discovered and were commonly based on nothing more than on-site visual comparisons of shape—diminishing their value as cultural and chronological indicators. Moreover, many published typological sequences do not consider the range of variation that a “type” may actually encompass resulting from raw material constraints as well as resharpening and reworking procedures. A primary goal of this research is to contribute to this ongoing discussion and document morphometric variation within the projectile point assemblage from Fresnal Rock Shelter, New Mexico. Multivariate analysis of variance was used to examine whether patterns in morphology generated from traditional metric and geometric morphometric attributes support the typological organization that has historically been used to describe the cultural sequences at Fresnal.

[274] *The Search for Paleo Dog and the Recognition of Ancient Art*

During archaeological field schools in 1976-1978, unfamiliar chert objects and tools were recovered from a sandy/clay deposit at the Container Corporation of America site (CCA 8MR154), Marion County, Florida. This deposit, the Alachua Clays, was traditionally considered “culturally sterile.” The specimens from the sandy/clay deposit did not resemble in any way chert artifacts from the overlying sand layers that ranged from Middle Archaic to Paleoindian. Significantly, a gigantic chert boulder, jokingly designated “Paleo Dog,” was exposed in Area 3, Square 3, and numerous chert specimens were recovered around and below it from the Alachua Clays. Field schools terminated, excavation units were backfilled, and Paleo Dog did not see the light of day again until March 28, 2017. Renewed interest in the CCA site led to the exposure and study of its stratigraphy in several backhoe trenches, and to the excavation in 2017-2018 of nine new units in Area 3, seven of which confirmed the existence of cultural material in the Alachua Clays, including animal figures of chert. Paleo Dog's resurrection, chert animal figures, the Alachua Clays, and exciting recent discoveries are the subjects of this presentation.

[208] *The Dreaded Pox: Agent-Based Simulation of the 1870 Smallpox Epidemic in Tucson, Arizona*

In October of 1869 a smallpox outbreak developed in Tucson, Arizona, which lasted until late April of 1870. Historical documents do not agree on the number of deaths resulting from the epidemic, and no concrete information is given about the extent of the illness spread through the Tucson community or the surrounding region. Bioarchaeological evidence of smallpox is also scant. Therefore, in order to estimate the total number of deaths and impact of the epidemic, an agent-based computer simulation was constructed using AgentSheets® 3.0 simulation software. Census figures from the 1870 federal census were used to populate the simulated Tucson environment. This initial simulation tests a “virgin” environment where no previous immunity is assumed and agents progress through all levels of smallpox infection (susceptible, pre-eruptive, pre-symptomatic, symptomatic, immune or dead) based on agreed upon disease epidemiological parameters. Ten simulations were run and the averages of the simulation resulted in 779 deaths, 1721 infected individuals who recovered, and a 311-day long epidemic. These results are similar to what would be expected in a virgin population of this size based on disease parameters. This suggests that further simulation specification could yield results which more clearly approximate the unknown historical truth.

[214] *A Functional Study of ‘jiandiping’ (Pointed base) Amphorae*

There have been many debates on the function of jianping (or pointed base) amphorae of the Yangshao Culture in the Wei River valley. Although analyses of plant residue suggested that the amphorae might have been used as wine vessels, their function and the usage are still in doubt. Based on the observations of typological characteristics and the production technology, this paper investigates the functional significance of the morphological structure of the jianping amphorae from the perspective of design. The main function of the pointed bottom is to separate by precipitation, but the narrow mouth is not suitable for the fermentation of cereals, contrasting with the wine brewing process in which fermentation and precipitation taking place simultaneously. In addition, the specific functions and usage of the large and medium-sized amphorae are different, while the double handles on amphorae of different sizes also show variation. The large amphorae were inconvenient for transportation, but suitable for long-term storage in an environment with consistent humidity and temperature. The smaller ones were used at feasting or sacrificing events, usually forming a set with the similarly shaped flat-bottomed bottles. Once the more convenient precipitation technique emerged, the inconvenient pointed-bottom structure was replaced.

[78] *Pluvial and Fluvial: Investigating the Environmental Resistance and Driving Force of Wheat Cropping in the Central Plain of China*

Recent archaeological evidence suggests that wheat, one of the most important grain crops originating in the Near East, was introduced into the Central Plain of China as early as approximately 4,000 BP. However, it is not until around 2,000 BP or even later that wheat was widely cultivated and consumed. Why was there a two-thousand-year gap between the earliest emergence and widespread cultivation? And why was wheat eventually accepted by the Central Plain inhabitants? These questions have attracted but also puzzled archaeologists for a long time. Although cultural and culinary traditions may play a significant role in resistance and acceptance, this research mainly focuses on environmental factors. We first compare the pluvial patterns of the Mediterranean climatic zone with the East Asia Monsoon zone, and investigate variance in rain fall pattern as a factor in the resistance of wheat cropping in the Central Plain of China. The study then reconstructs the fluvial sequence in the lower reaches of the Yellow River and investigates the increasingly frequent Yellow River floods as the driving force of wheat cropping in the China's Central Plain.

[280] *Examining the Ramifications of the Formation of a Late Classic Maya Polity on Local Exchange Systems at Lower Dover, Belize*

Traditionally scholars envisaged Classic Maya economic centralization and commercialization as being poorly developed. However, the discovery of markets at several Maya political centers has begun to shift these perspectives. One important question which remains is how much did centralized markets affect the redistribution of items within hinterland households? The Late Classic (AD 600-900) Maya polity of Lower Dover, Belize arose in a densely populated landscape dominated by autonomous communities with long-established local elite leaders. The recent discovery of market facilities at the civic-ceremonial center indicate the possibility that the rise of the political center was accompanied by centralized marketing of certain commodities. This paper provides a settlement-based perspective grounded in the distributional approach to test the hypothesis that differences existed between the exchange items among high and low status commoner and intermediate elite residences in the hinterlands of the polity. Our investigation applies ANOVA (analysis of variance) to the proportions of imported ceramics and obsidian diachronically before and after the emergence of Lower Dover. Based on preliminary data we hypothesize an increase in commercialization following the rise of Lower Dover, most probably associated with the centralized markets.

[355] *Factional Ceramic Economies in the Inka Imperial Heartland*

Inka ceramic workshops have been identified in many Inka provinces, but the process of making and disseminating Inka pottery in the imperial heartland of Cuzco has been largely unknown until recently. Previously, scholars assumed Inka pottery was made in state-sponsored workshops near the urban capital. However, excavations at a royal estate site 30 km northwest of Cuzco (Cheqoq, Maras) revealed a small-scale imperial-style ceramic workshop operating in the late decades of Tawantinsuyu. This paper examines the archaeological and ethnohistoric context at Cheqoq, an Inka village where forcibly migrated retainer laborers from nearby and distant ethnic groups were resettled in the late imperial period. Cheqoq was one of the largest Inka domestic sites in the Cuzco region, with dozens of large imperial storehouses, a corral complex, heterogeneous domestic terraces, and the first securely-identified imperial pottery production locus in Inka Cuzco. The site was likely one of many where imperial pottery was produced; however, household excavations there indicate that the pottery was not destined to be used at the same site. Retainer laborers at Cheqoq produced imperial-style goods for the benefit of a particular royal faction, and contributed to the formation of a decentralized ceramic economy in the imperial heartland.

Querenet Onfroy De Breville, Iris (Barnard College of Columbia University)**[213]** *Analyzing Archaic Rock Art in Northern New Mexico through Landscape Survey*

My paper will be centered around an archaeology of the ancient indigenous rock art analysis through the landscapes of northern New Mexico. This project utilizes two primary lines of evidence. First, it examines the plant and animal ecology of the Rio Grande Gorge, particularly the so-called natural signs or traces of mammals such as the modern distribution of tracks, game trails, and scat. Second, it examines the ancient human-made signs of the hunt, particularly the hundreds of animal tracks that were pecked on rocks in the Rio Grande Gorge over the past 12,000 years -- by re-visiting rock art sites to study their relation to surrounding features of the landscape. This project, then, will bring together iconography, ecology, and Native American traditions to understand how early hunters "read" the landscape of the Rio Grande Gorge in their pursuit of game. I will re-contextualize the art, facilitating its interpretation and hopefully bringing it to life.

Quilter, Jeffrey [253] see Fehren-Schmitz, Lars

Quinlan, Liz (University of Massachusetts - Boston)**[136]** *"... and his wife Sally": The Binford Legacy and Uncredited Work in Archaeology*

Often mentioned as an afterthought in sentences about her more famous husband, Sally R. Binford has long been a topic of discussion for those interested in 20th century female archaeologists. Her foundational work in the early endeavors of the 'New Archaeology' set the stage for an academic revolution, however, much of her work went uncredited. The legacy of stolen work affects a broad demographic, with graduate students, post-doctoral, and early career researchers often suffering the same insult. Through discussion of Sally R. Binford's contributions to, and omissions from, the field of archaeology, this paper will examine solutions for the threat of lost attribution, and how we might successfully navigate hostile academic environments. Sally's position as a queer Jewish feminist academic working in the 1950s to 1970s, and the actions she took, serve as both a warning and a model for those who may be facing similar problems today.

Quinn, Colin [58] see Dorr, Lana

Quinn, Colin (Hamilton College)**[183]** *A Bioarchaeological Approach to Contested Mountain Landscapes in Transylvania's Golden Quadrangle*

In this paper, we introduce the agenda for the session Living and Dying in Mountain and Highland Landscapes. Mountains and high altitude areas are ideal spaces where archaeologists can examine the relationship between social action and the environment. As this session will show, the study of human remains must be situated with a holistic bioarchaeological approach to life and death in order to understand the dynamic relationships between people and mountain and highland landscapes. We highlight one such approach through a case study of mortuary archaeology and bioarchaeology in the Apuseni Mountains of Transylvania (Romania). The Apuseni Mountains are home to the richest gold and copper deposits in Europe; key resources that fueled the development of social complexity during the Bronze Age. In this heterogeneous landscape, we document and discuss changes in upland use throughout the Bronze Age. We introduce the results of recent bioarchaeological research to discuss the biocultural consequences of living in upland environments. We argue that the Apuseni mountain topography channelized mobility through mountains, heightened competition for access to metal trade routes, and provided relief that Bronze Age peoples used to create monumental reminders of ancestral connections on daily and decadal temporal scales.

[410] *Lead Isotopic Evidence for Foreign-Born Burials in the Classic Maya City of Holmul, Petén, Guatemala*

La Sufricaya, a Classic Period Maya civic-ceremonial complex in the city of Holmul, Petén, Guatemala, has several epigraphic elements that potentially link it to the Maya city of Tikal and the central Mexican metropolis of Teotihuacan. The La Sufricaya area boasts elaborate elite residential buildings, plazas, a ball court, and carved stelae; rulers from Holmul trace their dynasties back to a Teotihuacan-linked founder. La Sufricaya also shows epigraphic and architectural similarities to Copan, and both sites share a foundation narrative of a ruler embarking on a pilgrimage to a distant place, possibly Teotihuacan. In an effort to test if cultural connections at La Sufricaya included foreign-born individuals, we analyze lead isotopes of dental enamel samples and report new AMS dates of six burials. Framed within established lead isoscapes, five of the six individuals suggest geographic origins in the Northern Highlands, a region that includes Copan. We cannot rule out that the Maya Mountains region, which includes Caracol, was also a possible source. One individual, who died during late infancy, was likely born in the Northern Lowlands. We interpret an interchange of people between the Holmul area and other Maya geopolitical regions within the Yucatan Peninsula and discuss possible political connections.

Quiñonez, Patricia

[356] *Estudios de las especies de moluscos en Quilcapampa La Antigua*

El sitio arqueológico de Quilcapampa se ubica en la margen derecha del valle medio del río Sihuas al sur de Perú. Los datos recuperados durante dos temporadas de campo lo ubican cronológicamente en el Horizonte Medio, asociándolo directamente a la cultura Wari, evidenciando actividades específicas, entre las que destacan aquellas relacionadas con la alimentación, identificando una dieta variada que combina productos agrícolas y productos marinos. La inclusión de estos alimentos marinos en los grupos humanos asentados en las partes media y altas de los valles andinos nos pone en manifiesto 5 aspectos a tener en cuenta: El acceso al mar para la actividad de recolección de moluscos (distancia desde la entrada/salida del valle medio hasta el litoral), la especialización de las personas para la obtención de los moluscos en diversos fondos marinos, la selección de individuos aptos para el consumo, la identificación de la presencia o ausencia de un fenómeno ENSO, y el traslado de los moluscos al interior del valle, cuya inversión de esfuerzo sería una variable importante según el lugar de intercambio del producto, pudiendo ser en el valle bajo o valle adentro.

Quintana Ortiz, Luis (University of Puerto Rico, Río Piedras Campus)

[418] *Analysis of Households in Calle de Isabel II, San Juan, Puerto Rico, 1910*

Calle de Isabel II was the main street of La Puntilla, a neighborhood located in a small peninsula outside the San Juan city walls. Throughout the 19th century a series of construction projects were undertaken in this area, including dwellings, schools and colonial government buildings. Unfortunately, a large part of this neighborhood was demolished in the mid-20th century to give way to new residential units, but the proposed plan was not completed and the land was converted into a parking lot. This presentation focuses on an analysis of households located in Calle de Isabel II, to identify information related to family units, trades and professions, in addition to building characteristics. Documentary resources like maps, blueprints, photographs, commercial directories and newspaper advertisements were used to recreate the stories of the people who lived on this street.

Quintela, Daniel

[180] *Petroglyph Panels in Isolation: Differences in Cultural Expression through Rock Art Placement in the Landscape of Petrified Forest National Park*

Across Petrified Forest National Park, ancestral Puebloans left their mark on the landscape through the creation of thousands of petroglyph panels. While the exact meaning behind the glyphs depicted in petroglyph panels has been blurred by the passage of time and poses a formidable interpretive challenge to archaeologists, the locational context of petroglyph panels has the potential to provide insights into the nature of cultural expression occurring across different rock art sites. While many petroglyph panels within Petrified Forest have a clear association with pueblo settlements located in their vicinity, many more petroglyph sites are in relative isolation on the landscape; these different petroglyph site types may provide evidence for distinctive forms of sociocultural expression occurring at these sites. A GIS-based locational analysis will allow for the identification of isolated petroglyph sites and ethnographically-documented landforms of cultural significance that these sites occur on. This paper will additionally compare the distribution of easily-identified glyphs of

sociocultural significance between isolated petroglyph sites and those associated with habitations to identify possible differences in representations of sociocultural affiliation occurring across these two site types.

Quintus, Seth (University of Hawaii at Manoa)

[354] *Small Islands and Hinterlands: Exploring Scale and the Sāmoan Archipelago*

The concept of a "hinterland" is a tool. As such, the concept is only beneficial if it can help us understand human behavior or the archaeological record better than alternatives. Recent research has shown that it can be usefully applied in Polynesia, but its application is geographically and substantively limited. This paper will explore the use of the concept to understand social relationships and the archaeological record of the Sāmoan archipelago. The Sāmoan archipelago is one of the largest in Polynesia and occupies a culturally and geographically transitional location. It also features significant environmental variation that results in behavioral variation throughout time and space. Such variation is, in some ways, relates to complex socio-political changes that resulted in the movement of power, according to oral tradition, from one side of the archipelago to the other. That shift in power no doubt had implications for how human populations lived and what materials they created and left behind, but I argue that the use of the hinterland concept in this circumstance is only helpful with recognition of scale. In other words, the hinterland concept is useful to the extent that we address hierarchies of spatial and temporal scales.

Quirin, Carley (Seton Hall University), Rhonda Quinn (Seton Hall University; Rutgers University), Jason Lewis (Turkana Basin Institute; Stony Brook University), Kathryn Ranhorn (Peabody Museum of Archaeology and Ethnology, Harvard) and Christian Tryon (Peabody Museum of Archaeology and Ethnology, Harvard)

[47] *Mammalian Enamel Stable Isotopic ($\delta^{13}C$, $\delta^{18}O$) Evidence for Environmental Change during the MSA-LSA Transition at the Kisese II Rockshelter, Tanzania*

Environmental perturbations are invoked as an influence of hominin speciation, dispersal and technological innovations. Archaeological occurrences preserving the transition from the Middle Stone Age to the Later Stone Age are critical to gauging environmental influences of human adaptations, yet there is a dearth of well-dated sites in eastern Africa. The Kisese II Rockshelter (Tanzania) has a chronologically constrained ≥ 6 -m-thick stratigraphy spanning the MSA/LSA transition and includes lithic artifacts, ostrich egg shell beads, evidence for red ochre use, and hominin and non-hominin skeletal and dental remains. Here we isotopically ($\delta^{13}C$, $\delta^{18}O$) analyze 109 bulk enamel samples representing 30 herbivorous and omnivorous mammal species in order to characterize the site's environments throughout the succession. Kisese II shows an increase in the percentage of C3-browsers at the expense of C4-grazers and C3-C4-mixed feeders through time. Kisese II faunal $\delta^{18}O$ values are slightly higher during the latest (Holocene-aged) archaeological occurrence potentially indicating increased aridity and/or changes in rainfall $\delta^{18}O$ values. Kisese II faunal enamel isotopic data stand in contrast to those of the comparably aged archaeological site at Lukenya Hill (Kenya). Local controls on environments and latitudinal differences in vegetation structure and water availability potentially linked to the African Humid Period are discussed.

[287] *La escultura monumental Inka: Chinkana Grande y Teteqaqa, Cusco, Perú*

En las sociedades andinas como la Inka, la preocupación de las poblaciones agrícolas por el agua para sus cultivos conlleva a realizar dos tipos de obras: las obras hidráulicas que suministraban del líquido vital y las obras artísticas realizadas en las nacientes del agua donde coexistía un afloramiento rocoso de dimensiones monumentales. Estas obras artísticas fueron talladas por los Inkas, transfigurando las rocas en esculturas monumentales, con el plan esencial de sensibilizar a los grupos humanos próximos sobre la relación del poder del Tawantinsuyu con las expresiones de la pachamama y la importancia de la preservación del agua. En Cusco existen afloramientos rocosos con tallados en distintas formas, tamaños y composiciones, denominados como elementos compositivos. En este trabajo se presentan los

resultados del estudio de dos de estas esculturas monumentales inkas en Cusco, Chinkana Grande y Teteqaqa. El análisis permite apreciar la plasmación de aspectos ideológicos vinculados a la organización de la sociedad Inka. Estudiar las relaciones entre distintos elementos compositivos tallados sobre estos afloramientos rocosos mejorara nuestro conocimiento del rol desempeñado por la ideología en los imperios tempranos y representara un referente para entender los cultos desarrollados por las religiones prehispánicas en los Andes Centrales.

[121] *The Use of Forensic Anthropology Methods in Historic Cases*

"Historic" is a term commonly used in archaeology and bioarcheology but is not typically associated with forensic anthropology. However, historic cases have been brought to forensic anthropology labs, where biological profiles are built using forensic anthropological methods. These osteological methods used within forensic anthropology can be applied to historic cases, as seen in the cases from Beaverhead County, Montana. The initial request for this study came from an individual that believed a deceased family member had not been transferred to a new cemetery. During the initial exhumation done by the City of Missoula, three individuals were discovered and transported to the Montana State Crime Lab, where they were transferred to the University of Montana. Sex, age, stature, ancestry, and pathology were estimated using forensic anthropology and bioarcheology methods in order to aid in identification. Analysis of sexually dimorphic traits of the skull and pelvis were used for sex estimation. Known changes within the pelvis and skull were used to estimate age-at-death. Morphological characteristic and cranial measurement were used in correspondence with FORDISC 3.1.'s statistical analyses to determined ancestry. Trauma and pathological analysis were performed and corroborated by Dr. Aldo Fusaro of the Montana State Crime Lab in Missoula, MT.

[363] *Complexity Science and Archaeological Cultures: Evaluating Archaeological Phenomena Using Networks Analysis of Copper Supply in the Balkans, c. 6200 – 3200 BCE*

The concept of archaeological culture is one of the most challenging yet most enduring concepts in prehistoric archaeology. Recently we used innovative method based on complex networks for identifying community structures in the archaeological record that allow for independent evaluation of archaeological cultures that show evidence of copper use in the Balkans,

from c. 6200 to c. 3200 BCE. We employ chemical data of copper-based objects from 79 archaeological sites as the independent variable for detecting most densely interconnected sets of nodes with a modularity maximization method. For each time slice, the structure of the network based on copper tools was compared to the spatial distribution of archaeological cultures. However, the effect of isolation by distance was not explicitly controlled. Here we build upon our previous study and apply the methodological approach developed in Radivojevic & Grujic (2018) to empirically determine if traditionally defined archaeological cultures of the Balkan Neolithic and Chalcolithic (6200-3200 BC) represent meaningful entities from the perspective of dynamics of copper supply networks and technology transfer. Furthermore, we improve our previous method by doing the cluster analysis of the bipartite network instead of the projection as in our previous study.

Radlo-Dzur, Alanna (Ohio State University)

[411] *Greater Nicoya Metates and the Art Market: A Case Study*

A distinctive tradition of intricately sculpted metates—commonly known as grinding stones—flourished along the Pacific coast of Nicaragua and Costa Rica circa 300-900 CE. The Greater Nicoya burials that contain carved metates often include grave goods made of precious materials such as jade and gold. As a result, these sites have been subject to looting since the 16th century when the Spanish thought of cemeteries as “mines.” Interest in other types of artifacts only began to increase in the 19th century as encyclopedic museums clamored for new types of objects to fill their halls. Unfortunately, the preponderance of undocumented artifacts in collections—along with continued looting—has obscured the emergence of a new type of object. Based on archaeological examples, these Greater Nicoya metates first appear in museum collections at the turn of the 20th century, in the same moment that the earliest scientific excavations began in the region. Today, they frequently appear in auctions of Precolumbian art and are on prominent display in museums around the world. This case study describes these metates, showing how they reflect the interests and desires of collectors, particularly in the 20th-century market for “primitive” art.

[192] *Population Structure in the Valley of Mexico at the Time of Spanish Conquest*

Cultural processes connected the various regions throughout Mesoamerica. Increased long-distance trade, political alliances, imperial conquest, and spread of religious ideology in the Valley of Mexico facilitated more migration over time. City nucleation to important economic, political, and religious centers increased population variation throughout the Valley of Mexico in the Late Postclassic period (1200-1521) compared with previous settlements throughout the region. This variation resulted in the complex population structures and multi-ethnic cities and towns the Spanish encountered upon their arrival in 1519. Here we present population structure results of Formative, Classic, and Postclassic groups in the Valley of Mexico. We compare dental morphological observations among skeletal samples from the Valley of Mexico and nearby regions, over time, using traditional biological distance and genetic population structure analyses. Results indicate population variation greatly increases during the Postclassic period, particularly during the Late Postclassic. Increase population variation correlates with increased economic, political, and religious complexity throughout the region, most likely resulting from complex migration networks associated with cultural interactions. Our results support increased migration prior to, and throughout the Postclassic period led to a biologically diverse environment in the Valley of Mexico at the time of the Spanish conquest.

[346] *Bedrock Mortars as Symbolic Features*

Bedrock mortars are common features in various parts of the world, including western North America. They are most often viewed as food-processing facilities, and indeed there is ample historical evidence for this function, especially from

California and parts of the Great Basin. However, there is also evidence that bedrock mortars, or similar features, were used for more symbolic purposes. This includes ethnohistoric and archaeological examples in which mortars served symbolic functions, or could not have been effectively used for food processing. Known or possible symbolic functions include calendrical devices, earth openings, and sexual representations. After reviewing some known or suspected examples of symbolically functioning mortars from various parts of the world, this paper presents a case study from the Culebra Bluff site in southeastern New Mexico. This site, located along the Pecos River, was occupied over a long period of time and has numerous bedrock mortars in several spatially discrete clusters. The conglomerate bedrock into which many of the mortars were carved would have made them less-than-ideal for food processing. The bedrock mortars at Culebra Bluff may have embodied a symbolic function, perhaps intended, in part, to reinforce the site's status as a persistent place.

Raillard, Daniela (Northwestern University)

[287] *Embodied Deathscapes: Above-Ground Mortuary Structures in the Northeastern Peruvian Andes*

The northeastern slopes of the Peruvian Andes are ruptured by jagged limestone cliffs containing tombs built into caves, ledges, and overhangs. While these tombs vary considerably in structural and stylistic form, ranging from painted sarcophagi to multi-storied mausolea, they have been associated with a single archaeological region defined as Chachapoyas. Pedestrian survey conducted in 2017 and 2018 begins to address the significant quantity and diversity of above-ground tombs. This poster examines survey results to propose that the mapping of above-ground tombs can 1) provide insight into questions of the region's social and political diversity and 2) develop understanding of how the dead in the Andes structured the landscape of the living. I introduce a preliminary model of a deathscape to explore how above-ground tombs acted to structure the landscape of the living. Through catchment analyses, settlement patterns and viewsheds, the poster visualizes the embodiment of the dead in a lived landscape. Finally, I complement these analyses with the phenomenological experience of moving through a deathscape on both pre-Hispanic and contemporary trail networks in Peru's northeastern ceja de selva.

Rainville, Charles (University of Oklahoma)

[325] *Remote Sensing's Capacity to Identify Shell Deposits at the Silver Glen Springs Complex, Florida*

Landscape archaeology is fundamentally directed towards understanding the intersection of natural and constructed places, and their reciprocal influence on history. Mounds constructed of earth or shell have been the predominant focus of Southeastern archaeologist for generations. Subsequently, the spaces outside the bounds of mounded places have not been adequately studied. Remote sensing equipment such as: ground penetrating radar, magnetic susceptibility gradiometer, and electrical resistance meters, as well as coring, and test unit excavations were utilized during the 2018 field season at the Silver Glen Springs Complex in Northeastern Florida. The use of combined remote sensing, coring, and excavations can provide the resolution needed to investigate the subsurface architecture and patterning of the non-mounded spaces. Geophysics' capacity to identify archaeological deposits without the use of destructive excavation has been useful, but methodological concerns persist in its ability to clearly identify subsurface variations in composition, like pit features. This poster delves into the efficacy of multiple geophysics equipment's ability to identify discrete shell deposits and sub-surface architectural elements by comparing the remote sensing data with coring and test unit excavations. It is through this analysis that a protocol is developed for identifying shell bearing middens and other subsurface elements from geophysics data.

[338] *Geochemical and Sedimentary-Based Reconstruction of the Palaeoenvironment and Formation of the Late Stone Age Site of Txina-Txina (Massingir, Mozambique)*

This study aimed to reconstruct Txina-Txina site (located between the junction of Machampane and Chifati rivers, Southeastern Mozambique) paleoenvironment and site formation processes to better understand its occupation pattern,

preservation of archaeological materials and the impact of palaeoenvironmental changes on human evolution. For this, we collected sediment samples from test pits and sections on the wall of Txina-Txina for textural, morphometric and geochemical analysis. Additionally, the number and weight of lithics was measured on the test pits. These data allowed us to conclude that next to the hill slope there are colluvial sediments with angular boulders. These sediments were overlaid by a conglomerate covered by fine sediments episodically interrupted by gravel layers. The presence of a conglomerate and round gravel layers indicates that there were high energy events along the rivers. According to the dates, the gravel layers were deposited in wet periods that occurred before 29000 and after 14000 years ago, during the African Humid Period. Although our interpretation is that the fine sediments have a colluvial origin, more analysis will be carried out to confirm this hypothesis. The lithic concentrations showed that the site occupation was likely to have been more intense during drier periods.

Rakita, Gordon (University of North Florida)

[185] *Bodies of Evidence: Indications of Non-Western Ontologies at Paquimé, Chihuahua*

Ethnographic descriptions of historic and contemporary peoples with clear connections to prehistoric cultural groups offer ready sources to explore non-Western views of reality. Researchers working in the American Southwest and much of Mesoamerica benefit from robust ethnographic accounts that can be fairly unambiguously connected to prehistoric cultures. However, in the absence of clear ethnographic analogs, the direct historical approach to elucidating indigenous ontological principles is difficult. The prehispanic community of Paquimé in northwestern Chihuahua, Mexico represents just such a situation. While there are some existing native cultures that provide hints at possible Paquiméan ontology, no direct connection between the prehistoric past and existing cultures has been established. In this paper, we examine what ethnographic materials do exist along with archaeological evidence, especially evidence from human remains, to explore possible Paquiméan views of the body.

[353] *Working, Living, and Dying Together: Rethinking Marginality, Sex, and Heterarchy in Kayenta Communities (AD 900-1150)*

Pueblo groups living in the Kayenta region of northern Arizona differ remarkably from their contemporaries in adjacent regions. At Mesa Verde and Chaco to the northeast and southeast respectively, there is compelling evidence for rigid hierarchical and political systems of trade, governance, and decision-making that generated inequalities across localities and sex, age, and status groups. In the Kayenta region, communities formed alliances and kin networks across vast spaces, while trading local items within Kayenta boundaries. This study examines patterns of disease, enthesial changes, robusticity, and trauma in adult males and females from the Kayenta region. The comparable distribution of these skeletal markers across sex and age groups suggests a unique form of heterarchy foundational to the people occupying what has been described as a marginal and challenging place to survive as farmers. These data have implications for understanding the successes of the Kayenta populations in terms of health outcomes and growth compared to other groups. What explains this island of heterarchy in a sea of hierarchy? Utilizing Gidden's notion of ontological security, it can be argued that by focusing inward and developing a subculture of equity and security through inclusiveness, Kayenta communities put their faith in collaboration and innovation.

[82] *Trade and Exchange in the Greater Mapungubwe Landscape*

Our understanding of the trade and exchange networks systems in Southern Africa during AD 700 to AD 1300 has mostly been drawn from sites located in the Shashe Limpopo Confluence Area (SCLA); a drainage basin that is positioned on the borders of Botswana, South Africa and Zimbabwe. This has led to bias interpretations and conceptualisation on how trade and exchange networks were structured. The question of control and access to materials such as gold, copper, iron, glass beads, ivory and many other remain central. Was access to these objects controlled, if so how? Similarly, more questions need be asked about the objects that archaeologists associate with the high-status elite communities. Were these objects always reserved for and restricted to elite consumption? Alternatively, can we identify variable patterns in the distribution of the different objects, both spatially and temporally? Such question is crucial in reconstructing and understand the trade and exchange network systems in the Greater Mapungubwe Landscape.

[255] *Obsidian Blade Caches from the 8N-11 Group of Las Sepulturas, Copan, Honduras*

Ongoing excavations in Structures 69C and 70W in the 8N-11 group of Las Sepulturas have uncovered pressure blade caches of great complexity and size. While blade caches are relatively common at Copan, these caches were excavated with an eye for context and technology. Careful recording of the relative positions of these blades, as well as a detailed technological analysis reveals previously unrecognized symbolic patterns in their deposition. We discuss the method of excavation and recording of the blades, symbolic meaning and explain the processes of production that must have occurred to create these caches.

Ramos Madrigal, Jazmín (Natural History Museum of Denmark, University of Copenhagen) and M. Thomas P. Gilbert (Natural History Museum of Denmark)

[302] *The Genetic History and Diffusion Routes of Early Maize in North America*

Archaeological and genetic evidence from modern and ancient maize (*Zea mays*) samples indicate that maize initially reached the southwestern United States (U.S.) by around 4,000 years ago via a highland Mexican route, followed by a second introduction via the Pacific coast, around 2,000 years ago. However, maize diffusion routes northward from the domestication center from southern Mexico up to the U.S. Southwest and Southeast remain contentious. To explore the potential diffusion routes, we generated high-throughput sequencing data from 24 ancient maize cobs and kernels from three archaeological sites dated to different time periods: the Romero Cave in northeastern Mexico (n=2; 2,450-2,750 BP), the Three Fir Shelter in the southwestern U.S. (n=6; 2,075-2,500 BP) and the Ozarks Shelter in the southeastern U.S. (n=16; 70-1,120 BP). By comparing these data to a reference data set composed of modern maize land races and previously published ancient maize samples, we assess the genetic ancestry of early maize in North America and identify potential dispersion routes north from the domestication center into northeastern Mexico and the southeastern U.S.

[85] *Complexities and Opportunities in a Living Landscape: Developing a Cooperative Management Strategy for Historic Navajo Architecture in Canyon de Chelly*

Canyon de Chelly National Monument's enabling legislation language is unique among units of the National Park system. Rights, title and interest to all lands and minerals were retained by the Navajo tribe upon the Monument's establishment in 1931. Legal authorities are therefore executed by multiple governmental entities including, but not limited to, the Bureau of Indian Affairs (BIA), the National Park Service (NPS), the United States Department of Agriculture, various Navajo Nation departments and local tribal Chapters. While cooperative management between these entities is crucial for protecting the canyon's resources and trust relationship, the canyon's historic vernacular landscape has largely been shaped and maintained by generations of Navajo families. Many significant Pre-Contact architectural sites also contain historic Navajo alterations and structural additions. Despite a shift away from extensive farming and livestock grazing toward tourism, Canyon de Chelly's resident Navajo community still maintains a strong bond with archaeological sites that contain historic Navajo elements. As the NPS joins the BIA and Navajo Nation in developing a Joint Management Plan for the canyon, cooperative preservation strategies will be explored with individual residents whose families have preserved and contributed to the evolution of the canyon's historic vernacular landscape.

Ran, Weiyu

[416] *Households in Middle Neolithic Northeastern China: A Study on Shangchaoyanggou Site Applying An Intensive Collection Method*

The remains of around 40 households within the Shangchaoyanggou site in northeastern China have been collected and analyzed in order to reconstruct the social and economic activities of different households during the middle Neolithic Hongshan period. In the Shangchaoyanggou site, as well as many other Hongshan sites, the original Neolithic cultural layers are shallow and heavily damaged, which prevents delineating the layouts of households via excavation. The method of intensive surface collection offers considerable advantages in coping with such a situation. By applying full-coverage ground survey and shallow earth screening, the distribution areas of Shangchaoyanggou household artifact clusters were delineated and artifacts, such as lithics and ceramic sherds, were collected. Further comparative studies will provide evidence on the degrees of various aspects of social differentiation between different households within Shangchaoyanggou site, and between Shangchaoyanggou households and those in other parts of the Hongshan Area.

[168] *A Post-Archaic Public Structure on the Middle St. Johns River, Florida? A First Look at the Evidence*

One of the more vexing issues facing archaeologists working in the middle St. Johns River valley of northeast Florida is a general lack of architectural evidence for public or private structures. Evidence for landscape terraforming abounds in the form of earthen and shell mounds built for ceremonial or mortuary purposes. Yet, there is little discrete evidence in the form of patterned features or post holes that can be used to delineate how non-mounded spaces were used. With the goal of locating architectural evidence, the combined University of Oklahoma/University of Florida 2018 field school deployed multiple geophysics techniques amid Archaic, Woodland, and Mississippi Period shell and earthen mounds. One result of the survey was the delineation of magnetic anomalies arranged in an oval that measured 15 by 20 m. Test unit excavations along one side revealed a series of post holes and molds arranged in a linear array. At least two of the pits contained inclusions such as a whole ceramic cup and a box turtle carapace, and which date to the St. Johns Period. This poster explores the results of investigations compared to the known examples of historic and archaeological public structures in the region.

Randall, Ian

[301] *Littoral Society and the Heterotopic Fabric of Early Medieval ports*

Ports have long been recognized as nodes within grand skeins of connectivity, the thresholds over which goods and ideas move into a wider hinterland. But how, and to what extent, do ports function as their own world, and what can we say about littoral society and the contextual relationship of sea-adjacent peoples to their material culture? This paper builds off of Myrto Veikou's work to examine Early Islamic ports in the Eastern Mediterranean as Foucauldian 'heterotopias,' and the sea

as a connective fabric that binds together an engagement with material culture qualitatively different from inland areas. Moving from the 7th to the 9th century the ways in which this fabric changes through, what Horden and Purcell have called the 'Early Medieval Depression,' will serve to highlight the 'otherness,' and continued connectivity, of peoples outside of shifting religious and political contexts.

[16] *Prehistoric and Historical Period Agricultural Strategies in the Western Papageria: Archaeological and O'odham Perspectives*

This paper investigates prehistoric and historical period agricultural strategies in the Western Papageria, a vast area of southwest Arizona and Northwest Mexico. It is the hottest and driest portion of the Sonoran Desert with temperatures that exceed 110o and rainfall of 2"—11"/year. It is also a place of great biological and cultural overlap and diversity. Since 1996 archaeologists have surveyed nearly 200,000 acres and identified about 1,900 archaeological sites on the Barry M. Goldwater Range East. One of the biggest surprises is the presence of large villages and associated features that represent various agricultural strategies. These are examined from the perspective of archaeologists and O'odham Elders working together. Once thought to be too dry and hot to practice agricultural there is evidence for canal irrigation, ak-chin farming, dry farming, and walk-in wells at large Formative period sites occupied from AD 1050-1450. Historically, anthropologists described the Hia C-ed O'odham (Sand Papago) as being hunters and gatherers who lived in small villages/basecamps scattered between the Gulf of California and the Gila River. Recent research and oral history indicates that the Hia C-ed O'odham also practiced agriculture—canal irrigation from marshes, floodwater farming along ephemeral washes, and use of playas for agricultural fields.

[49] *A Concealed Landscape: Historic Processes of Landscape Change at Cahokia Mounds, IL*

Ongoing geoarchaeological research studying the relationship between urbanism and environmental change at the UNESCO World Heritage Site of Cahokia Mounds has begun to unravel a pre-contact landscape concealed by historic land-use practices. Archaeological excavations and sediment coring conducted to understand the environmental conditions during the construction and utilization of the North Plaza, a wetland mound and plaza group within the central precinct of Cahokia Mounds, has ubiquitously uncovered 60 – 100 cm of historic sediment from Cahokia Creek flooding events. These historic flood events have altered both the size and shape of the five Mississippian mounds located within the historic creek floodplain. Using elevations of the original Mississippian ground surface obtained through excavations and sediment cores, we have interpolated a new elevation model of the Mississippian landscape in the North Plaza. This elevation model is not only significant in providing a more complete understanding of the Cahokian landscape, but also has implications for archaeological preservation.

[22] *A Sense of Community: Archaeology, Participatory Democracy and Social Justice in Canada's Easternmost Province*

Memorial University, located in St. John's, Newfoundland, was developed in 1925 to help build a better future for the people

of Canada's easternmost province, whose largely rural fishing communities were rapidly transforming through industrialization and urbanization. Mandated by a "special obligation to the people of the province" university archaeologists embraced applied, community-based projects which encouraged local solutions to the social and economic issues arising from the transformation to modernity. Today, community-archaeology remains integral to our research program and the majority of our research is undertaken in partnership with rural and Indigenous populations who continue to be marginalized both geographically and economically. Two case studies will describe how archaeological resources are being used to promote economic and social justice, as well as reconciliation, and how archaeology has the potential to make valuable local contributions that change lives in the present.

[151] *Geochemical Characterization of Sediments for the Understanding of Site Occupation History in Mt. Trumbull*

The first excavation of the pithouse structure site was conducted during the summer of 2018 in Mt. Trumbull as a part of settlement pattern investigation in this area. A long trench excavation conducted at the center of a depression observed in this site revealed a large pithouse floor in the limestone bedrock. The profile of this trench shows at least two or three possible occupations above the limestone bedrock layer. The interpretation of the stratigraphy, however, is somewhat challenging, partially due to the small amount of artifacts and ambiguous texture difference. Thus, in this paper, we address the questions about the history of the site use. Specifically, we seek to investigate which stratigraphic level is a human related level (e.g., living floor). Geochemical characterization of soil has successfully been applied to infer human activity elsewhere (e.g., Mesoamerica). By analyzing soil samples for phosphorus content using pXRF spectrometry, the stratigraphy of the excavation is better contextualized and the distinction between human related fill and natural fill in the archaeological feature becomes clearer. In this paper, we are presenting the results of pXRF analysis of sediments from various depth and locations within this trench.

[386] *Economies of Symbolism: Procurement and Production with 'Precious' Materials in the French Upper Paleolithic*

Since the Lower Paleolithic, the collections and/or minimal modification of rare or unusual materials – 'precious' materials – such as amber, lignite, soapstone, has been a part of the human behavioral suite (Moncel et al. 2012). During the Upper Paleolithic, this behavior intensified as these materials were routinely incorporated into symbolic systems through the production of beads, contours *découpés* as well as animal and so-called 'Venus' figurines. Due to the enigmatic nature of the subject matter of objects rendered in these materials, there has traditionally been a morphological focus in their study. But, by examining the patterns of raw material procurement and object production based on the choice of 'precious' material, certain regional and site-specific patterns emerge concerning the organization of craft production in the Upper Paleolithic as well as potential implications for the different societal roles of these materials between regions based on sites of local (<5-10km from source) production and objects whose final disposition reflects a practice of down the line exchange. This will be explored through case studies presenting novel data from sites in the Dordogne and French Pyrenees.

Ranslow, Mandy (Connecticut Department of Transportation) and David Leslie (Archaeological and Historical Services, Inc.)

[72] *Not Your Average Shovel Test Pit Survey: Archaeology at the WALK Bridge, Norwalk, CT*

The Connecticut Department of Transportation's rail bridge replacement in Norwalk, CT required a variety of innovative archaeological survey techniques. The heavily developed urban landscape, future construction impacts in the Norwalk River, and constantly evolving engineering plans led to a flexible and thorough archaeological survey, which included terrestrial and underwater testing. Archaeological and Historical Services partnered with scientists and students at the University of Connecticut to conduct the testing and analysis. In addition to determining areas of archaeological sensitivity, the recovered data was further used by UConn students to enhance our understanding of coastal changes in Connecticut. This paper will describe the array of archaeological testing used on the project and how the results were achieved efficiently and cost effectively. This paper will also discuss the importance of agency regulators advocating for the incorporation of scientific archaeological techniques and analyses into cultural resource management surveys and excavations.

[127] *ZooaRchGUI: Novel Implementations to the Statistical Package for Archaeologists in the R Programming Language*

The study of zooarchaeological data illuminates some of the most important and challenging questions in archaeology. Statistical and other quantitative methods are frequently employed to address these questions by evaluating hypotheses with empirical evidence. Such methodologies range from standard "statistical tests" to novel, non-traditional inferential techniques. Unfortunately, no single standard software package exists to encompass the extent of analytical tools used by zooarchaeologists and archaeologists. In 2016, we developed ZooaRchGUI, an open-source and easy-to-use comprehensive statistical software designed for archaeologists interested in using traditional and non-standard statistical methods. ZooaRchGUI is an R package available from the Comprehensive R Archive Network (CRAN). It enables archaeologists unfamiliar with R-coding to manipulate, visualize, and analyze their data by utilizing the latest quantitative techniques available in the R programming environment via a user-friendly Graphical User Interface (GUI). We have made several advances to ZooaRchGUI. Newest developments make the underlying R code available to users, increasing the replicability and transparency of the results. This functionality also improves the utility of ZooaRchGUI as a teaching tool for R and quantitative methods more generally. We will continue to expand the functionality of ZooaRchGUI to provide the most complete experience for computational archaeology across all of its sub-disciplines.

[213] *Ceramic Evidence of Complex Social Boundaries in Central New Mexico*

In the American Southwest, regional sub-divisions in the archaeological record have been defined using linguistic evidence, similarity of artifact assemblages, and ceramic technology and/or styles. In central New Mexico, H. P. Mera's ceramic sub-divisions from the 1930s are still helpful in understanding some issues of social and political boundaries during the 14th century, when Glaze A pottery was first adopted. Our initial ceramic studies seemed to confirm the presence of significant cultural and economic boundaries in the region. Additional information regarding the manufacture and exchange of Chupadero Black-on-white pottery throughout the region, however, creates a more nuanced and dynamic picture of how various local groups were differentiated and also integrated during this early Pueblo period.

[217] *Naturalizing Authority: Sociopolitical Inequality and the Construction of Monumental Architecture at Early Xunantunich, Belize*

Over the last decade, the Mopan Valley Preclassic Project has extensively investigated the Preclassic ceremonial center of Early Xunantunich, Belize. These excavations have yielded significant information regarding the construction of monumental architecture during the Middle and Late Preclassic periods, as well as data regarding early ritual activities and sociopolitical organization at the site. Across the lowlands, the Preclassic was an extremely dynamic period of Maya prehistory, during which some of the grandest monumental architecture was erected and the institution of divine kinship

began to take root. As early centers were carved out of the jungle, natural features were often incorporated into the built landscape. In this paper, we share insights from ongoing excavations of a monumental platform structure at Early Xunantunich in order to explore the ways in which the Maya merged their built and natural environments by modifying the natural landscape during these early construction events. We contextualize the architectural history of this important early platform within the broader ceremonial center, incorporating new data on the structure's complex form. Finally, we examine the implications of monumental architectural forms in the processes of sociopolitical complexification and the legitimization of hierarchies.

[176] *Investigations at the Sugar Potato Workshop Site: Repeated and Long-Term Exploitation of Burlington Chert from the Pinnacles Quarry in Central Missouri*

The Sugar Potato site is located on an alluvial fan at the base of the Pinnacles, an eroded upland area that borders the Missouri River floodplain in central Missouri. The lower slopes of the ridges in this area contain residual deposits of high-quality Burlington chert, which were quarried for more than 2,000 years. Test excavations at the Sugar Potato site in 2015 and 2017 revealed a series of six stratified lithic-reduction workshops between 1.5 and 3.7 m below ground surface. Radiocarbon ages from four of the six workshop features indicate intensive quarrying and associated workshop reduction during the Middle Woodland and Late Woodland periods. Concentrated workshop debitage found at higher elevations in the alluvial fan suggests that exploitation of Burlington chert also occurred during later Mississippian (Steed-Kisker) and Terminal Prehistoric (Oneota) times.

Raymond, Tiffany (Binghamton University) and Carl Lipo (Binghamton University)

[325] *An Evaluation of the Relations between Morphology and Thermal Properties among Poverty Point Objects (PPOs) of the American Southeast*

Poverty Point Objects (PPOs) are thought to have functions related to contexts of heating and cooking in areas where stone alternatives are not locally available. PPO morphology and composition, therefore, may potentially be explained by the efforts of prehistoric populations to manipulate thermal properties that impact performance for cooking and heating. In this pilot study, we examine variability in the surface area morphology in relation to the thermal properties of PPO composition to determine whether heat transfer properties vary with form. Using a 3D scanner to detail PPO shape, CT scans to examine internal structure, and measures of porosity and density, we characterize sample PPOs in terms of heat transfer models.

[247] *An HBE Perspective on Niche Construction*

Decades of research in human behavioral ecology (HBE) demonstrates that questions about human ecological and reproductive adaptations generally lead to questions about cooperation. Partly for this reason, much recent research in HBE has focused on issues such as marriage, cooperative child raising, and exchange and social support (including food sharing). Here, we review some recent trends in HBE and suggest that, by expanding its' focus beyond functional questions to Tinbergen's other forms of evolutionary explanation, and especially through a deeper interest in history, social structure, and cultural phylogeny, current work in the field addresses some of the critiques made by proponents of the Extended Evolutionary Synthesis (EES). We suggest that a similar shift in perspective can enhance our understanding of human biological and cultural evolution in deep time. However, we argue that some of the tools of the Modern Synthesis (e.g., game theory, foraging theory, and life history models) remain the strongest theoretical grounding for developing niche construction hypotheses and testing them in the archaeological record. We illustrate this approach through an agent-based

model that combines diet breadth with life history constraints to examine the relative cost of maintaining cooperative networks in a context of fluctuating resource availability.

Real, Cristina (Universidad de Valencia), Carmen María Martínez-Varea (Universitat de València. Departament de Prehistòria), Yolanda Carrión (Universitat de València. Departament de Prehistòria) and Ernestina Badal (Universitat de València. Departament de Prehistòria)

[144] *Human Adaptability to Fauna and Flora Changes during MIS 5-3. Is the Iberian Mediterranean Region a Refuge?*

Neanderthal and AMH from the Early Upper Palaeolithic have a really good knowledge of their environment and its potential resources. The local landscape and its changes should influence their behavior and the availability of resources. In this sense, the faunal remains have been better documented than flora. But our team is getting more information about charcoal and seeds thanks to new sampling methods.

Data obtained from diverse sites (e.g. Quebrada, Cova Negra, Malladetes, Cendres) are presented in order to improve our knowledge of the climatic and edaphic conditions from the Middle Palaeolithic to the Early Upper Palaeolithic in the Iberian Mediterranean region. Available data suggest that refuge areas for thermophilous plants are located south of parallel 40° N. Identified plants may be in categories: temperate/cold conditions, warm/dry conditions, matorral and riverine habitats. The taxonomic diversity shows a steady panorama throughout the sequence under study here. The main faunal species are continuously present, mainly because they are eurytherm. We need, therefore, to focus on species that could be bioindicators, as for example rabbits or pines. Combining the results of our studies with the published data from other sites, we can identify some tendencies regarding latitudinal/altitudinal gradients.

Reamer, Justin (University of Pennsylvania- Department of Anthropology) and Kyle Olson (University of Pennsylvania- Department of Anthropology)

[411] *Combating the Curation Crisis Through Dissertation Research: An Argument for Disciplinary Valorization and Financial Support of Legacy Collection Rehabilitation*

Over the past 60-plus years, the adoption of more rigorous cultural heritage preservation laws in the U.S. and abroad coupled with a rapid expansion of active practicing archaeologists have led to ever-increasing volumes of archaeological collections. These enormous stores of artifacts and documentation have been acknowledged since the early-1980s as constituting a "curation crisis," in which there are more collections to be curated than space to keep them or time, resources, and expertise to analyze them. To combat this crisis, archaeologists have advocated for investing in a variety of both analog and digital infrastructures that will allow for both greater access to curated collections and increased reuse of such collections to produce new interpretations. Due in part to changes in archaeological data collection, management, and curation practices, however, many curated collections require serious rehabilitation to be accessible and analyzable. As graduate students ourselves, we focus on the role graduate students can play in combating the "curation crisis" in dissertation research. Drawing from our own work, we argue for the importance of curated collections in dissertation research as not only an inexpensive and non-destructive form of data, but also as an urgent disciplinary and funding priority.

Recinos, Roxanne and Sarah Rowe (University of Texas Rio Grande Valley)

[350] *Breaking the Site Museum Mold: Designing the Dos Mangas Community Museum*

Archaeological investigations began in Dos Mangas in 2006, and continued with excavation of a Valdivia village site, Buen Suceso, in 2009. Those and subsequent excavations carried out by Sarah Rowe have combined archaeological inquiry with community engagement activities such as presentations in the primary school, workshops for community guides, and presentations at community meetings. From early in the project community leaders have expressed an interest in constructing a museum in the village to highlight the archaeological resources that exist on community lands. This paper presents the results of a community-needs assessment conducted in Dos Mangas, Ecuador by Roxanne Recinos in June and July of 2018. A series of interviews with individuals and small groups was conducted to elicit their ideas and interests in relation to this proposed community museum. Themes drawn from these interviews are used to create a museum design that is responsive to community interests and faithful to the archaeological findings. Notably, this design eschews the typical, cultural period-driven presentation of many site museums. Further consultation with community members and leadership will refine this proposal and be used to secure funding and local support for construction in the (hopefully) near

future.

Reckin, Rachel (Okanogan-Wenatchee National Forest) and Lawrence Todd (GRSLE)

[80] *Illuminating High Elevation Seasonal Occupational Duration in the Greater Yellowstone Ecosystem Using Patterning in Lithic Raw Materials and Tool Types*

In recent years, our understanding of high elevation landscapes' potential contribution to prehistoric foragers' seasonal rounds has developed significantly. This paper advances that understanding further by offering a method for estimating relative occupational duration through time for high elevation landscapes. Using assemblages from the Absaroka and Beartooth Mountains of the Greater Yellowstone Ecosystem, we measure lithic diversity, both in terms of tool types and raw materials, to consider how and why foragers adjusted their seasonal rounds through time. Ultimately, we find that the major drought known as the Early Holocene Warming correlates with the most extended high elevation occupations in the Beartooth Mountains, while the Absaroka Mountains experienced their longest occupational durations during the Middle Archaic, when the climate had ameliorated. Indeed climate, in general, does not clearly correlate with high elevation occupational duration. In addition, we consider the potential impacts of the Numic Expansion, an influx of Shoshone people from the Great Basin whose timing is much debated. In the Absarokas, the increase in obsidian use at high elevations may indicate Numic arrival during the Middle Archaic, while patterns of occupational duration in the Beartooths register no clear disruption to signal the Numic Expansion.

Redon, Antonio (University of Iceland)

[142] *Female Warriors of the Viking Age*

In my presentation I will explore how women in the Viking age contributed to acts of violence by looking into three different cases of burials containing women with weapons and armaments. I will draw these studies from my original Master's thesis published in 2017 and focus solely on the archaeological evidence, leaving out additional textual mentions of women warriors for the sake of brevity. I will also discuss the theoretical approaches one can use when examining these sites, archaeology of gender and feminist theory, and compare them to the original interpretations from these sites and the implications they bring.

[10] *Birnirk and Thule Pottery: Analysis of Arctic Ceramics from Inuigniq (Cape Espenberg), Alaska*

We are conducting a multi-year (2009-2018), multi-disciplinary research project at Inuigniq (Cape Espenberg) to explore changing patterns of human occupation, culture change, and environmental conditions in Northwest Alaska. Our current focus is on the emergence of Birnirk archaeological culture ca. AD 1000, and the question of how Birnirk culture factored into the formation of Ancestral Iñupiaq (Thule) culture around AD 1300. We undertook analysis of Inuigniq ceramics to address the question of continuity and change over this transitional period, and to further evaluate data on Birnirk spheres of influence as established by prior ceramic research. Excavation of five Thule and Birnirk semi-subterranean houses at Inuigniq (800 AD and 1400 AD) yielded over 9,100 ceramics. We compared the Inuigniq ceramic technology to ceramics from the Birnirk type site and later Thule sites. We found similarities in ceramic technology over time, and also the development of local decorative styles that are linked to previously established geochemical source groups. These new results inform our understanding of interaction and cultural change during this pivotal cultural period, and also contribute more broadly to the study of circumpolar ceramic technology and foodways.

Reed, Paul (Archaeology Southwest)

[41] *Pueblo of Acoma Ethnographic Study of the Greater Chaco Landscape*

Over the last 4 years, Archaeology Southwest has been working to protect the Greater Chaco Landscape from the damaging effects of oil-gas development. We have partnered with a number of environmental and preservation organizations, engaged the NM Congressional delegation on numerous occasions, and attended many, many meetings with the New Mexico Bureau of Land Management (BLM) and the Bureau of Indian Affairs (BIA). None of efforts have been

more important than engagement with Native American Tribes, with the primary goal of helping to get Native voices out in front on this critical issue. Together with the Pueblo of Acoma, Archaeology Southwest is completing preservation work in specific areas of the Greater Chaco Landscape (GCL) that are threatened by oil-gas development. Goals of the project include: 1) having Acoma cultural leaders visit the landscapes of Greater Chaco to make connections; 2) collecting appropriate data and creating an Acoma-approved report to help inform Bureau of Land Management and Bureau of Indian Affairs as they manage oil-gas development across the GCL; 3) compiling data and producing a confidential report for the Pueblo of Acoma.

[12] *Fire Archaeology: Preservation in Practice*

This poster focuses on the development and future of Cultural Resource Protection and Management before, during, and after wildfires. As the number of fires and acres burned continue to increase each year cultural resources are at critical risk of being damaged and destroyed. To protect these resources archaeologists work in a variety of ways to assist with fire management, including enlistment and qualification as fire fighters and joining the fire fight. The poster illustrates the variety of roles and techniques in use during prescribed fires, fire suppression, and burned area recovery.

[47] *Shell Midden Zooarchaeology and Paleoecology of Guaimoreto Lagoon, Northeast Honduras*

Recent research documents resource use and ecological change at the Selin Farm site, a group of around 30 well-stratified house and shell mounds occupied AD 300 – 1000 near the Guaimoreto Lagoon on the northeast coast of Honduras. A 4.5 m high shell mound with excellent preservation of vertebrate and invertebrate remains provides a full view of landscape change throughout the occupation of the site, including nearby terrestrial, riverine, and estuarine ecosystems. Alongside incipient agricultural practices, people exploited a wide range of wild animals from the region, with a particular focus on deer, several fish species, oyster, and conch. High species richness throughout the occupation, however, indicates an exceptionally high diet breadth and a flexible subsistence system that served the inhabitants of Selin Farm well during the upheaval of economic, social, and political systems that occurred during the 8th-9th centuries A.D.

[199] *Komkom What May: The Ancient Maya Kingdom of Komkom in Time and Place*

Painted and carved pictorial pottery of the Classic Maya (250-850 CE) served primarily as ostentatious serving vessels at feasts and other principal celebrations. The vessels were masterful creations by accomplished artisans and are, for the most part, individualistic expressions. The imagery includes a dedicatory hieroglyphic text ending with the names and titles of the vessels' patrons/owners, implying they were the proud possessions of royalty and the high elite. Among these are the little-known kings of Komkom, who are mentioned in the monumental glyphic texts at Naranjo, Guatemala and on portable ceramic and other portable objects found at the sites of Buenavista del Cayo and Baking Pot, in Belize. Yet its geographic location remains to be verified. Through detailed epigraphic and chemical analyses of objects bearing reference to the kings of Komkom, this paper presents our recent results combining epigraphic, artistic style, and trace elemental chemical analyses. Research goals focus on (1) discerning the location(s) of manufacture of pottery bearing Komkom nominals, (2) establishing the archaeological identity of Komkom, and (3) shedding light on Komkom's socio-political interactions during the Classic period.

[128] *All for Drone and Drone for Free: A Free and/or Open-Source Workflow for UAV Imagery Collection and Analysis*

Full coverage pedestrian survey to record new sites on unknown archaeological landscapes is costly in terms of money, time, and personnel. Archaeological projects are usually limited in these resources and have to simultaneously balance data quantity with quality within their budgetary means. Researchers have experimented with Unmanned Aerial Vehicles (UAV) and remote sensing technology over the past decade, but the initial cost of equipment, software, and necessary processing power has hindered the ubiquitous implementation of UAV technology for archaeological survey. This poster presents a systematic analysis of UAV orthoimagery in a variety of landcover contexts to determine the most effective means of identifying archaeological sites in a previously unsurveyed area. By implementing the methods presented here, researchers will be able to identify and target areas of interest to visit while in the field through a free and automated process using R, DroneDeploy, and OpenDroneMap. The development of an effective and free methodology for collecting and analyzing aerial orthoimagery increases the accessibility of cutting-edge technology to researchers without the funds to purchase proprietary software. A case study from the Mesa Verde North Escarpment in southwestern Colorado is used to demonstrate the process and results of the proposed free and open-source workflow.

[410] *Evidence for Early Sedentary Occupation in the Yaxnohcah Region, Campeche, Mexico*

Early settlement at Yaxnohcah appears to have been widespread throughout a landscape covering over 40km². In this paper, we specifically discuss the distribution of this settlement in the period from 900-700 BCE and contrast it to the distribution from 700-300 BCE. Initial analyses suggest that the spatial range of the settlement contracted in the latter period. We explore the possible causes of this contraction and its implications for early sedentism in the Maya lowlands.

[184] *The Most Overlooked Component of Public Programming: Approaches to Educational Assessment*

As scientists, archaeologists collect data. Why don't we often collect data on the effectiveness of archaeology education programming? Public archaeology is developing into an essential practice. However, our field lacks extensive comparative information about the outcomes of these programs, and we rarely assess what our participants learn or how effectively practitioners deliver programming. Building a library of such information would help contribute to the long-term success of archaeology education and more informed public stewards of cultural resources. This paper clarifies the need for archaeologists to understand the importance of assessment and evaluation. Through comparative case studies and learning research, the authors outline best practices for developing instruments, conducting formal and informal assessments, and using results to refine public programming. The goal is to lay a foundation for assessment tools that will improve archaeological education and communication going forward.

[288] *Stone Tools from the Buen Suceso Site, Santa Elena, Ecuador*

In the summer of 2018, the lithic artifacts of two units of the Late Valdivia (2100 BC - 1800 BC) occupation of the Buen Suceso site were analyzed as an undergraduate research project. The Valdivia people were a settled agricultural society based on the utilization of marine, forest, and riverine resources. The people of Buen Suceso lived on the edge of the cloud forest in western Ecuador, on the banks of the Culebra-Colin River not far inland from the Pacific Coast. Their ancestors were one of the first people to develop ceramic technology in South America, and yet they utilized a simple flake based lithic technology that was little changed from their hunting and gathering predecessors. In this poster, we examine the physical characteristics of some of these lithic artifacts and present some preliminary suggestions about their manufacture. Patterns of material selection and flake sizes are investigated, and changes in flake size and distribution are analyzed. While most of the artifacts examined were amorphous flakes, some may have been designed specifically to be comfortable to hold in the hand.

[196] *Genetic Insights into Indo-European Origins*

Ancient genomic data has provided important new clues that help to address the more than 200-year-old problem of the origin of Indo-European languages. Beginning in 2015, a series of papers have shown that Yamnaya steppe pastoralists--who spread over the steppes north of the Black and Caspian Seas after around 5,300 years ago--harbored a distinctive mixture of ancestries that is present in nearly all the indigenous speakers of Indo-European languages today. By documenting large-scale population movements correlated to the geographic distribution of these languages, these findings increase the plausibility of the hypothesis that the language ancestral to all Indo-European languages except for the earliest branch (Anatolian languages like Hittite) was spread by the Yamnaya. In this talk I will review the genetic evidence for this process in Europe and South Asia.

[101] *Mongol Period Urban Sites and Their Hinterland in Comparison: Karakorum and Khar Khul Khaany Balgas*

With its sparse population and few forest coverage, Mongolia is ideally suited for a wide array of surveying methods and as a consequence for landscape archaeological approaches. The proposed paper particularly looks into power and authority as expressed within the landscape. Two valleys in Mongolia will be compared. Both were partially covered by systematic pedestrian surveys carried out by a joint collaboration of Bonn University with colleagues from the Mongolian Academy of Sciences in 2017 and 2018. The Khanui and Orkhon valleys with their large settlement sites dating to the Mongol period serve as perfect case studies. With special emphasis on the Mongol period but including other historic periods also evident within the retrieved materials the following questions will be addressed: How was the landscape used? In which ways can we detect strategies of power in the material record? How is power enacted by objects, sites and landscapes? The paper

presents preliminary analyses of the surveys from 2017 and 2018 to approach these questions.

[12] *Addressing the Inevitable: Site Preservation Efforts in the Face of Global Climate Change*

Global climate change is contributing to the escalation of large catastrophic wildfires across North America. Fires are increasing in frequency, intensity, and scale, posing one of the greatest contemporary threats to thousands of archaeological and historic properties across the western US. Modern tree densities in many forests far exceed historic norms. Coupled with warmer, drier and erratic weather patterns, forests are experiencing more frequent stand replacement fire. During these events, heavy equipment, extreme heat, winds, and post-fire flooding are resulting in devastating effects to fragile sites. Post fire damages are particularly destructive in the American Southwest, where seasonal monsoon precipitation patterns often generate massive flooding and erosional events immediately following wildfires. On the Kaibab National Forest, archaeologists are working with project planners, fire fighters, scientists, and volunteers to preemptively manage cultural resource sites to increase site resiliency during wildfires and to develop post fire treatments that help preserve sites threatened by erosion and vandalism. This presentation illustrates current methodologies and integrated planning efforts utilized by forest staff to actively protect and preserve vulnerable sites on National Forest lands.

[290] *Wari State Expansion and Middle Horizon Roads in the Majes-Chuquibamba Region, Southern Peru*

This project investigates the social mechanisms behind culture change and contact in Peru's southern coastal valleys through the lens of road infrastructure: i.e. the built networks of communication, travel, and commerce. Here we present recent investigations of a pre-Inca road network in the Majes/Chuquibamba region of Arequipa. Excavations at three associated waystation sites indicate the development of road infrastructure was both a product of local communities and an intrusive Wari state during the Middle Horizon. Analyses of recovered materials show various cultural signaling and long-distance interaction between Arequipa and Ayacucho. Excavations at Pakaytambo, a newly discovered Wari enclave and D-shape temple along this road network, indicate the intersection of political economy and ritual that would have embedded local communities into the Wari sphere.

[78] *Crops, Gender, and Food Choices: Investigating the Formation of Chinese Staple Cuisines via Stable Isotope Analysis*

The modern Chinese food system was formed over thousands of years from a diverse set of regional agricultures and cuisines. Isotopic analysis of archaeological skeletons can be used to investigate the importance of different food resources to past diets. This approach has been extensively applied in China in the past decades, with more than 50 publications featuring isotopic results from >2,000 human and >800 faunal skeletal remains. Here we take advantage of the contrasting isotopic signatures of major crops in prehistoric China (e.g., C3 rice, wheat and barley versus C4 millets) to investigate the historic geography of staple cuisines between 6000 BC and 202 AD. By drawing together these numerous isotope studies with recently published archaeobotanical datasets, a new picture of the formation of Chinese staple cuisine in prehistory and its geography starts to emerge. We contextualize the isotopic and archaeobotanical evidence for three successive periods (6000-5000 BC, between 5000 and 2000 BC, and 2000 BC to 202 AD) divided into three major areas with distinct environmental and culinary trajectories: the broad Loess Plateau, the Yangtze and Hai river, and the continental interior. By 2000 BC, three distinct culinary and staple food systems coexisted within China.

[386] *Biocultural Analysis of Atypical Mortuary Pattern Symbolism in Three Medieval Transylvanian Millstone Burials*

Unusual treatments of the dead frequently merit extensive archaeological attention as they provide windows on a society's concepts of personhood, use and manipulation of symbolic representations, and cosmology. In this work, we examine the use of millstones placed atop funerary contexts at the Papdomb site located in Văleni, Romania (A.D. 1100-1800). The site encompasses the remains of a medieval church and its associated cemetery. Some 579 burials have been recovered from site. During the 2015 excavation, three simultaneously buried individuals were uncovered from beneath a broken millstone within the walls of the church. Multi-person interments are not unusual at the site, however, the association of three adults underneath a broken millstone required additional investigation. The literature regarding use of millstones in burial is limited and offers only broad generalizations. Here, in contrast, we explore a range of specific possible interpretations, ranging from simple, postdepositional movement of the millstone to considerations of the practical and religious importance of millstones through various cultures and times. By exploring the multiple meanings, symbolisms, and mythologies associated with millstones, this work contributes to the reconstruction of mortuary symbolisms in Romania and approaches to interpreting atypical or unique burial contexts in general.

[34] *Isotopic Evidence for an Emerging Colonial Urban Economy: Charleston, South Carolina*

Stable isotope analysis enables us to test the hypothesis that specialized animal economies were fundamental to the development of emerging urban centers, including colonial American cities. The distribution of meat and other animal products is a basic urban process and a barometer for the economic development of such early urban centers. Skeletal representation from colonial Charleston, South Carolina suggests urban residents obtained animal products through both direct (home-slaughter) and indirect (market) acquisition. Isotopic variation is high in cattle bones and teeth. Stable isotope ratios ($\delta^{13}\text{C}$ and $\delta^{15}\text{N}$) in cattle bones indicate that animals and animal products were from both local and distant sources within the evolving colonial distribution system. Lower-status/dual-function sites had a different "catchment" for beef than either markets or upper-status residences. A suite of isotopic ratios ($\delta^{13}\text{C}$, $\delta^{15}\text{N}$, $\delta^{18}\text{O}$, $\delta^{34}\text{S}$, $^{87}\text{Sr}/^{86}\text{Sr}$, and Pb-series) measured in cattle teeth indicates that cattle were from both inland and coastal sources. Some cattle were free-ranged and others penned. Isotopic variation could be due to landscape modification (burning or manuring fields) and/or micro-environmental variations such as would be evidence for procuring cattle from distinct, but unspecified, rural sources. Some of these differences may correlate with time.

Reitze, William (University of Arizona) and Maria Zedeno (University of Arizona)

[80] *A Preliminary Assessment of Prehistoric-Contact Period Blackfoot Camp Demographics*

The weakest link in reconstructing patterns of organizational complexity among Late Prehistoric Blackfoot ancestors known archaeologically as the Old Women's Phase (1000-250 BP) is the dearth of population estimates that would explain the need to adopt institutions of social control such as esoteric societies and systems of political influence beyond those built on

prestige (e.g., hereditary chieftaincies). Despite the large number of domestic stone architecture in the form of stone rings, little is known about population dynamics of prehistoric camps along the Rocky Mountain foothills. A great part of the problem is the difficulty in establishing contemporaneity of individual rings within aggregated camps. Yet, contact period accounts of camp composition and size provide a solid foundation to analyze the spatial structure of Late Prehistoric camps and aggregation processes. Here we present an assessment of camp aggregation on the Kutoyis Complex, located along the Two Medicine River within the Blackfeet Indian Reservation, Montana, to find new lines of evidence for estimating population and spatial arrangement of large camps, and to suggest future avenues for securing precise radiocarbon dates to aid in reconstruction of camp demographics.

[195] *An Investigation into Ochres from Arene Candide Cave: Implications for Mineralogical Properties and Provenance Studies in the Liguria Region*

The Arene Candide Cave, a key sequence for western Mediterranean prehistory, became famous in 1942 after the discovery of a Gravettian adolescent buried in a pit filled with ochre and spectacularly ornamented. At the end of the last glaciation, with a similar choice, at least 20 Final Epigravettian burials were deposited on a layer of ochre powder, which gave to this level and the to the bones themselves a distinctive red color. The provenance and compositional features of coloring material, naturally available in the Liguro-Provençal arc, has received scant attention despite their technical and symbolic value. Over the course of the 2008-2012 excavations, micromorphological samples were collected from the middle portion of the older excavations section, which is dated to the beginning of the Early Epigravettian (19,630 ± 250 BP). Among other findings, the micromorphological analyses recognized, in a specific layer, a relative abundance of ochre fragments scattered in a poorly sorted sediment. The results of the micromorphological and mineralogical analysis and their interpretations and correlations are discussed here. They shed new light on the geographical and geological origin of coloring material in Liguria and suggest that heating played an important role in the processing of the raw ochre.

[16] *Developing a Condition Monitoring Plan for Archeological Sites at Organ Pipe Cactus National Monument*

The Cultural Resources Program at Organ Pipe Cactus National Monument (ORPI) manages multiple cultural resource types across the unit. As part of the National Park Service's (NPS) overall mission to preserve and protect natural and cultural resources, regular condition assessments of the monument's archaeological sites should be a high priority. Monitoring archaeological sites on a regular schedule greatly aids in determining the overall status of the monument's cultural resources, the most frequent site disturbance types, and enables cultural resources staff to make better informed management decisions. Due to staff changes, policy modifications, and budgetary adjustments, many archaeological sites at ORPI have been either inconsistently monitored or not monitored at all since their initial recording. All of these factors contribute to an increasing backlog of needed site monitoring. This work presents the methods, documentation, and results of the 2018 archaeological site monitoring conducted at ORPI. The study concludes with the resulting data learned regarding the frequency and intensity of disturbance types observed throughout the sites that were assessed, where these sites are most impacted, and what mitigating actions ORPI recommends regarding future site assessments according to site types and the site disturbance frequencies.

[97] *Elemental and Isotopic Geochemistry to Source Shell-Tempered Ceramics – Late Woodland and Mississippian Contexts in the Yazoo Basin*

Sourcing shell-tempered ceramics using compositional analyses has revealed to be challenging, if not impossible in some contexts. Recent pilot studies have shown that freshwater mussel shells from archaeological sites located in different drainages in Eastern and Southeastern United States display different elemental compositions. The present research further investigates and evaluates the potential of elemental and isotopic geochemistry to trace the origin and circulation of shell-temper ceramics within a single basin. We analyzed the elemental chemistry of both whole shells and shell-temper extracted from plain wares. These samples are selected to represent the local signature of multiple sites, from Late Woodland and/or Mississippian contexts, located in the Yazoo Basin (Mississippi). In addition, we are exploring the possibility of using the strontium isotopic composition of freshwater mussel shells as a complementary tracer. These results provide a geochemical database for the Yazoo Basin that is then used to differentiate between local and imported ceramics in a case-study conducted on material from Lake George (Mississippian period).

[119] *Developing an Archaeology Simulation via the Unity Engine*

Employing virtual reality for academic enrichment is a holistic undertaking. A multifaceted team was formed to attain a pedagogical goal; construct a simulation that teaches archaeological methods and procedures. The Cal State University San Bernardino team encompassed students, staff, and faculty from disciplines including: anthropology, applied archaeology, art design, audio/video production, and computer sciences. The poster will illuminate how each aforementioned discipline contributed to this archaeological simulation entitled "Project Ambrosia." Poster subject matter will be devoted towards tasks the player would undertake in the virtual world of Ambrosia. Tasks include: choosing suitable gear for fieldwork, conducting a transect survey, examining ceramic artifacts, and interpreting bone remains within site context. By focusing upon tasks one would encounter in a field school curriculum, the poster becomes "archaeology first" in nature. These tasks will further allow a technological component to complement the primary theme of archaeology. Technical skillsets like programming in the Unity game engine, implementing user friendly movement mechanics, and rendering artifacts into interactable 3D models via photogrammetry will expand upon the world of Ambrosia. The poster will create an open discourse into the future utility of virtual reality within both academia and the field of archaeology.

[364] *Biogeographic Barriers, Marginality and Explicit Analytical Scales in the Northern Archipelago of Western Patagonia, Chile*

The last decade of archaeological research in the coast of northwestern Patagonia, specifically in the Chonos Archipelago (43°-46° S), has been profoundly influenced by theoretical foundations developed by Dr. Luis Borrero. His concepts of marginality and biogeographical barriers and well as the use of explicit analytical scales are included in this paper to shape a study oriented towards measuring the intensity in the use of space along the occupational sequence of this archipelago, starting in the middle Holocene. The methodology has included search criteria that allows us to explain the conditions in which the archaeological record is encountered/preserved in this dynamic geomorphologic setting. The human occupation of the western channels of Patagonia by maritime hunter-gatherers fluctuated during the last six millennia, showing a remarkable concentration in the last 2000 years. Cave sites, shell middens, human burials, and intertidal lithic scatters comprise a complex archaeological record that characterizes this remote and discontinuous landscape. To this date, results show a profound maritime adaptation as indicated by indicators of technology, subsistence, diets, and spatial mapping on the territory. FONDECYT Grant 1170726.

Reyes Parroquin, Maria

[349] *Where the Laugh Died: The Archaeological Contexts of the Smiling Figurines, a Comparative Analysis*

The smiling figurines found more than half a century ago in Mexico's Gulf Coast, have always captured researchers through their enigmatic smile. Through these scholars' work, we know they were possibly related to deities like Xochipilli or Quetzalcoatl, linked to the main city of El Tajin and perhaps dedicated to the god of death. What we know for sure is that they were used from Late Preclassic to Early Postclassic. But, were all figurines used the same way? In this paper we present the result of our research focused on the contexts of the smiling figurines and how they changed through time and space in order to clarify their last function. We have identified a geographical and chronological region with a group of sites where the figurines were used extensively and in different contexts, both domestic and ritual; while the sites which are farthest from this region have less amount of figurines and only in elite contexts. Finally, we present a comparative analysis that explains the variation in micro and macro contexts, defying original interpretations of the archaeological record and offering a new vision of how the figurines were used for the last time.

[402] *Large Mammal Fauna from Klasies River Main Site: Changing Environmental Conditions during the Late Pleistocene of South Africa*

Klasies River is one of the most significant Middle Stone Age (MSA) sites in Africa with a sequence spanning from c. 120,000 to c. 50,000 years ago (ka). Because it yields one of the largest collections of human remains dated to the Late Pleistocene associated with an abundance of MSA cultural remains, it is an important site for understanding the development of modern Homo sapiens. A key issue in Palaeolithic research are the links between complex behavior and the environment. Given its abundant faunal remains, Klasies may allow us to unpack this relationship. Here, we examine the large mammal faunal remains from c. 120 ka to c. 90 ka layers from the Witness Baulk Cave 1 with the aim of exploring environmental changes through Marine Isotope Stage 5. Our data indicate a taxonomically rich assemblage with high species diversity. Generally, the lowermost LBS member is dominated by grazers with browsers becoming more common in the subsequent SASU and SASW sub-members. Ungulate diversity is highest in the LBS member and the reasons for this will be explored. We also discuss how the Klasies faunal data is linked to changing environments along the South African Cape coast during the Later Pleistocene.

[254] *Archaeological Evidence of the 1848 Newby Campaign Against the Navajos*

In 1848, towards the end of the Mexican War, Colonel Edward Newby, Commander of the Ninth Military Department of New Mexico, responded to Navajo raids on New Mexican settlements by leading a military campaign against the Navajos, which imposed the second treaty between the United States and the Navajos. Unlike most military campaigns of the era, Newby's Expedition did not include a topographical engineer, and Newby did not prepare a report on the campaign, so most of what is known about it is what was reported in newspapers, and the actual route of the expedition has long been conjectural. Ethnographers working on the Navajo-Gallup Water Supply Project consulted with a local Navajo woman who directed them to cavalry inscriptions that proved to be the nine-day campsite of the expedition. Archaeological documentation of the site provides new insights about the Newby Expedition and will lead to preservation of Newby's campsite.

[366] *Simmons at DRI: Years of Famine and Triumph*

Prior to his long and distinguished professorial career at the University of Nevada-Las Vegas, Alan Simmons spent eight years in Reno at the Desert Research Institute (DRI), an independent soft-money component of Nevada's university system. For a young Near Eastern Neolithic archaeologist to be reliant on Great Basin cultural resource management contracts was a formidable challenge, but one he negotiated with enviable élan (and barely-discernible anxiety). The crush of scarce projects and high overhead always loomed, but Alan's DRI time was marked by singular research successes including his work at Akrotiri Aetokremnos. This paper briefly remembers Alan's time at DRI. Then, because Alan is at heart a dirt archaeologist with a long-standing interest in island prehistory, I consider the early Holocene history of Isla Cedros, Baja California, its transition from a peninsula to an island, and implications for early occupation there.

[246] *Hohokam Platform Mounds and Costly Signaling*

Hohokam platform mounds (as well as ball courts and earthen "trash" mounds) are forms of monumental architecture requiring the expenditure of labor for purposes not related to shelter and subsistence. Selectionist theory predicts that economically unessential behavior (wasteful spending, superfluous activity) used for monumental architecture can contribute to group fitness by accurately signaling political power. We use the theory as modeled by Neiman to examine the ultimate function of platform mounds as a form of costly signaling that contributed to the fitness of Hohokam populations. The size of a platform mound was a function of the number of people involved in its construction, and thus a proxy measure of that community's competitive ability in political contests. The ability to effectively judge the size of mound-using

populations enabled small groups to avoid fruitless expenditures of labor and resources in political contests with larger neighbors that they were unlikely to win. We find that ecological factors are correlated with variability in platform mound size as predicted in the application of the model.

[412] *Structurally Speaking; Architecture of El Rayo and the Greater Nicoya Region*

Located on the shore of Lake Nicaragua, El Rayo is a unique archaeological site, enriched with a large material base and many examples of human burial practices. Dating from the Late Bagaces Period (500-800 CE) to the Sapoa Period (800-1300 CE), El Rayo's stone architectural features cover both major timeframes, indicating a significant occupation of the site, and the importance of the site to the communities which would have inhabited the region. While a great deal of attention has been paid to the burial elements of the site, the functionality of the architecture has been overlooked. El Rayo displays a range of architectural variation. In hopes of bridging the gap, this paper examines the structures excavated at El Rayo, concluding with comparisons to other sites in the Greater Nicoya region.

[349] *Digging the Scene: More on the El Perú-Waka' Burial 39 Figurines*

The ancient Maya resurrection ritual depicted by the 23 ceramic figurines methodically arranged by mourners at the feet of the deceased ruler interred in El Perú-Waka' Burial 39 continues to be a source of intriguing information about the Classic Maya. More recently, extensive examination of the results of Instrumental Neutron Activation Analysis (INAA) demonstrates that the manufacture of the scene speaks directly to what we know from hieroglyphic inscriptions about the complex political situation playing out in the southern Maya lowlands during the mid-7th century CE. These data are especially relevant because of the scene's archaeological context. This paper summarizes the contextual detail that permits a varied and multifaceted analysis of the scene, its layout and meaning, and its greater relevance to Maya geopolitics.

Richards, John (University of Wisconsin - Milwaukee)

[318] *Got Collars?: Braced Rim Jars in the Late Woodland Western Great Lakes*

Pots with rims formed into distinct collars appear in the western Great Lakes during the early eleventh century A.D. and appear to have been produced well into the fourteenth century A.D. Such "collared ware" has a wide, though uneven distribution in the region and includes at least three types of true collared vessels (Starved Rock Collared, Aztalan Collared, and Point Sauble Collared). In eastern Wisconsin, collared pottery often co-occurs with Mississippian shell-tempered varieties. This paper reviews the distribution, chronology, and morphological variability among collared varieties with emphasis on morphological variation within the type Aztalan Collared.

[87] *DEBS: Using Digital Tools in Community-Led Graveyard Recording*

Discovering England's Burial Spaces (www.debs.ac.uk) is an Historic England-funded project based at the Archaeology Data Service and Digital Creativity Labs in the University of York, UK. We are collaborating with community groups to develop new tools and resources for burial space research, recording and dissemination. We are working with a number of community groups and societies, representing multiple faiths and denominations, to co-design and test training and recording materials that can be used to record burial spaces like churchyards and cemeteries. We have developed a mobile recording application and are also providing training in techniques such as digital photogrammetry to help the groups record and decipher inscriptions of the monuments in their community burial spaces. Alongside this, the ADS has created a pilot national database for burial space research, so that groups conducting work at burial spaces can safeguard their research in perpetuity and share findings with other researchers, using standardised recording methodologies and vocabularies. Our paper will introduce the DEBS project and address the challenges of working with digital technologies with disparate groups to create a coherent national research resource.

Richards, Katie (Washington State University), James Allison (Brigham Young University) and Lindsay Johansson (University of Colorado Boulder)

[84] *Fremont Villages in Their Cultural Landscapes*

Physical and cultural landscapes are integral aspects of everyday life; however, traditionally Fremont archaeologists have focused on studying sites or even features as discrete units instead of attempting to understand them in the broader context of their natural and cultural landscapes. Many Native American groups imbue the landscapes that surround them with cultural and religious meaning which are often materialized in rock art, alignment with celestial phenomena or prominent geographic features, and/or repeated use of meaningful locations. Discerning these meanings is difficult, particularly without ethnographic continuity, but we examine Fremont cultural landscapes from the perspective of several Fremont villages. More specifically, we examine the alignment of buildings within Fremont villages, which are strongly patterned but vary from one village to another, as well as the rock art and other sites in their immediate vicinity. These demonstrate that, as for societies across the Greater Southwest, cardinal directions and landscape features were important to Fremont worldviews.

[371] *Community Organization and Urban Dynamics at Copan, Honduras*

For decades, many archaeologists did not consider ancient Maya centers such as Tikal, Palenque, and Copan to be cities. While today most archaeologists would agree that large Maya centers were cities, the nature of Maya urbanism is still little understood. Maya cities seem different, and in attempt to explain these differences, they have been termed "Garden Cities" and "Low-density Agrarian-Based Cities." In this poster, we employ Geographic Information Systems (GIS) to identify potential community boundaries at Copan using a Least Cost Analysis approach. After we define potential community boundaries, we apply settlement-scaling theory to contribute to broader research on Maya urbanism, and urbanism more generally. Finally, we compare these computationally-derived boundaries to ethnographically-defined boundaries (i.e., *sian otots*) and discuss our findings in relation to community organization and urban dynamics within and between communities.

Richie, Jillian**[3]** *Culture, Community, and Collaboration: Lessons from the Nome Archaeology Camp*

Since 2015, the Nome Archaeology Camp has hosted over 40 Alaskan high school students in four, week-long explorations of Northwest Alaska's rich cultural heritage. A partnership between federal agencies, regional tribal consortiums, non-profit organizations, and local experts, the annual summer camp engages students in place-based educational experiences with an emphasis on community based participatory research. Through hands-on activities and field trips students are introduced to cultural resource specialists and career paths, and gain experience in archaeological field techniques, heritage preservation practices, and museum studies. Within each lesson, campers return to the theme that local heritage is worth celebrating and protecting, and consider how these goals can be achieved at community, state, and national levels. Here, we'll share lessons learned from creating a collaborative place-based educational experience and hear the next generation's ideas about community led preservation in Northwest Alaska.

Richter, Kim (Getty Research Institute)**[28]** *Postclassic Huastec Art and the Cult of the Feathered Serpent*

The Feathered Serpent was one of the principal Mesoamerican deities before the Spanish Conquest. During the Epiclassic and Postclassic periods, the cult dedicated to this ancient deity, associated with wind, fertility, and rulership, became firmly established within an international elite network, composed of diverse ethnic and cultural groups. The network shared a conventionalized visual language that transcended linguistic boundaries. Postclassic Huastec art reveals how a Huastec regional identity was constructed, asserted, and negotiated in the context of this interregional network. Artistic evidence from the Huasteca points to a prolonged cultural dialogue with their Gulf Coast neighbors as well as to stylistic and iconographic affinities with the American Southeast, Central Mexico, Oaxaca, and the Maya region. Artistic similarities range from portable artworks such as codex-style incised shell pectorals, polychrome vessels, black-on-white figural vessels, and red-on-cream murals to monumental anthropomorphic stone sculptures representing elite men and women. These elite Huastec patrons signaled their membership within the Epiclassic and Postclassic networks by commissioning such artworks and fashioning their costumes in a cosmopolitan style. This evidence indicates that the Huastecs were active participants in shaping the artistic vocabulary shared across Mesoamerica, while at the same time maintaining their own regional identity.

Paleomicrobiology is probably best known as an approach that yields anthropological findings connected to human health and disease, such as long-term records of oral microbiomes recovered from ancient dental calculus. However, the tools of microbial ecology have been tested for their potential to address other anthropological questions, and aid in paleoclimatic reconstruction and dating. The latter category includes an experimental approach (Trophic Group Method) that assumes the physiological properties of present-day bacteria in buried paleosols can serve as indicators of climate aridity at the time of soil formation. The method was first systematically tested on samples collected from the Hell Gap site (Grund et al., 2014; Viable paleosol microorganisms, paleoclimatic reconstruction, and relative dating in archaeology: a test case from Hell Gap, Wyoming, USA; *J. Archaeological Science* 46:217-228). This study prompted us to explore alternative paleomicrobiological methods that directly analyze cellular macromolecules without prior bacterial cultivation to better understand the relationship between extant bacteria and past climate. We will report on microbial community structure in a soil column collected in 2017 from a trench at the La Prele Mammoth site. Community composition is being determined through high-throughput DNA sequencing of biomarker genes for bacteria and fungi.

[42] *I Would Walk 500 Miles: Survey of Copper Age Settlements in Eastern Hungary*

The Copper Age (c. 4500-2800) of the Great Hungarian Plain was a period in which the widespread adoption of metallurgy and a series of large-scale population shifts substantially transformed the social landscape. However, research has primarily focused on the large cemeteries (e.g. Tiszapolgár-Basatanya), while the settlements and social structure of the period remain poorly understood. My research focusing on the Bodrogkeresztúr culture group (Middle Copper Age) takes a regional approach to understand the settlement system during a period regarded as, "the real floruit of the Copper Age with its golden symbols of power and the heavy copper axes" (Horváth and Virág 2003). In this presentation, I report on the findings of preliminary fieldwork conducted in the summer of 2018. Guided by the extensive survey work of the Magyarország Régészeti Topográfiája (Archaeological Topography of Hungary), I visited 70 previously identified Bodrogkeresztúr find spots throughout Békés County, Hungary. The primary goals of this survey were to identify clear Bodrogkeresztúr components at sites – as they are usually obscured by more prominent and dense assemblages from other periods (i.e. Middle Neolithic; Bronze Age) – and to set up the next, more intensive phases of fieldwork, including magnetometry and excavation.

Riebe, Danielle (The Field Museum of Natural History)

[42] *Timing the Difference: New Radiocarbon Dates for Late Neolithic Sites across the Great Hungarian Plain*

Over the past six years, the Prehistoric Interactions on the Plain Project has worked to reconstruct multi-scalar patterns of engagement between Late Neolithic (5000-4500 BC) Tisza and Herpály cultural units on the Great Hungarian Plain. By conducting multiple types of analyses on ceramics and chipped-stone tools, it has been possible to model a strongly enforced socio-cultural boundary during this time. However, what remains unclear is the chronological sequence in which these regional cultural developments occurred. Therefore, in an effort to begin building a stronger chronology for the region we conducted radiocarbon analysis of twelve samples from one Tisza site, Szeghalom-Kovácsshalom, and two Herpály sites, Esztár-Fenyvespart and Szeghalom-Várhely. This paper presents our initial findings and contextualizes the results within the broader macro-region.

[371] *Excavation of a Maya Cist Burial at Group A of the Medicinal Trail Community, Northwestern Belize*

Excavation within Structure A-4 at Group A of the Medicinal Trail Community uncovered Burial A-7, a cist burial located below a series of six capstones. Numerous burials have been recovered from Structure A-4, the largest at the group, including the previously excavated Burial A-6, which was situated directly above the six capstones which covered Burial A-7. Consisting of two individuals, Burial A-7 is notable for its types of grave goods including a jade bead and a human ulna that was possibly modified into a flute or similar tool. The large size of Structure A-4, its location on the eastern side of the courtyard, and its continual use as a burial space suggest the structure was a place of communal veneration within the more residential courtyard. This presentation will explore how the complex nature of Burial A-7, and the presence of multiple

burials within Structure A-4, indicate this was a place of importance and likely an example of ancestor veneration.

[195] *A High-Resolution Investigation of the Middle-Upper Paleolithic Transition at Riparo Bombrini (Balzi Rossi, Liguria)*

This paper presents an overview of the results of the 2015-2018 field seasons at Riparo Bombrini, a collapsed rock shelter part of the storied Balzi Rossi site complex in Liguria, immediately next to the border with France. The excavation has sought to capitalize on the insights of the 2002-05 excavations at the site with the explicit goal of refining our understanding of the Middle-Upper Paleolithic transition in this key region which is home to some of the earliest Proto-Aurignacian assemblages in Europe. We present here the larger framework of the project to achieve this goal by combining fine-grained spatial analysis, proteomics, micromorphology, lithic raw material proveniencing, multiple dating methods, aDNA recovery and photogrammetry. This, combined with original methodological tools focused on reconstructing mobility patterns from lithic assemblages, provides us with an unprecedented overall picture of process in the region.

[29] *Nearly Two Millennia of Occupation along Ylig Bay, Guam: Archaeological, Osteological, and Paleoenvironmental Data*

Through CRM compliance-mandated investigations nearly two millennia of occupation at Ylig Bay, Guam, has been documented. Stratified archaeological deposits at three locales along the northern portion of the embayment reveal late Pre-Latte occupation and a possible decades- to centuries-long hiatus before later Latte Period settlement. Both occupations are represented by burial assemblages. These data are complemented by paleoenvironmental information obtained by Steve Athens and Jerome Ward through sediment coring at the Ylig River mouth. Taken together, the results of these investigations provide insights into land use along a dynamic coastline during much of the island's human history.

[220] *Both Secular and Sacred: Kiva Function at Two Sites in the Mesa Verde Region of the American Southwest*

Investigations into the use of space at two sites in southwest Colorado have yielded strong evidence suggesting that archaeologists' understanding of the pit house to kiva transition warrants further study. For many years, archaeologists have asserted that pit houses became formalized ceremonial structures called kivas by the end of the Pueblo I period (A.D. 750 to 900). Thus, by A.D. 900, the function of kivas had become strictly religious, whereas rectangular surface rooms had become the main location for all remaining habitation activities. Recent work at the Bowthorpe and Pigg sites contradicts this traditional assumption and suggests that the structures we call kivas remained primary loci for habitation activities well into the Pueblo III period (A.D. 1150 to 1300). Based on this research, it appears that a strict separation between sacred and secular activities is an ethnocentric interpretation of activity organization and, further, that the strong distinction between kivas and houses in contemporary Pueblo villages is likely the result of a complex series of dynamics including internal changes in Pueblo society, different regional trajectories of development, impacts on Pueblo religion imposed by Spanish

occupation, and other factors.

Riggs, Erin (SUNY Binghamton)

[83] *Refugees as a Productive Force, National Belonging as Mutable: The Case of 1947 Partition Refugee Resettlement in Delhi, India*

Many archaeologists have focused on the material ramifications of nationalist exclusion. Such works have documented how discriminatory policies impact the ability of immigrants and refugees to build new lives post-migration, and in some cases, even endanger their lives. In this paper, I explore the opposite question: what happens when immigrants and refugees are welcomed? I discuss the example of refugee resettlement in Delhi after the 1947 Partition of India and Pakistan, following which property-less individuals became productive citizens through successful rehabilitation schemes. I analyze the minimal yet effective spaces and buildings the government allocated for their use. Refugees transformed these basic allotments into thriving, modern neighborhoods within a generation. In today's world of increasing exclusion and closed borders, this case study demonstrates how refugees with access to basic resources and social acceptance are a valuable, productive force.

[89] *Blind Dates and Nervous Anticipation: Adding Temporal Context to Perishable Artifacts in Legacy Collections from eastern Utah*

The Ephraim P. and Dorothy Hickman Pectol Collection, probably the largest single collection of Fremont-associated perishable artifacts, was donated to the Utah State University Eastern Prehistoric Museum in the Spring of 2017. Most of this collection was amassed from sites along the Fremont River during the early 20th century, near what is now Capitol Reef National Park. Unfortunately, little besides this basic information was known about most of the objects in the collection. The museum embarked on a campaign to provide temporal data on perishable artifacts from this and other collections housed at the museum. Over forty objects were selected and sampled for radiocarbon dating through DirectAMS. While many of the results corroborated cultural or temporal affiliations that were already suspected based on chronological and stylistic typologies, some of the results were much younger or older than expected. This initial project of adding a temporal association to these objects has reaffirmed the need for museums and museum-engaged researchers to assess the hidden research potential within existing collections, particularly through modern analytical methods and other novel approaches.

Ringle, William (Davidson College)

[28] *The Other Flying Serpent*

From at least the Epiclassic period onward, the Feathered Serpent was frequently accompanied by a Cloud Serpent. In the mythology of the Nahuas he was known as Mixcoatl or Camaxtli in his anthropomorphic form, and was either the father or half-brother of Quetzalcoatl. A patron of the hunt, he was also associated with warfare and was central to the pantheons of Tlaxcala and Huexotzinco. A Mixcoatl also functioned prominently in the Mexica peregrinación.

Archaeologically, depictions of the Cloud Serpent at Chichen Itza, in the codices of the Mixteca-Puebla region, and at Tula and Tenochtitlan, among others, strongly suggest a deeper connection with the ideology associated with the feathered serpent. This paper will examine several of these contexts to better understand this connection, making especial use of the Tlaxcalan historical record.

Ringle, William [100] see Seligson, Ken

Riordan, Kyle (The Ohio State University) and Julie Field (The Ohio State University)**[408]** *Ancestral Pathways of Fiji: Using GIS to Analyze Landscapes of Movement and Lineages within the Sigatoka River Valley*

The concept of landscapes of movement establishes the theoretical basis for understanding meaning behind the creation and use of roads, trails, and pathways. This meaning can be categorized by “prioritized relationships” (i.e., social, political, religious, economic) which ultimately stimulate the existence of landscapes of movement. This research uses GIS to investigate prioritized relationships between the Tualeita, a prehistoric trail system on Viti Levu, and various environmental, archaeological, and genealogical factors. Socially prioritized kinship relationships in Fiji can be distinguished within lineage groups called mataqali. Traditional stories tell of ancestors traversing and settling the Sigatoka valley and locations beyond. With an understanding of ancestral migration networks, GIS analyses reveal the degree to which these routes are connected to the Tualeita. This may suggest either a high or low priority given to social and religious relationships maintained by the Tualeita. Data include ethnohistorical accounts of the Tualeita, aerial photography of trail systems in the valley, and oral traditions pertaining to genealogies.

Rios Allier, Jorge (Indiana University)**[88]** *Archaeological Heritage Management in Mexico: Current Panorama*

This poster examines the innovations of different finance mechanisms for cultural heritage management (FMCRM) in support of open archaeological sites at the subnational level in Mexico in the last few years. The federal states (subnational level) that have implemented these policies for at least ten years have had diverse designs, implementations, and results. This study aims to show the findings in the literature about the use of financial mechanisms for the application of cultural heritage management in Mexico and other countries experiences, their definition according to their legal framework, the possible dependence on changes regarding political alignment or their socio-economic context. Based on these early studies, this study anticipates that finance mechanisms are firmly related to the political ideology of the current government at national and subnational levels but does not highlight the existence of a relationship with economic growth indicators. This study also emphasizes that the creation of these financial mechanisms for the management of cultural heritage leads to the first steps towards decentralization of the cultural sector as they transfer operational decision-making and collection capacity to the sub-national levels.

Rippee, Kassandra (Coquille Indian Tribe) and Stacy Scott (Confederated Tribes of Coos, Lower Umpqua, and Siu)**[136]** *Changing Tides: Tribal Engagement in Oregon's Coastal Archaeology*

Archaeology on Oregon's Coast has been largely limited in scope and lacks a holistic viewpoint of coastal history. Archaeological investigations began in earnest around 1930 with avocational archaeologists like Marcus Seale interested in expanding their “trophy item” collections. The heavily male dominated field of professional archaeology began to evolve in the 1940s and 1950s with investigators from varying backgrounds like Luther Cressman who began studying the material culture of the tribes as if they were an extinct group. The push for federal recognition in the 1970s sees increased tribal involvement with archaeologists such as Dick Ross. Unfortunately, tribal interests in archaeology are still not well captured today. Cultural resource professionals at major institutions continue to curate “cultural material” under the egis of science and resource protection, while arguing against the repatriation of material based on lack of skeletal components, or a misguided understanding of “affiliation,” and of the Native view of sacredness. We explore the legacy of our predecessors and how we as archaeologists must take a more comprehensive approach to understanding coastal history since time immemorial.

Risner, Lacy [158] see Wann, Kevin

Rissetto, John (Nebraska State Historic Preservation Office [NeSHPO]) and Kelli Bacon (Nebraska State Historic Preservation Office [NeSHPO])**[104]** *Balancing Public and Professional Interests in Archaeology from a State Historic Preservation Office (SHPO) Perspective*

As the public increases its influence over how the discipline of archaeology defines its scientific and educational value, state-sponsored archaeological institutions, such as the State Historic Preservation Office, must continue to adapt to satisfy their professional and public audiences. In 2017, the Nebraska State Historic Preservation Office (NeSHPO) conducted its five-year review of the State of Nebraska's historic preservation plan. This plan communicates to the National Park Service,

lawmakers, and the public the State's strategic goals regarding how to best record, secure, and distribute cultural resource information across the state. To collect data for this plan, the NeSHPO Archaeology division conducted two independent, online surveys that targeted both Nebraska citizens interested in archaeology and professional archaeologists living or working in Nebraska. Separating the survey populations allowed for a greater definition in which to gauge the unique and sometimes conflicting opinions of both groups regarding their knowledge, experiences, and priorities for how Nebraska archaeology and archaeological resources should be administered by the NeSHPO. This paper will present the methodology of both surveys, compare and contrast the results, and offer suggestions for future surveys that can be models for other SHPOs.

Rissolo, Dominique (University of California, San Diego)

[360] *A Reexamination of Postclassic Maya Cave Altars along the Central Coast of Quintana Roo*

The construction and ceremonial use of miniature temples, or shrines, in caves across the central coastal zone of Quintana Roo, Mexico is a well-documented tradition and one that has received recent scholarly attention. Also common in caves throughout the region was the siting of unenclosed altars in a range of different forms and styles. Interestingly, a number of these altars closely resemble those found within the inner-sanctums of temples located at surface sites. Religious specialists who would have had access to (and familiarization with) more restricted temple interiors may have also presided over cave rituals involving those altars that reflect a close stylistic correspondence to their temple-enclosed counterparts. It is proposed that in the case of such cave altars, the cave itself could have functioned as a "temple," thereby enclosing the altar and creating a symbolically analogous performative space.

Ristvet, Lauren (University Of Pennsylvania)

[359] *Negotiating Empires: Village Dynamics in Naxcivan, Azerbaijan*

Archaeological research on empires has focused on centers and periphery, with much less emphasis on the interstices of empires. During the first century of the common era, the polities of the Southern Caucasus were located between the competing empires of Arsacid Persia and the Roman Mediterranean. Recent fieldwork in Naxcivan, Azerbaijan considers how a small community negotiated this often fraught position. Excavations of high and low status domestic areas and burials highlight the roles of violence and migration along the edge of empire. The analysis of ritual pits and burials located near the remains of the Iron Age citadel and fortification walls illustrate how people engaged with the long term history of the city and crafted a specific local identity. Alternatively, petrographic and stylistic analysis of ceramics indicates how well-integrated this community was with both empires.

Ritchey, Melissa (University of Massachusetts Boston) and Heather Trigg (University of Massachusetts Boston)

[351] *Reconsidering Cereal Production and Consumption in the North Atlantic: A case study from Northern Iceland*

During the Viking Age, the Norse settled Iceland, a sub-arctic volcanic island at the climatic margin of cereal production. These settlers brought with them a distinctive subsistence economy involving animal husbandry and cereal production, most notably barley. Barley (*Hordeum vulgare*) has been noted by archaeologists and historians as important to early Icelandic society because it is the only cereal grain that could be cultivated in such an environmentally marginal landscape due to its high climatic tolerance. Barley production has been consistently interpreted as restricted to high status farms because of its connections to feasting practices and the sustainment of social hierarchy in the Icelandic political economy. However, new systematic sampling from the Skagafjörður Church and Settlement Survey (SCASS) project of 50 farmsteads has shown that this cereal can be found ubiquitously across both the larger, wealthy sites and smaller, less-affluent ones. Because Iceland is on the edges of successful agricultural production, understanding the regional variation in agropastoral practices adds to the broader discussion of human adaptation and colonization of marginal landscapes and new environments.

Ritchison, Brandon (University of Georgia)

[97] *The Downstream Effects of Abandonment: Immigration and Transformation on the 14th Century Georgia Coast, USA*

By 1390 CE, the Mississippian chiefdoms of the Savannah River Valley (SRV) had been depopulated. Settlement and radiocarbon evidence suggest that the former residents of the SRV spread to neighboring regions. On the Georgia Coast, immigrants arrived into a rapidly changing context. Settlement expansion meant the establishment of new locales, occupied for the first time in history. The settlement history of the Kenan Field site, a 60-ha, persistently occupied site on Sapelo Island, provides an example of how residents of the Georgia Coast responded to the arrival of SRV migrants through dispersal and contraction.

Rittenour, Tammy (Dept of Geology and USU Luminescence Lab), Heidi Van Etten (University of Wyoming) and Judson Finley (Utah State University)

[329] *Hell Gap in a New Light: Luminescence Results from the Witness Block*

The Witness Block (Locality I) at Hell Gap preserves a well-studied open-air stratified record of near-continuous Paleoindian occupation. Radiocarbon-based age control has been problematic due to age reversals and inconsistencies related to old and young carbon contamination and calibration uncertainties. Recent work by Pelton et al. (2017) has used Bayesian analysis to tease-out a satisfactory age-depth model using the available radiocarbon ages. However, limited age control from some strata, low calibrated resolution of older radiocarbon ages, and inherent contamination/mixing problems in an open-air site have reduced the precision of the age-depth model. In order to provide independent age control for the Witness Block we have collected 15 samples for optically stimulated luminescence (OSL) dating. Preliminary OSL results range from 13.6 to 11.9 cal ka (stratum D2 to E3) and are in stratigraphic order except for two samples that produced younger than expected ages, likely due to sampling unrecognized krotovina. OSL results from samples spanning stratum D2 to F2 (2 m of section, covering ~14-8 cal ka) will be compared to the radiocarbon chronology and the existing Bayesian age-depth model. We highlight differences and similarities between the two chronologies and discuss implications for site formation and paleoenvironmental interpretation.

[215] *Ethics, Etiquette and Engagement: The Role of Archaeologists in Active Opposition*

Stewardship in archaeology has had its run around the debate block regarding definitions and scope as to whom and what archaeologists are exactly protecting and promoting out of the archaeological record. Ethical principles of public outreach, accountability, preservation and reporting coincide with an archaeologists responsibility to utilize their specialized training to promoting understanding and support within the greater community. Today's effusive information accessibility and the popularity of well-produced pseudoscientific infotainment have created bottlenecks of misinformation that have an insidious effect on the public intellect. It is therefore the ethical responsibility for the professional engagement of archaeologists to actively oppose pseudoscience in the media. As false news is passed as educational material, we owe it to the scientific community, the public, and the archaeological record to be stewards on the front line against alternative facts, biased histories, and ancient aliens. This presentation will exhibit the ethical imperative for the professional engagement of archaeologists with pseudoscience in public venues in order to improve and progress scientifically accurate community outreach and social understanding.

[306] *Junius Bouton Bird, Archaeologist and Explorer*

Junius Bird's legacy to Andean Archaeology is reflected in several fields. Bird's fieldwork, commonly known as "dirty archaeology" was decisive in establishing the first stratigraphic sequences in the three areas where he did work: Patagonia,

Northern Chile, and Central Peru. Bird was the first in reclaiming the antiquity of early man in South America in the 1950's. He also contributed significantly to develop a variety of technical analysis, including the study of Andean textiles.

[300] *An Ethnoarchaeology Study of Water Rituals at Bagan, Myanmar*

Water is an element which characterizes and links Southeast Asia, however, due to the difficulties of understanding its religious significance within the archaeological record, few studies have examined its symbolic meaning. As part of this ethnoarchaeology study, interviews and observations conducted in ten traditional villages near Bagan were aimed at requesting participants to describe the festivals, healing rituals, and ceremonies in which water has a prominent role. The results indicate that the symbolic use of water was directed towards increasing protection, healing, purifying (or exorcising), renewing, and linking individuals with one another and with supernatural beings. Within the performance of certain water rituals, in particular rain-calling ceremonies, aspects such as by whom, when, and where this ceremony was performed showed greater variability. This is possibly linked to the soil, weather, crop cultivation, and water accessibility variations across villages which have led to diverse water needs. Observation of shrines, offerings, and the material culture used to provide water offerings indicate that the properties attached to water had little relation to the nature of water vessels, and rather depended on the properties infused to it by the power of the Buddhist texts, and the morality of the reader of such texts.

[206] *Defining Markers of Occupational Stress in the Ancient Fisherman of Huanchaco, Perú: When Modern Ethnography and Bioarchaeology Intersect*

Archaeological excavations and bioarchaeological analyses reveal that marine resources and fishing are main form of sustenance on the north coast of Peru – these traditional fishing practices have endured over 3,000 years. Although the degree of reliance on marine resources has shifted from the Initial Period (1500-1200 cal. BC) to present day, traditional fisherman continue to utilize the traditional reed fishing boats caballito de totora (*Schoenoplectus californicus* subsp. *tatora* plant). A deep knowledge of marine resources is still prevalent in the small northern coastal town of Huanchaco, Moche Valley, Peru. Past excavations of the Programa Arqueológico Huanchaco (PAHUAN) have recovered the remains of ancient fishermen, as confirmed by their grave goods. Bioarchaeological analysis clearly reveal a common pattern of physical stress on these ancient remains. These specific markers of occupational stress, left by activities related to human interaction with the sea, will be defined. Specific examples from ethnographic study of modern-day fisherman of Huanchaco will be presented, with a discussion of how bioarchaeologists can recognize the same stress markers on the bones of past people by looking to people here today.

Rizvi, Uzma (Pratt Institute)

[161] *Crafting Labor and Landscape*

This paper revisits how landscape and mineral extraction have been contextualized in the third millennium BCE, Ganeshwar Jodhpura Cultural Complex (GJCC), Rajasthan, India. The GJCC has very specific formations of sites around resource-high regions particular to this landscape and time period that demonstrate a focus on copper production and indicate a high level of socio-cultural and political complexity. Site development is a controlled, planned and materially articulated strategy that requires community mobilization, craft specialization and placemaking, and intimate high levels of political, social and economic self-realization. These levels of control are negotiated by and through value placed on new forms of material culture that emerge from high levels of craftsmanship that provide specific forms of sociality to the members of the GJCC community. Rather than considering the landscape only as mise-en-scène and context, this paper will understand landscape as laboring alongside the human body. Investigating the affective response to the landscape, this paper tests the agentive properties of place in relation to ancient subjectivity. The discussion of belonging in relation to labor and its link to placemaking will be investigated in an effort to provide clarity around the question of an agentive and laboring landscape.

[216] *After the Ice Age in the Ozarks*

Fluted point techno-complexes of the Ozarks include Clovis, Gainey, Folsom, and Dalton. Folsom point-making people are comparatively less well represented in the interior Ozarks possibly because of the lack of grasslands and bison. In this presentation, we explain the origins and evolution of Clovis technology and the exploitation of lithic resources from Clovis to Dalton in North America. Lithic raw material patterns, use-wear analysis, and environmental parameters are the basis for inferences about mobility and range size for each of the cultural complexes. Initial colonizers are on foot, however, by the Dalton period, circa 10,900 to 9,900 rcybp, at least some individuals routinely used watercraft to access non-local resources and mates.

[317] *Bioarchaeology of Madness: A Biocultural Perspective on Transgression, Strangeness, Folly, and Delirium in the Past*

The invention of the Ospedale (hospital) in fourteenth-century Italy marked a turning point in human relations. The othering process of medicalization began as an attempt to provide respite for incurable strangeness, delirium, or transgressive and foolish behavior, particularly for those without family to care for them. The disordered mind became a subject of oversight and confinement even as economic and social changes created new potential for dietary deficiency and fostered the spread of infectious diseases like the Black Death, tuberculosis, leprosy, and syphilis. This paper explores the relational and socio-cultural aspects of madness in Medieval Veneto, Northern Italy. We will discuss the intersection between 'strange behavior', nutritional insufficiencies, and infection. We will examine what is known and what can be hypothesized about the paleopathological record of madness, including both a medical perspective on pathognomic and non-specific indicators of disease that can result in behavioral changes on one hand and skeletal manifestations of stigmatization and institutionalization in the Medieval context on the other. Through this research, we hope to inspire bioarchaeologists to explore notions of "health," medicalization, the embodiment of mentality, and institutionalization in the past.

Roberts, Alicia and Danielle Kurin

[286] *A Study to Determine Sex of Prehistoric Peruvian Commingled Remains by Comparing Femoral Neck Osteometrics*

The Chanka are a prehistoric agro-pastoral culture that settled in what is now the Andahuaylas province of Peru during the Late Intermediate Period (LIP [ca. AD 1000-1250]). The Wari predate the Chanka and developed their cultural settlement within the Ayacucho Basin during the Middle Horizon Period (MHP [ca. AD 600-1000]). This study will examine excavated remains from two bioarchaeology sites in Apurímac, Peru: Cachi and Turpo. Cachi is a Chanka site and Turpo a Wari site,

each with excavated burial caves. The remains from these caves are commingled and will be analyzed to determine sex of the individuals as well as demography of the sites. Results will determine whether or not there is a demographic pattern to who was placed in these burial caves and if the demographics vary from Chanka to Wari sites. I will conduct this study by taking two measurements on femora found at both sites: the femoral neck width and the femoral neck axis length. I will then compare these results to previous sex determining studies of this collection to find if my results are consistent or if there are discrepancies with other osteometric methods.

Roberts, Heidi

[36] *Cholla Bud Roasting in St. George, Utah during the Early Pueblo II Period*

Cactus-bud procurement is not typically associated with Virgin Branch Ancestral Puebloan subsistence systems. Yet, when I visited a small artifact scatter on the apex of a rocky, cholla-covered hill near St. George, Utah, I was reminded of cactus-procurement landscapes on the Tohono O'odham Reservation in southern Arizona. Subsequent data recovery investigations proved my suspicions correct, revealing several slab-lined roasting pits that had been used to cook cholla buds. This paper describes those excavations and our experience gathering and processing cholla buds with Southern Paiute Tribal members to study the cholla bud nutritional values and return rates.

[352] *The Relationship between Humans and Camels in Late Prehistoric Southeastern Arabia: The Problems of Distinguishing between 'Wild' and 'Domestic' Camels Using Zooarchaeological Materials and Methods*

The dromedary camel (*Camelus dromedarius*) is a crucial component of the lifeways of humans in arid regions. Delineating the nature of the early relationship between humans and dromedaries is therefore critical to our understanding of the ancient human societies that co-existed with the dromedary in these areas. Many studies into this relationship have focused on the domestication of the dromedary, attempting to distinguish between wild and domestic camel populations with the assumption that a stark dichotomy exists between the two. This has led to the creation of a model whereby dromedary domestication is hypothesised to have occurred in southeastern Arabia over a short period, around 1000 BCE.

This presentation outlines evidence from a camel bone assemblage recently excavated at Saruq al-Hadid, U.A.E. (2200 – 800 BCE), which questions the assumed dichotomy between wild and domestic camels. The evidence from Saruq al-Hadid reinforces a framework of camel domestication as a longer-term process, as opposed to the commonly accepted short-term model. The theoretical implications of these findings are discussed, and new methods are proposed that might allow future researchers to further elucidate the nuanced relationship between humans and dromedary camels, prompting us to rethink the way we view camel 'domestication'.

Roberts, Jerod (Shumla Archaeological Research & Education Center)

[305] *Assessing the Patterns and Variation of a Common Pecos River Style Motif*

The Lower Pecos canyonlands of southwest Texas are home to over 350 identified rock art sites containing various pictographic styles. The Pecos River Style is the most well-known and contains many diagnostic characteristics. One of the most ubiquitous is a motif that has been interpreted as a prickly pear pouch, gourd rattle, catfish on a string, dart-headed figure, and a datura seed pod. Shumla classifies this motif as a powerbundle. This referent is not an interpretation, but is solely used as a descriptor. While the names differ, each describes a figure consisting of a line or set of parallel lines extending from a perpendicular line, terminating in an ovoid shape. Over 200 instances of powerbundles have been identified among the 100-plus rock art sites recorded by Shumla in the past 2 years. This presentation discusses new insights into powerbundle attributes and variation, their distribution across the landscape, and patterns in motif association.

Roberts, Laylah**[171]** *Social Significance of Glass Beads at San Luis de Talimali (8Le4)*

How do the number and type of glass beads found in the structure recovered from FSU's 2018 field school at San Luis de Talimali (8Le4) differ from other Spanish living structures on the site? And what do these beads (especially the special decorated types, such as Cornaline d'Aleppo or striped beads) tell us about the social status and wealth of the people who lived there? Glass beads, which were forms of personal adornment especially in Spanish La Florida, tell archaeologists more about both the Spanish and the Apalachee indigenous to the area. This study will focus on the Spanish and their lifestyle in San Luis—were their glass beads markers of status and did they differ between Spanish households? In order to answer this research question, the glass beads recovered from San Luis during the 2018 field season will be compared with glass beads from earlier excavations. Spatial distribution, bead type, and the number of decorated glass beads will be the main focus of research and will concentrate on the beads excavated from a newly recovered domestic structure in the Spanish village.

Roberts, Patrick [34] see Swift, Jillian

Roberts, Victoria (Shumla Archaeological Research & Education Center)**[305]** *Bold Line Geometric: Revisiting a Lesser-Known Rock Art Style in the Lower Pecos Canyonlands of Texas*

Bold Line Geometric is one of five currently identified rock art styles in the Lower Pecos Canyonlands of southwest Texas. It has previously been described as thick, glossy pigment applied in bold lines, geometric shapes, and globular anthropomorphic and zoomorphic forms. In 1965, David Gebhard laid the ground work for the initial description and definition of this abstract style using characteristics found at five sites. Solveig Turpin expanded this sample to 14 sites in 1986 and proposed Bold Line Geometric dated to the late archaic to protohistoric time periods based on relative preservation and superimpositioning with older styles, but problems with classification have plagued this style since its initial description. In 2017, Shumla launched the Alexandria Project to collect baseline data at all the known rock art sites within Val Verde County, Texas. Since the launch of this project, Shumla has identified at least 10 additional sites containing possible Bold Line Geometric imagery. This paper presents preliminary research revisiting the attributes, context, and chronology that define the style using this expanded dataset.

Robertshaw, Peter (CSU San Bernardino)**[223]** *Teaching Archaeology in Virtual Reality: Project Ambrosia*

Field schools have been the best way to provide hands-on experience with archaeological fieldwork in an environment geared to student learning. However, field schools are beyond the financial and logistical reach of many students, particularly first-generation students and those from underrepresented groups. The decreasing costs and increasing accessibility of Virtual Reality simulations have the potential to provide an alternative to traditional field schools. However, most VR applications in archaeology have focused upon immersion in famous archaeological sites, with the student as a passive explorer in this VR world. Our VR development team has instead developed a simulation in which students become members of an archaeological survey team that searches for and records archaeological sites on the fictional island of Ambrosia. Students learn how to conduct archaeological reconnaissance surveys, experience the excitement of discovering sites, and interact with the archaeological materials on those sites to answer questions about site formation processes and learn about the inferences that may be made from material culture, while also being exposed to ethical issues in archaeology. This presentation will provide information on the development and pedagogy of Project Ambrosia, together with data gleaned from student testers.

[223] *Chair***Robin, Cynthia (Northwestern University)****[58]** *Aventura: Understanding Sustainable Cities*

As over half of the world lives in cities today, there is perhaps no more pressing question than: how can people create cities that are sustainable? Archaeology is uniquely suited to answer questions about the longevity of cities, because archaeologists excavate long expanses of human history. The social, political, economic, and environmental pressures that modern people and cities face are not new and archaeology provides a means to evaluate how people in the past successfully and unsuccessfully dealt with challenges in establishing and maintaining cities. This presentation examines

archaeological evidence and public education programs generated by the Aventura Archaeology Project. With a five millennia history, Aventura provided humans a home across periods of vastly differing environmental and socio-political conditions. The Pre-Columbian Maya city at Aventura thrived during the period of the Terminal Classic Maya collapse providing a window to understand how cities survive periods of political and environmental disruption. Public education programs focus on developing local partnerships to sponsor events for a broad range of stakeholders: archaeology fairs for families, summer camp experiences for kids, and workshops for educators and adults.

Robinson, David (Texas Archeological Research Lab, UT-Austin) and Marybeth Tomka (Texas Archeological Research Lab, UT-Austin)

[346] *Calibration of Chronometric Assays from the WS Ranch Site (LA 3099) and Other Sites in the Middle San Francisco River Valley, West-Central New Mexico*

The aggregation of existing radiocarbon assays and tree-ring and obsidian hydration assays, combined with new linear accelerator dates, allows the potential realignment of regional chronologies in West-Central New Mexico, the Middle San Francisco River valley in particular. The WS Ranch Site Project, sponsored by the University of Texas at Austin and supported by the USDA Forest Service, conducted contextual analysis of chronometric assays collected over 16 years of field research. The research shows the occupation of the river valley at least as early as Cochise Archaic times. Pithouse occupation began as early as A.D. 100 on low as well as high terraces above the river, supported by some degree of maize horticulture. Great Kiva ceremonialism began at A.D. 750 or earlier, and it persisted through the Puebloan occupations, ending slightly later than A.D. 1300. Saladoan sites and limited reoccupations of Puebloan rooms at the WS Ranch site left a few dates in the early A.D. 1500s.

Robinson, Erick (University of Wyoming)

[248] *The Role of Edge Effects in Late Holocene Archaeological Radiocarbon Time Series*

Many archaeological radiocarbon time-series throughout the world display a decline of radiocarbon date frequencies from ca. 900-600 cal BP. In this presentation we examine alternative hypotheses that may explain these trends. We analyze whether dramatic declines in radiocarbon date frequencies are due to biases such as i) favoring the use of relative dating using well-known diagnostic artifacts, ii) the use of directly dated historical documents, iii) imprecision in calibrated dates between 900 and 600 cal BP, or iv) whether social-ecological dynamics provide a more plausible explanation. This presentation develops a multiple-proxy method for the assessment of edge effects in archaeological radiocarbon time-series, and we attempt to apply causal methodologies to distinguish between potential edge effects and sharp declines generated by social-ecological processes.

[303] *Ceramics from Q'umarkaj: Heritage Collection and Instrumental Neutron Activation Analysis*

Research on the ceramic collections from Q'umarkaj housed at the Middle American Research Institute, Tulane University, provides an opportunity to apply Instrumental Neutron Activation Analysis to pottery from the site. This research has the potential to delimit areas of ceramic production and trade in the Terminal Classic - Late Postclassic periods of this famous capital in the K'iche' area. This paper will review the results of INAA on a sample of 82 monochrome domestic wares, censers and bichrome ceramics representing 9 types identified by John Weeks at Chisalin. Study of the elite pottery published by John W. Fox et al. in 1992 from a central sector of the site, has started with INAA analysis of a single Tohil-like vessel whose chemistry does not match the Soconusco region. Museum research at the National Museum of Archaeology and Ethnology in Guatemala has found almost all of the vessels from the cache of broken vessels from Q'umarkaj. Eventually research will evaluate the Fox thesis that these vessels date to an Epiclassic-Early Postclassic migratory period tied to the founding of Q'umarkaj and the identification and iconography of the vessels.

[51] *Clovis Technology on the Southern Colorado Plateau: An Analysis of the Glen Quarry Locality*

This paper details my archaeological research on Clovis lithic tool technology at the Glen Quarry Locality, Glen Canyon National Recreation Area, southeastern Utah. As the earliest inhabitants of North America dating from approximately 13,400 BP, Clovis cultures form the baseline for the archaeology of the continent. I report the results of intensive field survey and GPS mapping, in-the-field analysis of artifacts and features, and laboratory analysis of additional collections from regional Clovis localities and sites. My research provides evidence for a Clovis presence at the Glen Quarry locality in the form of diagnostic Clovis lithic technology and provides further understanding of mobility and land use by Paleoindian people in the Glen Canyon area. Glen Canyon National Recreation Area also has extensive evidence ranging from Archaic times to the proto-historic human occupation (Geib 1996). My research at the Glen Quarry locality adds to the growing body of evidence for Clovis presence on the central and southern Colorado Plateau.

Robison, Jade (University of Nebraska-Lincoln)

[220] *Memory-Dependent Practices at a Chaco Outlier: Insights from the Ceremonial Deposition of Shell Ornaments at Salmon Pueblo, New Mexico*

In the late Pueblo II period, around A.D. 1090, migrants from Chaco Canyon constructed Salmon Pueblo, which would become an important ceremonial and political outlier in the Middle San Juan region of New Mexico. Salmon Pueblo rivals the size of canyon great houses, boasting three stories and nearly 300 rooms, as well as a tower kiva and great kiva. The Ancestral Puebloans who occupied Salmon continued to emulate Chacoan characteristics, especially through the possession and ritual deposition of shell ornaments. In this study, I present the results of research conducted at the Salmon Ruins Museum regarding taxonomic and stylistic classification of the shell assemblage from Salmon. Further, I evaluate the spatial and temporal distribution of the shell ornaments utilizing data from the Salmon Pueblo Archaeological Research Collection (SPARC). Participation in the deliberate creation of a Chacoan locale at outliers like Salmon Pueblo may be enabled by a memory-dependent exchange of objects embedded with high social value. With this in mind, I consider how the attainment and ceremonial deposition of shell ornaments at Salmon Pueblo might inform our understanding of social transformations in the Middle San Juan prior to and following large-scale changes in Chaco Canyon.

Robles Garcia, Nelly (Instituto Nacional de Antropología e Historia)

[173] *La Restauración Arquitectónica ante los sismos: Monte Albán 1999 y 2017*

Esta ponencia parte de las experiencias de tratamientos de restauración aplicados a los daños producidos por los sismos de 1999 y 2017 a la zona arqueológica de Monte Albán, Oaxaca, México. Apoyados en la larga experiencia en trabajos de restauración monumental llevados a cabo en México desde finales del siglo XIX hasta hoy, los proyectos de recuperación por daños causados por movimientos sísmicos tienden a establecer una especialización que conlleva respuestas inmediatas para salvaguardar los monumentos dañados y prevenir deterioros mayores. Igualmente implica procesos de planeación para la intervención, en los que se priorizan las acciones preventivas, las condicionantes de integridad y autenticidad, la seguridad del monumento, trabajadores y público visitante. Hoy en día, se atienden las causas de deterioro durante los sismos de 2017, lo que significa el establecimiento de modernas estrategias de estudio, de intervención, y la necesaria interdisciplina para resarcir los daños, tanto como para establecer manuales de prevención de daños por desastres naturales en los sitios del Patrimonio Mundial.

Roche Recinos, Alejandra (Brown University), Charles Golden (Brandeis University) and Andrew Scherer (Brown University)

[219] *An Obsidian Workshop at Budsilhá Chiapas, Mexico*

One of the persistent difficulties in understanding Classic Maya (AD 250–900) economies has been the challenge of identifying the loci of production (e.g., workshops) and exchange (e.g., marketplaces), and thus interpreting how the two figured into local and regional economies. During the 2013 fieldwork at the site of *Budsilhá*, Chiapas, Mexico—a subsidiary

site of Piedras Negras–Golden, Scherer and colleagues excavated what they interpreted as an obsidian workshop. In this paper we present a preliminary analysis that supports this hypothesis from the data collected over the course of the 2013 and 2018 field and laboratory seasons of the Proyecto Arqueológico Busiljá-Chocoljá. We focus on the differences between household versus non-household areas, drawing comparisons with known production areas in Mexico and Guatemala to argue that Budsilha artisans were among the major producers of prismatic blades in the region. We also present the data from other lithic industries collected during the 2018 field and laboratory seasons, such as chert, to argue for a possible shift from the manufacturing of chert implements to obsidian blades and other artifacts.

Rockman, Marcy (U.S. National Park Service)

[251] *Improving Integration of Archaeology into the Work of the IPCC (Intergovernmental Panel on Climate Change): A Status Report*

Modern anthropogenic climate change has its roots in the Industrial Revolution and has developed further through social and economic processes that have grown into world dependence on fossil fuels. Archaeology has much to say about these developments and provides important cultural and natural baseline information from which the scope and scales of change can be better understood. However, to date, information from and attention to the impacts of climate change on archaeology and heritage broadly has had only minimal representation in reports of the IPCC. In 2017, the World Heritage Committee asked the International Council on Monuments and Sites (ICOMOS) to improve these connections. This paper presents a status report on efforts to develop an IPCC expert meeting on heritage, plan for an IPCC special report on heritage and climate change, and engage the archaeological field in developing new and needed approaches to research and publication.

[324] *The Steven's Site: Investigations of Possible Quarry Adjacent Habitation at the Munsungun Lithic Quarry*

Red Munsungun Chert appears in Paleoindian archaeological assemblages throughout Northeastern North America. While ubiquitous, the source location for this material has only been recently discovered. The NKP quarry, in far Northern Maine, identified by the authors is located within the Munsungun Lake region. Over the past three years, the authors have been conducting geoarchaeological reconnaissance, small-scale test excavations, and geologic sampling. This poster will present results from our most recent fieldwork, lithic and microwear analysis results, and interpretations of the site spatial patterning. The authors contend that they may have discovered a quarry-associated habitation site dating to the Paleoindian period located near the NKP source.

Rodas, Diana (Universidad de las Américas Puebla), Aurelio López Corral (Instituto Nacional de Antropología e Historia Tlax), Ramón Santacruz (Instituto Nacional de Antropología e Historia Tlax) and Nora A. Pérez Castellano (Instituto de Investigaciones Estéticas-UNAM)

[68] *Estudios Químicos sobre la Cal de Tlaxcallan del Posclásico Tardío (1250-1519 d.C.)*

La cal fue uno de los principales cementantes en Mesoamérica y es considerada un rasgo clave para identificar niveles de complejidad social debido al alto costo energético que conllevó su producción artesanal en sociedades preindustriales. La cal también fue utilizada ampliamente en la antigua Tlaxcallan durante el Posclásico Tardío (1250-1519 d.C.) en morteros para repellados de elementos arquitectónicos, recubrimientos de artefactos, y para el proceso de nixtamalización del maíz. En este trabajo analizamos la estructura físico-química de la cal de diversos contextos arqueológicos en Tepeticpac, Tizatlan y Teotlalpan, tres subsecciones del sitio arqueológico de Tlaxcallan. Empleamos las técnicas de FRX, FTIR y petrografía para establecer los procesos pirotécnicos involucrados en el quemado de la materia prima y las

características composicionales de los morteros, para así establecer las implicaciones sociopolíticas de su consumo en el asentamiento.

[100] *Refugios y rituales: Conflicto en el Fortín Preclásico de Macabiler, Guatemala*

Entre los grupos mayas; fortalezas, armas, y sistemas de murallas defensivas nos indican lo común que era el conflicto en las relaciones sociopolíticas de estas comunidades. En las Tierras Bajas occidentales, fueron pocos los sitios que alcanzaron un alto grado de desarrollo convirtiéndose en grandes centros urbanos para el Clásico. Dentro de la región, una entidad que alcanzó un gran desarrollo durante el Preclásico fue Macabiler, ubicado en las márgenes del Usumacinta. Su localización en la cima de un cerro, su conjunto de terrazas megalíticas y una serie de murallas que cierran los valles circundantes; evidencian que Macabiler funcionó como una fortaleza o refugio defensivo durante un periodo turbulento. Nuestras investigaciones se enfocan en contestar ¿Qué papel jugó el conflicto en el desarrollo sociopolítico de la región? Las investigaciones presentadas en este trabajo, resultado de tres años de excavaciones, se resumen en la documentación, cronología, y función de las terrazas, plazas y estructuras; además de la exploración de las áreas cercanas, identificando varias cuevas que tuvieron un papel importante como foco de prácticas rituales. Todo esto en conjunto nos brindará información importante no solo para comprender Macabiler, sino para entender el desarrollo y dinámicas sociopolíticas de la región.

Roditi, Effrosyni (University of Tübingen) and Britt Starkovich (University of Tübingen, Senckenberg Museum)

[144] *Were Neandertals the Original Snowbirds? Zooarchaeological Evidence from Greece*

Compared to other parts of Eurasia, the southern Balkan Peninsula had a relatively stable climate during the Late Pleistocene. Zooarchaeological materials from the Asprochaliko Rockshelter in northwestern Greece provide evidence for hominin subsistence strategies in the Middle and Upper Paleolithic. In this study, we employ taxonomic abundance and diversity indices to investigate hominin prey choice, while taphonomic observations provide further information on resource exploitation and site use. We discuss these lines of evidence in relation to data on environmental productivity and site occupation, relying on ungulate evenness and mortality profiles to assess the relationship between hominin subsistence practices and climate. We complement our results with published faunal studies from Klissoura 1, Lakonis 1, and Kalamakia caves in southern Greece. We examine changes in the faunal composition of the four sites in an attempt to identify the extent to which climate influenced resource availability and diversity in the region, stimulating shifts in hominin subsistence. Additional evidence for seasonal variation in site use allows us to evaluate the region's character as a refugium during MIS 5d-3.

[367] *What Happened at Joara, Cuenca, and Fort San Juan: Archaeological Finds from the Berry Site in Western North Carolina*

Between 1566 and 1568, expeditions led by Captain Juan Pardo sought to establish permanent Spanish colonial towns and forts along an overland route connecting Santa Elena, the capital of La Florida, in coastal South Carolina, with New Spain and the rich silver mines near Zacatecas, Mexico. Written accounts chronicle the movements of Pardo himself and some of his men, and they record some of the major events that took place at Native American towns in the Carolinas and eastern Tennessee, but documentary sources only record the broad contours of what happened, and why. Written accounts also do not shed much light on how Native Americans themselves interpreted these developments, nor how they responded to the challenges and opportunities created by encounters and entanglements with Spanish conquistadors and colonists. This paper considers recent archaeological finds at the Berry site, in western North Carolina, the location of the Native American town of Joara and the Spanish colonial town of Cuenca and Fort San Juan, with particular emphasis on evidence about how

the people of Joara managed interactions with colonial newcomers and neighbors, and impacts of Spanish colonial history on native groups in the northern borderlands of La Florida.

[84] *Procession and Sacred Landscape*

The idea of a sacralized landscape is popularly associated with site-specific Native American religious beliefs and practices, but a landscape and its features can have religious meaning for other people as well. This paper examines the northern New Mexican folk-Catholic tradition of religious procession. Processions belong to a genre of human ritual behavior that involves symbolic discourse through spatial practice. They reference a relationship between those in the procession and the specific topography or territory through which they pass. From an ethnographic standpoint a procession is an observable behavioral event and also a complex communicative text. Such cultural texts are about those who perform them and they symbolically encode peoples' collective relationship to the place where they live. Processions ritually inscribe a circuit or pathway around or through a territory sacralized by constructed sites such as altars, oratorios (built shrines), chapels, churches, camposantos (cemeteries), moradas (Penitente chapter houses), calvarios (large crosses), and sometimes descansos (smaller crosses commemorating a deceased individual). In the Catholic world processions are spatial events that occur within a temporal framework or religious calendar based symbolically on the life and passion of Christ and the lives of saints.

[418] *Trade, Professions and Education: Women in Puerta de Tierra, Puerto Rico, 1910*

The purpose of this research is to identify the types of trade and professions carried out by women who lived on the Puerta de Tierra neighborhood of San Juan, Puerto Rico using data from the population census of 1910. The information contained in the census allows the study of women by looking at specific variables such as their age group, household composition, place of origin, place of employment, type of work and literacy level, among other things. The data can be further analyzed to shed light on the conditions under which women worked, the types of jobs available by age group, and if certain trades took place in specific parts of the neighborhood. Consultation and analysis of photographers showing women as part of the workforce enhances our knowledge of the types of material culture associated to trades and professions and can be used to create models on the type of artifacts that could have been present in their workplaces.

Rodríguez López, Isabel and Aleksander Borejsza (Universidad Autónoma de San Luis Potosí)

[38] *From Tlacolol to Metepantle: A Reappraisal of the Antiquity of the Agricultural Niches of the Central Mexican Symbiotic Region*

With the benefit of a culture-ecological mindset and thousands of man-hours spent in the then still extensive countryside of the Basin of Mexico, The Book devoted many pages to the discussion of traditional farming techniques, potential maize yields, and abandoned agricultural features. Terraced slopes, irrigation networks, and chinampas, the triad of intensive techniques identified by Sanders in 1956 as distinctive of his Central Mexican Symbiotic Region, were discussed in this order, one of increasing technological sophistication, labor investment, and yield. The Book theorized that their adoption

roughly followed this order on a regional scale, but acknowledged the pitfalls of dating unexcavated features by association with surface sherd scatters. Stratigraphically-constrained contexts explored in the last forty years in the Basin, Puebla-Tlaxcala, Morelos, and the Toluca Valley put us on a firmer footing in reconstructing the order of infilling of the different agricultural niches. They confirmed the existence of swiddening and early development of irrigation in the Formative but failed to uncover widespread evidence of terracing or wetland agriculture prior to the Postclassic. Aztec agriculture now looks less like the final flourishing of millennia-old traditions and more like a singular historical achievement in the face of adversity posed by inherited land degradation.

[114] *Photogrammetry Modeling and GIS Analysis at Rumiqolqa (Cusco, Peru), a Multi-ethnic Labor Colony Occupied during Inca and Spanish Colonial Rule*

This poster employs digital archaeological mapping methods such as photogrammetry and Geographic Information Systems (GIS) to examine domestic labor practices, architectural style, and town planning at Rumiqolqa, a massive colony in Cusco, Peru where a multi-ethnic population of forcibly resettled workers quarried stone for Inca and then Spanish colonial regimes (ca. 1400-1650 CE). The goal is to understand resilience and community formation among these workers by documenting patterns in their house construction practices. The study does not assume that house construction style reflects ethnic or cultural background. Rather it documents common house construction techniques to identify groups of builders—communities of practice—who may have shared skills, technologies, and materials. GIS analysis traces the distribution of 35 architectural attributes (e.g., measurements, stone masonry, mortar recipe) to document whether and where workers in the settlement pooled construction labor and materials. The analysis reveals that Inca period work groups organized construction labor in ways that crosscut the town plan and its imposed neighborhood boundaries. A three-dimensional photogrammetry model of the colony, paired with GIS analysis of pathways and viewsheds, will also test whether Spanish colonial era changes in the architecture of Rumiqolqa further constrained or enhanced social interaction among the workers.

Rodríguez Zariñán, Nora (Universidad Nacional Autónoma de México)

[81] *Canids in the Faunal and Iconographic Record at La Quemada: An Analysis from the Perspective of Huichol Ethnography*

The presence of canids (members of the biological family Canidae, including dogs, wolves, coyotes, and foxes) at the archaeological site of La Quemada in Zacatecas, Mexico has been established through multiple lines of evidence, including broad representation in iconography (e.g., ceramics, shell, carved lithics) and their physical presence identified through faunal analyses. The analysis of canids remains indicates several ritual uses—which attest to various interactions between humans and canids—, but what would this have meant in ideational terms. The importance of canids seen in ethnographic evidence from the neighboring Huichol (Wixarika) region suggests that the relevance of canids at La Quemada can be explored through ethnographic analogy. In this paper, we analyze iconography and faunal remains alongside a careful review of ethnographic data from the Wixarika region to explore new ideas about the relationships between humans and canids in the pre-Hispanic past at La Quemada. Specifically, we explore the possibility that canids identified in the La Quemada faunal assemblage were wolves, beings from which the Wixarikari people prefer to keep a distance. We consider this hypothesis in comparison to an alternative, that the canids were dogs who were benevolent spirit companions of departed souls.

Rodríguez-Alegría, Enrique (University of Texas)

[238] *Wealth and Ownership of Indigenous Goods among Spanish Colonizers*

Scholars have debated the relationship between ownership of indigenous goods among Spanish colonizers and different economic, cultural, and social variables. Some argue that wealth had a strong impact on consumption patterns, and wealthy colonizers used more European imports and less indigenous goods than poorer colonizers. Others have argued that wealth did not determine consumption patterns, and scholars should focus instead on social and political factors that affected consumption, including strategies of cultural separatism or alliance-building. I contribute to this debate by examining data from the probate inventories of 39 Spanish colonizers who died in Mexico City in the 16th century. The probate inventories allow calculating two separate statistics that will be useful: the wealth of each decedent, and the ratio of European to indigenous goods that each decedent owned. Results indicate that the wealth of these colonizers varies widely, and so does the ratio of European to indigenous goods found in their inventories. But is that variation correlated with wealth? Or

can other variables explain the pattern better? The results will help address the broad implications of economic, political and cultural explanations of consumption among colonizers, and they will aid in understanding archaeological patterns better.

[190] *Search Beneath the Rock Surface: Legend Chasers, Treasure-hunters and Rock Art in NW Spain*

Polly Schaafsma has often emphasized the use of ethnographic analogy to get insights into the use and ideological framework of ancient pictographs. While this is both feasible and reasonable in Southwestern rock art, the numerous petroglyphs known in the Galician region mainly belong to a period spanning the Final Neolithic to the Earlier Bronze Age and, as a result, are completely detached in cultural terms from the present inhabitants. At the same time, the presence of the decorated panels in the landscape has not been altogether overlooked by the later, historic communities. In most cases, however, there is no reference in the local folklore to the carved rocks and those effectively acknowledged by the modern peasants generally belong to the so-called geometric group, made up of circular combinations, while other types of representations (such as zoomorphs) remained comparatively ignored. As to the first, the traditional peasants kept a variable disposition, ranging from Christianization -they carved crosses beside or over the prehistoric images- to the pursuit of the bullion allegedly hidden beneath the actual petroglyphs. In this paper, we explore those different attitudes with respect to prehistoric rock art, spanning from the Iron Age to the present day.

[392] *Paleotemperature Adjustments for Obsidian Hydration Dating*

Obsidian hydration dating (OHD) is a method for estimating age of an obsidian artifact based on time-dependent absorption of water. The process is temperature-sensitive, and its application to archaeological dating currently requires assuming that current temperature parameters are a reasonable approximation to ancient temperatures. This is generally valid for ages in the Holocene, but temperature proxy data show significant shifts in ancient temperatures relative to the present, especially for ages before approximately 12-13Kya. For these ages, the prevailing temperatures were significantly cooler than today, and ages computed assuming current conditions will be too young. We describe a simple numerical method for correcting OHD ages for long-term changes in climatic temperature regimes, based on published temperature proxy data. The method is based on reading hydration rims by optical microscopy; however, since the method applies to the ages and not to the measurements themselves, it will also work for other measurement methods: secondary ion mass spectrometry (SIMS); FTIR or IRPAS spectrometry; manometry; or SIMS/SS. We present calibration curves relating paleo-corrected to uncorrected ages.

[32] *The Middle Stone Age at Gona, Afar, Ethiopia: Implications for Regionalization and Migrations*

Tentatively dated to MIS 5/4, the YAS-1 (Ya'alu South 1) site at Gona, Ethiopia is a high-density open-air archaeological site preserving classic Middle Stone Age (MSA) stone tools such as Levallois cores, Nubian cores, points, and blades in

addition to a variety of fossil fauna, some with bone modifications including cut marks. While most of the archaeological material has been found on the surface over the last twelve years, recent excavations have documented both lithics and fauna in situ. Though the zooarchaeological remains and depositional context of the site will be discussed, the emphasis here will be on the lithic assemblage, which includes Levallois points, preferential and recurrent Levallois cores, unidirectional and bidirectional prepared cores, prismatic blades and blade cores, and a small number of retouched tools. Similarities are seen with other late MSA sites in the region (e.g., Aduma), and also with other more distant sites, such as at Wadi Surdud (Yemen) and Rose Cottage cave (South Africa). Ongoing and future research at the site will hopefully refine the site's age, identify the obsidian source(s) of the obsidian artifacts, and expand the archaeological sample.

Rogers, Thatcher (University of New Mexico) and Alexander Kurota (Office of Contract Archeology, UNM)

[413] *Possible Evidence for Mimbres Integration into Jornada Mogollon Villages: Introducing the Eastern Mimbres San Andres Aspect in South-Central New Mexico*

Investigations at Mesilla and Doña Ana phase villages within and adjacent to the Tularosa Basin have identified a set of cultural traits associated with the Mimbres culture. Extraordinarily high frequencies of Mogollon pottery, as well as similar mortuary patterns, agricultural practices, and possible evidence of gambling point to direct cultural influences from the Mimbres region. Petrographic analysis and INAA sourcing of Mimbres sherds from a sample of these sites indicate they were all made in the Mimbres region. Yet, the sheer volume of Classic Mimbres pottery imported to Jornada Mogollon villages along the San Andres and Organ Mountains suggests that a possible migration and integration of Mimbres groups occurred. There is an emerging cluster of residential sites (Huntington Pueblo, Lake Lucero Pueblo, Ricochet Village, Cottonwood Pueblo, Pole Site, Grandview Pueblo) with hundreds to thousands of examples of Mimbres pottery that we term the Eastern Mimbres San Andres Aspect. This paper synthesizes data from recently documented and prior known sites in the region from survey and excavation projects to assess the potential for and impacts of Mimbres integration into the area.

Rogerson Jennings, Jennifer (California State University, Chico)

[411] *The Ontological Approach: Applying Social Theory to Physically Manifested Culture*

The practice of collections management is changing with the ever-growing technology that is embedded in society today. The museum's visitor no longer receives information on an analog platform, or at least not the majority of it, so why is this the main form of communication between museums and patrons? This creates a necessity for museums to alter their methods of communication between museums and visitors, both academic and public. The design, integration, and accessibility of digitized collections allows visitors to determine a "thing's" meaning for themselves, instead of having to accept or deny the preexisting representation applied to said "thing." This will create possibilities of expanded representation for objects, cultures, and meaning. The missing component has been access to the cultural heritage devoid of the predetermined and associated meaning. Finally, this work is not designed to negate any of the previous theoretical notions used to derive anthropological meaning, it is purely here to augment and add to the investigative repertoire of both the researcher and the civilian. The creation of a tested and affordable digital integration methodology is not an atheoretical research approach but is a *modus operandi* used to answer the looming theoretical ideas which exist within anthropological thought.

[315] *Chavín after Chavín: Funerary Facts through the Voices of its Protagonists / Architectural Sequences and Occupational Events in the Ceremonial Center Chavín de Huántar during Formative Period (950-550 BCE)*

The Chavín Archaeological Monument is one of the most important ceremonial centers of the Formative period in the Central Andes. The pioneering work in the Temple focused on understanding the ritual complexity of the Chavín world through its monumental buildings, plazas, and sculptures. The crossing of reaching architectural surfaces and elements "Chavín" exposed multiple times "late" architectural elements (societies Mariash-Recuay, Callejón and Inca), witnesses of the non-functional occupational continuity of the Temple. John Rick, since 1996, directs the Archaeological Program Chavín de Huántar, focusing his actions on the unveiling of the north esplanade of building C (northern component of the Temple). His findings exposed a generalized picture throughout the site: the reoccupation by adapting spaces and architectural structures associated with different construction phases. Our work focuses on the analysis of one of its fronts: the north

façade of building C, which was joined by a series of enclosures that housed human burials of the Mariash-Recuay society. Funerary data bring us closer to the resident population of the former temple; for this, we use bioanthropological analysis providing data on the biological profile and inferences about their general living conditions, data complemented with the contextual analysis of each funeral unit.

Roksandic, Ivan (University of Winnipeg)

[276] *Cuban-Canadian Collaboration at the Sites in the Canimar River Basin and in the Cauto Region*

The Cuban-Canadian research project was developed during the last 10 years between scholars from the University of Winnipeg and the University of Havana, the University of Matanzas and The Cuban Institute for Anthropology in order to investigate problems and help build a more complex picture of migration and exchange within the Greater Antilles and between Cuba and the adjacent continental areas. Our project, using a multidisciplinary approach involving archaeology, bioarchaeology, isotope analysis, paleoethnobotany, bathymetry, ancient DNA, and toponomastics, was concentrated so far on two regions: the Canimar River basin (especially the site of Canimar Abajo) in the west (Matanzas Province), and the Cauto region (especially the site of Playa del Mango) in the east (Granma Province). This contribution will present some important results of our project showing very early use of (exotic and local) cultivated plants, the concurrent existence of two different subsistence systems in Cuba as reflected in the cultural norms and biological profiles of supposedly Archaic Age groups, and their survival till the end of the 1st millennium CE.

[41] *Language as a Cultural Resource: A Case Study with the Tolowa and Hupa Languages*

Through past and current language and Cultural Resource Management (CRM) policies, this study aims to include revitalization efforts in indigenous communities, technology as a factor in protecting and spreading a language, and the state of diversity within Athabaskan languages. The Athabaskan language family contains indigenous languages with long histories riddled with past and current colonialist and language policies. A focus on emphasizing the notion of language as an essential cultural resource to the CRM field will be explored. In recent years, CRM practitioners have been implementing and advocating for progressive policies to help communities that host at risk languages. Using this information, this project will consider the adverse effects to at risk languages when conducting a CRM investigation and develop an understanding for the consideration of language as a cultural resource. A complete understanding of how to use language resource management theories and practices to implement conservation efforts in endangered language areas will be developed by working with tribes, linguistic anthropologists, and CRM professionals.

Rollefson, Gary

[366] *The Road More Traveled: 'Ain Ghazal and the Peopling of the Black Desert*

The late Pleistocene and early Holocene Neolithic connections over the maritime routes from the eastern Mediterranean shores to Cyprus have been fruitfully investigated, and those links clearly involved more than the simple movement of ideas. Another development in the transfer of people and ideas occurred during the 7th millennium, but in the other direction. From ca. 11,500 to 7,000 BC population grew rapidly throughout the southern Levant. In the highlands of western Jordan, "megasites" of eight to 25 hectares and with up to 4,000 inhabitants. By c. 7,000 BC there appears to have been a tipping point in the pressure put on local environmental resources. Some 15,000-20,000 people from at least eight megasites left their settlements, raising the question of "Where did they go?" In the first half of the 7th millennium, there was a population explosion in Jordan's Black Desert. Large clusters of permanent dwellings spread along prominent local drainages and seasonal pools. Most of this sudden eruption of population is attributed to the collapse of the megasites, among them 'Ain Ghazal. The redistribution of population set up an exchange network between the hunter-herders of the Black Desert that would last until the end of the Early Bronze Age.

Roman-Ramirez, Edwin (El Zotz Archaeological Project)

[79] *The Moral Community of Pa'ka'n during the Classic Period*

Stephen Houston's collaborative article on the moral community and changes in settlement at Piedras Negras, Guatemala proposed that long-term Precolumbian settlement changes should not simply be analyzed in terms of "agricultural potential, land tenure, and natural increase," but should consider beliefs and morality as well. This new framework for studying the rise, life, and abandonment of cities is important because it demonstrates that rulers and the nobility played important roles not only in community development, but also in processes of migration and abandonment. In the Buenavista Valley, evidence shows that dynastic rulers of the Pa'ka'n kingdom were decision makers that designed the urban landscape and were responsible for shifting their communities to new locales with new centers of power. This paper, inspired by the concept of the moral community, will explore these changes through time based on thirteen seasons of research, many of them led by Houston himself, centered at El Zotz and surrounding sites

Romera, Aida [168] see Mann, Evan

Romera Barbera, Aida

[334] *Fragmented Bodies: Early Bronze Age Cremation Burials in Kilmagadwood, Scotland*

There is a clear dichotomy between the practice of inhumation and the rite of cremation. From an anthropological perspective, a community's preference for one or another reflects changes in its beliefs system. Conceivably, this occurred during the transition from the Neolithic to the Bronze Age when cremation became dominant. The symbolism that accompanies the cremation of the deceased, and its subsequent burial, has long been linked to transformation, fragmentation and reconstruction of the body. Furthermore, with cremation, the mourners have control over the changes inflicted to the body immediately after death. The discovery of a large Early Bronze Age urnfield cemetery in Kilmagadwood, Scotland, opens the door to further investigate the characteristics of such funerary program. Here we present data derived from the examination of cremated bones including osteological and paleopathological analysis, evidence for pyre technology and ritual and the formation process of the mortuary deposit. In addition, the analysis situates Kilmagadwood in the broader conversation about the perception of integrity and life histories of these Bronze Age fragmented bodies.

Romero, Danielle (University of Nevada, Las Vegas)

[263] *Cache Flow: An Analysis of Vessel Assemblages from the Elk Ridge Site*

Designs on Mimbres pottery have long fascinated archaeologists. These complex geometric and figurative images can shed light on daily activities, household organization, and groups of potters. Excavations at the Elk Ridge Site, a large Classic Mimbres pueblo in the northern portion of the Mimbres River Valley, have yielded numerous complete or nearly complete vessels, many in caches. Vessel caches have been recovered from both household and extramural contexts. The room block under investigation is also of importance because it reveals a sequence of construction that extends from the pithouse-to-pueblo transition until site abandonment at the end of the Classic period. This poster analyzes whole and partial cache vessels recovered from the site to investigate ceramic type and use-wear, puts them in their larger context to determine if they were associated with domestic and/or ritual activities, and how this may have changed through time. Additionally, the designs are examined, both within and between the caches, in order to gain information on their similarities and differences and to ascertain data related to the presence of potters or learning frameworks.

Romero, Levi (Chicana/o Studies)

[193] *Mi Querencia: A Connection between Place and Identity*

What is the connection between place and identity? The story of human existence is one of movement and settlement. Origin stories the world over feature accounts of where a people came from as a way of telling how they came to be. Northern New Mexico cultural envoy, Juan Estevan Arellano, used the traditional northern New Mexico concept of querencia to define the relationship between place and identity. Querencia, he wrote, "is that which gives us a sense of place, that which anchors us to the land, that which makes us a unique people." Although I grew up hearing the term used,

it had no special relevance for me beyond what I understood *querencia* to be, the place where one is born and raised. In my contemplations regarding the theme for this presentation, I speak of *querencia* from an experience embedded in an upbringing amongst close-knit relations and community. For me, *querencia* is not only personal, it is communal and deeply connected to the people and place where I was raised. It rises from the depths of archaeological remains and makes its way to the every-day *platicas* (conversations) the local folks have at the village general store.

Romero, Lynda (Poeh Cultural Center)

[311] *Presenting Pojoaque History through Exhibits*

As someone who was born and raised in my own Pueblo, it amazed me how much I don't know of the history of the Pueblo of Pojoaque. I've heard bits and pieces, different versions of stories from different people, and I've read about our history but none made an impact until I was part of a discussion at the University of Colorado, Boulder this past spring as a participant in a public exhibition project about the University's and Pojoaque's collaboration. In 1952, Florence Ellis brought her field school to survey the old village sites in Pojoaque Pueblo. My grandfather was Governor at the time and gave his consent for the survey. After seeing what was taken and reading the report Ellis wrote, I immediately felt that I needed to know more... more about my family, my people, the land, the way we survived. I want to know our past. Through the exhibition I would like to create something to teach our tribal members, visitors, and community members our history...but more so to show what we have endured to survive and how we are working towards for our future.

Romero, Raquel (Northern Arizona University)

[119] *Tribal Youth Engagement: Establishing a Model for Archaeological Outreach*

This poster provides an overview and analysis of four Tribal youth events attended in the Southwestern United States in 2018. Educational outreach is an important field to explore, because Tribal representation in educational institutions is despairingly low (PNPI 2017). The goal of this research was to learn the best methods for performing outreach to youth. I was particularly interested in analyzing if archaeology was present during outreach events and career camps, and how various Tribes conveyed archaeology, if at all. Through participant-observation, I noted that archaeology was not represented at any of the events. Though formal archaeology was not present at all the events I observed, significant time was devoted to cultural preservation activities. In two instances, I observed at least half of the allotted time spent on language and cultural traditions. Pulling from my personal experience and my current research, I argue that archaeology is an underutilized resource for connecting Tribal members to cultural traditions and strengthening cultural appreciation. This poster explains the links I have made between archaeology and cultural preservation, and how this information may be used to connect Tribal youth to their heritage, and hopefully increase the number of Tribal archaeologists in the future.

Romero Escobar, Jhoan [46] see Kellett, Lucas

Romero Padilla, Laura Angelica (Laura Romero Padilla)

[309] *Ritual Cave Utilization Near Tenosique in Tabasco, Mexico*

As part of the Middle Usumacinta Archaeological Project, I conducted reconnaissance in three caves with archaeological remains, named Santo Tomás, San Marcos, and Corregidora. The three caves are located in the Tenosique municipality in Tabasco, Mexico near the border with Guatemala. A detailed examination of the rock art style and pottery found in the caves provides a tentative chronology of ritual cave use. Santo Tomás cave exhibits a group of three elements that were painted in red and black on the southern wall of the main chamber, yet the presence of pottery is scarce. In contrast, the San Marcos and Corregidora caves have concentrations of unslipped and decorated ceramics in most of their passages and chambers, but no rock paintings were found. Based on this preliminary analysis, the evidence suggests that ritual activities were mainly conducted during the Classic period (AD 250-950), and that there were notable differences in the performance of local practices inside these caves. Ritual significance of cave use in this region will shed light on the relationships between local cults and social complexity, and how these practices helped shape lowland Maya society.

Romih, Stanislava (Northern Arizona University)**[280]** *Unleashing the Beast: Exploring Peri-abandonment Deposits in the Maya Lowlands*

The BVAR project has been investigating peri-abandonment deposits, also known as problematic or terminal deposits, at sites located along the Belize River in Western Belize. These investigations have focused on understanding the formation of such deposits as well as their significance across sites in the Belize Valley region. The project has employed a new microstratigraphic excavation method, that utilizes subplot systems for more comprehensive analysis than ever before conducted on the assemblages of individual deposits. Lower Dover is a recently discovered site located at the confluence of three waterways in the village of Unitedville, right across the Belize River from the site of Barton Ramie. In 2013, excavations conducted on the southern end of the smallest of 4 courtyards which make up the palatial acropolis revealed the first of such deposits at the site. Most recent excavations on the northern end of courtyard 4 have revealed another such deposit of similar composition, which has been excavated using this new methodology. This paper will focus on the research results of a regional comparison of peri-abandonment deposits in the Belize Valley using this new data from Lower Dover site core excavations.

Rondeau, Michael (Rondeau Archeological) and Nicole George (University of Nevada, Reno)**[249]** *Paleoindian Projectile Points in the Far West*

A review of selected fluted point and Western Stemmed Tradition (WST) studies are highlighted to present a series of intriguing results, implications, and interpretations. This wide ranging overview of themes and unanswered research questions offers a look at the past and present links between fluted point and WST research.

Roney, John [263] see Whisenhunt, Mary

Ronsairo, Karleen (The George Washington University), Jeffrey Blomster (The George Washington University) and Sarah Breault (The George Washington University)**[394]** *Early Mixtec Urbanization at Etlatongo, Oaxaca, Mexico*

Past studies of early urbanism in Formative Oaxaca, Mexico, have highlighted evidence of the construction of monumental architecture, increased population densities, and the expansion of Middle to Late Formative period occupations onto defensive hilltops. In the Mixteca Alta of Oaxaca, investigations at urban centers, such as Cerro Jazmín, Monte Negro, and Huamelulpan, have provided evidence of Mixtec urbanization during the Early Ramos phase (300-100 BCE). We argue that at Etlatongo in the Nochixtlán Valley of the Mixteca Alta, urbanism began in the preceding Yucuita phase (500-300 BCE), and is contemporaneous with urbanism at Monte Albán in the Valley of Oaxaca based on settlement data, architectural transformations, including the construction of a low platform on the Etlatongo hill, and the changing nature of ceramic crafting. The relative close proximity of early urban centers in the Mixteca suggests the great antiquity of the different nature of Mixtec urbanization compared to that of Monte Albán in the Valley of Oaxaca.

Rooney, Matthew (University of Florida)**[41]** *Chickasaws and Presbyterians: What Did It Mean To Be Civilized?*

In the decade prior to their removal, the Chickasaws allowed Presbyterian missionaries to set up a school on their lands to gain the benefit of a western education for their children and potential allies in the struggles they were inevitably going to have with the expanding United States. Here, native children were being exposed to missionary tactics to "civilize" them and convert them into idealized Anglo-American-like farmers. This meant exposure to developing capitalist ideas and practices regarding work and gender. It included removing young girls from agricultural work and ensuring that the young boys learned how to farm in addition to their traditional development as hunters. In some cases, missionaries also encouraged natives, with varying degrees of success, to forego their matrilineal kinship system and place more importance on patrilineal relations. Archaeological investigations were performed on this site, Charity Hall, for the first time last summer and will continue this year. I am using materiality theory to guide the excavation process and learn how the material world played a role in this contact situation as well as how students and missionaries may have used it for their own purposes.

[41] *Chair*

Roos, Christopher (Southern Methodist University)**[20]** *Pyric Herbivory in Ancient North America*

Fire is a powerful tool for hunting because fire effects have important consequences on habitat and forage for prey species. Using case studies from the northern Great Plains and the Southwest US, I explore how fire-use positively impacted prey abundances or location, resulting in higher encounter rates for particular hunting strategies. Specifically, these case studies document the use of fire to purposefully manipulate bison herds in Montana and, perhaps indirectly, manipulate the location and abundance of ungulates in New Mexico – a strategy that is called pyric herbivory. Using geoarchaeological methods to reconstruct fire use and its impacts on prey populations, we can document variability in human-fire-animal relationships by American Indian populations in North America.

Roos, Christopher [408] see Field, Julie

Roquemore, Katie (Syracuse University), Nikki Waters (Alliance Archaeological Services), David Gilliam (Syracuse University) and Robert Belden (Syracuse University)**[69]** *Intellectual Disability, Employment, and the Public Record*

Disability is a natural part of the human experience and our work as archaeologists should reflect this. The key to recognizing and minimizing bias in our work is to include marginalized groups as much as possible. But in a field that by its traditional definition demands a high level of intellectual and physical rigor how can we best do this? This paper evaluates this question through an examination of the complexities of working on the Community 4 All project, a Community Based Participatory Research project at Syracuse University, that is creating digital toolkits by, with and for adults with intellectual disability. As we created tools to support deinstitutionalization and lifelong learning and employment, we were forced to confront the histories of state schools, sheltered workshops, and continued segregation of adults with intellectual and developmental disabilities from the community and public record. Our toolkit explores ways of including people with intellectual disability in the exploration of culture and history and finding ways to incorporate their voices archaeological research.

Rorabaugh, Adam (Colville Confederated Tribes)**[175]** *Evolution for the People: Big Data, Big Software, and How Compliance Archaeology is the Missing Link of Compliance Archaeology*

A growing concern in archaeology is the potential inaccessibility of various methodological and theoretical approaches in non-academic contexts. Open access and open source software (R, Quantum GIS, ImageJ) provide means for applying complex analyses within a budget, but due to cybersecurity concerns these may not be available for archaeologists working for state, federal, or tribal agencies. In an effort to address this issue, I provide several case examples of using standard office suite software to conduct analyses examining artifact metric variation and stylistic variation typically employed in the evolutionary archaeological literature. I argue that these technological issues are not insurmountable for being able to analyze large datasets and that compliance archaeologists can contribute the large datasets necessary to capture variation and properly examine the material record from an evolutionary perspective. In effect their experience and datasets provide a “missing link” for assessing cultural evolutionary hypotheses.

Rosa, Alexander (MSU of Denver), Michael Kolb, Scott Kirk and William Balco**[337]** *Siculo-Norman Tableware Consumption upon Monte Bonifato: A Spatial Analysis*

After the Norman conquest of Sicily, the newfound rulers of the island found themselves greatly outnumbered in a land where a majority of the population had converted to Islam. Under these conditions, many of the technological and artistic innovations brought to the island by the Arabs continued under the new, Christian regime. Of particular interest to archaeologists are the ceramics that remain so ubiquitous in the archaeological record of this time. This paper focuses on the spatial distribution of Siculo-Norman tableware across Monte Bonifato, Alcamo, Western Sicily. Highly decorated with colorful glazes, this ceramic type is considered characteristic of this time period, though its continued use into the Swabian era makes earlier material harder to distinguish from later developments. Nonetheless, the ornate appearance of this pottery leads most scholars to believe that only the houses of elites would have contained this material. Connecting Siculo-Norman tableware with the presence of rubble features, thought to be collapsed housing, demonstrates that this material can be used to define where elite structures would have been located in the now abandoned medieval village that sits at the

summit of Monte Bonifato.

[337] *Risk Management in Agriculturally Marginal Areas of Southwestern Anatolia during the Ottoman Period*

The results of recent surveys around the Mediterranean have revealed a wealth of information about rural populations during the Ottoman period that had for a long time been ignored by historical and archaeological research. This has also brought to light the role of people who occupy politically, economically, or socially marginal niches. This paper aims to understand the way agriculturally marginal populations fit into the economic fabric of southwestern Turkey specifically, and how they were often able to retain their presence in areas with poor agricultural potential for long periods of time. Evidence from surveys indicates that not only were populations in marginal areas involved in the economic systems of the entire region, but that it was necessary for them to do so as a way to limit the risk associated with their location. In addition to maintaining relationships with other areas that they could call on in times of stress, these populations also diversified their subsistence methods, were often mobile, and retained stores of surplus food stuffs. Despite hardships due to climate change and political policy throughout the Ottoman period, risk management allowed populations in marginal areas a buffer from complete devastation.

[267] *UAVs, Photogrammetry, and Mortuary Landscapes: A Study of Napatan Cemeteries*

This paper discusses the broad implications and applications of UAV or drone surveys to archaeological data sets, through a detailed case study in Nubian archaeology. The author employs drones to map and model Napatan royal necropolises, dating to the 8th century B.C.E. and located in modern day Sudan, using photogrammetry. The primary research objective of this study is to better understand the diachronic spatial development of necropolises on a landscape scale, within the context of complex and multifarious contact between Napatan and ancient Egyptian cultures. The author argues that physical changes, in terms of the organization of tombs, temples, and other modifications to the natural landscape, are the result of political interactions and negotiations of identity. Regarding the implications of the methodologies involved, drones provide an efficient means of gathering a massive amount of photography and data on a much greater landscape scale than traditional forms of mapping and photography. Furthermore, the capability of drone photography to form the basis of photogrammetric models has implications for the preservation and presentation of cultural heritage. Using drone photography, models of these sites can be shared on open access platforms that allow the public to experience the cultural heritage of Sudan.

[106] *Technology on the Move: The Influence of Mobility on Pottery Production on the Ancient Russian Steppe*

On the desert-steppe zone of southwestern Russia, mobile pastoralism served as the dominant mode of subsistence for much of its history. However, mobile pastoralism as a term refers to a diversity of practices, distinguished across multiple axes, the least of which is the mobile strategy itself. Pottery, as both an everyday object and a form of technology whose use and production is constrained by mobile lifestyles, serves as an avenue of insight into this everyday diversity. Between the Eneolithic and Early Iron Age, or the end of the fifth millennium B.C.E. to the first few centuries C.E., mobile pastoralists would first emerge in the river valleys then expand their exploitation to each available ecological niche of this area of the steppe, before developing into what has historically been recognized as pastoral nomadism. By focusing on pottery from newly emerging camps in this region and period, technical choices concerning resource procurement, clay recipes, and investment, informed by p-XRF and ware-analysis, allow insight into how technological production shifted with increasing mobility, as well as how these technical choices reflect contemporary diversity among potters otherwise engaged in similar subsistence and mobility practices.

Rosen, Steven (Ben-Gurion University)**[399]** *The Tabular Scraper Trade: Complexities of a Prehistoric Pastoral Trade System*

Originally modelled as a down-the-line exchange system from the desert to the settled zone, analyses of previously unpublished materials synthesized with newer materials indicate that the flint tabular scraper production and distribution system was a complex mixture of local desert consumption and long distance trade of objects that changed in function, role, and value depending on context and place in their use-life trajectory. These complexities are reflected in: 1. Different kinds of quarry sites reflecting different structures of production, 2. Find proveniences reflecting mortuary offerings, other cultic contexts, trade caches, secondary production sites, and domestic contexts, 3. Chronological variability suggesting changing symbolic meaning, and 4. Techno-typological variability which may, in part, be associated with both geography and chronology. Although originating in a system of desert pastoral production, itself variable in terms of degrees of intensity of production, it is likely that some kind of agent system operated at the seam between the settled and nomadic zones. The original simple down-the-line model must be tempered by these complexities.

Rosencrance, Richard (University of Nevada, Reno)**[249]** *Assessing the Chronological Variation Within the Western Stemmed Tradition*

Western Stemmed Tradition (WST) projectile points exhibit considerable morphological variability, which may reflect difference in function, ethnolinguistic affiliation, resharpening/rejuvenation, or age. These ideas represent hypotheses that remain to be tested, and rejecting one or more of them will improve our understanding of the terminal Pleistocene/early Holocene. To address questions surrounding the morphological variability of WST points, I evaluate existing radiocarbon assays associated with WST-bearing archaeological components across the Far West and present new dates from five previously excavated sites where good chronological resolution was lacking or absent. These data are poised to inform on technological innovation and spread, population movements, and how and when early groups settled into the Far West.

Rosenfeld, Silvana (High Point University) and Matthew Sayre (High Point University)**[250]** *Wari Foodways: A Comparison across Space*

The advances in food studies have revealed significant new information about life during the Middle Horizon (AD 600-1000) in the central Andes of Peru. Botanical and faunal data from Wari affiliated sites shows differential use of at least two items: molle (*Schinus molle*) and guinea pigs (*Cavia porcellus*). After examining recent data from the Patipampa sector of Huari, we discuss the possibility that differential consumption of chicha de molle and guinea pig meat during the Middle Horizon could have been an important aspect of a cuisine to sign Wari ethnicity or/and status outside of Huari.

[387] *Petrographic Analysis of Ceramics from Umbro Greek, Southern Calabria, Italy*

Here we present the first results of petrographic analysis on ceramic sherds from Umbro Greek archaeological site, a Classical period farmhouse in Southern Calabria, Italy, dating from the 5th to 4th centuries BCE. The site is located on the Umbro plateau, halfway between the Ionian Sea and the Aspromonte Massif, an area extensively researched by the Bova Marina Archaeological Project over the last twenty years. Michelaki et al. (2012) completed comprehensive petrographic and chemical analyses on sediments within a radius of approximately 4 km around Umbro Greek and identified three distinct geological units with clays suitable for ceramic production. The Classical period sherds examined for this project were made of local clays as well as clays of unknown provenience, indicating that the farmhouse occupants interacted with people from other regions. Comparatively, ceramics from two Early to Middle Neolithic sites were made exclusively of local clays (Michelaki et al. 2015): Umbro Neolithic, a rock shelter, and Penitenzeria, a small open-air terrace, each date to the 6th century BCE and are within a half-km of Umbro Greek.

[255] *"An Instrument for Seeing": The Multivalent Nature of Volcanic Glass in Mesoamerica*

Throughout Mesoamerica, obsidian commonly turns up in the form of prismatic blades, knives, projectile points and spearheads—pragmatic tools of daily work and routine life in the Pre-Columbian world. Yet these ordinary usages did not preclude obsidian from occupying a prominent place in religious symbolism, ritual practice and political theater across time and space in Mesoamerica. In such settings, obsidian was a material that was symbolically charged yet practical; menacing, yet also protective. With special attention to obsidian "eccentrics" and ceremonial blades, this paper draws from archaeology, ethnohistory, artistic analysis and epigraphy to take a fresh look at the multivalent nature of obsidian in Mesoamerica and explore the symbolisms and contradictions this material came to embody through time.

[195] *New Multi-disciplinary Studies Re-shape Our Understanding of Neolithic Peopling and Biocultural Adaptations in Western Liguria (Northwestern Italy)*

Beginning in the mid-1800s, about 200 burials and an undefined number of scattered human remains have been reported from several caves and rock shelters in western Liguria. The skeletal series, excavated following the methodology of the time, were considered likely/probably/possibly "Neolithic" or "Middle Neolithic", and as such were studied by anthropologists. As a result, anthropologists could make only general inferences on "Neolithic" funerary behaviors, biological adaptations, and health and well-being.

We obtained higher-resolution information through surveying the extant Neolithic skeletal series from Liguria, re-analyzing the available documentation, and performing new direct radiocarbon dates (c 150). This allowed for the discovery of burials

from the 8th, and 6th millennium cal BC. Most burials belong to the 5th millennium cal BC, when the Neolithic Square Mouth Pottery Culture was attested in Liguria. Scattered human remains span from the 6th millennium, through the Metal Ages, to historic times, attesting for a long-term use of the Ligurian caves as funerary sites. The new chronological framework allows for a characterization of possible funerary practices. In addition, through the integration of chronological, funerary, and skeletal data, we can explore possible differential funerary behaviors based on biological traits, including sex/age, but also pathology and trauma.

[276] *Contemporary Archaeology of the Recent Soufrière Hills Volcanic Eruptions on Montserrat*

In July of 1995, the Soufrière Hills volcano began a series of eruptions that would fundamentally alter the communities and landscapes of the small Caribbean island of Montserrat. By the turn of the millennium, two-thirds of the island had been abandoned or destroyed, and a comparable proportion of the population had relocated abroad. This paper presents the initial results of an ongoing research project investigating the villages lost to volcanism, and the Montserratian community's material engagements with this disaster. The project combines archaeological survey with ethnography to better understand the interplay between human actions and natural processes throughout the volcanic crisis. The findings of the project are employed to expand archaeological knowledge in two distinct ways: to understand Montserrat's material record in its distinctly contemporary and Caribbean context, and to offer a degree of detail on site formation processes in volcanic landscapes that cannot generally be achieved when looking at the archaeological record of ancient disasters.

Rowe, Marvin (Office of Archaeological Studies)

[369] *In Search of Hot (or Cool) Dates with Larry*

Rowe's research group at Texas A&M University changed their direction about three decades ago when they undertook to develop a method for dating rock paintings. The method is based on the use of plasma-chemical oxidation to gently, at low

temperatures, convert to carbon dioxide the organic material that was initially added to prepare paint. Professor Larry Loendorf was among the very first archaeologists to seek collaboration with our group, collaboration that has continued to the present day. Although almost of our dating attempts have been on rock paintings, a recent interesting artifact from Larry, an iron axe head found near a Lewis & Clark encampment in Montana, is discussed. Innovations in the plasma apparatus over the past four years is described briefly.

[415] *The Curious Case of Bunnies: Human Behavioral Ecology Perspectives on Fauna from Homol'ovi I, Room 733*

Human Behavioral Ecology (HBE) models are useful in linking the composition of faunal assemblages deposited in archaeological sites to environmental conditions at the time of their deposition, but questions remain about HBE's utility in evaluating assemblages dominated by small fauna. In this paper, we view the faunal assemblage from Room 733 at Homol'ovi I, an Ancestral Hopi site near Winslow, Arizona through the lens of HBE. Room 733 dates to the Late Homol'ovi Phase (LHP) 1385-1400, but also includes dates from the Early Homol'ovi Phase (EHP) 1330-1365. The room was likely used for maize storage and habitation and closure of the room occurred over an extended period. The resulting fill contained a large trash cone made up of alternating layers of sand and ash. Filling of the room occurred during a period that was much wetter than current conditions, and contrary to predictions drawn from Human Behavioral Ecology, Lagomorphs dominate the assemblage and larger fauna are poorly represented. Given the wetter conditions, HBE models predict that there should be a much greater representation of large fauna. We explore alternative hypotheses to explain the composition of this faunal assemblage and evaluate the applicability of Human Behavioral Ecology models to this assemblage.

[332] *Megafauna 101 for Archaeologists*

The Pleistocene... basically a no-man's land that is trapped between the disciplines of archaeology and paleontology when it comes to the animals that inhabited that period. For American archaeologists, these animals are sometimes too old to be considered as having archaeological connotations. For Paleontologists, these are not fossils and, by some paleontologists' standards, are considered too young for paleontological studies. It is important for archaeologists to understand these animals and their environmental niches. This paper will focus on bison, mammoth, the occasional sabre cat, and a few other species that have been found in archaeological contexts. Using field examples from Colorado, Iowa, North Dakota, and Wyoming, the remains of these animals can be used to ascertain the environment that each lived in and in doing so these data can be used to widen the studies of the prehistoric environment in which the earliest of humankind in the Americas.

[110] *Investigating the Sex Selectivity of Middle Iroquoian Salmonid Fisheries through Ancient DNA Analysis*

Lake Ontario once supported large populations of Atlantic salmon (*Salmo salar*) and lake trout (*Salvelinus namaycush*). However, by the mid-19th century populations of these salmonid species had collapsed as a result of overharvesting and habitat alteration by European settlers. Prior to this collapse, it has been hypothesized Indigenous peoples were able to maintain the productivity of Lake Ontario Atlantic salmon and lake trout stocks through the use of resource management strategies. In this study, we sought to examine whether sex-selective fishing was one of the strategies Middle Iroquoians used to manage Lake Ontario salmonids. To test this hypothesis, we attempted to assign sex identities to Atlantic salmon and lake trout remains from the Middle Iroquoian (ca. AD 1250-1300) Antrex site (AjGv-38), Ontario, Canada, using DNA-based assays that screen for the presence of the salmonid master sex-determining gene (sdY). The results of this study provide new insights into the fishing strategies of pre-Contact Ontario Iroquoians.

[252] *Documenting the Complexity of the Petroglyphs of Toro Muerto, Southern Peru*

Toro Muerto, situated in Arequipa Region in southern Peru, consists of over 2.5 thousand stone blocks covered with petroglyphs, which makes this site unique not only in Peru but also in South America. In this presentation we outline the current results of a new project which aims to document the whole site. This includes creating GIS satellite map, aerial photography, photography and tracing of the petroglyphs, as well as recordings of offerings hidden near the blocks with rock images. We also briefly discuss iconography, with a particular focus on geometric designs which prevail in Toro Muerto. These patterns are often associated with human figures, often referred to as *danzantes* - dancing humans. We will show that surprising similarities to these motifs can be found in Amazonian area of South America, which together with analogies from other parts of America may suggest that at least part of the geometric patterns code cosmological ideas, possibly related to the concept of traveling to the other world.

[100] *Using Architectural Sculpture to Think about Center and Periphery in the Puuc Region*

The Puuc region of Yucatán is distinguished by its architectural style, composed primarily of low, range-type structures with limestone veneers. These building surfaces, elaborately carved with iconographic content, also served as backdrops for stucco and stone sculptures, which were placed in niches, on projecting platforms, and incorporated directly into the façades. At the largest, and consequently most well-known, Puuc sites there is considerable experimentation with building forms and architectural adornments, while at the smaller sites the structures and their decoration tend to be more restrained. This paper assembles data from dozens of archaeological sites to compare how iconographic elements are distributed across the region as well as their placement on buildings. The aim of this research is to expand what we know about the region's socio-political organization using extant architectural sculpture.

[155] *Hopewellian Woodhenges: Recent Research at Hopewell Culture National Historical Park*

Monumental timber post circles or "woodhenges" are ancient and enduring elements in the ritual landscapes of Native North America. Examples are known from as much as 3500 years ago at Poverty Point; from 2400 years ago in Adena ceremonial contexts in the Ohio Valley; from 1000 years ago at Cahokia; and in contemporary use at many American Indian traditional ceremonial grounds. Archaeologists are now documenting a growing number of examples in Hopewellian contexts. Recent landscape-scale geomagnetic surveys at Hopewell Culture National Historical Park identified numerous examples ranging from about 10 m in diameter, to a colossal timber post circle more than 320 m in diameter. Small-scale ground-truth excavations at two of these are beginning to shed light on the age and function of these monumental Hopewellian woodhenges.

[362] *The Hidden Voice of Forests: Revisiting Archaeobotanical Legacy Collections from Southeastern U.S. Shell Rings*

Can't-see-the-forest-for-the-trees as a metaphor conveys that we sometimes cannot assess situations while we are in the midst of them. Archaeobotanists often report that the most ubiquitous plant type at a site is charred wood. But have we really assessed what these once trees represent: fuel, building remains, indirect evidence of food, or something else? This presentation reviews European settlement legacy accounts, witness-tree documents, paleoecological data and the reevaluation of selected legacy archaeobotanical collections from southeastern U.S. shell ring sites to introduce new research questions. Have we accepted climate as the primary agent of vegetation change during the Holocene? Can charred archaeobotanical assemblages be reexamined beyond diet and subsistence to assess anthropogenic agents of change to forests? For example, are hickory mast deposits at sites evidence of silvicultural or other land management practices, or even potential sacred places? This paper will consider a few traditional perspectives and attempt to develop new challenges for various legacy data sets and how they may inform ancient plant husbandry practices. "Can one see the forest for the trees" or should it be "Can we see the trees for the forest?"

[371] *Symbolism and Ritual Associated to Ancient Maya Water Management*

Effective water management was key to settle in the Maya Lowlands, where scarce surface water is found. While numerous investigations have showed how complex systems had been organized in Maya sites, implying a great deal of attraction to them, new data, available through LidAR for example, indicates a much more decentralized reality, where household-scale features are not uncommon. This study aims to go deeper into understanding this topic by looking at the ritual and symbolism associated to water and its management. In an animistic society, the possibility of water, or its containers, being perceived as conceptually different, and requiring negotiations in the form of ritual, is an element of the discussion that has been overlooked. While our understanding of the material and functional aspects of ancient Maya water management gets better, it is important to keep asking questions about the symbolism that underlies it, and the rituals that organized it.

[172] *Analyzing Afro-Caribbean Ware from Fort Amsterdam (SE094) and Battery Rotterdam (SE129) on St. Eustatius, Caribbean Netherlands*

In June 2018, excavations were conducted at Fort Amsterdam, a military fortification, on the leeward side of St. Eustatius, along the Caribbean coast. Many different types of ceramics were found during the investigations, including Afro-Caribbean Ware made by enslaved and freed Africans. This study analyzes the recovered Afro-Caribbean Ware using a typology developed by Barbara Heath (1988) and examines the effects globalization had on the Dutch and enslaved Africans living within and near Fort Amsterdam during the 18th century. Another important aspect is to understand how these two different communities interacted with each other near Battery Rotterdam, Godet Cemetery and Fort Amsterdam. The data for this study was collected from Fort Amsterdam and Godet Cemetery in June 2018 and data from Battery Rotterdam was excavated and collected from December 2016 to January 2018. A total of 387 sherds was recovered and categorized according to Heath's typology. Sherds from the sites are primarily types 1 and 3 (A & B) indicating that the pottery was potentially made locally or on nearby islands.

[396] *Underwater Investigations of Mass Burials in Two Cenotes at Mayapán, Yucatán, Mexico*

With support from The National Geographic Society and The Waitt Foundation, the Mayapán Taboo Cenote Project conducted investigations at Cenote Sac Uayum, a sacred, water-bearing sinkhole located at the Postclassic Maya political capital of Mayapán, Yucatán, Mexico (AD 1150-1450). The work brought together an international collaboration of researchers from the United States, Mexico, Estonia, Italy, France and Australia. The research revealed a large mass burial deposit within the cenote. The study yielded significant new insights into the cenote that many modern inhabitants consider to be "alive" and believe is guarded by a large feathered serpent with the head of a horse. The feature has drawn the attention of researchers working at the site since the first archaeological work began at the ancient city because of its conspicuous and apparently intentional exclusion by the large defensive wall surrounding the bulk of the settlement. This paper will present findings from the study and compare them to the results of the previous study of a second mass burial deposit first discovered in 1997 by a team led by INAH researcher Eunice Uc González. Osteological analysis of samples collected from both locations were analyzed by osteologist Stanley Serafin.

Russell, Hannah

[19] *Looking at the World through Rose-Colored Flaked Glass*

Flaked glass can be a critical keystone artifact in identifying historic Indigenous sites. Yet flaked glass is frequently overlooked or looked at skeptically and dismissed. The effect of overlooking or dismissing flaked glass is a narrowed archaeological perspective and understanding of the Indigenous experience during the historic period. This presentation will look at flaked glass from known contexts and existing literature to establish a baseline, and then introduce how-to YouTube videos and traditional lithic analysis techniques to explore how to identify and validate flaked glass with a critical and objective eye. Lastly, the presentation will look at flaked glass from two archaeological sites in southern Utah to apply the information and techniques presented. The sum-total goal of this presentation will be to explore this artifact type with new perspective- looking at the world through rose-colored flaked glass- that can enhance our archaeological knowledge of the historic Indigenous landscape.

[319] *Animals at Spiro Mounds: Patterns from Faunal Specimens and Engraved Shells*

This paper discusses results from examination of faunal remains and iconography from Spiro Mounds, Oklahoma. By combining multiple analyses, this research yielded data useful to recognizing animal use patterns at the site that may

suggest how ideological structures affected food choice at the site. In particular, this paper highlights some examples that may clarify why certain animals are depicted in iconography, even when absent from identified faunal remains at the site. I consider these patterns alongside faunal data from sites in the region. Informed by ethnohistoric and ethnographic accounts, I propose that these patterns may clarify our interpretations of social relationships between animals and humans in the past.

Ruth, Susan (Central New Mexico Community College) and James Boone (University of New Mexico)

[8] *Clovis/Folsom Endsrapers and Gendered Hideworking: Ethnographic Analogy or Inference to the Best Argument?*

Cross-cultural data show a strong positive relationship between latitude and dependence on hunting for subsistence. Higher latitude foragers that were dependent on megafauna for subsistence were equally dependent on animal hides for clothing and shelter to survive through winter, and for the survival and reproduction of corporately organized, hearth-centered family groups. Hunting and clothing/shelter making were strongly gendered in these societies. Both activities require a great deal of skill and training to do well, which in turn require long periods of training and practice during childhood and adolescence. We suggest that strong division of labor between hunting and hide processing results from the channeling of these two skill-intensive tasks onto male and female roles. Hence, the argument that Paleoindian endsrapers were used and probably made by women to process hides in a manner similar to historic Plains bison hunters is more than an ethnographic analogy, a rather weak logical construct, but rather, an inference to best argument. Similar patterns of recent Plains and Pleistocene Paleoindian hideworking and tool use arose under similar biological and social reproductive constraints and thus constitute a form of evolutionary convergence.

[67] *Under Fire: An Experimental Examination of Heat on Lithic Microwear Evidence*

Lithic microwear analysis provides important insights into stone tool function by identifying various polishes, residues, and striations that ultimately represent microscopic evidence of how these tools were used. However, recent archaeological analyses have recognized an interesting pattern: burned lithic specimens do not appear to preserve microwear traces to the same extent or frequency as non-burned specimens. With the use of experimental methods, the co-variation was tested to determine if the pattern was causal. The experimental design included fifty lithic flakes that were used to cut wood for long enough period to develop a strong microwear signal. Then, the flakes were exposed to different levels of heat to test this hypothesis.

[327] *Know Before You Dig: Using Comparative Geophysical Exploration and Ground-Truthing for Surgical Excavation*

This poster presents the results of geophysical exploration and excavation from new research at 48PA551, a Middle Archaic (McKean Complex) site in the Sunlight Basin of NW Wyoming. In the field season of 2017, total field magnetic survey was conducted at the site to identify and interpret areas that would be candidates for further geophysical investigation and eventual excavation. In the field season of 2018, further geophysical testing occurred using ground penetrating radar (GPR), specifically in the areas in which magnetic survey was conducted. Finally, 50 x 50 cm test units were excavated in areas suspected of containing anomalies of cultural significance. The outcome of this fieldwork model demonstrates the success of multi-technique geophysical exploration which can lead to highly successful excavation and discovery of cultural features. This method also can significantly decrease the amount of time spent conducting exploratory excavation and instead can surgically target valuable areas of cultural significance within archaeological sites.

Ryan, Ethan [327] see Kaviani, Kelsi

Ryan, Joseph (Okayama University)**[416]** *How Was Iron Weaponry Obtained by Local Elite during Japan's Kofun Period?*

The Kofun period of Japan, stretching from the mid-3rd century to the late-6th century AD, witnessed the formation of an almost archipelago-wide sociopolitical consolidation centered on the paramount elites of the Nara Basin. Considered by many scholars to have been an early state, this Yamato polity exercised unprecedented control over the production, importation, and distribution of prestige goods, which were bestowed on participating elites. Iron weapons, which displayed a significant increase in burials from this time, are also considered by many scholars to have been distributed, if not produced, by the central Yamato polity. While the case can convincingly be made that the majority of bronze mirrors imported from China and various other ritualistic items were indeed distributed out from the Yamato polity, little research has been carried out on the iron weapons, themselves. In this presentation, the author analyzes the iron weapons buried in the mounded tombs of the Kibi region (present Okayama prefecture) in order to understand how iron weaponry was obtained by local elites during Japan's Kofun period.

Ryan, Karen**[138]** *Discussant***Ryan, Stacy (Archaeology Southwest)****[263]** *Classic Period Projectile Point Traditions in Southeastern Arizona*

Similar projectile point types were used by people in central and southern Arizona during the Classic Period (A.D. 1150-1450), a time when considerable changes occurred within the region. An analysis of over 600 points was conducted to examine how social, technological, and environmental factors contributed to projectile point design choices during this period. Metric and morphological attributes were used for comparisons within two areas in southeastern Arizona—the Tucson Basin and the San Pedro Valley. Comparisons between early Classic period sites in the Tucson Basin, where differences in social relationships and access to large game were evident, did not show significant differences in point attributes. However, variation in base morphology is apparent at some sites. Points from late Classic migrant enclaves in the Lower San Pedro Valley are similar to those used by local groups in the area. In contrast, differences are seen at a site to the south, where the presence of northern migrants appears limited. These results indicate that the use of similar point types is consistent with the growth of social networks during the Classic period, but base shape, the presence of serrations, and other microvariables can inform on technological traditions and cultural influences within the region.

[341] *Discussant***Ryan, Susan (Crow Canyon Archaeological Center), Shaw Badenhorst (University of Witwatersrand) and Jonathan Driver (Simon Fraser University)****[57]** *Faunal Remains and Social Organization at Albert Porter Pueblo, a Great House Community in the Northern Southwest*

The Albert Porter Pueblo great house, located in the central Mesa Verde region was surrounded by numerous residential structures during the Pueblo II and Pueblo III periods. Using a variety of ratios to measure the exploitation of wild game and domestic turkeys, we examine evidence of social organization by evaluating similarities and differences in faunal assemblages from the great house and the domestic households that surrounded it. Although the great house was a unique and prominent architectural feature at Albert Porter Pueblo, the fauna from the great house are generally similar to those from surrounding structures. There is some evidence that more meat was consumed in the great house than in domestic structures. All members of this community seem to have had equal access to animals consumed for food and used in ritual and ceremonial practices. We explore different interpretations of social organization suggested by faunal remains.

Sabin, John (Florida State University) and Jessi Halligan (Florida State University)**[216]** *Shifting Tides and the Role of 'Big Data': Modeling Paleoindian Land Use and Site Preservation in the Aucilla Basin,*

Florida

The past 18,000 years in northern Florida have been characterized by shifts in climate and sea level, which affected settlement patterns and site preservation. Regional sea level curves have only recently been established with the accuracy and resolution required to model paleohydrology (Joy 2018). Advances in non-linear modeling and the use of multi-scalar remote sensing and geoarchaeology allow for a more comprehensive approach to envision the social landscape as it would have existed during the Pleistocene-Holocene transition around what today is the Big Bend region. GIS modeling of the geomorphology and paleohydrology for the Aucilla-Wacissa drainage basin utilizing multiproxy paleoenvironmental records were combined with known site distributions of pre-9500 cal BP cultural components in order to reconstruct Paleoindian site preservation, discuss Paleoindian land use, and to potentially locate additional sites.

[384] *Rises and Falls of Uaxactun Dynasty: Combining Epigraphic and Archaeological Evidence*

The dynastic history of Uaxactun is one of the most ancient among the political centers of the Maya Lowlands in the Preclassic and Classic periods. The beginning of history of a dynasty concerns to the III cent. BC, and its end to the final years of the IX cent. AD. On an extent more than a thousand-year history the dynasty of Uaxactun has endured some stages of rising and decline in Preclassic, Early Classic and Late Classic periods which have been connected with change in political life of ancient Maya in the area of the Central Lowlands. These periods have found the reflexion as in building activity of the city center corn, and in epigraphic inscriptions on the monuments established by lords of Uaxactun during the periods of blossoming of the kingdom. We will try to track correlation between the basic dates from a dynastic history and the archeological data reflecting stages of development of the early state in Uaxactun. And their relations with the general political situation in Maya Lowlands until the end of the Terminal Classic period.

[389] *Evolution of Feasting among Jomon Societies Focused on Prestige Wooden Food-Serving Technologies*

Cross-culturally, wooden food-serving items and serving utensils, such as shallow bowl, plate, ladle and spoon, as prestige items are essential elements for conducting ritual feasting among many transegalitarian societies in the Circum-Pacific Rim regions. Thus, they are keys to understanding prehistoric feasting and ritual activities, and are strong archaeological signatures of these activities among the societies. Recent development of wet site archaeology in the Japanese archipelago associated with a highly refined Jomon pottery chronology has uncovered the importance of the past wooden and plant use at feasts. This paper explores evolution of feasting among Jomon societies focused on prestige wooden food-serving technologies by 1) building chronology of these food-serving items and serving utensils, and; 2) examining temporal and spatial variability of these items and technologies.

[151] *The First Excavation of a Pithouse Site in the Mt. Trumbull Area*

The first excavation of Virgin Ancestral Pueblo structures was conducted at Mt. Trumbull during the summer of 2018 after more than 15 years of intense surface surveys. The goal of this study is to gain a better understanding of the settlement patterns and changes in adaptive strategies among the Ancestral Puebloans who lived in this marginal environment. A potential pithouse site, 71 ASM, was chosen for excavation after a previous GPR survey indicated the existence of a possible subsurface feature underneath a large depression. The OSL dates for previously analyzed ceramics from this site

suggest the time associated with this feature is the Basketmaker III period. A long trench excavation was conducted to answer several questions, such as site function, length of the occupation, seasonality of the site, and the energy devoted to construct this structure. This excavation showed that a five-meter diameter pithouse was constructed by digging into the limestone bedrock, which suggests a relatively large amount of energy was devoted to the construction of habitation during the early occupation in the Mt. Trumbull area. To understand the history of this pithouse, OSL dating of 30 ceramics from various layers will be discussed in this paper.

[33] *Swordfish Hunting as Prestige Signaling within Middle Holocene Fishing Communities of the Atacama Desert Coast?*

Since around 8500 years BP, the archaeological record on the Southern Coast of the Atacama Desert shows evidence of growing population density and low residential mobility. A maritime specialization process is also evident by a rich set of specialized tools, and a pronounced increase in the abundance and richness of fish assemblages. Among these fish assemblages, the presence of offshore species like sharks, dolphins and swordfish has been considered as indirect evidence of navigation technology. How do we understand and contextualize the presence of big offshore prey within the context of increasing population and social complexity evidenced by the archaeological record of the Taltal area (25° S)? In the present work, we attempt to discuss, through Costly Signaling Theory, the appearance of swordfish hunting in the context of growing population density and lower residential mobility. We will argue that this social context may have generated the need to differentiate individuals in order to avoid costly conflicts. Can this approach enrich our interpretations of the sociopolitical context of fishing communities from the study area? Was swordfish hunting a mechanism of prestige signaling? The present study aims to discuss these questions presenting archaeological data from the Middle Holocene of Taltal.

[116] *On Making Kw'ets'tel and Interpreting the Remnants: An Archaeological and Experimental Archaeological Study of Stó:lō - Coast Salish Slate Fishing Knives*

Although critically important to the seasonal work of processing hundreds of thousands of fish for storage, kw'ets'tel, or Stó:lō-Coast Salish slate fish knives, are rarely recovered in the archaeological record. Knife-making debitage, however, is often recovered in great abundance during subsurface investigations in and near Stó:lō dwellings. Debitage assemblages are useful for exploring inter-household variability in labor allocations to knife production, although fuller considerations of household labor investments (and other inferential reconstructions of behavior) have been hampered by insufficient knowledge of kw'ets'tel design and production processes: source(s) of raw material and transport costs; the embodied work at different toolmaking stages; grinding techniques; ideal knife morphology; and ratios of debitage to final tool forms. A culmination of a two-year faculty-student research project, this poster presents and synthesizes new data and findings emerging from recent archaeological research and rigorous experimental exploration of kw'ets'tel production practices. We show how the products of experimental archaeological research afford new insights into routine household practices that, in turn, are critical to comparative reconstructions of household and settlement organization across space and over time.

[360] *Recent Radiocarbon Dates from the Shaft and Cave under the Osario at Chichén Itzá: Rethinking the High Priest's Grave*

In the archaeological literature, the Osario at Chichén Itzá has been defined by the 998 A.D. long-count date inscribed on a pillar at the top of the pyramid. Although the pillar could have been added long after the construction of the pyramid, the complex is, nevertheless, consistently treated as a late construction. From the outset, this has been problematic. J.C. Harrington, who mapped the Osario, the shaft, and the cave in the 1920s, discovered the soffit of a vault behind the stones of the shaft suggesting that a vaulted structure stood on the stone platform at the base of the shaft before the pyramid was built. An investigation of the Osario by the Gran Acuífero Maya project collected charcoal from the shaft and the cave. Radiocarbon dating establishes that the earlier structure was terminated and the Osario pyramid was constructed in the early eighth century A.D. Thus, the Osario predates the Castillo.

[296] *Polychromes and People at 76 Draw, New Mexico*

People of the Casas Grandes and Salado regions are known for their polychrome pottery. Often pottery from both areas are found at the same sites, but the degree of interaction between the areas is not known. Neutron Activation Analysis (NAA) was conducted on Ramos and Gila Polychrome pottery, as well as some plain wares, from 76 Draw, a Medio period site in Luna County, New Mexico. These data were compared to other researchers' data on the same types from other settlements in southern New Mexico. In total, 217 samples, including all of the Ramos Polychrome NAA samples north of Mexico, were analyzed at the University of Missouri Research Reactor (MURR). Several compositional groups were identified among the types including three Ramos Polychrome groups, a single Salado group (which corresponds to a previously identified production location in the Upper Mimbres), and six plainware groups. From this I conclude that one or more of the Ramos groups might reflect local production, but all of the Salado and likely much of the Ramos polychrome was acquired through trade. This in turn suggests that the Casas Grandes interaction sphere was operating as far north as southern New Mexico.

[302] *Unravelling the Origins of Pre-Columbian Agave Domestication in Present Day Arizona*

Botanical exploration over the last thirty years in Arizona has revealed at least six putative domesticated agaves still surviving in their archaeological context. These agaves share characteristics of relictual domesticated plants including clonality, reduced genetic diversity compared to wild agaves and reduced seed set or complete sexual sterility. Because of the importance of corn, beans and squash to the pre-Columbian peoples of this region it might be assumed that the agaves are also of Mesoamerican origin. In order to identify the ancestors of these domesticated plants we have undertaken traditional Sanger, and now Next-Gen, sequencing to infer the evolutionary relationships. Our phylogenetic data show that the domesticates are resolved in four distinct clades and only one, *Agave murpheyi* Gibson, has a sister relationship with Mesoamerican taxa, the other are in clades with local wild species or in the case of *A. delamateri* Hodgson & Slauson still unresolved. Expanded sampling of wild species and collaboration with archaeologist to pin-down the when and where these domesticated taxa originated is needed for a better understanding of this new secondary center of plant domestication.

Sampson, Christina (University of Michigan)

[70] *Trade, Tradition, and Rivalry: Late Pre-Columbian Craft and Exchange on the Central Peninsular Gulf Coast of Florida*

This paper examines changes over time in the ways that fisher-hunter-gatherer communities on the central Gulf coast of peninsular Florida participated in the regional trade of specialized crafted goods. The social landscape of the greater Tampa Bay area appears to have become increasingly politically integrated between the end of the Woodland period and the time of Spanish contact; that is, during the Safety Harbor archaeological period. Changes in Safety Harbor sociopolitical organization and ideological schemas emerged through historical circumstances including interactions with neighboring complex farmer (Mississippian) and fisher (Calusa) societies. A recent research emphasis on residential contexts in the Safety Harbor area has expanded possibilities for investigating community organization and the interplay of local interactions and regional patterns of change. Craft production and trade were likely venues for social change at different scales. By transitioning from peripheral participants in Weeden Island era ceremonial culture to purveyors of raw and crafted shell goods, Safety Harbor people created a new role for themselves on the regional landscape, with implications for local historical trajectories.

[10] *Assessing Impacts of European Contact on Beothuk Projectile Point Technology*

The lithic technology of the Beothuk has seldom been the focus of diachronic or regional comparative studies. Recently excavated Beothuk materials from Stock Cove, a site located in southeastern Newfoundland that has significant time depth, provide an excellent dataset to assess change through time and regional technological variation. The research presented here focuses on potential variation through a systematic examination of Beothuk and ancestral Beothuk projectile points from Stock Cove and extant collections from other sites across the island. Through a comparison of these data, we will compare the morphology of pre-contact points to post-contact examples in an attempt to identify potential impacts that access to European materials and restricted access to traditional raw materials resulting from the presence of Europeans had on Beothuk tool production and use. This comparison will provide important new information concerning diachronic technological variation among the Beothuk that have broader implications regarding the impacts that European contact had on their economic strategies and social structure.

[33] *From the Forest to the Steppe: Mobility Strategies of Late-Marine Hunters (Alakaluf) in the Strait of Magellan, Chile*

In this paper we discuss the characteristics of marine hunter-gatherer peopling (Alakaluf) in the Strait of Magellan (52°30'-54°00'S) during the last 2000 radiocarbon years. Focusing on zooarchaeological information and other sources of evidence, we evaluated the modalities of use of space and the relationships with seasonal availability and concentration of faunal resources in a region characterized by a marked environmental west-east gradient.

The coastal archaeological record shows an extensive use of this territory, which integrated hyper-humid forest environments predominantly associated with marine resources (western zone) and forest-steppe ecotone areas associated with the combined exploitation of terrestrial and marine resources (central-eastern zone). Based on information on the intensity of occupations, the faunal exploitation modalities and the inferred seasonality for the use of the different zones of the Strait of Magellan, we propose a model for the late settlement of the area, centered on the summer concentration of marine resources in islands (breeding colonies of birds and pinnipeds), and the combined exploitation of terrestrial mammals and marine resources in the steppe-forest ecotone zones of the continental shoreline during winter.

Sanchez Fortoul, Carmen (Independent Researcher)**[407]** *Characterizing Pottery Fabrics Using Digital Image Analysis: An Investigation of the Socio-economy of the Late Postclassic Maya of Northern Yucatan*

Late Postclassic Maya Pottery from northern Yucatán sites, including Mayapán, was analyzed using petrographic, chemical, and surface features analyses, seeking patterns in ceramic technology and social interactions. New information was gained (Sánchez Fortoul, C.G. 2018) regarding the selection and processing of raw materials, ceramic production location and technology, export/import of Mayapán vessels and mechanisms of exchange, and the role of Mayapán and north-central

centers in the sub-regional economy. New insights on the existence, time depth, and scope of technological traditions were gained. Mayapán traditions linking raw materials and some vessel types differ from the minor centers. Furthermore, varied composition characterizes the samples from minor centers, likely from dispersed production, while compositional and technological homogeneity characterize Mayapán samples. However, two fabrics (sparite and micrite sascab), commonly found in north-central samples but rarely in Mayapán samples, remained broadly defined, hindering research on movement of vessels. This paper focuses on further examination of samples using digital-image analysis of thin sections aiming to understand the movement of vessels and social interactions between north-central centers and Mayapán. Preliminary results indicate differences between samples from minor centers and Mayapán suggesting that vessels from the minor centers were not taken to the main center, Mayapán.

[375] *Archaeological Analysis of a Colonial Copper Smelting Furnace from Santa Clara del Cobre, Michoacan, Mexico*

In 1788 the Spanish Crown wanted to evaluate the mining industry in New Spain in order to start the implementation of new technologies, change the domain and administration of the mines, and create new foundries that would help the mining industry to have more efficiency in all the processes related to this activity. That is why the Crown sent German miners and mineralogists from Europe. Our work refers to Francisco Fisher, because he was responsible for making studies for the Crown of the mining conditions in Michoacan. He was also commissioned to construct a copper smelting furnace based on the new technology of Europe. This poster is about a copper smelting furnace that was found near Santa Clara del Cobre by our team, PAPACSUM, in the 2018 survey season. By comparing archaeological analysis and documents, we show that this smelting furnace is the same that Francisco Fisher constructed. Additionally we reconstruct digitally the smelting furnace starting from sizing the ruins of the site. Moreover, we want to explain why Francisco Fisher's technology did not work in the region, because the copper workers of the area still use the prehispanic and early colonial techniques.

[276] *Towards a Historical Ecology of An Alluvial Plain in North-Central Puerto Rico: Preliminary Geoarchaeological Results*

Under the precept of Historical Ecology landscapes are considered artifacts where the mediation of humans over environments accumulates over time leaving traces of these relationships in the form of sedimentological and paleobotanical records. Alluvial plains in the Neotropics are among the most important environments where humans first settled, beginning the process of landscape domestication seemingly due to their fertile soils, diverse biota and the advantages of rivers for intra-island movement. The alluvial floodplain between the rivers Grande de Arcibo and Grande de Manatí in north-central Puerto Rico has an archaeological record that spans the entire history of human occupation on the island from the Pre-Arawak (5,000 BP) to the present. This area was one of the first in Puerto Rico where humans began the process of landscape domestication; adaptations continued during ensuing centuries with new migrations from South and Central America, and later with the spread of European colonization into the New World. This presentation will focus on an assessment of geoarchaeological data collected during the summer of 2018 to begin elucidating the historical ecology of this alluvial plain.

[39] *Judging a Vessel by Its Surface: Investigating Production Process in Corinthian Ceramics through Use of Multiple Non-invasive Instruments*

Evidence of ceramic production techniques, such as multiphase firing utilized by 4th-century BCE Greek potters, can be observed through use of non-invasive instrumentation. Portable X-ray fluorescence spectrometry (pXRF), fiber-optic reflectance spectroscopy (FORS), multispectral imaging (MSI), and macrophotography are utilized in the analysis of five Corinthian ceramic vessels housed by the University of Colorado Boulder Art Museum. Each of the five vessels are previously identified as Greek ceramics ranging in production dates throughout the 6th-century BCE. Investigation of the objects provided positive evidence that four of the five vessels were most likely produced through the Corinthian multiphase firing technique. The fifth vessel, however, may have undergone a different production process. Non-invasive instrumentation allows investigators to interact with protected material culture in ways previously unimaginable.

[243] *Flowers in the Religious Ideology of Contemporary Nahua of the Southern Huasteca*

Flowers are a central feature of religious rituals among today's Nahua of the southern Huasteca. They are associated with

the sun, growing corn, life-giving water, the bounty of the living cosmos, and ancestors who visit their relatives during Day of the Dead. For the Nahua, flowers are far more than simple expressions of beauty; they are seen as evidence of a beneficent universe that, although unstable and filled with forces of chaos and destruction, is responsible for children, abundant crops, health and well-being, and the very possibility of human existence. The word for ritual in Nahuatl is *xochitlalia*, which means “to put down flowers,” and no ritual is ever held without incorporating copious blossoms in elaborate altar displays. While we have no evidence for a well-developed Flower World conception among contemporary Nahua peoples, we have documented the importance of flowers in many areas of their lives, both within and outside the religious context. The privileged place of flowers in myths, chants, and ritual practices of the Huastecan Nahua is most likely an example of the ancient and widespread idea of a Flower World in Mesoamerica.

[73] *Timing the Circulation of Nonlocal Materials in Seneca- and Onondaga-Region Sites*

In this paper, I evaluate newly acquired AMS radiocarbon dates for Seneca- and Onondaga-region sites, focusing on what these new dates can tell us about the regional exchange of non-local materials in the circa fourteenth- to seventeenth-century ancestral Haudenosaunee homeland (what is today central New York State). I examine the material properties of non-local marine shell and copper objects (including copper objects of both North American and European origin) and their associated relations and practices. Through the use of macroscopic analyses, digital radiograph imaging, x-ray fluorescence spectrometry, and digital mapping via ArcGIS software, I study artifact forms, manufacturing methods, sources of raw materials, and distributions of artifacts. Lastly, I establish a refined temporal understanding of the incorporation of these materials by employing radiometric dating and Bayesian chronological modeling via OxCal software. The combination of chronology-building and artifact analyses provides new details with which to discuss the exchange of nonlocal materials in the ancestral Haudenosaunee homeland.

[70] *Networks of Exchange in the Late Archaic Southeast: Copper and Crematory Practices*

Societal complexity, once a stalwart of archaeological research, has become increasingly difficult to define as archaeologists increasingly look at its various aspects, including entrenched authority, monumental architecture, and economic specialization as rising independently of one another. To date, long-distance exchange among hunter-gatherer communities has not received the same level of attention as other aspects of complexity. This paper examines the movement of copper across vast distances during the Archaic period (8,000-3,000 B.P.) and considers the implications of this exchange. Found in a mortuary context in a site created, in part, through ritual events, this paper investigates the connection between cosmological belief systems and far-flung trade networks. We also provide evidence that the trade linking the Great Lakes and coastal Georgia was not a simple, down-the-line network in which objects moved through innumerable hands over vast amounts of time, but rather a more direct line of exchange that transferred both objects and information, including mortuary traditions. Alongside other exchange networks through which hypertrophic blades, zoomorphic beads, and other items moved across the Eastern Woodlands, the exchange of copper between the Great Lakes and the Southeast United States suggests a massive reconfiguration of social networks during the Archaic period.

[23] *The Seasonality of Ritual Sites in Viking-Age Scandinavia and Iceland*

This paper will address Viking-age ritual sites (cult sites assembly (thing) sites) in Scandinavia and Iceland from the perspective of their seasonality. These sites were used for gatherings of various kinds seemingly at certain points of the calendar year. Calendrical rituals formed a key part of Viking-age religion, although the impact of these have not yet been analysed by archaeologists. An introductory survey suggests that the most important Viking-age feasts and gatherings took place at the times of the year when people were not tied down by key agricultural tasks. In this paper, the interplay between calendrical rituals and daily life will be examined for the first time and the archaeological evidence for gatherings at key points of the year analysed.

[238] *Conquista y artefactos arqueológicos: Una lectura desde el Derecho Indiano*

El periodo que corresponde a la conquista, establecimiento e imposición del orden español en México, de 1519 a 1821, se caracterizó por la colisión cultural entre poblaciones nativas y colonizadores europeos. En ese contexto, este trabajo analiza a los artefactos de manufactura mesoamericana, hoy denominados arqueológicos, como elementos que trascienden la denominación utilitaria del objeto para ofrecer una lectura del orden social y jurídico impuesto con la aplicación del denominado "Derecho Indiano", en particular: las Leyes de Indias, las Siete Partidas, el Fuero Juzgo y la Novísima Recopilación. Ordenamientos aplicados básicamente para la supresión de prácticas culturales nativas, como para la disposición, enajenación y despojo por la vía jurídica de bienes ancestrales en favor del monarca, por considerarlos bienes con valor económico. Sin embargo, este trabajo demostrará que las relaciones sociales asimétricas entre dos grupos históricamente enfrentados originaron procesos de resistencia cultural donde los objetos antiguos fueron la piedra angular que sustentó la identidad e igualdad étnica y racial entre los pueblos oprimidos para, con el paso del tiempo, constituirse en símbolos de identidad nacional.

[102] *Agricultural Practices in the Atacama Desert (Northern Chile): New Perspectives from Stable Isotope Analysis on Archaeological Crops*

Agricultural practice began in arid northern Chile during the Formative Period just prior to 1000 yr BC. Unusually, preservation of crops, including maize, squash, quinoa and beans is excellent due to the extremely arid conditions that characterise the Atacama Desert. In order to explore crop management, and particularly the use of fertilisers, we carried out stable carbon and nitrogen isotope analysis of archaeological plant samples dating from the Formative to the Late Intermediate Period (1000 BC- AD 1450). Prompted by results showing high d15N values for crops from domestic and funerary sites, and by comparisons with modern experimental data (Szpak et al 2012), we explore the ethnohistorical documents that show evidence for manuring in the valleys and oases of the Atacama. Based on these records, different types of fertilisers are discussed in order to explain the high d15N values, including the use of llama dung, llama ashes after incineration, fish-heads, seabird guano and decomposed tree-leaves. We highlight the relevance of fertilisers for the development and consolidation of agriculture in the Atacama.

[349] *Early Formative Figurines from Tlatilco - Understanding the Diversity and Individuality*

The Early Formative site of Tlatilco, has like so many other ancient sites, been covered by modern-day urbanization. Many of these sites suffered a fate of early exploitation and looting leaving the archaeologists with puzzles that often lack many pieces. With resilience and patience, and often sheer luck, it is possible to stitch back more pieces of the puzzle. Tlatilco is one of the sites that scholars were interested in early on, and rightly so, but while waiting for permits, and other determinants, the site remained under the mercy of brick workers and art collectors, with only sporadic excavation seasons until eventually being completely covered by modern-day Mexico City. My research takes a holistic approach in my attempt at stitching back the puzzle that is Tlatilco. Incorporating archival documentation, museums objects, publications, as well as Instrumental Neutron Activation Analysis, understanding Tlatilco has become a captivating journey. Tlatilco has yielded astonishing objects; particularly the figurines stand out as something extraordinary as they are very diverse and display a sense of individuality! Through my research I have looked at hundreds of Tlatilco figurines in order to determine patterns and trends among this Early Formative community.

[289] *Examining Inter-regional Interaction in the Tiwanaku State (C.E. 500-1100) using 87Sr/86Sr Analysis of Building Material from a Provincial Ceremonial Center*

Recent approaches to inter-regional interaction emphasizing the study of heterogeneous identities in peripheral contexts advance scholarly debate about sociopolitical organization in the archaic Andean state of Tiwanaku (C.E. 500-1100). The present study employs 87Sr/86Sr analysis to determine the source region of four archaeological ichu grass (*Stipa ichu*) samples from the Omo M10 temple in the Moquegua Valley of southern Peru, where there was significant Middle Horizon (C.E. 600-1000) Tiwanaku-affiliated settlement. Use of ichu grass (*Stipa ichu*) as building material is an architectural technique found in the higher elevation Tiwanaku homeland and it is more well suited to the frigid, rainy climate there than the hyper-arid Moquegua Valley. The present analyses test existing hypotheses concerning how the Omo M10 temple related to Tiwanaku colonists' multi-scalar identities. Surprisingly, the ichu (*Stipa ichu*) samples were found to have 87Sr/86Sr values within the range of known local values for the Moquegua Valley. This study adds to our understanding of the practices involved in constructing the ceremonial center at Omo M10 and suggests colonists sought to situate ritual activities in a built environment that not only gestured to the homeland, but that also incorporated and sanctified the local landscape.

[323] *Cascade Phase Context and Chronology at the Connley Caves, Oregon*

Cascade projectile point chronology in the northern Great Basin is poorly understood, with associated evidence ranging from the early to middle Holocene. The broad temporal range of Cascade points results from the difficulty in distinguishing this type from the more general "foliate" category and lack of well-dated sites containing such artifacts. Recent excavations at the Connley Caves, in the Fort Rock Basin of south-central Oregon, have recovered diagnostic Cascade points in association with directly dated early Holocene cultural features. As such, this site offers a unique opportunity for the refinement of local projectile point chronologies and informs Cascade point user procurement and technological strategies.

This poster presents new radiocarbon dates, projectile point source provenance data, and a preliminary debitage analysis of the Cascade component at the Connley Caves.

[363] *Trade Networks and Selective Cultural Transmission of Ceramic Technologies in Neolithic Southern Vietnam*

New research on trade networks amongst early sedentary Neolithic communities, c. 4200-3000 BP, in southern Vietnam has shown that domesticated cereals and stone resources were imported to the coastal site of Rach Nui. While the stone likely came from quarry locales in the upper reaches of the Dong Nai River, possibly with specialist toolmakers, few fine ceramic wares were transported downstream to Rach Nui. Incised and impressed fine wares commonly seen in Neolithic communities throughout mainland Southeast Asia appear to have not been produced locally at Rach Nui. The local potters at Rach Nui manufactured a limited range of coarse wares not identified at other contemporaneous sites further upstream. This suggests there was no cultural transmission for learning fine ware technology at Rach Nui. A comparative analysis, including sites along the Dong Nai River and from other areas of southern Vietnam, has been conducted using statistical methods to assess the variation between ceramic assemblages in the region. Applying these results, this paper explores the cultural mechanisms, and the limitations of the current evidence, that might have caused the apparent reduced exposure to certain ceramic technologies at Rach Nui compared to other sites in southern Vietnam.

[123] *Micro-residues: Developing a Geochemical Baseline for Archaeological Analysis at Temyiq Tuyuryaq*

Geochemical analysis of anthropomorphic sediments in a household context have contributed to our understanding of 'home-making' including spatial organization and use of residential space (e.g. Frink and Goodale). Geochemical signatures can identify micro-residues such as calcium and phosphorous, suggesting activities that have occurred that we may not be able to visually conceptualize. These traces often coincide with cultural memory and place and can indicate continuity or adaptation in a changing environment due to a number of factors such as climate instability and colonial entanglements. This preliminary research analyzes samples collected from both natural and anthropomorphic environments at Temyiq Tuyuryaq in order to establish a baseline for further geochemical analysis relying on field collection using pXRF technology. The portability of pXRF analyzer also provides benefits for collaboration with local students in terms of field collection and analysis as well as the ability to address potential public health concerns such as lead paint and environmental contaminants which have substantial implications in a region relying predominantly on a subsistence economy.

Saucedo, Alfredo and Carl Wendt (CSUF)

[405] *Some Temporal Markers in Olmec Pottery from Los Soldados*

Los Soldados has been considered by many to be a secondary center with respect to La Venta due to its proximity to the capital; however, in the absence of a tuned ceramic chronology for the Middle Preclassic, this cannot be corroborated. Over a number of seasons, the Arroyo Pesquero Archaeological Project has carried out excavations at Los Soldados, and among the proposed objectives was to generate a chronology. However, radiocarbon dating during the Middle Preclassic present inconsistencies, namely chronological fluctuations do not allow to establish a reliable sequence. For this reason, we intend to carry out a stylistic and morphological analysis that shows the variations in the ceramics materials from this settlement. Thus, this presentation intends to show some morphological transformations identified in the types, shapes and decorations of the archaeological ceramics of Los Soldados. When combined with stratigraphy and excavation data these data can serve as chronological markers and solve the issues of the regional radiocarbon during the Middle Preclassic to be able to

approach a reliable regional typology.

Saule, Jolyane

[169] *Domestic Pottery: Styles, Variation and Social Organization at the Droulers Site*

Droulers is a prehistoric Saint-Lawrence Iroquois village occupied during the 15th century in Southern Quebec. The site has been excavated by Université de Montréal's field school since 2010 and the goal of the excavation, under the banner of social archaeology, was to understand the social organization of the village. In continuity with the excavation, my MA thesis aimed to document the social fabric of the group through an intrasite stylistic analysis of domestic pottery. Style can be used to document the social interactions within the village, especially the clan affiliation of the inhabitants. Indeed, the ceramic knowledge was transmitted from mother-to-daughter and the social organization among the Iroquoians revolved around matrilineal kinship. Thus, the interest of ceramic style studies lies in their scope; they help to understand choices made by potters, those being influenced by social constraints. With those premises in mind, my focus was to ultimately understand the variability through two scales: the long-house and the village. My objectives were to make a thorough attribute description of the pottery assemblage, assess if variability was seen within the village, document that variability and interpret it to discuss social organization. This poster will present the outcomes of these objectives.

[197] *Foodways and Diet in the Prehispanic Mixteca Alta: Ceramic and Isotope Analyses in the Specific Case of the Tomb 1 Burial in Nduatiucu (San Felipe Ixtapa, Teposcolula)*

This presentation examines the archaeological possibilities for investigating prehispanic foodways and diet. We do this through the analysis of a burial recovered in Tomb 1 at Nduatiucu, in the Teposcolula valley in the Mixteca Alta. The burial first excavated in the 1970s by Winter et al. (1975) and later re-assessed and radiocarbon dated by Saumur 2017 dates to the early Postclassic period (ca. 1000 A.D.). We discuss two specific elements of this find: first, the associated ceramics that inform us about food preparation and consumption in this specific context in the Mixteca Alta; second, the results of an isotopic study of the human remains that inform us about the individual's diet. We will present the aims, methods and results of this case study and compare our results with those from other analyses that have been conducted on early Colonial human remains recovered at Pueblo Viejo de Teposcolula (Yucundaa) (Warinner et al. 2012). This comparative work will also consider the available data coming from other Mesoamerican regions.

[253] *How to Choose Samples for aDNA: Bioarchaeological Best Practices for Sampling Human Remains*

Recent methodological advances have rapidly increased the pace and scale of ancient DNA (aDNA) studies, prompting widespread sampling in museum collections and raising ethical concerns about inter-lab competition, treatment of human remains, and the research questions being addressed. Another key issue is selection of material that will be destroyed for this research. Few osteological manuals cover aDNA sampling, and those that do focus on how to identify and handle elements with probable aDNA preservation, rather than which bones should be used. Human samples should be documented prior to any destructive analyses, but few texts specify how or consider that some methods (e.g., casting) may be incompatible with aDNA protocols. Existing resources focus on how to sample instead of what samples should be sacrificed. This creates a climate in which morphologically-informative elements like petrous pyramids and teeth are preferentially destroyed for aDNA, often with minimal documentation and from understudied collections. Here we suggest some simple rules for choosing human remains for aDNA research that balance laboratory needs with preserving material for future study. We hope that this will lead to the adoption of best practices among archaeologists, geneticists, and others, paving the way for more integrated research on archaeological human remains.

[315] *Life Outside of the Ceremonial Center of Chavin de Huantar*

The monumental site of Chavín de Huántar in the Central Peruvian Andes has been the subject of archaeological investigation for close to a century. One person, more than any other, has been associated with the archaeology of the site for the last twenty five years. John Rick and the Stanford team have led research in the monumental sector of the site. The project has also encouraged work in other sectors of the site. The domestic sector of La Banda, located across the Mosna River from the monumental sector, offers the best opportunity to analyze contiguous domestic space from the Chavín time period. Research in this sector has focused on analyzing local production practices as well as the nature of exchange with outside regions and sites. Just as no site exists in isolation it is also important to consider that no sector of a site exists in isolation. This paper will analyze connection between the La Banda sector and the monumental sector of Chavín as well as the relationships that existed between the broader site of Chavín and other contemporary sites.

[111] *Crowd-Sourcing Isoscapes in (Bio)archaeology: The Andean Paleomobility Unification (APU) Project and Geolocation of Skeletons and Artifacts*

Stable and radiogenic isotopes are fundamental in (bio)archaeological studies of migration and trade, reflecting the isotopic catchment during tissue development. Foreign outliers have been defined by matching samples to a statistically "local" range. Because outlier provenience cannot be identified where the local range is undefined, researchers have increasingly studied water, soils, flora, and fauna to establish baseline values in broader areas. However, these studies are limited: 1) sample collection is largely limited to areas around easily accessed sites (tourist destinations and active excavations); and 2) we do not fully understand how to characterize regional variation in complex isotopic systems like the Andes. Predictive isoscape models have been applied to geolocate samples in ecological and forensic contexts, but their power and accuracy is increased by spatially-systematic sampling and robust geostatistical analysis. The APU project uses an open-source spatial database for collecting baseline isotope samples along regular intervals across hydrological systems. Here, we interactively present the APU database. We also test the power of strontium and oxygen isoscapes generated from the data by using maximum likelihood estimation to create probability density surfaces for skeletal and artifact samples. Results demonstrate the potential for isoscapes as a tool for geolocation in (bio)archaeological contexts.

[159] *Predation and Production in the Rock Art of the Middle Orinoco: Food for Thought*

The interpretation of rock art is fraught with difficulties, even when images may appear to be easily identified with cultural objects or elements found in nature. When considering the possible meaning of images of animals, plants, and artifacts depicted in the rock paintings and petroglyphs in the Middle Orinoco, we propose that an ethnographically informed approach may offer potentially fruitful insights into the symbolism related to food procurement, production, and consumption. By viewing the rock art in its broad social and geo-environmental setting, and as an integral participant in the conformation and structuration of the indigenous landscape, we will explore its possible role through time in 1) the mediation of the relations between predator and prey/society and nature, and 2) activities related to agricultural production and consumption. The use of rock art motifs in other media, such as body paint and stamps, basketry, maracas, and, to a lesser degree, ceramics, points to a ritual complex that permeated daily life as it related to food production and consumption in its broader context of societal reproduction, wellbeing and health.

Scarborough, Vernon (University of Cincinnati)

[58] *Archaeology as Our Urban Futures*

Archaeology is at a crossroads with a new generation of scholars more mindful of our disciplinary role within the social milieu we occupy. For years, the word “applied” in several corridors of our discipline implied something other than rigor and certainly of less significance than the real work of reconstructing past environments or modeling ancient societal activity. Although anthropology on campuses of the late 60s and 70s was a match for our politics, with time most of us invested in the immediacy of earning our degrees focusing on well-defined paradigms and the intellectual safety of our disciplinary silos. Most of us have carried that latter orientation and perspective forward in making anthropological archaeology a formidable study with incredibly well-controlled datasets. However, we are now in a position to significantly address our futures and at a time when few other disciplines can. This paper will examine the role of our urban futures drawing from the resilience of dispersed but sizable urban aggregates found in past contexts; and why the notion of “city state,” with our new realities like climate change, community cohesion, geographical scalar issues, etc., may be more flexible and better positioned than our current views of the nation state.

Scarry, C. Margaret (Univ. of North Carolina-Chapel Hill)

[404] *Agricultural Wealth, Food Storage, and Commensal Politics at Azoria an Archaic City on Crete*

Azoria (630-480 BC) is a small urban center on the island of Crete. Ten seasons of large-scale excavations have shed light on the formation, organization and operation of this Archaic city. At its heart is a massive civic complex with shrines, assembly halls, public dining rooms with associated kitchens and storerooms, a large free-standing storehouse, and an olive press. Surrounding the civic complex are “townhouses” of important families: here too, storage, preparation and consumption of foods were prominently displayed. The layout and contents of these public and residential buildings manifest the importance of food storage and display in urban politics. This paper draws on ceramic, architectural, and archaeobotanical evidence to discuss the mobilization and storage of agricultural products—particularly from vineyards and orchards. We argue that city authorities, or some other supra-household group, administered the mobilization, storage and distribution of a range of foods (such as grain, pulses, olives, wine, oil, and almond) for display and consumption in symposia and larger banqueting events.

Scarry, John (U of North Carolina)

[239] *Purification Ritual and the Creation of Place in the Mississippian Southeast*

While the indigenous societies of the Eastern Woodlands shared ways of life, they also differed in many important ways so that we cannot view them as a single culture. Even where material cultures and iconography appear to have been shared across great distances and over significant periods of time, the meanings and practices connected to those representations and items undoubtedly varied. Here I look at a particular assemblage (the beaker-bottle complex of the Chattahoochee-Apalachicola Valley and adjacent areas) and ethnohistorical accounts of Apalachee rituals connected to their ballgame to interpret an assemblage from Mound 6 at the Lake Jackson site and to argue that the peoples of this area were distinct from Mississippian peoples in other parts of the Eastern Woodlands in terms of their ritual practices. I argue that the people who lived at Lake Jackson employed the material culture of the beaker-bottle complex to create purified (sanctified) space for the construction of mounded architecture. I go on to suggest that this space and the mound that capped it likely served as a locus for rituals connected to the Apalachee ballgame (rituals that may also have involved the beaker-bottle complex).

Scerri, Eleanor (Max Planck Institute for the Science of Human History)

[247] *Rethinking Trees, Species and Hybridization in Recent Human Evolution*

Models of recent human evolution are fundamentally rooted in the idea of tree-like genealogies and species concepts, regardless of the specifics. The range of explanatory models has elicited some consideration of the need for flexibility, yet without a reconsideration of the fundamental heuristics, we are limited in our ability to fully describe processes of recent human evolution. In this paper, I will argue that the recency of the emergence of humans problematizes the concept of hybridization with more divergent hominins, problematically referred to as 'archaics'. This is the case irrespective of the fact that the wellspring of contemporary humans lies in Africa. I will argue that the concept of dynamic metapopulations is a far more flexible conceptual framework than reticulating trees for understanding human origins and earliest prehistory. Moreover, this framework recognizes that population structure exists, as it has always existed and did not come into being at a certain point in evolution as suggested by certain models (e.g. Classic Multiregionalism). Finally, this framework offers a way out of what have become overly polemical views of human origins that have affected interpretative approaches for too long.

Schaafsma, Curtis and Polly Schaafsma (Museum of New Mexico)

[28] *Which Serpent Are We Talking About?*

In many parts of the world including the Americas, snakes are incorporated into symbolic and metaphorical constructs in order to better describe and understand natural and social components of various cosmologies. As a result, their depictions are often enhanced with attributes that depart from nature, granting them the visual characteristics that define their various roles. In this paper we review the portrayals of the horned and often feathered serpent in the Greater Rio Grande Tradition in the American Southwest, which includes Paquimé. We identify variations in its temporal and spatial distribution and distinguish it from other modified snakes. While details vary, its depiction is remarkably stable throughout, an indication of ideological standardization. For at least 1000 years, its attributes in the archaeological record and its meaning today among the ethnographic Pueblos, confirm its link to the complicated Quetzalcoatl complex of Mesoamerica in its many manifestations. Its cosmological dualities are more specifically defined via its ties to terrestrial waters, plus Venus and warfare in the celestial realm, and finally in leadership roles.

Schaafsma, Polly (Research Associate, MIAC\LOA) and William Tsosie (Navajo Tribal Archaeologist)

[84] *Making a Homeland and Navajo Cultural Landscapes*

In indigenous America fundamental consideration in addressing "the materiality of religion" is the land itself. In native thinking the land and the people comprise inseparable entities that interact and give definitions to each other. The Navajo, in their migrations into the Southwest, adapted to cultural landscapes already defined by various Pueblo people who preceded them and were still spiritually engaged with topographic features to which they had long ago ascribed mythic/historical meanings and supernatural powers. The Navajo, heeding previous meanings, added new places of significance, thereby creating a cultural landscape of their own. Making rock art was part of this process. With a focus on the Navajo homeland, or Dinétah, we examine the ways in which rock art and the oral traditions and beliefs it promoted functioned to establish a Navajo identity between ca. AD 1670 and 1760.

Schablitsky, Julie (Maryland Dept. of Transportation)[292] *Discussant***Schach, Emily (Arizona State University)**[290] *Preliminary Analyses of Materials from the Terminal Terrestre, Moquegua, Peru*

Archaeological investigations in Moquegua indicate that this valley has been the site of multi-ethnic imperial processes since the Middle Horizon. Large cemetery sites in Moquegua have largely dated to the Middle Horizon Period, however, and thus little work has focused on the transition between the Late Intermediate Period and Inka occupation. Rescue excavations conducted in 2010 from a large cemetery site under the bus station have the potential to address important questions regarding Late Intermediate Period multi-ethnic processes and responses to the Inka Empire. This poster presents preliminary analyses of skeletal and ceramic specimens conducted during the summer of 2018. Assessment of ceramic vessels indicates that this site was used primarily during the Late Intermediate Period, and contains ceramics associated with Cabuza, Tumulaca, Chiribaya, Estuquiña, Gentilar, and San Miguel styles. This site also contains ceramic vessels associated with the Inka Empire, reflecting continued use of the cemetery during the Late Horizon. Skeletal analyses reveal multiple styles of cranial modification, antemortem cranial trauma, and vertebral lesions consistent with tuberculosis. Thus, materials from the terminal terrestre rescue excavations have the potential to address multi-ethnic processes in the Moquegua Valley during the Late Intermediate Period and responses from contact with the Inka Empire.

Schachner, Gregson (UCLA)[188] *Keith Kintigh and the Cibola Region over the Long Term*

This paper provides a brief overview of Keith Kintigh's career and contributions, with a special emphasis on his research on Pueblo archaeology in the Cibola region of western New Mexico and eastern Arizona. The seeds of many themes in Dr. Kintigh's research and professional contributions can be seen through his research in the region, which began as a field school participant with the Cibola Archaeological Research Project in the 1970s. His investigations in the Cibola area exemplify the power of a mix of fieldwork, particularly survey, collections research, quantitative methods, and the gradual accumulation and preservation of data for understanding some of the grand challenges of archaeology, including human population movement and responses to environmental change. Through a presentation of the results of this work, including a "grand synthesis" of current settlement data, we explore important themes in Dr. Kintigh's career and archaeology more broadly.

[188] *Chair***Schaefer, Benjamin (University of Illinois at Chicago)**[206] *Reconstructing Life Histories at the Site of Estuquiña: Incorporating Isotopic Data from Archaeological Hair to Investigate Palaeodietary Trends*

The site of Estuquiña is a Late Intermediate Period (AD 1100-1476) site in the Osmore drainage near the modern city of Moquegua in southern Peru. This time period is characterized by regional socio-political decentralization and transition of imperial polities throughout much of Andean South America. Previous research on human remains from the site investigated segmented cortisol levels to examine psychosocial stress, however this study incorporates $\delta^{13}\text{C}$ keratin and $\delta^{15}\text{N}$ keratin from archaeological hair (n=12) to elucidate how diet may have played a pivotal role in regulated cortisol production, social inequity, and overall health. Segmented isotopic values demonstrate variation in diet in the months leading up to death and illuminate which individuals had access to certain foodstuffs. Preliminary results range from -16.3‰ to -23.4‰ for $\delta^{13}\text{C}$ keratin and 9.7‰ to 13.1‰ for $\delta^{15}\text{N}$ keratin and suggest a lower dependence on maize and higher dependence on local flora and fauna.

[213] *In-Field XRF of Obsidian from Sites in the Lion Mountain Community of West-Central New Mexico*

The Lion Mountain Community of west-central New Mexico is the largest and most easterly example of what has been described as a Zuni Region phenomena. A focus of this research is examining interactions both within the community and the broader region. In contrast to other lines of evidence, such as architecture and ceramic typology, in-field ED-XRF analysis of obsidian provides a narrow but precise indication of broader regional interaction. The McDaniel Tank obsidian source, located just southeast of the study area, dominates the assemblages of the 13th century sites associated with the Zuni Region phenomena, while an earlier adjacent pithouse site is dominated by the Mount Taylor sources to the North.

[37] *Sensorial and Transformative Qualities of Caves among the Lucayan-Taíno of the Bahamas*

Caves act as the mythological archetype and physical portals that validate the cosmogony-cosmology-eschatology spectrum of many past and present human societies. Among the prehistoric Lucayan-Taíno of the Bahamas, caves played an important role in both validating perceptions of the cosmos, but also the maintenance of ancestral spirits. These roles were implemented through material objects, human remains, and in ritual performance to invoke and adulate particular deities (or *cemis*) as part of a pantheon known as *cemiism*. This presentation seeks to use the known mortuary record of the Lucayan-Taíno to examine the way in which caves provided ritual platforms for ancestral worship and the preservation and maintenance of the cosmos, including the sensorial and transformative qualities of caves and material culture to entreat and perpetuate *cemiism*.

Scharf, Elizabeth (University of North Dakota)

[393] *Reducing Large Data Sets Using Granger Causality: A Paleocological Example from the Columbia Plateau*

This paper presents proxies of vegetation, climate, human population, and fire from late Holocene sediments from the Columbia Plateau (USA). Statistical analyses such as multivariate regression and Granger Causality time series analysis are used to reduce complexity and illuminate the underlying structure of the data set. Results show that multivariate regression can overfit a model in such cases, identifying variables as statistically significant when they are not. Granger causality removes multicollinearity and identifies a smaller set of more tightly interconnected variables, revealing basic lead-lag relationships over several time intervals. Differences in conclusions based on the two statistical procedures are discussed, along with the implications of choosing one method over the other.

Scharlotta, Ian (Texas State University)

[397] *Habitat-Specific Marine Reservoir Corrections along the Central California Coast: The Effects of Differential Upwelling*

A confluence of natural factors has created three different ecological habitats for marine shellfish with potentially unique marine reservoir offsets along the central California coast. Deep-water trenches adjacent to the rocky points (e.g., Arguello, Concepcion, Sal), create localized upwelling environments. Reported offsets range from 400-1000 years for rock-dwelling species that comprise most shell middens. Sandy beaches dominating this section of shoreline were an historically important shellfish source formed by an offshore shelf; hypothesized to approximate average California coastal offsets (~225 years). Muddy lagoon species have yielded offsets of 90-150 years. The range of uncertainty between aquatic niches and terrestrial organics leaves sizable data gaps that could produce poor chronological precision and incidental evidence for extended habitations. Lowered sea levels would have brought the accessible coastline closer to these marine trenches potentially exacerbating the problem. Paired samples covering different ecological niches from twelve short-term archaeological sites were analyzed to gauge the offset(s) during primarily the late Holocene. Two main hypotheses are

tested through this research: 1) quantify reservoir effects and determine appropriate ΔR values including any localized variance; and 2) outline the presence and extent of ecological niche-specific offset corrections needed for rocky shoreline, sandy beach, and lagoon shellfish species.

Schavelzon, Daniel

[53] *The Nazi Hideout of South America: Studies on the Teyu Cuare 1945 Neighborhoods*

The discovery of the Nazi refuge on the border of Argentina and Paraguay during 2015, built around the year 1945 and abandoned shortly after, led to work inside it first to demonstrate the hypothesis of use and chronology. Last year, the mapping of the area and the survey of the surroundings intensified, finding new structures and groups strategically located in the accesses to the protected area, between the main cliffs that control entrance to the place.

Schechter, Heeli (The Hebrew University of Jerusalem), Nigel Goring-Morris (The Hebrew University of Jerusalem) and Daniella Bar-Yosef Mayer (The Steinhardt Museum of Natural History, Tel Aviv)

[15] *Shells at Death – The Use of Shells in Neolithic Mortuary Contexts*

Shells constituted a cultural resource for human groups throughout history. As such, they were used and incorporated in different aspects of life – and death. In this study we examine the use of shells in mortuary contexts, focusing on the Pre-Pottery Neolithic B (PPNB) cultic/mortuary site of Kfar HaHoresh. Architectural elements, material culture and mortuary practices change through the Early, Middle and Late PPNB sequence found at the site, reflecting changing cultural behaviors, norms and beliefs.

A large molluscan assemblage (>3,200 shells), including marine, freshwater and land-snail shells, was found in different contexts at the site. Here we focus on marine shells from mortuary contexts. They are all of Mediterranean origin, dominated by bivalves. A small fraction of them are worked, perforated, or otherwise manipulated to function as beads and pendants. Different use-trends, including the choice of taxa, intentional manipulation of the shell, and possible use-traces, are examined. These trends are compared between interred individuals, burial types, and PPNB phases, in order to highlight different aspects of the cultural use of shells, as part of evolving Neolithic mortuary practices.

[19] *Native Narratives and Settler Colonialism in the Rocky Mountain West*

The study of the social and material effects of European colonization on indigenous inhabitants has been a regular topic of archaeological discourse in the United States for the last twenty years, with strong publication records in the Southeast, Southwest, and California. A generation of recent scholars embraced a redefinition of prehistoric and historic archaeology in the 1990s, but in practice the divide between the two remains strong. The use of the Protohistoric as a term continues despite its inherent flaws. Extensive European contact in the Plains and Rocky Mountains occurred much later than other areas, with a florescence of culture change in the nineteenth century. Archaeological investigations here often remain in a liminal state, in part because of the invisibility of Native presence in post-reservation periods. In this presentation, I will discuss my research exploring historic-period sites of the mountains and Plains in northwestern Wyoming, an area deeply influenced by Cowboy-Indian dichotomies. I give examples of ways that archaeological sites and culturally-significant places played their own roles in historic narratives of the twentieth century, with legacies that continue today.

[364] *"In pursuit of the past": Borrero Influences in Our Regional Research in the NW of Patagonia (Chubut, Argentina)*

This presentation aims to highlight the theoretical and methodological relevance of Borrero's work to address regional research in Patagonia through our own project in Genoa and Pico valleys (NW of the Argentinean Patagonia). From a theoretical standpoint, it was argued that Borrero's peopling model (1989, 1994-1995) was utilized in two ways: 1) strong or direct, allowing to generate archaeological expectations for each one of the peopling stages, and 2) the most frequent one, a weak or indirect utilization, as a post hoc interpretation of data. In our study area, this model was utilized in both ways: weak or indirect (Caridi and Scheinsohn 2016) and strong or direct, for analyzing the human settlement of Northwest Patagonia during the last 12.000 years (Rizzo 2018). From a methodological standpoint Borrero (1988, 2001) posited a regional taphonomic perspective to consider the way in which different processes affect preservation and artifacts localization in a regional scale. This perspective was incorporated in the Genoa and Pico Valleys to generate a baseline from which to begin to discuss the past human occupation in these areas.

[79] *The Death Within: Bone as Material among the Maya*

Houston's "The Life Within" is among the most perceptive and nuanced statements on Classic Maya materials and the animate quality of things. Here, I draw inspiration from this future-classic work to more deeply probe Maya understandings of bone – a material most generally treated by archaeologists as either a window into ancient bodies and beings, or, more simply, a malleable material from which to fashion a range of utilitarian and (occasionally) decorative and ceremonial objects. Yet there is much more to be said about how past peoples perceived this complex material. A key paradox of bone is that it is both emblematic of death yet represents a vital element of living beings. Although this paradox may seem a universal truism, in this paper I highlight what is especially distinct about Maya philosophies of bone as they relate to matters of the living and the dead.

[418] *Incorporating "Otherness" to Archaeological Research*

Much has been written about widening our research scopes to incorporate peripheral topics that include ethnicity, class, gender, age, and status. Although these past decades there has been significant progress, we should ask ourselves how can we impact and motivate students to address these issues. This presentation will demonstrate the benefits of teaching how to use primary sources to develop research projects in undergraduate archaeology classes. Drawing from my experience, I will use examples of the types of documents that can shed light on the "forgotten" protagonist of our recent past and the ways in which existing archaeological collections can be incorporated.

[248] *The Suitability of Dry-Farming and Its Impact on Fremont Paleodemography in the Northern Uinta Basin*

Recent work in Utah's northern Uinta Basin shows close relationships between precipitation variability and population dynamics during the Fremont period, AD 300-1350. In this study, we evaluate the role that changes in the suitability of local dry-farming conditions had on observed regional settlement patterns and community formation. We examine the relationship between dry-farming suitability and Fremont demography using tree-ring derived estimates for precipitation and temperature. These environmental proxies, combined with a GIS model that accounts for topography, soil conditions, surface-recharged springs and regional variations therein, are used to build the dry-farming suitability model. Using ~500 radiocarbon ages, we compare the dry-farming suitability of the northern Uinta Basin to a Fremont Period population curve based on both a summed probability distribution and a bivariate kernel density estimation integrated into the GIS model. This research has the potential to explain the rise in population between AD 300 – 750 and the marked shift in population and site distribution after AD 750 and again after 1050. In a broader sense, this research addresses socioeconomic changes in forager-farmer subsistence and settlement strategies within a context of emergent agriculture.

[128] *Comparing the Performance of Machine Learning and Traditional Approaches to Archaeological Site Modeling and Prediction*

Site prediction models have helped archaeological resource management in site prospecting, impact mitigation, and information recovery. Beginning in 2009, we developed probability models for the Shoshone National Forest (SNF). These models helped to prioritize inventory of areas burned in wildfires, to rapidly appraise archaeologically sensitive areas. The methodological tool most used in model-building has been logistic regression. However, developments in Data Science via traditional and Machine Learning algorithms provide opportunities to improve predictive ability. Here, we use SNF archaeological presence/absence location data with several modeling techniques to create and compare predictions. Predictive methods include Generalized Linear Modeling, Generalized Additive Modeling, MaxEnt, Multilayer Perceptron, Conditional Inference Trees, Recursive Partitioning and Regression Trees, Random Forest, Flexible and Mixture Discriminant Analysis, Radial Basis Function, Support Vector Machine, Gradient Boosting Machine Learning, Partial Least Squares Regression, k-Nearest Neighbors, and Neural Networks. We compared predictions using 17 diagnostics including gain, true/false positive rates, true/false negative rates, likelihood ratios, diagnostic odds ratio, accuracy, positive/negative predictive values, false discovery/omission rates, the F1 score, Youden's J statistic, markedness, and Matthews coefficient. Techniques offer prediction tradeoffs depending on the diagnostics used. We recommend users become familiar with the diagnostic tools that best reflect modeling goals.

[86] *The Social Implications of Pottery Technology, Production, and Design from the Basketmaker Communities Project*

The Dillard site (5MT10647)-the earliest community center identified in the Mesa Verde region-may contain among the oldest examples of multi-household pottery production during the Basketmaker III period. A thorough understanding of how pottery was produced, decorated, and obtained at this early large pithouse village, which is centered on a great kiva, provides important insights on village organization and interpersonal relationships. In addition, comparison of pottery from small, contemporaneous habitation sites surrounding the Dillard site allows exploration of the social connections across the community. In this paper, I explore typological, compositional, and decorative variation in pottery from the Dillard site and a number of small Basketmaker III period habitation sites. These lines of evidence allow me to identify spatial patterns in the distribution of pottery and its potential differences among the pithouses at the Dillard site and small habitation sites in order to address the organization of production, as well as the extent of influence the Dillard site may have had on the broader surrounding community through pottery production and exchange.

[367] *The Persistence of Resistance: Resiliency and Survival in the Pueblo World, 1539-1696*

From the first instance of contact with outsiders, native peoples of the American Southwest have been confronted with, and have confronted, challenges to survival and cultural continuity. The earliest organized exploration of the Southwest by Fray Marcos de Niza in 1539 resulted in an initial act of resistance by Zuni pueblo: the killing of his Moorish guide, Esteban. In 1540, the huge expedition led by Francisco Vázquez de Coronado caused wide-spread impacts met by many acts of Puebloan resistance, ultimately ending in bloodshed. A 40-year period of disinterest in Nuevo Mexico ended in the early 1580s with small explorations and attempts at establishing a colony. By the time of Juan de Oñate's 1598 colony, Spanish attitudes and administration shifted from exploration to goals of missionizing native peoples of New Mexico. The 1600s were marked by intense in-fighting between Franciscan missionaries and newly-formed colonial governance. Pueblo peoples were caught up in this dispute and shifting inter-tribal alliances were common. Equally common throughout the 1600s were terrible governorships, famine, drought, disease, and resettlements. In the face of multiple challenges, native groups resorted to various passive and active tactics to ensure long-term survival, up to and including the 1680-1696 Pueblo Revolts.

[175] *A Population Graph Based Style Transmission Model*

The now classic Neiman (1995) is a baseline for many influential applications of Cultural Transmission to explore Stylistic Variability in archaeology. It and many of its successors represent social interaction and generational development in a deliberately simplified way to facilitate the exploration of parameters and algebraic analysis. While justified, this omits both the theoretical trajectories of information transmission elaborated by Cavalli-Sforza and Feldman (1981) as well as the insights archaeologists have gained through social network analysis. This paper explores an alternative, agent-based simulation framework that attempts to be more flexible: a diachronic population graph is established as a landscape, in which ideas as entities with individual agency seek expansion -- the meme's eye view. The social network can be constructed to represent archaeological knowledge concerning population size development, the degree of intra- and intergroup exchange or spatial or cultural patterns of interaction. Ideas may be long-term static or evolving over time, selectively neutral or functionally different, distributed randomly or according to real world examples. Population graph generation and idea expansion simulation are implemented in R and C++ and accessible with an R interface - but computationally expensive. The presentation will elaborate on the concept and show an example application.

[82] *The Early Iron Age and "Hiatus" Occupations: Archaeological and Chronometric Data on Holocene Human Settlement in the Northern Congo Basin, Southern Central African Republic*

Recently, Lupo and colleagues (2018) reported data on the nature and timing of late Holocene human occupation in the northern Congo Basin rain forest, southern Central African Republic and this paper presents new archaeological and chronometric information. Field reconnaissance identified 25 new archaeological sites, including additional iron smelting features, and 19 radiocarbon dates from 14 of these mark human habitation across some 1900 years. Together with the previously reported investigations a diverse suite of sites have been identified, including the only documented iron ore mines in the Central African forest, and radiocarbon assay of nearly 50 charcoal samples have returned dates for 32 sites that signal nearly contiguous occupation of the lower Lobaye River basin over the past 2300 years. Among others, these data 1) provide, for the first time, an Early Iron Age date on charcoal from a northern Congo Basin rain forest site containing evidence of iron production; 2) include calibrated age estimates on multiple sites dating to the alleged hiatus in regional human occupations ca. 1300-800 BP; and 3) afford a number of additional dated contexts that fall during the Late Iron Age increase in sites reported in other forested regions of Central Africa.

[294] *Moving beyond Redemptive Archaeology on the California Coast*

The past two decades of archaeology in California have produced several examples of successful indigenous and community-based research. There are still other examples of a lingering tension between archaeologists and tribes as the agendas of western science and indigenous epistemologies grate against one another. This current climate of getting along while staying the same gives shape to an archaeology in which the values of indigenous communities are often secondary to an archaeology driven by a sense of debt or threat. As we discuss, this redemptive archaeology conceals two important ideas. First, examples from the 1970s and earlier demonstrate that California tribes and archaeologists can and have worked productively under a rubric of social justice. Second, archaeology has the capacity to be much more than meets the eye. To illustrate this, we present two case examples of our efforts at practicing more inclusive and socially just research. This work, ostensibly called "archaeology," is fundamentally about empowering Indigenous communities by foregrounding their histories, concerns, and goals. The first example addresses two decades of research in Marin County with Coast Miwok and Southern Pomo people. The second example examines the early stages of a collaborative project co-created with Salinan T'rowt'raahl in Monterey County.

[96] *Patients and Practitioners: Archaeological and Ethnohistorical Approaches to Ancient Medicine and Healing Practices in the Americas*

Medicine, health care, and healing comprise a sub-set of cultural practices that are under-represented in archaeological work in the Americas. In other parts of the world, rich textual traditions consisting of medical treatises or surgical manuals combined with archaeological evidence in the form of metal implements or tools have contributed to the rising popularity of an archaeology of medicine. Such textual traditions do exist, to an extent, in the Americas, often the focus of colonial or ethnohistorical work which is subsequently used by archaeologists to interpret archaeological data. However, there is much more that archaeologists can be saying about medicine and healing in the past, particularly from the perspective of material culture, or how these practices might have interfaced with the human body. Collaboration between archaeologists and ethnohistorians on this topic has the potential to truly paint a holistic picture. This paper will examine the history of the study of medicine and healing in the Americas from the perspectives of archaeology and ethnohistory and discuss some of the ways in which archaeological data from osteology, paleoethnobotany, archaeometry, and other methodologies can contribute to the study of medicine and healing in the Americas.

[357] *Refining Archaeological Probability Models: Case Studies from Georgia DOT Systematic Wetland Surveys*

The results of several recent wetland surveys for the Georgia Department of Transportation are raising new questions about traditional archaeological probability models for inundated areas. Wetlands are often left largely uninvestigated during archaeological surveys due to restricted access, logistics issues, and by assumptions that swamps were not suitable for long-term habitation. This logic is somewhat flawed, as wetland resources are known to have been crucial to certain precontact subsistence strategies and many "swamps" are only newly or seasonally inundated. This presentation will use recent data from systematic wetland surveys, combined with regional LiDAR data, to initiate discussions on how to more accurately distinguish between high and low probability areas in different wetland types, how to determine appropriate levels of effort in searching for wetland sites, and how updates to traditional field methods can increase survey accuracy for these areas.

[72] *Turners Falls Gorge Geoarchaeological Investigations: Modeling Landscape and Archaeological Developments within the Connecticut River Valley.*

The Turners Falls Gorge region of the Connecticut River Valley is composed of a dynamic post-glacial alluvial landscape which contains extensive Pleistocene and Holocene deposits as well as an abundance of Pre-Contact archaeological sites spanning the last 12,000 years before present. This paper presents a new geoarchaeological study of the geomorphological formation of the post-glacial alluvial landform in the Turners Falls Gorge region of the Connecticut River Valley using soil and geomorphologic information combined with dating based on radiocarbon samples and temporally diagnostic, cultural artifacts. Previous geoarchaeological studies within this study area have focused on landform development in relation to the location of archaeological sites just above the falls. This study focuses on landforms and sites below the falls. A synthesis of this modern study with past geomorphological or geoarchaeological studies is presented to provide a model of landscape development which can be used to help predict the location and age of archaeological sites both on and buried below the landscape in the Turners Falls Gorge region.

[127] *Using Event History Methods to Analyze the Diffusion of Dynastic Rituals in Classic Maya Society*

Diffusion of innovation describes the way novel cultural traits or information spread in a population. Understanding the specific factors that account for the spread of these innovations calls for a multivariate approach. Event history analysis provides a set of statistical methods to explain and predict the occurrence of events for the entities within a population. These methods have been successfully applied in a range of disciplines to examine the determinants of events such as migration, death, failure of components, and recently, the adoption of novelties. Multivariate event history models allow simultaneously testing the effects of various diffusion determinants, including information content (e.g. trait characteristics), entity's attributes (e.g., prestige), and social and contextual factors (e.g., geographical proximity). These factors are interlaced, and therefore, their effects cannot be analyzed separately as done in recent archaeological studies. In this paper, we apply event history techniques to study the diffusion of dynastic rituals in Classic Maya society. We examine the role of different network configurations on the spread of rituals recorded on hieroglyphic monuments. We demonstrate the effectiveness of this approach by discussing its application to a wider set of cultural traits, like ancient technologies or artifact styles, when time of adoption is available.

[180] *Geoarchaeological Assessment of Agricultural Quality in an Eolian Landscape*

The region of Petrified Forest National Park on the southern Colorado Plateau is often considered to be a marginal area during prehistoric occupation. This is due to the expected low potential for agriculture, and the location in between major cultural centers. This study uses geoarchaeology to engage the question of whether this landscape is a marginal area and to further examine agricultural potential in the landscape of Petrified Forest National Park, which is dominated by sandy, eolian soils. Specifically, this study tests the inference that the area is only of marginal quality for cultivating crops using analyses of soil physical and chemical properties. Results confirm that soils are of low agricultural quality, but within the range to support crops. The area's geologic setting may have improved the water holding capacity for the sandy soils, and local microenvironments likely played a role in selection of agricultural fields. Despite the low potential for agriculture, the area was occupied nearly continuously from the Basketmaker II through Pueblo IV periods (c. AD 400-1450) and shows evidence for long-distance trade and extensive movement within the region. This suggests that social factors may have been an important draw for habitation of the region.

[32] *Landscape Technological Strategies in the Southern Kalahari Basin: North of Kuruman Archaeological Survey, South Africa*

The southern Kalahari Basin in the northern interior of South Africa has provided evidence for early use of fire, Mode 3 technological developments, early stone-tipped spears and pigment use. Innovations seen in the southern Kalahari Basin early in the Middle Stone Age may represent changes in how human populations were able to adapt to changing environments. Excavations at the new site of Ga-Mohana Hill are developing a stratified rockshelter sequence to contextualize the open-air archaeological discoveries in the region. However, here we report on an initial survey of archaeological occurrences and carbonate formations (calcrete, tufa, and breccia) in the region north and west of Gamohana Hill in the Korannaberg and Kuruman Hills out on the landscape. The survey targeted rockshelters along the dolomite and banded ironstone formation contact zones where brecciated carbonates and tufa features were identified. Access to limited water resources may influence social behaviors in many ways that influence technological organization including reduced levels of group fluidity. Identifying how MSA foragers adapted to these environments provides context for identifying potential drivers of technological innovations that developed in the southern Kalahari Basin.

[273] *What Happened to the Victims? Constructing a Model of Care for Cranial Trauma from Non-lethal Violence at Carrier Mills, Illinois (8000 – 2500 BP)*

A different model of care is required for trauma resulting from non-lethal violence. In the prehistoric Midwest, raiding and warfare were endemic, making trauma from non-lethal violence a part of everyday life. As such, the peoples living in this region would have needed a model of care specifically designed to treat individuals suffering from traumatic injuries resulting from non-lethal violence. This paper examines cranial depression fractures (CDFs) on skeletal remains from Carrier Mills, Illinois (8000 -2500 BP) and highlights the model of care required for cranial trauma resulting from non-lethal violence. Sixteen individuals (10 males, 5 females, and 1 subadult) had CDFs severe enough to require direct healthcare and accommodation to survive their injuries. A general model of care for CDFs is constructed to highlight the similarities and differences of caring for each case. This paper indicates that the people of Carrier Mills were no strangers to violence yet they provided healthcare for members of the community who survived the raiding and warfare endemic to their region.

[100] *Processes of Collapse, Resilience, and Reorganization at El Infiernito, Chiapas*

Discussions of political collapse in archaeology have shifted recently to approaches that incorporate the adaptive cycles of resilience and reorganization that highlight the continuity of certain cultural practices, belief systems, and worldviews alongside the disintegration of political systems. This approach has garnered support especially in the Maya area to explain the processes of social transformation that took place during the Terminal Classic period. This paper introduces a case study in the Usumacinta region at the site of El Infiernito, Chiapas. This site was founded during the Late Preclassic period and resettled early in the Late Classic period through the Early Postclassic period. This occupational history is contextualized in terms of the site's proximity and political integration with nearby Piedras Negras, Guatemala throughout the Classic period. Furthermore, the processes of collapse and resilience are examined during the Terminal Preclassic period and the Terminal Classic period to understand how El Infiernito may have served as a refuge for populations during periods of political crisis and transformation. Changes and continuities at the site from the Late Classic to the Early Postclassic period are also examined, especially in terms of evidence for political reorganization and the maintenance of long distance trade.

[400] *Context-Free Archaeology: Private Collections, Data Quality Assessment, and Achieving Meaningful Research at Heavily Looted Sheltered Sites—A Case Study from West Texas*

There is a long history of engaged amateurs providing the professional community with productive field efforts and artifact collections and of equal length is the controversy surrounding this work. The controversy, from the perspective of this talk, focuses on the issue of artifact context and the gap between the professional and amateur communities' stances on the issue. In spite of this, the importance of private collections and amateur involvement as valuable sources of knowledge about the past seems to have gained more attention with the development of interest groups like the Archaeologist-Artifact Collector Collaboration Interest Group (ACCIG) by the Society of American Archaeologists and the increasing recognition of the topic in more professional publications. The example I present from Spirit Eye Cave is typical of research with private collections: one side places the importance on the recovered artifacts, the other laments the loss of context while both groups acknowledge the importance of the site to the field of archaeology. However, in the case of Spirit Eye Cave, I de-emphasized the importance of context with the collectors and worked from a position of mutual respect. The results of this approach are the subject of this talk.

Schroeder, Sissel (University of Wisconsin-Madison)

[348] *Migration, Population Change, and Climate at Cahokia*

In this paper we explore sociopolitical, economic, and climatological aspects of the population history of Cahokia and compare these with the timing of the appearance of Cahokia materials at hinterland sites to better understand some of the factors that may have contributed to the migration of people out of the American Bottom. Paleoenvironmental proxies from two sediment cores from Horseshoe Lake, Illinois, are integrated with fecal stanol data from the same cores to investigate the relationships among environmental events, climate change, and population size for Cahokia and the Horseshoe Lake watershed between ca. AD 800 and 1600. A radiocarbon age model developed for one core shows close correspondence between archaeologically derived models of the population trajectory for Cahokia and the fecal stanol data, while the paleoenvironmental proxies and stanol data show a significant decrease in population within the Horseshoe Lake watershed after a major flood event and after the onset of decreased summer rainfall ca. AD 1150. Based on the timing of the appearance of Cahokian ceramics at sites across the Midwest, migration out of Cahokia predates these climatic changes, and population decline at the site accelerates after the flood and onset of decreased summer rainfall.

[72] *What Next? The Pivotal Role of Archaeological Science in Heritage Management*

Heritage Management and CRM are relatively new, evolving industries that have changed the charge of archaeological work in the past half-century. Previously, archaeological sciences were developed and applied in research settings (universities and museums) to extend the range of archaeological exploration and interpretation. But times have changed. Archaeology has transitioned from a research to management and preservation-based endeavor at a dizzying pace. We no longer dig or explore what we want but apply our craft to landscapes threatened or designated for preservation by private and public interests. Recent advances in remote sensing, geoarchaeology, zoo-archaeology, forensic sciences and GIS have all found applications in archaeological settings. These sub-fields and others have altered research designs and maximized the efficiency of archaeological exploration and data recovery. The trend is to less digging and more non- or minimally invasive technologies. I trace the history of inter-connected CRM and archaeological science efforts. I promote the thesis that innovative archaeological science in CRM is both cost-effective and high yield. Cases from various sub-fields are drawn upon to demonstrate this thesis. The future of archaeological science is bright in an age of diminishing budgets where ever-increasing development concerns take center-stage under a legal compliance umbrella.

[37] *Bones of the Lucayans: Radiocarbon dating of human remains from the Bahamian Archipelago*

The Bahamas were among the last islands to be settled in the Caribbean, with no known occupation prior to ca. AD 600 and reportedly complete depopulation by ca. AD 1520. The constrained island setting and restricted timescale provides an excellent opportunity to address a range of questions relating to island adaptations, all requiring a robust chronology. In this paper, we present the preliminary results of a new AMS radiocarbon dating project focusing on human remains from the Bahamian archipelago, which will eventually provide 60 new determinations, comprising nearly half the total number of human remains known from the islands. The preliminary results – combined with previously available dates on humans and other materials – are modeled using Bayesian statistics, in order to address questions of initial colonization and post-Columbian collapse, the latter particularly catastrophic in the archipelago. Spatial and temporal differences in island adaptations will also be explored using stable carbon and nitrogen isotope measurements of the dated human remains.

[90] *Public Perceptions: The Utility of Narrow-Scope Visitor Surveys to Improve Cultural Resource Interpretation*

As budgets for resource preservation and protection are outpaced by increases in visitation, managers in many parks, monuments, and protected areas depend on public interpretation as a cost-effective strategy to safeguard sensitive cultural and historical landscapes. Interpretative programs are an effective avenue for reinforcing resource protection narratives, cultivating institutional support among allied stakeholders, and building public interest in underrepresented or controversial cultural subject matter. To maximize the impact of resource interpretation, thorough assessments of visitor perceptions are crucial. However, designing a rigorous survey program targeted to improve resource interpretation can be a highly complex enterprise: costly to develop, time-consuming to design, and difficult to analyze by interpretative specialists. This study explores the utility of generalized, narrow-scope, visitor surveys as a surrogate for more complex interpretative statistical analysis. Using the example of a data collection operation from the Los Alamos unit of the Manhattan Project National Historical Park, this exploration will concentrate on the benefits and challenges of developing meaningful interpretative outreach strategies with limited technical resources. The study includes a discussion of the unique problem of attempting to extrapolate a generalized visitor experience from surveys of highly specialized populations, and the difficulties inherent in using non-robust datasets for program development.

[160] *Integrating Close-Range Photogrammetry Methods for Outdoor Scene Documentation of Scattered Remains*

Documenting the context of outdoor crime scenes with decomposing bodies and skeletal remains using traditional methods can pose a challenge due to the complexities of outdoor scenes and various taphonomic processes that can modify the remains and the scene. While the use of close-range photogrammetry (CRP) methods are currently more often utilized within archaeological settings, these methods are not currently used as a standard documentation method within forensic archaeology settings. Photogrammetry is a data collection technique that utilizes a series of 2D images to generate a 3D digital resource. The application of CRP to forensic archaeological settings offers a number of documentary advantages over traditional photographic methods, including preserving the overall context of a scene, producing a 3D model, and various imagery outputs generated from the 3D model. The purpose of this presentation is to discuss the advantages of integrating CRP methods for documenting outdoor scenes with scattered remains on the ground surface. A number of simulated common forensic scenarios with human skeletons were constructed utilizing different ground surfaces. All scenarios were photographed with ground control markers and 3D models were rendered using Agisoft Photoscan Professional.

Schulz Paulsson, Bettina (University of Gothenburg)**[358]** *Sperm Whales and Neolithic Whaling Societies along the Coasts of Atlantic Europe*

Sperm whales played a central role in the cosmological world view of early megalithic societies (4700-4200 cal BC) in the Bay of Morbihan, Brittany, France. The whales were engraved as iconic signs on colossal standing stones, some of which were re-used to build megalithic graves. The largest of these standing stones, the Grand Menhir, was originally 24m high and weighed 330 tons and was erected in a collective symbolic act by these megalithic societies. The re-documentation of some of these whale stones" with new documentation and visualization techniques revealed boat engravings in association to the sperm whales. This paper discusses the possibility of the whaling of large whale species by Neolithic societies and with Neolithic technologies. We applied an agent-based modelling approach for Neolithic whaling societies along the coast of Atlantic Europe, taking into consideration factors such as whale reproduction rates, whale behaviour, seafaring risks, hunting strategies, Neolithic boat technologies, the bathymetry, etc. to address this question.

Schulze, Niklas (FCSyH-UASLP) and Luis Barba (IIA-UNAM)**[41]** *Pyrotechnology in the Ethnohistoric and Archaeological Record of Prehispanic Mexico*

In pre-Hispanic Mexico the use and the importance of fire are demonstrated by materials and objects that, without the use of high temperature processes, or pyrotechnology in general terms, would not exist. As examples it will be sufficient to mention ceramics, metals and lime production. The processes that do not qualify as industrial and that employ lower temperatures also were very significant for the development of everyday life. We find the byproducts of production processes that depend on the transformative power of fire, the ashes of combustion that increase pH values, soil color changes, carbonized materials, traces left by high temperatures on the facilities used to manage and contain fire, and changes in magnetic properties of the heated areas. In some cases, even possible remains of fuels can be identified in the archaeological contexts. In this presentation the authors compare the expected remains of pyrotechnological processes with archaeological finds and information from ethnohistorical and ethnographic sources. The main example used to highlight a discrepancy between the expected and the actual archaeological finds is the metallurgical production process.

Schumacher, Emily (The University of Tulsa)**[170]** *It's a Date: A Comparison of Pipe Stem and Ceramics Relative Dating at Christiansted National Historic Site*

Dating techniques, both relative and absolute, are key members of the archaeological toolkit. They serve to chronologically situate the remnants of past peoples, material or otherwise, in the overarching narrative of a place or region. However, not all methods of dating are created equal, and the utility of a particular method for clarifying the historical and archaeological records can be context-specific. This project is a comparative analysis of two datasets derived from an artifact assemblage recovered as part of the CHRI-92 Tree Stump Removal Project conducted by the National Park Service at Christiansted National Historic Site. More specifically, this project compares the results of the seriation of the pipe stems and ceramics within the CHRI-92 assemblage as a means of determining the utility of the dating method for archaeological sites within the former Danish West Indies.

Schurr, Mark (University of Notre Dame) and Madeleine McLeester (University of Notre Dame)**[239]** *Native Voices: Contributions by John Low, Alysha Edwards, Denise Pouliot, Paul Pouliot, and Others*

In this session, we seek to reveal rituals that have been silenced and broaden our understandings of indigenous rituals in North American archaeology. The treatment of this topic requires a diverse set of perspectives due to its complexity as well as the ways that past rituals continue to reverberate in the present. Central to the aims of this session, we present a series of short contributions by American Indian collaborators, elders, and historians that briefly address the role of archaeology in investigations of native ritual and the contributions that archaeology can provide on this topic. Their insights help us reflect on the intellectual and practical impacts of our work on the descendants of those we study through archaeology.

Schuyler, Lucy (Maxwell Museum of Anthropology - Volunteer)

[25] *The Jewelry of Tijeras Pueblo*

Beads, pendants, and other items of personal adornment were recovered during excavations at Tijeras Pueblo in 1948, 1968, the 1970s, and 1986, and are stored at the Maxwell Museum of Anthropology in Albuquerque and the Laboratory of Anthropology in Santa Fe. Shells from the Gulf of California, turquoise, and items resembling Mesoamerican designs indicate trade and the spread of design ideas. The locations of jewelry artifacts within the site were examined for possible differences in ornament use within the site. Comparisons with Arroyo Hondo, Coconito, Gran Quivira, Paa-ko, Pecos, Tonque, and Pottery Mound allow more general statements of ornament use in Classic period Rio Grande culture.

Schwadron, Margo (NPS-Southeast Archeological Center)**[362]** *Lost and Found and the Peculiar Lives of Collections: Examples of Bridging Ethical Stewardship and Research with Florida National Park Legacy Collections*

Many of our culture histories and chronologies were built by early generations of archaeologists who targeted superlative sites, often excavating voluminous areas or entire sites. Decades later, many of these collections remain uncatalogued, unstudied, or worse—relegated to garages, garbage piles, or lost completely. Contemporary archeologists and institutions face many modern challenges, including: lack of public support and funding; lack of space in curatorial facilities; and the looming threat of climate change which threatens the loss of sites, security, and stability of existing collections. These issues drive current and future collection policies as we continue to increase our collections and face capacity issues while salvaging sites being lost to climate change. We are running out of room—and so it is often asked, do we have room for legacy collections? Using examples of recent research on lost, rescued and legacy collections from Florida National Parks, we illustrate the incredible value and potential that legacy collections have to inform paleoclimate and paleoecology; refine spatial and temporal variability among sites, artifact typologies and chronologies; rewrite culture histories; employ new digital technologies; provide public outreach and educational opportunities; and offer new interpretations of Florida iconic sites.

Schwartz, Christopher (Arizona State University)**[246]** *Elevating Animals: Exploring Ritual Fauna and Socially Integrative Architecture in the Tonto Basin*

The frequent deposition of animals in public spaces suggests an essential role in public rituals in the pre-Hispanic U.S. Southwest. Using ethnographic evidence and large-scale analysis of faunal remains in the Tonto Basin area of central Arizona, I ask whether ritual fauna cluster in socially integrative spaces and what implications this had for integrating migrant Puebloan populations with local people. Though typically considered Hohokam, the Tonto Basin exhibits influence from neighboring Sinagua and Puebloan regions. The emergence of the Salado phenomenon and public architecture in the region is evidence of broad sociopolitical and religious change, which involved specific treatments and storage of fauna. I find that ritual fauna cluster in room contexts associated with socially integrative architecture, suggesting a centralization of ritual practice and storage. Ultimately, Tonto Basin communities targeted specific taxa for the enactment of public activities, aiding in the integration of non-local people.

Schwartz, Erin (The College of William and Mary) and Nick Belluzzo (The College of William and Mary)**[295]** *Forged by Many Hands: Analyzing Transformations of Space in the Antebellum Industrial South*

Often overshadowed by agriculture-based slavery, industrial slavery shaped the physical, economic, and cultural landscape of the antebellum South on multiple scales. Mills, factories, mines, industrial plantations, and other operations exploited natural resources and enslaved labor on large scales, as enslaved industrial workers and communities attempted to use their limited degrees of autonomy and resources to create their own space. The Buffalo Forge iron plantation in the Shenandoah Valley of Virginia offers a unique opportunity to investigate enslaved workers' alterations of space. While Buffalo Forge's ironmasters oversaw its large workforce across discrete, yet interconnected spaces, spaces around enslaved quarters in particular could be used to participate in diverse individual and communal activities invisible to ironmasters. This project focuses on the area surrounding two standing women's quarters, tacking between geospatial,

archaeological, and architectural data. While initial archaeological work focused on the front yards of both quarters, geospatial data generated from drone-acquired aerial imagery identified previously-invisible features and areas of visibility, prompting alterations in sampling strategy. Subsequent archaeological work has illuminated enslaved spaces as shifting over time and space. In providing both a novel method and new interpretations of industrial spaces, this project promises to advance scholars' understanding of our industrial past.

Schwendler, Rebecca (PaleoWest Archaeology)

[357] *Metamorphosis of the Unique Pueblo III–IV Hokona Site in the El Morro Valley of New Mexico*

In 2007, the New Mexico Department of Transportation (NMDOT) sponsored full excavation of a small prehistoric archaeological site located on NMDOT and State land adjacent to Highway 53 a few miles east of El Morro National Monument in Cibola County. Earlier documentation suggested that the site comprised three basalt field houses and a surface artifact scatter. However, excavation revealed a complex sequence of 45 partly superimposed features that included a masonry roomblock, habitation pit structures, hearths, post holes, and human burials. Artifacts included stone pendants and blanks, curated projectile points, abundant and diverse ground stone and ceramics, and minimal floral and faunal remains. Hokona's most intensive occupation dated to the late Pueblo III and early Pueblo IV periods, ca. A.D. 1275–1300, although the site was also used before and after that time. Hokona's significance lies in its exhibition of qualities that are both typical and unique. The small site reflects a relationship with larger social and political trends in the El Morro Valley and beyond. Yet, it also exhibits uniquely frequent remodeling and diverse and far-ranging cultural connections. As such, Hokona expands our knowledge of the complexity of prehistoric life in the El Morro Valley.

[142] *Women Warriors among Central California Hunter-Gatherers: Egalitarians to the Last Arrow*

Participation of females in inter-group combat is well-attested in the historic and ethnographic record of central California, but is often overlooked and/or trivialized in contemporary archaeological research. Drawing from the Central California Bioarchaeological Database (CCBD) that includes information on more than 16,820 individuals dating between 3050 B.C. and A.D. 1899, we evaluate the relative involvement of males and females in sharp-force and blunt-force trauma. Specifically, we analyzed ante and peri-mortem trauma in relation to location, trajectory, and number of instances per individual. We then summarize the temporal and spatial distribution of evidence for female participation in violence during times of trouble and demonstrate that, while female combatants were fewer in number relative to males, they clearly were involved during all periods.

[69] *Archeology, Disability, Healthcare, and the Weimar Joint Sanatorium for Tuberculosis*

Social expectations regarding normative abilities, behavior, and bodies have changed through time. Archaeology lends itself well to the study of disability because social expectations about normative ability and behavior are embedded into the built environment, landscape, artifacts, material culture and daily practices. Archaeologists are well situated to study and destabilize these norms by investigating the ways in which normative expectations varied over time. Additionally, locating the body in buildings, landscapes, artifacts and other forms of material culture can assist in separating the study of disability and the body from a humanist concept of individuality. Archaeology can also be a mode of exploring the intersection between embodied experiences, agency, and identification, and archaeological research into embodied and social experiences of disability can inform current debates about accessibility and healthcare inequality. This paper presents approaches to studying disability in the past using examples from the Weimar Joint Sanatorium for tuberculosis in Placer County, California.

Scott, Ann (Terracon Consultants)**[360]** *Turning a Critical Eye on the History of Maya Cave Archaeology*

A major reformulation of the history of Maya cave archaeology has recently been proposed for the second half of the twentieth century. Jon Spenard, in his dissertation, has suggested that modern cave archaeology began to emerge during the Post War Period (1950 – 1980) based on work carried out in Belize. This paper takes a closer look at that assertion and notes that far more significant work was actually being carried out at the time in Yucatan, which Spenard did not appear to take into consideration. Although J. Eric Thompson and Doris Heyden do propose a ritual use of caves, models of ritual cave use during this period still lack and actual field studies by Andrews and Pendergast still endorse cave habitation. A critical comparison of the Balankanche Cave monograph by Andrews with the Naj Tunich report leaves no doubt that a major shift in cave investigations occurred during the 1980s and not before.

Scott, Rachel (DePaul University) and Finola O'Carroll (Blackfriary Archaeology Field School)**[310]** *Burial at the Black Friary in Trim, Ireland: 700 Years of Friary-Town Relations*

The Lord of Trim, Geoffrey de Geneville, established a Dominican friary to the north of the town in AD 1263. Ongoing excavations at the Black Friary since 2010 have documented a sequence of burials that date from the 13th through the early 20th centuries. Despite this continuity in the use of the site, the characteristics of the interred individuals varied over time. As an important religious center in the late Middle Ages, the Black Friary provided a final resting place for both the Dominican friars and the lay population living around the town. The friary lost its formal religious status in AD 1540 during the dissolution of the monasteries under King Henry VIII. Yet the site retained significance for local Catholics who continued to bury their dead within the church and cemetery. The most recent interments are all infants and young children, suggesting that the final stage of burial took the form of a cillín, or burial ground for unbaptized children. In this paper, we explore how these temporal differences in the burial population not only reflect larger changes in religious practice in Ireland but also illuminate the long relationship between the Black Friary and the town of Trim.

Scott Cummings, Linda (PaleoResearch Institute, Inc.)**[397]** *Dating Charred Food Crust: Offsets, Pretreatment, and Organic Compounds*

Unlike charcoal, charred food residue has an obvious advantage of fundamental association with use of the pottery and hence, human activity. Food is annual or short-lived. Usually animals hunted for food live only a few to perhaps a few tens of years. Therefore, good dates on food residue from ceramics or pottery should tighten ceramic chronologies and provide more accurate chronologist of occupation. What, though, are good dates? Recent focus on dating annuals to better understand chronologies has included dating ceramic residues under the assumption that they were equivalent to annuals. Examining and comparing dates on annuals, wood, and ceramic residues from many locations has shown otherwise. Focus on freshwater reservoir offsets suggests the problem may be regional and embedded in the food; however, dating reference bones indicates that trophic level of fish contributes to offset making assigning offset values impossible. Food crust from different locations on a single vessel may yield different dates, suggesting the rim and neck are better sampling locations. Combining lab pretreatment and location of food crust on the vessel appear to provide the tools necessary to obtain congruent dates on charred food crust and annuals. FTIR analysis tracks soluble compound removal prior to dating.

[285] *Online Cultural and Historical Research Environment: Flexibility versus Standardization*

In this first season of excavations by the Corral Redondo project in southern Peru, a database was needed to capture excavation, conservation, and survey data in the field and later respond to the reporting standards set by the Peruvian government. The Online Cultural and Historical Research Environment (OCHRE) proved to be a powerful tool for this data capture and storage, as well as flexible enough to cater to the Peruvian government's wishes. A project using OCHRE may create a project vocabulary, or taxonomy, from scratch, or build on existing structures used by other projects. But, when taxonomic elements are shared between projects, it allows easy comparison between project datasets. This opens the door for cross-comparisons between projects which may have separate data capturing or reporting standards, but which share similar details that would allow OCHRE to detect patterns across time and space. With this poster we intend to demonstrate the successful implementation of OCHRE in the field for the Corral Redondo project and its potential for future research. (The Corral Redondo project wishes to acknowledge and thank the Institute for Field Research for funding the excavation and field school).

[25] *Turquoise, Lead and Copper at Tijeras Pueblo and Environs*

How did the people of Tijeras Pueblo acquire and use non-lithic and non-ground stone mineral resources? What role did such resources play in communities in the region east of the Sandia and Manzano Mountains? Minerals addressed include turquoise, galena (lead ore), and various copper compounds. Prehistoric mining and processing sites, coupled with the use and trade of these minerals, will be covered.

Sedig, Jakob (Harvard University)

[253] *Building a More Precise Understanding of the Past by Merging Techniques from Archaeology and Ancient DNA Analysis*

Ancient DNA (aDNA) data have provided unprecedented new insights on demographic changes through time. This paper demonstrates that aDNA can also enhance well-established archaeological techniques, by building on research that has explored how aDNA data can help refine radiocarbon date range estimates. Previous research established that since there is a biological maximum for the number of years between the deaths of relatives, the ability to identify first- and second-degree related individuals through aDNA analysis can serve as a constraint on date range estimates for related and radiocarbon-dated individuals. Since the initial research on this topic, myriad new relatives, and in some instances multiple-generation lineages, have been defined through aDNA analysis, which have helped further refine the methodology. Additionally, data from ethnographic accounts and historic death records have been compiled to create more realistic date of death separation estimates than biological maximums for first- and second-degree relatives (i.e. ethnographic/historic data suggest that, on average, a parent and offspring are separated by about 25 years, not the biological maximum of 125 years). Finally, this paper reviews a few key case studies to explore how this technique can serve to augment both archaeological and aDNA approaches.

[14] *"Life is Better in Flip Flops": Erasure of Coastal Indigenous and Gullah Geechee History and Communities by the Beach Vacation Industry*

Beaches have long attracted day-trippers and vacation goers who come to soak up the sun, splash in the ocean, and collect shells along their expanse. Nearly all coastal areas have their beach attractions and accompanying tourist industries. But the beaches along the American Southeastern coastline have long been contested spaces, where Indigenous, Euro-American, and African American communities have clashed for land and property rights, among other things. This paper will discuss the ways in which the vacation and tourist industry in Hilton Head Island, South Carolina benefits from pop culture notions of the beach; pristine, uncomplicated, neutral places where the weight of the world's problems fade into the sunset. Aspects of film and television, the internet, and particularly social media platforms will be analyzed to discuss how popular notions about vacation beaches maintain their ahistorical reputations. Furthermore, by effectively erasing Hilton Head's deep Indigenous and Gullah/Geechee past, how these pop culture ideas of beach and vacation places perpetuate stereotypes of each community. Lastly, I will discuss how contemporary Gullah communities on Hilton Head are using these same platforms, combined with public archaeology to help regain control of the dominant vacation narratives so pervasive on this island.

[347] *Indian Ocean Comparative Dimensions of Slavery: Resistance and Memory from Mauritius*

The materiality of slavery has received much attention over recent decades. Unequivocally focused on the Atlantic experience, comparative models from the Indian Ocean serve to enrich our understanding of slavery on a global scale. The body of literature on slave artefacts, mortuary practices, and diet highlight the nuances and complexity of slave life-ways. This presentation focuses on Mauritius, and draws on a decade of work into the dynamics of both forced and free labour on the island, and wider region. Using a range of case studies, I illustrate the nuances of slave-lifeways as they are understood from this region: what do we know about the process of arrival; working conditions, and daily existence? How were mortuary practice enacted? At a greater level: how did slave communities resist, and maintain memory? And finally, in order to enhance the comparative power of the region even more: how did the system of slavery enforced on this island compare to new methods to provide labour once emancipation was enacted? By tackling these questions, the paper provides both insightful similarities to Atlantic counterparts, as well unique features that help contextualize the experience of slavery in this part of East Africa and the South-western Indian Ocean.

[133] *Katie Bar the Door: The Time for Archaeologists to Respond to Climate Change Impacts is Shorter than We Think*

Even the most aggressive models of sea level rise don't predict major inundation in the Middle Atlantic for many decades. However, the time available to archaeologists for managing coastal archaeological sites and mitigating their inevitable destruction may be far shorter than that. As awareness by politicians and the general public of the threats to coastal infrastructure hits an inflection point, there will come a time when political and physical necessity results in the monies once available for archaeological site management being reallocated to what may be rightly seen as more pressing and important issues. We need to ensure that plans are in place over the next few years to triage resources (archaeological and monetary) before the decisions are made for us.

Seidemann, Ryan (Louisiana Department of Justice)

[135] *State-Level Law and Prosecutorial Interest in Archaeological Resources Protection*

Archaeological site damage, destruction, and looting is nothing new. For years, the archaeological community has bemoaned the minimal protections for these resources under federal law. Little discussion has occurred regarding what protections may exist under various states' legal regimes. This paper reviews Louisiana's archaeological resource protection laws with an eye towards identifying how such laws can work in tandem with federal law to expand resource protection as well as to examining the existing laws for possible improvements. These laws are also reviewed through the lens of real-life experiences in Louisiana related to looting at the Toledo Bend Reservoir and Lakes Vernon and Anacoco. Included in this latter review is a brief discussion of prosecutorial discretion and mechanisms to raise interest in local law enforcement communities and ethical obligations of archaeologists in this process.

[392] *Variation in Obsidian Source Consumption within the Kingdom of Piedras Negras*

More than a decade of archaeological research has characterized the political landscape of the middle Usumacinta river valley as a tense political rivalry between the Classic period Maya (250 – 900 C.E.) kingdoms. Recent archaeological work in the kingdoms of Piedras Negras and Yaxchilan has sought to unravel how the internal economies of these kingdoms functioned. Here we contribute to these efforts by presenting the results a pXRF study (n ~2100) from nine archaeological sites in the modern nations of Guatemala and Mexico. This includes large data sets from the polity capital of Piedras

Negras; an obsidian workshop at the subsidiary site of Budsillha; hinterland communities within the suspected borders of the Piedras Negras kingdom and interstitial communities which were not affiliated with any known political entity. By elucidating how obsidian source consumption shifts in terms of political borders and relationship to political centers, this regional study aims to add a nuanced perspective to the economic structure of these kingdoms. In particular, we emphasize that within the borders of Maya kingdoms the availability of obsidian sources is uneven with more politically centralized communities enjoying greater access to a variety of obsidian sources despite apparent access to markets.

[382] *Intersections of Identity, Health, and Diet in the Wyoming Territory*

The mid to late 19th century in the United States is noted by the Department of the Interior as a significant period of westward colonial expansion, leading to an extension of colonial power structures. This biocultural Master's thesis research on Wyoming Territory burials establishes methodological and theoretical approaches for associating stable isotope results regarding diet and mobility, developmental anomalies, and sociocultural contexts in historical Wyoming. Previously, a sample of the remains was analyzed for light stable isotopes to reconstruct diet and mobility in this context. Individuals buried at historical sites across the state (Red Mountain AD 1880-1910, N=6; Platte Bridge Station/ Fort Casper AD 1859-1867, N=3; and Korell-Bordeaux AD 1830 to 1890, N=17) will be analyzed for developmental anomalies and nonspecific indicators of stress. Relationships between the osteological and stable isotope analyses will then be explored. Results will inform a discussion of these peoples' lived experiences embodied in their material remains. Using a postcolonial lens augmented by Critical Discourse Analysis of historical documents to provide insight into the identities of these individuals, the historical narrative can be viewed critically and systematically in order to illuminate a more multivocal history of Wyoming.

[154] *Taskscapes of Reindeer Herding: Changes in the Land-Use Dynamics and Campsite Organization of the Sámi Pastoralists of Northern Fennoscandia c. 700–1800 AD*

Domestication of reindeer commenced amongst the Sámi of northern Fennoscandia in the 8th century AD, and was accompanied by significant cultural changes. This presentation focuses on diachronic changes in the land-use, inter- and intra-site settlement patterns and human-environmental relations. I focus especially on two pivotal stages: 1) the initial domestication of reindeer within a hunter-fisher-gatherer society (700–1050 AD); and 2) the shift to nomadic large-scale reindeer husbandry (c1500/1600-1800 AD). The initial shift from hunting-gathering and fishing based livelihoods to small-scale reindeer herding in the Middle Iron Age changed people's everyday lifeworlds, environmental perception and human-reindeer relations. This is mirrored in archaeological record by the changing campsite organization and structures, most importantly by the introduction of so-called rectangular hearths, which are also placed differently in the landscape than the earlier hunter-gatherer sites. Also, the shift to large-scale nomadic pastoralism in the Middle Ages is reflected in the archaeological record. Nomadic pastoralist sites appear at different locations and with differing features than the previous rectangular hearth sites related to small-scale use of domesticated reindeer. The pastoralist landscapes should not be approached as purely anthropogenic constructs, and instead, the agency of animals and things should be acknowledged using a pluralistic perspective.

Sejas Portillo, Alejandra (University of Pittsburgh)

[18] *Conflict, Spatial Organization and Group Identity during the Late Intermediate Period in the Bolivian Southern Altiplano*

During the Late Intermediate Period, the Southern Altiplano region was characterized by the presence of conflict and fortified settlements. These societies have been described as having a corporate leadership, linked to a founding ancestor, which granted them privileged access to resources. Little is known about the dynamics of spatial organization of the settlements and its relation to group identity formation among these corporate groups who were in constant conflict with their neighbors. This investigation studied this relationship through a comparison of the socio-spatial organization of residential areas among villages, in terms of settlement planning, and interhousehold variability. Differences between villages' distribution, delimitation, placement, and proximity to their dead help us understand the dynamics of group identity formation. The importance of building group identity during conflicting times is one of the key aspects to maintain social structure and integration. Settlements studied in this research were registered in a 91 km² full coverage survey around the Yaretani Basin, north of the Uyuni Salt Lake. Data were collected through detailed architecture mapping, systematic collection of materials as well as stratigraphic excavations conducted in these settlements.

[100] *The Yaxhom Valley Survey II*

The second season of the Yaxhom Valley survey, conducted during the summer of 2018, continued its assessment of LiDAR imagery collected by an NSF-sponsored mission flown over the eastern Puuc region of Yucatan, Mexico. Our focus shifted to Muluchtzekel, which LiDAR revealed to be the dominant site of the entire valley. We covered approximately one square kilometer of the site center during the 2018 pedestrian survey and used LiDAR to suggest possible excavation loci in our search for the earliest civic architecture in the Puuc. The survey data allowed us to refine our understanding of the LiDAR signatures of various classes of features in the imagery and to quantitatively assess feature identification confidence levels in areas yet to be ground-truthed. Digital elevation models of Muluchtzekel provided insight into the network of public structures and elite households involved in the administration of both agricultural production and quarrying, and revealed extensive modification of hilltops along the interface of the valley with the Bolonchen Hills. This paper discusses possible involvement of these hilltop groups in the production of construction materials and suggests that administration strategies for environmental resources at Muluchtzekel differed noticeably from sites in the eastern part of the valley.

Sellen, Adam (Universidad Nacional Autónoma de México)

[394] *La Sorpresa Hotel in Mitla, Oaxaca: Gateway to 150 Years of Mexican Archaeology*

In this paper I will investigate 150 years of Mexican archaeology by analyzing La Sorpresa, a hotel-museum-research center located in Mitla, Oaxaca. Using archival materials, principally photographs and correspondence, I will explore the hotel as a memory space, emphasizing the interactions of archaeologists and travelers who stayed there, considering also the curation and final destiny of the archaeological collections that were displayed in the museum in the second half of the twentieth century. By focusing on the dynamics of this space, my aim is to elaborate a parallel narrative of Mexican archaeological practice and politics from the nineteenth century to the present and tell the compelling story of Oaxaca's archaeology through the lens of those who participated in the endeavor.

Seltzer, Heather (Aspen CRM Solutions)

[272] *Prehispanic Pueblo Use in the Rio Grande del Norte National Monument*

Prior research in and around the Rio Grande del Norte National Monument has predominately focused on the Archaic use of the area. Minimal focus has been emphasized to explore the use by Pueblo groups. This paper examines use of the landscape from the Developmental Period (900-1200 A.D.) through the Classic Period (1350-1540 A.D.) in the National Monument and surrounding area and compares it to the better understood Archaic Period. Data explored in this paper was acquired through large-scale archaeological survey projects. The objective is to assess whether differences are able to be detected in land use during the aggregation of large pueblos along the Rio Grande Valley in the Classic Period (1350-1540 A.D.). Trends noted within the Rio Grande del Norte National Monument are placed within both a local and a regional scale. By examining differences in material culture (i.e. pottery versus projectile points) and site locations, diachronic trends in

types of settlements and land use will be better understood.

[260] *The Ritual Lives of Southwest Dogs*

Dogs, as the first domesticated species, have held a wide range of roles in human societies including hunting assistants, guardians, companions, and food sources. In this poster we will explore their ceremonial roles through a comparative analysis of the life histories of ritually deposited dogs. Specifically, we will compare Southwest dog burials to a late Pithouse Period (A.D. 550-1000) dog internment from Kipp Ruin, a multi-component Mogollon site on the Mimbres river of southwest New Mexico. These dog remains exhibit traces of human-caused physical trauma including skinning, bludgeoning, and dismemberment followed by ceremonial disposal. We will also contextualize the Kipp Ruin dog through morphological, chemical, and genetic testing to assess potential evidence of breed, coat type, fur color, diet, and possible migration of dogs with people across the region.

Semon, Anna (University of North Carolina)

[168] *A Regional Comparison of Complicated Stamped Pottery Designs from Coastal Georgia*

Late Mississippian ceramic assemblages from the Georgia coast contain abundant quantities of complicated stamped pottery. Motifs include concentric circles, figure nines, nested squares, and the filfot cross. Recent research tracking filfot cross design variation from assemblages on St. Catherines Island, GA was successful in identifying twelve unique variations of the filfot design. In this poster, I build on the St. Catherines research and present results from an ongoing regional study that tracks complicated stamped designs from several Late Mississippian sites on the Georgia coast. These data expand our knowledge of Late Mississippian iconography, pottery practices, networks, and social interactions.

Recent surveying and excavation works on the coast of the state of Guerrero and Oaxaca has shown that this is a region with ample archaeological potential. Dr. Román Piña Chan who made several visits during the sixties in that area, already indicated that the systematic study of the coast, would allow us to understand the development of various groups located in the central valleys of Oaxaca, as well as those established in the central highlands. The present poster focuses on one of the sites with the greatest amount of sculpture and monumental architecture found in the Costa Chica of the state of Guerrero. This site is Piedra Labrada, which has a large concentration of architectural complexes distributed throughout the site, as well as 23 sculptures that decorate the different public spaces of the pre-Hispanic city. In this poster I will present the results of the surface survey made on the site, as well as the association of the architectural spaces with the sculpture that is scattered throughout it.

Serra Puche, Mari Carmen (IIA-UNAM)**[38]** *"The Basin of Mexico: Ecological Processes in the Evolution of a Civilization" y nuestras excavaciones en el Sur de la Cuenca de Mexico*

Cuando llegó a nosotros el contenido The Basin of Mexico: Ecological Processes in the Evolution of a Civilization se nos abrió un horizonte nuevo para explorar una región fundamental de nuestro patrimonio arqueológico como es el sur de la cuenca de México.

Guiados por las enseñanzas de William Sanders, Jeffrey Parsons y Robert S. Santley, se llevó a cabo el proyecto "El Hombre y sus recursos en el Sur de la Cuenca de México" con la excavación de tres sitios clave: Terremote-Tlaltenco, un islote artificial que explotaba los recursos lacustres del periodo Formativo; Temamamtlá, al pie de Monte, edificado sobre lava y con un juego de pelota también del Formativo y algunos sitios del Epiclásico en el lago de Xochimilco.

Los resultados de estas excavaciones se dan a conocer en el presente trabajo.

Sesma, Elena (University of Massachusetts Amherst)**[122]** *Mapping Place and Materializing Memory: Contemporary, Collaborative Archaeology in the Bahamas*

This poster documents a community-based archaeology and oral history project in the Bahamas, and makes the case for accessible, digital methods in recording and preserving sites in areas vulnerable to development, climate change, and economic difficulties. The site in question was a 19th century plantation estate on the Bahamian island of Eleuthera, which was left by the last owner to the descendants of her former slaves and servants in 1871. This descendant community still maintains their rights to this acreage and continue to live on this and surrounding lands. Under a framework of contemporary archaeology, this project utilized a combination of pedestrian survey, digital mapping, photo documentation, and oral history interviews to create a community archive of life in the region over the past 200 years through present day. This poster illustrates several key methods within the community-based and collaborative project to study and preserve the historical and cultural landscape of the area, including the construction of a Google Tour of standing structures, compilation of a historical report, and the creation of 360-degree panoramas which can be used to recreate sites in virtual reality.

Seuru, Samuel (Université de Montreal), Liliana Perez (Laboratoire de Géosimulation Environnementale, Dep) and Ariane Burke (Département d'Anthropologie, Université de Montreal)**[128]** *Dynamic Simulation of Large Herbivore Distribution during the Last Glacial Maximum: Implications for the Distribution of Human Populations*

In this study we propose the use of agent-based modelling (ABM) and cellular automata (CA) to test the impact of predator-prey relationships on the distribution of prehistoric human populations. Our research goal is to establish a dynamic model of the distribution of large herbivores that constituted the main food source for human populations during the last Glacial in Western Europe. We propose the application of ABM and CA as an innovative methodology for modelling, simulating and analysing artificial herbivore communities in order to study predator-prey dynamics and their impact on human populations.

Long-distance migrations of mammals can significantly impact the spatial dynamics of local populations and communities. ABMs, when coupled with CA, enable us to capture explicit representations of spatial processes, spatial interactions and multiscale phenomena and is tailored to the study of ecological and social systems. If this promising approach is to reach its full potential, the integration of data, models, and expertise from multiple fields into ABMs of organism migration is necessary. Thus, we will rely on already available data such as climate simulations and static modelling of the distribution of prehistoric human populations.

[402] *Shacks and Scraps: Understanding Middle Epipaleolithic Site Structure in the Southern Levant through Taphonomic Analysis of Faunal Refuse*

We explored the spatial organization of the Middle Epipaleolithic site of Neve David (Mt. Carmel, Israel) through macro and micro contextual taphonomy of ungulate bones. The Epipaleolithic (23,000-11,500 cal BP) of the southern Levant is renowned for its cultural diversity, culminating with the complex hunter-gather Natufian culture. Emerging research from earlier Epipaleolithic sites suggest complex behavior began prior to the Natufian and this assumption should be reevaluated against preceding evidence. The site of Neve David is an exceptional case study to understand pre-Natufian site structure, due to its high density and diversity of finds, in situ activity areas, and stone architectural features. Our study incorporates micro and macro zooarchaeological techniques to characterize differential preservation and distribution of bones from various localities. Fourier Transform Infrared spectroscopy (FTIR) assisted in assessing the preservation of bone, augmented by conventional taphonomic analyses. FTIR results revealed no evidence of differential bone mineral or collagen preservation from each intra-site locality. Contextual taphonomy showed increased activity in one context, associated with higher frequencies of burned specimens. These macro and micro observations allowed for a more nuanced understanding of bone assemblage formation and site organization, contributing to our knowledge of pre-Natufian site structure.

[94] *Household Archaeology of a Late Archaic Pit-house in Southern New England*

The focus of this paper is the Warner Site, a Late Archaic Pit-house in Southern New England. The research combines traditional and modern perspectives of household archaeology. Traditionally, archaeologists relied on spatial analysis of activity areas, and ethno-archaeological comparison. However, more recently there has been a concern for overcoming ethnocentric assumptions of the function, construction, and organization of households. This more progressive perspective is necessarily data driven, because it must allow for new and non-traditional analysis and interpretation. It also forces archaeologists to acknowledge interconnections among peoples and sites, and production of data at multiple scales.

Shaffer Foster, Jennifer (Archaeological Survey, University at Buffalo)**[351]** *Just Beyond the 'Land of Women': Examining Gender in Early and Late Medieval Ireland*

In 1996, historian Lisa Bitel published "Land of Women: Sex and Gender in Early Ireland," a critical study of medieval gender, which remains influential over 20 years later. While more recent historical and literary research is available, there have been relatively few archaeological investigations of gender roles and constructs in the Irish Early (c. AD 400-1200) and Late (c. AD 1200-1600) Medieval Periods. Most discussions of medieval gender reference early Irish laws, which provide perspectives on social status and the roles of men and women in society. The laws suggest that women were largely engaged in traditional domestic activities and that their position in society was constructed in relation to their male family members; men are portrayed as lords, farmers, craftsmen, scholars, and clerics, all of whom had status in their own right and dominant gender roles. Archaeological knowledge of medieval Ireland has expanded dramatically in the past decade, enabling a much more nuanced understanding of gender than the laws alone can provide. This paper will address the complexities of interpreting Medieval Irish gender from archaeological remains vis-à-vis past expectations of the roles of men and women drawn from textual accounts.

Shakour, Katherine (University of South Florida)**[279]** *Ignored by Some, Remembered by All: Challenges of Disaster Archaeology of the Great Famine*

Archaeologists have explored disasters throughout the discipline's history, and these calamitous events range from volcanic eruptions, floods, earthquakes and more. The material footprint of the Irish famine presents a challenge to archaeologists investigating disasters. Further, famine-era sites are from the nineteenth century, a time not protected under Irish laws. Those most impacted by the famine have been left voiceless due to the marginalization of the famine sites. Employing archaeological and ethnographic methods, this project aims to understand the disaster known as the Great Famine in Ireland. Through a case study and comparisons of Westquarter village on Inishbofin County Galway, an island five miles off the western coast of Ireland, I consider how archaeologists regard the Famine and the various factors which impact archaeological investigations on the disaster. I conceptualize how to study a disaster that has been largely ignored by archaeologists and official heritage bodies. Further, this research investigates how to study a time and an event when the sites are at risk. This work reframes how archaeologists can understand disasters and how to work within a system that ignores the disaster for political reasons.

[408] *Navigating Public LiDAR in Samoa*

In 2014, The World Bank helped the government of Samoa to launch a climate resilience program. Included in this initiative was the financing of a light detecting and ranging (LiDAR) survey throughout the entirety of the country. Although originally meant solely for national climate information services and hazard mapping, the LiDAR dataset has since been shared between The Samoan Ministry for Natural Resources and the Environment and The Center for Samoan Studies (CSS) at The National University of Samoa. This information sharing was prompted once the data set's use as an instrumental tool for archaeological survey was identified. CSS intends to further this information sharing in order to elicit assistance in expanding upon their archaeological survey of recent years. Soon, this LiDAR dataset will be available to the public with the hope that Samoans will take a more active role in rediscovering their own cultural heritage. This paper overviews the archaeological research in Samoa in the years since 2014 and provides direction for a potential upwelling of public archaeology in the islands. Additionally, this paper discusses how the people of Samoa may interpret, add to, or reject the information drawn from the newly public information.

Sharp, Emily (Arizona State University)**[353]** *Old Tomb, New Ancestors: Investigating the Role of a Pre-ceramic Burial in Huarás Community Formation*

The social and physical history of a place often plays a crucial role in people's decisions regarding where to establish a community. In the ancient Andes, burial monuments offered powerful connections to landscape and shaped community identity by demonstrating claims to a shared ancestry and legitimizing access to ancestral lands. In this paper, I examine how a Late Pre-ceramic mortuary space at Queyash Alto (Ancash, Peru) influenced where and how people established a small Huarás and later Recuay settlement during the Final Formative and Early Intermediate Periods (200BC–AD700). Previous work by Joan Gero emphasized how the Huarás performed large feasts at Queyash to organize collective labor. Some feasts were situated directly outside a tomb entrance thought to include Huarás remains. I present recent radiocarbon results from human teeth, which indicate that the people who feasted outside the tomb were separated by several millennia from those interred within it. These individuals were not recently deceased loved ones but were Queyash's earliest inhabitants who occupied the site 2,000 years earlier. Through my bioarchaeological research on these burials, I interrogate what the reuse of this old mortuary space suggests about cooperative forms of community decision-making and the extended agency of long-dead ancestors.

Sharp, Kayeleigh (Southern Illinois University Carbondale)**[54]** *Gallinazo Networks: Economic Complementarity and the Persistence of Gallinazo-Mochica Social Interrelationships*

Early archaeological works that overemphasized societal elites and funerary contexts have led to several biases that limit comprehension of society's lower-echelon, or their roll in quotidian social spheres (political, religious or economic) during the latter part of the first millennium on Peru's north coast. This is a topic of much interest when considering long-term coexistence of groups like the Gallinazo and Mochica that persisted beyond the 8th century (based on C-14 dates) in the Lambayeque region. What characterizes the form and content of Gallinazo-Mochica coexistence? Did these groups work side-by-side and economically complement each other, or did they occupy different environments (coast vs. middle valleys vs. highlands) for centuries without interacting? My recent investigations at the Songoy-Cojal site in the mid-Zaña Valley suggests that long-term social interrelationships were built upon asymmetrical engagements in mining, irrigation, and multi-craft production industries. These combined factors are the constituents of what I define as Economic Complementarity: the mutually interdependent relationships of production, distribution, and consumption of goods and services. In this paper, I explore the development and application of my approach, which combines broadly applicable techniques of archaeological network analysis and geostatistics, summarizing key findings that help to elucidate Gallinazo-Mochica social interrelationships.

Sharpe, Ashley (Smithsonian Tropical Research Institute)**[309]** *Shifting Course: Change as the Norm in the Preclassic Usumacinta Faunal Record*

The Usumacinta River and its tributaries played an integral role in the survival and growth of Maya communities in the southern lowlands of Mexico and Guatemala. Early human settlements relied on the river as a source of food and

transportation. Examining the animal bones and shell remains from Preclassic (c. 2000 BC – AD 250) communities along the river provides clues as to what the wildlife was like in the region before the advent of large human populations. Some activities, such as the procurement of large quantities of freshwater snails, attest to seasonal-timed events that are not found in later periods of Maya history. At the site of Ceibal, Guatemala, a decline in the numbers of certain fish and shellfish species over time suggests that increasing human habitation along the river resulted in a cultural or environmental change that was responsible for their gradual disappearance from the faunal record. Other animals, including unique breeds of dogs and various marine shells, begin to appear over time in the region, attesting to long-distance trade and the river's use as a means of transport.

[335] *Crafting Community: A Multi-site Analysis of Craft Production and Exchange in the Aftermath of State Collapse*

Techniques derived from analytical chemistry are critical to examining the impact of macro political change on the production and circulation of craft goods in the past. LA-ICP-MS analyses of objects and the raw materials used in their manufacture in the Moquegua Valley of southern Peru have been directed at reconstructing patterns of production and exchange in a region subject to episodes of conquest and colonialism over 1500 years. To date, analyses addressing production and exchange in the wake of state disintegration have been limited to one site, Tumilaca la Chimba, established circa AD 1000 as the Tiwanaku state's authority faltered in Moquegua. Complementing that preliminary work, which suggests that this post-collapse community both engaged in altered long-distance economic networks and continued to draw on pre-collapse knowledge about resource procurement, I present compositional data generated through LA-ICP-MS analyses of 80 ceramics derived from an additional four contemporaneous, post-collapse sites in the Moquegua Valley. I draw on those results to examine a) the extent to which different communities participated in shared or distinct patterns of long-distance exchange, 2) whether and in what ways different communities made varied choices about resource procurement, and 3) the organization of ceramic manufacture within each community.

Shaul, David (University of Colorado, Boulder) and Scott Ortman (University of Colorado, Boulder)

[311] *Incorporations into Tewa Language and Culture*

Linguistic acculturation during the Columbian exchange traditionally focused on loan words from European languages into Native American languages, privileging European culture. Southwestern studies in particular have presented lists of Spanish words in native garb, with little discussion other than possible borrowing strata, based on how well the loans fit the local sound pattern. We deconstruct this, considering total production of Tewa linguistic artifacts during the 1600s that refer Spanish concepts, comparing native materials (calques; coined words) versus loans from Spanish. We compare the Tewa situation with other communities of the Rio Grande culture area, and with peripheral speech communities (Zuni, Hopi). Between 50% to 75% of the attested lexical artifacts of acculturation were created using Native lexical resources. Tewas and other native peopl, not passive recipients of European culture, exercised agency in adapting to and naming the benefits (largely dietary) and impositions (religion; government) of European culture.

Shaum, Katherine, Neil Dixon (Front Standard Photography) and Katharine Williams (University of New Mexico Department of Anthropology)

[85] *RTI Photography inside a Hohokam Great House*

The Great House at Casa Grande Ruins National Monument is a monumental 11 room, three/four story structure made of puddled mud "caliche" that has been called "the pinnacle of Hohokam architectural achievement" and is significant for its high degree of preservation. The building is home to intact prehistoric red and pink earthen plasters and washes as well as three "plasterglyphs". Yet these glyphs had never been extensively documented due to the inherent difficulties of working inside an important archaeological and ethnographic resource, including access, lighting, and animal waste issues. Following tribal consultation and a grant award from the Western National Parks Association, researchers and resource managers were able to employ a digital photographic technique called reflectance transformation imaging (RTI) photography. This technique generated very high resolution images of selected plaster surfaces and fulfilled project goals:

baseline documentation of physical condition, study of layer stratigraphy and age, and investigation for previously unknown elements in surrounding areas. Because of its surface enhancement and lighting features, RTI photography is especially useful in archaeology when one needs to look at objects with low-relief etching or carving, as is the case with petroglyphs, headstones, and certain artifacts.

Shaw, Chris (U.S. Forest Service) and Jason Millet (U.S. Forest Service)

[213] *A Survey of Gallina Phase Sites in Santa Fe National Forest*

This poster presents the results of an archaeological survey near Laguna Jacquez in the Cuba region of Santa Fe National Forest, which was performed in advance of a prescribed burn to mitigate damage to archaeological resources. An inventory of newly-discovered Gallina phase sites is described in the context of contemporary issues in Gallina archaeology, including settlement patterns, social violence, and the cultural affiliation of the inhabitants of the Gallina area in relation to other Ancestral Puebloan groups (Constan and Bremer 2017). The effects of controlled fire are also investigated through field observation and participation during the burn.

Shaw, Jennie (Salix Archaeological Services LLC)

[312] *The Tricky Business of Dating Shell Middens and Improving Regional Chronologies*

Fifteen years ago, Julie Stein spearheaded research into the often problematic task of dating shell middens and interpreting their accumulation. By examining paired charcoal-shell dates from the San Juan Islands, Stein and colleagues refined the local marine reservoir correction (ΔR) associated with radiocarbon-dated shell, thereby enabling construction of more accurate chronologies in and around the Salish Sea. Her methods for quantifying shell midden accumulation rates helped differentiate gradual versus punctuated occupation and, perhaps more importantly, highlighted the benefit of an extensive dating regime. The ripple effects of these two research programs continue, as archaeologists working in various coastal settings increase chronological control by developing regional reservoir corrections and more rigorously modeling site accumulation dynamics.

Shaw, Justine (College of the Redwoods)

[146] *Surviving the Apocalypse: A Late Terminal Classic Household in Northern Yucatan*

Following the widespread Terminal Classic florescence that saw booming occupations at every site in the Cochuah region of west-central Quintana Roo, Mexico, many settlements were entirely abandoned. However, some sites possessed late Terminal Classic populations, living in novel architecture yet continuing other Classic Maya material practices. One such round foundation brace, at the site of Sisal, was excavated in 2018, with its interior and immediate exterior subjected to detailed spatial analyses of its ceramics, lithics, shell artifacts, soil chemistry, and burials. Comparing and contrasting these patterns to those of other ethnographic and archaeological examples provides a rare window into the household activities and practices that characterized this generally ignored point of collapse, as the few remaining resilient inhabitants both clung to past practices and attempted new strategies to provide for themselves and their households.

Shaw-Müller, Kyle, John Walden (University of Pittsburgh), Michael Biggie (Los Angeles Maritime Institute), Abel Nachamie (University of Pittsburgh) and Qiu Yijia (University of Pittsburgh)

[113] *The Spatial Distribution of Wealth throughout the Neighborhoods of the Late Classic Maya Polity of Lower Dover, Belize*

The formation of neighborhoods and their integration into polities necessarily involves changes to the wealth of their inhabitants, especially as certain economic activities such as craft production intensify. For example, households that were among the first in a community, especially in low-density agricultural communities such as those of the ancient Maya, probably had more extensive property rights that afforded a greater accumulation of wealth-indicating items. Alternatively, households established later in time were often located in marginal zones with access to fewer resources, unless patronized by an emerging elite. This poster diachronically reconstructs the spatial distribution of wealth across the political landscape as three small Maya communities dating to the Middle Preclassic (1000-300 BC) were integrated as neighborhoods into the Late Classic (AD 600-900) polity of Lower Dover, Belize. Specifically, we address whether wealthier commoner households clustered concentrically around older minor centers and how this pattern changed with the emergence of politico-economic

entities such as specialized production areas and the civic-ceremonial center of Lower Dover. In sum, the economic effects of communities' political integration (into a newer, larger polity) upon their pre-existing patterns of wealth distribution is the central topic of this poster.

Sheets, Payson (University of Colorado)

[255] *Was the Elaborate Chert Eccentric from San Andres, El Salvador, Made by the Rosalila Copan "El Maestro"?*

Many decades ago Stanley Boggs discovered a particularly elaborate chert eccentric from San Andres, El Salvador, yet he never published the find. Here we compare it to the set of more elaborate eccentrics manufactured by "El Maestro" for the Rosalila cache at Copan. The similarities in morphology, symbology, and manufacturing techniques are so similar that I posit they all were made by the same person. The San Andres eccentric is so fragile that I believe it must have been manufactured at San Andres, shortly before being cached. So it was the craftsman who traveled, not the finished artifact. Rather, the craftsman must have carried the eccentric in blank or roughout form, along with manufacturing tools, to San Andres. That craftsman's home might have been Copan, or some other Maya city. This supports the "itinerant craftsman" model that is often posited but generally has little direct evidence.

Sheldrick, Nichole (University of Oxford)

[77] *Big Data, Heritage Management, and the EAMENA Project*

Heritage inventories are crucial for effective cultural heritage protection, especially during conflicts or disaster situations. Digital technologies, particularly remote sensing, are making it easier and faster than ever to create and disseminate these inventories, and collect data on a scale not previously possible. Since 2015, the Endangered Archaeology in the Middle East and North Africa (EAMENA) Project has been integrating new and existing datasets into an open-access database to identify, record, and assess disturbances and threats to archaeological sites across the MENA region, and to aid heritage officials in the management and protection of their cultural heritage. But how can we best utilise these ever-increasing quantities of data to manage and protect heritage, particularly where the human and financial resources available for these activities remain limited? Furthermore, how does the ability to collect vast amounts of data from afar change the relationship between local stakeholders and foreign researchers? Using the EAMENA Project as a case study, in this paper I will reflect on how the rapid collection and analysis of large amounts of data is changing heritage management methodologies and

practices, and the advantages and challenges of this kind of approach in the MENA region.

Shelley, Nathan (Eastern New Mexico University)

[89] *Assessing Archaeological Applications of Curated Sediment Samples: A Case Study at Mesa Portales*

This project assesses the research utility of curated sediment samples excavated at Mesa Portales, New Mexico. These archaeological deposits date to the Pueblo III period (1150-1300 AD) and contain evidence suggesting two traditionally estranged cultures, Gallina and Chacoan, co-existed. This evidence stands in contrast to other instances of Gallina archaeology appearing to represent a culturally isolated population. Curated samples were compared to new geologic-core samples from the site vicinity to characterize site-formation processes and test stratigraphic context of artifact provenience and previous interpretations of cultural interaction at Mesa Portales. In addition to contributing to our understanding of the occupation sequence at Mesa Portales, project goals include developing protocols for using curated sediments to address new geoarchaeological problems and generating information regarding the utility of curated sediments to aid in future collections-management decisions. Evaluation of certain curated archaeological materials, such as sediment samples, is needed to determine their archaeological value and whether their continued curation is appropriate. As the archaeological community awaits the long overdue approval of updates to 36 CFR 79 (Curation of Federally-Owned and Administered Archeological Collections) the ability to discard federal collections remains in limbo and research involving the curated Mesa Portales samples can provide an invaluable perspective.

[81] *The Social Use and Value of Blue-Green Stone Mosaics at Sites within Canal System 2, Phoenix Basin, Hohokam Regional System*

The occurrence of nonlocal objects, raw materials, and ideas in the southwestern United States (US SW) has long been recognized as evidence of interaction between prehispanic peoples of this region and those of greater Mesoamerica. Though many archaeologists have analyzed the directionality and potential means by which these objects and concepts moved across the landscape, few have assessed the degree to which Mesoamerican practices and traditional assemblages remained intact as the artifacts and ideas moved farther from their places of origin. The current study analyzes the distribution and deposition of blue-green stone mosaics, a craft technology that originated in greater Mesoamerica during the late Formative period (400 BCE – 200 CE) and spread to the US SW by the start of the Hohokam Pioneer Period (475 CE). We assess the spatial distribution, contextual deposition, and morphology of mosaics at sites within Hohokam Canal System 2, located in the Phoenix Basin of central Arizona. These data are used to infer mosaics' social value and function within Hohokam social structure. Analysis suggests that, while the concept and technology of mosaics may have originated in Mesoamerica, the contexts and ways in which mosaics were used in the Hohokam region were decidedly Hohokam.

Shepardson, Britton (Terevaka.net Archaeological Outreach, Northern Arizona University)

[408] *Making Geospatial Data FREELY Accessible: Potential for Crowd-sourcing, Site-monitoring, and Multimedia Data Archiving*

The island communities of Oceania, and none more so than that of Rapa Nui (Easter Island, Chile), continue to develop their economies, modern identities, and narratives of their cultural past based on plentiful archaeological remains that are

visited by hundreds, or even thousands, of people on a daily basis. While archaeologists surge ahead with ever more impressive technology, local communities struggle to find ways to benefit from advances in research. A spreadsheet-to-website approach to GIS allows archaeologists to host interactive, multimedia data on a Google Map to provide access to information, informational crowd-sourcing, and conservation-oriented site monitoring at no cost for the archaeologist or for the users who access the data. A combination of Excel, HTML, JavaScript, XML, and Google Maps API allows for automatic generation of interactive webpages to host massive, multimedia data sets (text, images, links, files, videos, 3D viewer, etc.). This freeware approach to GIS provides great potential for local communities to play a more active role in, and benefit sustainably from, collaborative international heritage management.

Sherfield, Anne (University of Michigan)

[52] *Dig Until You Find Blood: A Spatial Investigation of Menstrual Seclusion Practice at Deir el-Medina*

Ethnographic investigations into menstrual seclusion practices worldwide show that investigating these behaviors is not only fruitful, but also integral in understanding a community's ideology and social structuring. Texts dating to the New Kingdom and Demotic periods suggest that ancient Egyptians engaged in a menstrual seclusion practice that included a strong spatial component within the household. This material manifestation of Egyptian menstrual seclusion opens the topic to archaeological inquiry that will compensate our textual understanding of the behavior. To that end, this paper analyzes the access, viewshed, and movement possibilities within 28 domestic structures at the New Kingdom site of Deir el-Medina (1550-1070 BCE). The aim of these investigations is to determine whether or not the architectural layout of the houses allows for the intentional segregation of women away from the rest of the household. The results of these analyses dispute the common notion that the houses at Deir el-Medina were too small to contain menstrual seclusion behaviors. Instead, the analysis finds that every house contained a space that could have been used opportunistically for seclusion while a woman was menstruating. Additionally, two houses contained rooms with unusually limited access that may have been used specifically to house menstruating individuals.

Sheridan, Kelton

[145] *Buying Into It: A Study of Economic Engagement on the Eastern Pequot Reservation*

This multi-scalar project examines economic patterns and foodways related to Native American ceramic use on the Eastern Pequot reservation in North Stonington, Connecticut. Engagement with local Euro-American markets by the Eastern Pequot was necessary during the late 18th and early 19th centuries. Analysis of ceramic assemblages focusing on ware type, vessel form, and decoration inform how the Eastern Pequot negotiated these markets and utilized ceramics. The three sites from the reservation examined in this study date to different time periods, allowing for a diachronic study of Eastern Pequot ceramic use and associated household practices. The analysis of ceramics lends insight into consumer and social practices on the Eastern Pequot reservation. Using additional comparative site analysis, this study provides a unique addition to the discussion of indigenous experiences during colonialism through a focus on market engagement and foodways. In order to solidify these interpretations, the three sites are then compared to nearby Anglo sites at Lake of Isles in southeastern Connecticut and the Nipmuc site of the Sarah Boston farmstead in Grafton, Massachusetts.

Sheridan, Susan (University of Notre Dame)

[317] *Social Media as a Tool for Research and Outreach in Bioarchaeology*

Social media has provided bioarchaeology a tool for collaboration with colleagues around the globe; interaction with legislators, the press, and the general public; a means to quickly disseminate research; an educational tool for reaching a younger audience; and, a means to employ the latest Web 2.0 technologies. The BioAnthropology News Network (BAN) was established to capitalize on these possibilities. BAN fosters cross-disciplinary interaction using Facebook, Twitter, YouTube, and Instagram. Bioarchaeology utilizes the sciences and humanities to explore life in the past, emphasizing an integrative anthropological approach to understanding our place in the natural world -- not surprisingly, it has benefited the most from the BAN platform, with 8X the number of posts of other areas of anthropology. It draws ~23,000 viewers combined, fostering collegial interaction in the discussion of even contentious topics, providing teaching tools for professors and students, networking scholars across 100 countries on all seven continents. We have developed a video series provides depth to topics making the news, have compiled a massive database of bioarchaeology publications for research use, offer a weekly suite of educational modules, and are working on introducing 3D components to permit in-depth exploration of research in a virtual reality environment.

[312] *Soil Fertility and Chronology at the RapaNui Rano Raraku Megalithic Statue Quarry*

Rano Raraku on Easter Island (RapaNui) is famous as the source of the megalithic moai statues. Past research by the Easter Island Statue Project (EISP) documented and mapped the statues. Other studies, based on coring the freshwater lake in Rano Raraku, identified microbotanical evidence of a cultivated landscape inside the quarry. This paper concentrates on recent excavations of statue 156 confirming that the statue was permanently placed in this location and was not “in-progress” or awaiting transport. We present a Bayesian model based on 20 radiocarbon dates that addresses the timing of the raising or “use” of Statue 156, visitation to create secondary petroglyphs, and the tempo of sedimentation that buried most of this statue. Micromorphological analyses reveal the presence of incipient surfaces as the slope deposits accumulated around the statue. Results from the soil chemistry indicate that the quarry was exceptionally fertile and likely produced uniquely high yields of traditional cultivars on an island struggling with poor soil conditions. This complex land use history for Rano Raraku has significant implications for understanding how specialized craft production may have impacted or otherwise influenced the evolution of social relationships on the island in the 16th through early 18th centuries.

[345] *Moving Off-Road: Traversing Taskscapes at Wari Camp, Belize*

The study of movement has long been relegated to the background of archaeological investigations, as its materialization proves multifarious yet equally elusive. The resulting collection of archaeological “movement studies” generally focuses on the most formalized manifestation of movement: road systems. Yet at the ancient Maya community of Wari Camp, the lack of constructed roadways (i.e., sacbeob) warrants a step back from roads to return to the fundamental questions of: 1) What constitutes movement? and 2) How does movement materialize archaeologically? In doing so, movement is theorized more broadly via the cultural rhythms of engagement between humans and things. This paper will explore the process of movement in the production of landscapes through the lens of Tim Ingold’s notion of “taskscapes”. In doing so, taskscapes extend movement beyond the physical act of traversing space but constitutive of the daily, accumulated activities that come to craft fundamentally different landscapes, the communities that dwell therein, and the insidious powers at play in their development.

[335] *Large-Scale Craft Production and the Andean Religious Center: A Reconsideration*

Our conventional conception of the prehispanic Andean religious or ceremonial center emphasizes a limited range of sacred, ritual activities, intermittent public gatherings, a relatively small resident population, and perhaps small-scale

production of craft items for offerings. At the Middle Sicán (900-1100 CE) religious center of Sicán, however, the large central plaza was not only surrounded by a dozen monumental and minor platform mounds, but also at least two major metal workshops and a large food preparation area. One of the workshops we excavated in 2014 and 2018 measured at least m 20 m E-W and 25 m N-S, had three superimposed floors, food residues, and numerous burnt features including a series of large (over 1 m across), adobe-lined, open furnaces that remind us of the well-known Moche sculptural representation of at least four metalworkers surrounding a furnace. These features suggest a highly intense and permanent precious metal working involving well over a dozen artisans with a reliable support system, particularly high-quality charcoal fuel and food. Overall, the impressive scale and intensity of metalworking along with these factors force us to reconsider the significance of the Andean religious center.

[80] *A Dearth of Dogs? The Archaeological Record of Canids in Wyoming*

Despite ethnographic and ethnohistoric evidence suggesting the Great Plains were teeming with canids during prehistory and the contact period, the archaeological record of canids (wolves, coyotes, dogs, and foxes) in Wyoming seems rather sparse. This presentation briefly describes the nature of the canid record in Wyoming, including the types of evidence available and its distribution across time and space. I offer possible explanations for the nature of the record, focusing on behaviors both prehistoric and contemporary which shape the expression of the canid archaeological record. Finally, a few archaeological sites in Wyoming will be highlighted as interesting cases illuminating canid function, care, and health among prehistoric Wyoming groups.

[404] *From the Early Holocene to Amazonian Forest Groves*

Ecological studies in the Amazon increasingly report groves of economically useful tree species thought to be legacies of past human occupation and management practices, in contrast to an inherent composition with high species diversity and low species concentration. Brazil nut (*Bertholletia excelsa* – Lecythidaceae) trees occur in grove-type forest formations and are currently a principal non-timber forest product and major source of income for indigenous and rural populations. Paleoethnobotanical results from 18 archaeological sites in the Brazilian states of Acre, Amazonas, Pará and Rondônia contribute a temporal dimension to discussions of the degree to which humans influenced, managed, and/or created Brazil nut groves. The majority of analyzed archaeological sites have remains of Brazil nut seed testa and occupation dates vary, ranging from 12,000 years ago to the late Holocene. The results indicate that human populations have had a long history of interaction with Brazil nuts and corroborate the hypotheses that these relationships, over millennia, contributed to the distribution of *Bertholletia excelsa* across the Amazon Basin. Furthermore we consider new dynamics in human-plant interactions where trees are a major component of the environment as they are conducive to different management practices than those employed in the production of annual plants.

[397] *Deciphering Raman Analysis of Fire Cracked Rock*

Residue analysis has the potential to reveal hidden information about objects' use; however, interpretation must be done carefully. Presented here are the final results of Raman analysis of food residues on fire cracked rock (FCR) from south-central North America. For this, the residues on archaeological FCR were compared to residues on experimental FCR, control samples, and a reference collection. While the exact origins of the residues could not be determined, it confirms that these residues are likely the result of cultural rather than environmental processes. This is a major step for residue studies of FCR; however, there is still much work to be done, before this is an economical process for the average archaeological researcher.

[23] *Hunter-Gatherer Fission-Fusion in Ethnographic and Archaeological Records: From the Mbuti to Paleoindians*

Archaeology views hunter-gatherers as nature's children or launching pads to complex society. Ethnographic hunter-gatherers exhibit fission-fusion cycles that we explain variously, including modular organization of group sizes (e.g., "scalar-stress"). However well models explain ethnographic pattern, archaeological tests pose challenges when we approach remote hunter-gatherers using what the Mbuti teach us. We believe that Paleoindians practiced fission-fusion, based partly on sites considered aggregations because they are unusually large and possibly organized as collections of smaller modules. Precisely because of the flexibility that encompasses fission-fusion, however, large sites can be one-time aggregations or accumulations from repeated occupations. Seeking ethnographic pattern in material data requires archaeological measures of group size and occupation span. Assemblage size and composition reflect size and behavior, but also span (itself parsed as aggregate or per capita) in ways not always appreciated. Surovell's models of hunter-gatherer assemblage accumulation and methods to estimate span may distinguish synchronic aggregation from diachronic accumulation in eastern North American Paleoindian data, corroborating or confounding ethnographic patterns applied to the past. Whether nature's children or autocrats-in-waiting, prehistoric hunter-gatherers can be understood only knowing how their material records formed.

[387] *In the Hands of the God or in the Depths of a Well? Examining the Evolution of Disability in the Ancient Mediterranean Basin*

This study presents a cross-cultural comparison of disability in ancient Greece, Rome, and Egypt from the beginning of the Bronze Age to the 4th century CE. I use archaeological and textual data to examine the temporal evolution of notions of disability in these three cultures. Results suggest that prior to Macedonian and Roman imperial expansion, Egypt's notions of disability were generated through a model of supernatural significance. As this model developed throughout time, physically impaired individuals were increasingly elevated as functionally specialized, unique, and eventually associated with the divine. In contrast, Greece and Rome developed notions of disability largely through a socio-political model in which physical impairments were only seen as debilitating if they did not contribute appropriately to society. The specific metric for being "disabled" changed in relation to when the socio-political system of Greece and Rome changed. While Egypt's model of disability may seem to lend itself more towards a "positive" outlook on the physically impaired, both models actually provided room for compliments and derision of the physically impaired. Finally, both models became intermixed as cultural diffusion occurred via Macedonian and Roman imperialism.

[244] *Ute Mountain Ute Tribal Historic Preservation Office Reflections on Tribal-Archaeologist Collaborations*

The Ute Mountain Ute Tribal Historic Preservation Office has worked regularly with archaeologists. While archaeology focuses largely on scientific understanding, the effects of this work on tribes and other stakeholders also needs to be considered. Through this talk, we highlight ways that archaeologists and tribes can more effectively collaborate and to find scientific inquiries of interest to both parties. Some important considerations include providing sufficient time for the tribe to consider the project and provide recommendations, bringing results back to the tribal community, not speaking for the tribal community, and respecting the sacred nature of many archaeology sites cultural landscapes. Such collaborations will deepen both relationships and understanding of the resulting data.

[134] *Digitization of Small Artifacts*

Over the past 20 years, technology has been developing at great speeds. Multiple methods of digitization have been emerging and been applied to archaeology. The most commonly used tools have been photogrammetry and laser scanning. However, one of the problems encountered with those tools when digitizing archaeological data occurs when working with small-sized artifacts. This paper compares the outcomes of three methods of three-dimensionalizing small figures and artifacts: photogrammetry, laser scanning, and structured-light-technology (SLT) scanning. The comparison focuses on quality of three-dimensional image outcome as well as the time and labor required to complete it with each method. The SLT digitization method resulted in much faster process as well as more precise three-dimensional models.

[233] *Prior to Pachacuti: A Pre-Imperial Phase for Monumental Construction in Cuzco?*

The plan of Inca Cuzco is sometimes explained as following a unified design, which some historical accounts attribute to the 9th Inca leader, Pachacuti. While Cuzco was a planned settlement, it was constantly being reconstructed and altered to accommodate a growing Inca elite, to facilitate the needs of the emerging state and the priorities of successive rulers, to better express Inca values, and to facilitate their rituals. It is difficult to identify phasing within Inca architecture, but our

mapping of variations in the style, location of walls, and choice of building stone within central Cuzco suggests a sequence for early Inca constructions prior to the re-building of Coricancha associated with Pachacuti. This includes constructions using green diorite such as at Hatun Rumiyoq, and the use of small andesite blocks from varied sources as in Cusicancha and Amarucancha. These buildings demonstrate Inca access to a growing labor force and more distant raw materials, which was made possible by the expanding reach of Inca alliances and control during this phase of state development. The construction and form of these early buildings also has implications for understanding their functions and the role of monumental architecture within the nascent Imperial capital.

[256] *Crouching (Jade) Monkey, Hidden Lessons: A Formative Period in Honduras*

The authors, along with many others, got their first immersion in archaeology thanks to Pat and Ed as part of the Kenyon Honduras Program. Their subsequent trajectories in archaeology took both of them away from Mesoamerica, albeit in very different directions, but both trace their origins to the Naco Valley during the Spring of 1995. Using examples from their work, ranging from the Levantine Neolithic to Civil War battlefields of the American Southeast, they reflect on the significance of that early inspiration, and consider why it was so effective in fostering their respective careers.

Silliman, Stephen (University of Massachusetts Boston)

[244] *A Braiding, Not Abrasive, Approach to Indigenous Cultural Heritage and Archaeology: The Eastern Pequot Example*

A key challenge in the development and sustainability of collaborative archaeological approaches with indigenous communities is ensuring that community members participate as true partners in knowledge production and dissemination. If not, hopes for a braiding knowledge approach could end up being more “abrading” to community participants. The indigenization of archaeology and community heritage can involve indigenous community members having more voices in academic worlds, but it can and should also involve indigenous people being able to use and develop heritage materials for community-based initiatives that draw upon the skills and resources of the archaeologists who work with and for them. The Eastern Pequot Archaeological Field School has been exploring these issues since 2003, and despite what we feel are notable successes, the maturation that more than 15 years brings has helped us realize some gaps and new opportunities. We use this paper to outline new heritage directions that we have been developing that ensure more community voices are in the foreground of this project, including the weaving together of a commemorative book, videography, guided tours, and augmented reality applications.

[372] *Chemical Analyses of Obsidian from Classic Maya Paynes Creek Salt Works, Belize*

The Paynes Creek Salt Works were an ancient Maya Classic Period (A.D. 300-900) salt industry located in a shallow salt water lagoon in southern Belize. The rise of the Paynes Creek Salt Works mirrored the growth in population at inland communities during the Late Classic Period (A. D. 600-900) where salt—a basic biological necessity—was scarce. The demand for salt and other marine resources underscores the importance of coastal trade. Small amounts of ceramic pottery from inland sites has been recovered from survey and excavation at the Paynes Creek Salt Works suggesting that inland cities were consumers of coastal salt. Forty obsidian blades were collected from systematic flotation survey between 2005 and 2008. These blades were assayed using a portable X-ray fluorescence in order to obtain the qualitative data to source the material as well as quantitative data to compare with other published obsidian sources. Assigning Maya obsidian artifacts to their geological source locations by chemical characterization is useful for reconstructing trade routes between the volcanic highland outcrops and lowland Maya consumers of obsidian. Identifying the source locations of obsidian from the Paynes Creek Salt Works will aid in the identification of the consumers of Paynes Creek salt.

Silva De La Mora, Flavio

[146] *Beyond the Palace Walls: Daily Life and Domestic Activities during the Late Classic in the Maya Lowlands (600-875 CE)*

This presentation centers on the daily life of Maya commoners from the Classic Maya site of Chinikihá in Chiapas, Mexico. The excavations are part of a regional effort to understand rural communities and social complexity. The presentation will offer an intimate view of the materiality of the daily life of non-elite groups from a domestic context, offering a bottom-up perspective. The residential group excavated was also associated with a specialized production area that illustrates the technological ability and social knowledge embedded in non-elite groups. The site of Chinikihá is located in the Maya Lowlands, close to larger nodes of settlement known for their epigraphy, urban complexity, temples, and elite groups; like Palenque. The presentation illustrates the results from the study of visual and non-visual evidence using different techniques to analyze and better understand the material culture of daily life and the use of space. This study will contribute to our understanding of social organization and the interdependence between commoners and elites during the Late Classic.

Simmons, Alan (University of Nevada Las Vegas, Department of Anthropology)**[275]** *Neolithic Voyagers: Why Colonize the Mediterranean Islands—The Example from Cyprus*

The “Neolithic Revolution” in the Near East and Anatolia is the oldest known in the world. This transformative economic and social event occurred in several mainland locations, and conventional wisdom was that it did not spread to the adjacent Mediterranean islands until relatively late, essentially being a “Neolithic footnote.” Cyprus has the oldest Neolithic, and until the past two decades or so, the aceramic Khirokitia Culture, starting around 7,000 cal. BC, was believed to be the oldest on any of the islands, and to represent the first human use of the island. Newer research, however, has dramatically reversed this perspective, and now Cyprus has both PPNA and PPNB occupations, as well as Late Epipaleolithic ones, that pre-date the Khirokitia Culture. The former are, in fact, as old as the mainland Neolithic. These findings raise several issues, such as seafaring and navigational skills, importation of floral and faunal resources, and the development of unique island identities. The ultimate question is why colonize these islands in the first place? This presentation examines these issues from the perspective of Cyprus and, specifically, the PPNB upland site of Ais Giorkis.

Simon, Rebecca**[86]** *Rules Are Made to Be Broken: Reassessing Use-Life of Basketmaker III Structures*

Basketmaker III earthen architecture in the northern Southwest is commonly understood to have a use-life of one, maybe two generations. This understanding comes in part from experimental studies combined with the recent modeling of momentary populations. Crow Canyon Archaeological Center identified and tested over 40 Basketmaker III pit structures during the Basketmaker Communities Project (BCP) and found enough variation to suggest that the generalization of use-life and even function of these structures may be premature. As an example, ancestral Pueblo peoples repeatedly remodeled Mueller Little House (5MT10631), a “typical habitation site” tested during the BCP, suggesting a longer commitment to a singular structure than usually accepted. This study will reassess the applicability of generalized pit structure use-life in the northern Southwest with detailed architectural data and dating from the BCP.

Simpson, Diana and Keith Jacobi (The University of Alabama)**[325]** *Bioarchaeology of the Little Bear Creek Site: New Insights into Health, Violence, Mortuary Behavior, and Identity in Prehistoric North Alabama*

Although many prehistoric shell burial mound sites within the Pickwick Basin of the Tennessee River Valley of Alabama have been the subject of extensive archaeological and osteological analyses, The Little Bear Creek Site (1CT8) was excluded from such modern study until recently. However, the most recent skeletal inventory of the site revealed high levels of perimortem trauma, violence, and disease within this population when compared to neighboring sites. Based on this, the site was selected for a more detailed bioarchaeological analysis and contextual interpretation during the summer of 2018. Considering site population level demographics, as well as detailed osteobiographies of certain notable individuals, and integrated grave good analysis and burial records, this study was able to demonstrate several unique insights into life and death at 1CT8. It is argued that production and manufacturing were occurring at the site during the Archaic Period based on skeletal activity markers. Additionally, interpretation of postmortem processing and mortuary treatment indicate the presence of complex ritual and identity during this early period. These results contribute to an expanding archaeological understanding of life and death at 1CT8 and provide valuable data for future comparison, contributing to our overall

understanding of prehistoric Alabama both synchronically and diachronically.

Simpson, Erik (Bureau of Land Management, Farmington Field Office)

[44] *Making and Breaking Boundaries in the American Southwest*

This presentation explores two related but temporally detached examples of communities interacting with the physical and cultural boundaries that partially define them. During the AD 700s and 800s communities in the La Plata and Animas river drainages of New Mexico and Colorado moved away from each other creating an unoccupied region between themselves during a time of significant societal and ideological change and violence. Later in the AD 1200s, communities in the Gallina region of New Mexico, who have been widely noted for their persistent isolation, begin to settle and trade among neighboring groups along their southern margins. These are considerations of just two of the many possibilities available to communities living within the borders that delineate them.

[23] *The Strange Attraction of Viking-Age Urbanism: The Predicament of Emporia*

Maritime trading emporia were nodal points of social networks and economic interactions in Viking-age Scandinavia. Despite their social centrality, archaeology shows that such places were rather small, unassuming, and sometimes short-lived settlement. This contrasts with a wealth of evidence pointing to communities sustaining a complex economy involving intensive long-distance trade and the practice of specialized, professional crafts. Research debates have centered around whether Viking-age emporia can be characterized as a form of urban settlements, and if so, why aspects of an urban economy would be maintained in otherwise overwhelmingly non-urbanized societies. This paper approaches the problem of urbanization as an emergent historical dynamic, converging upon – but not fully determined by – a complex set of cultural attractors. It reviews results from recent, major excavations in the Ribe, Denmark, and argues that a trajectory converging towards an urban pattern of society emerged from diverse attractors including multi-craft collaborations, the search and transaction costs of early commercial seafaring, and the social control of foreigners and 'weak ties'.

Sinelli, Pete (University of Central Florida)

[37] *You Come from Where? Ceramics and Cultural Exchange at Palmetto Junction*

The Palmetto Junction site on Providenciales, Turks & Caicos Islands provides an abundant and diverse ceramic assemblage. These artifacts help describe movements of people, goods, and ideas among Lucayan Taino groups in the Bahama archipelago and affiliated Greater Antillean settlements to the south. The assemblage includes Meillacoid and Chicoid ceramics that were likely produced in Hispaniola and are commonly found in Lucayan sites in the Turks & Caicos Islands. However, the presence of sherds with elements of Saladoid zone-incised-crosshatch (ZIC ware) suggests ongoing contact with peoples east of the Mona Passage, perhaps Puerto Rico. Moreover, the discovery of an unusual style of imported pottery, adorned with fiber mat marking on the exterior body of the vessel, suggests that traditional Palmetto Ware motifs may have diffused out of the Bahama archipelago to influence potters in the Greater Antilles.

Sinensky, R. J. (University of California Los Angeles)

[258] *The Early Brown Ware Horizon in East-Central Arizona, AD 300-550: Preliminary Results from Recent Survey, Excavation, and Collections-Based Research*

The Early Brown Ware Horizon, also known as the Basketmaker II-III transition, is one of the most pivotal yet poorly understood temporal intervals in the Prehispanic northern Southwest. This poster reports on recent site reconnaissance, small-scale excavations, and collections-based analyses focused on an area with a dense occupation at this time, East Central Arizona. Recorded sites range in size from small hamlets with a handful of structures to large sites with over 50 pithouses. Spatially extensive test excavations and intensive paleoethnobotanical sampling at two large sites provides new high-quality chronometric data and a robust botanical record with implications for understanding mobility practices. Survey and excavation data also suggest important differences between the routine activities that took place at contemporary sites located in higher elevation and lower elevation areas. Further research on this transitional period will help shed light on the scale and tempo of the social and economic changes that accompanied the shift to sedentary agrarian life across much of the region.

Singletary, Jennifer (University of South Florida) and Jose L. Peña (University of South Florida)

[222] *Fibers and Weaving Techniques in Casma Textiles, Huarmey Valley-Peru*

Textile production was one of the most important aspects of Andean economy, since households were required to produce it for elites or local authorities, and in other instances, large specialized centers were exclusively producing textiles for the state. The excavations conducted at the site of Santo Domingo, which is a large cemetery, have provided information about ancient Casma people including access to resources and funerary practices. Although this cemetery has been affected by looting, remains of textiles were recovered during the excavations and in some instances, they were found as part of the few burials excavated at the site. Analysis of the textiles was conducted using a digital microscope to observe the weaving techniques and the different fibers used by Casma inhabitants during the Late Intermediate Period (A.D. 1000 – 1400). The aim of this research is to obtain valuable information about the pattern of textile production, interregional exchange and social function of textiles for the Casma people.

Sinkovec, Christina

[241] *Slope Armoring at Leone Bluff: A Collaborative, Landform-Scale Effort at In Situ Preservation*

The US Army Corps of Engineers recently undertook a project to mitigate cumulative adverse effects to the Leone Bluff archaeological site at the Corps' Trinidad Dam and Lake Project in Las Animas County, Colorado. The Leone Bluff site is one of two type sites for the Sopris Phase (AD 1000-1250), a cultural manifestation almost exclusive to the Park Plateau. The site has been subjected to multiple sources of disturbance, including excavations from the 1950s to the 1970s that resulted in a substantial collection of significant artifacts. Continued erosion in recent years, in part from high lake levels, exposed additional buried archaeological deposits. In response, the Corps collaborated closely with the Colorado State Historic Preservation Officer and with Tribes to stabilize and protect the remaining buried deposits and repatriate culturally significant items. The Leone Bluff site stabilization project is important because it is a large-scale, non-project-related effort by the Corps aimed directly at the preservation of a valuable archaeological resource. The project is also important because it represents a comprehensive collaboration with Tribes regarding both creative mitigation strategy and the disposition of culturally unidentifiable items.

Sirak, Kendra (Department of Genetics, Harvard Medical School)

[253] *Genetic Variation and Sociocultural Dynamics in Two Early Christian Cemeteries from Kulubnarti*

Skeletal remains from two contemporaneous Early Christian Period (550–800 CE) cemeteries at Kulubnarti in Sudanese Nubia have been the subject of a decades-long biocultural research program. Craniometric and dental analyses have suggested biological similarity between members of the “R” and “S” cemetery communities, while analyses of health and survival have suggested that the “S community” experienced more stress and disease than the “R community.” These data support a hypothesis of a single population, biologically related and culturally unified, but divided into socially-distinct

communities.

To test this hypothesis from a new perspective, ancient DNA data were generated for 14 individuals from each community. These data were analyzed to investigate if the two communities were a single genetic population and to assess their ancestry and genetic affinity to present-day populations. Results identified no genetic population substructure and suggested that both communities showed most genetic affinity to present-day Northeastern African populations. Unexpectedly, Eurasian-associated patrilineal ancestry was overrepresented in the "S community", while Eurasian-associated matrilineal ancestry was overrepresented in the "R community." These data revealed a previously-unknown pattern of sex-specific and community-based genetic variation and demonstrated the importance of investigating patterns of genetic variation within a context of known sociocultural dynamics.

[94] *Pre-Contact Land Use of the Gallinas Mountains, Lincoln County, New Mexico*

SWCA Environmental Consultants is conducting heritage resource surveys across 4,388 acres of lands managed by the Cibola National Forest. These surveys will aid the U.S. Forest Service and the Claunch-Pinto Soil and Water Conservation District of Mountainair, New Mexico, in completing landscape-level treatments designed to protect an unburned forested watershed in the Gallinas Mountains, Lincoln County, New Mexico. The project area lies at the northern end of the Sierra Blanca region, along an ambiguous border with the Salinas area. Previous surveys in this area were restricted to roadways; the vast majority of the acreage had not been inventoried for heritage resources. SWCA archaeologists have surveyed 2,900 acres thus far, and have identified strong evidence of resource exploitation, lithic reduction, and tool manufacture/refurbishment, beginning in the late Paleoindian period and continuing into the 1400s. This paper would provide an initial overview of the environmental setting and cultural history of the project area and a brief literature review of prior research in the area, and present field results from 2017 and 2018 surveys with a focus on lithic reduction and tool manufacturing technologies. The goal of this analysis is to encourage a deeper understanding of pre-Contact lifeways in the Estancia Basin.

[118] *In the Third Degree: Modeling and Photogrammetry at the Ancient Maya Site of Pacbitun, Belize*

The archaeological site of Pacbitun is located in west central Belize and has a long history of occupation at the site. Starting in the Middle Preclassic (600 – 400 BC) and continuing until AD 800-900. Recent student research projects have led to three differing uses of photogrammetry. First has been for public education and outreach, with students converting artifacts found in elite burials and caches into physical replicas using 3D printing. The second has been the construction of models of the units for mapping and profiling of the excavations. Additionally, the 3D models are hosted online and allow collaborators a more detailed explanation of the structures found at the site. Finally, morphological characteristics of similar sorts of artifacts have been compared across excavation units. The modeling of these fragments allows researchers to compare new landmark feature measurements that were not directly measured in Belize. This means the artifacts can still be numerically analyzed, without the cost and difficulty of removing them from the home country. For example, mano fragments from a production area were compared to those found in other contexts to determine which have been used for maize processing.

Skeates, Robin**[92]** *Sensory Archaeology: Key Concepts and Debates*

This presentation defines and evaluates some of the key concepts and debates in sensory archaeology, arguing that this field is necessarily a work in progress. Today, there is a growing archaeological interest in the senses, experience and perception; but are we justified in calling for or claiming a 'sensory turn' in archaeology? And, besides seeking to understand what is meant by terms such as 'sensorium', 'sensory model', 'ways of sensing', 'the sensory field', 'sensory attributes', 'affect' and 'sensescapes', are these terms useful additions to archaeological vocabulary and theory. What are the implications of sensory studies for museum archaeology? Finally, how should archaeologists undertake 'sensuous scholarship'?

[388] *Phoenician Iron Smithing and Cult at Tel Akko, Israel*

Recent excavations (2010 - 2018) directed by A. E. Killebrew and M. Artzy at Tel Akko, a major eastern Mediterranean Phoenician maritime center and emporium, have uncovered an unprecedented quantity of iron smithing slags, hearths and cultic artifacts, all dating to the sixth - fourth centuries BCE. This assemblage includes fragments of figurines and masks, a standing stone, a possible animal sacrifice and a fifth-century-BCE Phoenician inscription, which alludes to dedications made by Akko's metal-working guild to an unspecified deity. These findings, interpreted in their coastal Levantine context, provide an unparalleled opportunity to explore the connection between iron production and cultic activities at late Iron and Persian period Akko. This poster presents the preliminary results of the chemical and mineralogical composition of Tel Akko's iron slags and the possible provenience of the iron ore; the spatial distribution of these smithing slags, hearths and iron objects in relation to associated cultic artifacts; and a reconstruction of the economic role of the iron industry at Akko, which during the sixth - fourth centuries BCE served as a major administrative and military center for the Achaemenid Empire.

Skinner, Sarah**[67]** *A Geometric Morphometric Analysis of Projectile Point Maintenance using Experimental Resharpening Techniques: An Examination of PFP1 Curation, Cooper's Ferry Site, Idaho*

The implementation of controlled experiments to identify and describe the behaviors of the past has been influential in understanding the material evidence left behind in the archaeological record. This in combination with the advent of new 3D scanning technologies and geometric morphometric analysis methods can be used to establish novel approaches to topics like stone tool curation. A unique opportunity to further morphometric research in tool curation has presented itself in recent findings at the Cooper's Ferry Site in western Idaho. Excavations have revealed a pattern of stone tool caching associated with a late Pleistocene-aged Western Stemmed Tradition (WST) cultural occupation. In particular, the fourteen projectile points in Pit Feature P1 (PFP1) have been described as displaying distinct characteristics of use and resharpening before being interred into the ground (Davis et al. 2017), an assumption that will be further explored in this study. By introducing a series of resharpening experiments and geometric morphometric analyses, stages of resharpening will be identified and described as a comparative tool for stone tool curation.

[390] *A Characterization of Site Formation Processes at FxJj34, Northern Kenya*

Any inference of behavior based upon the spatial distribution of archaeological material requires an understanding of site formation processes. Natural agents, such as water flow, may be responsible for post-depositional alteration of buried materials and can result in spatial patterns which mask the behavioral processes associated with the initial deposition of artifacts. FxJj34 is located in Area 129 within the Okote Member (1.56-1.39mya) of the Koobi Fora Formation in Northern Kenya. Excavations revealed dense accumulations of artifacts (50 artifacts/m²), confined to a horizon of coarse sands. Excavated lithics exhibit variable degrees of rounding, suggesting that FxJj34 is not representative of its primary depositional context. This study investigates the impact of such formative agents in the depositional history of material at FxJj34 through a series of geoarchaeological proxies that provide insight into site formation processes. This includes regional- and site-based sedimentation sequences, artifact and material sorting, orientation analysis, and artifact rounding. While the results of orientation analysis do not support post-depositional displacement of artifacts, results of geoarchaeological proxies suggest that water acted as an agent in the formation of FxJj34. These results demonstrate the nuanced relationship between the anthropogenic agents and the geological processes that form the archaeological record.

[326] *A Comprehensive Study of the Variability in Flake Scar Patterns on Clovis Fluted Points*

Clovis fluted points are the earliest and most technologically recognisable artefacts that covered North America between ~ 11,080 ± 40 to 10,800 ± 25 14C yr B.P. (12,994 to 12,817 Cal yrs B.P.). Although Clovis is the most well documented of the Paleoindian cultures, much more is yet to be learned from their apparent rapid expansion over the North American Late Pleistocene landscape. Previous studies have led researchers looking at the variability and similarity of Clovis fluted points; some suggesting a uniform technology across North America, whilst others propose a more local regional adaptation. This study is part way through a joint project that is investigating similarities into flake scar patterns on Clovis fluted points from North America, especially the Southern Plains and Desert Southwest. With a large enough sample it is anticipated that flake scar patterning will reveal insights into Clovis technology, chronology, and regionalization.

[378] *There and Back: An Evaluation of Modeling Pre-sail Seafaring Exchange Routes*

In the field of modeling water-based movement, many researchers have focused on modeling colonization or larger migration patterns. However, longer and more exploratory voyages encompasses only part of humanity's use of sea travel.

Evaluating closely connected sea-oriented communities can provide key insights into the everyday nature of sea movement, which is reflected in coastal archaeological findings around the globe. There is also ample evidence for peoples using the sea as a highway for both the movement of materials and for maintaining distant social relationships beyond exploration purposes. Additionally, more attention needs to be paid to non-sail powered vessels, which in some cases had less reach than those with sails. This mode of transport likely influenced the location of travel corridors. Here, I seek to build off this evidence by exploring movement between known archaeological sites and evaluating possible corridors of reciprocal exchange between them. By evaluating shorter voyages connected to communities known to be in contact or to have collected resources on neighboring islands, it may be possible to evaluate relationships between mariner and travel corridor. I will discuss my own research into this paradigm, as well as explore broader implications for modeling between known points of connection.

Sliva, RJ (Desert Archaeology, Inc.)

[261] *Light, Sharp, Lethal: Functional and Social Implications of Cienega Point Technology in Early Agricultural Period Southern Arizona*

The Cienega phase (800 BC-AD 50) of the Early Agricultural period in southern Arizona is marked by an abrupt shift in projectile point technology from the large, heavy, side-notched San Pedro dart points of the preceding San Pedro phase (1200-800 BC) to significantly smaller, deeply corner-notched Cienega points. Investigations over the past two decades at residential sites in the floodplain of the Santa Cruz River in Tucson, Arizona have recovered numerous Cienega points that exhibit a range of design variation on the basic template that was originally defined in 1995. Recent excavations at the Clearwater site, AZ BB:13:6(ASM), indicate design differences between points recovered from pithouses and points recovered from burials—including points found within the skeletons of presumed homicide victims. These points are placed within the context of the larger regional database to explore the functional and social implications of a new technological tradition that was quickly adopted within the Santa Cruz and San Pedro drainages of southern Arizona at the beginning of the Cienega phase.

Slocum, Diane (Fort Huachuca Cultural Resources)

[189] *An Investigation of Demographic and Spatial Patterns at the Fort Huachuca Cemetery, Arizona*

This paper investigates the development of the Fort Huachuca Cemetery, an active burial ground first established in the late-nineteenth century on a military post in southern Arizona. The cemetery is known as a final resting place for a unique combination of individuals including Apache Scouts, Buffalo Soldiers, other late-nineteenth and early-twentieth century military members, non-military early pioneers, and modern-day military personnel. In this study, I use archival data in combination with a survey of the layout of the cemetery to shed light on cemetery demographics and spatial distribution. The data derived from this research contextualize the cemetery in the historical-period development of Fort Huachuca and Euroamerican settlement in southern Arizona.

Slocum, Kat (Wayne State University)

[414] *The Forest through the Trees: Using Vivifacts to Analyze How Native American Landscapes Shaped Colonial Encounter*

In 1836, after centuries of occupation, Native Americans signed over 13 million acres of Northern Michigan land to the U.S. in an attempt to curtail complete removal from their ancestral homeland. This research project examines the transitional period of land loss in the mid-19th century to analyze to what extent Native Americans utilized the landscape before, during, and after reservation allotment and how Native American landscape use shaped colonization. Using a landscape approach, this research evaluates primary source accounts of missionary cartographers as they mapped the region and identified land for reservations. These reservations intended to limit Native Americans to smaller defined territories and challenged mobility outside of those allotted spaces. In contrast to the emerging colonial landscape, this research examines to what extent Native Americans maintained mobility within the broader landscape and whether this mobility played a central role in maintaining a distinct cultural identity. Using mapping of culturally modified trees and excavation, this research reconstructs the Native landscape at a key point in the colonization process and contributes to current debates in anthropology surrounding indigenous landscapes, how colonial power is actively negotiated, and the relationship between exploration and colonization.

Slotten, Chelsi (American University)**[273]** *Surviving Violence: Healthcare in the Danish Viking Age*

The Viking Era has been characterized as a time of great violence in both modern and historical accounts, however, little work has been done to analyze the cultural norms and practical considerations surrounding healthcare during the Viking Age. If Viking Age society was as violent as purported, it would have needed to have well-honed systems of care in place to deal with the inevitable aftermath of these violent encounters. Bioarchaeological data provides an avenue for exploring how this society dealt with non-lethal violence through an examination of the actual bodies that experienced and received forms of healthcare. This paper will utilize the bioarchaeology of care method to analyze the care that one individual from the Danish Viking Age site of Bogøvej received after suffering blunt force trauma to the skull.

During the Late Paleoindian period in North America approximately 12,000 years ago, Dalton hunter-gatherers substantially altered their hunting technology by modifying their point blades with teeth-like serrations and bevels. The functions of these attributes have been the focus of a long-held debate. Some argue that the variation relates to use as knives and drills, showing an adaptive shift to processing smaller game like deer, and others suggest these new attributes were crafted only to tip darts of an atlatl for projectile hunting. Investigating the functions of these points is critical for understanding how humans technologically adapted to a return to glacial-like conditions and the extinction of megafauna at the end Pleistocene. In this study, we use experimentation to build analogues for interpreting usewear traces on an archaeological Dalton point assemblage. We then consider changes in point functionality within the broader context of the organization of Dalton lithic technology and how these changes reflect adaptations to the emerging Holocene environment.

Smeeks, Jessica (Binghamton University)**[98]** *Constructed Landscapes: Late Intermediate Period Architecture and Spatial Organization in the Huamanga Province of Peru*

According to landscape archaeologists, structures are not passive forms of material culture or passive backdrops of culture. They are cultural modifications that not only reflect, communicate, or symbolically express past ideas and cultures but also actively mold or influence future human actions. Architectural form depends on functional and social demands—a wide range of cultural decisions. Drawing on five months of archaeological survey work in the Huamanga Province of Peru, this paper considers the architectural designs and layouts of 17 Late Intermediate Period (ca. AD 1000-1450) sites. In an effort to understand the socio-cultural logic behind architectural construction during this time period, I combine four forms of analysis—stratigraphic analysis (analyzing the architecture vertically like a site by looking at the design and construction processes), spatial analysis (breaking down social space to identify site layout, different structure types, and architectural features), movement analysis (evaluating accessibility), and visual analysis (noting perception from and perception of various structures). This is a first step in understanding the everyday lives of these prehistoric people.

Smiarowski, Konrad (CUNY Graduate Center), Christian K. Madsen, Michael Nielsen and Jette Arneborg

[251] *Environmental Threats To Viking Age and Medieval Norse Sites in Southwestern Greenland*

This presentation is one of the products of a series of ongoing inter-connected, international, interdisciplinary fieldwork projects coordinated by the North Atlantic Biocultural Organization (NABO) research cooperative since 2005 in Greenland. The projects drew upon more than a century of prior field research, where four generations of archaeologists described and assessed organic preservation conditions at their sites in several regions of the Norse Eastern Settlement. This created a unique form of “archaeological TEK” (Traditional Ecological Knowledge) that represents an invaluable guide into the changing preservation conditions since late 19th century. Between 2005-2017 we conducted extensive coring surveys of over 100 Norse middens, and open area and small test excavations at over 15 sites. The results show a shocking and almost complete loss of once outstanding organic preservation in a region where only 60 years ago wood, bones, leather, wool, and feathers were recovered. Our findings draw attention to the destructive process of the modern climate change that has been affecting the organic preservation conditions for at least 60 years, and to the need to organize a circumpolar-wide, international response strategy to rescue the endangered sites and their unique cultural heritage before it is too late.

Smit, Douglas (University of Pennsylvania)

[271] *Photovoice and Participatory Strategies for Community Heritage in the Peruvian Andes*

The Huancavelica mining landscapes in the Peruvian Andes present two historical narratives that continue to shape contemporary heritage discourse. On one hand, Huancavelica was the “crown jewel” of the Spanish empire due to lucrative mercury mining. For indigenous Andean peoples forced to labor underground, Huancavelica became known as “the mine of death” due to the lethal toxicity of mercury extraction. More recently, the Peruvian Ministry of Culture placed Huancavelica on the UNESCO Tentative List, and ongoing heritage discussions continue to follow this interrelated binary of wealth and violence. However, for the Santa Bárbara community, the high-altitude grasslands near the colonial mines and ruins of smelters are not just spaces of past exploitation or technological development, but home. In this talk, I examine how the people of Santa Bárbara negotiate the development of cultural heritage in their community in concert with and sometimes counter to the narratives of government officials, outside consultants, and North American archaeologists. Drawing from archaeological fieldwork and oral histories collected since 2013, as well as a PhotoVoice project initiated in 2018, I show how Santa Bárbara people root their heritage claims in a communal notion of landscape, rather than specific historical sites.

Smith, Adam (Cornell University)

[196] *The Stone Bridge: Obsidian Circulation and the Friction of Persistent Frontiers*

In Jose Saramago’s classic “The Stone Raft”, the Iberian peninsula breaks free from Europe to float unmoored into the Atlantic, etching into continental geology what David Anthony has termed a “persistent frontier”: a fault line demarcating durable cultural, ethnic, and linguistic differences. In the archaeology of Southwest Asia, stone has typically been understood, contrarily, as a resource that, as early as the Neolithic, was able to move through and across significant social, cultural, and economic zones with relative ease. Obsidian, in particular, looms large thanks both to Renfrew’s examinations of exchange patterns and to recent chemical characterization studies. What remains less clearly defined are the specific spheres of practice within sites that were linked by this stone bridge. Did all households participate in the same material flows or is there evidence of differential participation? Did some institutions nurture some network pathways over others? This paper will present the preliminary results of a pXRF geochemical characterization study of obsidians from residential, mortuary, and divinatory contexts at the Early and Late Bronze Age site of Gegharot in northwestern Armenia in order to assess stability and change in one site’s link to the stone bridge.

Smith, Alexander (The College at Brockport, State University of New York), Nathan Hayes (Cumming Nature Center), Vincent Feucht (Cumming Nature Center) and Chris Matagne (Rochester Museum and Science Center)

[118] *The Excavations at Frost Town: Public Archaeology at a 19th Century Logging Settlement*

The Cumming Nature Center of Naples, New York contains a significant portion of the remains of a 19th century logging settlement, once known as Frost Town. The site, home to many Euro-American settlers throughout the 19th century, saw the rapid rise of a logging-based economy associated with the growing industrialization of Western New York, following the construction of the Erie Canal. Frost Town subsequently saw the decline of this industry as environmental circumstances

changed and the old-growth forests disappeared due to over-logging. This led to some failed attempts at farming, followed by the eventual abandonment of the site in the early 20th century. The Cumming Nature Center is part of the Rochester Museum and Science Center. In recent years, the center has increased its efforts to engage with the museum's public via Family Archaeology Weekends and collaborations with the College at Brockport. This poster will showcase the work being done at Frost Town by undergraduate archaeology majors, local archaeology enthusiasts and area children during our outreach events. This poster and project will add to the continuing conversations on how best to responsibly integrate students and the public into archaeological excavations at Frost Town and beyond.

[22] *Mapping Unmarked Graves in Remote Australian Aboriginal Communities*

This presentation outlines the public good that is being produced by a project being undertaken at the request of the Elders from the remote Aboriginal community of Barunga, Northern Territory. It may be hard to believe, but in 2018 the vast majority of graves of Aboriginal people in remote Northern Territory communities are not recorded in any register. When someone dies they are buried, but there's no written record of which grave belongs to whom. This makes it difficult to mourn properly, or to care for that person by caring for their grave. Accordingly, this project is locating unmarked graves, identifying the occupants of those graves, mapping the cemetery and developing a burial registry for the Barunga community. This research will make it possible for family members to mourn for their loved ones properly, to care for them by caring for their grave. In addition, this project addresses the need for new models of employment that allow Aboriginal people to stay on country. Having the skills to work as archaeological field assistants will broaden the employment opportunities of people trained in this program.

[32] *Cryptotephra Studies in Africa: A Tool for Precise Dating and Continental Correlation of Archaeological Sites*

Placing archaeological sites on the same timeline across the African continent is essential for determining the initial appearance of key human behaviors and cultural features. Analytical error associated with traditional dating techniques makes these determinations difficult. Cryptotephra, which are small (<80 micron) volcanic glass shards that occur invisibly in sediments and are deposited nearly instantaneously after an eruption, can provide a new dating tool suitable for addressing questions that cannot be answered without precise age control. This can be particularly valuable in situations where radiocarbon and other techniques are not applicable. One widespread tephra deposit ideal for this purpose is the

Youngest Toba Tuff (YTT), erupted ~74,000 years ago from Indonesia. YTT was identified at Lake Malawi (Lane et al., 2013) and on the southern coast of Africa at Pinnacle Point and Vleesbaai (Smith et al., 2018). YTT may have covered most of central and southern Africa, making its identification ideal for linking archaeological sites. Our goal is to provide regional correlation of archaeological sites by searching for YTT across Africa. We collected and processed samples from the Diepkloof rock shelter and Klasies River and plan to extend our work to other critical sites in southern, eastern and central Africa.

[249] *The First Centuries after Clovis: A Review of Younger Dryas Western Stemmed Tradition Occupations in the Great Basin with a Focus on What They Can Tell Us about How and When Humans Colonized the Western United States*

In recent years the number of researchers who argue that the Western Stemmed Tradition (WST) marks the descendants of colonizing populations who traveled along the Pacific Coast before moving inland has increased. The Paisley Caves and Cooper's Ferry sites have provided compelling evidence that groups in the Intermountain West used WST points at around the same time that groups used fluted points on the Great Plains and the Southwest. In the centuries that followed the Clovis Era, additional WST sites were occupied for the first time. These sites provide snapshots of Paleoindian life during the last few centuries of the Pleistocene. In this presentation, I review what we know about WST lifeways during the Younger Dryas with a focus on what the earliest sites in the Intermountain West can tell us about how and when groups colonized the region.

Smith, Gerad (University of Alaska Fairbanks)

[269] *A 2000-Year-Old Family: Interpreting Site Structure and Human Behaviors at the Swan Point Site, Interior Alaska*

This paper seeks to interpret the spatial patterning of the Swan Point Locus 2 site, interpreted to be a seasonal residential site. The site, located on a hill overlooking a small northern tributary of the Tanana River, consists of several features in excellent preservation. The assemblage suggests a pattern of features and artifacts consistent with a residential site. The features (housepit, cache pits, and footprint) are a unique look into domestic behaviors of the later millennia of the Northern Archaic tradition. The lithic and faunal assemblages suggest either impoverished activities, or possible adherence to later known Athabascan behaviors consistent with cleansing a site upon abandonment, rather than a reflection of economic success. The interpretive results suggest an interesting case study where the investigator's cultural biases can inform the results into very different conclusions.

Smith, Gregory [407] see Alonso, Alejandra

Smith, Heather (Eastern New Mexico University)

[51] *Variability in Clovis Biface Morphology from the Type-site, Blackwater Draw Locality 1*

The Blackwater Draw Locality 1 site provides one of the most unique perspectives of Paleoindian behavior in North America. Spatial evidence surrounding faunal and lithic assemblages have inspired researchers to hypothesize site function to represent kill, scavenging, caching, or domestic activities. Its setting relative to other localities of resource acquisition has served as a heuristic for models of early Americans' mobility and technological organization. However, thorough analyses of biface collections from the site have not been completed in entirety. This is partially because of a history of excavations conducted by an array of institutions where the assemblage resides in pieces across the country. This research represents the launching of an endeavor to compile an exhaustive dataset of lithic bifacial artifacts from Blackwater Draw, beginning with examination of the morphological variability of artifacts curated at Eastern New Mexico University using Geometric Morphometrics. Intra-assemblage morphological variability will be compared to that of Paleoindian sites from across the Southwest representing specific behaviors, such as kill and quarry activities, to increase our understanding of the function of Blackwater Draw in the late Pleistocene.

[51] *Chair*

Smith, Heather (Kent State University)**[92]** *Rock Music: The Sounds of Flintknapping*

All natural substances have intrinsic acoustical properties. Flint, obsidian, and basalt, because of their comparable structure, have very similar sound properties. We explore here whether every piece of knappable stone, within certain parameters, will produce the same fundamental pitch along with its associated partials. The partials of the harmonic sequence are determined by wave theory. This pitch can be modified slightly in a few ways, but the wide majority of the sounds produced are at the exact same frequency. Variables such as stone quality, morphometrics, pressure, and heat treatment may have differing effects upon the sound of the stone. The distance that the knapping sounds can be heard would vary according to several ecological factors. The sounds of flintknapping may have influenced many aspects of the life of ancient peoples, including their choice of raw materials.

Smith, J. Gregory (Northwest College) and Kierson Crume (BLM, Cody Field Office)**[17]** *Archaeological Collaboration in Northwest Wyoming: Recording BLM Sites with College Students*

This paper reports on a developing collaboration in northwest Wyoming between Northwest College (NWC) and the Bureau of Land Management, Cody Field Office (BLM). The collaboration began as an informal partnership where college students visited prehistoric archaeological sites on BLM land as part of an extra credit field trip. This past fall, the partnership became more substantial as now an entire NWC course has been built around recording BLM sites. Using a range of recording techniques both ancient (tape, compass, paper) and modern (drone, photogrammetry) students documented a prehistoric stone circle ("tepee ring") site in Park County, Wyoming. The site has seen increasing impact from proliferation of Off-Highway-Vehicles, which instilled a tangible sense of stewardship for the students. In addition to learning field methods, the students applied the newly acquired data to complete a Wyoming Cultural Properties Form. The project is mutually beneficial in that NWC students get some hands-on experience doing archaeological fieldwork and the local BLM office gets much-needed documentation about cultural resources under their jurisdiction.

Smith, Jane**[12]** *The Ranger Boat Chugach*

The Forest Service in Alaska has long relied on marine vessels to access the wild and remote country of the Chugach and Tongass National Forests. The MV Chugach, a ranger boat listed on the National Register of Historic Places, was integral to successful forest administration and the maritime history of the Pacific Northwest. Launched in 1925 she influenced the regional economy while providing for the welfare and safety of isolated communities and vessels in distress. Her role in revealing the rich and complex cultural identity of Alaska Natives is well documented, not only by the hundreds of archaeology sites discovered off her bow but by the likes of noted archaeologists and anthropologists who plied Alaska waters. Frederica de Laguna, Kaj Birket-Smith, Aleš Hrdlička and Robert F. Heizer all spent time aboard the Chugach visiting villages and staging significant excavations.

[88] *Archaeological Salvage at Pockoy, a Late Archaic Period Shell Ring Site on the Botany Bay Heritage Preserve, Charleston County, South Carolina*

Coastal property owners and managers face a range of ever-growing threats, from frequent flooding to wholesale land loss, as the effects of anthropogenically induced climate change come home to roost. The problem is particularly acute for land managers of archaeological sites already at or near sea level. Pockoy (38CH2533), a late Archaic period shell ring site on the Botany Bay Heritage Preserve, Charleston County, South Carolina, is one such site. Land loss on the windward side of Pockoy Island is occurring at an astonishing rate of about 9m a year, causing direct and irreparable harm to Pockoy 1, one of the two rings that make up 38CH2533. The 60m diameter shell ring will be gone by 2025, if erosion rates hold. In this poster, we present our efforts to recover information about this significant site before it is lost forever.

Smith, Kevin (Haffenreffer Museum, Brown University)

[31] *EAGERs and RAPIDs – Small Grants with Big Outcomes at Surtshellir Cave, Iceland*

Anna Kerttula's stewardship of NSF's Arctic Social Sciences program not only expanded opportunities for large-scale collaborative research projects in the North, but also increased opportunities for supporting smaller "high risk" and "time-sensitive" projects through the EAGER and RAPID programs. These smaller projects, funded at the discretion of the program officer, generally attracted less attention but had the potential to generate significant results, set larger projects in motion, or resolve crisis situations efficiently.

In this presentation, I discuss my own experience with EAGERs and RAPIDs in the re-investigation of a unique Viking Age site located inside a lava cave within Iceland's rugged interior. While an EAGER initially allowed us to test the capabilities of an NSF-funded photogrammetric program inside the confined setting of a cave, the work done on that small project revealed the presence of unanticipated intact deposits that were threatened not only by unregulated tourism but also by the very work we had done. A subsequent RAPID allowed us to mitigate that risk through the site's excavation, producing new and surprising data on this unique site that has forced a reconsideration of its role and of myth, ritual, and leadership in Viking Age Iceland and perhaps beyond.

[265] *The Western Gateway: Identification and Recommendation of the Hoosac Tunnel National Register Historic District*

The Hoosac Tunnel is a 7.6 km long railroad tunnel within Hoosac Mountain located in northwestern Massachusetts, extending between the towns of Florida and North Adams. The project was deemed of utmost value to encourage efficient trade between opposite sides of the Hudson River, which is why, regardless of its obstacles, the construction continued and was completed by 1877. Overall, the construction of the Hoosac Tunnel was and remains one of the largest engineering feats within North America. The Hoosac Tunnel itself was listed on the National Register of Historic Places in 1971, however, none of the associated structures required for the construction (e.g. the Deerfield dam and compressor building and machine shop) had been documented, let alone assessed for eligibility for inclusion in the National Register of Historic Places. A recent hydroelectric relicensing project within the region, required under Section 106, has identified seven archaeological areas associated with the construction of the Hoosac Tunnel, and as a result, has recommended the creation of the Hoosac Tunnel National Register Historic District. This paper will discuss the recent findings and their

association with the construction of the Hoosac Tunnel.

[331] *Where the River Flows: Water Politics and Textile Production in Colonial Peru*

Water is intrinsically linked to textile production. The dye process requires a substantial amount of water to acquire a consistent and proper color. Colonial textile mills, known as obrajes, were strategically built near bodies of water for this reason. Obrajes significantly shaped colonial water politics. Their presence on the water changed waterscapes, or the way that local communities culturally and sensorially interacted with the water. Obrajes additionally altered the waterworld by changing how society and water sources were connected. The obrajes policies altered traditional textile production roles, often among new gendered and racialized lines, thus changing the ways people were connected with water. This paper focuses on the obraje de San Marcos de Chinchero (Ayacucho) to examine how obrajes changed the waterscape and the waterworld of the region. The obraje de San Marcos de Chinchero located in the Ayacucho region of Peru operated from the 1570s through the 1820s. Built on a Pre-Hispanic sacred landscape the obraje significantly defined how people interacted with and experienced the nearby Huancapi river and a tributary which runs alongside the obraje site. The obraje provides an excellent case study to understand the relationships between water politics and textile production in Colonial Peru.

[23] *Temporary Aggregation Sites in the Past: Are They Really So Strange and Anomalous?*

Recent research suggests that temporary aggregation sites were more common in the past than many traditional models would predict. Why have scholars failed to recognize these sites? Why do they seem so strange? Beyond the development of more refined methods of settlement analysis, a major reason is a pervasive conflation of urbanism and social complexity. While these two processes more often than not co-occurred in the deep past, each may exist without the other. A growing number of archaeologists (including Justin Jennings and David Wengrow) are now suggesting that urban settlements preceded states in the past. I present a sketch of a simple model that explores the drivers of aggregation and dispersion, for hunter-gatherers, village farmers, and complex polities. There are strong economic and social reasons to resist aggregation, and it may take serious threats of violence or conquest to overcome these forces. But, social complexity can thrive in the absence of permanent urban centers, as we know from Anglo-Saxon England and some of the case studies in this session. An appreciation of the nature and diversity of temporary aggregation sites can help us develop better explanations of settlements and urban dynamics in the past.

[31] *Norse Textiles at the Western Edge of the North Atlantic*

Anna Kerttula's vision of Arctic research incorporated a desire to see female scholars succeed and work on issues pertaining to women's lives in the North. Three NSF-funded grants from Arctic Social Sciences, focusing on textiles as women's production, used over 1500 textiles from Iceland, Greenland, the Faroes, and Scotland to emphasize the work of women in the North Atlantic's past and have helped contribute to a gendered archaeology of the North. In this paper, I will focus on textiles from Norse Greenland, where new data indicates that the emergence of weft-dominant cloth was a strategic response by Greenlandic women to climatic deterioration at the start of the Little Ice Age. Moving farther west, new NSF-funded research on sporadic textile finds from the Canadian Eastern Arctic demonstrates that while the Norse did travel these northern seas, and interacted with Indigenous people, leaving evidence including vaðmál from Skraeling Island and northwest Greenland, they did teach not the Dorset to spin as was previously assumed. In these NSF funded projects, textiles have been analyzed as valuable expressions of culture, rich with meaning and significance,

providing new details about Norse subsistence, culture and life style at the edge of the medieval European world.

[325] *Toward the Remote Identification of Stone Tools in Submerged, Buried Contexts Using Acoustics*

Since the inception of geophysical survey, archaeologists have longed for the ability to detect the presence or absence of artifacts in buried contexts remotely. This ability is particularly desirable underwater, where accuracy in site location and efficiency in excavation are paramount given the expense and logistical burden associated with performing archaeology underwater. Generally speaking, traditional remote sensing instruments used in area survey, such as side-scan sonar and magnetometers, only identify underwater historic sites, or in rare circumstances, exposed prehistoric sites. The search for submerged prehistoric sites in buried geologic contexts largely relies on identifying high-probability landforms through sub-surface geophysics or bathymetric survey. However, recent research pioneered by Dr. Ole Grøn and colleagues demonstrates the potential for using acoustics to identify and map offshore prehistoric sites by remotely identifying human-worked flint. Here, we test the reliability and replicability of this method on submerged prehistoric sites in Florida. We present the results of controlled laboratory experiments on the acoustic resonance signatures (in kHz) of different stone tool raw material types. We then present the results of sub-bottom sonar surveys of fresh and saltwater prehistoric sites in Florida. Last, we discuss the implications of our findings for CRM, government, and academic archaeology.

[8] *Materiality and Memory: Understanding the Clandestine Movement of Child Migrants along the U.S.-Mexico Border*

The Undocumented Migration Project (UMP) is a long-term anthropological analysis of clandestine border crossings between Northern Mexico and Southern Arizona that began in 2009. The UMP uses a combination of ethnographic and archaeological approaches to understand the distinct experiences of migrant subpopulations. This study focuses on child migrants and how they are represented through public discourse and the archaeological record. Lab analyses were conducted on the artifacts that the UMP has collected to examine how child migration is represented in the archaeological record. Archival research was utilized to investigate statistics related to child migration and the ways in which the subject is discussed in popular media and policy reports. Additionally, interviews were conducted with undocumented youth regarding their immigration experience. The statistics indicate that tens of thousands of children are migrating, however, the minute amount of archaeological evidence does not correlate. This research project aims to demonstrate the relationship between the materiality of migrant children and their narratives and memories in order to make these lived experiences visible. Little work has been conducted on understanding child migrants, therefore this study sets out to shed light on their experiences and the ways in which we think about children migrating across borders.

[253] *Beyond the Genome: Unravelling Life Processes Using Epigenomes and Ancient RNA*

The power of ancient DNA to archaeological research needs little introduction. Recent technological revolutions in DNA sequencing have allowed entire populations, lineages, ecosystems, and epidemics to be reconstructed. While these large-scale studies address 'big picture' questions of prehistory, more subtle, specific questions about past organisms' interactions with their surroundings - for example, those surrounding domestication, sudden palaeoclimate change, or local adaptation - can also be asked as part of wider archaeological themes. Recent technological developments allow complex, elusive questions of 'in vivo' processes - what genomes actually do, as opposed to what they are - to also be asked as archaeological questions, through the lens of evolutionary biology. By studying ancient epigenomes, for example, we can see how and when genes are 'switched' on or off, and better understand past, causative environmental events. By sequencing ancient RNA, we are moving towards confirming these processes and more: new research shows the potential

to identify otherwise unknown tissues, uncover a greater range of palaeopathogens, and even observe their hosts' genetic responses at the moment of death. Here we present several case studies of our original research using these techniques, illustrating how the various layers of ancient genomics can help serve wider archaeology.

Smith, Ryan (University of Pittsburgh)

- [18] *An Alternative Pattern of Coalescence: A Study of Architecture and Organization at a Non-fortified, Pre-Inca Town in the Southern Highlands of Peru*

This paper presents a detailed analysis of architecture and spatial organization at Maukallaqta de Nuñoa, a pre-Inca site in the highlands of southern Peru. Maukallaqta was constructed at a time when societies across much of the central Andean highlands were constrained by persistent threats of violence and political decentralization, as indicated by the coalescence of large communities perched atop hills with large man-made walls, reinforced natural defenses, sweeping views to survey the surrounding landscape, and often very little in the way of permanent architecture other than relatively simple 'round-house' foundations and defensive walls. Contrasted by its immediate neighbors which all conform to these patterns, Maukallaqta's residential sector is distinguished by the presence of over 400 well-made domestic structures of relatively uniform size, form, construction, and orientation along with several dozen above-ground chullpa burial towers scattered throughout. The organization and spatial relation of these structures in addition to the site's non-fortified nature provide immediate clues as to the exceptional use of this space during this time. Preliminary results based on site-wide architectural mapping and further GIS analysis focus on comparing site planning, use of space, and nature of social life at Maukallaqta with that of contemporaneous hillforts in the Andes.

- [86] *Subsistence and Daily Needs at the Basketmaker Communities Project: Insights Through the Microscope from Plant Remains, Wood, and Pollen*

Large archaeobotanical datasets concentrated in a specific region are rare, especially those representing multiple sites excavated over several years. The Basketmaker Communities Project is one such rare research program that resulted in the analysis of hundreds of macrobotanical, flotation, and pollen samples. This exceptional record documents the intense Basketmaker III (A.D. 500-750) investment in maize agriculture and an intimate knowledge of the useful resources in these peoples' home landscapes. Recovered plant remains represent species from local canyons, water sources, and the fertile rolling hills of Southwest Colorado.

Smith, Tam (The University of Queensland)

- [240] *Coastal Southeast Queensland, Australia: An Historical Ecology Model of Mid- to Late Holocene Settlement and Subsistence*

Coastal Southeast Queensland covers an area stretching from Fraser Island in the north to the border of northern New South Wales in the south, and possesses the best documented and most intensively scrutinized coastal archaeological record in Australia. The area was a major focus in the late 1970s when the Moreton Regional Archaeological Project, a long-term multi-stage regional project, was established at The University of Queensland to coordinate archaeological investigations. Initial studies provided the basis for a regional chronology, as well as models of settlement and subsistence based on the exploitation of the area's rich marine resources. In the time since the original work was conducted the research foci for coastal archaeology have moved toward more complex issues such as assessing the impact of humans on marine ecosystems, the identification of patterns in resource exploitation strategies, and the use of molluscs as proxy evidence in local and regional environmental reconstructions. Re-analysis of midden deposits from differing locations in Southeast Queensland in the context of recent regional palaeo-environmental reconstructions indicates considerable variability in site characteristics across the region, strongly influenced by local environmental factors.

[47] *Did the Neolithic Revolution Revolutionize the European Landscape? An Analysis of the Relationship between Climate, Vegetation, and the Arrival of Agro-pastoral Subsistence*

Archaeologists have long recognized the spread and adoption of agro-pastoral subsistence in Europe as a transformative economic and social process. While many studies have tied site-specific changes in vegetation communities to the arrival of the Neolithic, very few attempts have been made at synthesizing these data to examine the Neolithic revolution in Europe as a whole. Our recent research highlighted transitions in vegetation communities associated with the arrival of Neolithic agriculture across much of Europe through a segmented regression analysis of over 400 pollen records. In many cases, the timing of these shifts coincides with the arrival of Neolithic agro-pastoral land use, but not all. In this paper, we extend our analysis to focus on how changing climate associated with the early and middle Holocene may help explain vegetation changes not tied to the arrival of the Neolithic. Moreover, we now explore how intensifying land use related to post-Neolithic population growth may have resulted in delayed vegetation responses beyond the initial Neolithic revolution throughout Europe.

[37] *Coming to the Islands: Strontium and Oxygen Isotope Investigation of Human Mobility in the Bahamian Archipelago*

Initial settlement of the Bahamian archipelago is currently thought to have derived from Cuba and/or Hispaniola. The first forays may have been seasonal, with permanent settlement not in evidence until ca. AD 1000. As well as initial settlement, we might expect a continued movement of individuals between the Greater Antilles and the Bahamas. Strontium and oxygen isotope analyses of human dental enamel provide the opportunity to explore both early settlement and subsequent movements. A recent strontium isotope study of modern plants from the Bahamian archipelago demonstrates very homogeneous results, so that outsiders from different geologies should be readily apparent. This paper presents the first strontium and oxygen isotope results on human remains from the archipelago, with associated radiocarbon dates enabling an investigation of the temporality of migrations.

[286] *Reconstructing Childhood Diet in the Aftermath of Wari Imperial Decline: Stable Carbon Isotope Analysis of Human Dentition from Huari-Monqachayoq-Solano, Peru*

Stable isotope analysis can illuminate aspects about a population's diet and migration patterns otherwise unavailable through skeletal analysis. The population for this study is a mass burial at the site of Huari-Mongachayoq, excavated by Francisco Solano in the 1980s. The skeletons date to the second half of the Andean Late Intermediate Period, ca. 1275 – 1430 CE, approximately two centuries after the political decline of the Wari Empire. This time was also characterized by a long-term drought, which may have affected agricultural production, thus affecting the diets of these post-Wari individuals. Our study uses stable carbon isotope analysis of human dentition to explore how specific aspects of childhood diet changed, if at all, from Wari to post-Wari times. Furthermore, because dental enamel forms during childhood, we can investigate whether juvenile males and females consumed distinct diets, an insight that can shed light on gender norms and gender roles in post-Wari society. We also explore how isotope values differ between those with cranial modification and those without. Forty-eight enamel samples from this population will be compared to previously published data from the same site, which showed $\delta^{13}\text{C}$ values ranging from -7.9‰ to -2.3‰, and the mean $\delta^{13}\text{C}$ = -4.7‰ (s.d.=1.5).

Soderberg, John (Denison University)

[351] *Care and the Disregard of Care in Medieval Ireland*

In recent years, bioarchaeologists have become interested in developing archaeologies of care. Their goal is to articulate evidence of disease/trauma/impairment on skeletons with social processes that shape healthcare and other forms of assistance. Realizing the full potential of this perspective requires deepening understanding of care as a social phenomenon and explaining why scholars have often disregarded care as an important social dynamic. This paper offers two steps toward developing an archaeology of care, using medieval Ireland as a case study. The first expands application of the perspective to a different type of archaeological data: animal bones. Zooarchaeological reports on "pathologies" are often little more than lists of conditions identified. This paper will examine how such data on the health of animals reflects changing social conditions in medieval Ireland. Second, the paper considers how inquiry into medieval Ireland has been impaired by disregard for care and how establishing care as an important social dynamic provides new insights.

[110] *Estudio de la variación del ADN mitocondrial en entierros de Tlailotlacan, Teotihuacan*

Teotihuacan fue una ciudad del periodo Clásico (100-650 d.C.), que tuvo una gran interacción con otras áreas de Mesoamérica como el Occidente y el Golfo de México, el Área Maya y Oaxaca. Este trabajo se centra en el análisis de restos óseos del barrio oaxaqueño en Teotihuacán, que también se conoce como Tlailotlacan. En este barrio existe evidencia de intercambio de bienes que proceden de Oaxaca, del Valle de Toluca y del Occidente de México. El análisis de marcadores moleculares del DNA mitocondrial humano en conjunto con los datos geográficos, arqueológicos, históricos y culturales permiten realizar estudios a nivel regional, para comprender mejor la composición genética y dinámicas de las poblaciones antiguas. Este estudio se centra en conocer la estructura genética de la colección ósea de los antiguos habitantes de Tlailotlacan, a partir del análisis de los haplogrupos amerindios del DNA mitocondrial. DNA de fragmentos de huesos largos y falanges de 20 individuos fue extraídos para calcular distancias genéticas con FST, de acuerdo a la distribución de haplogrupos mitocondriales. Un flujo génico fue reconstruido entre otros barrios teotihuacanos y grupos del

Centro y Sur de México de la época prehispánica del período Clásico y Posclásico.

Solis, Kristina (University of Texas at San Antonio)

[111] *Postmarital Residence Patterns of Late Archaic Hunter-Gatherers from the Loma Sandia (41LK28) Site, Live Oak County, Texas: An Analysis Using 87Sr/86Sr*

Archaeologists researching hunter-gatherers in the Texas Coastal Plains (TCP) and Central Texas have noted differences between sexes in carbon and nitrogen isotope studies. One explanation offered for these differences is due to mate exchange, specifically patrilocality. Evidence for hunter-gatherer patrilocality in Texas also comes from the ethnographic record but there has been little other archaeological evidence to evaluate this possibility. The study presented here will utilize strontium (Sr) isotope analysis as a more direct archaeological method to evaluate postmarital residence patterns in the Late Archaic TCP. Human male and female 87Sr/86Sr were analyzed and compared to each other, and also to the local faunal bioavailable strontium, in order to understand postmarital residence patterns. This presentation reports the results of strontium isotope ratio (87Sr/86Sr) analysis from 47 samples from Loma Sandia (41LK28), a Late Archaic site in Live Oak County, Texas.

Solis, Reyna (MUSEO DEL TEMPLO MAYOR-INAH) and Emiliano Melgar (Museo del Templo Mayor)

[39] *Archaeometric Characterization of the Lapidary Objects from Teopancazco and Xalla, Teotihuacan*

One of the main goals of the archaeological researches in Teotihuacan is the analysis and classification of the material culture in order to distinguish local and foreign goods among this multiethnic settlement. In this paper, we will present different archaeometric studies applied to the lapidary assemblages from the neighborhood center of Teopancazco and the palace compound of Xalla. These objects were analyzed by non-destructive techniques (UVF, IRR, OM, SEM-EDS, and μ Raman) to identify their chemical composition, mineralogy and provenance, and the characterization of their manufacturing traces. We detected raw materials from diverse geological origins, like jadeite, green quartz, serpentine, white and green travertine, amazonite, pyrite, slate, and marble, among others. With the traceological analysis we distinguish four technological patterns. Their comparison with the lapidary traditions developed in Classic Mesoamerica allowed us to identify them as Teotihuacan, Mezcala, Maya, and Zapotec. Also we appreciate specific relationships and cultural preferences between some types of raw materials, objects, and techniques. Finally, the temporal and spatial comparison of these lapidary items with other areas at Teotihuacan showed the existence of different mechanisms of production and distribution of these goods.

[38] *The Role of Pedogenesis in Palaeosols of Mexico Basin and Its Implication in the Paleoenvironmental Reconstruction*

Most of the paleoenvironmental information for the Basin of Mexico for the basin comes from sedimentary proxies, which unfortunately are incomplete for the terminal Pleistocene and the Holocene. In this paper, we present a temporal and spatial reconstruction of past soil cover in the south and north of the Basin of Mexico, during the MIS 2 and 1 (Marine Isotope Stage 2 and 1). Palaeosol profiles were selected from three locations (Cuicuilco, Copilco, and Avon) in the south basin, and compared with soils studied in the Teotihuacan valley, Pachuca, and Texcoco at north of the basin. The results show that the Pleistocene soil cover is more homogeneous, dominated by the presence of Luvisol type soils with secondary carbonates, dated to around 20000 cal yr BP. During the Holocene, the soil distribution changes, with Andosols developing in the south while Vertisols and Calcisols form in the north. The new soil distribution reflects differing climate conditions during the Holocene, conditions which characterize the basin today. The Andosol cover in south basin although represents the result of short term pedogenesis, are considered high quality soils and attractors for the settlement of sedentary villages.

Solometo, Julie [213] see Rautman, Alison

Solometo, Julie (James Madison University), Wesley Bernardini (University of Redlands), Dalton Olson (James

Madison University) and David Biddle (James Madison University)**[258]** *Shields and Shield Bearers in Hopi Rock Art*

Shields and shield bearers are recurrent and widespread motifs in Pueblo IV (AD 1300-1540) rock art. Polly Schaafsma has argued that depictions of shields and shield bearers in the Rio Grande were part of an iconographic complex that expressed ideas about warfare and war ritual. When inscribed on the landscape, shields may have recalled actual warfare, but they also may have been intended to attract supernatural protection and to project the village's strength and willingness to defend itself. Schaafsma has argued that war iconography is more frequent, diverse, and complex among the protohistoric Eastern Pueblos, suggesting the eastern origins of the imagery and associated concepts. However, her conclusions are based on a limited sample of Western Pueblo rock art. This poster evaluates Schaafsma's claims about Western Pueblo war iconography with more than 100 representations of shields and shield bearers recently recorded on the Hopi Mesas. Potential sources of shield iconography at Hopi are explored with reference to Pueblo III (AD 900-1300) rock art and through Hopi migration accounts. Temporal and spatial variability among Hopi shield depictions suggest that multiple communities of practice produced shield iconography and that they may have had diverse origins or influences.

Somerville, Andrew (Iowa State University)**[81]** *Reconstructing Past Environmental Landscapes in the Semi-arid Regions of North America Using Stable Isotope Analysis of Faunal Bones*

Stable isotope values of carbon, nitrogen, and oxygen in animal bones are influenced by the environmental and climatic conditions present during the lifetime of the organisms. Stable isotope analysis of faunal bones thus permits the reconstruction of past environmental landscapes of archaeological settlements. This paper presents stable isotope results from analyses of rabbit and hare bones at the archaeological sites of La Quemada (Zacatecas, Mexico), La Ferreria (Durango, Mexico) and Pueblo Grande (Arizona, USA). The environmental implications of the results are discussed and contextualized in relation to the known culture history of the region.

Sommer, Caitlin (Crow Canyon Archaeological Center)**[86]** *Oversized Pitstructures in the Central Mesa Verde Region*

The Basketmaker III period (A.D. 500-725) in the northern U.S. Southwest was typified by new technologies, new social and religious practices, and groups of people from distinct cultural backgrounds living in close proximity for the first time. In this sociopolitical milieu, new architectural forms played an important role in the development of larger communities. Oversized pitstructures, such as the one on the Ridgeline site (5MT10711), were one such kind of architecture. These structures had floor areas of greater than or equal to 60 square meters, making them significantly larger than other domestic structures within a community. This paper explores the rise and role of oversized pitstructures in the central Mesa Verde region.

Sonderman, Elanor**[89]** *Evaluating Sandal Types and Chronologies in the Lower Pecos Region of Texas*

Recent research on an existing archaeological collection from Conejo Shelter (41VV162) in Texas explored potential spatial and temporal changes within sandal styles of the Lower Pecos. A sample of 122 sandals, excavated in the late 1960s and stored at the Texas Archeological Research Lab were examined. This research produced 30 new radiocarbon dates for the region, including 17 directly dated sandals. These new dates refined date range estimates based on lithic artifact types - and indicate that the site was occupied as early 7,500 years ago. While the data were not robust enough in early time periods to conclusively suggest distinct stylistic changes through time, some regional affinities were observed. Additionally, a small subset of the sandal assemblage was further evaluated for potential use in children's play or craft learning. Beyond expanding our current understand of sandal use and manufacture in the Lower Pecos, this research also promotes and exemplifies the potential of conducting collections-based archaeological research.

[89] *Chair***Sonenshine, Krista (The Evergreen State College) and Ulrike Krotscheck (Professor)****[107]** *Excavations at the Bush Homestead in Tumwater, Washington*

The family of George Bush has been described in the written record as the first family of mixed white and African American heritage to settle in Washington territory. Systematic excavation of this homestead was not carried out until 2015, at the request of the landowners. This paper describes three seasons of excavation, including two field schools, of the Evergreen State College, and summarizes the results. The excavations uncovered several hundred diagnostic artifacts from the 19th and early 20th centuries, helping to validate written and oral histories of the family. First, surveys were conducted at the site, identifying two main areas of interest: one, the possible location of one of the original barns, the other, possibly the location of Bush's original split log cabin. The 2015 and 2016 field schools yielded numerous diagnostic artifacts clearly showing a consistent agricultural use of the land as well as trade beads and other items from 19th century daily life. The 2018 season focused on a midden deposit, which contained artifacts of similar nature as well as carbonized paper. The archaeological evidence corroborates the historical descriptions of the Bush's livelihoods as well as of their amicable trade relationship with sound Puget Sound Native peoples.

Sørensen, Lasse (The National Museum of Denmark)

[141] *Jadeitite Axes in the Aegean and Anatolia—The Emergence of a New Network*

The largest known jadeitite source in the Aegean is located on the Cycladic island of Syros. During sampling, several patinated flakes and preforms of considerable age were identified, demonstrating, for the first time, the presence of several knapping places around the large jadeitite boulders. In order to classify the specific trace elements from the source of Syros a series of investigations has been initiated using radiospectrometry, XRD, and ICP-analysis.

In connection with the study of jadeitite axe assemblages in the Aegean and Anatolia, several Neolithic and early Bronze Age sites contain these rare objects, thus allowing comparison between larger geological jadeitite and archaeological artefacts. The results indicated that the axes originated from jadeitite sources in the Italian Alps, the local source on Syros and unknown sources. Another ground-breaking result was the discovery of jadeitite axes originating from Syros, found at the site Cukurici Höyük in Western Anatolia. The axes were found in layers dated by 14C analysis to 6500 cal. BC, making them the earliest evidence of jadeitite exploitation in the Eastern Mediterranean region, which was contemporary with the first farmers in Western Anatolia.

Sorresso, Dominique

[204] *Analyzing the Utilization of Shell in Chickasaw Pottery Using Petrographic and Chemical Composition Techniques*

Archaeological and ethnographic records indicate that a change in ceramic technology from recent shell to fossil shell temper took place as the contact period Chickasaw of Mississippi migrated north and adjusted to upland settlements of the Blackland Prairie. While this shift is widely accepted within the archaeology of the region, it can be difficult to apply to specific ceramic assemblages. In order to examine the phenomenon of Chickasaw shell tempered ceramics in more detail and investigate the proposed shift, sherds from three sites in northeastern Mississippi have been analyzed in detail using ceramic petrography, X-ray fluorescence and scanning electron microscopy. Using these techniques, analysis was completed to discern the characteristics of the recent shell and fossil shell tempers, determine the provenance of the ceramics, and understand if elements of the ceramic creation process, such as paste preparation and recipes, were consistent between sites or individual to a single site. Results show compatible versions of recent shell and fossil shell paste recipes across the sites were followed using clay local to each site. This data also demonstrates that macroscopic temper identification is helpful for rough sortability, but fails to recognize key characteristics, such as the use of both tempers simultaneously.

[401] *Collaboration, Accountability, and Performativity: Defining Collaboration in Northern New Mexico Archaeology*

In recent years, collaborative approaches with descendant communities play an important role in archaeological research. One single understanding of "collaboration" does not prepare the archaeologist for the pitfalls and problems of engaging with communities. The result is a multitude of methodological approaches that display as a "continuum" of archaeological projects with collaborative experience that is essential in developing collaborative approaches. "Continuum" and "spectrum" are words that resonate with terms usually associated with Butler's "performativity" in gender identity, but in this case,

collaboration is not defined by the archaeologist's or community's intention, but rather by the outcome or result of knowledge production from working together. The result allows the archaeologist to be accountable to all stakeholders, participants, and partners in all aspects to build community capacity while incorporating multiple forms of knowledge. A local or descendant community can either make or break an archaeological project making collaboration detrimental to several milestones in a project related to research questions, permits, and distribution of knowledge. Learning from previous collaborative projects and working together with the Merced del Pueblo de Abiquiu in northern New Mexico on issues of knowledge distribution gives this descendant community an opportunity to share their history in their own terms.

Soto, Gabriella (Trinity College)

[193] *Absent and Present: Contested Landscapes and Undocumented Migration at the U.S.-Mexico Border*

In pursuing archaeological research on contemporary undocumented migration at the Arizona-Sonora border, it became necessary for me to address the myriad and potent absences that made the entwined processes of undocumented migration, humanitarian efforts on behalf of migrants, and border security aimed against migrants tangible to me through scales of space and time. I confronted a landscape filled with traces of undocumented passage, but where undocumented people were seldom encountered, for many reasons. These traces, most often in the form of intimate survival belongings left behind by migrant travelers, were also changing and disappearing as ephemeral objects subject to degradation in the desert and active removal through organized "trash" clean-ups. Contextualizing all of this was my knowledge of the thousands of deaths and disappearances of undocumented travelers that were also largely absent from view. In this paper, I pair Bender and Winer's seminal work on contested landscapes with Bille, Hastrup and Soerensen's work on the Anthropology of Absence, outlining how material engagements with the conflict landscapes of contemporary undocumented migration must also engage absence. On a broader scale, I query how the power engagements that produce contested spaces might be better understood through an analysis of absence.

[334] *Decontaminating Archaeological Dental Calculus: A Protocol for Reliable Extractions*

During dental calculus formation, mineralization preserves microbotanical remains. These provide paleoenvironmental and dietary information. However, modern contaminants on archaeological samples overlap with target species thus necessitating decontamination procedures. We present an efficient protocol to avoid the presence of contaminants: a) testing the efficacy of Sodium hydroxide, calcium hydroxide, sodium EDTA and alpha-amylase when degrading starch polymers; b) synthesizing artificial dental calculi, from co-precipitating ammonium phosphate and calcium chloride; c) decontaminating samples under controlled conditions; and d) decalcification with EDTA and hydrochloric acid. Precipitation of synthetic calcium phosphate entrapping potato starches simulated the mineralization process in the oral cavity. These matrices were contaminated with a corn-glycine solution (1ml: 1.11M-2.66 M) to simulate the effect of modern contaminants. The immersion of samples in sodium hydroxide (1ml: 0.5M) for 24h, and deionized water (15ml), eliminated the corn granules. Starches originally trapped in the matrices remained undamaged, showing higher resistance to enzymatic and chemical reactions. Calculi were then decalcified using EDTA (1ml: 0.5M) and hydrochloric acid (1.5ml: 0.5M). This protocol has been applied to decontaminate calculi from a late Holocene Congolese individual, with a known C4-dominated diet, demonstrating the elimination of modern contaminants allow stronger paleo reconstructions.

[185] *Ritual Commensality in the Lower Amazon on the South of Amapá State, Brazil, During the Precolonial Period*

In many Amerindian worldviews, commensality pervades to different degrees both mundane and ritual spheres, being a way of caring and building relationships as revealed by available information from ethnology and ethnohistory. Based on these issues, this paper explores the central concepts of body fabrication and ritual commensality as possible ways to interpret

two villages in the south of Amapá State, Brazil, in the lower Amazon river, dating to the 8th to 15th centuries AD. The archaeological structures are associated with two distinct cultural complexes, Jari and Koriabo. These cultural complexes present, based on the depositional contexts, a formalization of the ceramic deposition and arrangement related to funerary program. Possible interpretations include that the archaeological structures could be markers of differences and sociabilities related to ancestor worship.

[8] *Four Horns Lake: Physical and Spiritual Interactions*

Four Horns Lake, located on the southern end of the Blackfeet Indian Reservation in Montana, was surveyed in July 2018 as part of the expansion and rehabilitation project for the Four Horns Dam. Built in the early 1900s, current focus on this dam has induced action to record resources that may be impacted by development. The sacredness of Four Horns Lake to the Blackfeet people is demonstrated by the multitude of associated archaeological sites, stories, and cultural practices. Tipi rings and cairns surround the lake, as do culturally-significant plants and other natural resources. Additionally, the lake is known for being a collection area for Iniskim (ammonites) and the home of Soyeitaapiks (water spirits). This poster will provide an overview of the use and occupation of this area through an archaeological and cultural perspective to comprehensively contextualize and demonstrate the complex culture history of this place concerning pending development.

[195] *New Discoveries on Late Upper Paleolithic (Final Epigravettian) Funerary Behavior at Arene Candide (Finale Ligure, Italy)*

The Epigravettian "necropolis" at Arene Candide Cave (Finale Ligure), excavated in the 1940s, yielded a large Late Upper Paleolithic skeletal series consisting of 10 primary burials and six clusters of bones in secondary deposition, accumulated during two distinct phases separated by a few centuries (AMS dates spanning 12,028 – 11,181 and 12,816 – 12,421 cal BP). At the site, older depositions were intentionally moved aside, then bones (especially crania) were selected and re-arranged around the new burial. In one case, two individuals bearing skeletal evidence of congenital dysplasias (possibly X-linked rickets) were put in relation through this funerary behavior, suggesting that disease and relatedness may have been factors determining mortuary gestures. New analyses demonstrate that one child burial excavated in the 1940s, and attributed to the Neolithic, belongs in fact to the terminal Pleistocene (12,098-11,827 cal BP). The spatial position of this burial suggests the presence of additional burials in the unexplored layers of the cave. One adolescent individual unearthed in the 1970s presents a radio-ulnar dysplasia compatible with Madelung deformity, a dominant X-linked condition, further suggesting that congenital disease, possibly due to inbreeding, may have been central during life, and during the representation of death, in the Final Epigravettian.

Sparaga, Joseph (USACE), Kelly Eldridge (USACE) and Forrest Kranda (USACE)

[241] *You're Building What Where?: Innovation with MOAs in the Far North*

The U.S. Army Corps of Engineers (USACE), Alaska District conducts numerous undertakings in the Arctic regions of the United States. Many of these undertakings, such as coastal erosion protection and small navigation improvement projects, require Memorandums of Agreement (MOAs) among the USACE, the State Historic Preservation Officer, local governments, land owners, and the combination of federally recognized tribes, Alaska Native village corporations, and Alaska Native regional corporations. Many communities in Alaska have both historic structures and precontact sites either within or in their immediate area. A number of proposed undertakings are also located within National Historic Landmarks, where additional considerations for mitigation are needed. Determining appropriate mitigation of cultural resources requires not only collaboration with all concurring parties, but also taking into account the logistical challenges which come with conducting Section 106 in the Far North. This includes both the distance of communities from roads and port facilities, and working in the variable Arctic environment. These restraints create opportunities for innovative MOAs that benefit communities and protect their cultural resources.

Sparks-Stokes, Dominique (University of Cincinnati) and Kenneth Tankersley**[374]** *Mineralogical and Chemical Properties of Preclassic Maya Ceramics from Colha, Belize*

This paper examines the question of whether or not Preclassic Maya exploited volcanogenic ceramic raw materials, which have refractory properties such as thermal conductivity, resistance to thermal shock, abrasion, chemical weathering, and thermal decomposition. Scanning electron microscopy, energy dispersive X-rays, energy dispersive X-ray fluorescence, and X-ray diffractometry are used to examine the mineralogical and chemical composition of Preclassic Maya pottery from Colha, Belize. These analyses demonstrate that the pottery was manufactured from ancient volcanogenic minerals, which has significant implications for understanding the Preclassic Maya ceramic technology. Potential sources of these ceramic raw materials are illustrated.

Spaulding, Britta (University at Buffalo)**[279]** *"Wars are good for the economy": Warfare and Industrialization in Sweden*

Industrial archaeology has been defined in the anthropological literature of the last several decades to analyze the period, related archaeological record, and resultant and surrounding socioeconomic changes of western industrialization—the establishment of large-scale manufacturing—from 1800 CE to the present. In considering a “movement” such as industrialization to be both the result of human agency and of outside conditions around it, I think it is possible, where appropriate, to extend the scope of this sub-field to before the oft-cited mark of 1800 CE. By the 17th century, after the dissolution of the Kalmar Union, Sweden had become a nation-state and would continue to engage in warfare with Denmark for several more centuries. Swedes made preparations for warfare in early modern Europe, with its theaters on land and sea, and increasing sophistication in engaging on both, possible through adapting pre-existing routines of supplementing farming with other economic choices. This background allowed them to increase the scales of resource acquisition, transportation, and ultimately production related to military needs. I look at how industrial archaeology’s methodologies and theoretical lenses help to research how early modern, especially naval, warfare was possible with a largely agrarian, rural population.

Speakman, Robert [94] see Napora, Katharine

Speakman, Robert**[316]** *Things People Do with XRF*

Over the past 15-20 years, archaeological chemistry has moved largely from centralized laboratories of interdisciplinary expertise to decentralized laboratories where expertise often times is lacking. This shift is most pronounced in the widespread adoption and use of inexpensive, compact, highly portable XRF instrumentation. The proliferation of this technology has resulted in an increase in “black box” science where some practitioners analyze anything and everything with complete disregard for foundational studies that demonstrate such an analytical approach is not feasible, desirable, or even possible and/or where the practitioners ignore fundamental issues of reliability and validity in the measurements. In this presentation, I explore published examples of XRF “gone wrong” using case studies solicited from the archaeological science community.

Speal, C. Scott (State of Connecticut), Jean Howson (NV5 Global, Inc.) and Leonard Bianchi (NV5 Global, Inc.)**[357]** *Re-discovery of the Jackson Street “Dog’s Nest” in Waterbury, Connecticut: The First-Generation European Immigrant Experience in New England’s Brass City*

Section 106-mandated review associated with two recent transportation projects—one a City-driven US Department of Transportation TIGER grant program designed to stimulate economic development through local road improvements, and the other a Connecticut State Department of Transportation (CTDOT) undertaking involving construction of a temporary bypass to support repairs to a freeway interchange—resulted in re-discovery of a forgotten first generation immigrant community along the Naugatuck River near downtown Waterbury, Connecticut. Situated in a less-than-pristine location between the city’s famous brass mills, a railroad yard, and a coal gasification plant, this neighborhood was home to

hundreds of predominantly Irish, and subsequently Italian, immigrants between 1850 and 1911 attracted to the labor opportunities provided by the many industrial plants comprising America's 'Brass City'. The cultural resources consulting firm NV5 was tasked by CTDOT with determining what remained of this neighborhood and investigating its historic significance and material integrity through both documentary and archaeological efforts. The resulting investigations have brought to life the trials and tribulations of first generation European immigrants to the United States during the late 19th/early 20th Century, and shed light upon the people who lived in this rough and tumble neighborhood once referred to as "The Dog's Nest."

[244] *Zuni Perspectives on Historic Preservation*

The federal historic preservation program of the United States is built on a framework that privileges Western epistemologies of time and space and perceives historic properties as inanimate and valuable for their scientific potential. The concept of historic preservation is far more personal for the Zuni people, however. Zunis see their historical sites as "memory pieces" where culture and history are recalled and discussed, and where ancestral spirits live on and offer power and strength to today's generations. Zunis believe that any disturbance to these places will have negative and lasting effects on the Zuni people and the world as a whole. Zunis thus define historic preservation as the maintenance and continuity of Zuni culture through the protection, commemoration, and continued respectful interaction with their historical sites and ancestors. In this paper, we explore Zuni perspectives on historic preservation and provide recommendations on how the process of mitigation of adverse effects on historic properties can be improved to better reflect Zuni interests.

[67] *Simulating Organic Projectile Point Damage on Bison Pelves*

A *Bison latifrons* pelvis was discovered eroding out of shoreline sediment at American Falls Reservoir in Idaho in 1953. The ischium section had a unique groove and hole with a depth of 35 mm and 10 mm in diameter. The pelvis was X-rayed in 1961 for indicators of the origin of the damage and this could not be ascertained. An experiment was developed to determine whether a dart fitted with an organic projectile point could re-create the same damage. The experiment consisted of encasing 120 fresh, mature *Bison bison* pelves (ischium as target point) in ballistics gel to simulate bison musculature and skin. A total of 40 projectile points were manufactured to a similar size and morphology from antler (10), bone (10), ivory (10), and wood (10). The points were mounted on a 2 meter dart of 15 mm ash dowel weighing between 180-200 grams. Each point was used 3 times before being replaced unless damaged. These darts were launched using compressed air to between 38-42 m/s. The speed of each shot was recorded using a ballistics chronograph. The various breakage patterns were analyzed and compared. This research provides new data for taphonomic and archaeological interpretations of bison bone damage.

[419] *Exploring Turkey Exploitation and Management in the Maya Lowlands*

As one of the few intensively managed species in Mesoamerica, the turkey plays a key role in understanding cultural interactions and subsistence, particularly in the Mayan lowlands. Two populations of turkeys were exploited in this region: the local, wild ocellated turkey (*Meleagris ocellata*) as well as the non-local Mexican turkey (*Meleagris gallopavo*), likely introduced by the Late Preclassic. Here, we apply biomolecular methods to archaeological and modern turkeys to explore the timing of the adoption of turkey husbandry, and the intensity of turkey management in the Maya Lowlands. We conduct ancient genomic analyses to document the distribution of ocellated and common turkeys within archaeological contexts, identify the sex ratios of the birds, and provide insight into genetic diversity of local and non-local turkeys. We combine these results with stable carbon and nitrogen isotope analyses to document the diversity of feeding strategies in captivity-

reared and wild individuals.

Spenard, Jon (Cal State University San Marcos)

[339] *Cosmopolitan Caves of the Pre-Hispanic Maya: What Can Cave Artifact Assemblages Tell Us about Maya Socio-political Interactions?*

Although the field of Maya archaeology has come to recognize caves as locations of prime social importance for the pre-Hispanic Maya, those underground places and their artifact assemblages are frequently overlooked by researchers who do not study them directly. In this paper, I aim to challenge this perception of cave artifacts by discussing how they can help us realize the interplay of local and far-reaching socio-political connections that have been inconspicuous or understood incompletely from settlement contexts. I present three case studies documenting regional and interregional interactions made apparent in the cave ceramic assemblages from Pacbitun, Belize, and Cancuen, Guatemala. For one case, I discuss evidence for a socio-political connection between Pacbitun, and Xunantunich in the Late Classic period, complicating long-held understandings of the former city being held sway by the major polity of Caracol to its south. In another, I discuss a molded-carved ceramic production mold from a rockshelter at Pacbitun and the ties to secondary elite gifting networks during the Terminal Classic period it implies. Lastly, I discuss long-distance pilgrimage from around the site of Ixcun, into the greater Cancuen area in light of the latter city being a hub connecting Maya groups from the highlands and lowlands.

[356] *The Petroglyphs of Quilcapampa la Antigua*

The site of Quilcapampa la Antigua is hypothesized by Jennings et al. (in press) to be a “moving place”, strongly associated with roads leading up out of the valley bottom onto the pampa above. As the roads near the site, they pass beneath white sandstone cliffs. The visually striking cliff face is incised with hundreds of petroglyphs, with designs ranging from simple camelids and foxes to what appear to be representations of mummy bundles, solar figures, and perhaps even hallucinogenic plants. These petroglyphs vary greatly in size and visibility. Some are only seen as one passes near them on the road while others are visible from across the valley. Some petroglyphs are hidden from sight almost entirely. This paper presents our analysis of the designs as they relate to Quilcapampa’s own unique culture history as well as the broader petroglyphic tradition of the Sihuas region, an area replete with petroglyph and geoglyph sites contemporaneous to the era. Following the methodology proposed by Berquist et al. 2018 we also investigate how the designs were distributed in space as well as differential patterns of visibility. Finally, we evaluate whether certain designs were associated with specific routes or destinations.

Spencer, Kaylee (University of Wisconsin - River Falls) and Maline Werness-Rude (Ventura College)

[410] *Head on a Platter: A Reexamination of a Cache Vessel Lid*

Narratives featuring the Maize God are well represented on Classic Maya ceramics. Appearing with numerous other characters and plants in underworld settings, this deity is abundantly documented in scholarly literature. Despite his ubiquity in ancient imagery, the Maize God remains a slippery creature, with an identity that overlaps with other supernaturals. What is more, his image was used to further diverse, and often differing, ancient agendas. One famous example, a carved ceramic cache vessel lid, shows the Maize God’s head resting atop a platter. The artist surrounded the disembodied head with images of bloodletting, water, and the Water Lily Monster. While these icons are readily identifiable, closer examination of specific features reveal nuanced narratives that layer axuality and cosmology onto the standard Maize God theme. Scale and compositional relationships suggest an interplay between text and image, and further blending can be observed in the introduction of solar iconography. Such additions take this beyond a ‘simple’ presentation of agrico-bloodletting as world-sustaining; we offer a detail-oriented reinterpretation of the lid in its entirety, exploring the fluidity between conceptual categories and how such blurring contributes to the rich messages contained within the scene.

Spengler, Robert (Max Planck Institute for the Science of Human History)

[302] *Examining the Shift in Seed-Dispersal Mechanisms During Early Plant Domestication*

Scholarship is reframing the study of plant evolution under cultivation to focus on the effects of complex human harvesting practices (seed predation), increased human population size, and sedentism, while turning away from conscious human selection. Research has pointed out that parallelism in domestication is linked to seed-dispersal mechanisms, but few of

these studies look beyond the role of tough rachises in large-grained cereals or non-dehiscent pods in legumes. Gene flow through seed dispersal is one of the most prominent drivers in plant evolution in the wild and appears to have been under early cultivation as well. Hundreds of thousands of plant species have evolved mutualistic bonds with seed dispersers; these evolutionary changes are driven by the selective advantage of strong gene flow and often evolve from a predatory relationship. Additionally, few scholars have discussed the fact that most crop progenitors were endozoochoric dispersed. In order to understand the earliest traits of domestication in these crops, we need to understand seed-dispersal-based mutualism before human intervention. Evolution under cultivation is no different than the evolution of mutualism or anti-herbivory defenses as a response to heavy herbivory in nature and is simply an example of keeping pace with the Red Queen.

[76] *To Spin and Whorl: Functional and Symbolic Associations of Chancay Weaving Tools*

Archaeological sources suggest that textiles from Chancay culture (ca. 1000-1470), occupying the central coastal region of Peru, were produced in large quantities. While they are ubiquitous in collections all over the world, they remain to be systematically studied, as do the tools that were used to make them. Along with textiles, weaving tools stored in reed baskets are commonly found in burial contexts. Included in the baskets are spindles, often wound with thread and with the whorls in position; balls of yarn; weaving battens; and other wooden implements used in the weaving process. Additionally, textile samplers from this period have also been found, adding to our knowledge of weaving methods and technologies. Our focus will be on the spindles, which are often painted with bands of colors, and the whorls, which come in a variety of shapes and have incised and painted designs that may be either geometric or zoomorphic (with birds being seemingly common) in composition. In addition to being tools made with a specific purpose (i.e., the production of thread), their decoration also appears to have had a symbolic function, and it is this intersection that forms the core of our analysis.

[398] *Forest and Farm, River and Sea: Food and Diet at Three 17th-Century Sites in Connecticut*

Recent research in Connecticut has focused on the 17th century and archaeological investigations at several significant sites are ongoing. Extensive work at three sites, an early 17th-century (ca. 1615-1640) coastal Native American trading fort in Norwalk, a first period (ca. 1630-1640s) domestic site in Wethersfield, and a mid-late 17th -century (ca. 1650-1710) farm on the Connecticut frontier in Glastonbury, resulted in the recovery of large and extremely well-preserved assemblages of faunal and macrobotanical remains. The sites represent a microcosm of 17th-century daily life in Connecticut and this unique dataset provides the opportunity to explore Native American and English food procurement strategies, diet, and foodways in the tumultuous early colonial period. This paper outlines the overall research strategy for investigation of the food remains from these sites and presents the initial results of the faunal and botanical analyses.

Springer, Chris (Simon Fraser University) and Dana Lepofsky (Simon Fraser University)

- [70] *Conflict and Territoriality: An Archaeological Study of Ancestral Northern Coast Salish-Tla'amin Defensiveness in the Salish Sea Region of Southwestern British Columbia*

Coast Salish ethnohistory describes how various locations associated with settlements were used for defence within the Salish Sea region of southwestern British Columbia. During times of conflict, these linked places formed defensive networks that functioned to maximize defensibility at both the settlement and allied settlement scales. Examining the distribution of such defensive networks in time and space provides insights into the role of conflict in broader social contexts including territorial and tenurial claims expressed through territoriality. In this paper, we explore the relationship between defensive networks, social networks, and expressions of territoriality among the ancestral Northern Coast Salish-Tla'amin. Combining visibility analysis with an index of site defensiveness, we find that Tla'amin defensive networks were in place from at least 900 years BP. This in turn suggests the longevity of territorial and tenurial claims expressed through defensive territoriality, as noted in the ethnohistoric record.

- [379] *All in a Day's Work: The Health and Welfare of Children Living in 19th Century Staffordshire, UK*

Children played a key role in coal mining and the pottery industry in 19th century Staffordshire (UK). The number of children that worked in this region during the study period fluctuated between 13% and 33%, and one fifth of the workforce comprised of 5-14 year olds. Long working hours and hazardous conditions had a detrimental effect on the health and well-being of children. Children working in coal mines were susceptible to stunted growth and respiratory conditions and were vulnerable to accidents, such as explosions and roof collapses. Stunted growth, lead poisoning, and silicosis were among the most common conditions experienced by those working in the pottery industry. Legislation was introduced over the course of the 19th century to improve the working conditions of children, though these were not wholly effective in the early 1800s. This paper aims to shed new light on the health and longevity of children that worked in 19th century Staffordshire. Census data, testimonies, and modern clinical data will be used to explore how their roles in industry ultimately affected their health and quality of life. It is hoped that this research will provide a more comprehensive insight into child labour in 19th century Staffordshire.

St. Amand, Ani (University of Maine Climate Change Institute)

- [47] *Contributions from the Archaeological Record: Climate Proxies and El Niño-Southern Oscillation*

El Niño-Southern Oscillation (ENSO) is a complex climatic phenomenon that has shaped both the environment and human behavior on the North Coast of Peru for millennia. Currently, El Niño, a component of ENSO, occurs every 3-8 years. Often associated with heavy rains that penetrate this normally arid coastal desert, ENSO brings flooding, erosion, and an interruption of marine upwelling that disrupts fisheries productivity. Archaeological records show that ENSO activity and intensity have varied throughout the Holocene. Key to better understanding ENSO's impacts on human populations is the improvement of our current, incomplete record based on multiple, often conflicting proxies. Additionally, understanding past variations of ENSO is imperative to improving modeling and predictions of El Niño, particularly important in the current regime of anthropogenic forcing. Archaeological data are among the most promising sources of climate proxies in this desert, where higher-resolution metrics such as nearby marine corals, tree rings, and pollen are often nonexistent. This metadata study develops a database of ENSO proxies for temporal and spatial comparison. Samples producing conflicting stories of ENSO behavior are examined to understand potential sources of error. Gaps in the overall record are addressed with legacy archaeological and climatological data and fieldwork.

[252] *Spatial Analysis and the Interpretation of Rock Art at the Cajamarca Site of Callacpuma, Peru*

Callacpuma is a multicomponent archaeological site in the Cajamarca Basin of the northern highlands of Peru with a long and complex history of human occupation spanning from at least 1000 BC to approximately AD 1500. An estimated 3,000-4,000 rock art panels dot the landscape of Callacpuma. Over the past three field seasons, 100 panels have been recorded. We use this sample to examine the spatial relationships of the rock panels to each other and to other important features on the landscape. This research provides an example of how GIS-based spatial analysis can be used to employ rock art panels in understanding the patterns of human occupation at archaeological sites. The work also presents preliminary conclusions regarding the chronology and function of the Callacpuma rock art. Thus, contributing to our understanding of both the development of prehistory in the Cajamarca Basin as well as the use of spatial analysis in rock art studies.

Stahl, Alan (Princeton University) and Lee Mordechai (Hebrew University of Jerusalem)

[310] *FLAME: Framing the Late Antique and Early Medieval Economy*

The FLAME project is a collaborative effort of a dozen scholars worldwide to track the production and circulation of coinage in western Eurasia from CE 325-750 in order to investigate the transition from ancient economies to those of the Middle Ages in Europe, North Africa, and Western and Central Asia. The core of the project is a database with two distinct data sets. The first data set records all of the coinage issues throughout the regions and periods under study and presents the data either as maps or data that can be customized by time spans and regions and can be downloaded as data; this phase of the project is online at coinage.princeton.edu. The second database includes the records of hundreds of thousands of finds of coins of the period throughout the regions under study; it uses input from published reports and the transfer of data from ongoing surveys in Great Britain and Israel. The 2019 SAA Annual Meeting will represent the first public presentation of the query, report, and mapping capabilities of the circulation phase of the project.

Stahl, Ann (University of Victoria)

[87] *Co-Creating Digital Heritage Resources in Ghana: How Is It Going?*

Funded by a Canadian SSHRC-funded partnership development grant, our working group of collaborators is engaged in training and capacity building in digital heritage methods in Ghana. Project aims include fostering a community of practice inclusive of archaeologists, heritage practitioners, students and community members who appreciate the value of and are versed in practices of sustainable digital archiving; are committed to producing digital heritage resources relevant to communities and usable in local schools; and who are committed to expanding the community of practice through development of accessible training resources. I'll provide an assessment of how things are going as we approach the end of our first year in a 3-year project, sharing our successes but also addressing the challenges we've faced in co-creating sustainable and relevant digital heritage resources.

[417] *Charred Organic Matter in the Middle and Later Stone Record in South Africa: Exploring Multiple Anthropogenic Processes and Origins*

Middle and Later Stone caves and rockshelters in South Africa are commonly rich in organic matter. The formation history of the organic component in the archaeological deposits is still unclear and several natural and anthropogenic processes can be considered. This paper will focus on a discussion of possible anthropogenic processes of organic matter deposition and their alteration by burning. People transported plant material to sites as food, tools, construction materials and fuel. Microcontextual analyses of deposits have proven very helpful in identifying the latter two. At Sibudu, for example, plant beddings make up the bulk of the organic matter component of the deposits and many of these beddings were burnt as a form of site maintenance behavior. In other sites, preservation conditions are less ideal. Combustion features and beddings are prone to destruction by reworking and other post-depositional alterations including human behavior, for example rake out and dumping of material. This raises the question if and how much of the (charred) organic matter in Stone Age deposits in South Africa results from the variable forms of fire use, bedding construction and site maintenance behaviors.

[64] *An Endemic Maize (*Zea mays* L.) Landrace on the Copacabana Peninsula, Bolivia*

An endemic variety of maize (*Zea mays* L.) cultivated on terraces around the Copacabana Peninsula between 3600 – 4100 masl has been identified in the altiplano of Bolivia. This is the only known maize variety cultivated above 3600 masl. Indigenous communities in this region refer to this maize variety as tunqu and they consider it sacred. There were widespread landscape modifications such as raised fields and terraces geared to the cultivation of food crops by Pre-Columbian civilizations of this region particularly maize. Ethnohistoric and ethnographic evidence indicate it is primarily consumed as maize beer (aqha, or chicha) and central to ritual offerings extending back to the Yaya Mama religious tradition (ca. 800 BCE). Its phenotypic characteristics are unlike any other known landrace. It is an endemic maize variety particularly adapted to this part of the Titicaca Basin. Evapotranspiration around the lake reduces the diurnal temperature variation just enough to make its cultivation possible in the Bolivian altiplano. Its cultivation, preparation and consumption among Indigenous cultures are analyzed as are its botanical and biological characteristics.

Stanish, Charles (University of South Florida)

[182] *Buried Sites in the Chincha Valley Floodplain*

The Peruvian coastal valley of Chincha is the largest in the south coast of Peru. Research by our team since 2011 has discovered and excavated a number of archaeological sites that date from 3200–1000 BP. The data from this research provide exciting data to test models of early social complexity in Andean society. First, we discovered buried Paracas villages (ca. 800–200 BCE) under two meters of sediment in the floodplain suggesting a vastly larger population. It is probable that heretofore “missing” Initial and Pre-ceramic period sites are also buried in the floodplain. Second, our paleobotanical and other data indicate that at least some areas of the valley prior to initial village settlement were rich natural marshes and not open desert as has been generally presumed. Instead of a scenario of early agricultural settlement that irrigated the desert valley floors, we have data that suggest that these marshlands were drained and converted to agricultural landscapes. If this empirical fact is correct, it may be key to understanding why complex societies developed late on the south Peruvian coast, relative to the north.

Stanley, Brendan (Texas State University) and Tara D. Smith (Texas State University)

[405] *Jaguar Serpents, Smoke, and Ropes: Iconographic Analysis of Olmec Thrones incl. La Venta Altar IV and Oxtotitlan Mural I*

Formerly identified cosmograms for the Olmec culture include the Dallas Plaque and the Las Limas figure. Politically, this vision is centered by Olmec rulers which is visible through the iconographic interpretations of works including La Venta Altar 4, Oxtotitlan Mural 1, among others. These interpretations build on the work of previous scholars and are supported via upstreaming through the Maya. In general, the Olmec altar thrones mirror the Maya view of the cosmos as it is portrayed on Hanab Pakal's famous sarcophagus at Palenque, Chiapas. This paper will focus on the role of transformation within Olmec political ideology. In particular, Olmec thrones display that Olmec rulers validated their right to rule through their ability to transform into Nahaul or Uay Spirit Companions (“were-jaguars”). This transformation allowed for their contact with the

supernatural, it enabled their control of natural forces like rain and wind, and it occurred at the center of time and space, i.e. the Axis-Mundi and World Tree of Creation.

Stanley, Erik (Eastern New Mexico University)

[41] *Indigenous Interpretations of the Past*

This paper examines indigenous understandings of the archaeological record through the case study of the Mopan Maya of Belize. Among many traditional Mopan Maya, classic era artifacts such as potsherds and stone points are often attributed to the Cheil or “those of the forest.” Mopan believe that the Cheil are magical anthropomorphic beings descended from the unbaptized Maya who fled into the forest to escape European colonization. While the Cheil have played a central role in Maya environmental cosmologies for centuries, in recent decades local ideas about the Cheil have been challenged by both outside/Western institutions, notably archaeology. Through dialogue with archaeology, contemporary indigenous relationships to the past are transformed. Yet, at the same time that archaeology attempts to re-write cultural narratives of the past, excavations of new artifacts can support the present day accounts of and belief in the Cheil within Maya communities. Exploring the changing relationship between the Cheil and the Mopan allows for an understanding of how indigenous conceptions of local pasts are reshaped through engagement with global modernities.

Stanton, Christopher (New Mexico State University)

[346] *An Analysis of Projectile Point Agency from the South Diamond Creek Pueblo Site*

This paper presents an analysis of the projectile points recovered from the South Diamond Creek Pueblo (SDCP) site. This project took place over two summers in 2016 and 2017 and involved a salvage excavation of a Classic Mimbres pueblo. The excavation of the site yielded numerous intact projectile points in various contexts. By integrating a Behavioral Archaeology framework, I will examine object agency—how agents and materials interacted in an environment—using the spatial and temporal associations between the context of the projectile points recovered from the SDCP site and the Mimbres peoples. To achieve my research goal, I will discuss the morphology of the SDCP projectile points, their use-life, and the interactions between Mimbres peoples and their surrounding groups within and beyond the Mimbres study area.

Stanton, Thadra

[3] *Back to School: A Review of the Southeast Archeological Center's Focused Efforts in the Fields of Outreach, Education, Engagement and Relevancy*

On-going efforts to increase outreach, education, engagement and relevancy for the Southeast Archeological Center (SEAC) over the past 8 years have resulted in the increased visibility of SEAC, the National Park Service, and archeology. SEAC has worked with educators through the Teacher-Ranger-Teacher program to develop lesson plans. SEAC staff have participated in local and regional events geared towards science or the outdoors. SEAC has also developed Girl Scout Resource Ranger weekends that are focused on archeological resource stewardship. These events along with posters, stickers, bookmarks, traveling exhibit, as well as incorporating outreach into more projects, and other materials have culminated in higher numbers of visitor contacts than SEAC had experienced previously.

[76] *Social and Geographic Associations of Cotton-Sized Spindle Whorls in South-Central Veracruz, Mexico*

The western lower Papaloapan basin in south-central Veracruz was subject to systematic survey and surface collection in several blocks of terrain. An initial analysis of spindle whorls from one survey block showed cotton-sized whorls were relatively abundant during the Classic and Postclassic periods, consonant with documentary records attesting to substantial Postclassic Aztec tribute of cotton and cotton garments (Stark et al. 1998). The region was suited to cotton production, one of the local sources of wealth because cotton could not be grown in many populous highland parts of Mesoamerica, and cotton was a prized fiber for textiles. This study includes all the survey blocks and examines whether socioeconomic or local environmental factors are associated with greater whorl frequencies. High ranking landed families may have had client workers to produce more thread and textiles. Alternatively, more spinning may have occurred where farmers could only produce one crop a year, supplementing their income with labor in spinning and weaving.

[85] *The Bandelier Preservation Program: Accomplishing the Vanishing Treasures Mission by Encouraging Traditional Building Skills and Descendant Community Involvement in the Preservation Process*

Preservation efforts at Bandelier National Monument have followed the Vanishing Treasures core mission for nearly 20 years. Today, the Bandelier Preservation Program maintains this tradition by way of numerous and varied preservation projects. Two projects in particular that adhere to the VT approach are discussed in this paper: the involvement of the Bandelier Preservation Corps in preserving Ancestral Pueblo architecture and the stabilization of Pond Cabin, an early twentieth century log structure that played a role in the development of the first atomic weapon. Initial stabilization of Pond Cabin took place in the fall of 2017 as part of a Vanishing Treasures workshop. The project promoted the use of traditional building skills to educate individuals from multiple organizations and federal agencies in the preservation of log architecture. The Bandelier Preservation Corps began in 2015 and consists of local Pueblo youth who participate in wide-ranging activities structured to promote the transfer of traditional knowledge and skills in the preservation of their Ancestral sites at Bandelier.

[36] *Agave Bloom Stalk Ovens in the Southern Chihuahuan Desert*

Fire cracked rock (FCR) and hearth features represent one of the most commonly observed cooking features encountered by archaeologists. This research presents an ethno-archaeological context in which FCR utilization and discard is observed, providing a Middle Range theoretical platform for interpretively linking the material remains and related human behaviors associated with earth oven use. Ecological, social, and artifactual contexts are described for agave bloom-stalk processing

in the Sierra Catorce, San Luis Potosi, in the southernmost lobe of the Chihuahuan Desert. Specific observations indicate patterns of earth oven thermodynamics, FCR midden accretion, caching behavior, archaeological feature descriptions, and related artifact suites. Relevance of this ethno-archaeological case-study is in interpretive potentials, archaeological sampling methodologies, the modeling of FCR midden accretion, and the interpretation of abandoned hearth features. Bulk processing in the described earth ovens is highly seasonal, relating to the ripening of the agave bloom stalks. The described features are non-domestic, situated in relation to the naturally occurring agave clumps. These non-domestic agave bloom-stalk earth ovens are compared with the local use of domestic meat-focused earth ovens in festive contexts, noting that these two types of earth oven sites involve specific and distinctive artifact assemblages.

Starkovich, Britt (University of Tübingen)

[415] *Small Carnivore Use in the Upper Paleolithic and Mesolithic of Kephalaria Cave (Peloponnese, Greece): Opportunistic or Optimal?*

The Late Pleistocene of southern Greece adheres to many predictions set forth by human behavioral ecology concerning the use of small game in the face of demographic growth, ecological change, and advancements in procurement technologies. In Peloponnese, an increase in small, fast game use accompanied the transition to the Upper Paleolithic. The trend intensified through the Upper Paleolithic, culminating in the use of aquatic species by the Mesolithic. A less well-explored aspect of this shift is the use of small carnivores. Researchers have documented small carnivore species, specifically fox, lynx, martin, badger, and wild cat, at several sites in southern Greece. These taxa are always present, though their economic importance and ubiquity relative to their environmental abundance are not always clear. In this paper, I discuss the use of small carnivores in the Upper Paleolithic and Mesolithic of Kephalaria Cave in Peloponnese. I focus in particular on taphonomic evidence that humans exploited the taxa for meat in addition to fur, and explore whether or not their abundance changed throughout the phases of site occupation. In doing so, I discuss the extent to which models from HBE are useful in interpreting rare species that might have importance beyond the subsistence pursuit.

Stcherbinine, Sean

[328] *Geoarchaeology of Three Olcott Sites along the Elwha River, Clallam County, Washington*

Olcott sites are characteristically skewed toward lithic artifacts due to the acidic forested environment of western Washington. Site interpretations rely on several lines of evidence including landform type and age, soil formation, post-depositional processes, and vertical artifact distributions. Recent survey and excavations at three Olcott sites in the Elwha River valley produced a robust toposequence data set that is used for understanding landform development and the cultural context of this poorly understood early to middle Holocene occupation. Close-interval shovel testing across a broad area on both sides of the river identified subsurface cultural deposits and helped refine a landform age model for this section of the Elwha River valley. This poster presents how the model was tested during subsequent excavations that exposed artifact-bearing, shallow B horizons of Pleistocene river terraces with the results compared to other regional Olcott sites.

[263] *Textile Production in the Emerging Hohokam Ballcourt World*

The development of the Hohokam regional ballcourt system in the Phoenix basin caused an economic shift during the Colonial period that increased the need for trade goods. Surplus cotton became a valuable commodity for communities situated on heavily irrigated river valleys. This research hypothesizes that the presence of cotton is a good indicator of textile production with the emergence of ballcourts in the Colonial period. Botanical data on cotton ubiquity and standardized spindle whorl measurements provide data for identifying changes in textile production. This research presents data from the recently excavated site of East Pueblo Blanco and comparisons with similar indicators for the presence of cotton across other contemporary sites.

[259] *Evidence of Moieties in the Prehistoric Southwest? The Case Study of Sapa'owinge*

Meaning is assigned to spaces by the individuals who inhabit them. Individuals give spaces meaning many different ways, including through the placement of objects. This poster focuses on the use of kivas and rooms at an ancestral Tewa site in the Southwestern United States. Using ethno-historical data and zooarchaeological techniques to explore and better define the roles of mammalian and avian fauna, this research highlights the possible development of moieties at Sapa'owinge (LA 306), located in the northern Rio Grande region of New Mexico. Because kivas and rooms are generally assumed by archaeologists to have different functions, they were tested by comparing faunal data. Linear regression analysis was conducted and the fauna from kivas and rooms were evaluated for nestedness. The values indicated a significant relationship between NISP and NTAXA with moderate effect size in room contexts and no relationship between NISP and NTAXA in kivas with a weak effect size. For nestedness, it was clear rooms and kivas were subsets of one another, yet in kivas, specific sets of animals were recovered, implying perhaps kivas are representative of summer and winter moieties at Sapa'owinge. This line of evidence opens the door for larger archaeological discussions regarding space-use prehistorically.

[358] *Signs of Animal Masters and Associated Rituals in the ancient Near East*

What evidence is there for the existence of Animal Masters and their rituals in the ancient Near East? This paper ranges from Mesolithic/Epi-Palaeolithic to Chalcolithic times (ca. 15,000-4000 B.C.) and spans the transition from hunter-gatherer to agricultural societies. It surveys the iconography and material remains from caves, megalithic enclosures, public buildings, houses and burials and reconsiders their interpretation in light of available studies of fauna, flora and residue analysis as well as recent research in the field of neurotheology. I conclude by placing the resulting picture from the ancient Near East within the wider frame of cross-cultural studies on the subject of "Supernatural Gamekeepers."

Steinbach, Erik (Logan Simpson), Christopher Garraty (Logan Simpson), Gary Huckleberry (Geoarchaeological Consultant, Tucson, Arizona) and J. Andrew Darling (Southwest Heritage Research LLC, Dallas, Texas)[8] *Hohokam Water-Harvesting in the Queen Creek Area: Archaeological and Ethnographic Perspectives of Water Management along Ephemeral Drainages in the Southern Arizona Desert*

The Phoenix Basin Hohokam are celebrated for the construction of massive and elaborate canal systems fed by perennial waterways, principally the Salt and Gila rivers. In desert areas, however, along the many ephemeral drainages that crisscross the region, rainfall-harvesting and water-storage technologies largely overshadowed canal irrigation. These technologies permitted the establishment of year-round settlements in the desert interior. Archaeologists with Logan Simpson recently excavated and documented a massive human-constructed reservoir (Sonoqui Reservoir) and an associated intake channel at the Hohokam village site of Sonoqui Ruin, situated in a nonriverine desert environment along an ephemeral drainage, Sonoqui Wash, located about 25 miles southeast of Phoenix. The reservoir's estimated storage capacity of 1,200 cubic meters (317,000 gallons)—among the largest prehistoric reservoirs documented in Arizona—underscores the site inhabitants' ability to successfully harvest rainfall for year-round domestic use. Our investigation hinges on various lines of evidence, including a geomorphologic study of feature logistics and capacity and a comparison with ethnographically documented practices of harvesting and storing water among contemporary O'Odham groups in nonriverine areas in the southern Arizona desert.

This poster, combined with a virtual reality headset, will present the methods and results of the multi-disciplinary research project "Following in the footsteps of the National Geographic Society's original Katmai expeditions" carried out in partnership with the National Geographic Society (NGS), Explore.org and Katmai National park. The project sought to re-trace the routes of the century-old NGS expeditions which made the area famous and led to the establishment of the National Park at this site. Historic photos and pedestrian survey were used to pinpoint the locations of the associated historic camps; in parallel, a botanical inventory of the route was conducted to continue the expedition's primary research of documenting the post-volcanic succession of vegetation regrowth. In order to generate an interactive product and provide broader audiences with details about the experiences of the original explorers, historic archival materials were combined

with 360° photos and video footage of the sites. I will discuss the process of collecting and combining additional interpretative materials for public outreach both prior to and throughout the project. Conference participants will be invited to view, interact with, and provide feedback on the resulting virtual tour.

Stemp, W. James (Keene State College) and Danielle Macdonald (University of Tulsa)

[365] *Diversity and Lithic Microwear: Quantification, Classification, and Standardization*

Over the past decade, lithic microwear analysis has witnessed a shift in how data is collected, moving away from optical microscopy towards a more quantifiable practice. The adoption of surface metrology microscopes, including confocal and focus variation, allows for the measurement of surface roughness or texture, thus distinguishing different wear features based on surface measurements rather than verbal descriptions of wear characteristics and photomicrographic evidence. This paper explores how lithic microwear analysts traditionally define categories of wear, the range of wear classification criteria and categorization systems, the levels of variation within these categories, and how our definitions of wear are changing with new quantitative techniques. We explore how variables, such as duration of use, force, and post-depositional processes, change wear characteristics, necessitating a new assessment of diversity within microwear categories. Key to using diversity as a measure of variation of microwear on stone tools from different assemblages or sub-assemblages is the adoption of a consistent classification system for microwear categories. Understanding the processes by which wear categories are defined and the acceptable levels of variation within and between these categories brings us closer to creating a standardized microwear practice.

[129] *Hitting Huggins' Roadblock: Confronting the Challenge of Recovering the Missing from a World War II Battlefield in Oro Province, Papua New Guinea*

The complexity of accounting for missing in action personnel is highly dependent on the past—and present—context of the loss. In late 1942, during the Battle of Buna-Gona in New Guinea, United States forces established a roadblock behind forward Japanese positions in an attempt to cut off their supplies. While it would hold for weeks and eventually be named for Captain Meredith M. Huggins (3rd Battalion, 126th Infantry Regiment), the roadblock was exposed and spawned a bitter, drawn-out fight that was exacerbated by an inhospitable environment, inadequate weapons, starvation, and disease and resulted in as many as 67 missing in action Americans following WWII. Today, the difficulty of recovering those lost at Huggins' presents an interrelated set of cultural, historical, scientific, and logistical challenges. This poster presents a multidisciplinary, collaborative approach being forged by DPAA alongside stakeholder groups include local communities in Oro Province and organizations such as the University of Papua New Guinea, the Papua New Guinea government, and the Australian Unrecovered War Casualties—Army. Like the nature of battlefield engagements themselves, the resolution of battlefield-associated cases—such those at Huggins—requires a steady effort that can be sustained for as long as it is warranted.

Stephens, Doug [75] see Koepfel, Christopher

Stephens, Douglas (US Forest Service)

[12] *Attaining Goals Together: Collaborative Heritage Resource Stewardship and the Forest Service*

Passage of federal environmental laws during the 1960's forced otherwise autonomous bureaucracies to accept professions into their ranks that previously had no place. Public lands agencies like the Forest Service were required to employ archaeologists once the National Historic Preservation Act was enacted. The first to be employed in the new field of Cultural Resource Management were often individuals grappling with making sense of the new environmental and historic preservation laws frequently within an agency culture resenting their presence. Eventually programs were formed and the compliance with historic preservation requirements would become integrated into the agency. Now the Forest Service maintains a database of over 500,000 cultural sites and programs in Tribal Relations recognizing the Federal Government's trust responsibility to Indian Tribes. Today the integration and maturity of the Heritage Program is allowing the Forest

Service to expand the public relevancy and benefits of the resources it manages.

Stephens Reed, Lori (Aztec Ruins National Monument)

[245] *Shades of Meaning: Relating Color to Chacoan Identity, Memory, and Power at the Aztec Great Houses*

The Ancient Puebloan occupation of the Aztec complex in northwest New Mexico spanned a tumultuous two and a half centuries that saw the arrival of Chacoan people and Chacoan ways in the Animas Valley in the late 11th century C.E., followed by the waning influence of Chaco by 1140, and a new era of Aztec-centered power in the post-Chacoan period. Each of the three great houses at Aztec had its own unique history and represents a particular stage in the evolving relationship to Chacoan power in the Middle San Juan region. Over time, leaders at Aztec worked to establish and support Chacoan identity and power, to negotiate new relationships to the Chacoan polity, and ultimately to maintain the memory of a Chacoan past that legitimized their own power. These efforts can be traced through changes in architecture and material items. Our research examines the role color played in establishing, maintaining, altering, and revitalizing Chacoan identity and power at Aztec.

[168] *Deptford Settlement in South Carolina*

Deptford has been construed as a phase with a time-space-content connotation that incorporates aspects of pottery and adaptation. Recently, we examined regional settlement by considering Deptford phase site distributions and radiometric dates. In this study, we take our analysis a step further by constructing ceramic seriations for sub-regions in which Deptford pottery is well represented in the state. A number of contexts that we examined for this paper have purported mixed assemblages, for example, St. Catherine's pottery with Deptford. Are these actually mixed or are they contemporary? By using ceramic seriation as prior information and powerful analytical tools available in OxCal, we attempt to address this important question.

Steponaitis, Vincas (UNC-Chapel Hill) and Lynne Goldstein (Michigan State University)

[188] *Struggling with Complex Decision-Making in Public Policy*

In the late 1980s and early 1990s, the Society for American Archaeology (SAA) and other archaeological organizations struggled with a variety of public policy decisions and organizational policies that eventually resulted in major public laws on both the state and federal levels (NMAI Act and NAGPRA, for example). The work done at that time also set the stage for SAA positions on a variety of other proposed laws. The purpose of this paper is to outline and analyze the process of decision-making by which the SAA reached the positions it took. In this regard, Keith Kintigh stands out as someone who was not necessarily the public face of SAA, but who carefully negotiated the SAA position with archaeologists, Native Americans, Native American organizations, and congressional representatives. This aspect of Kintigh's work, which required a significant amount of time and focus, is often overlooked, even though this approach can also be seen in his research, and is a hallmark of thoughtful, respectful negotiations.

Sterling, Kathleen (Binghamton University) and Sébastien Lacombe (Binghamton University)

[186] *Why Build When There Are Caves? Investigating the Construction and Use of a Stone Structure in Pleistocene France*

The Late Pleistocene in Western Europe is the origin of the idea of the "caveman," and the majority of research has historically focused on cave sites. In regions of Europe where caves are not present but archaeological evidence is, the assumption is that people used lightweight ephemeral shelters such as tents and lean-tos, and this is sometimes supported through the presence of a few stones arranged in a pattern. The open-air site of Peyre Blanque in the Central French Pyrénées has the potential to change this narrative about Late Pleistocene hunting and gathering peoples. This site, in a region with many caves and rockshelters, was occupied shortly after the Last Glacial Maximum, and features a structure constructed of hundreds of sandstones. The structure presently covers nearly fifty square meters. Excavation and analysis are currently ongoing, but this structure is unlike other stone arrangements in Late Pleistocene Western Europe in its size and organization. The people who occupied Peyre Blanque were not "cavemen," neither literally nor metaphorically, and this

was by choice.

Sternberg, Evan (Office of Contract Archeology, UNM), Alexander Kurota (Office of Contract Archeology, UNM) and Virgil Lueth (New Mexico Bureau of Geology and Mineral Resources)

[413] *Utilization of Quartz Crystal Lithics During the El Paso Phase Jornada Mogollon*

Over the past several years, the Office of Contract Archeology has conducted fieldwork in the southern Tularosa Basin on White Sands Missile Range. This project has resulted in the documentation and testing of more than 36 sites ranging from the Paleoindian through Jornada Mogollon periods. Lithic raw materials utilized on all of these sites were dominated by local materials. Interestingly, a high proportion of these were found to be crystal quartz, a material not often associated with lithic tool production in the American Southwest. Due to the unusual nature of this material utilization for this region, a more detailed examination was undertaken to better understand the implications. The data indicate an intensification of use for crystal quartz in the Jornada Mogollon period, particularly as groups agglomerated into larger roomblock-complex villages during the El Paso Phase. Potential causes for this are thought to include toolstone availability, and possible ritual functions.

Sternberg, Evan [413] see Kurota, Alexander

Sterner, Katherine (University of Wisconsin-Milwaukee)

[97] *Upper Mississippian Stone Tools and Community Organization*

This research investigates community organization as an approach to understanding the shift from typologically complex to a simpler lithic technology after circa A.D. 500 in the Prairie Peninsula. I compare the lithic practice of Upper Mississippian groups settled in western Wisconsin (A.D. 1400-1700) at the La Crosse locality to that of groups in eastern Wisconsin (A.D. 1100-1450) at the Koshkonong locality to develop a model for communities in two different geographic and temporal contexts. The data indicate that the Koshkonong tradition was characterized by a tightly knit multi-village community while evidence of such a community unit at La Crosse does not exist. Evidence from microwear analysis indicates that both men and women used lithic tools and that women produced some, if not most of the lithic tools. The decline in formal lithic tool complexity and diversity through time was likely the result of a shift in the gendered division of labor of producing stone tools.

Stevenson, Christopher [316] see McCoy, Mark

Stewart, Brian (University of Michigan) and Genevieve Dewar (University of Toronto Scarborough)**[32]** *Charting Late Pleistocene Social Networking in Southern Africa Using Strontium Isotope Geochemistry*

The roots of long-distance social networking run deeper than Facebook. At some point in the Pleistocene, hunter-gatherers began exchanging 'non-utilitarian' artifacts like beads and other ornaments over hundreds, and sometimes thousands, of kilometers. Among ethnographically documented foragers these networks symbolically link distant groups, acting as social adhesives that enhance fallback opportunities, information availability, and reproductive potential, among other benefits. Charting the evolution of long-distance social networks can thus help determine when, why and how our species began harnessing material culture to mitigate risk. The archaeology of Pleistocene Africa is, as usual, central to this endeavor given our species' anatomical and behavioral origins. This paper presents the preliminary results of strontium isotope analyses of ostrich eggshell beads recovered from late Pleistocene and Holocene contexts in two sharply contrasting southern African environments: the Namaqualand Desert (South Africa) and Maloti-Drakensberg Mountains (Lesotho). Our data demonstrate the existence and persistence of highland and dryland exchange networks, and hold implications for tracing the development of social strategies for long-term survival in the southern African interior.

Stewart, Brian [33] see Dewar, Genevieve

Stewart, Caitlin, Mark Brodbeck (HDRI, Inc), Andrew Darhling (Southwest Heritage Research, LLC) and Jennifer Rich (ACS, LTD)**[114]** *A GIS-Approach to a Prehistoric Travel Corridor in the Phoenix Area*

This poster presents the preliminary results of a GIS-based approach for the documentation and interpretation of a prehistoric Hohokam travel corridor in the South Mountains of Phoenix, Arizona. Trails, their associated features and co-occurrences of artifacts, when combined with settlement data, provide important clues about intercommunity relationships and communications. Trails connect areas that have different resources and identify routes between task-specific sites and base camps or villages. Mapping and analysis of trail segments and artifacts found in association with trail systems is necessary in order to evaluate processes related to mobility, resource acquisition (both spiritual and physical) and communication. The GIS-based study investigated site AZ T:12:207(ASM), an approximately one-mile section of a prehistoric trail system through the South Mountains connecting prehistoric settlements of the Gila and Salt River Basins. The research explores artifact distribution, feature distribution, points of origin, and destinations of this prehistoric trail system. Additionally, geospatial data from this site, along with associated artifacts and features, are integrated into the larger prehistoric and historic cultural landscape.

Stewart, Carlyn (University of New Mexico)**[118]** *Why We Need Public Archaeology Specialists: Beyond Shards and Dinosaurs*

The underlying goal of Public Archaeology is to make archaeology accessible to the public in engaging ways that inspire meaningful connections to the people and places of the past. By presenting archaeological facts and theories in an interactive manner, it is more likely that the information not only sticks, but is also personal, thus inspiring a more active role in preservation. In an innovative effort to explore the applications that Public Archaeology has to offer in the National Park Service, Tonto National Monument and nonprofit organization Archaeology Southwest teamed up to create a unique position entirely devoted to implementing and testing Public Archaeology methods at the monument. The end goal was creating a Public Archaeology strategy to be used in future years. The 2017-2018 season was a valuable "pilot study" into what Public Archaeology-specific positions have to offer the National Park Service. By assessing the successes and challenges of new methods, outreach events, activities, and current interpretation and education programs at the monument it was my goal not only to create a successful strategy for the future, but to set the standard that specialized Public Archaeology positions are valuable assets to the National Park Service.

Stewart, Christina (University of Oklahoma)**[180]** *An Analysis of Ceramic Imitation and Trade at the Petrified Forest National Park*

The Petrified Forest National Park has a long range of occupation; however, the variety of artifacts present from these occupations makes it difficult to access the relationships early residents had with neighboring communities. Over the last decade, researchers have identified a diverse range of ceramics from across the American Southwest at newly documented sites in the park's boundary expansion. Spanning from the Basketmaker III period (A.D. 500-750) to the Historic periods, researchers identified what appear to be traded ceramics from three regions surrounding the park, in addition to locally produced copies of these distinct regional ceramics. I compare the frequencies of these trade items to locally produced copies to investigate the changing social and economic connections that the residents of the Petrified Forest had with surrounding groups in the American Southwest.

Stiger, Mark**[186]** *Archaic and Paleoindian Houses in the Southern Rocky Mountains*

A series of archaeological structures ranging in date from Folsom (10,400 RYBP) to Middle Archaic (3000 RYBP) have been excavated in a high mountain valley in central Colorado. These prehistoric residences show temporal changes in architecture and artifact assemblages which hint at variability in social and technical organization. An apparent Folsom community structure/lithic workshop and residences provide contrast to the later simple Archaic structures.

Stinchcomb, Gary [32] see Rogers, Michael

Stiner, Mary (University of Arizona)**[15]** *Does the Emergence of Paleolithic Body Ornamentation Signal an Unprecedented Aptitude for Symbolizing Behavior or Just a New Application?*

Given the collective evidence for the Paleolithic in Eurasia, it is peculiar that the emergence of durable art in archaeological records is taken to reflect a parallel emergence for the capacity of hominins to engage in symbolizing behavior of any sort. The ample record of burial practices of during the Middle Paleolithic supports an interpretation of symbolic acts just as strongly as the art record of the Upper Paleolithic, albeit in a very different way. Here lies an important key to understanding hominin cognitive evolution that too often is disregarded, at the expense of addressing useful scientific questions. After reviewing the evidence, I discuss how the directionality and scope of communication (audience) of the two behaviors seems to have differed, and what that difference can (and cannot) mean for framing questions in future research on Neanderthals and modern humans.

Stites, Michael (Bighorn National Forest/University of Wyoming), Price Heiner (Carson National Forest) and Bridget Roth (Coconino National Forest)**[397]** *The Search for the Primary Source of Kings Canyon/La Poudre Pass Obsidian in Colorado*

During field survey in 2011, archaeologists for the Medicine Bow-Routt National Forest discovered obsidian nodules contained in ancient alluvial gravels of the Miocene North Park formation in Jackson County, Colorado. The Northwest Research Obsidian Studies Laboratory in Corvallis, Oregon, analyzed this obsidian using ED-XRF and determined that it was previously uncharacterized by their lab. It was subsequently named Kings Canyon obsidian, after a local place name near the geologic source. Further discussions with archaeologists in the northern Colorado revealed that the obsidian was previously known from archaeological contexts. In fact, another obsidian lab had named it La Poudre Pass obsidian. Forest Service archaeologists then embarked upon a search for the primary source, which led to the Never Summer Mountains in Rocky Mountain National Park. Geochemical analyses of vitrophyre from Specimen Mountain proved inconclusive. Isotopic dating using the $^{40}\text{Ar}/^{39}\text{Ar}$ method on obsidian and fine-grained volcanic rock samples from the Kings Canyon gravels returned ages consistent with the age of the Oligocene Never Summer Igneous complex. These results suggest that the Kings Canyon/La Poudre Pass obsidian may have a broad geographic distribution across north-central Colorado.

Stoddart, Simon (University of Cambridge)

[23] *Delicate Nucleation in Etruria*

Etruria, the urban landscape of first millennium BC central Italy, is renowned for its powerful stable urban places. This projection of power not only conceals the Rise of Rome, which profoundly affected these urban centres, but also the dynamism of the Etruscan urban landscape in the interstices between the metropolises. This paper will examine the delicate urbanism that occurred in the internal frontiers between the major centres. These centres had a different tempo and a tendency towards the polyfocal that differed greatly from the outwardly presented patterns of Etruscan nucleation. African ethnography and landscape archaeology will be deployed to aid the interpretation of this contrast, a contrast that many classicists have found difficult to understand or conceptualise.

Stodder, Ann (Office of Archaeological Studies, Museum of New Mexico)**[317]** *Where Do Data Come From? The Legacy and Future of Cultural Resource Management Bioarchaeology*

This paper considers the role of CRM-based bioarchaeologists in bioarchaeology as practice and as a realm of research. Doing bioarchaeology in this context invokes professional challenges and responsibilities that transcend the individual project. Bioarchaeologists on the front lines of engagement with descendant communities, corporate clients, multiple government entities, neighbors, and business owners, have the opportunity to speak directly with people whose initial reactions range from respectful curiosity to moral outrage. The bioarchaeologist is responsible for what may be the one-time-only analysis and the collection of comprehensive data from human remains, not just a set of observations of particular interest. When the client-specified work product is a nontechnical report, or skeletal data tables are deemed uninteresting by principal investigators, the bioarchaeologist is the archivist, retaining the unpublished primary data. Much of the data from decades of salvage and CRM projects, especially small projects, are ignored. As archaeology turns to data mining and increasingly conservative approaches to excavation, and as museums repatriate collections, bioarchaeologists must promote and implement the systematic compilation, curation, and sharing of archival data. These are irreplaceable resources for future research that will utilize the continually developing array of new approaches that characterize the flourishing field of bioarchaeology.

Stoermer, Stephanie (FHWA)**[357]** *NDDOT's Collaborative Approach to Tribal Involvement during Project Development and Delivery*

The North Dakota Department of Transportation (NDDOT) has been working with regional Tribal Nations since 1998. In 2004, NDDOT and five of these Nations began jointly writing a Section 106 Programmatic Agreement for Tribal Consultation in North Dakota (PA). The PA among NDDOT, the Federal Highway Administration (FHWA) and nine regional Tribal Nations was executed in 2006 and subsequently renewed in 2014. Since that time, NDDOT has worked with up to 17 regional Tribes to address project-specific issues and has also collaborated with Tribes on several issues of mutual interest. An ongoing focus of the collaborative effort known as the North Dakota Tribal Consultation Committee (NDTCC) has been the recordation and evaluation of stone feature sites. As a working group, we agreed upon a recording standard for these types of features in 2011. While National Register eligibility of these features has prompted numerous discussions with State and Federal agencies, this matter currently remains unresolved. Confidentiality of oral histories and access to imparted Tribal knowledge are foremost among the many sensitive issues of concern to Tribes. This paper will discuss various NDDOT projects, implementation of ideals in an imperfect world, and considerations for the future.

Stoj, Kiley (SUNY Cortland) and Karen Schollmeyer (Archaeology Southwest)**[213]** *Plant Species and Their Uses in Mimbres and Salado Sites in Southwest New Mexico*

Examining climate patterns, archaeobotanical evidence, artistic depictions on pottery, and historic and modern uses of plants provides information on how Mimbres and Salado period farmers used local plant resources and influenced their distribution and availability. This presentation examines differences in archaeological plant remains found in Classic Mimbres (AD 1000-1130) and Cliff Phase Salado (AD 1300-1450+) period sites. An overview of the variations in flora between the upper Gila River basin and the Mimbres Valley provides insights into differences in resource availability. Because many plants that are found at archaeological sites are still present today, modern research and documentation

through ethnography offers perspective on the continuing contemporary uses of these taxa.

Stokes, Robert (Eastern New Mexico University)

[108] *The Effects of Inundation on an Early Fourteenth-Century Adobe Pueblo at Caballo Reservoir, New Mexico*

In late 2016, the U.S. Bureau of Reclamation significantly lowered Caballo Reservoir on the Rio Grande in New Mexico to clean out debris behind the outflow gate. As a result, several submerged prehistoric sites were temporarily exposed on the lakeshore. One of those sites was an early fourteenth-century Jornada Mogollon adobe-walled pueblo. Because Caballo Dam was constructed in the 1930s, few archaeological sites were documented prior to the filling of the reservoir. The site was first recorded during a previous drawdown event in 2002 where the recorders documented its condition. The 2016 drawdown event afforded Reclamation and New Mexico State Parks the unique opportunity to closely study the effects of inundation that occurred at this adobe pueblo between 2002 and 2016. This study also compares our observations to the landmark 1978 National Park Service study of effects of inundation on prehistoric sites in the western United States. We found that wave action during the variable length periods of exposure caused significant erosion damage that rapidly undid the stable conditions experienced by the pueblo while normally under 20 to 30 feet of water. Our observations and conclusions will assist other land managers who oversee cultural resources affected by reservoirs.

[252] *The Harare Style: Digitally-Enhanced Photography in Pursuit of a San Rock Art Regional Variant, Zimbabwe, Africa*

The painted parietal art of prehistoric San Bushmen of southern Africa has been in the public eye since the 1920s. Iconographic and stylistic differences within the San artistic corpus have been attributed to distinctions of time and space within and among the many centers of image concentration. Rock art found in the ravines of the Brandberg Massif, Namibia, for example, contrasts markedly from San art seen in the Drakensberg or Cederberg Mountains of South Africa, yet the primary defining characteristics prevail. Digital enhancement has increased the repertoire of San images found in understudied Zimbabwe and has prompted a more fine-grained analysis of regional variations. The distinct signatures of two extraordinary concentrations of Zimbabwean prehistoric art are revealed using digital enhancement. The better-known rock art found in the Matopos and environs on the west is contrasted to that known from the greater Harare area on the east and possible explanations explored.

[88] *Fulbright–Creative Ireland Museum Fellowship - Standards, Storage and Dissemination: New Approaches to Archiving, Curation and Data Sharing of Environmental Archaeological Material*

As part of a Fulbright–Creative Ireland Museum Fellowship collaboration with the Smithsonian Institution (Washington DC), research will be conducted to establish best practice for the curation and storage of environmental remains from archaeological investigations and establish codes of practice for digital archiving of ecofact material, addressing pressing issues in archaeological practice in both the Republic of Ireland and Azerbaijan. Archaeological specialists in countries with well-established archaeological protocols, such as Ireland, wish to further explore how best to archive, curate and disseminate knowledge obtained from environmental material to enable high-quality research, while also engaging with depository institutions to establish guidelines and codes of best practice for field archaeologists. New frontiers are opening in the world in countries where no tradition of environmental archaeology currently exists. In Azerbaijan, pioneering environmental archaeological initiatives are beginning to be conducted, but with no governmental or heritage guidelines for ecofacts, the safe storage, curation, and availability of data on environmental findings to international researchers in the future is in doubt. Working with the unparalleled heritage collections, world-leading archaeologists, and museum experts at the Smithsonian Institution provides an outstanding opportunity to establish and subsequently implement, best practice procedures in both Ireland and Azerbaijan Museums.

Stone, Elisabeth (University of Illinois at Urbana-Champaign)

[257] *Complex Lives, Simple Stories: Relations of Power Embedded in Museum Interpretation*

Museums are a primary platform by which the public engages the past. Museum interpretation is tied to concrete, well-defined storylines, and tends to avoid the complexity of competing narratives, reinforcing the idea that there can be a single understanding of the past. Where there were vibrant communities rich with human diversity, museums present ill-shorn cavemen in raggedy skins or isolated objets d'art dramatically backlit. Contextualized within our knowledge of the messiness and ambiguity of human lives, these flattened narratives work to reenact, reconstitute, and reinforce colonial relationships with the communities and individuals who made, used, and imbued these objects with meaning, keeping with the long-standing role of museums created for the collection, study, interpretation, and preservation of objects. As museum interpretation moves toward polyvocality, participatory strategies, and power-sharing, the representative role of objects shifts. I examine the pedagogical basis for object-centered and community-centered approaches to historical interpretation, considering the many audiences of informal education. Through understanding ways objects encapsulate the relevance of history for descent, local, and other communities, museum interpreters can work within communities to construct histories rooted in place, people, and meaning.

[212] *Possible Prehistoric Translocation of Non-human Primates to Remote Oceania*

New archaeological excavation at the Ucheliungs site, located in the Rock Islands region of Palau (northwest tropical Pacific), has yielded evidence of mortuary activity and small-scale marine foraging dating to the earliest period of human settlement in the Palauan archipelago, ca. 3000 BP. The assemblage includes a small number of artifacts consisting of undecorated ceramic sherds and a single carved bone fragment that appears to be a harpoon tip used for fishing. Because this type of artifact has not been identified elsewhere in Palau, Zooarchaeology by Mass Spectrometry (ZooMS) analysis was employed in an effort to identify the bone's taxon and shed light on the construction of early Palauan bone tool and fishing technologies. Preliminary results suggest that the bone belonged to a non-human primate and was likely a member of the Hylobatidae family. This is the first potential evidence for the prehistoric translocation of non-human primates or primate materials to Remote Oceania and raises questions about broader mobility patterns and intra-regional exchange systems in the region prior to European contact. Targeted sequencing of additional hylobatid taxa and associated radiocarbon dates are currently underway to more specifically identify the timing of movement and origin of this unique artifact.

Stone, Pamela (Hampshire College)

[142] *Warrior-Women: Strategic Use of Violence by Women Moving towards a Broader Understanding of the Poetics of Violence*

Engaging social theory with bioarchaeological analyses offers provocative ways of re-examining (pre) historic populations. With regards to violence and conflict, the research continues to be driven by androcentric notions that this is a man's arena, and that females, when associated with violence, are only victims. Just as relegating women to rigid positions in domestic spheres in archaeological analyses was criticized to be shortsighted and a culturally constructed idea, the inability to see females as violence perpetrators results in the loss of data that could expand our understanding of females in the past and their relationships with one another and with males. This paper discusses the ways in which anthropologists have defined violence, examines myths of the female warrior alongside archaeological and bioarchaeological evidence of "warrior - women" from a number of cultures, and explores how assumptions of male violence direct research models and consequently miss the impact females may have had in conflict situations. Rendering females less invisible in violence research leads to new interpretations of the poetics and meaning of violence, more nuanced ways of interpreting bioarchaeological evidence, and expands our understanding of the agency, resistance, and the role of women in violent encounters.

Stoner, Wesley [56] see Arnold, Philip

Stoner, Wesley (University of Arkansas)

[298] *Provenance Analysis of Tempering Materials using Quantitative Petrography in the Formative Basin of Mexico*

Ceramics sourcing studies in the Basin of Mexico suffer from the interior drainage problem. Sediment erodes from the mountains and mixes as it drains inward toward the lake at the center. Material composition, and the ceramics made from them, grades subtly over space as a result, making provenance analysis difficult. In a prior study, I used semi-quantitative analysis and a multitechnique approach to determine that, the aplastic fraction of Formative period pottery accounts for more geographically patterned compositional variability than the clay fraction (Stoner 2016). The hypothesis that drives the current research is that systematic point counting to derive a quantitative characterization of mineral assemblages on a scale from felsic to mafic composition will enable a clearer comparison to the natural geological variation within the region. I combine the petrographic data with chemical results from neutron activation analysis and laser ablation inductively coupled plasma mass spectrometry to improve sourcing studies of pottery in the region and to add to the tools that ceramic analysts employ for characterizing ancient materials.

[128] *Quantitative Analysis of Bone Surface Modifications on the Bowser Road Mastodon and Its Implications for the Human Predation of North American Megafauna*

Toward the end of the Pleistocene, North America experienced a mass extinction of large mammals, including Proboscideans such as mammoths and mastodons. The role of human predation in these extinctions is widely debated across several scientific disciplines, including Conservation Biology, Paleontology, and Archaeology. A frequently debated topic is the predator-prey dynamic between Pleistocene hunter-gatherers and Proboscideans. Traces of human butchery, such as cut marks and other bone surface modification (BSM), are usually presented as evidence for human/proboscidean predator-prey associations. However, many experts have challenged the validity of butchery evidence observed on several proboscidean assemblages due to the qualitative nature of BSM assessments. This study utilizes new statistical techniques based on 3D-imaging data and 3D Geometric Morphometrics to determine the origin of BSM observed on the skeletal remains of the Bowser Road Mastodon (Middletown, N.Y.). This technique has been shown to have high accuracy in identifying and discriminating types of BSM. This study quantitatively compared BSM from the Bowser Road Mastodon to experimental BSM resulting from butchery, trampling, carnivore gnawing, and agricultural plowing. Results allow us to discriminate between BSM causing agents, contributing to a more accurate account of the interactions between humans and Pleistocene megafauna.

[338] *New Excavations at Border Cave: Preliminary Reflections on Stratigraphy and Site Formation Processes*

The Border Cave rock shelter, formed in Early Jurassic fragmental rocks of the Jozini Formation on the western scarp of the Lebombo Mountains, KwaZulu-Natal, has a long history of archaeological investigation starting with Raymond Dart in 1934. Phases of informal and formal excavations have yielded remarkable archaeological assemblages including five hominin specimens and spanning MIS 4, 5 and 6. BC1 and 2 have unsecure provenances. BC3 and BC4 are claimed to have been excavated from burial contexts, while BC5 was excavated from strata 3WA during Peter Beaumont's extensive excavation of the site in the 1970's. The ages and stratigraphic associations of these specimens have been debated. Beaumont's excavations revealed a long lithostratigraphic sequence documenting perhaps 200,000 years of sedimentation and anthropogenic occupation until the Iron Age. Remarkable preservation of organic matter has provided a wealth of data on the anthropogenic activities and environmental context through the Border Cave sequence, which is divided into BS (Brown Sand) and WA (White Ash) Members. New investigations, started in 2015, aim to develop greater contextual and chronological resolution to this sequence and its rich archaeological record. Here, we present some preliminary geoarchaeological observations of the Border Cave stratigraphy made during these new excavations.

[403] *From the Mousterian to the Bronze Age: The El Miron Cave Project (Cantabria, Spain), 1996-2018*

El Miron Cave has a long, rich cultural sequence dated by 92 radiocarbon assays >46,000-c.500 BP. This large, strategically located site contains traces of Mousterian, Gravettian, Azilian, Mesolithic and historic uses and evidence of more significant occupations of diverse duration, intensity and function throughout the Solutrean, Magdalenian, Neolithic, Chalcolithic and Bronze ages. A short-term hunting camp during the LGM, the cave held major, repeated, multi-purpose residences in Oldest Dryas. At 18.8cal.kya, a healthy, middle-age woman died, was ritually buried with non-local ocher, and her burial marked by an engraved block. DNA from this human, from salmon and red deer confirm that Cantabrian Spain was a refugium during the LGM from which these species recolonized northern Europe in the Late Glacial. During the Upper Paleolithic humans fished salmon and hunted red deer in the valley below and ibex on the steep, rocky slopes around the cave. Magdalenian levels contain portable art and osseous artifacts that include both regionally distinctive types and items indicating social/trade contacts with SW France, as do exotic flints. El Miron has the oldest evidence of Neolithic adaptations in N. Atlantic Spain (wheat, ceramics, domesticated animals) at 6.5cal.kya. It was also a Copper and Bronze Age "hamlet" and stable.

[286] *Radiocarbon Dating and Carbon/Nitrogen Stable Isotope Analysis of Human Skeletons from the Lambayeque Valley, North Peru (Formative to Inca)*

We analyzed 73 human bone/tooth samples from the following archaeological sites of the Lambayeque Valley, North Peru: Huaca Rajada, Huaca Zarpán, Huaca Santa Rosa, Huaca El Pueblo, Huaca El Chorro, Huaca El Triunfo, Huaca Saltur and Huaca Ventarrón. The associated material culture indicates that this sample encompasses a deep and continuous time transect going from the Archaic to the Inca period. Collagen was retrieved from 32% of the samples (>30kDa fraction) indicating not ideal conditions of organic preservations in the Huacas of the region. Carbon and nitrogen stable isotope analysis was performed with this material. Additionally, we chose five samples of collagen from Huaca Ventarrón for radiocarbon dating – the first direct dates on human bones for this iconic site. The results indicate that the temple was used as an internment ground from at least 3700-3568 cal BP to 664-552 cal BP (95.4% confidence interval and not considering the maritime reservoir effect). An isolated partial femur originally described as belonging to the Archaic was shown to be 594-722 cal BP. Skeletons attributed to the Formative, Lambayeque, Chimu and Inca periods were directly dated to 3700-3568 cal BP, 685-562 cal BP, 664-552 cal BP and 1185-1010 cal BP, respectively.

[155] *Magnetometry Survey at the Mann Site: A Rich New Dataset on Hopewell Ceremonialism*

The Mann site in southwest Indiana is one of the largest Hopewell ceremonial centers in the Midwest and also one of the least studied. The site, which was occupied between A.D. 200 and 500, consists of flat-topped, conical, and geometric earthworks, similar to those from Hopewell complexes in Ohio and elsewhere. The most unique element of the Mann site is the presence of large quantities of habitation debris on the surface, a fact which sets it apart from contemporary Ohio Hopewell sites. Mann encompasses a huge area, approximately 350 acres, and no controlled surface collection or detailed mapping of the site has ever been undertaken, leaving us with piecemeal information as to the relative locations of earthworks, artifacts, and features. In 2006 and 2017, two large-scale magnetometry surveys were undertaken to better understand the distribution and nature of the features at Mann. The resulting data have provided a wealth of information, indicating numerous geometric post enclosures on top of and adjacent to the largest platform mound. The results also show dense concentrations of habitation-related features that are spatially segregated from the ceremonial area. Many of the features we have identified are thus far unique in the Hopewell world.

[390] *Phytolith Analysis of Site FxJj 20 AB*

Controlled fire could have significantly impacted hominin evolution, providing an adaptive release resulting in reduced teeth and gut size, and larger brains. Evidence of hominin controlled fire is sparse in the early Pleistocene archaeological record. These sites are usually in open-air contexts where taphonomic factors can obscure the identification of aspects of combustion that distinguish natural versus anthropogenic fires. Phytoliths can provide a useful proxy for identifying the use of fire in the record. Phytoliths that have been exposed to high temperatures for extended periods of time can be identified through distinct morphological features. Natural grass fires burn quickly and do not reach the temperatures that are typical of hearths, while hearth fires are likely to produce burned phytoliths and contain a high proportion of wood. We focus on phytolith analysis of the 1.5 Ma site, FxJj 20 AB, Koobi Fora, Kenya. Samples from this locality were analyzed using a rapid extraction methodology. Preliminary results indicate a typical grass to wood ratio for an open wooded area, for most of the site. Two squares exhibited an opposite ratio, suggesting wood was brought into the site and burned. This supports other lines of evidence that indicate localized combustion at the site.

Striker, Sarah (Arizona State University)

[176] *The Social Dynamics of Coalescence: Community Life among the Wendat of Southern Ontario ca. 1400-1550 C.E.*

In the fifteenth century C.E., the Ancestral Wendat lived in small, dispersed settlements of a few hundred people. By the mid-sixteenth century their descendants had aggregated into a few large, well-integrated villages of more than a thousand people. This process, described in the archaeological literature as “coalescence” has been the focus of considerable archaeological attention in recent years as archaeologists try to understand the nature of coalescent societies. My proposed research expands on previous work by focusing on the social dynamics of coalescence. I consider coalescence as the product of collective action – sustained cooperative activity among a group of people. I focus on two aspects of these social dynamics: how individual and collective social relationships changed throughout the process and how these relationships may have contributed to coalescence. I examine these questions in the context of four sequentially occupied communities from the Ancestral Wendat sequence using decorative, microscopic, and petrographic data from ceramic pottery and pipes. By understanding these social dynamics, this study will contribute a clearer understanding of how a coalescent community becomes socially cohesive.

Strong, Meghan (Research Associate, Cleveland Museum of Natural History)

[24] *Looking for Light in Ancient Egyptian Nocturnal Rituals*

Given the modern abundance of artificial light, it is often assumed that ancient cultures had the means and desire to illuminate the night. The paucity of artificial lighting devices from ancient Egypt challenges this assumption and has led scholars to conclude that the evidence must be there, but earlier archaeologists have failed to recognize lighting equipment. This presentation will reexamine that viewpoint and incorporate evidence from the rich textual and iconographic record of the New Kingdom (ca. 1550 – 1070 BC). The New Year’s festival serves as a case study for examining the necessity for lighting devices, the relative cost of obtaining a lighting implement, and the significance of employing light in nocturnal rituals. The sensorial impact of artificial light will also be explored and provide new insight into the experience of night in ancient Egypt.

[102] *Identifying Crop Rotation during the Early Medieval Period in England: Charring Temperature, Contamination and Isotopic Boundaries*

Farming practice changed in Medieval England, allowing a dramatic increase in cereal production. Historical documents describe 13th century agricultural practices as open-field collective farming including three-field crop rotation and use of the heavy plough. Our research investigates how and when such changes took place, using stable carbon ($\delta^{13}\text{C}$) and nitrogen ($\delta^{15}\text{N}$) isotope values to assess crop rotation practices. Wheat, barley, oats and rye form the main crops. Crop rotation – i.e. consistency of growing conditions among species grown in annual rotation – is investigated through inter-species comparison from the same archaeological sequences. Temporal changes are examined via comparison of the same species over time.

The effects of charring on rye and oat grain $\delta^{13}\text{C}$ and $\delta^{15}\text{N}$ values are unknown. Therefore, we undertook experimentation to assess charring effects, as previously done for wheats and barleys. Furthermore, due to limited Early Medieval archaeobotanical material, some grains exceed the 260°C maximum charring temperature used previously; the new

charring experiments examine the effect of higher temperatures on $\delta^{13}\text{C}$ and $\delta^{15}\text{N}$ values. However, using grains charred at higher temperatures, coupled with wet soils, introduces additional contamination issues that require appropriate screening before analysis.

Stuart, David (The University of Texas at Austin)

[79] *Proper Names and the Development of Early Writing Systems*

The 1980s saw dramatic new insights into the decipherment of ancient Maya writing, much of it spurred by collaborations with my friend and colleague Steve Houston. One of these was the recognition of inscribed "name-tags" on various types of portable objects and monuments, serving to specify the individual ownership of elite things and commodities, and perhaps developed in part to document the complex inter-relations among Maya dynasties by the Early Classic period. More recent discoveries of Preclassic Maya writing at San Bartolo, Guatemala, have added important new evidence to ponder about the origins of writing in the Maya area, and in Mesoamerica in general. These short texts do not "tag" objects, yet they are nonetheless almost exclusively examples of written names, used to identify images in the complex narrative of the mural paintings of the Las Pinturas complex. Houston, myself and others have explored the importance of naming in the advent of script in ancient Mesoamerica, but in this presentation I propose to go much further afield, exploring also the almost universal significance of proper names as key motivations in the development of ancient writing systems in the Near East and Asia.

[120] *Using Remote Sensing to Re-evaluate Prehistoric Land Use in Chaco Canyon, New Mexico*

Remote sensing has been used extensively the past several years to study prehistoric land use in Chaco Canyon, New Mexico. Previous land use models for Chaco predict economic activities such as agriculture and water management near some of the major sites within the canyon, and these models have been critical to understanding how land use contributed to the rapid social transformation of Chacoan society. Remote sensing methods, including ground-penetrating radar (GPR), magnetic gradiometry, LiDAR, low-altitude aerial photography, and structure-from-motion photogrammetry, have produced new information about these economic activities, including evidence of buried and remodeled land use features. The results from our remote sensing investigations point to a much more complex land use history than suggested by previous models. This poster highlights some of these recent results and interpretations.

[34] *Mapping Faunal Data to tDAR Ontologies to Address Data Comparability and Archaic Period Use of Animals in the Interior Eastern United States*

With support from a National Science Foundation grant, the Eastern Archaic Faunal Working Group (EAFWG) uploaded faunal datasets for 24 Archaic Period (10,000-3,000 BP) archaeological sites in the Interior Eastern United States into the Digital Archaeological Record (tDAR) to address research questions about the roles of cultural and environmental variability and change in human use of fauna. In order to compare the disparate faunal datasets within and among sites, we established agreed upon ontologies for variables in tDAR and then mapped our datasets to those ontologies. We used or expanded some ontologies developed by the Southwestern Faunal Working Group, and developed new ontologies to accommodate differences, such as in fauna, settlement types and contexts, cultural chronologies, and archaeological sampling and recovery in the Interior East. Mapping disparate datasets to the ontologies allowed us to assess data comparability related to bone preservation and modification, recovery methods, and site contexts and to document relative comparability within and among most sites. Mapping of faunal datasets to the resource use ontology, data integration for comparable datasets, and related analyses reveal differences and changes in resource use, particularly for aquatic resources, that we link to variability and change in cultural practices and environments.

[361] *Preliminary Exploration of Provenance of Stones and Strategy of Using Stones in Panlongcheng Site during Shang Period*

The production of stone tools is a systematic human activity, and the utilization of stone materials is the basis of the entire production. Before conducting research on the entire stone production, we should observe the provenance of stones and the strategy of using these materials. Through the analysis of the lithic facies of stone tools excavated from Panlongcheng Site, combining with the geological survey, we basically determine that the stones should come from the Dabie Mountains in the northern part of Panlongcheng. As for the strategy of using stones, Panlongcheng people fully recognized the characteristics of different stones. They considered the function of stone tools, and then selected appropriate types of stones to make tools. Meanwhile, based on landform, distribution of sites and situation of stone tools, there might be some professional production areas and these stone tools were transported by some certain routes.

Suarez Ubillus, Mónica (IDARQ) and Iván Ghezzi (IDARQ)

[236] *The Cahuacucho Idol of the Casma Culture*

In 2015 Suárez reported the discovery in the high parts of Cerro Cahuacucho (Sechin Valley) of a carved algarrobo (*Prosopis* sp.) tree trunk, over 2 m long and 118 kg in weight. It was carved on one side with the representation in profile of 5 felines. Because of this feature, it was named "The Cahuacucho Idol". After a complex rescue process, it was transferred to the National Museum in Lima for conservation and the extraction of samples for high precision radiocarbon dating using wiggle-matching, and then returned to Casma. The results of the analysis of the iconography and other features, as well as the archaeometric research carried out on this representative religious artifact of the Casma culture, allow the reconstruction of an important part of the ideology and paraphernalia in force during the Late Intermediate Period in the Sechin Valley.

[399] *Small-Scale Complexities: Tekkalakota and the Archaeology of the Southern Deccan*

This paper introduces the MAST project, a multi-year excavation program in South India that is designed to explore the role of small-scale societies in the development of larger interregional social formations. In particular this project will focus on areas of Iron Age and Early Historic occupation and production at the site Tekkalakota, and on the diachronic articulation of associated ritual places and political monuments which includes Neolithic ashmounds, megalithic features, and early inscriptions associated with the North Indian Mauryan Empire. In doing so, this project will reflect on long-term patterns of monumental construction and local innovation, challenging existing assumptions about the development of social complexity that looks almost exclusively to large-scale urban societies that are politically organized as formal states.

[81] *Urban Palimpsest Landscapes: Interpreting the Teotihuacan LiDAR Map*

With 54% of the world's population living in urban zones, investigating the nature and impact of urban centers has never been more relevant. Archaeology's unique ability to reconstruct prehistoric urban systems across the long dureé makes the Pre-Columbian metropolis of Teotihuacan (1-550 CE) an outstanding candidate for probing the complex sociopolitical, environmental, and economic circumstances that precipitate urbanization. Project Plaza of the Columns Complex interprets the new Teotihuacan LiDAR map within the framework of palimpsest landscapes; quantifying how prehistoric urban systems leave enduring impacts on the modern landscape. This 2.5 dimensional map covers 165 km² of the Teotihuacan Valley, expanding the reach of Millon's survey map by over 122 km². Not only does this map redefine ancient city limits, it quantifies how the present landscapes trace the contours of their past. Archaeology contributes valuable and influential insights about the continuity between past and present landscapes. The LiDAR data already attests to significant loss of the remaining traces of ancient urban systems. Extensive bedrock mining for the construction of the new international airport has demolished many archaeological features on entire hillsides. Evidence of these lost features are now preserved only as a digital archive on our LiDAR map.

Sugiyama, Saburo (Arizona State University)

[28] *New Data and New Perspectives of the Feathered Serpent Symbolism and Polity at Teotihuacan*

Intensive excavations carried out by the Proyecto Templo de Quetzalcoatl more than 20 years ago suggested that the pyramid symbolized human sacrifice, warfare, and rulership in Teotihuacan. The lack of a royal tomb inside the building indicated that more than 200 warriors were sacrificed in dedication to the monument itself. The recent discovery of the ancient tunnel under the Feathered Serpent Pyramid by Sergio Gomez substantially progressed our understanding of the Teotihuacan state polity and the Feathered Serpent symbolism. In this presentation I provide contextual and diachronic overview of the use and distribution of Feathered Serpent images, including related Venus-Tlaloc icons and discuss how they contained socio-political implications for Mesoamerican people. I also examine the Citadel's architectural layout and the spatial distribution of artifacts referencing the Feathered Serpent in the dedicatory chambers to argue Teotihuacan was controlled by powerful individualistic rulership. This is indicated by the city-wide ceremonial construction programs materializing Mesoamerican worldview in an early stage of the metropolis. Primary excavation data reinforce the hypothesis that the Citadel was the headquarters of ruling entities and military institutions, where state-sponsored sacrificial rituals and occasional accession ceremonies took place and the royal grave was once located.

Sukau, Dana (Portland State University) and Virginia L. Butler (Portland State University)**[118]** *Use of Backwards Design to Assess Public Engagement at the Archaeology Roadshow, Portland, Oregon*

Public archaeology has grown in recent decades with increased recognition of the need to garner public support and increase accessibility of archaeology to a range of publics. While public outreach efforts have been increasing, there have been limited reflections on how we measure the effectiveness of our efforts. One approach used in the field of Education is Backwards Design, which focuses on clearly defining goals and methods of assessment for education or public outreach. We applied the Backwards Design framework to the design and implementation of an outreach activity at the Portland State University Archaeology Roadshow in June 2018. The activity's purpose was to encourage visitors to take an active role in their visit to the event through engaging with several presenters hosting booths and activities. We proposed this could be accomplished and the activity assessed by giving visitors a card with several questions they could pose at booths. Presenters marked the visitors' cards, demonstrating their engagement, then visitors returned the question cards and were rewarded with a raffle ticket. A total of 221 cards were distributed, while 52 were returned, a 23.5% participation rate. Our poster reviews the promise and challenge of using Backwards Design in public archaeology.

Sullivan, Kelsey (University of Oregon) and Jaime Awe (Northern Arizona University)**[255]** *Eccentric Production Techniques and Caching Practices at Xunantunich, Belize*

Though identified at sites throughout Mesoamerica and the Maya Lowlands, eccentric lithics remain poorly understood and understudied. These esoteric artifacts, however, are very important to understanding the ritual expression of the complex ideologies of the ancient Maya. Over 100 years of archaeological research at Xunantunich in the Belize Valley, including ongoing work by the Xunantunich Archaeology and Conservation Project, has revealed prolific dedicatory caches containing eccentric lithics throughout the Late Classic site core. This large corpus of eccentrics makes Xunantunich an ideal center for a comprehensive examination of a range of production techniques and ritual practices at a single center. An investigation of these eccentric caches elucidates strong regional similarities in the manifestations of this pan-Maya caching tradition, as well as local divergences from other sites in the Maya Lowlands. In this paper, we expand on previous research into ritual caches from Xunantunich and focus on a range of complex technological processes associated with the production of these tools. We also present the results of an experimental study into the creation of specific eccentric types. This research explores methods for understanding the production techniques of eccentric lithics, which serves to enhance the study of ancient Maya eccentric lithics.

Sullivan, Lynne [183] see Harle, Michaelyn

Sullivan, Shaun**[37]** *The Salt Road at MC-6, a Public Work Empowering the Cacique*

Middle Caicos, in the Turks & Caicos islands hosted a protohistoric Chiefdom in the Classic Taino tradition as demonstrated by evidence of regional exchange, key resource control, social stratification, monumental public works, and the use of public ceremonial space that reflected advanced astronomical and calendric knowledge among the elite at a complex site, MC-6. Organization of public labor by an empowered cacique at MC-6 is reflected in the construction of a road, stretching from the edge of ceremonial space in the main plaza to a large deposit of a key resource, salt (hereafter the Salt Road). Control of trade in salt helped energize a regional exchange network that reinforced the social status and authority of the MC-6

cacique, and of associated kin and allies. The Salt Road is considered in the context of its reflection of centralized planning, control of public labor as well as of a key resource, and with regard to societal expenditure of time and energy, material and social gain, associated ceremonialism, and reinforcement of the authority of the cacique and associates.

[253] *MtDNA Analysis of the Paquimé (Casas Grandes), Mexico, Population*

This research project investigates the population interred at the archaeological site known as Paquimé (Casas Grandes), Mexico between two time periods known as the Viejo Period (700 - 1200 A.D.) and the Medio Period (1200 - 1450 A.D.). There was a shift in culture during the latter period marked by changes in material culture and the bringing together of larger populations near and within the city center known as Paquimé. Several scholars have suggested that this extraordinary cultural shift is principally due to migrations from other regions (for example: Di Peso 1974; Lekson 1999; Laekson 2015). The research conducted at this archaeological site addresses questions about migration patterns, individual identity, genetic relationships, and mortuary rituals using multiple lines of evidence including molecular data, archaeological data, and historic literature. Through full mitogenome analysis for the preliminary portion of this study, individual interments are examined for their genetic relationships in the greater context of their archaeological situ and understanding of the site at large. This data, when compared to that previously published, aids in our understanding of the past occupation and potential population movement at the site.

[130] *Bronzes, Mortuary Ritual and the Rise of Political Power in the NE Frontier of Ancient China: A Case Study of Upper Xiajiadian Burials*

This study focuses on manipulation of bronzes of different styles, and mortuary rituals overall, during in the emergence of political power in the northeastern frontier of ancient China. Data are presented on three richly furnished burials M101 at Nanshan'gen and M8501 and M9601 at Xiaoheishigou of the Upper Xiajiadian Culture (c.1000-600 BCE) centered in southeastern Inner Mongolia. Three types of tomb bronzes include imported Zhou capital style vessels, bronze weapons and horse ornaments featured with mixed Zhou and northern frontier style, and distinctive locally made bronzes based on indigenous pottery types. Examinations of the style, assemblage and mortuary use of bronzes indicate that material symbols were intentionally selected to mark prestige and authority of individual elites. This study will demonstrate the vibrant role bronzes played in the increasing complexity of the Upper Xiajiadian societies and the interactions between the Zhou from the Central Plain and frontier communities in Eastern Eurasia.

[190] *Polychrome Perplexities: The Painted Rock Art of the Southern Black Hills*

Infrared, ultraviolet, and D-Stretch imaging has provided a more complete view of a complex set of black and red painted rock from the southern Black Hills of South Dakota. The painted designs include bison, bears, other quadrupeds, humans, net-, web-, and gridlike figures, atlatl darts, hand- and footprints, mythological beings, and nonrepresentational figures. Most individual figures are either red or black, but some are dichromatic. Neither color is consistently superimposed over the other; rather, they appear to be part of a single tradition. Based on superimpositions and subject matter this rock art is

hypothesized to date to the Late Archaic period, approximately 2500 to 1000 years before present. It shows some affiliation with Eastern Woodlands cultures; however, no specific links were found between the pictures and oral literatures.

[70] *The Development of Sociopolitical Complexity among Chumash Hunter-Gatherer-Fishers on California's Northern Channel Islands*

The Chumash of the Santa Barbara Channel region of southern California are well known among archaeologists for developing complex sociopolitical systems within a hunter-gatherer-fisher subsistence system. This includes the advent of both hereditary high-status leaders and craft specialization in the form of shell bead and stone drill production industries. Chumash territory encompasses California's northern Channel Islands, occupied from the terminal Pleistocene until Spanish missionization in the early 19th century. These islands still contain a well-preserved trans-Holocene record of occupation. We present evidence of craft specialization (i.e., microblades and bead production refuse) and subsistence change (i.e., faunal remains) from Santa Rosa and Santa Cruz Islands, the largest and most intensively occupied of the northern islands, to trace the appearance of complexity among the Chumash. Evidence of changing landscape use and intensification of non-subsistence labor practices is central to understanding the rise of complexity in the region. Ethnohistoric and environmental research paradigms have led to a range of definitions for complexity in the region, an issue that current work still seeks to disentangle. This study will place the appearance of sociopolitical complexity within a global context as a valuable comparative case for other examples of non-agricultural coastal hunter-gatherer-fishers.

[385] *Open Data, Indigenous Knowledge, and Archaeology: The Need for Community-Driven Open Data Projects*

Over the past 20 years, much archaeological data has been digitized and made available online. With an increasing call for open data and open science models, driven largely by a desire to make research more accessible and reproducible, archaeologists are exploring new ways to make these data available without negative impacts to the archaeological record.

However, when archaeologists work in Indigenous contexts, there are considerations about how broadly knowledge should be shared, especially when it concerns deceased ancestors. Archaeologists have become more attentive to the sensitivities about ancestral remains, but other material objects and site locations can be closely tied to knowledge that needs to stay within the community, lest it cause harm to living members. While some best practices can be outlined, ultimately archaeologists need to allow descendant communities to decide what materials can be shared (if any), how they should be shared, and any protections that need to be in place before data are made available, including legacy and archival data. Drawing on my experiences working with Indigenous communities in Canada, I discuss how they engage with the archaeological data in specific ways, highlighting the need for community-driven projects that are attentive to the needs of each community.

[69] *The Entanglement of Health, Race, and Resistance at the Mount Pleasant Indian Industrial Boarding School*

Childhood illness and death at Federal Indian Boarding Schools are one of the most tragic aspects of these failed institutions. Preventable communicable diseases spread like wildfires in the close-quarters and overcrowded conditions of dormitories. Racist policies maintained poor nutrition and hard physical labor also contributed to illness and injury. The experiences of chronic physical trauma denied Native American children of their wellbeing and personhood. Furthermore, the harsh treatment experienced caused psychological injury in what is now recognized as historical trauma. Oral histories, documentary evidence, and archaeological data at the Mount Pleasant Indian Industrial Boarding School show that students here suffered a great deal, however, they were also immensely resilient. In this paper, I will share an individual story of resistance in the face of serious health risk. I will also present how Michigan Tribes are seeking healing from the disastrous consequences of the boarding school.

[249] *The Ages of Stemmed and Fluted Points in the Northwestern Plains and Rocky Mountains*

While the relative and absolute ages of fluted and stemmed points remain unclear in the Great Basin, particularly in the earliest periods of prehistory, to the northeast in Wyoming the archaeological record is unambiguous. Fluted points are consistently older than stemmed points, an observation supported by both absolute and relative dating of multiple localities. In this paper, I review the archaeological evidence for the chronology of stemmed and fluted points in the Northwestern Plains and Rocky Mountains, but ultimately argue that patterns we see in neighboring areas may not be relevant to the culture history of the Great Basin. Therefore, this problem in Great Basin prehistory may be one where sample sizes are not yet sufficient to provide a clear answer.

Susmann, Natalie (Boston University)

[337] *Expanding the Boundaries of Cultic Space: An Investigation of Nature in Greek Cultic Spaces in the Argolid and Messenia (2800–146 BCE)*

The importance of landscape to ancient Greek cultic activity has been long acknowledged. Beliefs and stories about Greek gods and lesser deities were firmly situated in the visible physical world. Despite our acceptance that this was a widespread practice, few modern archaeological studies consider these visual and topographical relationships on a regional scale, and focus on individual sites and particular periods. Recognizing the benefits of a multi-scalar approach, this paper investigates

the natural topographies of multiple Greek sanctuary spaces surveyed within the regions of the Argolid (2400 sq. km) and Messenia (3000 sq. km) (Greek Peloponnese) used between the Bronze Age through Hellenistic period (2800–146 BCE). With careful consideration for each sanctuary's "life history" (Ashmore 2002: 1173), in conjunction with phenomenological data, time-phased GIS analyses (e.g. viewshed and prominence), and 3D modeling, I identify particular cases where the natural landscape should be considered as a functional part of the cultic arena – specifically, to convey sociocultural authority, for asylum and protection, or crowd control. Ultimately, by investigating a wide array of previously unconsidered evidence, and applying a broad geographical and temporal scope, this research will provide a more nuanced picture of the Greek cultic landscape than is currently available.

Sutter, Richard (Purdue University - Fort Wayne)

[55] *Horizontality Revisited: Evidence for 3,000 Years of Prehistoric Biocultural Continuity of Fisherfolk at Huanchaco, North Coast of Peru*

The importance and distinctiveness of Peruvian fisherfolk, or pescadores, and their complementary role in coastal valley economies feature prominently in numerous ethnohistoric accounts, while archaeological evidence indicates that large, permanent fishing communities existed for centuries before. What is unclear is the degree to which, if any, these communities remained biologically distinct from other contemporaneous inland agricultural communities. Here we present preliminary dentally derived biodistance results for recently excavated Salinar (400 BC - AD 100) and Viru (AD 100-550) era coastal skeletal populations from Huanchaco, Peru. Comparisons with other skeletal samples from the Moche Valley indicate that the coastal Salinar, Viru, and lower valley Moche era (AD 200 – 750/800) populations show long-standing continuity with one another beginning as early as the early Initial Period (1500 – 1200 BC), and that lower valley Salinar and Viru fishing residents were slightly distinct from contemporaneous middle Moche Valley Salinar and Viru agriculturalists from Cerro Oreja. These results suggest that, despite cultural similarities between middle and lower valley populations, a degree of breeding isolation and differential gene flow from the adjacent highlands existed between them. We consider the implications of these results.

[237] *NAGPRA Successes, Challenges, and Emerging Issues: Forest Service Approaches to Post-1990 Discoveries*

The Forest Service manages 193 million acres and over 277,000 recorded sites throughout the United States; NAGPRA has become integral to how we conduct work. Developing POAs with tribes prior to intentional excavations has helped foster increased communication and collaboration; tribal roles in decision making influence how we work with academics and contractors. Providing reburial opportunities has added a meaningful dimension to our repatriations. However, we've often struggled with inadvertent discoveries. They rarely follow the "norm" envisioned by the regulations and many archaeologists and managers are far less comfortable with NAGPRA discovery than with collections requirements. Most of our inadvertent discoveries are made by recreational users and local law enforcement is frequently aware of discoveries before we are, further complicating the process by starting "sideways." Particularly in areas where discoveries are common, there is tribal interest in developing a more fluid disposition process than is laid out by NAGPRA. Another emerging issue is human skeletal materials inadvertently curated in post-1990 collections. After 29 years of working with NAGPRA, it is time to examine what is working well, what could be improved, and how we can better integrate NAGPRA into public education, university programs, and agency training and process.

[301] *Local Actions and Long-Distance Interactions: Challenging the Paradigm for the Emergence of Social Complexity on Cyprus during the Bronze Age*

Complex social networks or social complexity emerges from the actions and interactions of people as they pass information, goods and services. During the Bronze Age in the Mediterranean, particularly on the island of Cyprus, it has been hypothesized that two actions and interactions are particularly important for this process: differential access to metal resources and participation in international trade. This paper explores the role of local actions and far reaching interactions in the emergence of social complexity on Cyprus during the nascent sub-periods of the Bronze Age (2400-1700 cal BC), and the effect of cross-scale interactions on this process. Proxy data for these actions obtained from mortuary contexts is statistically analyzed at the community, region and island-wide scales to determine the distribution of access to metal resources and level of participation in international trade, and the hypothetical network configuration that best describe the social system. When complex social networks like small world or scale free configurations are approximated, differential access and participation are apparent and social complexity is emergent. The results of this research do not support the long-standing models that link metal consumption and long-distance trade to the emergence of social complexity during the Bronze Age on Cyprus.

[307] *Digitally Augmented Survey of Southern Veracruz Using Open-Source LiDAR Data*

In recent years, the Mexican Instituto Nacional de Estadística y Geografía (INEGI) released a LiDAR-based digital elevation module (DEM) that provides a mechanism to augment the area covered by pedestrian surveys. The DEM is of low resolution (5-m horizontal grid) compared to research-grade LIDAR studies in Mesoamerica, but the southern half of Veracruz is largely deforested and mounded architecture less than 1-m tall can be detected in many cases. The coverage using INEGI's open-source DEM is massive compared to pedestrian surveys and higher-resolution, research-grade LIDAR. In a prior test for a study area in south-central Veracruz, Stark and Stoner (2017) compared remote detection of formal architectural complexes with those identified through pedestrian survey, finding a high concordance between the two survey techniques. We move forward in the current study by describing the distribution and characteristics of centers with monumental architecture identified for the southern Veracruz lowlands (Tuxtla Mountains excluded) on the basis of the INEGI DEM. The results expand information spatially from the three systematic pedestrian surveys in southern Veracruz that have been undertaken in the past.

[34] *Potentials and Pitfalls for ZooMS Analysis in the Pacific: A Case Study from Ofu Island (Manu'a Group, American Samoa)*

Zooarchaeological analysis in the Pacific is often limited by the large proportion of small, highly fragmented, non-diagnostic remains recovered from archaeological sites. Recent advances in biomolecular methods, including collagen peptide mass fingerprinting (a.k.a. ZooMS) enable increased taxonomic identifications and refine investigations related to human subsistence and biodiversity. The Samoan archipelago is one of the last island groups to be colonized by Lapita people and, as part of the ancestral Polynesian homeland, figures prominently in discussions of Oceanic migrations, species translocations, subsistence, and culture change. Reanalysis of the non-diagnostic medium mammal assemblage recovered from the To'aga dune site via ZooMS provides new evidence for early commensal introductions and human activities. Stable carbon and nitrogen isotope analysis of newly identified commensal fauna from To'aga and elsewhere on Ofu Island further reveal patterns of human land use and ecosystem transformation throughout the island. This case study demonstrates the potential for technology-based methods to contribute to long-standing questions of species translocations and early subsistence economies across the Pacific. While such methods present exciting new opportunities for zooarchaeological analyses, particularly in collaboration with museums and archived collections, standards and guidelines

for ethical sampling are critical.

Swope, Karen K. (Statistical Research, Inc.) and Carrie J. Gregory (Statistical Research, Inc.)

[189] *Radioactive Mineral Mining in Southeastern Utah: National Register Multiple Property Documentation Form*

Statistical Research, Inc. (SRI), under contract with the BLM and Utah Office of Historic Preservation, developed a historic context for radioactive-mineral-mining-related resource types in the form of a National Register Multiple Property Documentation Form (MPDF). In addition, SRI generated an educational public product to interpret the resources. The purpose of the historic context is to assist agencies and researchers in NRHP eligibility assessments and findings of effect for undertakings across the Richfield Field Office, particularly in the Henry Mountains District. The purpose of the public product is to explain and interpret the resources to the interested public and to foster improved stewardship through knowledge. The Henry Mountains District is unique for being the scene of twentieth-century radioactive-mineral-mining booms. Two events at the turn of the twentieth century resulted in a mining boom targeting radioactive minerals in southeastern Utah. Pierre and Marie Curie isolated radium, and carnotite was found to contain uranium, vanadium, and radium. The industry experienced its biggest boom after World War II, when the Atomic Energy Commission supported renewed mining for radioactive minerals. For 70 years between 1900 and 1970, radioactive-mineral mining in the Henry Mountains District played a pivotal role on the local, national, and global stage.

Sykes, Naomi (University of Exeter)

[351] *Archaeologies of the Norman Conquest*

Despite the long-standing truism in archaeology that the Norman Conquest of England is largely invisible in 'the stuff of everyday life', an abundance of material remains dating to the 11th and 12th centuries has been recovered through excavation and still survives above ground. It is now becoming clear that while some level of continuity was not unusual, the Conquest also initiated and intensified developments in all aspects of society, including culture and identity, economy, diet, art and architecture, portable material culture, manorial and community landscapes, religion and mortuary practice, and the management of animals and the environment. Many of these elements are either inaccessible from documentary evidence alone or have distinct material implications, yet scholars have rarely taken advantage of these wide-ranging archaeological datasets to ask probing questions about the dynamics and impact of the Norman Conquest.

This paper presents the results of our recent research project, funded by the Arts and Humanities Research Council. It will showcase innovative approaches and interpretations from both the humanistic and scientific sides of archaeology that are helping us re-evaluate traditional narratives of the Conquest and better understand this rich period of British and Continental history.

[323] *Reconstruction of Late Holocene California Tule Elk Populations Using Ancient DNA and Stable Isotopes: An Update on Ongoing Analyses*

Zooarchaeological analyses have for some time suggested that California tule elk (*Cervus elaphus nannodes*) populations were depressed by late Holocene hunters, and more recent preliminary analyses focused on aDNA and stable isotopes (carbon, oxygen, and nitrogen) have supported that conclusion. This work indicated a significant decrease over time in genetic diversity, consistent with a declining elk population, but absent changes in stable isotopes that suggested climate change did not play a role. We present here further tests using this approach based on two sites in central California that have produced large samples of archaeological tule elk: the Emeryville Shellmound (CA-ALA-309), located in the San Francisco Bay area, and the King Brown site (CA-SAC-29), located in the Sacramento–San Joaquin River Delta. From a collection of over 80 individual elk from the two sites we derived radiocarbon assays, stable isotopes, and attempted extractions, amplifications, and sequencing of a 172-bp fragment of the mitochondrial D-Loop. This poster provides an

update of our ongoing analyses of these materials.

Szabo, Vicki, Brenna Frasier (St. Mary's University), Michael Buckley (University of Manchester), Thomas McGovern (Hunter College, CUNY) and Ingrid Mainland (University of Highlands and Islands)

[31] *Transdisciplinary Analysis of Marine Mammal Use in the Norse North Atlantic and Subarctic*

This ongoing project, funded in 2015 by Anna Kerttula and the Arctic Social Sciences Program, uses historical, literary, aDNA, ZooMS, and archaeological data to identify patterns in marine mammal exploitation across the North Atlantic and Subarctic from ca. 800 -1800 CE. With over 230 samples of archaeological whale bone from sites in Orkney, the Faroes, Iceland, Greenland, and Newfoundland, our project has revealed a high number of blue whale remains, along with right whales, grey whales and a range of other species across approximately thirty archaeological sites. New translations of premodern Icelandic historical and natural history texts have revealed specialized knowledge and intensive use of large whale species in periods corresponding with the archaeological evidence. This paper will address the insights gained from transdisciplinary collaboration on reconstructions of premodern marine mammal use, and the complications of aDNA analysis from archaeological assemblages from Norse sites across the North Atlantic. This unconventional transdisciplinary project is one of many supported by Anna Kerttula that addresses critical environmental issues in the premodern and modern Arctic and Subarctic worlds.

Szpak, Paul (Trent University) and Katherine Chiou (University of Alabama)

[102] *Stable Isotope Analysis of Charred and Desiccated Plant Remains from the North Coast of Peru*

One of the key findings of early work that utilized isotopic analysis of macrobotanical remains was that charred remains seemed to produce reliable isotopic measurements, while uncharred (desiccated) remains did not. This early research contrasted charred remains from the highlands of Peru with uncharred remains from the coast. In this study, we reexamined the notion of the reliability of desiccated remains by measuring the carbon and nitrogen isotope compositions of both charred and desiccated macrobotanical remains from two sites on the north coast of Peru. The results demonstrate no systematic differences in the isotopic compositions recorded in the charred and desiccated remains, calling into question the assumption that only charred remains will produce reliable isotopic measurements. Furthermore, the isotopic compositions themselves suggest the use of fertilizers (seabird guano or camelid dung).

Szremski, Kasia (University of Illinois)

[98] *How Much Can I Get for These Choros? New Evidence for Andean Markets from the Chancay Site of Cerro Blanco, Huanangue Valley, Peru*

The rich diversity of Andean ethnic and ecologic landscapes meant that exchange was essential to the economy of many prehispanic Andean societies. While exchange can and did take many forms (trade, vertical archipelago, reciprocity, centralized redistribution, etc.) one mechanism that has received relatively little attention is that of the feria or informal market. Using the Chancay as a case study, this paper draws from a growing body of literature (see Dillehay 2013; Mayer 2013, among others) to argue that ferias were a key part of the Andean political economy, particularly during the Late Intermediate Period when political fragmentation in the Andes would have led to inter-ethnic exchange becoming a key factor in facilitating the movements of goods (agricultural, mineral, etc.) between different ecological zones. Using information from colonial period documents together with data from recent excavations at the Chancay administrative center of Cerro Blanco, I argue that ferias connected to camelid caravans were likely a key part of the Chancay political economy, allowing both the circulation of goods between ecological zones and playing a key role in integrating far-flung Chancay settlements.

[404] *Paleoecological and Archaeological Evidence for Iron Age Economic and Ecological Transformation in the Highlands of Western Kenya*

Until recently, chronologies of food and iron production activities have been poorly resolved in the western Kenyan highlands, and have been informed largely by historical linguistics and only a handful of radiocarbon dates. New

archaeological and microbotanical data are presented that allows reexamination of earlier cultural history models for this region, and provides firmer date ranges for specific food production and iron smelting activities. These data broadly support extant theories of food production for the western highland region, and identify and contextualize transformations of the ecological landscape associated therewith. Further, faunal, iron, and microbotanical evidence is presented that region-wide economic transformation from relatively mobile herding and low-intensity root crop cultivation to more sedentary herding, millet and/or sorghum cultivation, and locally-performed iron smelting characterized the early part of the last millennium BP.

[58] *Sustainability in Society and Archaeology*

The processes that make a society sustainable not evolve over periods of decades, generations, and centuries. These processes are commonly not perceivable in a single lifetime. Sustainability must therefore be a historical science, and archaeology is well placed to contribute to understanding sustainability. Yet factors within society and the field itself inhibit the contribution of archaeology to understanding sustainability. Among these are popular ignorance, professional disinterest, the nature of academic achievement, failure to approach historical study in a comparative framework, and the evolutionary history of the human species.

[33] *Coastal Resource Use during the Prehistoric Times in the Amami and Okinawa Archipelagos, Japan*

The Ryukyu archipelago, Japan, is located between Kyushu and Taiwan islands, stretching approximately 1200 km. The Amami and Okinawa archipelagos occupy the central part of the Ryukyu archipelago. Astonishingly, *Homo sapiens* settled these islands as early as ca. 30,000 years ago. Based on accumulated archaeological data since around the 1900s, chronology of the region is divided into the Paleolithic (ca. 30,000-10,000 BP), the Shellmidden (ca. 7,000-1,000 BP) and the Gusuku (ca. 1,000-500 BP) periods. While archaeological evidence of coastal resource use during the Paleolithic is scarce, people appeared to collect shellfish from the coast, which is located ca. 4 km away from the site. During the Gusuku period, when subsistence economy was based on agriculture, while people consumed and used coastal resources, faunal remains imply that the importance of coastal resources decreased. Having briefly introduced coastal resource use during the Paleolithic and Gusuku periods, this presentation will focus on the Shellmidden period when people heavily utilized coastal resources, which are mainly available from coral reef environments. The availability of the coral reef resources (plus plant use such as nuts) enabled hunter-gatherer adaptations to the island environment, which is a very rare case in world prehistory.

Takamiya, Hiroto [74] see Yamagiwa, Kaishi

Talachy, Joseph (Governor, Pueblo of Pojoaque)

[311] *The Value of Anthropological Research for the Pueblo of Pojoaque*

Like many of my community, I grew up here, learning about the landscape by living within it and walking over it. Evidences of our long history are found everywhere and I always wanted to know more. Our older members taught us about our land too. But it was difficult to recognize Pojoaque when I read archaeology; I also noticed the dearth of information about Pojoaque. First as Lieutenant Governor and now as Governor I wanted to do more for my people –more opportunities to learn, but most importantly, to participate in the researching of our history. It is only with the hands and minds of Pojoaque community members that we can make sense of our unique ancestral and recent history.

As Governor, I am presented with a complex set of tribal and enterprise concerns every day. Archaeological research and the K'uuyemugh Partnership help balance these concerns because they are about our culture. Ongoing research provides Pojoaque with the foundation for understanding how we came to be and who we are, and what we are becoming.

[300] *The Temples of the Classical Kingdom of Bagan, Myanmar: The Bundling of Royalty, Religion, and People*

Bagan was Myanmar's political, economic, and cultural centre during the country's Classical period (c. 800-1400 CE). Encompassing an area of 80 kilometers square, this landscape was home to approximately 4,000 brick monuments. These monuments were the result of the Buddhist pursuit of merit-making, the idea that individuals could obtain merit through acts of piety to increase their social status upon rebirth. For the kings of Bagan, this typically took the form of sponsoring the construction and maintenance of religious monuments. This paper explores how these monuments became nodal features in the landscape, bundling together economic, environmental, social, political, and religious systems and bonding the Crown, the Sangha (Buddhist Order), and the commoner population in a variety of enabling and constraining relationships. During the early Bagan period, these monuments mutually benefitted both the Crown and the Sangha as their construction stimulated the economy and encouraged social cohesion. By the mid-14th century, the Crown began to feel stress associated with state-sponsored monuments, so much so that this eventually contributed to the collapse of the empire. Although the Sangha was able to persist, it would never again experience the same potency that it had during this golden age.

[141] *Raw Material Procurement and Production Technologies of Turquoise and Nephrite Jade in Prehistoric China*

As gold is for the West, jade has been one of the finest symbolic vehicles in the East since prehistory. In recent years, a large amount of nephrite accessories have been excavated from early Neolithic-Bronze Age archaeological sites in Northeast China, Cis-Baikal, and the Russian Far East, posing important questions regarding possible long-distance exchanges and movements of raw materials, products, and production technologies in Northeast Asia. On the other hand, new archaeological evidence indicates that turquoise came to be regarded as a precious stone independently in the prehistoric communities of the Yellow River basin in Central China since 9,000–8,000 BP. The eastern and central regions of China seemingly had a preference for nephrite jade and turquoise, respectively. Through analyzing geological provenance, production technologies, in situ archaeological contexts, sociocultural contexts, and temporal and spatial distributions of excavated accessories and related artifacts, we aim to better understand the long-distance exchanges and movement of semi-precious stones in early Neolithic to Bronze Age China. Our research will strengthen the study of early history of symbolism and long-distance human interactions in ancient China. This research is supported by the General Research Fund of the Research Grants Council Project No. CUHK14600118.

Tang, Liya, Xiage Wangdui, Yu Chun and Zhaxi Ciren**[78]** *New Discovery of Plant Remains in The West of Tibet*

In 2017, one grain and 24 spikelets of barley and other prestigious burial objects were found in the No. 2 tomb which is located at Gepa Serul cemetery, Zanda, Tibet, Chian (the region of the upper reaches of Indus River). Up to now, Gepa Serul cemetery is the earliest known in western Tibet, dating back to 3562-3000 cal. BC by radiocarbon (^{14}C) analyses. The barley remains are scanty, but still meaningful with regard to researching the eastward dispersal of barley. Actually, there are earlier direct radiocarbon dates for archaeobotanical barley grains from Qinghai and Gansu Provinces, China, the Indus Valley in Kashmir, and Pakistan than Gepa Serul. However, the barley of Gepa Serul may have spread from Indus valley due to their close geographical location.

Valley

Zooarchaeological analysis of both freshwater and marine shells from the Upper Belize River Valley is important to interpreting Ancient Maya daily lives. Shell analysis allows us to examine dietary practices and understand economy and trade between Belize Valley sites. This poster presents the results of an analysis of over 42,000 freshwater and 1,200 marine shells recovered from the sites of Baking Pot, Cahal Pech, Lower Dover, and Xunantunich in Western Belize. First, we report the results of taxonomic analyses at all sites, showing proportional differences of shell concentrations within the region. Second, we discuss patterns of taphonomic damage to jute, *Pachychilus* sp., versus culturally worked jute materials. Third, we present the marine shell working process as identified through evidence of shell bead production stages and shell debitage. Combined these analyses provide a holistic review of an often overlooked and typically only quantified category of fauna in Maya zooarchaeology.

[345] *Postcards in the Landscape: Considering Lower Pecos Pictographs as Nahua Pilgrimage Destinations*

Chicomoztoc, the place of seven caves, from which the Nahua ancestors emerged, appears in many central Mexican pictorial manuscripts as a place of origin and one of pilgrimage. Like the mythical Aztlan, its location has not been confirmed; perhaps several such places served different groups of people. However, recent research on the Lower Pecos pictographic tradition (2000 BCE – 400 CE), which spans a section of the US-Mexico border, has linked it iconographically with Huichol and Nahua pictorial and religious traditions. This paper explores two aspects of movement: the journeys depicted in Lower Pecos imagery and the possibility that Nahua groups made spiritually-motivated journeys to the northern frontier of Mesoamerica at times of stress.

Taube, Karl

[79] *The Olmec "Double-Merlon" Motif and the Origins of Color Directional Symbolism in Formative Mesoamerica*

Among the most striking signs of Olmec iconography is the "double-merlon," this being a horizontal form supporting two parallel, upwardly projecting tabs. This presentation examines and discusses where it appears in Olmec imagery during the Middle Formative period (1000-400 b.c.), stressing the importance of context to create an iconographic argument concerning its meaning from one of the most ancient and culturally remote cultures of ancient Mesoamerica. Among the varied bodies of evidence include Middle Formative greenstone carvings, polychrome murals and monumental architecture. In terms of its contextual range, the "double-merlon" is best considered as the Olmec sign for "green." In addition, I note that color directional symbolism was surely present among Formative period cultures, including the Olmec, and directly relates to other major themes, such as directional rain gods and colored forms of maize.

[27] *Don't Throw the Baby out with the Bathwater: New Insights into Palaeodemographic Change with the Intensification of Agriculture in Southeast Asia*

With the accumulation of bioarchaeological research in mainland Southeast Asia we are beginning to assess the impact that agricultural intensification and associated environmental and social changes had on these societies. Recent work is starting to build up a model of demographic change with increasing population size, and an increase in infectious disease and systemic stress during the late prehistoric period, the so-called Iron Age, largely based on archaeological work in Northeast Thailand. This paper presents a palaeodemographic analysis from this region using several sites that span from the early

Neolithic to the late Iron Age (3,800-1,200BP), comprising over 1,000 individuals. We find a statistically significant increase in infants and young children represented in the Iron Age, an age group often ignored in palaeodemographic statistics. These results indicate a palaeodemographic shift with an increase in mortality and/or fertility. At the same time, we also see evidence for major environmental changes, including larger settlements, modification of waterways and social and economic changes indicating the intensification of wet-rice agriculture, and development of hierarchical social organisation. We present a multi-factorial model, considering the bioarchaeological information within the context of environmental change using archaeological, palaeobotanical, geoarchaeological, and epidemiological evidence to characterise this significant biosocial transition.

[312] *Dominant Narratives and Gender Equality in Northwest Coast Archaeology*

This paper explores Julie Stein's work to challenge dominant narratives of precontact culture history of the Northwest Coast using geoarchaeological evidence. We compare feminist archaeology perspectives on standpoint theory and implicit bias in discussing how and why she arrived at a new approach to shell midden site formation on the San Juan Islands, Washington. By demonstrating that the base levels of shell middens are impacted by groundwater and that middens accumulate at vastly different rates both within and between sites, Stein questioned the narrative that there was an increase in social complexity in the late Holocene in the San Juan Islands. Throughout her career, she established that shell middens require both site and landscape-level geoarchaeological analysis before making broad interpretations of settlement patterns and social complexity. She guided her students towards carefully building new interpretations of the past using multiple forms of geological and archaeological evidence. We consider how Stein's approach impacted our 2005-2010 research on small shell middens and interior island occupations, as well as our experience of gender in conducting archaeology in the Pacific Northwest.

Taylor, Evan (University of Massachusetts Amherst)

[301] *The Contemporary Archaeology of Old Cities: State Heritage and its Production in Rhodes and Acre*

Among the historic urban centers represented on the UNESCO World Heritage List, nearly half are located in states of the Mediterranean Basin. Through the lens of contemporary archaeology, this paper traces how the material fabric of historic urban centers is manipulated to conform to particular ideas and visions for what an "old city" should be. Viewing these material interventions (including conservation, reconstruction, demolitions, and site management) as a process of contemporary site formation draws attention to the everyday grounded practices of power and resistance inaccessible through conventional ethnographic methods.

This paper examines the case studies of Old Town Rhodes (Greece) and the Old City of Acre (Israel). The urban layout and architecture of both cities date to the Crusader and Ottoman periods. Old Town Rhodes was, until the Second World War, a primarily Muslim and Jewish quarter, and the Old City of Acre today is populated primarily by Palestinian Citizens of Israel. The paper summarises a systematic photographic surface survey of interventions on the surfaces of Old Town Rhodes and the Old City of Acre made by both residents and state heritage projects that reflect struggles to materially inscribe the meaning of each city.

Taylor, Geoffrey (UC Berkeley)

[250] *What Is a Hill of Beans Really Worth?: Paleoethnobotanical Analysis of Urban Huari Foodways*

Preliminary investigation into the use of plants at the site of Huari from the 2017 field season of the Programa Arqueológico Prehistoria Urbana de Huari resulted in new information placing the common bean (*Phaseolus vulgaris*) as a central component of the daily meal for those living in Patipampa in the Middle Horizon (AD 600-1000). Studies have expanded since then to include materials from the 2018 excavation season and further experimental archaeology work to enable finer identification of plant varieties. The intent of this paper is to answer questions about the inhabitants of Patipampa and how food remains reflect their roles within the household, the city, and the political entity of Wari. Are those dwelling in Patipampa architectural complexes farmers, craftspeople, or other types of specialists? What can be gleaned about administrative control of food within the city of Huari? To what degree were foreign foods relied upon, and what does this tell us about Huari's socioeconomic relationships with people in the greater Wari sphere? Did the administrators of the Wari

state strategize to ensure a sustainable food supply for the burgeoning urban population of Huari?

[391] *New Archaeofaunal Evidence for Early Horse Pastoralism in the Northern Plains*

The introduction of domestic horses into North America by Spanish colonists prompted sweeping transformations to indigenous lifeways in the American West. Nonetheless, due to the incomplete historical record and the scarcity of relevant archaeofaunal data, the chronology and dynamics of this process remain poorly understood. We present a new scientific archaeological study of a young horse burial from Black's Fork, Wyoming. Previous analysis indicated that this site dates to the first half of the 17th century, earlier than most historical models for the adoption of horses by Plains native cultures. Using detailed comparisons with the archaeological record of Eurasia, we argue that the age of the animal, evidence for violent slaughter, the special treatment of the vertebral column, removal of vertebral meat, and the absence of hoof and tail elements are suggestive of pastoral ritual. Cranial injury and severe pathological changes to the skull of this horse suggest its likely confinement in close proximity to other horses. Using ancient DNA, we explore the sex and parentage of this young horse. We present a refined radiocarbon chronology for this specimen, and explore its implications for the emergence of pastoralism and horse empires in the Southwest and Great Plains of North America.

Tebby, Eric (University of Alberta)

[107] *Stitching History and Archaeology: New Investigations into the Chimney Coulee (DjOe-6) Métis Wintering Site*

Our understanding of the Métis experience on the Canadian prairies during the latter half of the 19th-century can be considered fragmentary and is typically understood alongside a colonial narrative. Métis wintering sites were important features in the Canadian west where the role of women cannot be downplayed despite being rarely investigated. Current theoretical frameworks in historical archaeology are aimed to bring out the narratives and daily activities of peoples marginalized by history. Successful investigations into the Chimney Coulee (DjOe-6) Métis wintering site in southwestern Saskatchewan have uncovered remarkable evidence that greatly expands our knowledge of the Métis lived experience at this site. Recorded oral histories surrounding this site are complimented and woven together with new historical research which reveals a comprehensive new perspective. Archaeological finds from a Métis cabin have brought to life the craftwork and daily activities of women. Investigations at this site have strengthen the historical and archaeological evidence known from other wintering sites and highlighted the crucial role that women played in maintaining the day to day functions of the settlement during the waning days of the Canadian fur trade.

[76] *A Little Bird Told Me: Use-Wear Analysis and Replication Studies as a Means to Identify the Function of Birdstones*

Among the most enigmatic ancient North American artifacts are the objects collectively known as birdstones: Small ground stone objects, usually made of banded slate, that take the generalized form of a simplified bird or a bird's head, sometimes with protruding "popeyes." The vast majority of birdstones are surface finds or were recovered from trash pits; among the few published finds discovered in context, the birdstone was placed in or above a cremation burial, in a manner ambiguous as to purpose. A variety of hypotheses have nevertheless been proposed for the use and meaning of birdstones, including the possibilities that they served as ornamental amulets, totems, or insignia on objects or on people, or as functional objects such as game pieces, corn huskers, atlatl weights, or atlatl handles—but none of these hypotheses has been thoroughly

tested, and scholars have not reached strong consensus on birdstone function. In recent analyses of birdstone collections from throughout North America, however, clear patterns of use-wear have emerged on different types of birdstones. Further experimentation strongly suggests that this use-wear was caused by wrapping with cordage, and ongoing replication studies that explore these use-wear patterns are clarifying the more likely functions of these enigmatic artifacts.

[307] *¿Bajo el Yugo de Metztlán? Un Reconocimiento Arqueológico de la Sierra Norte de Hidalgo, México*

La sierra norte de Hidalgo no está bien documentada arqueológicamente, a pesar de su ubicación entre dos esferas culturales mayores del Postclásico: el señorío de Metztlán y la Huasteca. Este trabajo busca llenar esta laguna del conocimiento, con dos metas principales: identificar la organización sociopolítica de los asentamientos de esta región (principalmente si corresponden a los correlatos arqueológicos de un altepetl); y determinar si la zona tenía alguna filiación con el hueyaltepetl de Metztlán. En esta ponencia se presentan los resultados preliminares de un recorrido micro-regional de cobertura total, realizado en el municipio de Huazalingo, en el noreste del estado de Hidalgo. Utilizando datos de los seis sitios del Postclásico identificados durante el recorrido, se realizó un análisis de la distribución interna de su arquitectura y se contrastó con los modelos del altepetl existentes. La revisión de fuentes coloniales y el análisis de materiales arqueológicos permiten acercarse a una caracterización de la organización interna de la zona, así como las relaciones que mantenía con áreas vecinas. Este estudio representa uno de los primeros trabajos sistemáticos de investigación arqueológica en esta región, así permitiendo alcanzar una comprensión más robusta de esta zona relativamente desconocida y sus dinámicas culturales.

Temple, Daniel (George Mason University)

[353] *Questioning Complexity: Amulet Usage and Relational Ontologies in Hunter-Gatherers from Japan and Alaska*

Social complexity is a term that often refers to the evolution of inequality in human populations along socioeconomic scales. This concept is historically traceable to unilineal evolutionary paradigms where reduced complexity is often defined based on othering in comparison to Western industrialized capitalism. This study questions such deterministic views of complexity by contrasting amulet usage in the mortuary practices of two hunter-gatherer populations, one originating from Point Hope, Alaska (ca. 1200-900 BP and 800-400 BP), a second originating from the Atsumi peninsula, Japan (ca. 3300-2500 BP). Along the Atsumi peninsula, amulet usage is found in the graves of approximately 13 percent of adult burials and these individuals consumed greater amounts of marine foods. By contrast, amulet usage is ubiquitous in adult and pre-adult burials from the Ipiutak and Tigara occupations at Point Hope, and appears to be incorporated into these burials through ideations of social maturation and follow the emergence of identities through interactions with the spiritual landscape of Point Hope. These results suggest that there exist alternative layers of complexity found in the ontological and ritual boundaries of cultures that defy traditional definitions and suggest that the ideations surrounding complexity must be critically evaluated.

[242] *Bridging Some Gaps: Advances of the Ethnoarchaeology of Salt in Romania*

The ethnoarchaeological research conducted for the past 15 years around the generous saliferous resources of the Romanian Sub-Carpathians revealed a surprisingly complex (even if in accelerated dissolution) rural universe generated by salt. In the era of advanced mining and industrialization, refrigeration and globalization, we were overwhelmed by the amount and diversity of data related to salt topics: exploitation techniques and tools, storage and transportation, human and animal mobility, distribution, uses (cooking, conservation, popular medicine), symbolism, toponymy etc. Given the rather discrete archaeological evidence of salt related activities and behaviors of prehistoric populations, establishing rules of transcultural correlates proved to be an enough difficult task. So, it became clearer that the perspective on salt studies must be widened, towards a holistic approach combining methodologies of both natural sciences and humanities – an “anthropology of salt”. This paper sums up the recent advances, challenges but also dead-ends of researches made in the area of the anthropology of salt in Romania, including spatial analysis, archaeometry, experimental archaeology, onomastics, all derived from or reported to the consistent corpus of ethnoarchaeological data. In this way, interdisciplinary approaches, both theoretical and empirical, contribute to understanding the role of salt in the human existence over time.

[258] *A Post-Chacoan Cylindrical Vessel from Northern Black Mesa, Arizona*

A recently identified Tusayan Polychrome (A.D. 1125–1290) jar from northern Black Mesa, Arizona, represents the only known Post-Chacoan cylindrical vessel. Identified within the midden of a small late Pueblo II-early Pueblo III period habitation site, the jar circumstantially connects Ancestral Puebloan groups in the Kayenta area to Chaco Canyon and the Chacoan system (or a common origin). In this presentation, we discuss the context of the jar, Hopi interpretations and insights, and ongoing residue analysis leading to two sociocultural considerations. First, we consider the possible connections between the Ancestral Puebloans of western Kayenta and Chaco Canyon, nearly 220 kilometers away. Second, we examine possible beverages the jar may have contained and how that may or may not relate to ritual beverage consumption associated with Chacoan cylindrical vessels and its connections to the Kayenta heartland.

Terrenato, Nicola (University of Michigan)

[23] *Weakness and Precariousness in Central Italian Urbanization*

The urbanization of western central Italy has had a peculiar role in our intellectual history, starting with its most famous fruit, the “eternal” city of Rome. With evident teleology, the narrative about the emergence of the earliest agglomerations in the early first millennium BCE has taken the form of an ascending curve. While there is no denying that this regional phenomenon has produced cities with 3000 years of uninterrupted occupation, recent archaeological and historical research have revealed how precarious the process was in its early stages. At various points in their trajectories, many of these centers were abandoned, moved or shrunk. Even more importantly, they all came together in a slow and hesitant way. It is now clear that they were the result of many distinct elite-led groups settling separately within the same defensible location. Such multifocality remained a long-term trait of these agglomerations, shaping their settlement patterns, their institutions and their sociopolitical life. Arguably, participating elites saw the city as a truce space to mitigate their conflicts and as a vehicle to further their long-range ambitions, but they never fully identified with it. This made all these polities inherently weak and impermanent, even when they lasted for centuries.

[420] *Soil Chemical Traces of Ancient Human Activities at Montezuma Village, UT*

Many of the elements associated with foodstuffs and mineral ores were deposited in the surface of soils and floors of ancient dwellings. Phosphorus and certain heavy metals remain chemically sorbed on soil and floor particles. Soil samples were collected from ancient patios of two structures associated with the Basketweaver culture at Montezuma Village in

southeastern Utah. The north structure was a multi room complex. High extractable P concentrations (450 mg/kg) were discovered in the patios on the north and south sides. Phosphorus levels were much lower in the patio floors of the South structure. Highest levels were found at the bottom of a wash located just south of the structure, likely associated with trash disposal. The north and east patios of the structure were shaded from the afternoon and elevated in P in those soils reflected their used in food preparation and consumption.

[349] *Mazapan Style Figurines at El Palacio: What Significance for The Early Postclassic Interregional Interactions in Northern Michoacán?*

Recent work conducted in Northern Michoacán by the CEMCA in the Zacapu Basin, 30 km North of the Tarascan core-region, shed light on a specific and poorly defined time period at the region before the Tarascan kingdom: The Early Postclassic. The local phase Palacio ranges from A.D. 900 to 1200±50, and recent field works conducted at the major and eponym site of El Palacio brought to the attention a new set of data. Among it, in radiocarbon dated contexts, the encounter of a series of figurines, known in the literature as Mazapan style, questioned many of hypotheses. Mazapan style figurines have never been observed in this sector of Michoacán before, whereas they constitute a strong and diagnostic marker of Early Postclassic cultural and economic dynamics among different regions of the Mexican highlands. The presence of this corpus at El Palacio becomes therefore critical in the understanding of the interregional cultural and economic connections during the Early Postclassic period. This paper presents the study of the figurine's fragments collection and stress a series of issues concerning their context (ceremonial sector, secondary contexts of refuse) and their interpretation at both local and regional levels.

[403] *Discerning Paleolithic Places Rather Than Pleistocene Palimpsests: Olival Grande and the Early Upper Paleolithic in Central Portugal*

The expansive, open-air archaeological site of Olival Grande contains the earliest, well-dated Upper Paleolithic assemblage known from the Rio Maior vicinity. Fabric analysis, sedimentology, and geochemistry studies detail manifold site burial mechanisms, very slow rates of deposition, and significant post-depositional processes at the hillslope site. This presentation uses data from intra-site spatial patterns, lithic technological organization, and artifact fracture patterns and surfaces to hypothesize a long-term view of forager technological organization and interaction with place. The archaeology of Olival Grande demonstrates interpretive limitations of the palimpsest concept, a designation which in practice often conflates and confounds cultural and geological processes of site formation.

[413] *The Distribution and Provenance of Turquoise from Southern New Mexico, USA and Northern Chihuahua, Mexico*

Compared to other regions of the Southwest, little is known about prehispanic turquoise acquisition and exchange in southern New Mexico and adjacent parts of Texas or in Chihuahua, Mexico. Here, we explore the distribution of sites with turquoise in the Tularosa and Hueco Basins as well as in northern Chihuahua. In addition, we use lead and strontium isotopes to investigate the provenance of turquoise artifacts from the Tularosa Basin and Paquimé. In the Tularosa Basin, turquoise from the nearby Orogrande mining district predominates in assemblages from Jornada Mogollon sites with occupational components related to the Doña Ana (AD 1000-1250) and El Paso (AD 1250-1450) phases. Given the close proximity of these sites to the Orogrande source, the abundance of raw turquoise and finished ornaments, and other evidence for regional interaction, it is possible that the inhabitants of the Tularosa Basin mined and manufactured turquoise for both personal adornment and trade. To investigate whether or not this trade could have extended far to the south, we also analyzed two turquoise artifacts from Paquimé. Although we were not able to link either artifact to Orogrande, isotopic measurements indicate that at least one artifact was imported from central Arizona.

[125] *The National Register of Historic Places and the Stations of the Cross Trail - Eligible?*

In October of 2016, Pima Community College's Centre for Archaeological Field Training worked with the Sisters of the Immaculate Heart of Mary on a project to determine if the Stations of the Cross trail and Calvary statues on their property were eligible for the National Register of Historic Places. The Calvary statues were constructed in 1952, with the Stations of the Cross added within a few years. Their long history in Tucson speaks to their significance to the Sisters and the community. Research for the project included mapping, photographic documentation, oral interviews, and archival research. This poster examines the research and conclusions of the project and documents the process of determining if a property is eligible.

Thomas, David (American Museum of Nat History)

[66] *A Shoshonean Prayerstone Hypothesis: Ritual Cartography of Great Basin Incised Stones*

The prayerstone hypothesis, grounded in Southern Paiute oral history, holds that selected incised stone artifacts were votive offerings deliberately emplaced where spiritual power (puha) was known to reside, accompanying prayers for personal power and expressing thanks for prayers answered. Proposing significant and long-term linkages between Great Basin incised stones and overarching Shoshonean cosmology, this article explores the prayerstone hypothesis in the context of the 3,500 incised stones documented from the Intermountain West, an assemblage spanning seven states and seven millennia. Employing object itinerary perspectives, it becomes possible to develop ritualized cartographies capable of matching oral Shoshonean traditions with specific geographic indicators. The results demonstrate that many (but not all) such incised stones are consistent with the votive emplacement of prayerstones. Multiple constellations of prayerstone practice operated across the Great Basin for more than 5,000 years and carried forward, without perceptible break, among several (but not all) Numic-speaking populations of the ethnohistoric interval. The diversity and antiquity implied by the prayerstone hypothesis suggest dramatically more complex cultural trajectories than those of Lamb's (1958) widely accepted model of a single, late, and simultaneous Numic spread across the Great Basin.

[382] *Bioarchaeological Ethics and Considerations for the Deceased*

The last few decades have brought changes to archaeology through the establishment of ethics codes, repatriation, and community-based, participatory research. However, established ethical codes are often unfamiliar to researchers and the treatment of human remains continues to be unequal, while scientific justifications for doing bioarchaeological research are still being made. To avoid receiving feedback from local communities or asking permission to do research, many scientists are simply moving their projects to areas where permission is not required and reburial isn't mandated. This not only avoids implementing ethical guidelines and sets a poor example for young professionals and graduate students, but shows blatant disregard for the deceased, their descendants, and the interests of the local community. Temporal or geographic context should not dictate the ethics employed by the researcher, and based on previous efforts of advocacy and international ethics policies we suggest six levels of consideration for scientists intending to develop bioarchaeological research projects.

[17] *Is It Possible to Please Everyone? Creating an Open Source Finds Database for Finland*

In this paper I present the work of SuALT: the Finnish Archaeological Finds Recording Linked Open Database (Fi: Suomen arkeologisten löytöjen linkitetty avoin tietokanta). SuALT is still in development, but aims to make it easy and reliable for members of the public to record chance archaeological finds that they discover and to browse other records. Inspired by similar 'citizen science' initiatives in other parts of northern Europe where it is legal for avocationalists and others to search for archaeological materials, our multidisciplinary team's challenge is to create a user-friendly, meaningful resource that not only "speaks" to other digital heritage databases within Finland and the rest of Europe, but that also responds to the specific needs and conditions of Finnish society. As well as being mindful of Finnish cultural heritage legislation, the team is very aware that there are a number of different communities within Finland, not least the indigenous Sámi minorities, for whom the meanings of their cultural heritage may be at odds with official policy. Our project's aspiration to make cultural heritage open and accessible to all faces challenges not only of whether all data should truly be open, but also on definitions of heritage itself.

[113] *Linking Landscapes and Resources to Settlement Decisions in Ancient Low-Density Cities in the Southeastern Maya Lowlands*

This paper compares the developmental trajectories of two Classic Period (AD 300 – 800) Maya centers, Ix Kuku'il and Uxbenká, located in the southern foothills of the Maya Mountains, Toledo District, Belize. High-precision radiocarbon dates and ceramic sequences from household contexts inform the chronological development within these communities. Initial settlement began in the Late Preclassic and settlement densities increased during the Early Classic Period. Followed by significant growth during the Late Classic, Uxbenká was abandoned by AD 830 while households at Ix Kuku'il persisted for the better part of another century. Human Behavioral Ecology (HBE) theoretical frameworks allow us to evaluate both

ecological and social factors influencing human-decision making in settlement choices, and how these decisions may have changed over time as rulers became more despotic and social inequalities increased. Using the robust settlement chronologies from both sites, settlement location choices are tested against probable suitability factors including distance to trade routes and water, soil qualities and slope, and the size of households.

[294] *Red Lake Ojibwe Food Sovereignty: A Historical and Contemporary Analysis*

Because American Indians suffer from diet-related diseases at higher rates than other ethnic groups, Indigenous organizers are finding ways to improve the health of their communities. One way they are accomplishing this goal is through the promotion of traditional foods their people consumed prior to European colonization, known as Indigenous food sovereignty. The Red Lake Ojibwe tribe has several food sovereignty initiatives, and yet, a holistic food sovereignty project that documents historical and contemporary Red Lake Ojibwe foodways has never been done. Using the historical record, oral histories, and community knowledge, the tribe proposed a project that would address questions such as, what traditional foods are important to the community? How are these foods produced? And why are these foods significant to Red Lake Ojibwe lifeways? By addressing these questions, we provide a framework for Red Lake food sovereignty programs that work to improve the health of the community. More broadly, Indigenous food sovereignty research ties into larger environmental protection movements for Indigenous peoples and society at large. Research that studies connections between humans and traditional food helps tribal communities and wider society better manage land and resources for the betterment of ecological and human health.

[420] *Ceramic from the Early Components at Nancy Patterson Village*

Nancy Patterson Village (42SA21 10) is a large Ancestral Pueblo site in southeastern Utah. The site spans the entire Ancestral Pueblo sequence, although most of the remains come from two relatively short periods when it was a village-sized settlement. Brigham Young University excavated at the site from 1983 through 1986, with a research design that focused on comparing households and public archaeology from the later (Pueblo III) village with similar features from the earlier component, then thought to date to the early AD 900s. Recent reanalysis of the pottery from the early component suggests the chronology was more complex than previously thought. The early village was large in the 900s, but the associated middens began to form in the late 700s, with substantial deposition throughout the Pueblo I and early Pueblo II periods, probably until about AD 1000. Additionally, many of the white wares from the early component appear to have been imported from the south.

[66] *Refining the Projectile Point Chronology of Western Pennsylvania during the Transitional Period*

Periods and typologies are artificial boxes that archaeologists use to classify cultures and the artifacts that they used, consequently there is a need to re-evaluate old paradigms as new data become available, particularly when these paradigms are internally inconsistent. This paper looks at the Transitional period in western Pennsylvania and analyzes both the semantic division of cultural periods between 2900 and 900 BC the types of projectile points used to define these periods. Current descriptions of the Transitional period adequately describe eastern Pennsylvania but fail to adequately describe the material culture and typology of western Pennsylvania. Data will be synthesized from existing excavations and site reports to compile a database of C14 dates associated with diagnostic projectile points in order to establish an accurate serration of point types. These data will be visually represented on a time line and a series of maps in order to show spatial, typological, and chronological variation. The paper's ultimate purpose is to create a consistent projectile point chronology that can be used as a framework to accurately date sites within this region on the basis of typology.

[247] *Archaeological Proxies of Early Modern Human Niche Construction in Northern Malawi*

Most archaeological literature dealing with niche construction avoids hunter-gatherer behaviors, in part because they can be difficult to detect archaeologically. As the role of humans in shaping environments over long time scales becomes increasingly apparent, it is critical to develop archaeological proxies for hunter-gatherer impacts. Modern hunter-gatherers engage in niche constructive behaviors intentionally aimed at maintaining or increasing the productivity of their environments, and these may have significant ecological and even geomorphic impacts over the long time scales of human evolution. In some cases, they may also represent behaviors unique to modern *Homo sapiens*. In the lateritic alluvial fan systems of northern Malawi, preservation conditions preclude development of many on-site proxies for human-environment interactions. However, by combining archaeological, geomorphic, and geochronological data from Middle Stone Age archaeological sites with off-site records of vegetation and charcoal from Lake Malawi, we can detect a fundamental shift in human niche constructive behaviors. The advent of anthropogenic burning ~85 thousand years ago altered the complexion of vegetative communities in favor of grasslands and woodlands, and facilitated alluvial fan formation in the northern basin. These impacts, starting in the Late Pleistocene, have had a long-term role in shaping the environments and landscapes of northern Malawi.

Thompson, Kerry (Northern Arizona University)

[150] *Held Hostage by a Paradigm*

Anyone who has studied southwestern archaeology is familiar with the paradigm that dictates how Navajos are understood in the trajectory of indigenous life written by anthropologists and archaeologists in the academic study of the southwest. The paradigm is this: descendants of migratory Athapaskans, Navajos arrived somewhere along the San Juan River in northwestern New Mexico sometime in the sixteenth century and quickly adapted to life in the arid southwest by becoming prolific cultural borrowers and perpetual recipients of acculturative forces. It isn't as simple as outsiders declaring, and publishing what Navajo origins and culture are and from where they derive. Like other paradigms about indigenous people, there are cultural consequences, legal implications, and political ramifications that arise from research based on unquestioned assumptions and rigid ways of thinking about living people. In this paper I discuss the relative absence of Navajo archaeology in discussions around using oral history in southwestern archaeological studies that began in earnest with the passage of NAGPRA almost thirty years ago.

Thompson, Victor (University of Georgia)**[312]** *Time and Tempo in Shell Midden Archaeology*

From her dissertation work in the Green River region of western Kentucky to her work along the coast of Washington, Julie K. Stein has engaged with core research problems related to the study of archaeological shell midden sites. One of the key issues that she has addressed is connected to how quickly and in what way do these sites form. Here, I draw inspiration from Stein's work and examine three case studies from the American Southeast. In this work, I address some of the larger theoretical issues and debates linked to the timing and tempo of shell midden and mound formation. One of the core reasons for these debates is that many stems simply from the macroscopic studies of profiles, which in the absence of other data sets (e.g., micro-artifacts, microstratigraphy, zooarchaeological analysis, etc.), provides only gross estimates of time. Thus, different researchers use the same dataset to argue competing interpretations — thus leading to a problem of equifinality. In this paper, I use these case studies to illustrate a variety of methods that can be used to bring resolution to some of these core debates in shell midden archaeology.

Thoms, Alston (Texas A&M University)**[36]** *Discussant***Thornhill, Cassidee A. (University of Wyoming)****[319]** *Equus caballus during the Protohistoric: Looking for the Horse in the Archaeological Record*

The introduction of *Equus caballus* (modern horse) into Native American life on the Plains during European-American contact has been associated with major cultural and ecological changes to native lifeways. The horse influenced a variety of cultural practices including the distance at which resources could be exploited, the number of material goods that could be transported, and war practices. Bearing in mind the importance of the horse, the expectation ought to be that horse remains are prevalent in the archaeological record. Despite the impact of the horse on native Plains societies, there is a paucity of horse remains in the archaeological record in Wyoming. This paper examines the distribution of horse remains in Wyoming dating to the Protohistoric. Utilizing computer simulations and a reanalysis of the remains recovered at the Blacks Fork River site (48SW8319), this article provides potential explanations for the low representation of horse remains in the archaeological record.

Thornton, Erin (Washington State University), Kitty Emery (Florida Museum of Natural History) and Camilla Speller (University of British Columbia)**[352]** *The Environmental and Cultural Context of North American Turkey Domestication*

The turkey (*Meleagris gallopavo*) is the only native vertebrate animal domesticated in North America. As such, the history, timing and process of its domestication is critical to our understanding of past human-animal relationships in the ancient Americas. This paper summarizes recent advancements in reconstructing the history of turkey husbandry in North America. We present original morphometric, isotopic and genetic analyses from turkeys in Mesoamerica and the American Southeast as a means of testing various hypotheses regarding the timing, geographic extent, and diversity of turkey rearing. Drawing upon the work of other scholars studying turkey domestication in the American Southwest, we then consider how region-specific environmental, cultural, and historic factors influenced the emergence, adoption and spread of turkey rearing throughout North America. Based on this comparative assessment, we also provide suggestions for future research on North American turkey domestication.

[421] *Landscape Ontologies as Landscape Politics: Chacoan Interventions in Northwestern New Mexico*

Indigenous perspectives and the ontological turn emphasize that Pueblo emergence was a process of relational engagement with particular places on the landscape. Following this relational perspective, no two places could be identical, nor could the resulting social assemblages that arose from them; emergence as a process of self-discovery contributed to the localization of identities and political orientations in the ancient past. Chacoan archaeologists have addressed this issue through the evaluation of material culture traits to determine whether communities in the 10th-12th century northern Southwest were “local emulations” or “Chacoan exports,” concluding that most communities were primarily local manifestations. However, at the metalevel of “spatial doxa,” Chacoan landscapes exhibited priorities and practices at odds with the logic of local emergence. They created a repeated canon of landscape constructs that effectively replicated portions of Chaco Canyon itself at dozens of sites throughout the northern Southwest. Using evidence from a community in northwestern New Mexico, I argue that restructuring local landscapes was a more effective political tool for Chacoans than controlling agricultural production and exchange networks, or replacing local leadership.

Thulman, David (George Washington University) and Brendan Fenerty (University of Arizona)**[51]** *Clovis Points Were Likely Knives: An Evaluation of the Evidence*

The Clovis projectile point attached to the end of a spear or dart is an iconic symbol of North America’s late Pleistocene hunter, but the point’s use is more assumed than demonstrated. We find evidence for the “point-as-projectile” inference equivocal, because that same evidence also supports “point-as-knife”. We present new experimental data that demonstrate that macro-flakes usually ascribed to projectile point impact fractures can be produced simply by dropping a replica Clovis point attached to a handle from waist-height. Additional evidence is reviewed that supports knife-use. Although no firm conclusions are drawn about Clovis point use, this review highlights the need for thoughtful experimental designs that include testing alternative hypotheses.

Thurston, T. L. (SUNY Buffalo)**[310]** *Traversing the Great Forest: Work and Mobility in Sweden’s Premodern Farmscape*

Most of pre-modern Sweden comprised wooded uplands lying outside more densely populated ‘civilized’ regions. Often collectively called The Great Forest, this territory stretched from south-central to the high north, where Scandinavian, Finnish, and Sami people often lived in close proximity. Agriculture, herding, and forest production in such different physical and social environments produced different paths and projects, whose varied spatial patterns, combined with historic records, shed light on the lived experience of women, men, and children in an otherwise under-documented time and place, illuminating socioeconomic conditions rooted in older traditions yet important in the future trajectory of the greater polity.

Tian, Duo, Jian Ma (PhD), Tongyuan Xi (PhD), Meng Ren (PhD) and Xinyi Liu (PhD)**[78]** *Diversity and Unity: Different Crop Consumption in East Tianshan Mountains, Northwest China*

The region of east Tianshan Mountains, located in east edge of Central Asia, has a diverse natural environment that is suitable for a variety of subsistence. The first millennium BC was a period with fluctuating climate and rapid cultural interactions in this region. This study conducted archaeobotanical studies on samples taken from different eco-zones, and refers to historical documents and ethnological materials to explore crop consumption during the first millennium BC. The result reveals barley is suited to the local environment of the eastern Tianshan Mountains, and a fit for local pastoral scheduling. Consequently, naked barley became one of the most popular crops in this region and predominated on the north slope of Tianshan. However, in the southern region, the agricultural system of multi-cropping predominated. That might have been a tactic to reduce risks and maximize the utilization of oases. Overall, continual agro-pastoralism is the most obvious feature of East Tianshan Mountains in the first millennium BC. Under varied environment and social institutions, the proportion of agriculture and pastoralism and the choice of cereal crops in this region are expected to show spatial and temporal variations.

Tichy, James (Texas State University)

[172] *Comparing Age-at-Death Profiles from Cemeteries on Sint Eustatius, Dutch Caribbean*

On the Caribbean island of Sint Eustatius (Statia), there are several cemeteries dating from the 18th and 19th centuries, primarily utilized during a time of colonization and trade by the European colonial powers, Netherlands, Great Britain and France. Cemeteries with gravestones denoting the names and ages of those buried are all associated with the European inhabitants, while an unmarked cemetery dating to the 18th century investigated during 2018 likely contains the burials of enslaved Africans from a nearby plantation. This project investigates whether differences in social status and ancestry between individuals interred in these cemeteries is reflected in the respective age-at-death profiles. Furthermore, data from a contemporaneous plantation cemetery for enslaved Africans on Barbados is used to expand the comparison to a different cultural context. Comparing the resultant graphs and trends for the ages-at-death across the cemeteries, it appears that there are not significant differences across the cemeteries on Statia and Barbados.

Ting, Carmen**[363]** *Did the Student Become the Master? The Development of the Glaze Technology in Cyprus during the 13th to 17th Centuries AD*

Despite marking the beginning of glazed ware production in Cyprus in the 13th century, the Paphos-Lemba production was a short-lived one and was replaced by other productions in the Famagusta, Lapithos, and Nicosia region. However, we know very little about the glaze technology of these later productions. Did they continue using the same technology as the early production, indicating the occurrence of direct learning from the Paphos-Lemba craftsmen? Or did the later productions have different technologies, which might reflect the influence from other well-established traditions, since there was a marked increase in the movement of and contact with people from places such as Latin Syria and Venice. This paper seeks to explore the range of technologies characteristic of these later productions, in terms of the glaze composition, the method of glaze application, the method of slip preparation, and the mode of decoration. The resultant data will be first compared with the early local glaze technology, and then with the published data on contemporaneous glaze technology in

the Mediterranean. This will allow us to understand the changes and continuities in glaze technology within the local context, and their link to the broader technological trends and socio-political developments.

[122] *Student-Driven Case Studies of Private Collector Collaborations: From the San Luis Valley of Colorado to Portland, Oregon*

Because of private land and genuine human curiosity, members of the public often hold considerable archaeological knowledge and cultural resources that professionals in the field have historically overlooked. When these collectors are “responsible, responsive stewards”, language set forth by the SAA Archaeologist-Collector Collaboration Interest Group, they become integral partners in the discipline and can deeply impact our understanding of the past. These two projects uniquely explore ways to incorporate public knowledge and private collections into the professional world of archaeology. The first project centers on establishing a systematic process for collecting and investigating archaeological information on private land and private collections throughout Portland, Oregon. With this database, archaeologist would be able to better find private collections and collaborate with private collectors in their project areas. The second project combines methods of ethnohistory and field methodologies to retro-actively document four new archaeological sites on the Baca National Wildlife Refuge in the San Luis Valley of Colorado with a local private collector. Both of these projects are examples of the growing understanding in the field that knowledge-making happens in many ways and to further our knowledge of the past, we need to engage with the public and work collaboratively.

[160] *The Complexities of Managing Global Forensic Archaeology with Differing Archaeological Entities, including CRM Firms, Private NGOs, University Researchers, and Field Schools in the Search for Missing US Servicemen*

The Defense POW/MIA Accounting Agency is a US DoD organization that has the awesome responsibility of conducting and managing world-wide forensic archaeological excavations to recover missing US military servicemen from past conflicts. The DPAA-Lab (which traces back to 1947) has the sole forensic authority to make positive identifications of missing servicemen from past accounting as granted by US Code, Title X. Its forensic archaeology operational tempo is largely-scoped, having processed 204 sites around the globe in the fiscal year 2018. A recent Congressional mandate to increase our optempo required DPAA to look outside our organic capacity to contract some of our archaeological activities to external entities as a force-multiplier. Having only partial decision-making control over which kinds of entities are contracted, the DPAA-Lab must train, manage, oversee (and be responsible for) all agency forensic archaeology activities, including those conducted by external partners that have no previous experience in working within the forensic medico-legal paradigm. The performance results have been disparate and extremely challenging. While the archaeological fundamentals and methods may appear similar, the most challenging differences have been forensic traceability, transparency, and defensibility. The hard lesson for some is that not all archaeologists can transition easily to forensic archaeology.

[327] *Archaic Period Obsidian Use in the Greater Yellowstone Ecosystem: The 48PA551 Assemblage in Regional Context*

In comparison to other Archaic sites in the eastern portions of the Greater Yellowstone Ecosystem (GYE), the Dead Indian Creek site (48PA551) has an unusually high number of obsidian projectile points (N=29). Geochemical source characterization of 23 of the 48PA551 obsidian points suggests that not only was the use of obsidian by Middle Archaic occupants of the site regionally anomalous in terms of frequency of use, but also in source selection. In this poster, we use a large sample of sourced obsidian from montane sites in the eastern and northern GYE to provide a regional baseline for examination of the 48PA551 assemblage. In the higher elevations of the Absaroka Mountains to the south of 48PA551, Lava Creek Tuff makes up just 2.0% (N=23/1087) of the sourced assemblage of obsidian. In contrast, 56.5% (N=13/23) of the Middle Archaic obsidian points from 48PA551 are sourced to Lava Creek Tuff. This suggests a vital pathway for people across the northern Absarokas and south through the Yellowstone Plateau from Lava Creek Tuff to 48PA551 during the Middle Archaic. It also suggests that cultural and social connections between the northern and southern Absarokas during this period may not have been particularly robust.

Tokovinine, Alexandre (The University of Alabama)

[358] *Mountain Lords: Divine Game Keepers of the Ancient Maya and their Mesoamerican Context*

This paper explores a set of mythical narratives on Classic Maya pottery (550-800 C.E.), which involve Huk Si'ip, the divine keeper of animals, and Itzam Kokaaj, the celestial creator of animals. Most of these narratives form part of a larger theogony cycle where the elderly gods of animals, sky, earth, and fire are confronted by a younger generation of deities associated with kingship and agriculture. Moreover, the bulk of the data originates from only two Classic Maya polities. The presentation explores possible reasons for the local importance of these narratives in the context of rivalries between the cities and their supernatural patrons. It also attempts to reconcile the pre-Contact data with Colonial and Modern Maya-area ethnography and with a broader Mesoamerican tradition of supernatural animal guardians.

Tomas, Helena (University of Zagreb)

[267] *Early Bronze Age Burial Structures of the Eastern Adriatic and Their Possible Connections with the Aegean*

The paper discusses connections between the eastern Adriatic coast and the Aegean during Early Bronze Age. This is the period when Cetina Culture saw its birth in the hinterland of the eastern Adriatic coast (present day Croatia). The pottery typical of the Cetina Culture subsequently spread to the Italian and northern Adriatic coasts, central Balkan Peninsula, Albania, and the Aegean, whereas the associated features were recognised as far as Sicily and Malta. It is fairly safe to suggest that such a wide radius of pottery dissemination was a product of an economic exchange. Bronze objects discovered in the Cetina tumuli, and the fact that the initial area of the Cetina Culture contained no metal sources, leads us to conclude that metal was obtained through trade, and that the Cetina people may have traded their pottery (or its contents) for metal, possibly from the Laurio mine in Greece. The Cetina culture chronologically coincides with the period of spreading of tumuli in Greece, which may have been a side-effect of contacts between the two areas. The paper explores the similarities of burial structures of the Cetina region and the Aegean, especially of their architectural forms, burial ritual and typical grave goods.

Tomaskova, Silvia (UNC Chapel Hill)**[358]** *Siberian Indigenous Traditions of Game Keeping and the Supernatural: Historical Continuities and Discontinuities*

Siberian Indigenous communities have been used for centuries as a stand-in for various western categories, mostly as a contrast to civilized, developed or familiar groups. This paper will consider the importance of history when archaeologists contemplate the role of the supernatural and the centrality of game keeping among prehistoric communities. Siberia is an excellent example of a vast region at an arm's length geographically and historically; not well known and therefore useful as a placeholder for imagined religious traditions and human animal relations. Yet we have rich historical travelers' accounts, many dubious ethnographic reports, and some veritable descriptions. Furthermore, during the last two decades indigenous communities in Siberia asserted themselves into these narratives through a range of new, old and invented traditions; many focused on the supernatural and the relationship between humans and animals. I will explore the nature of "historical facts", and suggest ways to think about historical continuities and discontinuities geographically and temporally.

Tomaso, Matthew**[17]** *Archaeology and the Historical Construction of Community at Feltville / Glenside Park*

This paper examines how concepts of community are constructed retrospectively and also in the present mainly through processes of argumentation and consensus-building and very often in lieu of many substantive facts. The "Deserted Village"'s 250+ year history is well-complemented by its landscape archaeology, but has, at times, been weighed-down and side-tracked by assumptions, exaggerations and highly fanciful ideas derived from secondary histories. And yet, these historical fictions have also shed light on empirical facts and have helped to create the modern communities that benefit from the preservation and study of the village. A more prudent approach to understanding the character of historic communities requires recognition of and sensitivity to the intersubjective and largely fictive elements of folk histories that often inspire community identity.

Tomazic, Iride (University of Michigan) and Jordan Dalton (University of Michigan)**[286]** *Late Horizon Mortuary Traditions at Las Huacas, Chincha: Preliminary Results from a Subterranean Collective Tomb*

Archaeological and osteological analyses of burial features allow archaeologists to explore questions related to an individual's life, activities, social status and potential role in society. This poster presents the analysis of a Late Horizon tomb from the site of Las Huacas in the Chincha Valley of Perú, with an emphasis on human skeletal remains. Las Huacas was a large 105-hectare agricultural centre with a diverse burial tradition: extended inhumations, mummy bundles, secondary burials and subterranean collective tombs. In comparison to three other subterranean tombs found, Tomb 3 presents a different pattern in orientation/position and artifact assemblage. Preliminary analyses of the human bones concluded that Tomb 3 was re-opened multiple times, and used for the burial of 12 individuals of various ages and biological sexes. The analyzed individuals presented evidence of disease, trauma, deformations and possibly activity patterns. The poster proposes questions on the methodology used to connect archaeological and bioarchaeological data for the analysis of mass graves and mortuary treatment and contribute to an understanding of Late Horizon mortuary practices in the Chincha Valley.

Tomczyk, Weronika (Stanford University) and M. Elizabeth Grávalos (University of Illinois – Chicago)**[288]** *Multifunctional Bone Tool Usage at the Prehispanic Site of Jecosh (Ancash, Peru)*

We present a preliminary analysis of the worked bone assemblage from the prehispanic settlement of Jecosh in the Callejón de Huaylas valley of Ancash, Peru. Inhabitants lived at this hilltop site for nearly two millennia, from the post-Chavín period through the time of Inka conquest of the region (~100BCE-1532CE) with noticeable settlement intensification during Recuay times (100 – 700CE). Within 2400 animal bones excavated from the site's domestic contexts, 60 had at least one worked surface or were transformed into tools. Most bone tools were made from bones of large mammals: camelids or deer, and the most frequently utilized skeletal elements were long bones (especially metapodials) and scapulae. The high metapodial frequency in the bone-tool making process suggest the re-utilization of discarded butchery refuse. Based on macroscopic qualitative and metric analyses, we created a tentative bone tool typology, which revealed a high tool standardization and specialization of production. Some tools were likely used to clean animal skins in the pelt-making process, while others could have been used for lithic, textile, and pottery production. This research suggests a wide range of craft activities pursued at Jecosh and is the first attempt at a bone tool typology in the region.

[89] *Planning Research at the Texas Archeological Research Laboratory and Don't Forget Your Cowboy Boots*

The University of Texas at Austin's Texas Archeological Research Laboratory (TARL) is the oldest and largest archaeological repository in Texas, housing many millions of artifacts from more than 8,000 sites in Texas and beyond. Collections at TARL range from massive WPA projects of the 1930s to recent CRM projects, and cover the entire range of Texas prehistory and history. Such massive collections, however, bring with them considerable organizational and accessibility challenges, particularly in a chronically under-resourced institution. Although the TARL collections hold vast amounts of data awaiting study and analysis, accessing these valuable resources can at times be frustrating and time-consuming. Here, TARL's collections staff provides guidance on planning research at TARL, preparing to visit, and making the most of your time at our facility. By opening a dialogue between researchers and staff, we aim to encourage more collections-based research and collaboration.

[129] *History, Archaeology, and the Lost Marines of Guadalcanal*

In 2016 Garcia & Associates conducted forensic archaeological investigations for the Defense POW/MIA Accounting Agency (DPAA) on Guadalcanal, Solomon Islands. Beginning on 7 August 1942 the Battle for Guadalcanal was the first major Allied offensive of World War II in the Pacific. The fight for this South Pacific Island included ground, air, and sea battles to maintain control of the airstrip known as Henderson Field. During the conflict, the ground war transpired from the airstrip to the Matanikau-Point Cruz area as the U.S Marines defended the airfield while simultaneously attempting to expand their foothold on the island. In late September 1942 five Marines from the 1st Battalion, 7th Marine Regiment, were killed while assaulting a Japanese position near Mount Austen. These five Marines were buried in marked field graves. Although the burial location was recorded on a wartime sketch map, the Graves Registration Service was unable to relocate the graves. Decades later a multi-disciplinary team of DPAA historians, analysts, and archaeologists reopened the case conducting archival research, field interviews, and test excavations. Finally, after being lost for more than 73 years, the 2016 archaeological work confirmed the location of the burial site thought to be that of the five Marines.

[287] *Early Ceremonial Architecture in the Cajamarca Highlands of Peru: A Newly Recorded Circular Court at Callacpuma within the Cajamarca Basin*

This poster presents data on a newly recorded monumental circular court located within the Cajamarca Basin of the northern Peruvian Highlands. Large circular courts, better known from the Initial and Formative Periods of the Andean Central coast and highlands, are very rare or at least not well known for the northern Andes. Recent work has investigated an 18 meter diameter court surrounded by concentric walls of vertical standing stones. Preliminary results indicate that this court dates to the Huacaloma Period (~1000 BC) and that it may have been the location of ritual deposition and action involving the large-scale consumption of food. This court is located near the summit of the 250 hectare multi-component site of Callacpuma located on the northern fringe of the Cajamarca Basin. Here, we contextualized this court within our current understanding of early monumental architecture in the region from sites including Kuntur Wasi, Pacopampa, Layzón, and Huacaloma, as well as the broader tradition of circular courts in the central Andes.

Torpy, James (University of Michigan)

[387] *The Environmental Setting of Cypriot Rural Sanctuaries*

During the first millennium BCE the countryside of Cyprus was marked by a large number of extra-urban sanctuaries. Previous studies have discussed the function of these shrines in demarcating or negotiating political boundaries between the island's city states, and their decline under Ptolemaic and Roman rule. This study seeks to investigate the environmental context of these shrines with an economic focus, as has been done in Greece, and to see whether the persistence of some sites into later periods may be due to associations between cultic practice and landscape use. Data on regional vegetation, geology, pedology, and hydrology will be combined with archaeological and iconographic data from these sites in order to assess whether any significant trends are observable.

[127] *The Effects of Climate Change and Risk on the Foraging-Farming Transition in North America*

The evolution of the Homo lineage is characterized by the emergence of numerous biological and cultural traits. One behavioral trait is the transition from foraging to farming. Some scholars suggest that climate change contributed to the emergence of agriculture while others hypothesize that continually increasing foraging risk caused the independent development of agricultural subsistence. No study has examined the connections between climate change and foraging risk or the effects of foraging risk on the foraging-farming transition. This study evaluates the effects of climate change and foraging risk as potential explanations underlying the foraging-farming transition in North America during the Late Archaic period (4500-4000 BP). In this study, my previous research reconstructing the paleoenvironment and assessing dietary variation throughout the transition period is combined with species distribution models, which model the geographic distributions of relevant prey species. This study estimates the availability of prehistoric resources and compares the expected and observed diets to quantify foraging risk. The quantification of foraging risk and the examination of its connection to climate change is a novel approach for studying the foraging-farming transition. These methods offer a more complete understanding of the regional foraging-farming transition and have implications for the global trend towards agriculture.

[412] *Pre-Columbian Adaptation to Fluvial Environments, Chontales, Central Nicaragua: 2018 PRISMA Results*

Alluvial valleys are dynamic environments that continuously change under the influences of flooding and erosive processes caused by climatic and tectonic events. The Roberto Amador site is situated on alluvial deposits, surrounded by a meander of the Mayales River, in the proximity of the city of Juigalpa, Chontales, central Nicaragua. The aim of PRISMA (Proyecto Arqueológico Interdisciplinario Santa Matilde) is to identify major environmental changes at the Roberto Amador site and determine how pre-Columbian populations responded to these impacts. Fluvial and archaeological variations have been investigated through the integration of archaeological, geoarchaeological, archaeobotanical, thermographic and remote sensing techniques. The site has been occupied between 900 - 1100 AD and that the settlement planning is intimately related to the disposition of streams and alluvial areas. Circular stone mounds were built on the highest part of the river meander, while semicircular stone features have been identified along seasonal streams. Furthermore, different occupational phases have been identified along the fluvial terraces. While the upper terrace shows evidence for continuous human occupation, the lowest ones experience periods of temporary abandonment. The recent excavation (2018) of a funeral vessel from the upper terrace, suggests that this area may have been used for funerary purposes.

[316] *Something About Kutau-Bao: Understanding Dominant Obsidian Sources*

After c. 50 years of research using a diverse range of geochemical techniques, patterns of movement for obsidian in the Pacific region, dating from the Pleistocene up to the historic period, have been documented comprehensively. Although there are eight high quality obsidian sources, by far the largest quantity of material transported both locally within Papua New Guinea and over long distances out into the Remote Pacific came from the Kutau-Bao obsidian outcrops on New Britain Island. Even communities adjacent to other obsidian outcrops with good quality stone seemingly preferred to obtain the bulk of their supplies from this single source. What is it about this source that made it so popular through time and across space? In what ways can Kutau-Bao's dominance be accounted for by the nature or timing of volcanic eruptions in the region, raw material properties of the obsidian, and/or social processes involving spirituality, ownership and security? To address these questions, I examine the history of Pacific obsidian use and distribution from a range of different perspectives and attempt to generalise more widely about dominant obsidian sources.

Torres Morales, Genesis, Celeste Gagnon (Wagner College) and Gabriel Prieto (Universidad Nacional de Trujillo)**[286]** *The Lives and Deaths of Moche Valley Children: What Endocranial Lesions Can Tell Us*

Children's lives were mostly largely excluded from bioarchaeology analyses before the 1990s. Since then, a new focus on the bioarchaeology of children has illuminated the importance of the lived experiences of childhood for understanding past societies. In this research, we examined the remains of 270 children who died before they were six years old, who were recovered from four Early Intermediate Period archaeological sites in the Moche Valley. Representing the Salinar and Gallinazo phases are children recovered from Pampa la Cruz and La Iglesia on the coast and Cerro Oreja in the middle valley. Children from these sites are compared to later Middle Moche period children from the Huacas de Moche in the lower valley. Among the most common paleopathological conditions identified was endocranial lesions. Such lesions can be caused by vitamin deficiencies, infection of the meninges, and trauma. The examination of the features of these lesions, their co-occurrence with other paleopathological conditions, and the age, temporal and spatial distributions of pathologies, allows us to propose a diagnosis as well provide us with an insight into the daily struggles of children on the north coast of Peru.

Torres Roldán, Isaac (University of Puerto Rico, Río Piedras Campus), Gelenia Trinidad-Rivera (University of Puerto Rico, Río Piedras Campus), Coralisse Guadalupe De Jesús (University of Puerto Rico, Río Piedras Campus) and Kelvin Blanco Peña (University of Puerto Rico, Río Piedras Campus)**[418]** *Foreigners Building a Future in Colonial San Juan, 1910*

Throughout the centuries, San Juan, the capital of Puerto Rico and a port city, has received an influx of foreigners who have left their footprint within the urban layout. This presentation will address another way of studying the presence of immigrants, within the six neighborhoods of the walled city of San Juan in 1910. Census data is used to locate where they lived and/or their places of business. A database was created to organize information that includes name, age, civil status, sex, color or race, place of birth, type of job, and place of work.

The main goal of this research is the creation of profiles by nationality, paying special attention to trades and professions. The data was transferred to a digital map that permits to distinguish the distribution of foreigners by nationality. With this study, we propose additional lines of research that can incorporate existing data from archaeological projects, a reassessment of foreigners within the city, and their distribution by neighborhood

Torres-Martínez, Jesús Francisco and Manuel Fernandez-Gotz (University of Edinburgh)**[50]** *Small Finds and Scattered Ashes: "Invisible" Burials in Iron Age Northern Iberia*

The Iron Age of northern Iberia is characterised, among other things, by a general scarcity of graves. Only some sites have provided burials that can be archaeologically identified, and in most cases the numbers seem to imply that most of the

population remains “invisible” from the funerary record. New research at the necropolis of Monte Bernorio, one of the largest oppida in the Iberian Peninsula, provides some clues about the rituals involved in the treatment of the dead, which were almost exclusively cremated. Although there are some wealthy burials with material such as daggers, most of the graves seem to have contained only extremely fragmented objects or no objects at all. The practice of the *pars pro toto*, where only a small portion representing the whole is included in the grave, seems to have been applied to both objects and human remains, meaning that in some cases we can only recover minimal portions of ashes. The results imply, on the one side, that previous research could have missed a large proportion of the existing burials, and on the other, that we need to rethink the very meaning and significance of Iron Age burials in the region.

Torvinen, Andrea (Arizona State University)

[81] *Social Identification and Collective Action at La Quemada, Zacatecas, Mexico (500-900 CE)*

According to the collective social identification framework, sustained collective action depends on the degree to which groups of individuals share networks of social interaction (i.e., relational identification) and recognize membership in the same social categories (i.e. categorical identification). This study investigates the interplay of the two modes of identification to establish the potential for collective action through time and across spatial scales within the Epiclassic (600-900 CE) site of La Quemada, Zacatecas, Mexico. Large centers in the northern Mesoamerican frontier shared social categories and were connected via exchange networks, yet La Quemada fell out of the regional system while other polities persisted into the Postclassic. Given that La Quemada was occupied for centuries, we know its residents had the capacity for collective action, so it is hypothesized that a change in how La Quemada residents identified with one another weakened collective identity prior to site abandonment. Material proxies in the form of ceramic categories (i.e., shared styles expressing categorical affiliation) and fabric classes (i.e., shared pastes indicative of relational networks) are used to assess the consistency of social identification at multiple socio-spatial scales within La Quemada and will provide a model for comparing the trajectories of northern frontier polities.

Tourigny, Eric (Newcastle University)**[109]** *Do All Dogs Go to Heaven? How Pet Cemeteries Document Changing Human-Animal Relationships*

Public pet cemeteries represent a relatively recent phenomenon in western European/North American societies. First appearing in the late 19th century in England, France and the United States, their numbers quickly expanded across these and other countries as people commemorated their non-human friends in new ways. The locations and organisation of these cemeteries as well as gravestone inscriptions are revealing of the changing attitudes towards non-human animals. They tell of the roles pets held in people's lives (i.e., were they treasured friends? or important members of the family?) and their perceived roles in the afterlife (i.e., did they have a place in heaven?). This project describes an archaeological survey of four of Britain's pet cemeteries. These include Britain's oldest public pet cemetery in Hyde Park, its largest in Ilford and two working-class pet cemeteries in northern England. Comparisons are made to contemporary human burial practices in order to identify how animals were treated differently and similarly. The goal is to document changing patterns in animal commemoration and contextualize British society's current relationship with animals while highlighting the importance of these spaces in documenting social history.

Toussaint, Mark (University of Nevada Las Vegas)**[142]** *Gendered Trouble: Reconsidering the Role of Females in the Masculinized Spaces of Violence in an Early Bronze Age Population*

Mierzanowice Culture (~2400–1600 BCE) communities in the Central European Early Bronze Age buried their dead in a formalized and gendered manner, in which males and females typically assumed mirror-opposite orientations in their respective graves. Furthermore, the archetypal "warrior" grave—whether simply an idealized presentation of an individual of esteem and influence or a reflection of a role in socially sanctioned violence—is highly masculinized and is usually associated with males. Examples of females buried with weapons, or females buried in the masculine orientation, have typically been regarded as exceptions to the rule. However, the fact that such "exceptions" are presented in a context as idealized and symbolic as the grave and that they have such nuance in the diversity of their forms, begs for the reconsideration of these cases not as exceptions, but as intentional and particular forms of "the rule." This presentation includes new bioarchaeological data and revisits assumptions of the role of females in the socially sanctioned exercise of power—whether violent or political.

Towner, Ronald (Tree-ring Lab, University of Arizona)**[220]** *The Forests and the Trees: Sourcing Construction Timbers at Aztec Ruins, NM*

Obtaining materials from distant landscapes is a hallmark of the Chacoan world. The movement of nonlocal materials into Chaco Canyon, and around the Chacoan sphere, has fascinated archaeologists for decades. Large construction timbers, in particular, have been subject to intense research because so few trees grow in or near the canyon. At Aztec Ruins, however, some wood resources, including pinyon pine and juniper were available locally. Other species that only grow at higher elevations, including ponderosa pine, Douglas-fir, and spruce, must have been imported from mountain ranges at least 20 km distant. Previous studies have used a variety of techniques to source construction timbers to areas more than 50 km distant from Chaco Canyon itself, but the methods are typically time-consuming and expensive. Here I report our research on possible timber sources used in the Aztec great houses using tree-ring width-based sourcing methods. To date, we have sourced more than 300 beams from Aztec, and have comparable data for great houses both in and outside the canyon. Our results document surprisingly distant timber sources and a dynamic pattern of resource utilization between the 12th and 13th centuries at Aztec East and West Ruins.

[150] *Discussant***[220]** *Chair***Townsend, Cameron (Los Alamos National Laboratory)****[90]** *Visualizing the Unique: Lidar and Three-Dimensional Modeling as a Preservation Tool for NHPA Compliance*

Section 106 of the National Historic Preservation Act requires federal agencies to consider the effects of actions carried out on historic properties under their jurisdiction. In the instance of an undertaking that would diminish or remove important characteristics from a historic building, action must be taken to avoid, minimize, or mitigate any potential adverse effects. For federal agencies with aging infrastructure that must support ongoing mission-related work, mitigating adverse effects through documentation and consultation with the State Historic Preservation Officer is often the only available preservation option. Many federal agencies facing this dilemma have especially complex and unique properties, such as highly specialized industrial and scientific facilities, that can be difficult to conceptualize to non-technical audiences. Effectively documenting these unusual facilities requires devising especially creative solutions. This poster highlights the challenges and benefits of documenting a particularly complex historic property from Los Alamos National Laboratory – a 5,000 ton, 41-foot tall, Cold War-era industrial press – using lidar scans, original drawings and manuals, photographs, and a variety of point cloud processing, 3D modeling, and animation software programs.

Townsend, Taylor

[171] *An Analysis of Garbanzo Bean Remains at Mission San Luis de Talimali*

Were garbanzo beans grown at San Luis de Talimali or were they imported? Were they able to be cultivated at all in a Floridian climate? Who cooked with the beans- just the wealthy Spanish who imported them or anyone with a garden? What was their dietary importance? Garbanzo beans were a staple of the Spanish diet, and were one of the plants brought to La Florida. San Luis was one of the wealthiest Spanish missions in La Florida and played a crucial role in the success of the Mission system. The farms associated with San Luis produced a majority of foodstuffs for the rest of the province, however, modest archaeobotanical research has been conducted on the site. The results of this research will give a clearer picture of botanical foodways during the Mission Period. This will be done by analyzing flotation samples from multiple contexts of the site for the presence of garbanzo remains. This study will utilize flotation samples in the State of Florida collections, those excavated in Spring 2018 by Florida State University, and a modern comparative ethnobotanical collection to identify the remains. The presence of chickpea will be quantified by variety, temporally, and by feature function.

[19] *Understanding Ancestral Wichita and French Trade at the Deer Creek (34KA3) Site*

Deer Creek is an eighteenth-century fortified site in Oklahoma that is featured in dozens of publications yet was not excavated until 2016. While archaeologists today acknowledge the site as a Wichita village, others have insisted Deer Creek is a European fort. Historical narratives bereft of archaeological investigation can prove problematic and have minimized the role of Wichita communities in economic relationships. The Deer Creek site was just one of many villages in the region where Indigenous peoples held significant power as they negotiated with European travelers.

Trachman, Rissa (Elon University) and J. Alex Canterbury (Texas A&M University)

[30] *Everyday Life in a Maya Center: New Data towards Social, Economic, and Ritual Behavior at the Ancient City of Dos Hombres*

The current research in the Dos Hombres civic ceremonial center utilizes the lens of “everyday life” in order to understand the internal ritual, economic, social, and ideological activities of this ancient city, as well as how it interacted with the surrounding household hinterlands, and the socio-political and economic role this medium-sized city played in the region. Current efforts are focused in the northern plaza, a very public space that likely was a place of commerce, public ritual and sacred space, thereby the prime backdrop for publicly legitimizing authority. Recently excavated data, especially architectural exposures as well as material culture deposits are presented. These new data are rich with information about public activities and architectural programming at the ancient city. In addition, off-mound non-architectural excavations, material culture, and isotope data combined with recent LiDAR are continuing to formulate an understanding of social, economic, and ritual behavior. As a result, the culmination of these data have begun to elucidate various social and economic relationships, both individually and collectively, of the ancient Maya at Dos Hombres and northwestern Belize.

[184] *Formative Assessment of "Project Archaeology: Investigating Food and Land"*

"Project Archaeology: Investigating Food and Land" is a new education guide that explores the intersections of culture, food, people, and the environment in ancient North America. "Food and Land"'s first regional investigation invites 3th-5th grade students to examine food systems in the Great Basin by using environmental archaeology inquiry techniques to analyze artifacts at the O'Malley rock shelter site in Lincoln County, Nevada. In the summer of 2018, Project Archaeology debuted "Food and Land" at a peer mentoring workshop designed to introduce Lincoln County teachers to the Project Archaeology national network and support curriculum piloting. A veteran Project Archaeology teacher will join workshop attendees as they pilot the new guide in local 4th & 5th grade classrooms during the fall semester of the 2018-2019 school year. Pre- and post-tests will monitor changes in student understandings of ecosystems, the archaeological research process, and stewardship while teachers will provide real-time user feedback via online file sharing systems. This presentation will discuss the initial findings from the "Food and Land" pilot, including the efficacy of this new piloting model and how students understand history and social studies through the investigation of archaeological data.

Traslaviña, Abel (Vanderbilt University)

[143] *Water Social Relations in Transition: Local Populations and Foreign Empires in Tension over Natural Resources in Mid and Lower Lurin Valley, Peru*

After the Spanish arrival in the Andes, the new social, economic, and political organization mainly materialized in two spatial entities: the "reducciones" or specially-designed towns where the Andean population was forcibly resettled, and the "haciendas" or large estates or plantations including a defined domestic space. These entities faced unequal access to certain resources like water, competing for the privilege of accessing these resources. This situation generated tensions not only between local populations but also between those populations and the new Spanish institutions.

Based on 17th and 18th-century archival documents and by tracing the material culture, I explore these "water social relations" in order to understand the local experience of the transition from their own rule through the Inca and the Spanish Empires in mid and lower Lurin valley, Peru.

Tremblay, Roland (Ethnoscop Inc.) and Christian Gates-St-Pierre (Université de Montréal)

[73] *Struggling with Radiocarbon Dates at the Dawson Site in Downtown Montréal*

In 2016, construction work on Sherbrooke street in downtown Montréal has led to the discovery of late St. Lawrence Iroquoian remains that are part of the Dawson site, an Iroquoian village first discovered in 1859. Two years of excavations, in 2016 and 2017, provided new data representing a welcome addition to the former Dawson collection that was thoroughly analyzed and published in 1972 by James F. Pendergast and Bruce G. Trigger. One major concern brought about by the Dawson site was the possibility of it being the famous village of Hochelaga visited by French explorer Jacques Cartier in 1535. A series of AMS radiocarbon dates suggests that the Dawson is about 150 years older than previously thought based on ceramic typology. Several avenues of explanation are examined to address this apparent discrepancy, including different aging effects on radiocarbon dates, the low degree of resolution in ceramic typologies, as well as aspects of Iroquoian settlement patterns.

[309] *The Origins of Maya Civilization: New Evidence from Ceibal and Sites in the Middle Usumacinta Basin*

The analysis of new LiDAR data has revealed many previously unknown early Middle Preclassic sites in the Middle Usumacinta drainage. The sites are monumental in their extensions and consist of a large rectangular feature or platform oriented slightly east of north, delineated by low mounds and an E-Group in the center of the rectangular construction. The architectural layout of these sites is so consistent that we have called it the Middle Formative Usumacinta (MFU) pattern. Excavations at two of these sites have shown that their constructions date to before 800 BC. They also show some remarkable consistencies in ceramics and building techniques with Ceibal, approximately 180 km to the southeast. They, as well as the early Middle Preclassic constructions at Ceibal, are marked by a planned horizontal monumentality from their inception, and these arrangements show planning and the participation of large groups of people engaged in communal ritual building efforts, who were probably still adhering to a mobile lifestyle. Our data suggest interactions between Ceibal and populations who lived in the middle Usumacinta drainage. These new data indicate radically different processes in the transitions to a sedentary lifestyle and increased social complexity for the early Maya than previously thought.

[367] *Spanish-Pueblo Interactions in New Mexico's Early Colonial Spanish Households: Negotiations of Knowledge and Power in Practice*

Missions and indigenous villages are commonly investigated contexts of indigenous action in response to early years of Spanish colonialism in the American Southwest. In New Mexico, colonists' households were also a venue for interaction and exchange of information between Pueblos and Spanish. Some models of colonial interactions have suggested that quotidian practices developed along dimensions of gender and ethnicity. However, Spanish New Mexican households, especially in the early colonial period, were contexts where power dynamics were multifaceted and knowledge of the local environment was useful. To explore Spanish New Mexican households, we use the concept of hybridity, a term not typically associated with investigations of colonizers, but one that assumes a more deliberative negotiation of practice. Such an approach with respect to colonizers' homes helps to focus attention on the power that indigenous people had and knowledge colonizers may have valued. In this paper, we explore the material remains of several 17th-century Spanish ranches in northern New Mexico as they illuminate the interactions between Spanish colonists and Pueblo wives, servants, slaves, and laborers. Using architecture and artifacts, we explore ways these ranches were constructed and inhabited and the interplay between Pueblo and Spanish ways of making do.

Trimble, Michael (U.S. Army Corps of Engineers)

[297] *Engaging Veterans in North American Archaeology*

As professional archaeologists who are charged with carrying out meaningful research and long-term collections care, one of our ethical and professional obligations is to inform and engage the public in what we do and why it is interesting and important. Our attempts at this are often uneven, but we recognize the best way to engage the public is by direct participation in our science. The Veterans Curation Program, sponsored by the U.S. Army Corps of Engineers (USACE), is a successful public archaeology program. The premise is simple: Veterans, who want to develop skills to compete in a civilian environment, are systematically schooled in modern curation and collections management, thus assisting the Corps.

Our professional staff teaches them the basics of archaeology, modern cataloging, records management, heritage management, and computer and communication skills. All of this alternative public archaeology not only contributes to the organization of our national patrimony, but more importantly, furnishes skills and confidence to our new civilian workforce.

Tringham, Ruth (Univ of California-Berkeley)

[87] *Archaeologists as Early Adopters and Critical Remediators at UC Berkeley's MACTiA*

In this presentation, I revisit the digital training that was carried out by myself and colleagues at the UC Berkeley Multimedia Authoring Center for Teaching in Anthropology (MACTiA). During the period of its existence (1998-2011) the program transformed itself enormously not only in response to changing hardware and software, but also as our own interests and experience in archaeological education and community building grew, along with our changing (and diverse) viewpoints of what "digital education" meant in practice. I regard the experiments that I was able (allowed and enabled) to carry out in teaching digital practice and media literacy through the MACTiA being the backbone of my own intellectual development during this period and more recently. The collaboration between faculty, graduate and undergraduate students in the MACTiA courses was quite unique, and created many diverse ways of developing digital practices. Throughout this diversity and change, however, there are certain features – notably the encouragement of remediation and re-use of media, a "content-first" attitude, and an "education of attention" - that characterize the "MACTiA style" of digital archaeology and continue to affect our practice.

Trinidad-Rivera, Gelenia (University of Puerto Rico - Rio Piedras Campus)

[172] *Setting the Table!: Comparative Analysis of Vessel Forms between the Fort Amsterdam and the Brimstone Hill Fortress Collections*

The Dutch Caribbean Island of Saint Eustatius has been a focal point throughout the Lesser Antilles and European economic development of the 17th and 18th century period. Food has always been a reflection of complex social and economic exchange between cultures. It is through dietary patterns that trades between countries can be traced back and current cultural patterns understood. This poster focuses on identifying the types of vessel forms from ceramic sherds recovered from Fort Amsterdam on Saint Eustatius and Brimstone Hill Fortress on Saint Kitts. An examination of everyday life vessels can help reconstruct and compare dietary customs, patterns, and table setting traits between Dutch and British sites. In addition, 17th-18th century cookbooks and still life and genre paintings from England and the Netherlands are used as reference to comprehend how common domestic traits can lead up to significant cultural influences that transcend between cultures through time. Quotidian choices can show how globalization can be found even in the way previous settlements in the Caribbean were setting their tables.

Triozi, Nicholas

[42] *Rethinking Prehistoric Hillforts in the Eastern Adriatic from a Human Behavioral Ecology Perspective*

On the Dalmatian Coast of Croatia and stretching for kilometers inland and along the shores of the Eastern Adriatic are massive drystone ramparts and enclosures that litter hilltops. These structures are known as hillforts, are poorly understood, and are colloquially assumed to date to the Iron Age, as there is scant settlement evidence in the area dating to the Eneolithic through the Bronze Age. Nonetheless, prehistoric populations living on the Dalmatian Coast eventually engaged in and experienced differential access to metallurgy exchange networks, which likely contributed to increased social stratification and perhaps conflict. Hillforts have factored into this process somewhat anecdotally, with explanations for their presence leaning towards elite control over the flow of commodity exchange. This paper proposes an alternative approach to shedding light on the emergence of hillforts in Dalmatia using a human behavioral ecology model to explain territoriality as just one of several possible outcomes following changes in resource distribution and predictability.

[316] *Open Obsidian Geochemistry Visualization with an Example from the Andes*

The open science movement is growing in archaeology, and raises fundamental questions about data and who it belongs

to. In this talk, we outline a protocol for sharing data on obsidian sources to facilitate replicable research. While in obsidian sourcing a direct calibration is preferable (e.g., measuring source standards on the same instrument used to measure artifacts), it is nonetheless useful to create a platform for researchers to share their data for comparison with others. To that end, advances in data accessibility via servers and the growth of open-source computing languages such as R make it possible for a repository to not only store data, but also provide an analytical environment data exploration. Here, an example is provided of a dynamic repository framework which allows for a) user-contributed data, b) aggregation of data across multiple researchers, and c) qualitative and quantitative association of new data. We use an example from the Central Andes where forty years of geochemical studies have identified primary obsidian sources and a sizable literature. Archaeological obsidian excavated from sites in the prehispanic Central Andes can inform on long distance exchange and community relationships with regional polities on emergent road networks.

[52] *The Monumentalization of Ma'at in the Tomb of Amenemhet: The Role of Text and Image in a System Approach to the Interpretation of Middle Kingdom Tombs*

Receiving little scholarly attention to date, most prior work on the tomb of Amenemhet at Beni Hasan has either focused on the translation of the titles and autobiography inscribed in and around the door jamb or on the description of the tomb scenes and accompanying decorations. To gain a more comprehensive understanding of this richly decorated structure, this analysis uses a system approach, taking into account the interrelationships among the various parts of the tomb. This integrated methodology recognizes that each of its components contributes to the comprehensive symbolism, message, and purpose originally intended, allowing a more complete and detailed picture to emerge that recognizes subtleties previously overlooked. In particular, the autobiography helps to guide and elaborate upon the interpretation of the images, clarifying and at times even changing the scholarly analysis. Through a careful study of all aspects of the tomb, Amenemhet as a man who upheld ma'at and dispelled chaos emerges as the dominant theme, evident in all of his actions that are portrayed. With this understanding, it then follows that the purpose of the tomb is to guarantee the owner entrance into the hereafter by monumentalizing his association with ma'at.

Trivedi, Mudit (University of Chicago)

[399] *The Hazards of High Resolution? Social Change, Site Structure and New Chronometric Concerns from Indor, North India*

How do high resolution chronologies change our interpretations of the archaeological record? What impact can and should they have on our analysis and our understandings of site-structure, social process and the narratives by which we account for our evidence? This paper provides one case study of considering the hazards and prospects of high resolution Bayesian chronometric models which poses new questions to site formation studies, household archaeology and the archaeology of religion. This paper draws upon the results of an extended project directed at an archaeological investigation of religious conversion to Islam in South Asia in the second millennium CE. The project combined extensive regional survey, excavations and architectural documentation focused upon the site and valley of Indor, located in the region of Mewat on the borders of Rajasthan, North India. A suite of 36 AMS radiocarbon determinations (conducted at the IUAC, Delhi) has allowed for a regional chronology which allows across different datasets for decadal, generational (25 years) and wider levels of control. The paper contributes to the following areas of emergent interest in Bayesian chronometry: the interpretation of structural life-spans, the consideration of age-depths models and defining the relationship between stratigraphic and dated events.

[94] *Understanding Early Archaic Stone Tool Production Practices: A Pilot Study*

Through Funk's (1993) research into the Upper Susquehanna Valley Region in New York, several important Early Archaic (10,000-8,000BP) archaeological sites were uncovered from Wells Bridge, New York. One of these Early Archaic sites named the Johnsen #3 site contains multiple Kirk horizon occupations in stratified deposits. Early Archaic sites are still rare in the Northeast; thus, the Northeastern Early Archaic is based on the cultural historical taxa developed in southeastern sites (such as Broyles, 1971; Coe, 1964; Chapman 1980). However, there is considerable variation within the Early Archaic (Kirk occupation) sites in the Northeast and Great Lakes regions (Burse, 2012). The analysis of the Johnsen #3 collection will focus on the communities of practice among the flintknappers who occupied this site. My overall goal is to examine the social mechanisms for the lithic technological system of the Early Archaic. This pilot study will present the results of a lithic attribute analysis, collecting data on the following attributes: characteristics of dorsal scars, thickness, platform preparation, and platform angle. These attributes will be statistically tested using PCA analysis. The patterns revealed from the analysis will extend our understanding of the maintenance of tradition and changes within the community occupying this site.

Troy, Aras (George Mason University) and László Paja (University of Szeged)

[126] *Identifying Differences in Funerary Practice from the Distribution of Fracture and Warping Found on Cremated Human Remains at a Bronze Age Cemetery*

Research at the Békés - Jégvermi kert (Békés 103) site and similar sites in the Lower Körös River region of Hungary have yielded evidence that the Middle Bronze Age peoples of the region did not undergo substantial social stratification, despite evidence to the contrary from contemporary sites. Stratification of social systems can be identified in both material culture and human remains, particularly in mortuary practices. The burials at the Békés 103 cemetery reveal different mortuary rites, but the majority of graves are characterized as urn cremation, where ceramic vessels were buried in shallow graves. Bone remains from five single urn burials were analyzed for identifying characteristics of heat-induced fractures and structural disturbance associated with heating, such as warping. The types of fractures and modifications were recorded and separated into four categories grouped by association with possible evidence of the pre-incineration status of the body. The sample largely provided evidence of uniformity between burials, supporting the conclusion that the individuals were cremated in a similar pre-incineration state. The results of our study add to previous research identifying factors relating to the social composition of the Great Hungarian Plain during the Middle Bronze Age.

[193] *The Pueblo de Abiquiú Library and Cultural Center as Leader in Genízaro Archaeological Investigations*

The Berkeley-Abiquiú Collaborative Archaeology (BACA) Project has been in partnership with the Merced del Pueblo de Abiquiú and the Pueblo de Abiquiú Library and Cultural Center for several years now. Recruiting assistance from a non-local academic partner, Abiquiú leaders created not only an opportunity for testing the utility of archaeology for achieving community goals, but also to fulfill the mandate of intergenerational knowledge transfer that is core to the partnership mission. The intersectionalities of storytelling, cultural revival, and control of heritage resources reframe how an archaeological partnership can serve local interests.

[337] *Around the Watering Hole: An In-Depth Analysis of Pompeii's Fountains*

Drinkable water and the strategies used to get it are at the heart of every sustainable society, and Roman Pompeii is no exception. Pompeii's remarkable water distribution system shapes the very character of the city from its network of water towers to its overflowing fountains. By the 1st century CE the Aqua Augusta, or Serino Aqueduct as it is known today, dramatically altered the urban development of Pompeii and served to provide water to many poorer citizens who, prior to this, would have had little to no access to potable water. In the summer of 2018, the authors conducted fieldwork in order to investigate the fountain and water tower system found at Pompeii. Results include updated and more accurate

measurements pertaining to the overall volume and construction of the fountains, detailed accounts of the wear patterns found on the fountain surfaces and proposed explanations for their presence, and layouts of the stone “supports” that surround many of the basins.

[117] *Does Mastication Damage Cultural Resources? A New Mexico Perspective*

Mastication refers to the mechanical thinning of tree cover such as piñon-juniper woodlands and mixed conifer forests in order to reduce fuels and fire hazards, prevent erosion and improve understory development. Mastication utilizes heavy machinery to shred standing vegetation and may involve significant ground disturbance. Though mastication is a cost-effective treatment, its effects on existing soils, vegetation, and wildlife species are variable and depend on several factors, including the type of machinery used, soil composition, and existence of surface or buried deposits. To better understand the effects of mastication on cultural resources we randomly selected areas within several thinning projects and noted the location and characteristics of selected artifacts before and after treatments. The results of this investigation will communicate to interested parties the consequences of such treatment.

[294] *Bioarchaeology and Genome Justice: What Are the Implications for Indigenous Peoples?*

This paper examines the theme of “discovery,” used in relation to Indigenous lands and peoples to designate the respective claims of Indigenous peoples and the European peoples that colonized North America. In particular, I look at the domain of “bioarchaeology” and the construct of “genome justice” to explore how DNA science attempts to create narratives of identity, belonging and continuous possession of Native lands. “Ancient DNA” has been one of the most contested categories of scientific study for Native remains from North America under contemporary laws regulating repatriation and ethical study of Native human remains. This paper evaluates the interests of contemporary tribal governments in the data and scientific narratives that emerge from such studies.

[141] *Geological Knowledge about Jadeite Jade (Jadeitite) for the Study of Jadeitite Artifacts*

Jadeite jade (jadeitite) is an important material for archeological objects from the middle Jōmon period (~5000–3500 BCE)

through the Kofun period (250–710 CE) in Japan. During the last two decades, in the field of geological science, studies of jadeitite worldwide have brought new knowledge about its origin, formation, and regional characteristics. Multiple trace-elements and stable isotope characterization for jadeitite becomes increasingly important to understand the geological process of jadeitite formation in past subduction zones, where an oceanic plate dives beneath a continental plate. Moreover, a large amount of data via in-situ analytical techniques and new experimental data has begun to allow to a statistical-mechanical analysis. All new descriptions and U–Pb geochronology using zircon in jadeitite have a great potential to revisit source materials of jadeitite artifacts in Japanese archaeological cultures. In this paper, we will give a perspective overview on an interdisciplinary approach for the study of jadeitite artifacts.

[409] *Archaeological Applications of Airborne LiDAR at the Maya Archaeological Site of El Palmar, Mexico*

Airborne Light Detection and Ranging (LiDAR) survey has changed our perspectives on ancient Maya urbanism. In 2017, we conducted airborne lidar mapping at the Classic Maya city of El Palmar, located in southeastern Campeche, Mexico, covering a total area of 94 km². Results show monumental architecture, possible marketplaces, causeways, vast intensive agricultural lands (raised fields), and terraces. These were verified in the field, during the summer of 2018, confirming these were not LiDAR's "raster artifacts", rather urban features. In addition, we also detected chert lithic workshops and two new stelae. Both textual and material data suggest that the El Palmar dynasty had broad social, political, and economic networks with other dynasties during the Classic period (AD 400-820).

[181] *The Outside of the Illuminated Temple: Chamber Constructions in the Early Monumental Architecture in the Andes, Kotosh (Huanuco) and Mosquito (Tembladera)*

Through the recent excavations at Kotosh, Tsurumi and Sara successfully reconstructed the whole architectural complex of the late Archaic Period. It is composed of complicatedly connected platforms and supposedly each of the platforms was made for the purpose of supporting "temple" constructions placed on them. In the Mosquito Plain located in an inland coastal basin known as Tembladera area, Tsurumi and Morales have identified many architectural complexes of the late Archaic Period. In the case of a monumental architecture named Platform Z1, the researchers discovered a chamber with a hearth on the central and topmost location of the platform. Kotosh and Mosquito are similar in the sense that they form irregularly formed masses composed of platforms, winding corridors, and narrow staircases. These architectural features were laid out like a labyrinth through which one can reach the chamber. On the other hand, in many cases of sites on the coastal plains, the platforms adopted well-ordered rectangular forms associated with straight and wide principal staircases. In addition, the chambers with hearths are not always arranged in the core of architectural complexes. We will analyze the structure of space among these monumental complexes focusing on the locations of chamber constructions in them.

[172] *Dating the Dead: A Temporal and Demographic Analysis of an Unmarked Cemetery on Sint Eustatius, Dutch Caribbean*

Recent investigation of an unmarked historical cemetery located between Fort Amsterdam and a nearby historical plantation on Sint Eustatius in the Caribbean raises several questions. Arguably the most fundamental question involves who is buried in the cemetery: if it was used to inter soldiers from the Dutch fort or enslaved Africans from the nearby sugar plantation. Identifying the cemetery's temporal context and demographic composition is an important first step in answering this question. This inquiry used artifacts from the grave fill and coffins to provide date ranges for specific burials and estimate an overall time period for the cemetery. Datable artifacts recovered from these burials, such as glass bottle fragments, European ceramic sherds, copper tacks, coffin nails, and clay pipes, were analyzed to date each of the burials. Demographic analysis of the burials revealed that males and females are present and ages range from infancy to middle aged adults which is consistent with a village population, not military personnel. Furthermore, the temporal analysis dates the nearby burials to the 18th century, aligning closely with the active dates of the nearby Godet plantation. This analysis suggests that the burials are enslaved Africans from the Godet plantation.

[29] *Farms with a View: The Evolution of Agriculture at Kealakekua, Hawai'i*

Above the 400 foot sea cliff at Kealakekua Bay on the leeward Kona coast of Hawai'i are the remnants of extensive pre-Contact Hawaiian agricultural infrastructure. Inventory survey and data recovery on 100-plus acres at the top of the sea cliff provided an opportunity to examine a relatively large and archaeologically intact area of what has become known as the Kona Field System. The investigations suggest the field system evolved in the 16th and 17th centuries as an elaboration of early localized, frontier gardening efforts in a difficult environment of shallow soils and exposed bedrock. The work was undertaken as compliance-driven projects but with Steve Athens' encouragement and philosophy of research first, offers an alternative perspective on a long-standing topic of Hawaiian archaeology.

[187] *Clovis in the Petrified Forest*

This paper presents the results of research at the Rainbow Forest locality and the Blue Mesa site, two early Paleoamerican occupations in Petrified Forest National Park. Rainbow Forest and Blue Mesa are likely Clovis occupations and present the problem of identifying Clovis-era sites in a region in which site surface assemblages have been collected by human occupants for literally 13,000 years. Clovis points are extremely rare on such sites and investigators must rely on the suite of non-projectile-point Clovis diagnostics: blades, bifaces, overshot flaking, and core morphology. The Rainbow Forest locality encompasses over 800,000 m² of surface artifact deposits that include 22 discrete Clovis activity loci. The Blue Mesa site, roughly 20 km to the north, was discovered using a predictive model based on environmental conditions at Rainbow Forest and consists of two spatially distinct Clovis activity areas around the periphery of a playa. The collected surface assemblages were examined using a suite of morphological, statistical, and comparative analyses to identify probable Clovis loci. This research demonstrates the value of GIS-based predictive modeling and the utility of analytical methods focused on other-than-projectile-point assemblage characteristics to distinguish Clovis cultural deposits in the absence of fluted projectile points.

Tune, Jesse (Department of Anthropology, Fort Lewis College)

[313] *Characterizing Paleoindian Landscapes of Southeastern Utah*

The earliest occupations of the greater Bears Ears area are represented by fluted, unfluted lanceolate, and stemmed projectile point technologies indicative of the Paleoindian period. Historically, this period has not been the focus of discussions pertaining to regional archaeological records. As such, we currently have a limited understanding of how people used the greater Bears Ears landscape at the end of the Pleistocene. The regional Paleoindian record is reviewed here to assess the nature of initial human occupation of the area. Site distribution data, toolstone selection, and lithic technological organization are used to characterize the archaeological signature of these early peoples. Results indicate that as early as Clovis times (ca. 13,000 BP) hunter-gatherer groups were familiar with the distribution of lithic sources and habitually make use of local materials. Moreover, the presence of Late Paleoindian Plains and Great Basin-related biface technologies suggests that by ca. 10,000 BP, southeastern Utah was part of established inter-regional land-use strategies.

[250] *Eating and Empires: Stable Isotope Analysis to Reconstruct Diet and Foodways in the Wari Heartland*

Dietary patterns within a community can reveal insights into how communities were organized and how social class or gender roles could shape who had access to which foods. In this study, we use stable isotope analysis of archaeological humans and fauna from three Wari sites in the imperial heartland (Conchopata, Qasa Pampa, and Huari) to explore those issues. We analyze $\delta^{13}\text{C}$ from 93 human dental carbonate samples to examine childhood diet and whether it differed between boys and girls, and we explore the spatial patterning of childhood diets within and between sites. Additionally, we present preliminary $\delta^{13}\text{C}$ and $\delta^{15}\text{N}$ values from human bone collagen (n=18), which are compared to previously published results, to document adult diets and whether they differed between the sexes and between sites. Animal dental carbonates (n=15) and animal bone collagen (n=21) are also examined to aid in reconstructing the Wari menu and Wari diets. Results show that $\delta^{13}\text{C}$ from human dental carbonates range from -12.2 to .3‰, a wide range that may reflect the differential access to carbon enriched foods, such as maize, within the heartland. Bone collagen $\delta^{13}\text{C}$ ranges from -19.1 to -8.7‰ and $\delta^{15}\text{N}$ ranges from 6.6 to 10.8‰.

[88] *Ancient and Medieval Monuments from Romania and Spain as a Testimony of Transcontinental Links—Cultural and Scientific Aspects*

The synergic approach to preserving and restoring chalk stone, artefacts, mosaics, and fresco surfaces, which belong to the cultural heritage, with archeomaterials brings novelty through transdisciplinarity. Applied research is needed to save some of the most important pieces of art and archeology belonging to the national cultural heritage and requiring high-level professional interventions, aligned with international standards. Heritage objects of great value are: painted frescos from the Hypogeum tomb in Constanta, the Roman mosaic of Constanta, metopes carved in stone in the form of bass reeds from the Museum of Adamclisi, the limestone components from the cave churches of Basarabi, painted frescos located in Loggia Mathia in the Corvin Castle, archeological pieces from Hunedoara and romans murals from Spain. These ancient and medieval monuments from Romania expose connections to Asia, Europe and the American continents. Stone and fresco surfaces are continuously exposed to physical, chemical and biological degradation. Some petrographic and bio-physico-chemical analyses of wall samples are presented in this paper, putting into evidence the status of degradation and the possible solution for its conservation. Innovative restoration solutions will be sought by material compatibility with the original.

Turkon, Paula (Ithaca College), Sturt Manning (Cornell University Tree-Ring Laboratory), Carol Griggs (Cornell University Tree-Ring Laboratory), Andrea Torvinen (Arizona State University) and Ben Nelson (Arizona State University)

[81] *The Contribution of Tree-Ring Studies to Archaeological Research in Northwestern Mesoamerica*

Despite more than fifty years of excellent archaeological research in Northwestern Mesoamerica, progress has been impeded by a lack of precise chronological controls to understand site developments and pinpoint the direction of political influence and cultural change. To address this longstanding impediment, this paper reports on a rich, yet previously untapped, source of chronological data, to demonstrate how dendrochronological tree-ring analysis can inform cultural interpretation at different scales. On a site-level scale, we present an example from the site of La Quemada, Zacatecas, to demonstrate how dendrochronological data can inform and refine building and site construction sequences, as well as the development of ceramic chronologies. On a regional scale, we demonstrate how, combined with radiocarbon analysis, tree-ring data can elucidate broad-scale chronological relationships between the Malpas Valley, Chalchihuites, and El C6poro regions. Although all were occupied during the Epiclassic period (A.D. 500-900), difficulties of chronological control make directionality of influence difficult to discern.

Turley, Cameron (The Graduate Center, CUNY) and Ak6 Bendsen (Ilisimatusarfik [University of Greenland])

[31] *Community-Based and Collaborative Archaeology in South Greenland: Past, Present, Future*

Archaeologists are increasingly engaging in community-based and collaborative approaches to develop frameworks for co-production of knowledge and its dissemination. Encouraging collaborative frameworks and community engagement has been a key element of the NSF Arctic Social Sciences Program under Anna Kerttula's leadership. These efforts offer correctives to disenfranchising research praxes, make archaeologists accountable to their subjects, and reposition those subjects as active producers of their narratives. Destabilizing the privileged position of Western academics results in a more ethical, nuanced, and, arguably, more relevant archaeology. In 2017, the Greenland National Museum and Archives issued an open letter to foreign researchers exhorting them to consider designing community-based, collaborative projects. In 2018, the Arctic Horizons Final Report specifically recommended expanded community engagement and financial support for promoting Indigenous scholarship. North Atlantic Biocultural Organisation archaeologists and their research partners have taken these recommendations seriously for over a decade. In this paper, authors Turley, City University of New York, and Bendsen, Ilisimatusarfik (University of Greenland), first discuss the general impact of these projects. Then, they present the experience and preliminary results from the first phase of their community-based, collaborative PhD and MA projects at Alluitsoq, a former Moravian mission site in South Greenland.

Turnbow, Christopher (New Mexico Gas Company)

[391] *Casa Crecida: A Buried Eighteenth Century Spanish Colonial Site in Bernalillo, New Mexico*

The Casa Crecida site (LA 114201) represents the remains of a mid to late eighteenth century Spanish Colonial habitation in what is now Bernalillo, New Mexico. Situated on the terrace of the Rio Grande, the site appears to have been abandoned during a major flood around the A.D. 1820s. This poster presents the results of geophysical survey and data recovery investigations carried out in anticipation of natural gas pipeline construction. This research revealed a remarkably well preserved cultural midden buried below 40 cm of alluvial overburden. Investigations suggest the presence of a substantial rancho or small community center that participated in intensive sheep herding and farming activities.

Turner, Andrew D. (University of Cambridge)

[243] *The Flower World in Central Mexico After the Collapse of Teotihuacan, AD 600-900*

During the tumultuous Epiclassic period (AD 600-900), several smaller polities in Central Mexico and the Gulf Coast rose to prominence in the wake of the collapsed metropolis of Teotihuacan. Although this period is often characterized by rampant militarism, wide-ranging economic activities, and eclectic monumental art programs that incorporate foreign styles, few studies have considered the role that religious ideology played in these phenomena. Flower World imagery is prevalent in the monumental and portable artwork of Cacaxtla, Xochicalco, Teotenango, and other Epiclassic polities. While beliefs pertaining to a solar paradise inhabited by the souls of deceased warriors were inherited from Teotihuacan, Epiclassic elites adapted and modified aspects of the Flower World complex to suit new political and economic strategies. The Epiclassic Flower World complex valorized warfare and linked elites through shared ritual practice, identity, and exchange of exotic prestige goods.

Turner, Bethany (Georgia State University)

[185] *Isotopes and the Body Politic: Estimating Residential Origins at the Imperial Inka site of Patallacta, Peru*

In just under a century, the Inka subjugated twelve million people across the Central Andes. As part of their governing strategies, Inca administrators relocated individuals and even entire communities throughout the empire for myriad purposes; this practice often produced constructed communities defined by individuals' socioeconomic roles in the state. Reconstructing the demographic composition of populations at Inka sites is therefore critical to better understanding how different subjects were affected by Inka imperialism: estimating who was moved, from where, to where, and why can provide insights into how individual bodies were transformed by imperial mandates.

This study presents oxygen ($\delta^{18}\text{O}$), strontium ($^{87}\text{Sr}/^{86}\text{Sr}$), and lead ($^{20}\text{nPb}/^{204}\text{Pb}$) isotope values in tooth enamel and bone from human remains ($N=81$) interred at the imperial site of Patallacta, in the Sacred Valley of the southern Peruvian highlands. Results suggest that most of the Patallacta sample were local to the southern Peruvian highlands; however, some individuals appear to have been from the coast, and one individual was likely from the highland altiplano. These results differ significantly from the nearby site of Machu Picchu, underscoring the complex nature of Inka subject communities and the important contribution of isotope bioarchaeology to elucidating lived experiences within ancient empires.

[245] *The Archaeology of Color in the Southwest*

Color plays a central role in the work of many archaeologists. We use it to establish cultural affiliation and seriation, to analyze artifacts, and to interpret sites. We type pottery, source glass, and identify lithic materials based largely on their colors. Yet the use and meaning of color have not been widely and systematically examined in archaeological thought and theory. Drawing on archaeological examples, as well as ethnographic literature and theoretical contributions from art history and anthropology, I will introduce this symposium with a general consideration of the archaeology of color. Ongoing research has advanced our understanding of the technologies, resources and chemical processes involved in color production, but color is much more than just a set of technological choices. Nor is it merely an aesthetic experience; color is also used to signal social identity, carry political messages, convey knowledge, confer prestige, connect to places and landscapes, and establish systems of ritual symbolism. As an introduction to this symposium on color in Southwest archaeology, this paper offers an overview of theoretical, ethnographic, scientific and methodological approaches to the study of color and its role in the lives of people in the past.

[184] *Archaeology and Literacy: Students Journey across the American Southwest*

Every year my fifth grade students trace a wagon train from Iowa to California across the American Southwest by reading *Sallie Fox: The Story of a Pioneer Girl*. Drawn from real events and contemporary diaries, Sallie Fox encounters a new

landscape through the eyes of a young girl moving to a new life in the West. She records the landmarks, the rivers, and wildlife along her journey. As Sallie travels, my students learn the history of each place she passes. On the Colorado River, American Indian people attack the wagon train; the class discusses the event from multiple points of view. A field trip to El Morro National Monument completes the study and students experience an important historical event. I begin the year with a survey of their perceptions of primary sources and archaeological sites and conclude with the same questions. The goal is to bring an abstract idea of history into the realm of reality and the concrete.

[388] *Assessing Inequality at Neolithic Çatalhöyük, Anatolia*

We use a wide variety of data sets in order to explore inequality at Neolithic Çatalhöyük in central Anatolia. Our goal is to shed light not just on variations in wealth but also on other forms of potential social differentiation in this immense early farming settlement. We assess architectural, mortuary, artifactual, and ecofactual data with an eye to both synchronic variation and to potential changes through time in the levels or forms of social or economic inequality. In doing so, we contribute to currently thriving discussions about the origins and pervasiveness of inequality worldwide and about the extent of social and economic differentiation in early agropastoral cultures (e.g., *Current Anthropology* 51[1], Kohler et al. 2017, Kohler and Smith eds. 2018).

Two Bears, Davina (Dartmouth College Charles Eastman Fellow)

[150] *Researching My Heritage: The Old Leupp Boarding School Historic Site and Navajo Survivance*

My research documents the history of the Old Leupp Boarding School (OLBS), a Navajo federal Indian boarding school in operation from 1909-1942, as it explores Diné (Navajo) survivance within the context of this school. Aside from documenting the history of this school, which has never been done before, I consider the questions, and begin to partially answer, how my Diné ancestors flexed their agency within a particular federal Indian boarding school, how they utilized their Diné foundations to meet the challenges imposed upon them by a settler society, and what were and are the positive stories of Native survivance achieved within the OLBS. In keeping with Navajo culture, I use non-destructive research methods including archival records, historic photographs, and oral history interviews with Navajo elders, who attended the OLBS in the past, to investigate and document the lives of Navajo children and history of the OLBS. My research is from a Diné perspective and contributes to: 1) postcolonial anthropology and resistance under colonial conditions; 2) Navajo Studies and survivance within a particular federal Indian boarding school, the Leupp Boarding School; and 3) the documentation of a significant historic archaeological heritage site to the Diné people.

[316] *The Importance of Identifying Specific Obsidian Subsources on Sardinia to Interpreting Long-Distance Trade in the Neolithic Central Mediterranean*

For the Central Mediterranean island of Sardinia, studies have shown that the usage of obsidian from specific subsources changed over time. Human selection may have been based on their accessibility, physical properties of the raw material, and the size and quantity available. In addition, socioeconomic factors, lithic technology, and usage needs affected their production practices, which varied geographically and changed over time from the Early Neolithic to the Bronze Age (ca. 5700-1500 BC). Production and widespread distribution was rapidly established in the Early Neolithic, and beyond Sardinia dwindled away after 3000 BC. Analyses of thousands of artifacts from many sites in Corsica, the Tuscan Archipelago, and mainland sites in Italy and southern France clearly show an extensive distribution overall of Sardinian obsidian, reaching more than 750 km away in Spain, but with significant differences not only in their percentage of the overall lithic assemblage but in the subsources that were utilized. The extensive data now available allows assessments of variables including changes over time in territorial control of source localities with the development of complex societies; in the distance and frequency of maritime transport; in the production technology used and involvement of specialists; and in contextual characterization and lithic usage.

[351] *Towns under the Microscope: Revising Historical Narratives on the Development of Medieval Towns and their Markets in Northwestern Europe*

The central markets of medieval towns in Northwestern Europe, and more specifically the Low Countries, are considered to be the theatres of late medieval urban identity. They are often associated with the origins of these towns, or at least their glory as merchant towns in the past. In reality, these emblematic places exhibit complex biographies in which selected memories were attributed to them in different historical contexts.

Geoarchaeological methods, such as micromorphology and geochemistry, have a strong potential to contribute new datasets to the study of complex sites. They offer a way to bypass the constant re-evaluation of the same material and written evidence. However, only in the last decade have they become more common in the study of towns in the Low Countries and Scandinavia, important regions for early medieval urbanisation.

Through the combined application of geoarchaeological data and historical writings, we will revise a number of existing narratives on town and market formation. We aim to reconstruct their biographies in order to discuss how their development did not follow set, teleological patterns. On the contrary, this paper shows how different strategies by different actors shaped this space.

[299] *Experimental Study of Bronze Casting Molds for Reproduction of the Ancient Chinese Bronze*

To understand ancient casting technology in China, the non-destructive SEM-EDS technique was applied to casting molds from Anyang. Their grain sizes were various but some of the molds showed a layered structure with fine decorations. The finest layers composed of very fine mineral particles which is comparable to the loess from Anyang area. It indicates that the grain sizes were intentionally controlled. Simultaneously, a series of manufacturing experiments with artificial fine mineral particles (named as Granite Powders) were conducted for reproduction of bronze casting molds. The particles were sieved and elutriated from silicate sands, and the size of the particles was sorted similarly to those found in the Yinxu molds. Those powders enable shaping and carving of the mold and transfer of decoration from model. From surface observations of the unearthed molds from Xiaotun site of Yinxu, a possible bonding technique between the molds is recognized. This should be a fundamental issue for restoring the Yinxu Bronzes technology which applied a composite mold technology to produce characteristic three-dimensional shapes. Further experiments attempted for bonding materials with

the granite powders.

[312] *Formation Processes of Late Pleistocene Archaeological Sites in the Atacama Desert*

We investigated site formation and modification of surficial and shallow Paleoinian sites (ca. 13-11 cal. ka) located in the hyperarid core of the Atacama Desert. Sites occur primarily on inactive Pleistocene to Pliocene alluvial terraces, in and beneath desert pavements, a sparsely studied context for archaeological sites. Our research reveals that desert pavements in the region are poorly developed: clast densities in pavements average ~30% and clast size averages 5-7 mm, independent of surface age. This is far less than densities >70% in mature pavements in other deserts. Differences between terraces of different ages are seen, however, in clast color and the progressive loss of bar and swale topography. Subsurface disturbance of vesicular and gypsic horizons by late Pleistocene human activity is extensive and slow to "heal". The highest density of archaeological materials, particularly lithic artifacts, is on the surface, indicating that larger and heavier artifacts are being pushed upwards, possibly due to earthquakes, whereas lighter materials such as microflakes, plus features such as posts and fireplaces remained in situ. We believe that the uniquely arid and salt-rich conditions of the Atacama slow and inhibit the process of both pavement formation and healing.

[28] *Quetzalcoatl in Late Aztec Sculptures*

Quetzalcoatl (Feathered Serpent) is often characterized as a wind god, but in Aztec sculptures, the traits of the wind god Ehecatl, principally the buccal mouth mask, are not found mixed with feathered serpent imagery. The mix is found in pictorial manuscripts, and alluded to in written sources. In late Aztec times, feathered serpent images are associated with the rulers Ahuitzotl and Motecuhzoma and refer to the legendary Toltec ruler, Topiltzin Quetzalcoatl (Our Lord Quetzalcoatl), the prototype of Aztec Rulership. If there is any natural association, it seems to be with water, notably the great flood of 1499 in the reign of Ahuitzotl.

[200] *Forced Migration in the Assyrian Empire, on the Periphery and in the Heartland*

Premodern states could and did reorganize the spatial demography of their domains. In the ancient Near East, the kings of the Assyrian Empire (ca. 900-600 BC) made grandiose claims in propagandistic inscriptions to have relocated entire kingdoms, and many thousands of persons, with their realm. The research of Bradley Parker demonstrated the spatial effects of these policies along the northern fringe of the empire, revealing them to have been more than just boasts. Because of political instability within the Republic of Iraq, these landscape questions have been impossible to address in the former imperial core. With the stability and openness of the autonomous Kurdistan Region in northern Iraq, Parker's demographic models are now being tested in the Assyrian Heartland by the Erbil Plain Archaeological Survey. Results since

2012 show a complex combination of top-down imperial landscape transformation and bottom-up local changes.

[420] *Lasers and Pixels: Using Terrestrial LiDAR and Photogrammetry to Record Rock Art at the Polychrome Site in Montezuma Canyon*

LiDAR scanning and photogrammetry are quickly becoming extremely useful tools for archaeologists. This is especially the case for documenting complex rock art panels that can be difficult to fully represent using traditional techniques constrained to 2D formats. In contrast, terrestrial LiDAR and photogrammetry provide a coverage, quality, and precision that traditional methods are mostly unable to achieve. This paper discusses the methods and results from both terrestrial LiDAR scanning and photogrammetry of a series of rock art panels situated on a cliff face at the Polychrome Site in Montezuma Canyon, Utah. Conclusions from this project show that these technologies are extremely useful for capturing rock art details. Data captured from LiDAR and photogrammetry can be used to generate digital models that can be processed for a variety of uses including detailed visualization, modeling, replication, and publication both in print and in online formats. As methods and technologies improve, they will prove to be some of the better technologies for documenting rock art.

[355] *Circulación de Cerámica en Tiempos del Inca: Aportes del Norte de Chile*

A mediados de 1970 surgió la conocida discusión si el dominio incaico en el norte de Chile había sido directo o indirecto, a partir de la aplicación que se hizo del modelo sobre la "verticalidad" andina de John Murra. De acuerdo con esta propuesta, la situación se dirimía en términos de que cuán abundante era la materialidad del Inca en los territorios conquistados, especialmente arquitectónica y cerámica, y cuánto ésta se atenía al estilo original del Cusco. De acuerdo con las incipientes investigaciones de aquella época, predominó y mantiene cierta vigencia la hipótesis de la ausencia de una conquista propiamente tal y que más bien se trató de un dominio indirecto sobre la base del sistema ecológico previamente implantado por grupos altiplánicos en tierras bajas. Aprovechamos este simposio para discutir estos planteamientos a través una síntesis y actualización de nuestros estudios cerámicos en el norte de Chile, aportando con nuevos datos composicionales, tecnológicos, estilísticos, funcionales y cronológicos sobre la expansión del Tawantinsuyo en las tierras altas y bajas del centro sur andino.

[409] *Automated Detection of Gridded Canal Networks in Veracruz, Mexico*

The ancient peoples of Classic Period Veracruz employed a suite of strategies for agricultural intensification aimed at increasing agricultural yields and managing seasonal rainfall. One common strategy involved the construction of gridded canal networks with alternating raised field platforms which drained water in the wet season and retained it in the dry season using check-dams. Many of these gridded canal networks are clearly visible in high resolution satellite imagery, especially when using products of the near infrared bands. This paper outlines a method to automate detection and mapping of these features using Object Based Image Analysis (OBIA) through the software eCognition. A simple GIS model using slope, distance to streams or water sources, and vegetation indices is first constructed to narrow the search area.

This is followed by a simple rule-based segmentation and classification process that aims to identify relatively regular and homogeneous patterns of alternating brighter and darker near infrared reflectance. The results show that the method serves as a statistically significant predictor of the location of gridded canals in Veracruz, and qualitatively the method serves as an effective mapping technique that may be of utility in other regions with similar features.

[346] *Reevaluating Mobility and Sedentism in Classic Mimbres and Salado Villages in Southwest New Mexico*

Fourteenth century Salado villages in southwest New Mexico show interesting contrasts with earlier villages from the Classic Mimbres period (AD 1000-1130). One of the most intriguing differences is the evidence that Salado period villagers may have employed a land-use strategy relying on more frequent mobility between villages and at larger spatial scales in comparison to Classic Mimbres period residents of the same areas. Researchers in the 1990s suggested "short-term sedentism" characterized Salado period sites, but had limited comparative data available. This study reexamines evidence for mobility and sedentism in the Classic Mimbres and Salado periods using architectural data from numerous excavations in the Mimbres region, including recent work on Salado villages. A Salado period land use strategy employing greater mobility may also have allowed more resilient use of farmland and other resources.

Vacca, Kirsten (University of California, Berkeley)

[179] *Queer Feminist Science in Hawaiian Archaeology*

Queer theory is an important tool for critically analyzing ideas about the past that are normalized and reproduced to the detriment of descendant populations. This approach is particularly relevant when investigating the social structures that governed daily life in the past. Historically, academic work in Hawai'i tends toward interpretations of the household that are homogenous and static, reflecting the colonial past more than Hawaiian history. Issues with these interpretations include the diminishment of the roles women played in Hawaiian communities. Queer theory shifts the currently accepted paradigm, providing a new approach to analyzing Hawaiian household data. I engage with queer theory in this paper to interrogate the structures of power that perpetuate colonial patriarchal interpretations. Queer feminist science approaches are relevant to this endeavor both in questioning the actions we assume are deviant in the past and reorienting ourselves to considering instead what Kanaka Maoli (Native Hawaiians) defined as deviance. This paper addresses these themes through the investigation of material remains from southeast Maui. The examination of architectural features and artifacts excavated from seven kauhale house complexes compared against historical and archaeological literature brings to the forefront practices that refuse to align with perpetuated assumptions about the Hawaiian past.

Vadala, Jeffrey (Human Relations Area Files)

[100] *Archaeological Actor-Network Theory: Case Study at Cerro Maya (Cerro, Belize)*

This study uses a modified actor-network approach to examine and characterize the human and nonhuman relationships that produced and shaped ancient Maya caches and the corresponding ritual events wherein they were buried. This contrasts with archaeological approaches that have generally focused on defining essential properties of artifacts to define or clarify typologies or to determine their symbolic meaning. These approaches have determined that caches marked the beginning of structure use (or final construction phases), were related to Maya cosmological beliefs of sacred space, and likely served ideological functions during ritual. Although extremely important insights, these traditional approaches have obscured the fact that, among the Maya, caches were experienced as a durational process of social life and were always contextualized and affected by social relationships, human-object relationship and interaction with the landscape. In this study Bruno Latour's (2005) actor-network theory (or ANT) is used to infer, model, and characterize the relationships between materials, objects, places, groups of people, intentions and actions. Latour's extremely flexible actor-network approach allows the researchers to map relationships as durational networks that contain social relationships, and human-object relationships all within the context of the landscape.

Vaiglova, Petra

[102] *The Nitrogen Challenge at Çatalhöyük*

Stable carbon ($\delta^{13}\text{C}$) and nitrogen ($\delta^{15}\text{N}$) isotopic values of archaeobotanical remains from the Neolithic site of Çatalhöyük have presented us with a series of challenges for interpreting ancient crop management systems in a complex environment. An exceptionally wide range of $\delta^{15}\text{N}$ values (0 to 18‰) obtained from charred domestic and wild plant species preserved across the Neolithic sequence raise the question of whether the plants were grown in soils with strikingly different biogeochemical properties or whether the variable values were the result of post-depositional processes. Fourier Transform Infrared Spectrometry (FTIR) was carried out in order to investigate whether nitrate contamination may have been responsible for the elevated $\delta^{15}\text{N}$ values, but the results showed that the samples did not contain the characteristic nitrate peak on the infrared spectrum. The discussion will present a tentative interpretation of ancient crop cultivation strategies developed in a landscape characterized (according to the latest geoarchaeological model) as an anabranching channel system, which offered the farmers opportunities for cultivating a range of wetter and drier soils. In addition, the implications of properly understanding the plant isotope data will be discussed in relation to better interpreting the nature of human and animal diets at the site.

[304] *Animal Manifestations of the Creator Deities in the Maya Codices and the Popol Vuh*

Scholars have long recognized that certain Mesoamerican deities appear in animal as well as anthropomorphic form. The Maya creator Itzamna, for example, has aspects corresponding to a bird, a turtle, and an alligator, while the aged "God L" may be linked to the opossum in its anthropomorphic form (Pawah-Ooch), and to the owl. This paper examines figures named with the "pawah" (or "itzam") prefix in the Postclassic Maya codices, best known for its relationship to an aged deity with a human-like appearance. This figure plays an important role in yearbearer ceremonies in the Madrid Codex, whereas related beings (named with the same prefix) also include turtles, crocodilians, and opossums. Similar patterning appears in the Popol Vuh, an early colonial manuscript from the K'iche' region of highland Guatemala, where the aged male creator (Xpiyacoc) has associations with turtles (the "coc" in his name likely means 'turtle') and opossums (under the name Hunahpu Uch), and one of his sons (Xbalanque) has a special relationship with jaguars (balan) and deer (que). We explore a series of almanacs from the Madrid Codex, as well as contemporary Atiteco rituals, to provide a deeper understanding of "animal" actors in Maya hunting and yearbearer ceremonies.

[288] *Pottery Production and Social Complexity: Ceramic Paste Analysis at the Site of El Campanario, Huarmey Valley, Peru*

The analysis of ceramic pastes can be used to study exchange networks, social identities, and technologies. The variations in the composition of ceramic pastes are related to the selection of clay, and non-plastic materials from ancient ceramists. The choice of these procurement areas is often influenced by technological traditions, social complexities, vessels' functions, and ceramists' preferences. The excavation conducted at an adobe platform at the site of El Campanario allowed the recovery of various types of materials including pottery sherds. This platform was probably used for public events, in which ceramic vessels were an important component of social interactions. The presence of both polychrome and Casma style ceramics indicates that various styles of pottery were used during public activities on the adobe platform. The analysis of ceramics paste was conducted using a digital microscope to observe the paste of both types of pottery to identify variations in paste composition. This analysis will provide insights into the context in which ceramic vessels were produced at the site of El Campanario.

Valcarce, Ramon, Alia Vazquez-Martinez (University of Santiago de Compostela) and Carlos Rodriguez-Rellan (University of Santiago de Compostela)

[252] *Drawing the Line: Recent Approaches to the Recording of Galician Petroglyphs (NW Spain)*

Research on the open-air rock art of Galicia has been going on for more than a century. During this time, one aspect that has experienced much change is the recording of the carved panels, starting with techniques that involved direct contact

with the rock's surface and resulted in a more or less adequate rendering of the depictions, and giving way to a combination of plastic sheets and artificial lights. In the last decade, the introduction of photogrammetry and image processing tools have revolutionized the recording of rock art, avoiding the risks of direct contact with the petroglyphs themselves and allowing more detailed cataloguing of the images. In this paper, we compare the results of the different recording techniques applied over a period of nearly 40 years to several rock art sites to show how the diverse methods achieved increasingly more accurate records that are changing our perspective regarding Galician rock art.

[39] *Characterization Using Raman Spectroscopy of Amazonite and Turquoise of Tomb II, Tingambato, Michoacán, México*

The archaeological site of Tingambato is located in the state of Michoacán, in a transitional zone between the highlands and the lowlands of the Balsas River. This geographical location allowed a long distance interchange of prestige goods used in different ritual context. Evidence of that, are the archaeological artifacts found in the tombs, especially the Tomb II. Inside it, an individual female burial was found with a funerary attire conformed by marine shells from the Pacific Ocean and Caribbean Sea, and blue-green stones. For this paper we will present the characterization of the lapidary minerals, carried out using noninvasive archaeometric analyses, identifying a majority of amazonite microclines and low presence of turquoise, green quartz, caolinite and malaquite. The use of Raman spectrometry helped us in the identification of raw materials, but the use of experimental analysis and Scanning Electron Microscopy (SEM) allows us not only know the raw materials, but also the technological gestures used for the elaboration of the objects found in Tingambato site.

Valdez, Francisco (IRD / France - Ecuador)

[181] *Early Ceremonial Hearth Use in the Upper Amazon: Santa Anna–La Florida, Palanda, Ecuador*

One of the outstanding traits of the Mayo Chinchipe – Marañón culture is the spiral architecture that appears on the mound terraces of at least two major sites of the upper Amazon. In one of them, the vortex of the spiral was a ceremonial hearth that contained a votive cache in its base. The offerings found within were probably status symbols of a former officiant. The care taken in the construction of the hearth implies its importance. The hearth seems to have been an altar, or a cleansing feature, located in the center of a structure that could have been called a temple. Although no organic remains were clearly identified among the ashes, we can assume that the hearth served as a privileged medium for communication between the forces of the cosmological / ideological universe. Other hearths have been found in others contexts on the site and a comparison of the features and their characteristics suggests the special function it performed in Santa Ana-La Florida some 4000 years ago.

[252] *Heháka Wačhípi: Re-examining the Elk Dance to Understand Lakota Women's Sacred Roles in Ceremony through Rock Art*

Historically, researchers have interpreted rock art based on ethno-historical accounts of ceremonies as male-created and male-oriented experiences and spaces. This has led to researchers ignoring traditional women's roles in the creation of rock art as well as women's interaction with rock art spaces. I examine how Lakota women of the North American High Plains created and experienced ceremonial imagery at rock art sites specifically focusing on elk iconography. These sites containing elk ceremonial imagery are widespread throughout the plains but the current focus of the project is on sites in Montana, South Dakota and Wyoming. The project synthesizes ethnography of Lakota individuals, both men and women, with more traditional archaeological methods to analyze the elk images and interpret them through an indigenous perspective.

Van Alstyne, Benjamin (UNLV)

[151] *Examining the Architectural Technology at Lava Ridge Ruin, Arizona*

One component of the archaeological record that can shed light on human behavior is architectural remains. Architectural studies in archaeology have mostly focused on evaluating the mechanical properties of construction materials, the amount of labor, time, and materials needed for construction, and room function to make inferences about the social context within which buildings were planned, constructed, and used. The present study builds on previous research, to investigate pueblo construction and use by the Virgin Puebloan people who lived on the westernmost edge of the Colorado Plateau. Specifically, this study focuses on Lava Ridge Ruin, a late Pueblo II/early Pueblo III period habitation site located on the southern Shivwits Plateau, Arizona. This study evaluates (a) the materials and methods needed for pueblo construction; (b) the labor requirements of its construction; (c) the season during which construction most likely occurred; (d) the function of the pueblo rooms; and (e) the implications of these data for understanding the inhabitants' degree of sedentism and the nature of their social organization. To investigate these issues, this study utilizes a multi-pronged approach and relies on data obtained from the archaeological record, ethnographic sources, experimental science-based research, and the use of Building Information Modeling software.

[92] *Putting the Soul into Archaeology—Integrating Interpretation into Practice*

This paper calls for a creative, interpretive archaeology that does not take reports for agencies or other archaeologists as its end goal but instead speaks to a far wider range of audiences through the development and presentation narratives that will engage and inspire people. I argue that this can be achieved by implementing "Emotion Design"—an interpretive design methodology that makes a clear distinction between 'information', 'message', 'emotion,' and 'media' to develop a concept in the form of an engaging story, supported by all stakeholders, that has the power to move and engage visitors. By drawing

upon several award-winning case studies in the sphere of museology and site interpretation by Dutch design agency 'Studio Louter', I will argue how a meaningful connection to the past can only be achieved by evoking the emotions of the visitor in constant relation to a clearly developed core interpretive message. This paper builds on previous insights that were published as part of the special volume 'Interpreting & Presenting Archaeology' of SAA Advances in Archaeological Practice (volume 6.3).

Van Dyke, Ruth (Binghamton University)

[83] *Migrants, Materials, and the South Texas Past*

I direct a historical archaeological project in the Alsatian community of Castroville, Texas. Members of the local heritage society, who sponsor the project, are descendants of economic migrants brought from Alsace to Texas in the 1840s during the aftermath of Texas' break from Mexico. Today, Castroville residents seek to revitalize and celebrate their Alsatian past. Our excavation of an Alsatian immigrant's house has given the archaeologists a detailed material window into the town's complicated 175-year history – a history that involves class differences, and Indigenous and Hispanic residents. Meanwhile, the heritage society has transformed the stone house into a stage on which to tell the story of valiant pioneer ancestors who prevailed despite the hardships of life on a savage frontier. Materials, with their abilities to evoke nostalgia, play a starring role in this drama. In this paper, I contemplate some issues raised by the project, including: How does self-identification with a European past fit into a contemporary Texas that seems hostile to today's immigrants? What roles might materials' particular valences play in creating different kinds of narratives about the past? Is there a way for us to deploy these particular archaeological materials in support of social justice?

[95] *The Life History of Early Celtic Vessels: An Experimental Approach towards Exploring the Inferential Limits of Interpreting Pottery Function*

In the context of the BEFIM project ("Meanings and Functions of Mediterranean Imports in Early Central Europe") the life history of (drinking) vessels from the Early Celtic hillfort settlements of Heuneburg and Vix-Mont Lassoix was examined, studying the way of production and use. We set up an extensive experimental program of dozens of experiments to explore the way this pottery was made and used. The participation of an experienced potter allowed us to reproduce exact replicas

of the archaeological vessels and investigate in detail the traces of production and the effect of temper, baking temperature and so forth on the development of production traces and use wear. Especially variations in temper strongly affected the characteristics of the use wear traces from the preparation of different products. The effect of alcohol production, including fermentation, on the pottery surface was explored. We also tested the effect of different gestures of preparing and consuming food and drink, storage and handling. Last, we studied the effect of post-depositional processes on the traces of production and use. The traces we observed on the experimental vessels, using an integrated low and high power approach, formed the basis for our interpretation of the archaeological pottery.

[241] *An Experimental Study on the Effects of Periodic Inundation on Surface Artifact Assemblages*

Thousands of archaeological sites are subject to periodic inundation and wave action due to the operation of more than 600 dams owned by the U.S. Army Corps of Engineers (Corps) nationwide. We used experimental archaeology to study the effects inundation was having on surface artifact assemblages. Specifically, in 2008 archaeologists with the Corps Albuquerque District undertook an experimental study on these effects in association with a temporary alteration of the timing and release of flows at Cochiti Lake on the Rio Grande in New Mexico. Corps archaeologists placed 432 aluminum disks of varying sizes, simulating ceramic sherds and large and small chipped-stone flakes, in known locations within the elevation range for expected lake level fluctuations. Over a five-year period, these artifacts were periodically relocated and their positions recorded, allowing a precise record of the movement of individual artifacts across the landscape as lake levels rose and fell. We correlated this movement data with daily lake level and weather records and found differences in artifact movement based on artifact size, duration, and depth of inundation, with particularly strong impacts occurring with inundation at shallow depths. This paper presents our methods, findings, and management recommendations.

[362] *Bioarchaeology Legacy Collections: Varying Perspectives, Perceptions, and Challenges*

Legacy collections can prove quite valuable in research, but may bring with them additional ethical and legal concerns and challenges. Known for the intricate wooden effigy carvings on a mortuary platform above a charnel pond, the site of Fort Center, 8GL13, also contains more than 24 earthworks dating from 800 BCE to 1700 CE. This paper explores the human skeletal individuals collected from the Fort Center site in Glades County, Florida in the 1960s and 1970s as well as the need for on-going NAGPRA compliance. Passed in 1990, NAGPRA is federal legislation that provides a legal pathway for Native

Americans to repatriate the remains and funerary objects of their ancestors. The history of Fort Center post-excavation, a complicated journey involving multiple institutions and many paperwork trails, plays a significant role in bioarchaeological legacy collections assessment for compiling this history, documentation and associations with the entire collection. Both institutional and tribal requirements and needs are an integral part of these special legacy collections story. Continued sensitivity and a willingness to consider other perspectives are important parts of this process.

Van West, Carla (SRI Foundation)

[25] *Tree-Rings Tales from Tijeras Pueblo*

This paper describes how Linda Cordell, working with colleagues, including me, used building timbers to (1) date room construction and village occupation at Tijeras Pueblo, (2) understand villager's choices about wood use, (3) describe changing climate conditions associated with the village's occupation, and (4) propose the source areas for the village's immigrant population. Her ability to accomplish this depended on dendrochronology—the science of dating and studying the annual rings of trees. Linda understood that trees were potentially vast repositories of ancient stories; here I share what she was able to learn from the woody archives of Tijeras Pueblo.

[125] *What Can We See from Here? Hilltop Sites Northwest of Prescott, Arizona and Their Local and Regional Connections*

The Burro Creek/Pine Creek archaeological survey northwest of Prescott, Arizona involved partnerships between Pima Community College and the BLM and private landowners in the area from 2003 to the present. When the survey began, the region was poorly known and only two sites had been recorded within the survey area, both located on prominent hilltops with associated masonry structures. These and other hilltop sites in the region were understood to be part of a network of similar sites with line of sight connections among them, but the broader context in which those sites were built and used was unknown. Survey of over 12,000 acres has located 170 sites including another hilltop site on State Trust land, showing that these hilltop sites were not isolated but were surrounded by contemporaneous smaller sites. This poster explores the line of sight connections among the hilltop sites in the Burro Creek/Pine Creek survey area and others in the local network. It also examines the nature of the smaller residential sites where the builders and users of the hilltop sites lived.

[47] *The Sacred Shells Speak: Sclerochronology and Oxygen Stable Isotopes in *S. crassisquama* (princeps)*

This project broadly examines shell ring growth patterns in the Pacific bivalve *S. crassisquama* (princeps). *Spondylus* shells were incorporated into pre-Columbian Inca (and greater Andean) ceremonial and ritualistic practices consistently until Spanish colonization. Existing paleoecological and archaeomalacology approaches have relied on oxygen isotopic geochemistry to ascertain small-scale environmental conditions recorded in annual calcium carbonate growth ring patterns. These isotopic signatures have been compiled to form sclerochronologies for certain long-living mollusk species. This project seeks to situate this shell ring approach in the Andes, and to apply oxygen isotopic geochemistry and sclerochronology-building to the Andean *S. crassisquama* (which occupies coastal Ecuador and Peru).

Vance, Emma (University of Montana), Ethan Ryan (University of Montana) and Anna Prentiss (University of Montana)

[327] *Connecting Lithic Technology to Socio-economic Organization at Site 48PA551*

The well-known Middle Archaic site, 48PA551, in northwestern Wyoming, was originally described as a single McKean Complex occupation. New data from 2018 now suggests the possibility of two occupations. This provides the opportunity to consider the connection between the organization of lithic technology and mobility/subsistence organization between the two occupation periods. Current data imply a high degree residential stability and likely use of logistical mobility during the

early occupation followed by a shift to a much less stable residential pattern in the latter occupation. Lithic assemblages excavated in 2018 can provide detailed insight into technological decision-making associated with these alternative organizational scenarios. Thus, this poster explores new insights into Middle Archaic/McKean Complex socio-economic, drawing data from analyses of tool manufacture, use, and transport patterns for a variety of raw material sources.

[187] *Questioning Clovis in Southeast Utah: Late in the Game or Transitional?*

This presentation provides a summary of what is currently known for the Lime Ridge Clovis site, as well as more recent data on Clovis sites, or components thereof, from Glen Canyon National Recreation Area, Utah. The data are fleeting, but suggest a trend comparable to the adjacent Nevada and Arizona regions for diminished size and boldness in blade manufacture, knapping style, and the resulting tools, which raises the question of at which point do we no longer call these Clovis. Included are discussions of raw stone material sources, potential diagnostics in the absence of finished points, knapping technology, including approaches to fluting points, and patterns of landscape use. The combined data potentially suggest a migration to upland locations within the Glen Canyon region at the end of the Clovis era, and a population sustained long enough in that location to have certain knapping characteristics show with regularity into succeeding periods, but direct dating is still needed to verify.

VanderVeen, James (IU South Bend)

[215] *The Danger in Dehumanizing the Dead*

The various undead or reanimated humans in world folklore (e.g., zombies, vampires) are examples of using supernatural explanations to account for misunderstood or inconceivable phenomena found in the natural world. Such creatures and what they represent are used as analogies even in the present day by scientists, the news media, and popular culture for the same purpose. But audiences may not read the comparisons as intended (illustrations for clarification) and rather see the explanations of monsters as actual equivalencies. This becomes problematic when a news report speaks of 'vampire burial' or a 'zombie skeleton' and reinforces the popular belief that maybe corpses can walk again. The sensational or exaggerated reports on burials that seem to deviate from the norm have the unintended consequence of reinforcing stereotypes and misconceptions about the living. Movies and comics that depict these monsters throughout history with great verisimilitude strip away the diversity of modern populations. Although the goal of the authors may have been to employ folklore to help audiences better conceptualize their stories (real or not), the result is often a reification of oversimplified and even dangerous ideas about modern people.

[382] *The Body at the Washtub: A Bioarchaeological Reconstruction of Identity from a Purported 1849ers Oregon Trails Burial at Camp Guernsey, WY*

In late spring 2018, a team of anthropology students and faculty from the University of Wyoming, with support from the Wyoming Military at Camp Guernsey Training Base, recovered a historical burial from an eroding cutbank near Emigrant's Washub Spring. Members of the Oregon-California Trails Association marked the location based on interpretations of 19th-century diary entries from later Oregon Trails travelers. These diaries described the location of the grave of Dr. McDermott, died June 21, 1849 at 28 years of age, from Fairfield, Iowa. As the burial was exhumed, questions arose as to whether these remains were McDermott or another unknown traveler. Given that the markers were placed in the mid-20th century and later, and knowing there were other Oregon Trails burials in the area, we wondered if there was a misattribution of identity for this grave. In this study, we make use of stable isotope and osteological analyses to compare the historical narratives about McDermott's burial to the information garnered from the geographical location, and the biological and material remains. This osteobiographical approach presents an opportunity to explore our understanding of accepted history and the different identities attached to this individual in life and in death.

VanPool, Christine and Todd VanPool

[245] *The Multivalence of Black in Casas Grandes Iconography*

Color symbolism was undoubtedly important to the Medio period (AD 1200–1450) Casas Grandes folks. Red, black, and white designs decorate their pottery, but excavations at Paquimé reveal that the Medio Period farmers used a variety of mineral pigments for painted murals and/or for makeup and body paint. They also conducted rituals with colorful scarlet and military macaws, which Charles Di Peso thought were related to water making ceremonies that used red/green symbolism. It consequently seems likely that such color symbolism is reflected in other contexts such as pottery where the entire range of color could not be reflected. Our analysis uses naturalistic images to evaluate what colors might be represented by black designs and what characteristics might be used to differentiate between the colors. For example, some double headed macaw effigies appear to depict scarlet macaws (painted with red heads) and military macaws (which have their green heads portrayed using black), suggesting that sometimes black paint can be read as green. Other times, black appears to really reflect black. Further, black can be used to denote different textures. Black speckling on the front of quail indicates downy feathers, whereas checkerboards and grids indicate scales.

[296] *Medio Period Borderland Dynamics at 76 Draw*

The New Mexico/Chihuahua border was also a borderland between AD 1200 and 1450 where the contemporaneous Casas Grandes, Salado, and El Paso phase cultures overlapped. The excavation of 76 Draw, a Medio period site on the northern periphery of the Casas Grandes region, is designed to evaluate the relationship among these cultures. Were different communities/households affiliated with each culture? Or were traits from each culture blended through cultural syncretism? Likewise, was the border between the cultures porous and largely informal, or more rigid and clearly defined? We evaluate these borderland dynamics at 76 Draw using ceramic type analysis and geochemical provenience analysis of obsidian. Both data sources reflect types/sources from the Salado and Casas Grandes regions. However, the ceramic assemblage has a greater proportion of Casas Grandes polychromes when compared to nearby Salado and El Paso phase settlements. Further, the obsidian from sources in the Casas Grandes region reflects direct procurement of unreduced cobbles whereas obsidian from outside the region reflects the acquisition of previously reduced obsidian through trade or discard from visitors. Our analysis indicates direct, community-level cultural integration with the Casas Grandes culture, but trading relationships with surrounding Salado and El Paso phase communities across a well-defined border.

VanValkenburgh, Nathaniel (Brown University)

[77] *Here's Looking at You: the Ethics and Politics of UAV-based vs. Satellite-based Archaeological Survey in the Andes*

The collection of geographically extensive archaeological datasets from satellite imagery and sensors mounted on piloted

aircraft and UAVs is transforming how archaeologists study the past, enabling us to map sites in difficult terrain, at new levels of detail, and explore social and political transformations at the scale of large regions. Yet the forms of vision engendered by satellite archaeology all too often seek to perform what Donna Haraway calls the “god-trick of seeing everything from nowhere,” masking the conditions of possibility by which digital data are collected, misrepresenting their completeness, and offering little consideration of their practical impact on non-archaeologists. Drawing on feminist critiques of geographic visualization, I explore the ethics and politics of distinct forms of aerial vision, contrasting UAV-based and satellite-based survey through a case study from Peru’s Chachapoyas region, where our work has incorporated both satellite imagery and LiDAR, hyperspectral imagery, RGB photographs and thermal imagery collected using UAV-mounted sensors.

[262] *Taking the Lab to the Field: Examinations at Etzanoa, Kansas*

Taking scientific lab analyses into the field requires special equipment and planning. PaleoResearch arrived with our mobile field lab to support the archaeological field work. Remote analysis of pollen, phytoliths, seeds, charcoal, and protein residues all are possible, as are the more commonly employed portable XRF and even FTIR analyses. Protein residue analysis of a projectile point from Etzanoa yielded a positive reaction to turkey antiserum, indicating that people living at Etzanoa at or near the time of contact hunted turkeys. Survey at Etzanoa involved the local community, providing an opportunity to engage them in use of scientific equipment, such as use of portable XRF to discriminate between lead and other metal objects recovered. Lead balls from the battle were among the objects recovered. A night of presentations at a local community center included XRF analysis of local collections to further engage residents in the discovery of their local history and prehistory.

[157] *Funding Archaeology and Heritage Conservation in Postcommunist Bulgaria and Beyond*

On 10 November 1989, Todor Zhivkov, the communist leader of Bulgaria, was ousted, bringing the fall of the one-party regime and Bulgaria’s transition to democracy. With the collapse of the communist regime, funding for archaeological research and conservation was dramatically altered and significantly diminished. In 2007, Bulgaria joined the EU but due the lack of national policies and corruption, the EU funding generally failed to address the real needs for quality research and preservation of Bulgaria’s cultural heritage. In response to these changes, entrepreneurial initiatives sprouted. Among them was the creation of Balkan Heritage Foundation (BHF), an independent non-governmental organization that uses funding from field schools to support archaeological endeavors throughout the Balkans. Over the past decade, the BHF has developed a successful model for symbiosis between educational projects (i.e. field schools) and ongoing heritage projects (research and conservation) through the collaboration of students and universities from all over the world, with local heritage specialists, communities and municipalities in benefit of cultural heritage.

Vasquez Pazmino, Josefina (University of Florida)**[331]** *Imperial Space Appropriation and Colonialism during the 16th Century in the Ecuadorian Andes*

The Inka Empire began its process of conquest and colonialism in 1420 in ancient Ecuador. The Inkas reproduced their own social spaces for the public, the sacred, and the economic over local spaces. However, such Inka layers of transformation were suddenly truncated by the Spanish arrival at around 1530, which again brought different kinds of populations that imprinted new contours onto the history of these spaces. This paper documents what occurred to Inka spaces after Spanish appropriation during the 16th century, using Colta Lake valley's material culture and monumental features to support the study case within the Chimborazo region.

Vawser, Anne (National Park Service)**[385]** *Why We Should Reassess How We Define Sensitive Archaeological Data and How We Share It*

We all want to be published and want our archeological research to be relevant, useful, and available to other archeologists, but in this digital age, it may be too easy to share, and too easy for sensitive site location information to end up in places that could cause irreparable harm to the archeology that we are so passionate about. We tend to write our reports for an archeological audience, including all kinds of useful information about where we found those wonderful artifacts and unique features. We often don't think about where these reports might end up when we write them: A thesis submitted to the university library that is scanned and made available through the libraries database; a technical report submitted to a government archive that decides they need to make all their documents public, even a paper copy sent to a colleague who passes away and leaves his library to relatives who, not knowing what to do with the material, donate it to the local library. Now is probably the time to rethink how we write reports, what we make available, to who, and in what format, for the sake of preserving the past.

Vazquez De Arthur, Andrea (Columbia University)**[54]** *Wari Bats? An Iconographic Analysis of Some Very Curious Zoomorphic Figures on Middle Horizon Andean Pottery*

For ancient civilizations with no form of writing, proper iconographic interpretation is an important tool for accessing the past. This is certainly true of ancient Andean civilizations, especially the Wari who produced some of the most captivating visual imagery of their time. However, Wari depictions of supernatural composite figures are so stylized that correct identification of the sources for their zoomorphic characters is very difficult. All too often, ambiguous figures are identified out of hand as either some type of feline or bird, considerably limiting our perspective on Wari artistic expression. Through careful iconographic analysis, I propose that the bat may have been a very prominent animal in the Wari pantheon. Some of the stranger zoomorphic characters on Wari pottery have so far eluded interpretation, despite being prominently depicted on ceremonial vessels excavated from such prestigious Middle Horizon sites as Conchopata and Pachacamac. Few, if any, references to bat imagery are made in the literature on Wari visual culture, therefore the identification of certain zoomorphic traits as pertaining to bats has the potential to significantly alter how Wari imagery is viewed and interpreted.

Vázquez López, Verónica (University of Calgary) and Daniela Triadan (The University of Arizona)**[309]** *Aguada Fénix: An Early Middle Preclassic Monumental Site in the Middle Usumacinta Region*

The site of Aguada Fénix, located on the San Pedro River in northeastern Tabasco, Mexico, was recently discovered by the

Middle Usumacinta Archaeological Project through LiDAR mapping. The site layout corresponds to what the project has defined as the Middle Formative Usumacinta Pattern (MFU), which consists of a large north-south oriented rectangular platform or feature, delineated by low structures, and a central E-Group. Aguada Fénix is the largest of these sites and may have served as a central place in the Middle Usumacinta drainage during the early Middle Preclassic. It features a monumental rectangular platform with a large E-Group at its center, and several causeways that lead towards it from the west, as well as pairs of ramps and causeways on its northern and southern ends, and is surrounded by large man-made reservoirs. The construction system of the monumental platform resembles some of the building techniques used at the Olmec center of La Venta. Nevertheless, the recovered ceramics suggest that the site was built during the early Middle Preclassic (ca. 1000-700 BC) and point towards an intense interaction between the local population and the central and southern Maya lowlands.

[247] *Testing Theoretical Approaches for Inferring Hominin Behavior at Liang Bua (Flores, Indonesia)*

Recent debates in anthropology surround the utility of human behavioral ecological (HBE) approaches for inferring archaeological phenomena. Criticisms of popular HBE approaches, including optimal foraging theory (OFT), challenge the assumption that humans will always maximize their behavior. Thus, these models may fail to account for 'maladaptive' and/or non-optimal aspects of human behavior. Alternative approaches include niche construction theory (NCT), in which organisms are not passive participants in their ecological circumstances, but actively modify and engage with their environments. For humans, this advanced capacity for engineering the ecosystem explains many critical events throughout our evolutionary history, including the Broad-Spectrum Revolution, agricultural origins, and climate change. The zooarchaeological record at Liang Bua (Flores, Indonesia) offers a rare opportunity to explore the utility of both OFT and NCT as theoretical tools for interpreting the behaviors of *Homo floresiensis*, modern human hunter-gatherers, and agricultural modern humans at the same site. OFT was used to generate test predictions about patterns of small prey acquisition, and we test these using taphonomic data. The results suggest that NCT and OFT are complementary approaches to understanding hominin behavior, and that each theoretical method can be used to examine change during different time scales at Liang Bua.

Veech, Andrew (National Park Service)

[16] *American Periphery, Sonoran Heartland: Recent Archaeological Explorations of Organ Pipe Cactus National Monument*

Organ Pipe Cactus National Monument (ORPI) is a vast, rugged, and remote unit of the U.S. National Park System situated in the heart of Arizona's Sonoran Desert. Measuring 1,338.25 km² (517.7 mi²), the park encompasses an area half the size of the state of Rhode Island. ORPI's 48.3 km (30 mi) long southern boundary constitutes a portion of the 3,201 km (1,989 mi) long international border between the United States and Mexico, and as a border park, ORPI suffers considerable impacts to its natural and cultural resources.

Since 2012, archaeologists with the National Park Service's Intermountain Region Archaeology Program have conducted a series of field investigations across ORPI, reassessing previously recorded archaeological sites disturbed by recent border-related activities and surveying previously unexamined areas of the park. Cumulatively, these investigations have contributed to a deeper understanding of precontact Native American lifeways within the Sonoran Desert.

Vehik, Susan (University of Oklahoma)

[207] *A Fourteenth-Century Southern Plains Star Chart*

In 1978 excavations in the first of four houses at the Uncas site (34KA172) produced several pieces of a burned clay panel carrying multiple fingertip impressions. Uncas is a late fourteenth-century site north of Ponca City, Oklahoma and south of Arkansas City, Kansas overlooking the Arkansas River. Several pieces of this panel were reassembled at that time, and the impressions seemed to be in a pattern, but the exact pattern was unclear. No suggestions were made as to what the panel represented or what its purpose was. The Uncas collections were reanalyzed in 2015 and attempts were once again made to reassemble the panel. With recent archaeological interest in belief systems the possibility was recognized that this panel might be a star chart. Further consultation with amateur astronomers reinforced this idea. The purpose of this poster is to demonstrate the close similarity between the pattern of fingertip impressions and a specific arrangement of the Pleiades, Hyades, and other nearby stars. Also discussed are possible purposes for the chart.

Veit, Richard**[17]** *Searching for the "Lighthouse Fort and the Refugee Town" on Sandy Hook, Public Archaeology at a Storied Historical Site*

Since 1764 the Sandy Hook Lighthouse has guarded the treacherous approaches to New York Harbor. During the American Revolution Continental forces unsuccessfully tried to deny the British control of the lighthouse. British troops and partisans captured Sandy Hook early in the war and, despite repeated raids by Continental forces, retained control of the sandy peninsula until the end of the conflict. Indeed, the British fortified the lighthouse and Loyalists, many of African descent, constructed a Refugee Town near the lighthouse which served as a base of operations for raiding parties along the Jersey shore. Monmouth University's 2016 archaeological field school was a cooperative endeavor between a private university and the National Park Service, designed to investigate the lighthouse property while providing local residents with an opportunity to participate in archaeological fieldwork at a significant local historic site. The project resulted in an improved understanding of the site and built local interest in regional archaeology.

Velasco, Matthew (Cornell University) and Sadie Weber (Harvard University)**[315]** *Lessons from Chavín for the Chullpa Horizon / The Cayman Keeps Giving: Interregional Interaction at Chavín de Huántar*

John Rick's long-term research program at Chavín de Huántar has revolutionized our understanding of the monumental center and its development through time. Inspired by his theoretical commitments and methodological rigor, this paper reflects on the relationship between monuments, power, and authority in a late prehispanic context far removed from Chavín: the "chullpa phenomenon" of the Late Intermediate Period (AD 1100-1450). Following the collapse of Middle Horizon states, peoples across the south-central Andes reconstituted authority in the mummified bodies of their ancestors, burying them in accessible above-ground sepulchers. At a regional level, the proliferation of chullpas has been interpreted as evidence of both broad cultural integration and political fragmentation. What insights can site-specific analysis of chullpa architecture and chronology provide into the social and temporal dynamics of these mortuary practices? Recent research in the Colca Valley (southern Peru) shows how one large cemetery was continually built across four centuries. Architectural and stylistic continuity in mortuary practice, however, stands at odds with other bioarchaeological evidence of changing social identities. Careful attention to chronology and construction, exemplified by John Rick and colleagues, is paving the way toward a richer accounting of political and religious transformations in the ancient Andes.

Velasco Alban, Janny (Universidad Andina Simón Bolívar) and Estanislao Pazmiño (University of Lethbridge)**[320]** *Monumentality and Social Complexity in the Ecuadorian Upper Amazon: Mound Builders in the Upano Valley, Ecuador*

The Upper Amazon frequently was conceived as a transitional area where social development was limited for the scarce resources and the harsh environmental conditions. In the last decades studies in the ceja de selva, pie de monte and the upper Amazon reveal that this region hosted an intense cultural development. Wide discussions in the academic forums contribute with new data to understand the emergence of complexity in this area. Precisely, the Upano Valley, in the upper Amazon of Ecuador, present archaeological evidence of a unique systematic space organization and landscaping strategies. Between 400 BC and 400 AD the valley was drastically modified by Upano culture, demonstrating that, the region can support the development of complex, densely populated, and highly organized settlements. This paper discuss the emergence of a complex socio-political system and the tangible effects of the landscape modification in the upper Amazon of Ecuador.

[386] *Asymmetry of Cranial Surface in Relation to Social Stratification in Great Moravia (Early Medieval Period, Mikulčice, Czech Republic, 9th–10th Century)*

According to the archaeological and written sources Great Moravian Medieval society was highly socially stratified. Recorded differences in facial cranial morphology were partly interpreted as a result of different masticatory load, and thus of different dietary habits in various socioeconomic classes. In this study we present a detailed analysis of cranial morphology and asymmetry using exocranial surfaces in Medieval and contemporary comparative samples (cranial CT images of 200 adult individuals). The Medieval sample was grouped by the localization of the graves (castle and sub-castle) or presence of grave goods ("elite" and "non-elite" graves). The entire cranial surface was analyzed using 3D methods of geometric morphometrics and multivariate statistics. Bilateral asymmetry was visualised using colour coded maps and maps of significance. Because the Great Moravian population relied for nourishment on a hard, grittier subsistence diet, we expected (1) that both the higher and lower socioeconomic classes would exhibit higher levels of asymmetry than the comparative contemporary sample. (2) higher asymmetry of splanchnocranium than neurocranium; (3) increased animal protein intake (and so greater facial asymmetry) in higher socioeconomic classes requiring heavy masticator load. According to preliminary results these hypotheses were confirmed. Supported by the project GACR 17-01878S.

Velemínský, Petr [386] see Velemínska, Jana

Vélez Álvarez, Zoè (University of Puerto Rico, Río Piedras Campus)

[418] *An Archaeological Approach to the Tobacco Industry in Puerto Rico*

During the early 20th century, agriculture was one of the most important industries in the economy of Puerto Rico. The production of crops such as sugar cane, coffee, tobacco and minor fruits (mostly plants like plantain, tubers, rice and corn). Traditionally, archaeological research in the Caribbean, especially in Puerto Rico has mainly focused on sugar cane and coffee production, while very little attention has been given to tobacco. This case study can be used as an example of a successful study of a generation of tobacco producers in Aguas Buenas, Puerto Rico; using oral history, population census and cadastre and property data. The combination of these sources is used to write narratives about who were these tobacco workers, household composition, gender roles, material culture, spatial distribution and the changes to land usage within a small farm.

[240] *Using Barn Owl (Tyto alba) Pellets to Build Environmental Profiles: A 1,500-Year-Old Record from Barn Owl Cave, Santa Barbara Island, California, USA*

Archaeology has a long history of applying proxy data to reconstruct past environmental conditions. Archaeological deposits, however, represent an anthropocentric view of the past, one biased by human selection and decision-making.

This research focuses on excavation and analysis of owl-generated, non-cultural deposits in Barn Owl Cave, located on the northeast coast of Santa Barbara Island. The goals of our research are twofold: 1) to understand predator (owls) and prey (mice, lizards, and seabirds) availability and dynamics through time; and 2) to use these data as proxies for reconstructing wet/dry cycles potentially linked to broader oceanographic conditions. Our results suggest that periodic prey switching is linked to wet/dry cycles and changes in relative sea surface temperature. The relative abundance of mice, lizards, and passerines from components dated to the Medieval Climate Anomaly (dry) and the Little Ice Age (wet) confirm these anomalies affected the terrestrial biota of the island. These data contribute to regional climatic and environmental reconstructions used to interpret the archaeological record and document local island extinctions of at least three breeding avifauna, which were likely caused by historic introduction of domestic animals and subsequent overgrazing.

[158] *Matacanela in Its Regional and Cultural Context*

In this presentation I synthesize recent studies that the Matacanela Archaeological Project has produced as a way of situating the presentations in this session within their broader temporal and spatial contexts, both with the Tuxtlas and the broader Gulf lowlands. One notable aspect of Matacanela's settlement history was its resilience from its Middle Formative Olmec occupation, through the Formative-to-Classic transition—a feature that differentiates it from several other Gulf lowland settlements, both within the volcanically active western Tuxtlas and beyond. That resilience continued through the Late Classic period. I review some of the creative strategies that occupants at the center employed as they negotiated and contributed to transforming physical, political, demographic, and economic landscapes, and introduce others that will be elaborated upon by individual session participants. Moreover, I examine evidence from Matacanela, which straddles a geographical boundary between the western Tuxtlas uplands and Eastern Olman, that speaks to the ways that Matacanela's geographical boundary position is also reflected in different cultural interaction networks during both the Formative and Classic periods.

[360] *Exploring Dental Modification Practices at Midnight Terror Cave, Belize*

Dental modification in Mesoamerica dates to the Early Preclassic Period and persisted into the 16th century. Investigations have suggested a number of possible explanations, generally aesthetic or ritual, for the practice. There is little consensus in the field. A total of 1194 teeth were recovered from Midnight Terror Cave (MTC), Belize, providing a large sample to critically examine previous hypotheses. Of the 339 incisors collected, 103 are modified (30%) using twelve different modification styles from Romero's (1970) classification system. Several of the previous suggestions, that dental modification is a display of local family or kinship affiliation have, heretofore, been largely untestable. Paleogenetic analysis was conducted on a number of the MTC modified teeth in order to ascertain sex and mitochondrial haplotypes for sampled individuals. With these data it is possible to better address issues of family or lineage affiliation, as well as sex.

[48] *Using the Neotoma Paleocology Database for Specimen Level Stable Isotope Data*

The Neotoma Database (neotomadb.org) functions as an interdisciplinary, open access database for the paleoecology community. Primary data types include proxies such as pollen, vertebrate remains, diatoms, and middens. As stable isotope data become ever more ubiquitous in our study of the past, a new repository within Neotoma has been created, allowing for the integration of this data with existing types. Neotoma serves as a hub for storing and accessing diverse types of data and offers an unparalleled opportunity for visualizing the intersection of multiple strands for paleoecological reconstruction from the macroscopic to microscopic and biogeochemical scales. To date, one of the limiting factors in stable isotope studies for our understanding of variability across not only spatial but also long-term temporal scales has not been lack of data but rather a lack of exchange and integration. In addition to the launch and initial population of the stable isotope repository, issues that exist as challenges for the future, including establishing best practices and standardization in recording/reporting, monitoring data quality, linking datasets, and increasing accessibility while protecting sensitive information will be discussed.

[35] *Decomposing Habitat Suitability With Theory-Driven Machine-Learning*

Archaeological applications of ideal distribution models have advanced beyond the study of straightforward settlement decisions to address a variety of important but difficult anthropological questions. To aid in these investigations, we demonstrate a method for (i) decomposing habitat suitability into its ecological components and (ii) showing how their relative contributions to settlement change through time. This method relies on the maximum entropy approach to species distribution modeling from ecology coupled with the prey-choice model from behavioral ecology. We use the extensive record of subsistence and settlement provided by the distribution of archaeological sites within the Grand Staircase-Escalante National Monument to test predictions.

[357] *The Stratton Mill Creek Site: Deciphering a Landscape Feature in the Upper Susquehanna River Valley*

The Public Archaeology Facility at Binghamton University has conducted CRM on transportation projects in New York State for over 50 years. Our archaeological investigations have discovered a full range of sites from the ubiquitous (lithic scatters, historic sheet middens) to the extraordinary (deeply stratified sites, ritual blade production areas). All have contributed new information to our knowledge of the past. This paper will focus on an example of the extraordinary – a large precontact ditch feature filled with artifacts and burned debris – and its potential to document a previously unknown ritual landscape along the Susquehanna River in Broome County, New York. This discovery during a NYSDOT project and the consultations involved in its interpretation have produced multiple (sometimes contradictory) opinions about its function. The undisputed conclusion is that this feature adds a new dimension to the commonly accepted precontact context, promotes future debates, and will contribute to a sparse database on such features in the Susquehanna Watershed. In this time of challenges to the Section 106 process and questioning the value of archaeology, it is important to broadcast how transportation archaeology adds valuable information not already known to the history of peoples long gone and those still living.

Verstraete, Emma (University of Illinois at Urbana Champaign)**[215]** *Ancient Egyptian Curses and Bog Bodies: The Role of Pseudoarchaeology in Tumblr's Subculture*

Current digital tools and social media provide a near constant stream of data. While the trustworthiness of this data may be suspect, communication mediums such as internet memes and Tumblr blog posts saturate common search results. Social media networks such as Tumblr rely on self-policing of content, allowing reductionist and incorrect ideas about archaeology and history to travel around the globe in seconds. Recent examples of pseudo-archaeology memes include questions like "should you lick the science?" (in the case of archaeology, you shouldn't since it 'might be human bone'). Social media can spread the news of archaeological discoveries more quickly than ever before, but the results are often reduced to witty quotes and references to the Ancient Aliens TV series. Other posts jokingly question the difference between archaeology and grave robbing, reaching back to harmful stereotypes of a profession that currently seeks to apply science and ethics to its research. This paper will present a discussion on the mechanics of Tumblr's unique ecosystem and subculture while presenting a variety of pseudo-archaeology and ancient history memes. Efforts to promote outreach and stop the spread of misinformation in the Tumblr network and suggestions to further promote archaeology will also be discussed.

Veth, Peter (The University of Western Australia)**[305]** *Kimberley Visions: Antiquity of Rock Art Style Provinces of Northern Australia*

Early figurative rock art from northern Australia contains large animal outline figures as well as monochrome anthropomorphic depictions. The latter often have extraordinary detail in accoutrements, headdresses, weaponry and associated material culture. They likely depict ceremonial and collective strategies shared over large areas and expected at the tail end of the arid phase of the LGM and until the re-set of the Indonesian Australian Summer Monsoon. The static and then dynamic phases in red/mulberry pigment anthropomorphs from both the Kimberley and Arnhem Land regions date to the terminal Pleistocene, when the two regions were connected by the now-drowned Bonaparte Basin; indeed, as much as 50% of the inscribed landmass was probably lost with post-LGM sea level rise. Intensive recording programs from multiple sites in both regions show that certain themes, artefacts and style conventions are shared while others differ markedly. This could be expected given the significant distance between the areas, likely different languages and clear differences in resource catchments and local climate. Nevertheless, these two cognate areas of the early non-Pama-Ngungan language family both show similar directionality in style during what I label the terminal Pleistocene Proliferation event (PE1) and early Holocene Proliferation Event 2 (PE2).

Veth, Peter [305] see Dortch, Joseph

Vianello, Andrea (University of South Florida)**[278]** *The Late Introduction of Metals in Southern Italy: Studies from Sicily and Calabria*

Metallurgy arrived quite late in Calabria, Sicily and Malta compared other regions, including the same Italian peninsula. Current hypotheses include an allogeous origin of metallurgy, brought by Aegean merchants, and an indigenous origin due to the presence of mines. The delicate state of many metals has prevented destructive analyses, but it has been possible to use a non-invasive pXRF to analyze the chemical composition of the surface of several metals in multiple spots. We have comparable data for the region regarding composite materials (made of different alloys) and alloys in use between the Copper Age and the Early Bronze Age. There is consistency in the data between Calabria and Sicily, and a significant level of complexity in the alloys. The results suggest that metallurgy was introduced from the Italian peninsula, but only after several centuries during which metals were not adopted. There are local mines, certainly in use at least in Calabria, but very little evidence that metals were used locally. Metals were therefore known to exist and potentially were accessible, but deliberately ignored. Since most early metals in the region are weapons, this may provide a clue to the processes that delayed the adoption of metallurgy.

[394] *Building Social Complexity: Differences in Bedrock Use at Early Formative Etlatongo in the Mixteca Alta of Oaxaca*

Construction materials such as earthen fills have frequently been an afterthought for many archaeologists interested in understanding past social relations in Mesoamerica. In this paper we reconcile this situation by assessing how the relationship between humans and materials, in regard to the use of construction fills, may have played out a significant role during the creation of novel social interactions that on the one hand fostered a sense of *communitas*, while on the other created venues in which social differences were expressed. We examine the differential use of elaborate construction fills made out of the natural beds in the region in domestic and public architecture at the late Early Formative site of Etlatongo in the Mixteca Alta of Oaxaca. We interpret these differences through the lens of indigenous ontologies to argue that relationships between humans and other-than-human things were an essential component of the multilayered techniques of power that were at play during early stages of political complexity. We compare Etlatongo with other contemporary sites in Oaxaca in order to underline the particularities of the way social relations were linked to construction materials at the site.

Vidal-Montero, Estefanía (Department of Anthropology, University of Chicago)

[64] *From Mud to Brick, or the Transformative Possibilities of Assembling Architecture*

This paper considers the often-overlooked practice of building, in order to rethink the role of architecture as a mere container of sociality, a proxy for domestic stability or the precondition of social complexity. By focusing on the building of a wall in the site of Ramaditas, a 2,000-year-old site in the Atacama Desert, this work seeks to question traditional assumptions about the origins of settled life by interrogating the taxonomies and traditional categorizations that have been mobilized to understand the “Neolithic” process. Rather than approaching this phenomenon as a universal event that involved the revolutionary shift in modes of production, the transformation of nature into culture, or the domestication of landscapes, I offer a version that focuses on the architectural assembling of a mudbrick wall, rendering its construction as a transformative action that signals how things or artifacts are always in a state of becoming and always open to new interventions. I argue that by paying attention to the material transformation of mud—and the social practices set in motion by this act—we may arrive at a more capacious understanding of architecture and the communities involved in its production.

Vierra, Bradley (Statistical Research Inc)

[26] *Drought and the Transition from Foraging to Farming in the American Southwest*

The American Southwest is an arid landscape that has experienced dynamic shifts in climate between dry and wet periods. Researchers have traditionally focused on the effects of drought conditions on farming communities. They often suggested that these extreme conditions dictated the regional displacement of populations, and more recently have emphasized the importance of mobility in understanding past land use strategies. By contrast, this paper will focus on the effects of drought on foraging groups, and how drought conditions have played a significant role in the transition from foraging to farming. Examples from the Tucson Basin, Colorado Plateau and northern Rio Grande will illustrate the different ways that foragers coped with living during these dry periods, and how their responses relate to an increased dependence on the cultivation of maize. In fact, each region is characterized by a separate historical trajectory which would eventually create the foundation for later agricultural societies.

Villalobos, César (UNAM/IIA)

[16] *Los que viven donde sopla el verdadero viento: Bahía Tepoca, Sonora, Archaeology of the Coast in the Gulf of California*

The archaeology of the middle coast of the Gulf of California offers an opportunity to document and investigate processes of human mobility that highlight a deep relationship between humans, sea and desert. The area defined as Bahía Tepoca confirms a cultural significance in this regard, especially for being one of the areas with access to the shore and the

availability of natural resources off the shore and inland. This paper, throughout a regional analysis in which 74 archaeological sites were recently recorded, provides insights not only on cultural history, but also proposes a better understanding of the cultural processes that occurred in the past. As a whole, the actions reported here provide preliminary information on the cultural affiliation and temporality of the social groups that inhabited this region, particularly the Trincheras Culture and prehistoric Seri groups. The presence of diagnostic materials and radiocarbon dates, contributes to a better understanding of technologies, interaction and cultural mobility over time. In conclusion, it is argued that the shore sites represent a node of differential interaction between humans, sea and desert.

Villalpando, Elisa (Instituto Nacional de Antropología e Historia, Sonora) and James Watson (Arizona State Museum - University of Arizona)

[16] *Early Mortuary Traditions in the Arizona-Sonora Borderlands*

The earliest settled villages in the Borderlands region of the Sonoran Desert are largely associated with the protracted transition from foraging to farming and the foundation of Formative period archaeological cultures in the region. Mortuary practices associated with the Early Agricultural (EA) period (2100 B.C.-A.D. 50) principally focused on inhumation burial but culminate with the introduction and eventual dominance of cremation burial. EA communities, spread across southern Arizona and northern Sonora, often placed the deceased in flexed positions in houses, pre-existing pits, or small groups with limited funerary objects. There is also a significant variability inherent in these patterns such as extended positions and multiple burials, indicating a great deal of individual expression in mortuary rituals. We argue that these traditions downplay vertical social distinctions and instead reflect horizontal distinctions based on achieved community role and gender. These commonalities end with the eventual adoption of cremation and begin to diverge near the modern border in subsequent archaeological traditions. The transition to cremation-based rituals is a major shift in the cosmology of death and formed the basis for mortuary rituals among the Hohokam tradition in southern Arizona and the Trincheras tradition in northern Sonora.

Villarreal Catanach, Samuel (Pueblo of Pojoaque)

[311] *Bringing Together Accounts of the Pueblo of Pojoaque*

Until recently, widely accessible published works concerning the Pueblo of Pojoaque, its people, culture, and history, have come by way of mostly non-Native academics and other researchers. While highly valuable for understanding this Tewa community's past, they often carry the inherent biases of their authors or leave out the perspectives of Pojoaque people entirely. In this presentation, Samuel Villarreal Catanach, a member of the Pueblo of Pojoaque, will discuss how bringing together these documents and account by non-Pojoaques with the stories and knowledge held by the people of the community itself and other Tewas is helping to reaffirm long held beliefs and to raise new questions about Pojoaque's past and where it could be headed in the future. Further, he will talk about how the inclusion of the Tewa language in this research is adding an essential layer needed in the overall cultural and language revitalization efforts currently underway there.

Villasenor Iribe, Eunice (Arizona State University), Christopher Morehart (Arizona State University) and Andrés Mejía (Pennsylvania State University)

[373] *The Distribution and Characterization of Agricultural Terraces on Cerro de la Mesa Ahumada, Mexico*

This poster presents preliminary results of ancient landscape modifications on Cerro de la Mesa Ahumada, a medium sized mountain between the northern Basin of Mexico and the southern Mezquital. Humans have used the hill at least since the Epiclassic period (ca. 600-900 CE) for human occupation, farming, or ranching. Terrace systems are located throughout the hillslopes. Documenting the extent, distribution, and chronology of the terraces is essential to understand the connections between anthropogenic landscapes, agricultural production, and demography. We present several lines of data to better refine our understanding of the terraces: (1) GIS maps made using satellite data; (2) topographic data collected with total stations; (3) GPS data from fieldwalking; (4) topographic data produced using drones; and (5) excavation data. These combined lines of data allow us to propose preliminary interpretations of form, function, distribution, and chronology of the terraces and their role in the ancient economic systems of the hills' inhabitants.

Vining, Benjamin (University of Arkansas, Fayetteville) and Seth Price (University of Arkansas, Fayetteville)**[64]** *Marginality and Opportunity in the Deserts of Chicama, Peru: Perspectives from Integrated Archaeology, Remote Sensing, and Paleoclimatic Analysis*

Broad regions of Peru's coastal desert are now highly adverse marginal environments, yet archaeological evidence indicate these settings often were used extensively in the past. Using a time-series analysis of Sentinel 1 and 2 remote sensing data, we document surface and groundwater resources that developed in the normally hyperarid desert margins of the Chicama Valley after anomalous rainfall driven by the 2016 – 2017 el Niño. Surveys suggest archaeological sites in these regions principally date to the Formative/Cupisnique and Late Intermediate periods, and reveal various strategies for capitalizing on these water resources. We relate these patterns to high-resolution paleoclimatic proxies from Laguna Pumacocha and Nevado Quelccaya, both of which suggest that the utilization of Chicama's desert margins coincides with subperiods of increased pluvial and/or ENSO activity. Rather than being entirely marginal, Chicama's desert edges may have provided buffers against the short- to intermediate-term effects of el Niño disasters, mitigating catastrophic losses. They further appear to have been productive regions during periods of sustained moisture increases. These data are input into Agent-based decision-making simulations, to evaluate the effects the use of Chicama's desert margins may have had on community structure, group action, and cultural transformations.

Vitale, Adam**[261]** *Social and Physical Landscape of Lithic Procurement in the Jemez Mountains, New Mexico*

The goal of this research project is to better understand the role that societal organization, namely the institution of Spanish colonialism, played in shaping Jemez lithic procurement and reduction strategies across the Jemez Mountains from 1300-1700 AD. Previous work (Liebmann 2017) using X-ray fluorescence to source lithic debitage from 31 ancestral Jemez sites, found that changes in the usage of specific obsidian sources seems to correspond with periods of colonial rule. Using a least-cost path analysis (LCPA) of the landscape, as well as a macroscopic attribute analysis of the lithic debitage (N=2222), I hope to uncover how the use of particular obsidian sources (indexed by ubiquity and percentage), is affected by Spanish colonial status (indexed by chronology of the sites) and the travel costs of obsidian procurement (calculated through LCPA). This analysis of lithic and topographic data will detail Jemez lithic resource procurement and reduction strategies, as well as outline differences that could be associated with changes in colonial rule.

Vivian, Richard**[190]** *Polly - Rock Art - and Understanding Chaco*

Polly's long and productive anthropological career has been characterized by her use of art as a means to better interpret the social and organizational characteristics of several prehistoric and historic societies in the American Southwest. Her research has ranged geographically from the northern Southwest to northern Mexico and temporally from the Archaic to the early Historic. One of the many subjects she has dealt with in her work - using rock art to better define Chacoan political and social organization - is critical in that most archaeologists never cite rock art in their interpretive schemes for Chaco. Polly's conclusions are summarized and their relevance for better understanding Chaco is discussed.

Vizcarra Zanabria, Miguel [290] see Reid, David

Voelker, Judy (Northern Kentucky University)**[27]** *Rethinking Household/Community Based Production – Broadening the Conversation*

The Thailand Archaeometallurgy Project (TAP) has focused on the Khao Wong Prachan Valley, central Thailand in efforts to better understand the origins of metallurgy in Southeast Asia. TAP has excavated three culturally and technologically

related copper production and habitation sites in this valley: Non Pa Wai (NPW), Nil Kham Haeng (NKH), and Non Mak La (NML). While much project effort has centered on understanding the metallurgical components and contexts at these sites less understood is the presence of other local craft production activities. The examination of small finds also provides insight into the organization of production at these sites. This paper first summarizes evidence for on-site craft production at TAP sites and then focuses on the spatial organization for non-metallurgical craft activities at the site of Non Mak La. The paper concludes with a short discussion of the theoretical framework of household/community based craft production and its implications for understanding craft production in Thai prehistory.

[404] *Seeds of Complexity: An Archaeobotanical Study of Incipient Social Complexity at Late Chalcolithic Çadır Höyük, Turkey*

The Late Chalcolithic (LC: 4250–3000 B.C.E.) is an understudied period of Anatolian prehistory even though the roots of Anatolian social complexity lie in this period. Çadır Höyük, a mounded site on the north central Anatolian plateau has yielded over 460 m² of excavated LC remains. This period witnessed rapid cultural and environmental change providing an opportunity to examine how populations react using archaeobotany since plants have a direct relationship with the environment and plant use can be controlled at both the household and state level.

This study presents analyzed data from 60 archaeobotanical samples that illuminates how the population at Çadır modified agricultural and fuel use practices between 3500 and 3000 B.C.E. Results reveal that prior to 3200 B.C.E., plant use was stricter and more controlled and animals were routinely provisioned with fodder. After 3200 B.C.E., plant use norms became less strict and the environmental change caused a shift towards provisioning animals through pasturing. By shifting emphasis from agriculture to agropastoralism after 3200 B.C.E., the population at Çadır was able to weather environmental and cultural changes.

[23] *Rhythms of Settlement Aggregation and Disintegration in Iron Age Bavaria*

In many parts of Temperate Europe, the first aggregated and fortified urban settlements developed in the Early Iron Age. However, many of these settlements disappeared after a few generations. After a period of decentralization lasting at least two centuries, another episode of settlement aggregation took place in Temperate Europe in the second half of the third and the second century BC. It led to the development of large but unfortified settlements. These sites are often called 'centers of production and distribution'. This process culminated in the development of the fortified oppida during the second half of the second century BC, of which many can be considered urban. Yet again, many of these settlements were abandoned in the first century BC following the Roman Conquest, especially those located in the Eastern parts of Temperate Europe. A database assembling several thousand sites from Iron Age Bavaria in combination with a Geographical Information System permits to study these rhythms of settlement aggregation and disintegration from a broad chronological and geographical perspective. Using this data, the aim of this paper is also to discuss and to question the reasons that have been put forward in the past to explain these processes.

Vorsanger, Andrew (Terracon) and Steve Swanson (Environmental Planning Group, LLC)

[346] *Footprints of the Ancestors: A 1,000-Year-Old Hohokam Trackway in the La Plaza Site, Tempe, Arizona*

In 2016, archaeologists with Environmental Planning Group, LLC, conducted excavations at a portion of the La Plaza site near the Arizona State University campus in Tempe, Arizona, for a HUD-funded veterans' housing project. Exposures near a large canal revealed a short prehistoric trackway segment associated with the Hohokam archaeological culture, ancestral to the O'odham people and dating to approximately AD 1000. This presentation will discuss the prehistoric context of features surrounding the trackway, as well as its placement in the immense La Plaza site. We will describe the techniques leading to its discovery and successful excavation. We'll discuss the collaboration of multiple stakeholders to ensure preservation and public interpretation of the trackway, and methods that we used to preserve and successfully extract the trackway intact for subsequent display. Preservation of the prehistoric trackway was a lucky combination of natural processes burying the trackway and subsequent urban development sealing the trackway until excavation in 2016. The trackway provides a visual and tactile link to past residents of Arizona.

[320] *Concealed Evidence of Early Human-Environment Interactions in Sedimentary Archives of Small Rivers in the Forest-Steppe Belt of Eurasia*

The results of on-site archaeological investigations alone are not enough to reconstruct landscape histories, because they provide incomplete information on past environments. In contrast, off-site sedimentary archives can provide information on the interaction of natural and human processes that modify the landscape. Our initial research on the sedimentary archives in small river valleys in the forest-steppe zone of the Mid-Volga region provides information on the sequential development of the landscape throughout the Holocene. Our regional investigation includes several fluvial settings. The first setting occurs in the lower reaches of a tributary of the Sura River, where evidence of three occupation surfaces are interbedded with levee and overbank deposits. The second setting occurs in the Kiremet River, a low-gradient meadow stream exposed by channel incision, where evidence of five occupations exists in its stratigraphic sequence. The third setting occurs in a deep, narrow tributary valley of the Sviyaga River, with a substantial sedimentary record associated with ore mining. The sequences of events interpreted from the sedimentation, soil formation, and evidence of fire reveal complicated relations between climatic changes and different forms of land use change by post-Neolithic peoples. In this paper, we discuss some

preliminary results and our methodological strategies.

[120] *Little Cabins on the Prairie: Preliminary Results from Geophysical Exploration and Archaeological Survey of the Chimney Coulee Métis Wintering Site, Canada*

Applications of remote sensing in historical archaeology have typically been surveys designed to locate large structures and have been less focused on the identification of ephemeral structural remains resulting from short-term occupation sites. Our research uses remote sensing methods, specifically ground-penetrating radar (GPR) and magnetic gradiometry, to delineate structural remains (wood cabin foundations and chimneys) at mid-19th century Métis wintering site of Chimney Coulee (DjOe-6), near Eastend, Saskatchewan, Canada. The results of these surveys were compared to data from current and previous archaeological research at the site and were assessed for their utility. Both geophysical techniques provided useful information contributing to site interpretations; however, GPR was found to be the most useful in delineating cabin structural remains. Supported by ground-truthed data, preliminary results show that the geophysical surveys were successful at locating two to three Métis cabins. Future surveys should incorporate a wider range of geophysical techniques to better understand archaeological sites. Finally, this survey is one of the first geophysical investigations related to the Métis in Canada, and has demonstrated the utility of remote sensing in surveying small targets at historical archaeology sites.

Wake, Thomas (Cotsen Institute of Archaeology at UCLA)

[398] *Mortuary Feasting at Sitio Drago, Panama and Elsewhere in Lower Central America*

The archaeological materials recovered from a central burial mound at Sitio Drago, Panama are diverse and include many well-preserved vertebrate and invertebrate faunal remains. I examine these materials in context with the artifacts recovered in direct association with four coral slab tombs located at the heart of the site and then compare the observed patterns with local and regional burial patterns and information concerning ritual behavior associated with the dead. Various regional similarities are noted and discussed in terms of a broader circum-Talamancan interaction sphere.

[373] *Assessing Classic Maya Intermediate Elite Political Strategies through Multivariate Statistical Manipulation of Settlement Pattern Data*

Intermediate elites played pivotal roles in the politics of ancient complex societies across the world. In the Classic period (AD 250-900/1000) Maya lowlands, intermediate elites acted as intercessors between apical rulers and commoners. These intermediate elites and the political strategies they employed, however, have rarely taken center stage in reconstructions of Maya politics. This poster evaluates the role of intermediate elites who occupied the middle level of the settlement hierarchy of the Belize River Valley of west-central Belize. Multivariate statistical analyses of previously recorded architectural and environmental variables (n=28) identified five types of settlement groups. Groups 2 and 3 were associated with intermediate elites, with Group 2 being large specialized elite centers with ballcourts, causeways, terminus groups and multiple plazas. In contrast, Group 3 were smaller residential and ceremonial groups focused around a single plaza. Investigation of patterned variability in the middle tier of the system indicates four primary intermediate political elite strategies used to gain and maintain power and authority: 1) apical elite emulation, 2) shielding client-commoners, 3) apical elite compliancy, and 4) the management of frontier zones. Elucidating the variability in intermediate elite decision-making provides a new avenue for understanding political landscapes, and the dynamics of integration.

Waldo, Brian (California State University, Los Angeles)

[360] *An Assessment of Water Resources at Chichen Itza*

Water has long been recognized as a critical but scarce resource in the Yucatan. At Chichen Itza, water resources have not received the attention they deserve. Traditionally, because of the focus on the Sacred Cenote, the Cenote Xtoloc became by default the profane cenote. Clearly, such a simplistic and culture-bound dichotomy tells us little. Guillermo de Anda's investigation of the Cenote Holtun and Cenote Kanjuyum fundamentally expanded and changed our appreciation of water and cenotes. The goal of the Gran Acuífero Maya project is to study the site of Chichen Itza in relation to its subterranean water resources. Utilizing recent advancements in Geographic Information Systems, this paper is a preliminary attempt to identify and illustrate a far ampler view of the resources available. In addition, this paper will show the polity's formal appropriation of these features through the construction of sacbeob, or formalized paths, connecting them to the site core.

[171] *Looking beyond the Mission: Insights from a Multicomponent Site*

I will present an analysis of historic material recovered during the systematic auger survey conducted within the ravine and the excavation of a 20th century tenant house located on the San Luis site. There will be discussion regarding the cultural material contents from these two locations, as well as comparing them to all other previously excavated 19th and 20th material currently housed within the collections at this multicomponent site. The goal behind this poster is to obtain an understanding of the landscape history of San Luis, which will be done through a combination of oral sources, historical documents, and mapping of the locations of diagnostic artifacts, small finds, and large clusters of antebellum and postbellum material. Focus during the analysis of this material and historical resources will be placed on gathering an understanding of the inhabitants of this site and attempting to understand their changing status and economic position overtime and how that can be potentially tied to the landscape of San Luis. Ultimately, this analysis will highlight the importance of incorporating perspectives of enslaved populations, and the related plantation, along with lower economic classes during the 20th century.

Walker, Danny (University of Wyoming) and Rachael Shimek (University of Wyoming)

[329] *Small Mammals from the Hell Gap Site, Wyoming and their Paleoecological Significance*

Limited small mammal remains were recovered from Hell Gap during the early 1960s. Based on these remains, a lowering of "life zones" was proposed at Hell Gap around c.a. 10,800 yrs B.P. In 1997, the Early Holocene small mammal population of the Hell Gap site Locality One was reinvestigated. Flotation samples were collected by five centimeter intervals within defined stratigraphic units. Small mammal remains were also collected during archaeological excavations in 1996-1998. Since 1998, additional small mammal remains continued to be collected during excavations and have been recently examined. While the small mammal sample from the site continues to be sparse compared with medium or large mammals, these small mammals remain critical for paleoenvironmental reconstructions of this early Holocene period.

[125] *Pima Community College Excavation at the Dairy Site, AZ AA:12:285 (ASM)*

The Dairy Site, AZ AA:12:285 (ASM), was first recorded in 1982 in Tucson, Arizona and in the three decades since, many investigations have been conducted. The boundaries of the site have been ever-growing, now extend well beyond the 1982 limits, and thus far are not well defined. From January 30, 2018- April 4, 2018 Tierra Right of Way Services conducted archaeological excavations at the site. The purpose of the excavation was to collect and record any cultural resources before a proposed development project utilized the land. As part of the project, students and staff from Pima Community College's Centre for Archaeological Field Training (PCCAC) worked one day a week to excavate several features. Although still waiting for results of ceramic analysis and radio-carbon dating, preliminary results suggest the site was inhabited as early as the Agua Caliente phase of the early ceramic period (C.E. 50-450) through the beginning of the Hohokam era. This poster will focus on the data recovery efforts participated in and the features excavated by personnel from PCCAC.

[9] *The Under-represented Mullet in SW Florida's Archaeological Assemblages*

Mulletts (*Mugil* spp.), especially the striped mullet (*Mugil cephalus*), because of their predictable mass-schooling behavior, are obvious candidates as having been surplus food for the socio-politically complex, Calusa fisher-gatherer-hunters. Moreover, López de Velasco, writing in about 1570, stated that there was in southwest Florida waters a "great fishery of mullet [lícias], which [the Indians] catch in nets as in Spain." And yet, mullet remains have not been recorded as particularly abundant in the region's analyzed archaeological faunal assemblages. Reasons for this situation are explored through a re-examination of Pineland, Mound Key, and other curated assemblages with an eye toward skeletal and/or preservation bias, sampling bias, analyst limitations, and temporal patterning. Results indicate that all of these contribute to a general under-representation of archaeological mullet. Also indicated is that assemblages dating to the height of Calusa complexity have higher numbers of mullet remains, compared to earlier time periods. This suggests possible intensification in terms of fishing techniques, improved storage and processing, or both.

[318] *Life Histories Thick and Thin: Scaling and Four Dimensions of Artifact Variability*

Life history analysis offers a means for organizing activities through time that tracks the interactions of one or more objects. These objects both human and nonhuman make up the stuff of ongoing cultures and their archaeological remains. We record these lives using four types of measures: object frequencies, object associations, object locations, and objects' physical properties (e.g., hardness, constituent elements, colors, lengths). A long-term challenge for behavioralism has been to work at more expansive scales than the behavioral interactions that form particular artifact life histories. How can we conceptualize addressing larger macro scale societal issues that implicate thousands of life histories? In this paper, I explore that challenge by unpacking cadenas, macroscale objects, conceived by behavioralists as units of analysis consisting of entire object histories rather than their particular parts (e.g., production behaviors, use behaviors, reuse behaviors, discard behaviors). How do we identify their interactions with other cadenas? How do we model their performance characteristics? How do we distinguish the life histories of composite physical objects such as kivas and pueblo buildings from cadenas? These are some of the questions I address using data from the late prehistoric villages of southern New Mexico and Northern Mexico.

[84] *Horizon Events: Hohokam Ritual Relations with the Distant and Phenomenal*

For well over a millennium, Hohokam communities in the southern Southwest dwelled in a terrain of perennial river valleys fringed by a horizon of jagged mountains. Villages and livelihoods were nestled on the valley floors near the rivers, leaving the uplands as an uninhabited periphery between the everyday experience and the phenomenally distant. These uplands were the realm of large animals and evergreens, and the interface between the terrestrial and the celestial—clouds and rain, lightning and thunder. This reach—beyond and above the village—was not unfamiliar, only untrammled, and ritualism was an arena in which people continually negotiated their relationship with the distant places defining their horizon. This paper explores the range and social scale of ritual practices in which Hohokam communities engaged the outer reach of their landscape. The structure and composition of these practices attest to a relationship that was reflexively and cyclically constitutive, with people giving and taking while coming and going. Communities became woven into the landscape as people left pieces of themselves on the fringe and brought elements of the distant and phenomenal into the center.

Wallander, Amanda (Colorado State University), Paul Woodruff (Cultural Resources Manager, Wright-Patterson Air Force) and Erwin Roemer (Air Force Civil Engineer Center, WPAFB Office)

[75] *Mitigating Cumulative Impacts to Historic Resources at Wright-Patterson Air Force Base*

The guiding principles of NHPA Section 106 mitigation stipulate that the value (not necessarily monetary value) of the proposed action should provide a "public benefit" that is greater or equal to the total value lost when a historic property is intentionally or inadvertently destroyed. To that end, some evidence suggests that creative mitigation has a greater tangible public benefit than the standard approaches to mitigation. How then do we identify mitigation options that provide real worth for the American public while also meeting the mission needs of an active military installation? In the case of Wright-Patterson Air Force Base (WAFB), whose built environment embodies nationally significant events in military and aviation history, a creative mitigation plan was developed to address the cumulative effect of demolishing over 50 historic buildings. This plan outlined a creative mitigation strategy that compensates for the cumulative loss of history by incorporating a blend of documentation, salvage, and interpretation; outreach and education; as well as partnering with public and private entities that offer unique opportunities to preserve not only the physical history, but also the heritage and legacy of WAFB.

[296] *Subadult Growth Velocity at Paquime, Chihuahua, Mexico*

Patterns of growth attainment are sensitive bioarchaeological indicators of sub-adult health. Growth velocity can be used to identify periods of stunting, and corresponding periods of rapid catch-up growth. In this study, we use femoral length to examine sub-adult growth at the prehispanic site of Paquimé. We conduct two analyses. First, we compare growth to modern growth curves, to identify periods of growth faltering. We then compare the results to Mimbres and Puebloan growth curves to identify patterns of stress unique to Paquimé. The results suggest that Paquimeños adolescents consistently experienced growth stunting, and that this pattern is marked after approximately 7 years of age. While our sample sizes for metric analyses are small, this pattern of stunting appears to be distinct from patterns of growth seen elsewhere in the Southwest. We discuss our results in the context of Paquimé social and ritual organization.

Wallis, Neill (Florida Museum of Natural History) and John Krigbaum (University of Florida)

[185] *Movement and Animacy of Bodies in Pre-Columbian Florida*

Pre-Columbian Florida burial mounds exhibit multiple modes of burial, including extended, flexed, mixed (and mass) bundles, skull only, and cremation, as well as emplaced objects in various conditions and configurations. These different forms often occur within a single mound, and have been explained mostly in terms of changing mortuary traditions and reflections of individual social identity and status. However, relational ontologies drawn from Indigenous experience and hinted at in ethnohistorical descriptions emphasize notions of animacy and personhood that transcend social identities of the deceased in life and extend to both human remains and mound accoutrements. Animacy/personhood is recognized in beings with particular qualities and may manifest in both human and other-than-human bodies. Here we consider various bodies' capacity for movement, which is a primary index of animacy that helps explain past mortuary practices. From this perspective we examine Middle and Late Woodland (ca. AD 200 to 800) mounds in northern Florida, and the relationship between modes of burial and histories of movement revealed by isotopic analysis of human bone and sourcing studies of pottery.

[34] *Stable Isotope Analysis of Human and Animal Remains from Trent's Plantation, Barbados, 17th through 19th Centuries*

Geochemical studies of stable isotopes on archaeological skeletal material offer information on human and animal diet, mobility and migration, exchange, and climate. Here, we apply stable isotope studies to human and animal remains recovered from archaeological excavations at Trent's Plantation in Barbados. Trent's Plantation was one of the earliest sugar estates on the island of the Barbados, and operated from the 17th through 19th centuries. The faunal materials recovered include primarily domestic mammals, birds, mollusks and land crab. Analysis also identified two human teeth from enslaved laborer occupation deposits. In this paper, we present the results of stable isotope ($\delta^{18}\text{O}$, $\delta^{13}\text{C}$, $\delta^{15}\text{N}$, $87\text{Sr}/86\text{Sr}$) analysis of bone collagen, apatite, and tooth enamel from the small sample of human teeth, and from a cross-section of the mammals identified at the site, including pig, sheep/goat and dog. These analyses provide insight into the geographical origins and diets of the two individuals who lived and labored as enslaved people on the site. In addition, isotopic study of the faunal remains offer baseline data to compare with the human samples, and convey information regarding animal diet, economic exchange, species biogeography and climate.

[251] *Site Damage and the Perception of Change in Northwest Greenland*

Archaeological sites in the Qaanaaq region of Northwest Greenland are under a variety of threats related to climate change. In addition to processes observed in other arctic contexts (increased coastal erosion and melting permafrost), the area has seen a dramatic surge in landslides caused by increased precipitation. Assessing damage to cultural heritage and prioritizing mitigation is complicated by access constraints and a lack of systematic survey. In this paper we present initial observations from collaborative work that involved visiting and surveying sites with Elders and hunters who identified them as significant locations under threat. Impacted sites are places where community members or their recent ancestors lived, and remain locations that are actively used as a part of hunting or other activities on the land. We will present some of the patterns of damage observed as a part of this work, and will also discuss the multi-layered reasons they remain relevant and a subject of concern to the community. In particular, we will highlight the continued role that archaeological sites play in how the Inughuit community apprehends and responds to the complexity of environmental changes underway in Northwest Greenland.

[157] *Archaeology in a Vacuum: Obstacles to and Solutions for Developing a Real Space Archaeology*

The practice of archaeology in outer space seems as far “outside the box” as it is possible for the discipline to go. There are major challenges to carrying out field research in off-Earth contexts – among them, remoteness, hostile conditions, cost, and the demonstrable bias of space agencies against the social sciences. Developments in the field have therefore come in fits and starts. The year 2019 marks the 50th anniversary of the Apollo 11 moon landing and the twentieth anniversary of the first space archaeology endeavor, Beth O’Leary’s Lunar Legacy Project. Her team identified and described the 106 objects left behind at Tranquility Base by the crew of Apollo 11. The initiation of the International Space Station Archaeological Project by the authors in late 2015 marked another step towards implementing archaeological approaches to studying human life in space. We have developed a series of strategies to surmount the obstacles presented by doing space archaeology. These include photoethnography, training a future crew member to carry out a survey by proxy, interviews of past crew members, and study of artifacts returned to Earth from the International Space Station. This paper will describe our strategies and results to date.

[386] *Tales of Bronze Age People: A Transdisciplinary Look at the Mobility of Persons, Materials and Ideas in Nordic Bronze Age Denmark*

Tales of Bronze Age People is a three-year (2018-2021) interdisciplinary research project supported by a Carlsberg Foundation Semper Ardens grant (CF18-0005) led by Karin Margarita Frei, Research Professor in Archaeometry at the National Museum of Denmark. The project investigates the dynamic ways in which people navigated social lives in the Early Nordic Bronze Age. The research explores mobility and cultural transmission at multiple scales and across landscapes. This project expands the ongoing Tales of Bronze Age Women project (CF15-0878) and combines state-of-the-art biogeochemical, biomolecular, and anthropological and archaeological investigations. Current research foci range from isotope analyses (e.g. $87\text{Sr}/86\text{Sr}$) of human remains from both inhumation and cremation graves, to osteological analyses, as well as to systematic collection and collation of data for statistical and cladistics analyses, all with a focus on basing interpretations on multiple frames of reference from an anthropological archaeology perspective aimed at illuminating aspects of individual lives in the past. This poster highlights the results and current research of the Tales of Bronze Age Women/ People projects and presents ongoing contributions to transdisciplinary approaches to interpreting archaeological

materials through integrated natural and social sciences methodologies and methods.

Walsh, Rory (University of Oregon)

[156] *Mahan Political Economy: Evidence from Ceramic Geochemistry*

Emerging data from the Mahan cultures of South Korea are fundamentally changing our understanding of this complex society and its relationship with Korea's early states. Using INAA data on ceramic geochemistry, patterns of production traditions and trade relationships reveal a political economy based largely on local production but incorporating production of more prestigious wares at a distance from major settlements, as well as the collection of pottery originating from other regions. As historical narratives have depicted Mahan as an advanced but decentralized society, this kind of evidence is crucial to interpretations of the internal function of individual Mahan polities, and the nature of their alliance with other cultures falling under the broad label of Mahan. This study will thoroughly interrogate the notion of Mahan-ness and the ramifications for Korean state formation.

[88] *Preserving the Faith: Archaeological Investigations at Mission San Lorenzo (41RE1), Camp Wood, Texas*

The Franciscan mission of San Lorenzo, established in 1762, survived for 6 years as an unsanctioned mission before closing its doors in 1768. Since its abandonment, the site has suffered from both the ravages of time and human interference. Today, the mission is located in the small community of Camp Wood, Texas where it has long been an important part of local history and efforts are currently underway to help preserve, interpret, and re-vitalize the site. Specifically, recent excavations focused on recovering information about the site's built environment with particular attention paid to mission layout and construction styles. While some foundations are still intact, subsequent events including fires, the construction of a 19th century military camp, and well-intentioned attempts to reconstruct the mission in the mid-20th century have greatly impacted the integrity of the site. The identification of each of these events and their subsequent effects as well as careful mapping and recording of architectural features are providing insight into the mission's current state of preservation and future needs. Moreover, archaeological, historical, and geographical lines of evidence have also been used to create a timeline of events and a more complete image of the mission plan.

Walton, David (Lake-Sumter State College)

[116] *Obsidian Tool Functions at Early Formative Altica, Mexico*

In central Mexican archaeology, tool functions have often been assumed for lithic artifacts based on material types and tool forms, which are classified broadly with labels such as bifaces, scrapers, blades, and flakes. Integrating the method of use-wear analysis derived through experimental archaeology is the most effective way to improve our understanding of tool functions in future studies. This poster draws on my experience with over 300 experiments involving obsidian tools and 30 materials in order to classify tool functions for 300 artifact specimens from Early Formative (1250-850 cal. BC) contexts at Altica, Mexico. Altica is the earliest recorded farming settlement in the Teotihuacan Valley and the only Formative site located within a day's walk to the Otumba obsidian source. Excavations at Altica indicate a domestic economy that involved large quantities of simple percussion flakes and percussion blades, and high frequencies of woodworking use-wear patterns observed on these specimens may reflect household craft specialization. Other activities that were accomplished with obsidian tools at Altica included: hunting small game; slicing maize and soft plants; butchering animals and slicing meat; extracting fibers and producing pulque from maguey plants; crafting tools made of bone; cutting stone; and shaping clay,

likely for ceramic production.

Walton, Lauren (Plateau Archaeological Investigations), Brandon McIntosh (Plateau Archaeological Investigations), Dusty Pilkington (Central Washington University) and David Harder (Plateau Archaeological Investigations)

[66] *Cobbling Together the Story of the Sinlahekin Valley: Prehistoric Land-Use Patterns in North Central Washington State*

The prehistory of the Sinlahekin Valley in north central Washington State is not well known. The archaeological record suggests the valley has attracted human occupants since the terminal Pleistocene. Various riparian, lacustrine, and mixed conifer ecosystems with the high elevation of surrounding mountain peaks have provided access to multifarious floral and faunal resources in antiquity, and supports agricultural productivity into the modern period. Scores of archaeological sites, both prehistoric and historic, have been recorded within the valley, but these data have yet to be sufficiently synthesized to provide a detailed understanding of land-use patterns across time. In this paper, we contribute to the cultural history of the Sinlahekin Valley by comparing prehistoric lithic assemblages. Comparing material and artifact type heterogeneity and relative spatial distribution patterns provides an understanding of how the valley was utilized during prehistory, highlighting the importance of local and non-local lithic raw materials, how these resources were utilized, and the natural contexts of these behaviors. The results of this study carry implications for a greater understanding of Columbia Plateau culture history, a comprehensive understanding of the human history of the valley, and provides greater cultural context for land management in the Sinlahekin Wildlife Area.

[161] *Beading a Nation, Beading a People: The Role of Métis Women's Beadwork in Crafting Culture*

The embodied act of crafting can bring into being a physical representation of relations and ways of being in the world. In 1945, ethnologist John C. Ewers reported that the Sioux word for the Métis in Canada translates as “the flower beadwork people”. With influences from their First Nations and settler ancestors, Métis beadwork has come to be recognized as a stylistically distinct artwork of its own and a means through which Métis women craft their relations to their kin, both human and non-human. Archaeological evidence of beadworking activities may be regarded as one of the diagnostic features of potential Métis sites. In this paper, we explore how the beadwork of Métis women has contributed to the crafting of Métis culture and how it demonstrates the complex web of relations through time and space that help define the Métis Nation, past and present. We trace the development of beadwork as a craft and the concurrent rise of the Métis Nation within the context of the 18th and 19th century Canadian fur trade. The subsequent coalescence of a distinct Métis beadwork style continues to be practiced by contemporary Métis beaders and artists, echoing ancestral relations and connecting past and present.

[299] *Experimental Study of Ostrich Eggshell Beads Collected from Shuidonggou (SDG) Site, China*

Ostrich eggshell beads and fragments collected from the Shuidonggou (SDG) site reflect primordial art and a kind of symbolic behavior of modern humans. Based on stratigraphic data and OSL dating, these ostrich eggshell beads date to the Early Holocene (less than 10 ka BP). Two different prehistoric manufacturing pathways are usually used in the manufacture of ostrich eggshell beads in Upper Paleolithic. In Pathway 1, blanks are drilled prior to being trimmed to rough discs. Statistical analysis of the characteristics of ostrich eggshell beads indicate that Pathway 1 was used to make the SDG beads, which exhibit great potential for the study of the origin of primordial art and the development of ancient cultures. They also provide important data for studying behavioral options adopted by hominids in SDG area, and bear important implications for the origin of modern humans in East Asia.

[389] *Identification of Adhesive on Bone-Handled Microblades from the Houtaomuga Site in Northeast China*

With the emergence and progress of composite tools in the Upper Paleolithic, the adhesive became one of the most widely used materials by early human societies. However, the precise composition identification of adhesive in archaeological remains is a real analytical challenge, because the adhesive mainly consists of organic materials that are susceptible to decay during burial process. Of particular interest is to know which animal/plant species were being exploited for glue manufacturing. The Houtaomuga site, located in northeast China, provides favorable conditions for the preservation of organic residues. A few bone-handled microblades were collected from this site, with some gray adhesive exposed in the groove of bone handle. In this study, we scraped micro adhesive samples of bone-handled microblades, and we have carried out FTIR (Fourier Transform Infrared Spectroscopy) and proteomics analysis to determine the protein components and precise origins. The identified from tandem mass spectra of doubly protonated tryptic peptides match most closely to known horse collagen markers, suggesting the adhesive was an animal glue made from horse. These results reveal the diverse utilizations of cattle in the Houtaomuga site, which provided not only meat and hides, but also parts for manufacturing adhesive.

[127] *Investigating Craft Specialization and Pottery Standardization Using Geometric Morphometry of Vessel Shapes from Iron Age Northeast Taiwan*

Changes in craft production over time can indicate shifts in past social structures. However, traditional typological and linear measurements of vessels are limited because they can be insensitive to subtle variations resulting from changes in craft specialization. To overcome this limitation, we measured craft specialization using standardization of pottery shapes to identify changes in pottery production. Using the R programming language, we applied reproducible geometric morphometric methods to study pottery shapes from Kiwulan, a large multi-component Iron Age site in northeast Taiwan, to investigate changes resulting from foreign contact with European and Chinese groups. We found significant differences in shape and shape standardization that indicate changes in pottery production resulting from foreign contact. We interpret this as increasing craft specialization and changes in social organization. Our case study, which includes an openly available research compendium of R code suitable for use with any other assemblage, will help to expand the use of shape-based quantitative methods to questions about craft specialization and standardization in prehistoric ceramic technologies.

Wang, Shujing (ISAW, New York University)

[267] *Mortuary Practices, Production and Exchanges in the Borderland: A Case Study from the Bukhara Oasis (Uzbekistan)*

This paper investigates potteries excavated from the Late Iron Age kurgan burials (i.e., burials with an aboveground mound)

at the fringes of the Bukhara oasis in present-day central Uzbekistan. Connecting the intensively farmed river oasis and the desert steppe, the border of Bukhara oasis as a frontier zone was also an arena in which complex social and economic interactions between pastoral and agricultural populations took place. The rich funerary ensemble located at this borderland includes more than 1000 kurgan burials, the major burial goods from which are wheel-made potteries. Combining a scrutiny of the burial contexts, especially the related mortuary practices, the chronological and the pXRF-based compositional analyses of these potteries, this paper seeks to explore the regional production, exchanges, consumptions and local cultural sequence in the Bukhara region. Through this examination, this paper aims to bring the discussion of mobile pastoralists away from models of mass migration and long-distance exchange but to emphasize their interaction and integration with local agricultural communities in the borderland of the oasis.

Wang, Yifan (Shandong University), Yu Dong (Shandong University), Fen Wang (Shandong University) and Fengshi Luan

[361] *Animal Resources Utilization and Management at the Late Neolithic Dinggong Site, China: Evidences from Stable Isotope Analysis*

The long-term excavations at Dinggong, a late Neolithic site in northern China (c. 2600-2000 cal. BC), have uncovered extensive human and faunal remains with clear contextual information. We carried out stable carbon and nitrogen isotope analysis of faunal remains to investigate the animal resources utilization and management of this site. By integrating the results of stable isotope analysis and morphological measurements, we found diverse management strategies for pigs or potentially co-existence of domestic pig and wild boars. Meanwhile, the results of this study show that some livestock (such as dog and pig) were similar to ancient humans that mainly consumed C4 food (millets), which suggested that animal husbandry and crop cultivation were closely integrated. The difference of food structure among different kinds of animals may be related to domestication states, natural habitats and feeding strategies. This study also demonstrates that beyond its applicability for palaeodietary reconstruction and animal domestication, stable isotopic analysis of archaeological animal remains has important implications for understanding the relationship between humans, animals and plants in an archaeological context.

[158] *An Examination of Middle Formative through Early Classic Ceramic Attributes from Stratified Contexts at Matacanela, Veracruz*

This study compares Middle Formative through Early Classic period ceramic attributes, including temper size, type, and abundance, from stratified deposits at Matacanela Site in Veracruz, Mexico to other contemporaneous sites located in the Tuxtla Mountains and riverine bottomlands in the southern Gulf Lowlands. Specifically, the study compares data from excavated deposits at Teotepec, located within the western Tuxtla uplands, and San Lorenzo within the Coatzacoalcos Basin. On the basis of obsidian source distributions, it has been hypothesized that Matacanela was located along a boundary between these two geographically different areas. This paper attempts to discern if Matacanela's location along a geographical boundary is reflected also in the technological choices that potters were making—whether geographical and other exchange networks were also reflected in ceramics. Lastly, we hypothesize other potential sources of divergence between sites.

Wanstead, Chelsea and Melinda Rogers (Department of Anthropology, Texas State University)

[172] *Identifying Genogeographic Affiliation of Burials from an 18th Century Cemetery on Sint Eustatius, Dutch Caribbean*

During the 18th century, Sint Eustatius (Statia) was the home to colonial Europeans, including Dutch, British and French, as well as enslaved and freed individuals of African descent.

This research explores the genogeographic affiliation of individuals from an unmarked 18th century cemetery located close to both a Dutch military and trading fort and a sugar plantation. It has long been unclear whether the individuals interred in the cemetery were soldiers from the Dutch fort or individuals of African descent who lived and worked on the plantation. The goal of this research is to determine if there is one or more genogeographic group buried in the cemetery. Ancestry was estimated for burials with the cranium and/or dentition present using statistical analysis of craniofacial and dental morphology. Most of these burials closely classify with reference samples of African descent, suggesting that this cemetery was used by enslaved Africans from the nearby plantation.

Ward, Christine (Espinoza Consulting Services)

[245] *Bright Spots in a Drab Landscape: Color Use and Symbolism in the Jornada Region*

“Color” often evokes thoughts of vibrancy, boldness, and distinctiveness. With no denigration or judgement of the area intended, a casual visitor to the Jornada region may not be left with such impressions. Miles of exposed sands, stark mountains, and sparse vegetation do not immediately bring images of bright and unique coloration to mind. A more intimate and perceptive relationship with the landscape, however, reveals the sometimes-fleeting moments of brilliance that abound. Mountains, lacking the thick or even moderate-density of vegetation of other regions, show off their constituent elements; sunrises and sunsets reflect off these mountains and desert floors; the sky, so often barren of clouds, provides a vivid backdrop against the earthen landscape, and the flowering of plants in the immediate aftermath of rare precipitation all add vibrancy and boldness. In this paper, I explore how Formative period populations in this region might have envisioned, selected for, made, and used color to reflect and emphasize these moments of vibrancy, stress the import of relationships, and symbolize their world in their material culture.

[29] *Kanaloa: Lessons from Paleoecology of a Once Common Lowland Forest Species in Hawai'i*

During the late 1980s and early 1990's paleoenvironmental investigations at wetland sites in coastal lowlands of O'ahu and Maui revealed a very common unknown mimosoid pollen type occurring during pre-Polynesian times. Following Polynesian arrival in the islands around AD 1000, sediment profiles consistently documented the abrupt decline and disappearance of lowland native forest elements, including the unknown mimosoid type, within a matter of several hundred years. The forest was mostly replaced by successional taxa, including grasses, chenopods, and ferns. While most of the fossil pollen types could be botanically ascribed using a reference collection of modern pollen, the fossil mimosoid type, lacking a botanically described counterpart, remained elusive. In 1992 the serendipitous discovery of a new mimosoid legume, surviving on a sea-stack separated from the main island of Kaho'olawe was reported and subsequently named *Kanaloa kaho'olawensis*. Using single grain microscopy technique, pollen obtained from flowers of one of the surviving *Kanaloa* specimens showed that its characters aligned perfectly with the fossil mimosoid type. This paper explores the paleoecology of *Kanaloa* in Hawai'i with interesting implications for Hawaiian vegetation history and conservation biology.

[329] *Genetic Analysis of Microbial Community Structure in Soils from the Hell Gap Witness Block*

Paleomicrobiology is probably best known as an approach that yields anthropological findings connected to human health and disease, such as long-term records of oral microbiomes recovered from ancient dental calculus. However, the tools of microbial ecology have been tested for their potential to address other anthropological questions and aid in paleoclimatic reconstruction and dating. The latter category includes an experimental approach (Trophic Group Method) that assumes the physiological properties of present-day bacteria in buried paleosols can serve as indicators of climate aridity at the time of soil formation. The method was first systematically tested on samples collected from the Hell Gap Witness Block (Grund et al., 2014; Viable paleosol microorganisms, paleoclimatic reconstruction, and relative dating in archaeology: a test case from Hell Gap, Wyoming, USA; *J. Archaeological Science* 46:217-228). This intriguing study prompted us to explore alternative paleomicrobiological methods that directly analyze cellular macromolecules without prior bacterial cultivation to better understand the relationship between extant bacteria and past climate. We will report on microbial community structure in a

Hell Gap soil column collected from the north wall of the Witness Block in 2018. Community composition is being determined through high-throughput DNA sequencing of biomarker genes for bacteria and fungi.

[63] *Towards a Museum Quality Artifact: 3D Documentation of Maya Artifacts from Blue Creek, Nojol Nah, Tz'unun, and Xno'ha in Belize*

Large collections of culturally significant material are often at a heightened risk of destruction simply due to their collective proximity. Organizations and individuals have begun to recognize the vulnerability of the artifact. The artifact is not something that can be easily copied and reprinted. Artifacts often possess a highly complex matrix of 3-dimensional and material qualities. The Blue Creek Archaeological Project recovers and documents immense amounts these highly complex artifacts. Digital archaeological techniques such as photography, photogrammetry, laser scanning, structured light scanning, etc. have emerged as favorable solutions to the problem of the mortal artifact. The Center for Heritage Conservation has worked closely with the project to apply these techniques and build a digital archive of recovered artifacts. This collection raises issues of proper visualization and dissemination of culturally sensitive to broader audiences.

[26] *Variation in the Configuration of the Middle Snake River and its Relationship to Prehistoric Fishing Site Locations*

The configuration of the various elements of a river system can have significant impacts on the availability, abundance, and nutritional profitability of aquatic organisms utilized as food by groups of human foragers. These factors may have influenced where and when Late Archaic foragers decided to fish along the Middle Snake River in southern Idaho during the transition to increased use of fish (beginning approximately 1500 B.P.). Previous work has established a relationship between physiographic features of the Middle Snake River channel and the presence of fishing sites. To expand on this, it is important to question two assumptions: 1) that the category of "fishing site" is useful and defensible; and 2) that the configuration of the Middle Snake River was static over the period when archaeological evidence suggests increased use of fish. This study assesses the argument that archaeological site location, regardless of evidence for fishing, should be influenced by physiographic features of pre-dam channels and how those features could have changed over time.

Ware, John

[308] *Beyond the Household: The Evolution of Nonresidential Organizations During the Southwest Neolithic*

The basic building blocks of human communities are residential groups held together by ties of kinship. As communities increase in number and size during the Neolithic, residential kinship groups persist, of course, but new institutions may emerge that draw their members from multiple residential groups. These "nonresidential groups" may affirm existing principles of kinship in new ways (lineages, clans, sections, moieties), or newly formed groups may cut across kinship boundaries in favor of common interest or special purpose (associations or sodalities). For whatever principle or purpose they originally formed, however, all nonresidential groups have an important latent function: "Because they are made up of persons who are not organized due to mutual residence, they unify persons who belong to different residential groups" (Service 1963:xxii). The archaeological delineation of residential kinship groups is comparatively straightforward since households often fill standardized architectural containers (structures with sleeping, heating, and cooking features, storage facilities, etc.). Nonresidential groups can be much harder to detect, and in recent years archaeologists have mostly stopped trying. This paper counters recent trends by addressing the archaeological recognition of nonresidential groups among the Pueblo peoples of the northern Southwest.

[289] *Political Economy at a Casma Valley Middle Horizon Center: Evidence from Pan de Azúcar de Nivín, Peru*

Since 2017 the Proyecto de Investigación Arqueológico Nivín seeks to clarify the cultural affiliation of the groups that occupied the middle Casma Valley, Peru. Architectural and ceramic features demonstrate the influence of both Wari and Casma cultural traditions at Pan de Azúcar de Nivín (PAN), a site occupied AD 950-1150. While the Wari Empire expanded from the southern highlands of Peru in the Middle Horizon Period, the Casma polity and ceramic tradition emerged along the north-central coast during this time as well. However, there is little research into the political economy of the Casma Valley during the Middle Horizon. Exactly how and why did PAN grow as part of a complex polity; which were the cultural affiliations of the groups that occupied PAN, and how did political economy and subsistence patterns materialize archaeologically? We reconstruct the economic focus of the site using macrofaunal, macrobotanical, and marine shells in conjunction with architectural and ceramic evidence recovered from the 2017 field activities. We approximate the original function of the site within the broader political economy of the Middle Horizon in the Casma Valley, involving other areas of the valley and wider trade networks.

[69] *Commingled Stories, Embodied Inequalities: An Historical Bioarchaeology of the Huntington Irish*

The George S. Huntington anatomical collection is comprised of the skeletal remains of some 3600 immigrants and U.S.-born individuals. These persons—who are now collectively named for the doctor who collected them—were gathered from institutions, hospitals, and almshouses around New York City between 1893 and 1921. They were dissected as part of anatomical instruction at New York's College of Physicians and Surgeons and subsequently became part of the doctor's comparative skeletal collection. These skeletal remains provide insights into health and inequality in the nineteenth century. By treating the laboratory space in which they are currently stored as a mortuary site, I excavate and articulate these individuals' various traces—archival, skeletal, and material. This historical bioarchaeological approach allows for the examination of the ways in which the treatment of these individuals in life and in death sheds light on the effects of inequalities over the life course. Such insights have important implications for how we conceptualize poverty, for how we define ethical practices in archaeology, and for our understandings of long-term histories of inequality embodied in immigrant bodies.

Warren, Kea (Arizona State University)

[373] *Ceramic Evidence for Immigration among Households at Calixtlahuaca in the Toluca Valley*

Calixtlahuaca is a Middle-to-Late Postclassic (A.D. 1130-1530) Mesoamerican site located in the Toluca Valley of Central Mexico. While originally a Matlazincan settlement, the site was conquered by the Aztec Empire, and documentary evidence suggests subsequent Mexica immigration to the region. I use the site to examine immigration patterns based on the Aztec-style ceramics found within household contexts. This poster uses attribute level data of ceramics to address the differences between imported Basin of Mexico ceramics as opposed to local imitations, in order to assess whether the pottery was imported from the Basin of Mexico, made by Aztec craftsmen who immigrated to Calixtlahuaca, or if the imitations were produced by local craftsmen in an attempt to copy the Aztec style. In turn, this will help address the larger question of what groups of people were sent out by the Empire to establish a presence in conquered areas.

Warren, Matthew (University of Texas at San Antonio)

[355] *Aryballos, Bowls, and Bolas: Examining the Distribution of Provincial Inka-Style Pottery in the Threatened Borderland Region of the Valles Cruceños*

As the violent threat posed by the marauding Chiriguano emerged in the terminal decades of Tawantinsuyu, the Inkas and their local allies made a concerted push to turn the southeastern imperial frontier into a strategically fortified zone and enhance their ability to repel the lowland invaders. Within the vulnerable valles cruceños, this led to the establishment of numerous fortresses and the development of the tampu site of Pulquina Arriba into a small administrative center. Despite the efforts to consolidate their hold over the region through such infrastructural investments, the Inkas seem to have disseminated relatively little of their imperial-style material culture across the valles cruceños. This represented a notable contrast to the patterns observed among Inka settlements in adjacent territories, even those similarly at risk from the hostile incursions of the Chiriguano. In this talk, I will (1) discuss the characteristics and contexts of such ceramics recovered within the Pulquina Arriba area, (2) review the broader spatial distribution of Inka-style pottery across the valles cruceños, and (3) consider the implications these local and regional patterns have for our understanding of the targeted use of imperial material culture in the embattled southeastern borderland region of Tawantinsuyu.

Warren, Stephen (University of Iowa)

[162] *Visualizing Diaspora: Fort Ancient and Shawnee Migrations in Early America*

Soon after the De Soto Expedition (1539-1542), Fort Ancient peoples from the Middle Ohio Valley abandoned their summer villages. For twenty generations, village life in this region had been both egalitarian and stable. Through a close reading of archaeological sources, including laser ablation testing of late Fort Ancient ceramics, we now know much more about migration out of the Middle Ohio Valley. Reading these sources alongside archival data helps explain why this region became a vacant quarter in the proto-historic period. Thousands of people in diaspora abandoned their homelands and adopted altogether new approaches to economic and cultural survival. By 1755, British colonizers were astounded at the Shawnees' capacity for travel and reinvention, labeling them "the greatest travelers in America." Through Community-Engaged Scholarship (CES), we created a database of Fort Ancient and Shawnee villages sites scattered across North America. In partnership with the Shawnee Tribe, we have tracked Shawnee migrations from the Fort Ancient Culture (+/- 1,000 A.D.) to 1871, the year of their forced removal from Kansas to modern-day Oklahoma. Close analysis of specific geographic and temporal contexts across this span of time reveals a general shift from entanglement to disentanglement well before the American Revolution.

[243] *Flower World Concepts in Hopi Katsina Song Texts*

This paper explores the idea that the Flower World references the moral imperatives that need to be followed to live the corn lifeway. The Flower World describes the perfect life where people live communally, sharing and caring for each other, and, in turn, the rains come and all life is perpetuated. I explore how this idea is embedded in the words, phrases and grammatical constructions in the texts of katsina songs of the Hopi, a Uto-Aztecan speaking people living in northeastern Arizona. Song texts are a particularly appropriate source for further understanding of the concept of the Flower World since Uto-Aztecan speakers equate flowers with song, both of which connote the beauty of the perfect world.

[55] *Strontium Isotopes and Human Migration at the Archaeological Site of Marcajirca, Peru*

The archaeological site of Marcajirca, located in the Puccha River Valley, atop a steep ridge at 3800 masl, provides an interesting context in which to examine changes in human mobility patterns through time on both a regional and local scale. Extensive radiocarbon dating of both archaeological and human skeletal material place occupation of the site between AD 1040 and 1640. This time range allows us to address questions surrounding temporal changes in human mobility and population dynamics during the Late Intermediate Period and Inca occupation. This region, between the Andean plateau and the Amazonian rainforest, is characterized by diverse geological formations of differing ages, which makes the application of $^{87}\text{Sr}/^{86}\text{Sr}$ ideal to trace patterns of movement over long and short distances. Here we present new $^{87}\text{Sr}/^{86}\text{Sr}$ data measured from 58 individuals buried at Marcajirca. In addition, this study provides the first in-depth examination of baseline $^{87}\text{Sr}/^{86}\text{Sr}$ geological values for the region by analyzing a combination of modern plant ($n=18$) and faunal ($n=22$) samples to generate an expected local and non-local range of bio-available strontium ratios.

Waters, Gifford

[367] *The Spanish Missions of La Florida: Archaeologies and Histories of Contact, Colonization, and Resistance*

The nearly 200 years of Spanish mission activity in La Florida had profound impacts on the lives of both the Native Americans and Spanish. Missions were places of new contact, culture change, cultural continuity, religious instruction, and the locations of exchange and introduction of new foods, materials, and ideas. This presentation examines the decades of historical and archaeological research on the Spanish mission system of La Florida, from its beginnings in the 16th century to its ultimate demise in the 18th century, in an effort to place the missions in the larger colonial landscape of the colonial Southeast. Combining historical and archaeological data can help inform how the Spanish missions functioned less as a force of colonization of Spanish Florida and more as a means to attempt to control the frontier and borderlands. Research has also informed on issues of contact and exchange, acceptance and resistance, and the active role Native American groups had in negotiating their place in the new colonial sphere in La Florida.

[217] *Tunnel Vision: Results from the 2018 Investigations of Structure A7 at Xunantunich, Belize*

Despite nearly a century of archaeological investigation, the ceremonial center of Xunantunich, Belize has yielded little insight on the center's earliest occupants and the architectural growth of the site through time. Previous research indicated that Xunantunich was initially settled as a small village during the Preclassic period (~1000 BC-AD 250), with rapid growth in the epicenter beginning around AD 600 after a three hundred year gap in occupation during the Early Classic. This occupational gap is often used to question the timing of the center's appearance on the Classic period political landscape of the eastern Maya lowlands. During the 2018 field season, the Xunantunich Archaeology and Conservation Project, in collaboration with the Belize Valley Archaeological Reconnaissance Project, carried out investigations of Structure A7 in the Xunantunich site core. The initial analyses of architectural data and cultural remains from this investigation indicate continuous occupation and monumental construction at the site from the Preclassic through the end of the Classic periods. These results provide a framework for exploring the role of the site as a major political power in the eastern Maya lowlands

perhaps as early as the beginning of the Classic period.

[87] *Building Capacity and Communities of Practice in Digital Heritage and Archaeology*

As digital methods have become ubiquitous and critical in archaeology and heritage, the challenge of teaching those methods has become more complex. More importantly, we're being faced with an equally important challenge - how do we build and foster communities in which scholars are connected through a shared perspective on both the methods and the thoughtful application of those methods. It is within this context that this paper will explore an approach developed at Michigan State University that speaks to both teaching (and learning) digital methods and the development of communities of practice in which those methods are relevant. The approach itself is informed by the activities of three separate initiatives: The Cultural Heritage Informatics Graduate Fellowship Program, the MSU Department of Anthropology Digital Heritage Fieldschool, and the National Endowment for the Humanities funded Institute for Digital Archaeology Method & Practice. Ultimately, the goal of this talk is not just to discuss the Michigan State University approach, but to suggest a suite of best practices that could be adapted and adopted in a wide variety of institutional, professional, or scholarly settings.

[11] *Settlement Ecology of 19th and Early 20th Century Farmsteads in Madison County, NY*

This pilot research is using archaeology to examine the role of agriculture, particularly dairy farming, in the formation of historic and modern rural spaces and landscapes in the United States. Our larger goal is to describe and explain what rural is and how it was constructed by and has influenced people throughout the nineteenth and twentieth centuries. Given the current economic concerns and challenges in the rural United States and the role its inhabitants and their ideologies are cited as having in recent political and social trends (warranted or not), we feel that an anthropological and archaeological explanation of the formation of rural American culture is of vital importance. In this work, we employ GIS and discriminant function analysis to describe the spatial patterning of a sample of nineteenth and early twentieth-century Euro-American farmsteads from Madison County, NY in relation to various environmental and cultural landscape features. This includes an examination of changes over time in general settlement patterns and in particular family landholdings. Our results are contextualized in earlier Haudenosaunee settlement patterns in this area; in the social, political, and economic climates of American society during the period of interest; and in modern settlement and socioeconomic patterns.

[319] *Diversity and Use of Ducks and Loons at the Hornblower II Site, MA*

Recent evaluation of avifauna from the Hornblower II site on Martha's Vineyard has revealed a rich diversity of birds, including Red-breasted loon (*Gavia stellata*), Common loon (*G. immer*), and various dabbling and diving ducks (Anatidae). The majority of the identified assemblage is represented by Anseriformes (70.6%) and Gaviiformes (17.6%), with very few gulls (4.2%), birds of prey (0.46%), and no Galliformes. This assemblage contrasts sharply with nearby sites, where birds are less frequently recovered and ducks constitute a much smaller portion of the collection. Many of these species are

found on the nearby Squibnocket Pond, where indigenous hunters may have captured ducks at night with torches and canoes as described in early Contact accounts (e.g. Denys 1908: 435-436). This paper will explore patterns of duck hunting and use at Hornblower II based on archaeological data and ethnohistoric accounts to understand their importance during the Middle and Late Woodland eras.

[121] *The Geochemical Profile of the Woman in the Iron Coffin, a Mid-19th C. Burial in Queens, New York City*

Illegal construction excavation in Queens (NYC) unearthed a mid-19th C. iron coffin and exposed the burial interred within. Known as the Woman in the Iron Coffin, the well-preserved burial was a young adult female of African ancestry who died of small pox. Here we provide stable isotopic ($\delta^{13}\text{C}$, $\delta^{15}\text{N}$, $\delta^{18}\text{O}$, $87\text{Sr}/86\text{Sr}$, $206\text{Pb}/207\text{Pb}$) and elemental (Pb, As) concentration analyses of a second premolar and one strand of hair to provide information about the woman's mobility, diet and health during childhood and near the time of death. Compared to established $\delta^{18}\text{O}$, $87\text{Sr}/86\text{Sr}$, and $206\text{Pb}/207\text{Pb}$ isoscapes of the US, we interpret her geographic location during the time of tooth formation as local to the NYC region. The woman's dietary isotopic values ($\delta^{13}\text{C}$, $\delta^{15}\text{N}$) are similar to those of modern residents of NYC and to contemporary free Black communities from Mid-Atlantic states. Lead concentrations are high, suggesting close proximity to mid-19th C. wealth goods and also indicative of lead-caused health problems. We discuss how this geochemical profile bolsters archival-based interpretations of the identity of the Woman in the Iron Coffin and reveals aspects of her life as a free Black woman in Queens.

[277] *Patterns in Robberg Tool Manufacture and Discard at the Open-Air Locality of Uitspankraal 9 Western Cape, South Africa*

Robberg technology is found across southern Africa, but currently is known primarily from cave and rock shelter contexts. This study characterizes the nature of the assemblage from a discrete cluster of Robberg artifacts at the open-air locality of Uitspankraal 9 (UPK9) in the Doring River catchment of the Cederberg Mountains. UPK9 is situated on the banks of the Doring River and 4 km from a silcrete source at Swartvlei. Previous research on rock shelter sites in the catchment has noted that distance to the Doring River exerts considerable influence on the size, reduction intensity, and raw material composition of Robberg assemblages. From this, it has been proposed that groups in the area manufactured artifacts – notably cores and small blades – at the river before transporting them into other parts of the catchment. The UPK9 assemblage allows us to test aspects of this proposition by examining the character of at-source (hornfels) and near-source (silcrete) Robberg artifacts, as well as the raw material composition of the assemblage. We compare the results of our analysis with available data from the rock shelter sites Putslaagte 8, Klipfonteinrand and Mertenhof to explore local-scale technological organization before situating the assemblage within the broader Robberg technocomplex.

Watson, Sarah, Joshua Schnell (Brown University), Shanti Morell-Hart (McMaster University) and Andrew Scherer (Brown University)

[96] *Health Care in the Marketplace: Exploring Medicinal Plants and Practices at Piedras Negras*

Botanical residues recovered from the proposed marketplace area of Piedras Negras have revealed rich information about healing and medicinal activities of Classic Period inhabitants. Excavations in this sector yielded a high quantity of identifiable plant remains in the same contexts as human dental remains showing evidence of antemortem extraction. The characteristics of the recovered archaeobotanical and bioarchaeological remains, in combination with a high documented density of sweatbath structures, yield new insights into marketplace activities apart from the trade of durable goods. Our combined evidence indicates that medicinal practices were occurring within the marketplace area and that medicinal plants—and likely services—were a key part of the economic transactions within this sector of the site. With the aid of ethnohistory, we are able to posit healthcare qualities associated with the plant remains, as well as medicinal practices associated with dental care. However, we complicate basic understandings of “healing” with a critical look at how some medicinal plants may have been ritually invoked, even when never directly ingested or applied. The results of this study have greatly changed our understanding of the marketplace at Piedras Negras and likely elsewhere in the Maya area.

[128] *New Simulation Tools for the Design and Assessment of Subsurface Testing Programs: Dig It Design It and Dig It Check It*

There is a general awareness among archaeologists that the intensity of a sampling program, i.e. the number of pits, their size and their spacing, has a strong bearing on discovery rates. However, rarely is the effect of this relationship explicitly assessed due to the difficulty of running the required mathematical models. This poster presents two simulation models: Dig It Design It and Dig It Check It which allow the archaeologist to easily design and assess subsurface testing programs using statistical modelling. Both models are available online, are very easy to use, and no mathematical knowledge is required to run them. These models have the potential to dramatically increase the use of statistically defensible sampling programs within the archaeological community, to improve site discovery rates, and to improve interpretations based on subsurface sampling by revealing the capabilities and limitations inherent in any subsurface sampling strategy.

Wayman, Joseph (Independent Researcher)

[95] *Experiment to Investigate the Effect of Animal Trampling on Flat Objects*

Researchers have found bifaces situated on edge at Acheulean sites in what are felt to be undisturbed sediments, and have posited that they were placed this way by early humans, offering a clue to the use of the devices. Opposing this, it has been argued that animal trampling of such objects will turn them on edge, challenging the idea that they were placed that way purposefully. Using benchtop devices, experiments are undertaken in an attempt to demonstrate this turning-on-edge effect. The author argues that if such effect exists, it could have been exploited by early human hunters setting bifaces in the ground as traps, and would have acted to keep the devices in the edge up, dangerous, animal damaging armed mode.

[373] *Analysis of Marine Sediment by Chemical Signatures to Discover Evidence of Ancient Maya Activities at Site 74, Paynes Creek Salt Works, Belize*

This poster examines multi-element chemical analysis on sediment at the underwater Site 74 in Paynes Creek Salt Works, Belize. Site 74 was once an ancient Maya salt work. Due to sea-level rise, sea water and mangrove peat now cover the site. Sediment from the site was exported under permit to the Louisiana State University Laboratory for inductively coupled plasma- atomic emission spectroscopy testing (ICP-AES). ICP-AES measured the amount of 20 elements in the sediment. Maps showing variation in the elemental concentrations across the site were made. The study of rapidly-abandoned sites as well as ethnohistorical and ethnoarchaeological theory and methodologies were used to interpret the results. These tests were used to investigate how Site 74 was used, what activities took place, how the buildings were constructed and the spatial layout of the saltwork. This research builds towards a larger investigation of structure and usage of ancient Maya Salt Works in coastal Belize.

Webb, Dallin [186] see Morgan, Christopher

Webb, Dallin**[222]** *Cooperative Foraging Strategies and Technological Investment in the Western Great Basin: An Investigation of Archaeological Remains from the Winnemucca Lake Caves*

This research investigates evidence for the intensity and development of cooperative foraging strategies and investment in cordage and lithic technologies through time in the western Great Basin. It specifically addresses (1) when the region's inhabitants invested in cordage technology used to create cooperation-oriented nets; (2) when the region's inhabitants invested in flaked-stone technology used for individual, active-search hunting; and (3) when nets occur in archaeological deposits. I therefore develop a methodology geared toward assessing diachronic changes in frequency and type of different cordage and flaked-stone technologies in the Winnemucca Lake Caves over the course of the Holocene (10,300–150 cal B.P.). The results of this study indicate that investments in cordage, netting, and flaked-stone technologies were greater during the Middle Archaic than during any earlier or later time period. Investment in these technologies increased during the Middle Archaic alongside growing human populations and ameliorating environmental conditions, suggesting that these factors may have played a role in the development of increased cooperation and technological investment during the western Great Basin's Middle Archaic Period.

Wei, Qiaowei**[242]** *Made Locally or Long-Distance Transportation? New Evidence on Ceramic Vessels from Salt Production Sites of Late Shang Period in North Shandong*

Questions about the salt production in Ancient China have been examining the function, typology, and chronology of a certain type of ceramic vessel, the Kuixingqi (Helmet-shaped vessel). Instead of examining typology of Kuixingqi vessels from salt workshops at North Shandong region, dated to 1000 BC, I will begin by looking at how those Kuixingqi vessels made and transported into the salt workshops, if those vessels are not made locally. I present the findings of the ceramic petrographic analysis conducted on Kuixingqi vessels, of which I present the ceramic material components by the low res microscope. This analysis will give us better understanding of how ceramic vessels are made for salt workshops, and what is the baseline for salt workshop management of the production process.

Wei, Shanshan**[130]** *A Study of Flexed Burials in the Central Lake Region of Yunnan: from Neolithic to Bronze Age*

The flexed burial is a distinct burial style that has prevailed in various regions of China since ancient time. Scholarly interest in flexed burials in the Central Lake region (Lake Dian and adjacent lands) of Yunnan began after discovery of a grave in 1955 during the excavation of the ancient necropolis at Shizhaishan. This topic became researched extensively after more flexed skeletal remains were found in ancient settlements and burial sites in the Central Lake region. Quantitatively, flexed burials account for a small proportion of burials in the entire Central Lake region, but this unique mortuary style appears to have conveyed special meanings and therefore deserves further investigation. Incorporating relevant archaeological materials from areas surrounding Yunnan, this project explores the reasons that led to the presence of flexed burials in the Central Lake region during the Neolithic era and Bronze Age, and discusses the evolution of this unique burial custom over time.

Weinberg, Camille (University of Texas at Austin), Jo Osborn (University of Michigan) and Kelita Pérez (Pontificia Universidad Católica del Perú)**[182]** *The View from the North: Topará and Early Horizon Commoner Lifeways at Jahuay, Quebrada Topará, Peru*

Just north of the Chincha Valley, the village site Jahuay at the mouth of the Topará valley offers an opportunity to investigate non-elite lifeways, and specifically the Topará cultural tradition, in the Chincha region during the terminal Early Horizon Period (approximately 250-1 BCE). This paper presents new results from the 2018 Jahuay excavations, which expanded on 2017 excavations that sought to re-examine the site following Edward Lanning's 1953 investigations that defined the Topará ceramic seriation. In this paper, we describe Topará cobblestone architecture and mortuary remains from Jahuay, and we discuss the abundant material evidence that these littoral villagers depended on both maritime and agricultural subsistence products. Finally, we consider the implications of Jahuay's location between the Chincha and Cañete Valleys and seek to contextualize the site within what we understand about the Early Horizon sociopolitical landscape of the Chincha region.

Weiner, Robert (University of Colorado Boulder)**[24]** *Night and Darkness in Chaco Canyon*

Chaco Canyon, an ancient monumental center in the Four Corners (ca. AD 800-1200), has long been a locus of charged nighttime activity. Visitors today are awed by the clear, dark, and vast night skies, and archaeoastronomical research at Chaco has revealed an extensive settlement design reflecting celestial movements. Investigating nighttime at Chaco requires a multidisciplinary approach that combines archaeology, ethnography, sensory studies, psychology, and cross-cultural research. I employ these methods to consider the role of darkness within Chacoan architecture; nighttime activities and the temporality of gatherings governed by moonlight; and commemorations of transitional moments between day and night. Special attention is given to a theme in Navajo oral traditions of female individuals in ancient Chacoan society who were restricted from setting foot in sunlight. I consider this motif from mythographic, ethnological, and archaeological

perspectives. Combining data and imagination, the study of night reveals not only novel aspects of the archaeology of Chaco, but a domain of experience shared by humans worldwide.

[301] *The Development of Plain and Monochrome Wares in Protohistoric Bronze Age Cyprus*

This paper will explore the development of the locally produced Plain and Monochrome ware pottery at the Protohistoric Bronze Age (1700-1200 BC) sites of Episkopi-Phaneromeni and Episkopi-Bamboula in Southwestern Cyprus. The Protohistoric Bronze Age is a dynamic time for pottery production on Cyprus. It is characterized by the emergence of new fine wares, the steady increase in pottery trade, and new methods of pottery production. These developments are intimately linked to changing eating and drinking practices throughout the period. Two mechanisms of development that indicate different responses to changing practices of consumers will be shown, one from the earlier Red Polished tradition and another from the new Plain Ware tradition. With evidence spanning nearly 500 years, several questions will be addressed: how do the local producers at these sites respond to changes over time, what social and economic implications does this have for producers and consumers, and how can similarities and differences between pottery producing communities be used to illustrate the local tastes, behaviors, and practices of their consumers?

[179] *Ungendering Sex in Moche Ceramics*

Moche ceramic art (Peru, first millennium) is a corpus of veristic images including explicit depictions of sex acts and human genitalia. Because anatomical sex is so visible in these artifacts, the temptation to collapse sex and gender is strong – but what if we begin, instead, by resisting this impulse? In my work with the Moche ‘sex pots’, I have tried to resist relying on ‘common sense facts’ including the sex/gender binary and heterosexual definitions of reproduction, looking instead for meaning that emerges from the corpus itself. This approach requires a high tolerance for ambiguity, and can be disappointing for those hoping for a clear-cut feminist, queer or trans political message. The results, however, include deeper insights into indigenous notions of embodiment, individuality and collectivity, which, I will argue, may include a collective ‘interior’ self and an individualized surface appearance, in contrast to the typical modern Western notion of a hidden interior ‘true’ individual self and a ‘false’ surface presented to others. Another result, of course, is a much richer appreciation for the deliberate deployment of gender ambiguity in the ancient Americas.

Weiss, Michael (Cornell University)

[196] *The Agricultural Lexicon of Western Indo-European: Crop Names*

The first speakers of Indo-European languages who entered Europe brought with them a fairly coherent agro-technological package. This is clear from the significant agreements that can be shown to exist in the lexicon describing the arid and its subparts among the Western Indo-European languages. Additionally, the absence of substratal words in this lexical field suggests that the bearers of Indo-European speech did not adopt much technology from the agricultural peoples already in place throughout Europe. In this talk I will examine the lexicon for crop names in the Western Indo-European languages. Archaeological evidence suggests that the speakers of PIE were familiar with 'barley' and 'wheat', yet no single lexical item referring to a specific species of grain can be reconstructed for the highest node of PIE. In light of this situation it is worthwhile to examine the lexicon for specific crop names in the Western Indo-European languages. What innovations can we identify? To what extent can these innovations be attributed to the sub-nodes Proto-Italo-Celtic or Proto-Western Indo-European? To what extent can these innovative names be attributed to substratal influence?

Weitzel, Elic (University of Connecticut)

[35] *Crop Management and Domestication in Eastern North America Inspired Both Cooperative Niche Construction and Territorial Competition*

Much recent research has emphasized the importance of both within-group cooperation and between-group competition in the human past. We hypothesize that the shift from foraging to food production in Eastern North America provided novel ecological conditions which impacted human sociality in the region, shaping patterns of cooperation and competition. We predict that 1) successful exploitation of the Eastern Agricultural Complex required an elevated degree of cooperation leading to site aggregation, and 2) continued human population growth and aggregation inspired a shift from cooperative to competitive settlement pattern dynamics, driving declines in site suitability. Our results demonstrate that there was a shift from randomly-distributed sites in relatively lower-quality locations to significantly clustered sites in higher-quality locations coincident with crop management and domestication in the Middle and Late Holocene, but that site quality declined after the adoption of the full crop complex in the Late Holocene. As predicted, these results indicate that niche construction in the form of managing and domesticating plants strengthened a preexisting Allee effect and led to greater within-group cooperation, but was also related to the rise of territorial between-group competition in the region which forced people into less suitable habitats in the Late Holocene.

[29] *Historical and Archaeological Investigations in the Mountain Forests of Okinawa, Japan*

Today the mountainous interior of the northern portion of Okinawa, covered by dense forests, remains sparsely populated or uninhabited. Archaeological surveys have found very little in the way of prehistoric or early historical remains, but widespread evidence of human use during the nineteenth and early twentieth centuries. American and Japanese researchers have together undertaken research of archival documents, historical maps and reports, and records of oral history interviews with informants who used these areas prior to and during World War II. Based on this background material, we have identified previous cultural activities, their probable locations, and the types of archaeological sites that might be expected, such as charcoal kilns, indigo cultivation terraces and dye vats, camphor processing stations, rice and taro pondfields, and hamlets and farmsteads. Archaeological surveys have been conducted of several watersheds, utilizing this information to locate sites and verify the presence or absence of probable sites identified in the background research. The research has documented historical forestry use and the settlement and pursuit of economic opportunities by displaced samurai class families after the abolition of the Ryukyu monarchy by the Japanese government in 1879.

[153] *Pioneering Poultry: A Morphometric Investigation of Domestic Chickens (Gallus gallus) in Preindustrial North America*

Chicken bones are common in many historic faunal assemblages. Historic accounts indicate that domestic chickens introduced to North America by European colonists did well and multiplied quickly, but provide little information on the origins, characteristics, or roles poultry played in the North American colonies. A morphometric dataset generated from a sample of skeletons attributed to known heritage breeds provide an opportunity to evaluate the skeletal similarity between archaeological samples and breeds associated with egg and/or meat production. Using morphometric data collected on chicken bones from 18th and 19th century contexts in North America this analysis investigates the role of chickens in preindustrial North America.

[34] *Ancient Mitogenomes from Oregon Sea Otters (Enhydra lutris): Genetic and Archaeological Contributions to the Historical Ecology of an Extirpated Population*

The sea otter (*Enhydra lutris*) was nearly driven to extinction on the Pacific Coast in the 19th century due to the commercial maritime fur trade. Despite successful reintroduction efforts in North America, the Oregon sea otter population remains locally extirpated and endangered. Prior studies have used precontact and modern sea otter phenotypic and genetic analyses to compare ancient Oregon and modern California and Alaska otters, suggesting sea otter groupings vary along the Northwest Coast. To further address the complex and environmentally important issue of the historical ecology of Northwest Coast sea otters we expand upon previous genetic studies by generating complete mitogenomes from ancient Oregon sea otters and present new data on their mitogenome diversity compared to modern otters from Japan to California. Preliminary analysis of sea otters from two archaeological sites in northern Oregon suggests this ancient population is more closely related to modern Alaska sea otters than the modern California sea otters. By applying genetic analyses to zooarchaeological remains we contribute to the historical ecology of sea otters in Oregon and demonstrate the relevance of archaeological remains to conservation biology decisions for species at risk as part of interdisciplinary projects.

[81] *Violence and Veneration at the Edges: Mortuary Traditions and Social Order along the Northern and Southern Frontiers of Mesoamerica*

The northern and southern frontiers of Mesoamerica are about 2000 km apart and are separated by an incredible diversity of peoples and environments. Yet, these frontier spaces appear to be developmentally similar in many ways during the period ca. AD 500-1000, including the scale and complexity of social forms, the types of regional interactions among multiple ethnic groups, and the prominent use of human skeletal material to mark ritual displays in living spaces and ceremonial centers. This presentation compares both areas, focusing on northwest Mexico and northwest Honduras, to consider how the multiethnic character of these frontier settings may have been conducive to the development of mortuary practices that emphasized a particular mix of violence and veneration for negotiating interethnic social dynamics. To what extent did different communities deploy imagistic (involving sensory arousal) and doctrinal (involving patterned repetition) modes of mortuary religiosity to structure social relations? What might the activation of these alternate modes of religiosity tell us about attempts to resolve ethnic conflict? We address these questions using bio/archaeological data from northwest Mexico published by Ben Nelson and colleagues along with new mortuary data from northwest Honduras.

[87] *Geographic Information Just Wants to Be Free: Capacity-Building in the Ethical and Practical Uses of Free and Open Source GIS Software and Open Geospatial Data Standards within the Digital Index of North American Archaeology (DINAA)*

The Digital Index of North American Archaeology (DINAA) is the largest compilation of completely free and open information about archaeological site descriptions and serves as an index to an ever-growing network of primary data and publications resulting from investigations at those archaeological sites. DINAA is an archaeological informatics project committed to the principles of unrestricted access to scientific and cultural data about the human past, as well as deliberate acceptance of the concomitant responsibilities for information security and facilitated reuse that openness entails. Many security and reuse concerns about archaeological site information, such as the data published and indexed through DINAA, fall into the realm of geographic information issues. DINAA uses and promotes open data standards for geographic data development and communication. DINAA also promotes and supports the use of free and open source software geographic information system applications for consumption and reuse of our geographic data. These choices are made with the ethical expectation that they should in the long run result in a project with greater impact on capacity building and knowledge mobilization among the community of DINAA users and contributors, by making the barriers to community involvement as low as possible.

[357] *Spiders and Mud Daubers at LA112420, an Early Developmental Pithouse in Sandoval County, NM*

Mud dauber nests are uncommon in archaeological contexts, but when preserved, are usually present as a result of having been burned in structures or other sheltered features. Approximately 70 nests have been examined from sites in the Midwest, Texas, Oklahoma, and New Mexico, a few of which contained charred spiders and wasp pupae. It is not possible to definitively determine the season of an archaeological feature by the presence of open or closed cells alone since the nests may occur year round. However, mud daubers reproduce throughout the spring and summer, and since spiders are usually consumed by wasp larvae within three weeks of being provisioned, their short-lived presence yields information about the seasonality of the site settlement. Furthermore, charred spiders can provide accurate AMS dates, as demonstrated at an Early Developmental (Basketmaker III) pithouse in central New Mexico. This paper describes the context of a burned spider-packed nest discovered at LA 112420 in terms of environmental inferences and how this information relates to site abandonment at LA 112420.

[78] *The Interaction of Aesthetics and Technology between East and West, from the Perspective of Glass Beads from Xinjiang, China*

Xinjiang is located in the crossroads of the Silk Road and connected the Central Asia, South Asia and central China. During the 2nd to 1st millennia BC, glass beads were transferred from the West Asia and South Asia to central China through the Tianshan corridor and southern edge oasis corridor of the Taklimakan Desert. However, central China glass beads had also spread west since the late 1st millennium BC. These glass beads present diverse appearance and manufacture processes in most sites of Xinjiang. The diversity of the aesthetics and technology of the glass beads reflect cultural communication across the Eurasian continent. This paper will discuss the interaction of material culture based on chemical composition and

manufacturing technique analysis for glass beads.

[361] *Chaîne Opératoire in Jade Study*

Since Wu Da-cheng's Catalogue of Ancient Jades in the Qing Period, research of Chinese jades has largely focused on analyses of their social and ritual significances. In latter half of the 20th century, excavations in Liangzhu, Hongshan, and Xinglongwa culture sites discovered many prehistoric jades. These important discoveries gradually shifted ancient jade studies to an archaeological approach, focusing on the settlement and burial contexts of the jades.

The use of the Chaîne Opératoire (French for "operational sequence") method in lithic studies has provided us a new research perspective and direction in the study of jades. This method pays attention to the full life history of the jades, from production to consumption and abandonment, which is treated as a dynamic and continuous process. Furthermore, it allows us to analyze the social and cognitive dimensions of the jade users through comparisons of the jades' production technologies and use wear.

This paper applies the chaîne opératoire method to study jades by analyzing related settlements and lapidary workshops, especially the latter.

[87] *Digital Archaeology Mentorship: Best Practices in a Rapidly Changing Field*

Digital archaeology comprises everything from obtaining digital data, to data analysis, representation, and preservation. It is a complex field that is in constant flux, due to the ever changing landscape of available commercial, home grown and open access resources. Training and mentorship are of vital importance for students, but also for the archaeological community as a whole. Mentoring should focus on the principles that underlie digital archaeology: workflow, integration of different information sources and sustainability. The most important goal of training is to create an understanding of why and how applications should adhere to a minimum of basic standards that enable those principles and how to apply these technologies in the archaeological practice. Based on understanding such fundamentals archaeologists will be able to find a medium between being intimidated by technology, or being enthusiastically naïve aficionados of costly experiments.

[419] *Determining Regional Hunting Patterns and Possible Domestication of Turkeys in the Mesa Verde area of the American Southwest*

Strontium and oxygen analyses of archaeological bone samples are frequently used to map human mobility. In this work, these isotopic signatures are analyzed to investigate archaeofaunal material dating to 750-1280 AD in the Mesa Verde area to determine the origins of these resources. While the project contains an overall scope of analyzing rabbits, turkey, and deer, this paper focuses on the turkey bones. Baseline isotopic signatures have been determined from rodent and modern plant samples for the surrounding geologies, and the baselines provide an isotopic map for determining the provenance of turkey bones collected from select sites. These primary strontium isotope results, combined with the complementary carbon and oxygen isotope analysis geologic background data, are used to reconstruct resource acquisition and determine whether the turkeys were wild or domesticated and whether the turkeys were possibly exchanged within the region.

[326] *Crossing the Line: The Incised Stones of the Gault Archaeological Site*

Previous publication has dealt with the discovery of incised stones at the Gault Archaeological Site and the artifacts of early Paleoindian age. To date, the project has identified 146 stones with incised lines and designs on them from provenienced collections, unprovenienced collections and collections in private hands. The artifacts are on both limestone tabular cobbles and pebbles and the cortex of chert flakes. This presentation will give some background on the site and our identification methodology as well as summarize the data from the stones not previously reported focusing on those with good provenience.

Werner, Patrick and Carrie Dennett

[191] *Collaborating with Fred Lange on Nicaraguan Themes*

Collaborating with Fred Lange has yielded interesting results. The focus of my interest has been the contact period, and information to clarify that time. Fred tirelessly provided materials and answered my incessant enquiries. *Vínculos*, vols 13, 1-2, helped enormously. Obtaining a complete copy of Walter Lehmann's *Zentral Amerika* proved invaluable to identify ethnic groups with place names. The disassembly and reassembly of the Cerrato tasación of 1548, when used in conjunction with Lehmann's sources, allowed for a reconstruction of contact period western Nicaragua in surprising detail. Some of the problems Lehmann wrote about were clarified by the exacting work of Cerrato in his tasación. Lehmann did not have the tasación when he wrote his *Zentral Amerika*, and more exacting information of the size, location, and subsistence economy all became clear with the materials supplied by Fred. Discussing disconnects between the abrupt drop in Indian populations and the lack of boats to transport Indians resulted in our paper on new views of slave exportation in the 16th century. What is found in the ground and what is found in old documents cannot, in the end, be in conflict.

[77] *Seeing Like a Neural Network? Possibilities and Predicaments of Automated Virtual Archaeological Prospection*

What might it mean to see like a neural network over vast areas of ancient landscapes? Rapid advances in computer vision—especially approaches using Convolutional Neural Networks (CNNs)—have made automated archaeological site and feature detection from satellite and aerial imagery over very large areas an achievable prospect. Such automated prospecting will dwarf pedestrian survey coverage, opening new possibilities for understanding past political landscapes. But with the promise of such big archaeology come several predicaments. Most obviously, machine learning-based virtual prospecting will necessarily focus on sites with superficially visible—mostly architectural—remains, and will tend toward the upper tiers of settlement hierarchies. Such unavoidable sample bias may tend analytical framings toward top-down framings (seeing like a state) and occlude local variation. Second, all CNN-based automated prospecting systems require large, human-generated training datasets, raising ethical and intellectual issues of authorship. Third, CNN-based computer vision systems are ultimately black boxes—how a CNN learns to identify objects cannot be known with any precision, raising fundamental epistemological problems. These promises and predicaments are explored through an emerging project involving the generation of large training datasets through brute force virtual survey and their deployment in a CNN-based prospecting in the Andean region.

[238] *The Intersections of Race, Class, and Labor in New Spain: Archaeological, Bioarchaeological, and Ethnohistoric Perspectives from the Basin of Mexico*

This paper brings together archaeological, bioarchaeological, and ethnohistoric data to highlight how daily life was transformed in New Spain. In particular, we focus on labor as an avenue for understanding the complex relationships and negotiations between working individuals and the emerging colonial structures of power that attempted to prevent or prohibit certain individuals from engaging in particular kinds of work. We attempt to show how these interactions occurred not just within urban spaces, but extended to other more rural areas of the Basin of Mexico. Examples range from the life history of an Afro-descendant person who served in the home of a wealthy Spaniard to indigenous communities in the countryside whose labor was protected from foreign rivals by law. The combination of data from material culture, the bodies of individuals engaging in work, and the written documentary sources allows us to explore this topic at both the individual and community level and emphasize a more complex, yet possibly more accurate, interpretation of how race and class influenced labor.

[33] *Human Behavioral Ecology and the Complexities of Arctic Foodways*

In this paper we will examine whether Arctic and Subarctic coasts have unique characteristics in the context of human behavioral ecology (HBE). We start with a review of the variability in maritime adaptations around the circumpolar north, and then examine efforts to apply HBE models in the North Pacific Ocean. Paleodemography and climate reconstructions for this region suggest people experienced changes in resource availability through time, yet the zooarchaeological record demonstrates remarkable continuity. Therefore, we ask: how can we use behavioral ecological models to explain why this might be? We argue that the behavior of the seasons, people, and animals in northern maritime environments is such that the zooarchaeological correlates used to test HBE models are distinctive and must be assessed before these models can be accurately applied.

[8] *A Cross-Cultural Study of Ancient Beer Production at Hochdorf, Hierakonpolis, and Cerro Baúl*

This poster focuses on a cross-cultural examination of the processes of beer making and the links between social status and this class of alcoholic beverage in three unique ancient cultures: The Celts at Hochdorf in Southwest Germany, the predynastic Egyptians at Hierakonpolis, and the Wari at Cerro Baúl in Peru. Together, these constitute rather diverse contexts for ancient brewing processes which enhance our understanding of the complexities of the production and consumption of fermenting beverages in antiquity. Additionally, we discuss the difficulties associated with the ephemeral nature of botanical remains and the ways in which the process of brewing beer can be teased out of the archaeological record by using macrobotanical flotation, residue analyses via mass spectrometry, ethnoarchaeological research, and experimental archaeology. To conduct this research, we employ a variety of existing studies deriving from archaeological and ethnoarchaeological data on beer brewing from each of these contexts.

[203] *Point Pueblo and Surrounding Middle San Juan River Valley Great House or Great Kiva Communities*

Geographically, the Middle San Juan River Valley, a well-watered area of northwestern New Mexico, is situated between the more famous Ancestral Pueblo culture areas of Mesa Verde and Chaco. After a brief review of known Middle San Juan great house or great kiva communities, this paper will focus on Point Pueblo. Field school excavations have been held by San Juan College, located in Farmington, New Mexico, for the last 13 years at Point Pueblo. A great kiva was constructed with Type II Chacoan style masonry and two sections of great house rooms exhibit local Middle San Juan vernacular compound-veneer walls. At least four kivas were constructed within the eastern great house section, one immediately north of an arc of rooms, two adjacent kivas at the eastern edge, and one at the northern edge. Point Pueblo is in a dramatic location, overlooking the San Juan River Valley immediately to the north. Red Mesa ceramics indicate extensive social interaction and network connection with early Bonito phase Chaco/Cibola people and Mesa Verde ceramics indicate extensive social interaction and network connection with late Mesa Verde people. Additionally, White Mountain Red Ware ceramics indicate extensive social interaction and network connection with the Zuni people.

[136] *Sacred Places and Contested Spaces in Maine: the Long Shadow of Colonialist Science in the Light of Repatriation*

The Nevin site in Maine has become a contested space as Wabanaki people, seeking to repatriate their ancestors, confront archaeologists who adhere to the antiquated postulates of their predecessors. From 1912-1920, Warren K. Moorehead of Phillips Academy's archaeology department, focused field work on Maine's so-called "Red Paint" cemeteries. Moorehead acknowledged the antiquity of the cemeteries, but saw the people as members of a "lost civilization," culturally distinct from later Indigenous groups. Douglas Byers succeeded Moorehead and excavated graves at the Nevin site from 1936-1940. Despite radiocarbon dates and a better understanding of the Archaic period, Byers could not bring himself to attribute Nevin's lavish grave goods to an early era. The confusion sowed by Moorehead and Byers have influenced archaeologists and museum personnel who resist Wabanaki efforts to repatriate their ancestors under contemporary legislation. Despite the lack of robust research on in-migration, prevailing ideas about the Late Archaic in Maine envision a population replacement by immigrants from the south. This hypothesis opposes claims of cultural connectedness by contemporary Wabanaki peoples. Here, we explore the archaeological legacy associated with the Nevin cemetery and challenge archaeologists to confront the remnants of colonialist science that permeate repatriation.

Whelan, Carly (California State University, Chico)

[116] *An Acorn in the Hand Is Worth Two in the Granary: The Effect of Decay Rates on Food Storage Preferences in Prehistoric California*

Though food storage is a crucial tool for avoiding subsistence shortfall in environments with seasonal resource disparities, it is costly relative to immediate consumption. Food stores are vulnerable to theft by animals and other people, and are susceptible to incremental loss from vermin and mold. To compensate for these anticipated losses, people must collect, process, and store more food than required to meet their consumption needs during the storage period. The ability of resources to preserve should, therefore, be an important factor influencing the decision of which ones to store. I present a model that takes into account the decay rates of resources to evaluate which foods should be preferred for storage periods of various lengths. I apply the model to prehistoric California to explain why some species of acorns were preferred for storage over others. Because decay rates have not been empirically derived for acorns, the model uses approximations based on anecdotal information about acorn storage ability and post-harvest loss estimates of grains stored with traditional techniques. To improve data inputs for the model, I have started a series of acorn storage experiments. I present the preliminary results of these experiments here.

[263] *Archaeological Survey in Arizona's Upper Gila River Valley: 2014 - 2018*

Southeastern Arizona's upper Gila River Valley is an understudied area that includes both large, aggregated prehistoric sites and small rock ring, pithouse, and pueblo sites from the Early Agricultural to Salado periods. University of Texas at San Antonio Field School surveys conducted from 2014 – 2018 have identified and recorded approximately 50 sites located in a variety of environmental settings, including terraces along the mainstem of the Gila River, floodplain, side drainages, and higher-elevation locations. While a geospatial information system site probability model underpins the survey's judgmental aspect, local informant knowledge was critical in identifying many of the sites, particularly those occupied during the Ceramic period. Site location, density, size, and persistence over time will be analyzed in relation to environmental zones and the distribution of arable land along the Gila River. Spatial and temporal patterns are compared to those of the Upper Gila's Red Rock Valley in New Mexico. Most of the sites in the research area remain vulnerable to pothunting and agricultural land modification, heightening the need for continued survey work and strong local partnerships to identify and preserve these important sites.

[10] *Least-Cost-Path Analysis as a Predictive Device for Conveyance and Mobility Patterns: The Case of Walker Road Obsidian*

The geochemical sourcing of artifacts manufactured on volcanic materials has often been used as a proxy for levels of landscape learning and mobility among Paleoindian peoples. Moreover, when traced to known sources, the distribution of volcanic materials has informed studies of specific conveyance patterns. The Walker Road site in the Nenana valley of central Alaska has yielded tools manufactured on obsidian sourced to Wiki Peak, located in northern Wrangell-St. Elias National Park, and the as-yet unidentified A' (or Ringling) source which is presumed to be somewhere in the Copper River drainage. The presence of these southern Alaskan obsidians at Walker Road suggests either long-distance seasonal procurement or established trade networks connecting the Nenana valley to the uppermost Tanana River basin and possibly the Copper River basin. We use a GIS-based least-cost-path analysis to identify the most probable route or routes used by Paleoindian peoples to transport obsidian from these sources to Walker Road. We use the Ringling site as a proxy for the location of the A' source and incorporate geologic estimates of Glacial Lake Ahtna's shorelines as well as regional ice coverage in the Wrangell Mountains and Alaska Range.

White, Jonathan

[301] *Regional Connections and Variations in the Archaeology of Healing and Disability: The Temples of Asclepius*

Asclepius was worshiped as the god of healing throughout the Mediterranean from c. 500 BCE to 400 CE. Temples to the god "Asclepieia" have been found across the region, from Epidaurus in Greece, to Pergamon in Asia Minor, to Tiber Island in Rome. In antiquity, asclepieia were renowned as places where the sick could have their ills treated or cured, and where disability could be averted or reversed. Asclepieia are also credited as the forerunners of hospitals and medical clinics, and excavations of various asclepieia have offered insight into not only into the god's cult, but also the hopes and fears of the sick and disabled in the Hellenistic and Roman worlds. This paper examines architectural remains, material culture and limited textual evidence from major asclepieia – Rome, Epidaurus, Athens, and Pergamon – to discuss how the cult of Asclepius was realized in different geographic and temporal contexts. The archaeology also reveals how asclepieia performed their communal and secular obligations: providing care to those society considered sick, disabled, or incomplete. While some of the care provided at the asclepieia was just a spiritual placebo, the idea that these temples served as early medical clinics has been exaggerated only slightly.

White, Joyce (Univ of Pennsylvania Museum)

[27] *Explaining Prehistoric Thailand's 2000 Year Resilient Growth Economy and Peaceful Society: A Bottom-up Approach*

After decades of archaeologists interpreting Thailand's metal age development using top down approaches drawn from 1980s archaeological theory, it has become evident they do not work for this region. During the course of interpreting metal assemblages from Ban Chiang and related sites in northeast Thailand, alternative perspectives emerged for how to more aptly interpret the resilient peaceful prehistoric societies dating from approximately 2100 B.C.–A.D. 300. A model is proposed applying "Ricardo's Law of Comparative Advantage" that focuses on "Regional Reciprocal Exchange Networks". These exchange networks existed from the pre-metal period through the metal age and underpinned heterarchical political and economic systems whereby goods and valuables were exchanged among decentralized networks of communities. In this kind of economy, communities invest in product specialization in order to engage in the regional exchange network and gain access to products they either cannot produce, cannot produce at sufficient quantities to meet local needs and demand, or choose not to produce because they see their efforts are better spent in producing other products to exchange for desired goods made in other villages or regions. Community agency and investment promoted peaceful conflict resolution as well as regional economic growth for over two millennia.

[29] *The Best Gifts Come in Small Packages? Coring Volcanic Landscapes in New Britain*

A volcanic environment built up by characterised and well dated airfall tephra is paradise for landscape archaeology because in any excavation the cultural material is placed accurately in time. Shouldn't this setting also be ideal for environmental data? With expertise provided by Steve Athens, we tried to recover a long-term record in the Willaumez Peninsula on New Britain, Papua New Guinea, a long way from his usual field sites. A beautiful, but nearly inaccessible, crater lake proved an insuperable challenge due to the depths and coarseness of the volcanic sediments. Adopting a slightly altered research question, our activity shifted to a somewhat less intractable sequence of peats and tephra. On the final day of Steve's visit, coring under difficult conditions produced a short but tantalizing record with exciting implications for early forest management. We offer this paper as a tribute to Steve's outstanding creativity, expertise, flexibility and collegiality.

White, William (University of California, Berkeley)

[385] *How Do We Keep "bro-ing" Away from Open Access Archaeology?: Open Access, Cultural Appropriation, and Archaeology*

"Bro-ing" is a market research practice pioneered by Nike and reported by Naomi Klein (2000:75) where designers bring prototypes to inner-city neighborhoods to gauge reactions to new styles and products. This practice also creates buzz that can be used to sell those products to the same communities.

Open access archaeology helps make archaeological data available to larger research communities. While this is commendable, much of our work in the United States is generated from research conducted on indigenous, descendant, or non-European American communities, many of which have histories of negative interactions with anthropologists and archaeologists. This paper explores protocols for preventing cultural knowledge from disproportionately benefitting archaeologists and keeping cultural knowledge from being used in ways that do not benefit descendant and indigenous communities. It also addresses ways open access archaeology advocates can keep from contributing to "bro-ing" in archaeological research; that is, capitalizing on research trends to insert themselves into non-European American communities in order to present their own cultural knowledge back to them in a more authoritative format.

Whitehead, William (SWCA Environmental Consultants)

[96] *Medicinal Plant Use in Southeast New Mexico: Botanical, Ethnobotanical and Archaeological Evidence*

Medicinal Plant use for Southeastern New Mexico is presented, covering major plant types, uses, and ecology. In collaboration with a botanist, who specializes in New Mexico flora, we present data on 331 plant species. The process of knowledge production will be addressed, as all of this information is taken from historic ethnographic accounts, botanical, and archaeological literature sources. The majority of the information in this work is from the Mescalero Apache, however other cultural groups are also included. A seasonal, geographic, and ecological analysis is given, showing when, where and for how long plants would be available in the environment. This has implications for human mobility, settlement, and the depth of knowledge traditional medicine practitioners are required to have, while also highlighting the disruptive nature of land exclusion has had on native populations.

[213] *Architecture and Ritual Abandonment Sequences at the BaahKu Archaeological Site, Taos Valley, NM*

This poster presents the variation of architectural features and abandonment processes excavated and interpreted from BaahKu (LA 37627), in Taos Valley, New Mexico. Recent discoveries indicate intra-site variation in both construction and indicating contact and exchange with communities in the greater northern Rio Grande Valley and possibly beyond. This research presents a comparison between two pithouses in close proximity to each other, an atypical trait for the Taos Valley, through their life history (pre-construction through abandonment). We will also present a greater geographic architectural analysis for the Taos Valley through time.

Whitley, David (ASM Affiliates, Inc.)

[369] *Ritual Space and Ritual Place in California Rock Art*

Larry Loendorf has always emphasized that rock art research is nothing if it is not also archaeology. Much of his research has accordingly considered the importance of the (dirt) archaeological context of rock art sites, and what this can tell us about the art. In the spirit of this concern, the archaeological contexts of three different corpora of California rock art (Coso Range, Southern Sierra, and Chumash region) are considered in terms of the distinctions between ritual spaces versus ritual places, and what this implies about ritual and political power across this portion of the far west. As these examples demonstrate, while the origin of the art may in each case appear similar, the landscape context of the art and its relationship to the remainder of the archaeological record provides important clues to its larger social and political function.

[305] *Time and the Landscape: Visualizations of Murujuga and Beyond.*

Developing 3D photorealistic visualizations of the landscapes of Murujuga going back nearly 125,000 years has been an objective of research since late 2015. Certain challenges have been met in relation to increasing the accuracy and resolution of bathymetric and topographic data, and in dealing with the complexity of hydrodynamic effects on currently submerged landforms. We still remain far from finding definitive paleo-terrain and climatic datasets. However, we are moving into a framework where we can start to build virtual and immersive models of past landscapes, and to interpret the locations and distribution of rock art, or settlement sites, in appropriate temporal contexts. Several examples of recent and on-going visualizations, both in Murujuga and also in other portions of Northern Australia, are presented here to demonstrate potential interpretive opportunities into land-use, migration, and maritime economies. As we look to the future, we are also concerned about how climate change and sea level rise will affect some of the significant sites in this region.

[232] *Modeling Early Medieval Agricultural Practices through Archaeobotany*

Medieval landscape archaeologists have described the Middle Saxon (650-850 AD) and Late Saxon (850-1100 AD) periods in England as times of increased agricultural production and economic expansion, but archaeobotanical analyses are not often integrated with these studies. Archaeobotanists have developed several methods of linking ecological properties of identified plants to past agricultural practices. Examples of agricultural practices inferred through archaeobotany include manuring, sowing season, and plowing. These models utilize comparisons of archaeobotanical assemblages to modern plant community observations (phytosociology) or analyze known growing conditions of weed species present in the archaeobotanical assemblage (autecology).

This paper will apply both phytosociological and autecological models to samples from a database of Saxon archaeobotanical reports for England. The aim is to assess whether model selection causes different interpretations of agricultural practices for the same data. This research will also consider whether these models can address archaeobotanical preservation challenges that cause underrepresentation of some seeds. By directly comparing interpretations generated from one dataset via different models, this paper will provide insight into how to interpret past agricultural practices from archaeobotanical data and the significance of archaeobotanical data to understanding increased Saxon agricultural production.

Whitlock, Bethany (Brown University)

[287] *On the Frontiers of Empire: Inka Hegemony in Chachapoyas, Peru*

Previous studies on the Inka conquest of Chachapoyas (AD 1470) have largely focused on an epic conflict between the invading Inka empire and warlike Chachapoya natives. Little attention has been directed towards understanding the processes by which the region was incorporated into the empire – how the landscape became naturalized as Inka, and how its inhabitants were transformed into Inka subjects. Past understandings of the Inka occupation of Chachapoyas have generally presented a picture of a minimal imperial footprint, coupled with significant population decline and reorganization. More recent work in the region has, however, suggested that the Inka invested significantly more in the region than initially supposed. Here, I focus on one settlement cluster – principally the sites of La Fila and Llaucán – located in the Utcubamba Valley, Chachapoyas – that displays clear evidence of Inka presence. Through a consideration of architectural and ceramic data from these sites, I examine how Inka rule was enacted, emplaced and experienced in this frontier region. Ultimately, I will consider how the materiality of Inka rule in these small communities can contribute to our understanding of the micropolitics of empire and the ways in which Inka hegemony was established and maintained in Chachapoyas.

[124] *Creating Context: How Developing Local Relationships Enriches Archaeological Knowledge*

While the Chiricahua Mountains are a part of the Sky Islands, Fort Bowie NHS and Chiricahua NM are not islands unto themselves--their rich archaeological past exists within the broader context of the landscape. In an area that has received little study compared to the rest of the American Southwest, it has been imperative for the NPS to develop and strengthen local relationships between private landowners and other land management agencies so that the bigger picture can become more clear. This poster explores some of this recently shared knowledge and developed context from within the northern portion of the Chiricahua Mountains.

[185] *Necrontology: Housing the Dead in Precontact Labrador and Greenland*

Conventional treatment of the dead varied substantially across the Inuit world. Bodies might be deposited in carefully constructed cairns next to settlements or more simply exposed on the land or sea ice. It also varied locally depending on understandings of the afterlife, how individuals were conceptualized in death, the circumstances of death, and the deceased's relationships to the living, as appears to have been the case in precontact Labrador and Greenland. Although a boulder pile overlying a simple crypt is the most widespread form of mortuary treatment, distinctly house-like cairn morphologies occur, some are associated with detached caches of mortuary offerings, and their placement on the landscape varied substantially. Many are clustered in cemeteries close to settlements, but some are idiosyncratically situated on elevated outcrops or next to isolated ponds. If the manner of disposal of the dead speaks to an ontology of death and the afterlife – a “necrontology” - as archaeologists conventionally assume, then the Inuit version was clearly complex.

Whitson, Erin (Binghamton University SUNY) and Maxwell Forton (Binghamton University SUNY)

[421] *“For the Benefit and Enjoyment of the People”: A Critical Examination of American Park-space*

“For the Benefit and Enjoyment of the People”. Teddy Roosevelt’s words speak to the legacy of park-land narratives as unrestricted spaces open to all. Beneath this public veneer are contested landscapes founded in social division and inequality. With the origins of the National Parks, we look at how such spaces were initially unavailable to segments of the urbanized American public. Next, we discuss the creation of city parks and how theses, like their National counterparts, reinforced and legitimized the American socioeconomic status quo. Using case studies from the West and St. Louis, we show that park landscapes are rooted in ideas of restriction as much as they are in narratives of inclusion. This restriction extends to the present, in how we continue to use such spaces, and in narratives archaeologists and park staff use to describe National Parks. Cherished as virgin wilderness, these subjectively constructed landscapes spin exclusionary histories. To maintain the myth of untouched wilderness, indigenous subjects are turned into romanticized objects, while simultaneously marginalizing the voices of historic-period peoples. The result is that complex narratives are often sacrificed for spoon-fed myths. Though subtle, critically examining park-spaces allows us to address colonialistic legacies that continue to haunt Americans today.

[286] *In the Heart of the Inca: An Osteobiography at Huanacauri (Cusco, Peru)*

This study takes an osteobiographical approach to describe the archaeological significance and life history of the only known individual buried within Huanacauri (Cusco, Peru), one of the most sacred sites in the Inca Empire (ca. 1400-1533 CE). Given the significant location of the burial—in the center of the place the Incas perceived as the foundation of Cusco—an osteobiography is an ideal method to identify the biocultural characteristics of this individual, and interpret whether and how these characteristics may have warranted special burial. Through gross skeletal analysis of age, sex, pathological lesions, dental health, and indicators of physical activity, this study generates a holistic picture of an individual social life during the height of Inca power. Our analyses show that this secondary burial is an adult male (40-55 years old), who was interred in a restricted-access space that contained a gold figurine, a carved stone column, and a textile floor covering. This skeleton exhibits no markers of infectious or developmental diseases or trauma, and only minor signs of osteoarthritis on several vertebrae. Comparing the bioarchaeological data from Huanacauri to an earlier population from the nearby settlement of Matagua, the study uncovers notable differences in trauma.

Whittington, Stephen (National Mining Hall of Fame & Museum)

[394] *Spatial Analysis of an Ancient Mixtec Capital in Oaxaca*

Chiyo Cahnu, a Mixtec mountaintop capital, is unusual in relation to the archaeology of Oaxaca because it is larger than normal for Postclassic settlements and apparently was inhabited for a short length of time. Mapping a one square kilometer area of the capital using powerful GPS devices between 2013 and 2017 revealed about 370 building sites, almost 2,400 agricultural and residential terraces, and ancient roads constructed on the steep slopes of Cerro Amole. The building sites range in complexity from single rooms to compounds with temples and dozens of rooms surrounding patios. The ball court is 45 meters long, making it one of the largest structures of its kind in Oaxaca. The capital is depicted on the famous Mapa de Teozacoalco, a document painted by a Mixtec artist and explained by a Spanish colonial administrator around 1580. Interpretation of images on the Mapa and in related pre-Hispanic and early colonial codices suggests that the principal occupation of the capital occurred over a period of only 236 years (AD 1085-1321) during the Postclassic period, yet the ceramic chronology does not support this interpretation. How can the historic and archaeological records be reconciled?

[245] *Subjective Color in Mimbres Black-on-white Pottery*

Subjective color is a well-known phenomenon in the psychology of perception. It results when certain patterns of dark and light are spun at a particular speed, which the viewer perceives as solid colors or rainbow effects. Experiments indicate that this phenomenon occurs when Mimbres Black-on-white vessels of certain designs are spun. I propose that the subjective-color phenomenon was used by shamans to induce trance states or related purposes. It is notable that the rainbow effects of certain designs and related color phenomena may represent water, the effect of light sparkling on water, and similar symbolic effects. It may be just one of many symbols in the ancient Southwestern religious ideologies, which appear to have been focused on bringing rain and agricultural fertility.

Wholey, Heather (West Chester University)

[133] *Archaeology on Sheppard's Island: Predictive Modeling and Heritage Preservation in Delaware's Inter-Tidal Zone*

The Delaware Bay is the second largest estuary along the U.S. Atlantic coast and is experiencing some of the gravest effects from sea level rise. Most of the estuarine shoreline is fringed by salt marshes that have been developing for over 2,000 years but are now being lost at a rate of up to an acre/day. The trend suggests that most of the Delaware Bay wetlands may convert to open water and that this will occur at a variable rate. A multi-disciplinary pilot project bringing together archaeology and coastal geomorphology to assess these threats has been implemented to 1) conduct paleo-landscape reconstructions at selected sites through sediment coring; 2) document coastal archaeological resources within the Delaware estuary through systematic archaeological survey; and, 3) refine predictive models for the discovery of archaeological sites and the impacts of sea level rise on those resources. The inter-tidal zone of the Delaware estuary has been understudied archaeologically, but results thus far suggest that this area is archaeologically rich, is on the front-line for experiencing adverse effects from sea level rise, and serves as a harbinger for the impacts of environmental changes on cultural resources along the estuary.

Wichlacz, Caitlin (Arizona State University)

[194] *Refining Perspectives on Salado Polychrome Ceramics at Las Colinas Mound 8*

As time passes, fewer and fewer of us retain an intimate knowledge of the site of Las Colinas and the excavations that took place there in the 1960s and 1980s. Published artifact data for the site do not accommodate certain research interests, including inquiry into Salado polychrome ceramics, a significant ceramic category present mostly in the platform mound area. In this paper I present results from ongoing work with the Las Colinas archival materials and collections that aims to improve the resolution and completeness of our view of the site. I present the results of a completed typological reanalysis of Salado polychromes recovered during the 1980s excavations and consider the broader implications of the chronological and technological patterns that emerge. Other ceramic and feature data are marshaled to situate the Salado ceramics within a broader context and allow for new perspectives on what people and things were doing in the platform mound area.

Wicker, Nancy (University of Mississippi)

[310] *Broken Edges: Investigating Jewelry Damage by Violence and Fatigue*

Many Scandinavian Migration Period gold bracteate pendants of the 5th and 6th centuries show evidence of pre- or post-depositional damage. Impressions of broken edges of the jewelry were made with polyvinyl siloxane (PVS), and the impressions were then analyzed as part of a larger project to analyze fatigue fractures of gold as a dental material. Attempts are made to ascertain which pendants broke due to metal fatigue from long-term wear and which were mutilated as the result of violence.

Wilcox, Timothy (Stanford University)

[150] *Diné le'saa litsxo bik'ah dash chá'ii dajíi la: Navajo Gobernador Polychrome Pottery*

Gobernador Polychrome is a Navajo ceramic practice whose development was hastened by participation in the Pueblo Revolt. It represents a visible change in Navajo ceramic technology and a window into their social history. My discussions, in this paper are not aligned with Navajo Archaeology's theme of "Origins" and the diffusion of styles is not in the context of the "Rapid Acculturation" narrative. My research uses a communities of practice and technological style framework to inform questions about the nature of interactions between Navajo and Pueblo people during the Revolt Era by examining proposed Puebloan influences. My research revealed a range of technological styles such as, form, design structure, surface treatment, and firing regimes, embedded within the production that support both independent and Pueblo technological styles. My research also shows a wider range of pigment types and I have documented evidence of organic paint and white slipped shoulder and neck fields, which contradict the accepted definitions of the type. Design structure and vessel form analysis suggest an Eastern Pueblo influence, especially from the Tewa, while my analysis of firing attributes, indicate an independent development of a novel, yet consistent, firing regime and design motifs that are distinctly Diné.

Wile, Kim, Sydney Tucker and Alexis Baide (Texas State University)

[172] *Mortuary Patterns of a 18th Century Cemetery on Sint Eustatius*

Little is known about the mortuary patterns of enslaved and freed Africans during the 18th to early 19th century on the Dutch Caribbean island of Sint Eustatius. Excavation and analysis of burials from a small 18th century cemetery provides information about the lives of the interred individuals, who are likely of African ancestry. Mortuary patterns can help assess health, status, and societal norms of these people. This study uses data from the burial excavations and analysis of the recovered human remains and artifacts to explore mortuary patterns in the cemetery. The study also includes information

comparing the Sint Eustatius cemetery data with other contemporary Caribbean and non-Caribbean cemeteries. These comparisons will effectively show variation in daily life, status and societal norms for individuals of African ancestry who lived under different 18th century European colonial powers.

[99] *Buried Landscapes: GIS 3D Modeling of Geoarchaeological Data*

Geoarchaeological coring provides deep and continuous samples of subsurface soils and sediments. Through analysis, dating, and interpretation of these data, we model land and site formation processes from the Late Quaternary to the near-present. GIS 3D modeling enables us to reconstruct and visualize buried landscapes and assess areas of archaeological sensitivity. Using a series of 3D animations, we present results from recent cultural resource management projects in the Eastern United States.

Wilfong, Faith (The University of Iowa) and Matthew E. Hill (Associate Professor at the University of Iowa)

[80] *Missing Metapodials: New Analysis of the Protohistoric Period Fauna from the Scott County Pueblo Site in Western Kansas*

The Dismal River Aspect sites, located within Lake Scott State Park in western Kansas, represent long-term settlement of the area during the AD 1500s-1700s by a mixture of Puebloan migrants and local Apache groups. This study uses faunal material from the protohistoric period to begin to understand the nature and timing of the occupation at the Scott County Pueblo site. We report on a recent taphonomic analysis of the faunal material from the site to help us infer site function (e.g., camps, long-term residence, or processing locality) and to determine seasonality of occupation. We then attempt to establish which cultural tradition (Puebloan or Plains) most influenced Dismal River Aspect foodways and cuisine. A key goal of this research is to evaluate the existing contradictory hypotheses that suggest the differences in faunal use at the site are due to the differing cultural traditions of the site occupants.

[32] *Investigating Human Origins in the Kalahari Basin: New Results from Ga-Mohana Hill North Rockshelter*

Investigations of the southern African Middle Stone Age archaeological record are transforming our understanding of Homo sapiens origins and evolution, however, the intensity of research on coastal and near-coastal Middle Stone Age (MSA) records has outweighed that on the deep interior record. The North of Kuruman Palaeoarchaeology Project was initiated to help correct for this bias. Here, we report new results from excavations at the Middle Stone Age site of Ga-Mohana Hill North Rockshelter (GHN), near Kuruman, South Africa in the southern Kalahari Basin. We show that the deposits are in good context with minimal disturbance based on stratigraphy, artifact density distribution, and fabric analyses. Optically stimulated luminescence analysis is providing high-resolution age estimates for the archaeological deposits. Uranium-series dating of extensive carbonate deposits in the area is producing a record of palaeohydrological dynamics and past environments. Ongoing excavations at GHN are generating a diachronic record of MSA human-environment interaction in the Kalahari Basin that will allow us to assess the competing hypotheses about the origins and evolution of H. sapiens.

[18] *Neither Up nor Down? The Late Intermediate Period Occupation of the Andes-Amazonia Frontier in Southern Peru*

This paper will examine the Late Intermediate Period (LIP) occupation of the eastern Andean piedmont (1200-3000 masl) in the Province of La Convención, Peru. Based on data obtained from recent archaeological survey and excavations, it will focus mainly on the distinctive spatial patterns of the LIP settlements in the Amaybamba Valley; an ecologically transitional space lying between the Andean and Amazonian regions. This discussion will include 1) the organization of residential structures within the village sites, and the extent to which artifactual evidence for labor activities can be seen to correspond to particular architectural units and clusters—and 2), the overall LIP settlement pattern within the local landscape, with particular attention to mortuary sites. It will be argued that in certain respects, the Amaybamba Valley had distinctive features that set it apart from other contemporary groups in the piedmont (e.g. in the Vilcabamba and Apurímac drainages). In general, substantial internal diversity appears to have typified the LIP occupation of the piedmont regions, and there were also notable contrasts between LIP groups in eastern slopes versus the highlands proper. The paper will conclude with some discussion as to how some of these variations might have come about.

[213] *A Stylistic Approach to Abrupt Ceramic Change in Salinas Province, New Mexico*

The sudden emergence of Tabira Black-on-white and Tabira Polychrome pottery during the late 16th to early 17th century in the southern portion of Salinas Province, central New Mexico after hundreds of years of production of Chupadero Black-on-white has been the topic of archaeological inquiry for decades. Competing models for the relationship between the pottery types have been suggested. Some researchers have highlighted the many stylistic differences between the types, most notably the emphasis of representational motifs among Tabira specimens, and have argued that the types represent two distinct, dichotomous ceramic traditions. Others, however, see some of the differences between the types as the result of exceptionally conservative, yet present change in Chupadero Black-on-white style through hundreds of years of production. Here I discuss the preliminary results of a design analysis of Chupadero Black-on-white and Tabira Black-on-white/Polychrome pottery. Ultimately, I argue that the data favor models of subtle, gradual Chupadero Black-on-white change, with a sudden burst of stylistic change around the turn of the 17th century.

Williams, Charlotte

[331] *Shipwrecked Heritage of the Old and New World: Owning and Owning up to the 'Midas Touch' of the Colonial Past*

The archaeological past rarely maps perfectly to the borders of current nation states, leaving stakeholder groups to constantly renegotiate boundaries. Located in international water and hosting assemblages from a variety of transitory groups, shipwrecks of the 'Columbian Exchange' have prompted Spain's former colonies to re-order ownership boundaries by claiming that artifacts are not located in their geopolitical borders, but in their intangible pasts. Stakeholders from Peru to Colombia have argued that material such as coins constitute both a protected national resource and a manifestation of indigenous labor, a view that is increasingly granted legitimacy with the acknowledgement of intangible history, but is not so reflected in legal structures that determine the objects' fates. This paper analyzes the legal trends from the results of 37 shipwreck disputes, tracking the most common ownership outcomes of colonial ships that are brought to court. From private hands to national museums, these different ownerships demonstrate a 'Midas Touch' of colonialism, in which Spain's contact with gold turns all gold to Spanish. In granting greater legal protection to historical ties to the nation state rather than archaeological links to a former colony, current management schemes disadvantage a co-custodianship that could

potentially protect sites.

Williams, Daniel (Ohio University)

[302] *Diverse Genetic Resources Facilitated Chenopodium Domestication*

The prehistoric domesticate *C. berlandieri* var. *jonesianum* is well documented in the archaeobotanical record of eastern North America from ca. 3,800 BP to European contact when it fell out of use. The seed morphology of the domesticate resembles other new world *Chenopodium* domesticates (*C. quinoa* and *C. berlandieri* subsp. *nuttalliae*) and is distinct from its progenitor and extant wild relatives. Although the relationships among extant North American chenopods are unclear, their morphology provides insights into the diversity of genetic resources available to early agriculturalists. Seed samples were collected from domesticated chenopods and their wild relatives. Seeds were photographed whole and in bisection with a digital optical microscope to capture morphological detail. Seed morphology was compared using linear measurements and 2D morphometrics with principal components analysis in R. Polymorphism is highly variable within wild *C. berlandieri* vars. Variation across the species demonstrates diversity, a prerequisite for domestication. Morphological anomalies may suggest prehistoric conspecific crop-weed introgression. In early agricultural contexts, directional pressure on isolated populations may have driven rapid phenotype changes. Modern breeding methods may be able to duplicate morphology observed in domesticates by using seed morphology as a criterion for selection, a step toward re-domesticating the lost crop.

[254] *Flaked Stone Artifacts from the San Juan and Cutter Laterals of the Navajo-Gallup Water Supply Project*

This paper presents the results of a lithic analysis of several archaeological sites subjected to data recovery efforts by PaleoWest within the San Juan Lateral and Cutter Lateral of the Navajo Gallup Water Supply Project (NGWSP). Three broad reduction strategies were identified within the assemblages, which fall chronologically and culturally between the Early Archaic and Protohistoric Navajo. Assemblages yielding large artifact sample sizes were subjected to detailed lithic analyses. Raw material analysis, including edxrf results from obsidian, indicate that nonlocal and semi-local raw materials were preferred during the Early–Middle Archaic periods, and during the Protohistoric Navajo period, whereas Late Archaic populations made much greater use of local and semi-local raw materials. Raw material selection, combined with other aspects of the lithic operational sequence, suggest increased residential mobility during the Early–Middle Archaic periods, and again during the Protohistoric Navajo period, whereas lower mobility and increased sedentism are suggested for Late Archaic occupations.

Williams, Justin and Matthew Landt (Alpine Archaeological Consultants, Inc.)

[207] *Raw Material Use through the Archaic at the Aught-Six Site: Northwestern Colorado*

Here we examine the data from a cultural resource management excavation of the Aught-Six site in northwestern Colorado. We utilize an expedited version of Minimum Analytical Nodule Analysis (MANA) to address the changes in lithic raw material use and acquisition during a 2,000 year period of the Middle Archaic (6400–4450 cal B.P.). We assign individual artifacts to their respective analytical nodules during a standard lithic analysis focused on stone tool reduction trajectories. We combine the traditional lithic analysis with nodule analysis to build a complete picture of the raw material use throughout these periods. Practically, because the results of our expedient MANA analysis mirror that of more traditional MANA analyses we suggest that MANA can be done on a tight cultural resource management schedule, while being profitable. Additionally, we highlight chronometric and cultural changes in raw material acquisition and use from the settled, basin-house dwelling foragers of the Middle Settled Archaic before 6000 cal B.P., to more classically mobile foragers of the Middle Transitional Period after 5500 cal B.P.). We suggest that nodule analysis pairs well with traditional lithic analyses while highlighting overall prehistoric patterns of time and effort in raw material acquisition and hunter-gatherer mobility.

[380] *Mineralogical and Micromorphological Analysis of Gypsum Washes at Casa Grande National Monument*

The great house at Casa Grande National Monument, Arizona, occupied circa 1350-1450 CE, is a four-story Hohokam structure made of puddled earth. All of the interior surfaces are finished similarly with individual clay (illite and palygorskite) and gypsum washes. Together, these two fine-finish materials give the walls a uniquely consistent red color and sheen. The gypsum washes on the interior wall surfaces of the great house have been characterized via scanning electron microscopy (SEM) and x-ray diffraction (XRD). This paper explores the mineralogical, micromorphological, and geochemical data gathered during the course of a plaster conservation project at the monument in order to elaborate on the technology and methods involved in the production of the gypsum washes. Specific attention is paid to the weathering processes and the solubilization and precipitation mechanics of gypsum and carbonate materials. An operational chain for the gypsum washes is suggested. The archaeological gypsum samples are supplemented with experimental data on gypsum processed in different ways.

[310] *Daily Lives in Early Medieval Bavaria: Degenerative Joint Disease in the Carolingian Altenerding, Germany*

This project investigates lived experience in early medieval Germany by examining degenerative joint disease (DJD) in human skeletal remains from Altenerding, Germany. A 2008 excavation at the PetersbergI site unearthed 128 burials from a 9th century cemetery associated with the Carolingian court at Altenerding. Osteological analyses conducted in 2011 and 2018 individuated 116 individuals from single and intermingled graves. Methods from the Global History of Health Project were used to assess DJD at the major joint complexes and in the vertebral column, recording presence and severity of arthritic changes to the joint surfaces. DJD was common across all joint systems, especially the vertebrae, where prevalence surpassed 73% (63/86).

To examine differential DJD prevalence between males and females, biological sex was estimated using features of the cranium and pelvis (males = 30; females = 31). Significantly more males (90%) than females (67.7%) had at least one body joint affected by DJD (Chi-Square, $p < 0.05$); though not statistically significant, this pattern also held for vertebral DJD. While recognizing the complex relationship between activity patterns and DJD, as well as that between sex and gender, these results suggest differential activity patterns between men and women in Carolingian Bavaria.

Williams, Nancy (University of Tulsa), Miriam Belmaker and Danielle MacDonald

[116] *Squeaky Clean: An Experiment to Test the Usefulness of Cleaning Agents on Silicon Dental Impression Molds*

As surface texture analysis has become more popular in archaeology, various materials were adapted to gather data left by use and dental-wear. Silicon-based dental impression materials, such as President® Jet by Coltène Whaledent, are used to make negative molds of wear patterns. These techniques have been applied to examining the dental microwear of teeth found in the archaeological record and are a useful tool in understanding past diets, vegetation and paleo-environments. Good images of dental wear patterns are captured using silicon impression materials. However, while we can clean the actual artifact, researchers are still confronted with the build-up of dust and finger grease on their silicon samples. For the most part, researchers work around these dirty little anomalies by cutting away the dust and grease from the images, but that can potentially lose valuable data. Using a modern collection of *Odocolleus virginianus* teeth, dental molds, from President® Jet regular body, were created to test the effectiveness of five different cleaning products: compressed air, water, alcohol, regular dish soap and laboratory soap. Molds were tested to see the effectiveness of the cleaning agent on dust and finger grease and to determine if the cleaning solution altered the molding material.

Williams, Patrick Ryan (Chicago Field Museum)

[200] *The Role of Institutions in Imperial Formations in the Andes*

Bradley Parker was first and foremost a student of empire. As an Assyriologist and a budding Andeanist, he was enthralled with understanding the rise and persistence of empire from a comparative approach, and at the time of his death was building an inspirational model to understand imperial expansion from the ground up. Our discussions lead me to question the role of institutions in imperial legacies. In this paper, I explore how Andean institutions were critical to the first imperial formations, and how the persistence of those institutions even after political collapse of empire was fundamental to the establishment of future imperial formations in the Andes. I start by examining Wari, a first generation empire that both Bradley and I have used as a basis for understanding the genesis of Andean expansive states. New research on Wari has been critical in understanding how institutions served the state in both incorporating and maintaining connections with distant regions under imperial influence. I then examine the histories of several Inca institutions that were essential to the establishment and maintenance of the empire, and argue that it was through institutional antecedents, especially those adopted and developed by Wari, that Inca imperialism was ultimately so successful.

Williams, Veronica (CONICET- UBA) and Calogero Santoro (IAI. Universidad de Tarapaca)**[355]** *Did Skilled Local Potters Emulate Inka Polychrome Ceramic Style and Pottery Paste? Code Declassification Through Instrumental Neutron Activation Analysis (INAA)*

Based on Instrumental Neutron Activation Analysis (INAA), we tried to decode Inka polychrome ceramics from northern Chile valleys, traditionally assumed of having been introduced by the Inka State from the Lake Titicaca region (more than 500 km away). The results show that these conspicuous Inka vessels were not imported to the region, on the contrary they were made with local raw material, crafted by skilled artisans that imitated Inka iconographic style. In this context it can be suggested that the Inka officials encouraged local artisans to replicate State pottery standard as part of mit'a requirement and that these vessels were later consumed by local elites friendly with the State. Alternatively, but less likely, local potters made these vessels for local elite that were using Inka prestige goods to gain and strengthen their political power in their local communities. These results show, also, the input of archaeometry analysis and petrography to shed light on the impact of the Inka State among prehistoric polities of northern Chile.

Williamson, Kylie [126] see Danella, Erika

Williamson, Kylie (University of Florida), George Kamenov (University of Florida), Neill Wallis (Florida Museum of Natural History) and John Krigbaum (University of Florida)**[168]** *Geochemical Analysis of Cremated Bone from River Styx*

River Styx, a Middle Woodland (ca. AD 100-300) ceremonial center located in North Central Florida, is currently the only known site in prehistoric Florida where cremation was the sole form of deposition of human remains. Previous analysis of material remains from the site indicate extra-local connections up into the Ohio Hopewell and Great Lakes regions. To explore these connections further, we utilize tools of geochemistry on well preserved fragments of recovered cremated bone. Recent advancements in strontium isotope studies have demonstrated that calcined bone retains in vivo signatures and therefore allows for potential analysis of residential mobility. We use a new approach, based on trace element data, to assess postmortem diagenesis in the bone samples. Using multi-collector inductively coupled plasma mass spectrometry (MC-ICP-MS) we determined an average $87\text{Sr}/86\text{Sr}$ value of 0.70981 (± 0.0005) in cremated bones from multiple individuals ($n=22$). At present, these data are consistent with $87\text{Sr}/86\text{Sr}$ values determined for contemporary sites in the

region using non-cremated bone, and our results suggest largely local status of the study individuals buried at River Styx.

Williamson, Ronald (Archaeological Services Inc.) and Peter Ramsden (McMaster University)

[73] *Time, Space and Ceramic Attributes: The Ontario Iroquoian Case*

Ontario Iroquoian chronology has been largely based on observed or inferred changes in the frequency of rim sherd types or attributes through time. Such observations include the increasing development of collars, decreasing complexity in collar motif, decreasing frequency of horizontals and changes to the location of their placement and decreasing neck decoration through time, to name a few. The frequencies of some of these attributes also vary from region to region, and between communities within regions, producing a complex three-dimensional picture. In recent years detailed site-wide ceramic data have been collected from hundreds of Iroquoian sites in south-central Ontario, including many aligned in sequences along drainages. Moreover, for the first time there are hundreds of radiocarbon dates to help in placing sites in chronological sequences. Considering these recent developments, this paper re-examines ceramic attribute frequencies to test the extent to which ceramic attributes may be chronologically sensitive locally, regionally, or more broadly across Ontario Iroquoia.

Willian, James and Winston Hurst

[313] *Now You See It: Ethnohistoric Archaeology in the Bluff, Utah, Area*

The archaeology of protohistoric-historic native groups in the southeast Utah can be challenging. Surface evidence for Navajo, Ute, and Paiute camps, particularly earlier ones, are oftentimes minimal and go unrecognized, either literally or in terms of significance. Alliance and kinship ties between these cultures further complicate the picture, as the presumed correlation between certain feature types and culture is not absolute. Recent archaeological work in the greater Bluff, Utah, area, reveals an ever more detailed picture of ethnohistoric occupation and life ways in the region. At the heart of this effort was the multiyear Comb Ridge Heritage Initiative (CRHI) project. Among various research priorities, the CRHI emphasized recognition and documentation of ethnohistoric sites, providing a springboard for ongoing research. A crucial step forward in revealing the extent of Ute occupation in the area, was the first ever identification of tipi rings in southeast Utah. While historic tipi use was known for the area, the conventional view was that tipi rings were absent. Additional sites with tipi rings continue to be recognized in the greater Bluff area, indicative of a broad Ute presence on this landscape, a presence that has been chronically underrepresented in the archaeological record.

[151] *Specialized Production Sites among the Virgin Branch Puebloan People? New Findings in Shivwits Plateau*

Archaeology on the Parashant National Monument

During the summer of 2018, the University of Nevada, Las Vegas Shivwits Research Project conducted an archaeological survey and documentation project on the remote southern end of the Shivwits Plateau. This region has seen little anthropological research since it was first explored by archaeologists in the early to mid-20th century. Our study specifically focuses on settlement patterns and landscape usage in hopes of better understanding the role and function of small one to two room sites in the area. Traditionally these sites have been referred to in the survey literature as “field houses;” however, whether they are or not is currently unknown. While many of the locations for these small sites documented during this survey were in areas adjacent to land suitable for agriculture, many others were found in locations where agriculture would not have been optimal. Furthermore, evidence for specialized activities, such as hide processing and rituals, has been found at several of these small sites. Our paper presents the variation in the assemblages documented at these sites and discusses their implications for Virgin Branch archaeology.

[145] *Domesticity, Trade, and Warfare: An Analysis of Three Early 17th Century Indigenous Domestic Sites in Southern New England*

One of the most iconic moments of the Pequot War was the massacre at Mystic Fort, an event which occurred on May 26, 1637 and took the lives of hundreds of Pequot men, women, and children. Immediately following the massacre, the English retreated back to their ships and were followed by returning Pequot warriors. Throughout the process of documenting this retreat route, to later be called the Battle of the English Withdrawal, Kevin McBride, in collaboration with researchers from the Mashantucket Pequot Museum and Research Center and local metal detectorists, discovered multiple seventeenth century Pequot domestic sites. These sites represent the “largest assemblage of early seventeenth century indigenous sites associated with a single Native group ever identified in southern New England” (McBride et al. 2016:20) and are dated, based upon their material signature, to between 1611 (the arrival of the Dutch) and 1637 (the conclusion of the Pequot War of 1636-1637). This paper will discuss the diagnostic artifacts recovered from each site thus far and the spatial organization of these artifacts. This research has implications for better understanding early 17th century indigenous settlement patterns and early trade interactions in southern New England.

Wills, Chip (University of New Mexico)

[189] *Archaeology of the Wetherill Trading Post in Chaco Canyon*

The Wetherill Trading Post and homestead at Chaco Canyon, New Mexico, was at the intersection of a nascent professional archaeology in the American Southwest, the emergent trading post economy in the Four Corners region, the establishment of national monuments through the Antiquities Act, and the creation of a culture history for indigenous people rather than by them. The sociocultural and political dynamics surrounding the Wetherill Trading Post continue to have profound consequences for archaeological research and historical preservation. In 1910, the Wetherill Trading Post changed management but the physical plant continued to grow and became the core of the National Monument’s administrative and visitor facilities. The buildings were leveled in 1952 with little documentation and the trading post complex largely disappeared under windblown sand and vegetation. The University of New Mexico has conducted investigations at the trading post since 2007 which suggest that some of our understanding about the prehistoric period has been masked or misled by historical landscape modification.

[171] *It's the Faunal Countdown! Analysis of Faunal Remains from the 2017 Excavations at the Ryan-Harley Site, Wacissa River, Florida*

In 2017, the Florida State University underwater field school conducted excavations of the middle-Paleoindian Ryan-Harley site (8JE1004) in the Wacissa River in northwest Florida. These excavations recovered significant faunal remains from three one-meter units in association with lithic artifacts, potentially representing a Suwannee-aged disposal midden. Previous research at the site, the only known single-component Suwannee site, has indicated that faunal materials represent a broad-spectrum subsistence adaptation. The current analysis focuses upon contextualizing the new faunal remains within the known site dataset. Fabric analyses are conducted in tandem with more traditional zooarchaeological methods in order to discuss site formation processes in combination with Middle Paleoindian subsistence strategies.

[254] *Nature and Organization of Ceramic Production During Early Phases in the Chuska Valley*

Examination of pottery recovered during recent investigations of the Navajo-Gallup Water Supply Project include the recording of stylistically-based typological categories and descriptive attributes relating to the manufacture and exchange of pottery vessels. This data provides clues relating to changing strategies of pottery production and community ties spanning seven centuries. Trends discussed here relate to important changes associated with the earliest ceramic periods (Early Basketmaker III through Late Pueblo III period) that provide among the best evidence relating to a series of shifts in the influences, organization, and nature of ceramic production and exchange. Such observations are critical to a better understanding of the early development of Pueblo adaptive strategies and lifeway.

[357] *Building Bridges: Federal, State, and Tribal Collaboration on the US 101 Elwha River Bridge Replacement Project, Washington State*

Dam removal is restoring the culturally significant ecosystem of the Elwha River on Washington's Olympic Peninsula, but the resulting increase in water flow at the US 101 Elwha River Bridge has accelerated erosion at pier foundations, necessitating replacement. Ethnographic and archaeological evidence indicate the area surrounding the bridge has been used for thousands of years by the Klallam people and contains important information about the early to middle Holocene prehistory of the Elwha River valley. In collaboration with the Washington State Department of Transportation, National Park Service, and the Lower Elwha Klallam Tribe, Archaeological and Historical Services supported compliance efforts by conducting geomorphological studies, intensive survey, and National Register of Historic Places (NRHP) evaluative testing, resulting in the identification of three archaeological sites considered eligible under NRHP criteria A and D. Details of the compliance process and the sites' Section 4(f) implications are discussed, as well as the project's contributions to the regional knowledge of pre-contact groups in western Washington.

[348] *Drought, Diet, Demography, and Diaspora during the Mississippian Period: A View from the Central Illinois River Valley*

For decades archaeologists have conjectured about the impacts of climate change on the distribution of Mississippian and related pre-Columbian populations in midcontinental North America. Until recently, climatological reconstructions were

coarse grained and lacked the temporal and spatial resolution to link in any substantive way with archaeological datasets on settlement size and distribution, subsistence, population movement, and biological relatedness. By that same token, archaeologists working in this region are only beginning to assemble operative databases to assess the relationship between the distribution of people and climate change. In this paper we examine the emergence, trajectory, and eventual decline of Mississippian polities in the central Illinois River valley (CIRV) of west-central Illinois. As a proximate hinterland to Cahokia and the American Bottom, the CIRV witnessed the development of early 11th century Mississippian centers, late 12th and 13th century consolidation into fortified towns and villages, and regional abandonment as part of the Vacant Quarter by the early 15th century. We investigate the variance in paleoethnobotanical, bioarchaeological, and settlement datasets from a series of time-transgressive Mississippian sites in the CIRV, comparing them to our recently developed high-resolution, multi-proxy lake sediment records that track midcontinental hydroclimate patterns over the last 2,000 years.

Wilson, Kurt (University of Utah) and Brian Coddig (University of Utah)

[65] *The Marginal Utility of Inequality*

The emergence of hereditary social inequality resulted in enormous impacts on human history, yet its causes remain heavily debated and unexplained. Here we propose and evaluate an environmentally informed model explaining the emergence of social inequality based on the interaction between circumscription and environmental inequality. We demonstrate how the combination of the two conditions results in situations where social inequality, as the best of bad options, may represent the optimal decision. Crucially, we demonstrate how inequality affects the payoffs for both dominants and subordinates, suggesting an explanation for its persistence. We then test this model ethnographically, using generalized linear mixed models on data from the Standard Cross-Cultural Sample. Our initial results support the model hypothesis that increasing circumscription and environmental inequality correlate with increasing social inequality among documented societies. The model results also suggest articulations with current archaeological inequality ideas, connecting with elite self-interest and collective good arguments. Overall, our research suggests social inequality may emerge as a result of dynamic ecological conditions.

[67] *Modern versus Prehistoric Hafting Mediums: Are They Comparable?*

This paper examines the performance of three different projectile point hafting mediums in order, to determine whether thermoplastic adhesive is an applicable medium to use in archaeological experiments concerning projectile point ballistic experiments. The study examines ninety, triangular projectiles (thirty points hafted with each of the three mediums): one group is hafted with the thermoplastic adhesive while the other two, organic-based medium groups will consist of a wood-resin pitch glue and a collagen-based hide glue, all fired into a domestic pig carcass. The statistical analysis from each group will offer insights regarding the performance of modern mediums in archaeological experiments.

Windes, Thomas (University of New Mexico, Department of Anthropology)

[313] *Hard Times and Mobility in Thirteenth-Century SE Utah: A Chronometric Study*

Large areas of the western Northern San Juan Region were repopulated in the early AD 1100s and mid AD 1200s, but the overall lack of systematic chronometric dating has complicated our understanding of events during these critical periods of settlement and abandonment. The Wood Project has assisted federal land managers in documentation of intact and semi-intact dwellings throughout southeastern Utah that are suffering from increased visitation, natural deterioration, and the threat of energy extraction. Our work has endeavored to systematically document intact building sites in basins and canyon systems throughout the area, in order to provide base-line information for the visible fragile structural wood remains, architecture, and additional cultural materials. In many cases, these wood elements and other remains have never been systematically recorded, even though they have the potential to greatly refine the temporal aspects of the late Ancestral Puebloan occupations and the subsequent final depopulation of the region by these people. Dates and detailed architectural documentation from our work on Cedar Mesa, and larger region, provide a new subset to add to the growing interest in the prehistory of the area.

[409] *Using LiDAR and Environmental Suitability Models to Predict Probable Locations of Ancient Settlements in Manabí, Ecuador*

In recent years, LIDAR has gained popularity among archaeological researchers for its capability to reveal ancient settlement features hidden beneath dense vegetation coverage in heavily forested areas. More often, these studies have revealed undocumented monumental architecture and in some cases modified landscapes such as agricultural terraces, canals, and elevated causeways. Recently, we processed LIDAR flown over Cerro Jaboncillo, Manabí, Ecuador. Earlier surface reconnaissance revealed a landscape dotted with dispersed Manteño settlement features and modified landscapes. We developed a bare earth model and subjected the data to a geographic information systems based suitability modeler that employs drainage, slope degree, networks, and other factors to predict the probable location of previously unknown settlement units. Our modeler revealed that the scope of settlement at Cerro Jaboncillo was much more extensive and heavily engaged in intensive agriculture than previously known as well as provides possible indications of a settlement hierarchy and social stratification.

Winnick, Meg

[3] *Artifacts and Lesson Plans: Using 3D Technologies to Teach Archeology*

Archeology education initiatives can benefit from 3D technologies to develop further engagement between archeological artifacts and the public. In the summer of 2018, the National Park Service in collaboration with the National Council of Preservation Education crafted a project to help NPS write guidelines for parks developing 3D printed artifact lesson plans. The goal of the project was to make park resources available on site and digitally. The project produced two lesson plans, one based on an already existing collection of 3D artifacts and one based on an artifact that had not yet been scanned. Both lesson plans were in keeping with the NPS goals, to utilize new sciences and technologies to educate and promote stewardship among the public. This paper will address the project challenges for implementing 3D technology in education programs while offering solutions to those challenges. Archeology has become invaluable as an interpretive tool, and 3D technologies can help archeologists and educators engage communities in a more meaningful way.

Wintch, Kenneth, Deanne Matheny and Ray Matheny (Brigham Young University)

[420] *Surveying Montezuma Canyon*

This paper presents the history of archaeological surveys by Brigham Young University in upper and middle Montezuma Canyon during the latter half of the 20th Century. The sequence, methods, context and goals of those various inventories are briefly presented, followed by a brief discussion of salient results and patterns of aboriginal settlement and occupation in the canyon. Lastly, we present an idea of our research orientation from here forward, as we work toward a canyon-wide summation of what has been learned about the Montezuma Canyon drainage during BYU's work there in the 20th Century.

Wisner, Gavin (Northern Arizona University)

[374] *A Zooarchaeological Analysis of Caves Branch Rockshelter and Sapodilla Rockshelter*

This poster provides an analysis of faunal materials from mixed deposits in both the Caves Branch Rockshelter (CBR) and Sapodilla Rockshelter (SDR) in Central Belize. This analysis continues previous research at the two sites from contexts spanning the Protoclassic to Terminal Classic temporal periods concerning ancient Maya ritual and mortuary behaviors. The composition of fauna from both rockshelters demonstrates similarities and differences between animal use at the sites and articulates the practices leading to the deposition of faunal remains. Analysis of materials followed methods used at the

Northern Arizona University, Department of Anthropology, Faunal Analysis Laboratory (NAUDAFAL), including standard procedures for identifying elements, taxonomic categories, and taphonomic features. For example, evidence of burning illustrates one of the primary taphonomic features present on these faunal remains. These data are further understood and interpreted through the context in which they were discovered, primarily location within the cave and associated artifactual or mortuary materials.

Wissler, Amanda (Arizona State University) and Nicolas Gauthier (Arizona State University)

[9] *The Frailty-Mortality Paradox: Insights from the Spanish Flu Pandemic of 1918*

The difficulty of inferring health from skeletal remains is an enduring problem in bioarchaeology. The concept of “frailty” has emerged as a convenient tool for relating observed skeletal lesions to human health and mortality, yet the biases inherent in archaeological samples have left the concept undertheorized. It remains unclear whether frailty should be considered an unchanging property of individuals - an innate risk of death - or whether frailty depends on changes in an individual’s external environment, such as a major epidemic event. We analyze a sample of 193 individuals who died during the Spanish Flu pandemic of 1918, when healthy young adults (traditionally the least frail segment of the population) were most severely affected. We present data on age-at-death, and several nonspecific indicators of skeletal stress, and use a multi-state hazard model to show how the relationship between frailty and risk of death varied over the course of the pandemic. We discuss how a more rigorous approach to the concept of frailty in modern populations can improve our understanding of disease, mortality, and the determinants of health in the ancient world. These results suggest that frailty should not be considered in isolation from the physical and social environment.

Wistuk, Bronson (Binghamton University)

[250] *Quispi Rumi: Geochemically Sourcing Obsidian from the Patipampa Sector of Huari*

From 2017-2018, over 1,000 obsidian artifacts were excavated from the Patipampa sector of Huari, once the administrative capital of the Wari state. During the 2018 season, over 350 artifacts were analyzed via portable X-ray fluorescence (PXRF) and then fingerprinted to Andean obsidian sources when possible. Artifacts found within architectural spaces were prioritized, aiding the understanding of non-elite spaces in the capital city. This paper focuses on obsidian’s role in state power, the economy, and cosmopolitanism as lived by the people of Huari. The presence or absence of local and exotic obsidians draws attention to how the Wari chose to exploit or not exploit the Ayacucho Region’s resources. While this assemblage is from a single, small sector of the city, it is the most extensive geochemical investigation of obsidian excavated from Huari to date.

[421] *“Once an Indian Village:” The Buffum Street Site, Dispossession, and Contested Municipal Landscapes in Buffalo, New York*

The Buffum Street Site in South Buffalo, New York, is the location of a multicomponent Seneca Village, with an historic component dating between AD 1780 and 1844. This village served as the focal point of the Buffalo Creek Reservation, and important cultural features such as a mission church, the first permanent school in Buffalo, ancestral mounds, and burial grounds within an earth ring were present. The famous Seneca orator, Red Jacket, lived here while he fought against the loss of the Seneca land base. After the sale of the Buffalo Creek Reservation in the 1840s, the land has been slowly parceled off and is now the site of a suburban neighborhood. A 6.8 acre lot surrounding the former Public School 70 and the 1.6 acre Seneca Indian Park are all that remains of this important cultural and historic landscape. However, a major development involving the school threatens what remains. Despite knowing of the area’s importance to the Seneca people,

municipal boards have approved the proposed changes; these approvals have been contested in court. This paper will present the site's history, and link municipal actions with the ongoing pattern of colonial dispossession experienced by the Seneca people.

[290] *Comparison of Slip Colors from Andean Styles*

Rescue excavations conducted at the Terminal Terrestre site in Moquegua, Peru recovered a diverse collection of complete ceramic vessels representing several styles dating to Terminal Middle Horizon (900-1100 CE), Late Intermediate period (1100-1400 CE), and Late Horizon (1400-1532 CE). Through the use of portable X-Ray Fluorescence (pXRF), over sixty vessels of the Chiribaya, San Miguel, and Inka styles were examined for differences in paste, slip, and pigment chemical compositions. The sample features vessels that use diverse colors, distinctive motifs, and difference production technologies. Pottery from the Terminal Terrestre were compared to examples from Cerro Baúl and Cerro Mejía. The focus of the analysis is to determine if the use of pigments as slip colorants changed overtime and were more restricted with the local Chiribaya and San Miguel versus the imperial styles of the Wari and Inka.

[36] *Hot Rock Cooking of Desert Lily and Winding Mariposa*

We describe Late Holocene hot rock roasting of desert lily (*Hesperocallis undulata*) in the Salton Basin of southeastern California, and winding mariposa (*Calochortus flexuosus*) near the Virgin and Muddy rivers confluence in southern Nevada. We briefly note differences but focus on similarities in these two arid region plant foods, and their use by sedentary groups from adjacent areas. Desert lily use probably peaked with periodic population influxes associated with Colorado River divergences into the Salton Basin. Winding mariposa appears to largely antedate the Western Virgin Puebloan settlement, possibly marking a wild carbohydrate option for the resident human population prior to fully committed maize-based farming.

Wold, Arthur (University of Iowa)

[47] *Environmental Reconstruction Using Molluskan Faunal Remains at Woodpecker Cave*

Woodpecker Cave is a Late Woodland rock shelter site in Johnson County, Iowa, and was the location of a field school operated by the University of Iowa from 2012-2018. During seven field seasons, over 25 kilograms of mussel shell were recovered; many of these were small, unidentifiable pieces found in screens. Shell hinge morphology is the key to identifying species, and from 3300 fragments containing hinges, over 2700 specimens were identified. Mussel shells are uniquely suited to inform us about ancient environments because they are very sensitive to environmental changes. This has also meant they have been the subject of a large amount of ecological research, and those findings are often applicable to species present in the Woodpecker Cave assemblage. This poster uses an interdisciplinary approach to help characterize the state of the Iowa River near Woodpecker Cave during the Late Woodland, and more generally, explores which environmental factors freshwater mussel remains are best suited to inform us about.

Woldekiros, Helina (Washington University in Saint Louis)**[242]** *The Social and Economic Context of Salt Production and Distribution in the Horn of Africa: Past and Present*

Salt was a significant item of trade in the Horn of Africa for at least 2000 years. It was valued by both mobile pastoralists and settled agriculturalists. It is also one of the few commodities for which direct archaeological evidence is lacking. Archaeological and ethnoarchaeological research conducted on the Afar salt trade route in northern Ethiopia provided contextual evidence on the production and distribution of salt from the Aksumite period (450 BCE-900 CE) to the present. Ethnoarchaeological and textual evidence showed that rock-salt was the primary type of salt traded on this ancient trade route. Contemporary highland farmers and lowland mobile pastoralists using donkeys, mules and camels transport about 20,000 tons of salt annually. The research shows that the pace and speed of salt production and distribution are determined by the logistical requirement of the Afar trade route. Analysis of lithics, ceramics, plant, and animal remain collected from campsites, rest-areas, small-towns, and villages located along the trade route provide proxy data for salt distribution in prehistory indicating regional participation in salt trade.

[242] *Chair***Wolf, John and Nicole Slovak****[315]** *John Rick and New Technologies for Archaeological Research / John Rick: The Ultimate Authority*

John Rick has been an advocate for the application of new technologies to archaeological field investigations, throughout his career. He has been devoted to training his students in the use of those technologies. Recently, the project he co-directs at Chavín de Huántar has added Stanford engineering students to the field team. Conceived as an aspect of the on-going conservation efforts at the site, the engineering students and their projects have become fully integrated into the broader investigations at Chavín. The 2018 field season saw the introduction of robot technology to the exploration and artifact recovery efforts within the restricted canal and gallery spaces. The prospects for further engineering applications to archaeological research hold great promise for both disciplines and is a fitting legacy for John Rick, as archaeologist, teacher, and mentor. John Rick's contribution to theoretical discussions on the origins of authority and the distinctions between system-serving and self-serving systems are the focus of Nicole Slovak's presentation. John's leadership style both in the classroom and in the field embodies a kind of system-serving model that promotes inclusion and equanimity within the archaeological community, and which can serve as a model for archaeological collaboration and research in the twenty-first century.

Wolf, Marc (GC CUNY) and Thomas Guderjan (Maya Research Program [MRP])**[30]** *Filling in the Maya Mosaic of Northwestern Belize: Survey and Mapping at MRP*

For several decades, MRP (Maya Research Program) has been working to amass an enormous base of survey and mapping data from the Three Rivers (Blue Creek, Bravo, Booth's) and upper La Lucha escarpment region of Belize. Over 50 archaeological sites have been precisely recorded using innovative technologies and techniques that complement other projects within the area, both internally—admirably at the nearby Program for Belize lands by the many University of Texas projects centered around massive sites like La Milpa and its sustaining area—and internationally like the work conducted within view-shed of the giant Alacranes bajo system of Mexico across the border. These mapping efforts have been supported by a vast network experienced excavators, archaeobotanists, conservators, water management specialists, GIS technicians, soil scientists, bioarchaeologists, artists, engineers, topographers, chemists, education professionals and other social and physical scientists. This discussion will focus on a selection of these sites and some of the noteworthy research methods that has been successful in lending greater geographical and cultural context to this area of Belize.

[308] *Of Longhouses and Lineages: Evaluation of Transformations in Maritime Archaic Social Organization in the Far Northeast*

The social organization of Maritime Archaic groups of Newfoundland and Labrador is notoriously difficult to assess due to poor preservational environments, challenging logistics of working in the Subarctic, and a paucity of research directly applicable to such questions; however, a long chronological sequence of their residential architecture and mortuary patterns has been documented that suggests that it may have undergone significant transformations in the Middle Holocene. While several researchers have proposed various causal elements that contributed to these transformations, a focused evaluation of how descent and residence patterns contributed and/or were affected by these shifts across the Maritime Archaic range is lacking. Part of the reason for this is that their world was vast and seemingly stretched beyond the ability to maintain direct social connections; yet, despite large distances, the material culture suggests they maintained some form of social relatedness even as we see regional variations develop in their socio-economic strategies. In this paper we discuss data from Maritime Archaic houses and burials from different periods and evaluate the possibility that they represent significant transformations in their social organization, including their descent and post-marital residence patterns.

[128] *Exploring Seasonal Aspects of Past Herding Systems Using Bayesian Modeling of Animal $\delta^{13}C$ and $\delta^{18}O$ Enamel Isotopic Profiles*

Intra-tooth samples of enamel $\delta^{18}O$ and $\delta^{13}C$ isotopic values produce isotopic profiles that reflect seasonal fluctuations in temperature, precipitation, and dietary composition. Archaeologists have interpreted trends found in animal isotopic profiles to estimate birth seasonality and to elucidate past management strategies (e.g., seasonal foddering) and variability in these aspects of herding systems across communities and over time. These research aims rely on comparisons of isotopic profiles. To help standardize such comparisons across teeth, Balasse and colleagues (2012) developed parametric summaries of isotopic profiles. These summaries typically work best with an intensive intra-tooth sampling strategy, however, preservation and budgetary constraints preclude this approach in all situations. This poster explains how to estimate isotopic profiles precisely using Bayesian statistics. Fitting a seasonal regression model to isotopic profiles of enamel $\delta^{18}O$ and $\delta^{13}C$ values in sheep and cattle teeth, researchers can produce parameter estimates and uncertainty statements surrounding isotopic profiles for teeth sampled as few as 5-6 times. This method may greatly expand the sample of specimens an archaeologist can use to explore seasonal differences in herds' diets and birth patterns as well as the strength of seasonality in the past. Model outputs also provide a straightforward way to evaluate hypotheses probabilistically.

[286] *Identification of Bilateral Congenital Radioulnar Synostosis in an Early Horizon Burial from the Site of Atalla, Peru*

Bioarchaeological research can help trace the development and distribution of rare pathologies across space and time, aiding in our understanding of how past peoples experienced and made sense of a variety of conditions and diseases. Congenital radioulnar synostosis (CRUS), a developmental condition resulting in fusion of the proximal radius and ulna, is one such pathology rarely identified in the archaeological record. This presentation introduces a prehistoric case of bilateral CRUS observed in a subadult excavated at the site of Atalla in the Huancavelica region of Peru. Atalla is a large early

village site with monumental public architecture and long-distance trade connections with other areas of Peru. The subadult, which dates to the Early Horizon (ca. 800 BCE) occupation of the site, was interred flexed in a simple oval-shaped pit associated with a nearby feature of a roughly circular arrangement of angular stones and rounded cobbles. This example is only the second case of CRUS reported from Peru and may represent the earliest case identified worldwide.

[75] *Beyond Data Recovery: Developing Mitigation for the Public Benefit in Washington State*

For historic properties such as archaeological sites and historic buildings, data recovery or documentation is often the predominant mitigation strategy offered by federal agencies when a cultural resource will be impacted by a federal undertaking. By extracting important information before destruction, we recover some part of a historic resource's informational value and address important questions of science, engineering, and culture. But all too often, for everyone except cultural resource professionals, recovered data disappears into an inaccessible sea of grey literature. The Washington State Historic Preservation Office has been implementing creative mitigation strategies that have ranged from incorporating historic mining resources into a private resort development to developing web-based GIS systems in order to increase access to cultural resource information in ways that are responsive to the needs of the public, Tribes, and scientific communities.

[298] *Who Attended Their Funerals? A Petrographic Comparison of Pottery from the Majiayao Culture of Neolithic China*

In northwestern China's Gansu Province, painted pottery from the late Neolithic Majiayao Culture has long been admired for its skillful construction and beautiful painted motifs. Since the majority of whole vessels have been recovered from graves, it has generally been assumed that these items were produced primarily for mortuary purposes, including for displaying wealth or projecting the political or religious power of the deceased. This paper reassesses these claims in light of a petrographic analysis of sherds from nearby mortuary and habitation contexts. By examining the production processes embedded in these items, including producer choices in paste recipes and raw material selection, as well as surface treatment, I suggest that vessels from mortuary contexts are not simply displaying wealth or power. Instead, they likely reflect diverse communities of producers and consumers who were directly participating in funerary events. These results highlight the importance of examining production choices alongside vessel style and context when interpreting the role of pottery in mortuary settings.

[48] *The Environmental Context of the Magdalenian in the Lone Valley of Southwest Germany*

The Swabian Jura of Southwest Germany is home to some of the best studied Paleolithic archaeological sites in the world. These sites have diverse artifact assemblages that include bone and lithic artifacts, art objects, combustion features, microfaunal remains, and archaeobotanical remains. This diversity allows researchers to reconstruct past environments from sources that lie in direct association with cultural remains. Although studies in geoarchaeology, archaeobotany, geochemistry, and paleontology have reconstructed Paleolithic environments at these sites, very few reconstruct the local conditions during the Magdalenian. The Magdalenian (~16.3 to 12.7 cal kyr BP in Southwest Germany) has distinctly regional settlement patterns that are, at least in part, a result of local environmental conditions. We use faunal remains from Langmahdhalde, a recently discovered rockshelter site in the Lone Valley of the Swabian Jura, to reconstruct local-scale Magdalenian environments and climates. These reconstructions are based on microfaunal analysis and carbon and nitrogen stable isotopic analysis on horse (*Equus ferus*), red deer (*Cervus elaphus*), and reindeer (*Rangifer tarandus*) archaeofaunal remains. We use these data to discuss the characteristics of local ecosystems in the Lone Valley during the Magdalenian and apply this to current interpretations of settlement patterns during the Magdalenian in the Swabian Jura.

Wonson, Katherine (National Park Service)**[85]** *The Vanishing Treasures Training Program- Closing the Skills Gap*

Vanishing Treasures (VT) began its training program in 2014 with five trainings and 90 trainees. Today, we have trained over one thousand people and hosted 90 trainings. Our growth has been guided by A Technical Preservation Needs Assessment and Training Strategy completed in partnership with the University of Pennsylvania. This document outlined the major skills gaps and resource preservation training needs in the NPS and identified a core curriculum and training delivery strategy for the VT program. As we have implemented this strategy, we have learned many lessons along the way and identified further training needs not met by our training offerings.

This session will explore the development of the training program, lessons learned and future directions for providing education on the preservation of traditional resources. We will also share ways in which our training program complements the project and technical assistance arms of the VT program.

Woo, Katherine (The University of Sydney)**[240]** *Shifting Palaeoeconomies in the East Alligator River Region: An Archaeomalacological Perspective*

The East Alligator River Region (EARR), Australia, has undergone considerable environmental change throughout the Pleistocene and Holocene. Rising sea-levels and changing climatic conditions drastically altered the environments and ecosystems of this region, forcing its inhabitants to adapt their economic strategies in order to successfully exploit these new and evolving landscapes. Throughout these shifting environmental sequences molluscs have played an important role in the economic activities of people, as demonstrated by the abundance of molluscan material found in sites throughout the region. Molluscs have rarely been analyzed in detail in the EARR, resulting in a poor understanding of their role in the past economies of the region. Given that molluscs provide critical information on both past economic and social activities and environmental conditions, this gap in the literature is clearly one which must be addressed. This research fills this gap through the detailed and holistic analysis of two rockshelter sites in the region: Madjedbebe and Ngarradj Warde Djobkeng. A multifaceted approach, which utilizes current zooarchaeological methods and biological and ecological information, has been used to critically evaluate and build on current archaeological and environmental models for the region to provide a more comprehensive picture of past societies in the EARR.

Woodard, Buck (American University)**[14]** *Representing Historical Culture on the Big and Small Screen: Success and Challenges from the Algonquian Chesapeake*

In what ways can archaeology and historical anthropology contribute to popular media representations of the past, and what responsibility do consultants have to ensure accurate portrayals of the peoples and cultures they study? For projects that combine dramatic performance, scholars and indigenous descendant communities, the drive for “authenticity” is often conjoined and conflicted with artistic license, romanticism and contemporary politics of representation. Television and film work that wish to access “real” Native people and culture must often contend with the impacts of colonialism, issues of narrative ownership and the negotiation of cultural authority. The outcome of civic engagement and collaboration can however, produce notable results that satisfy multiple stakeholders.

Woodcock, Rachel [37] see LeFebvre, Michelle

Woodcock, Rachel (University of Florida) and William Keegan (Florida Museum of Natural History)**[170]** *Measuring Seasonality in Codakia orbicularis Clams from Lucayan Sites in the Bahamas*

The shells of *Codakia orbicularis* clams are common at archaeological sites throughout the Bahama archipelago. These clams were harvested as food, and their abundance indicates that they were processed in habitation areas. Previous studies have suggested that the shells record daily, tidal, and seasonal growth sequences that can be used to determine when during the year that the living animal was harvested. However, there are a number of problems with those earlier studies that need to be addressed before clam shells can be exploited to their full potential. This study examines a large number of recently harvested living animals and compares them to archaeological specimens from the central Bahamas. Visual observations of cross-sectioned shells, along with carbon and oxygen isotope measurements, are used to develop a model of *Codakia* growth that can be used to determine the time of year when specific shells were harvested. In addition, the isotopic signatures should contribute to the refinement of paleoclimate models for the medieval Warm Period which coincides with the Lucayan occupation of the Bahamas.

Woodfill, Brent (Winthrop University)**[303]** *El Aragón: A Late Classic Town in Highland Alta Verapaz*

In April 2018, members of Proyecto Salinas de los Nueve Cerros were contacted by a local contractor who found something he said was of archaeological importance. Upon examination, he had uncovered the largest figurine workshop yet discovered in Mesoamerica. After receiving emergency financing from the National Science Foundation, project members conducted a salvage excavation of the site in July of the same year. Although El Aragón has been heavily damaged by the growth of Coban over the past 60 years, team members were able to recover important information about figurine manufacture, interregional ties, and the economic foundation of this important site in a heretofore uninvestigated corner of the Maya world.

Woodhead, Genevieve (University of New Mexico)**[380]** *You Spin Me Right Round: Reading Southwest Indented Corrugated Pottery for Movement and Directionality*

Corrugated vessels are ubiquitous in the northern U.S. Southwest, and yet their research potential is often overlooked. This study examines corrugated pottery to determine how much uniformity or variability goes into the process of manufacturing these everyday, utilitarian objects. The sample comprises Ancestral Puebloan and Mogollon corrugated vessels from the collections of the University of New Mexico Maxwell Museum, the Museum of Indian Arts and Culture, and the University of Colorado Museum of Natural History. I evaluate a potential relationship between coiling direction and indentation angle. Because corrugated vessels memorialize their own making, they shed light on the ceramic production process broadly. They also act as specific testaments to prehispanic pottery-making practices.

Woodland, Carol (University of New Mexico) and Keith M. Prufer (University of New Mexico)**[174]** *Comparative Stable Isotopic Analyses between Dental Enamel and Bone Collagen among Central American Archaeological Samples Spanning 8,000 Years*

Carbon, Nitrogen and Oxygen stable isotope analyses are popular tools within the field of archaeology. Applications for stable isotope analyses of human and faunal bone collagen and dental enamel include environmental reconstructions, modeling subsistence patterns, and investigating human-animal relationships, as well as potential to better understand human and animal physiology as it relates to carbon.

Using materials from two rock shelter sites in the Maya lowlands of southern Belize with a 10,000 year continuous use history, this project examines the relationship between $\delta^{13}\text{C}$ in tooth enamel and in bone collagen. We analyzed paired dental enamel and XAD purified bone collagen from 40 skeletons of humans and animals from two rockshelter sites in Belize dating from 9000-1000 BP. We present data on the offset between $\delta^{13}\text{C}$ from collagen and enamel within functional groups or taxa. We assess if there is a relationship between animal diet and $\delta^{13}\text{C}$ collagen-enamel offset, as well as if there is a change in the offset between human foragers and agriculturalists. Finally we assess the relationship between enamel

δ18O and enamel-carbon offsets, and suggest some physiological processes to explain the overall differences.

[255] *Replication Experiments: The Devil Is in the Details*

The manufacture of Mesoamerican flaked stone “profiles” involved a multi-step sequence from large percussion blank to detailed finishing using pressure-flaking. This paper explores issues involved with this last stage. Included is the shaping of head profiles often with elaborate headdresses; facial features including nose, eyes, ears, and mouths; arms and legs sometimes with digits; and an array of decorative margins including undulations, serrations, deep notches, and other complex repetitive patterns. During final shaping of a profile, a small flaking error would be catastrophic requiring substantial repair, a complete change in intended design, or discard. A distinctive Maya nose could become a diminutive “beak”, or a delicately serrated serpent tail could look like a saw with a tooth missing. This paper will summarize experiments using smaller preforms to illustrate the effects of miscues and attempted repairs of delicate margin features.

Woodson, Kyle [194] see Medchill, Brian

Woodson, Kyle (Gila River Indian Community) and Chris Loendorf (Gila River Indian Community)

[246] *Platform Mound Communities along the Middle Gila River*

Extensive archaeological evidence shows that major shifts in settlement patterns occurred over time within the Phoenix Basin, and it appears that population densities along the lower Salt and middle Gila Rivers fluctuated through time, such that periods of high density along one stream correspond with concurrent episodes of low density along the other river. When Platform Mound communities were at their height during the late Classic period, population density appears to have been comparatively low along the middle Gila, with only 12 Platform Mounds at 11 sites compared with 52 Mounds at 31 sites along the lower Salt. In contrast, much larger settlement areas such as Snaketown were present in the same area during the Preclassic period, and data show that during the Classic period many people moved either upstream to the Casa Grande area, or north to the lower Salt River and the Tonto Basin. The middle Gila and lower Salt Rivers have divergent stream flow regimes, which appears to at least partially account for the differences observed in settlement patterns, including the scale of the Platform Mound communities along the two rivers.

[386] *Reconstruction of the Diet at the Iron Age Site of Cvijina Gradina, Croatia*

Cvijina Gradina, located along the Zrmanja River in present day Croatia, was once one of the largest Liburnian settlements during the Iron Age period (6th – 1st century BC). The settlement was prominent in the region’s economic and sociopolitical sphere, leaving behind significant bioarchaeological evidence of diet to be researched. Based on the fragmentary skeletal material excavated at eight grave sites, the MNI is determined to be 41. This study reconstructs the diet of the Iron Age site of Cvijina Gradina through interpretations of stable carbon and nitrogen isotopic ratios. Previous research into the diet of Iron Age settlements at nearby sites suggested that Croatian Iron Age diet was composed predominantly of C3 plants and generally low δN15 values. Researchers theorize this diet was primarily herbivorous, with little contribution from marine food sources. This research contributes to our understanding of regional variability in Iron Age diets. It also establishes a baseline for considering how Romanization during the onset of the first millennium impacted the region.

Wooten, Kimberly (California Department of Transportation)

[69] *The Archaeology of the Color Pink*

Journey with me to the year 2167, where our intrepid archaeologist has made a fascinating discovery... a FOOB! Carefully cradled in its pale pink packaging, this breast prosthetic is thought to have had ritual purposes, and while the prosthetics do not deteriorate over time, intact packaging has never been found in situ before! This presentation uses humor and archaeology to discuss the author’s personal experiences with cancer and the association of the color pink with femininity and breast cancer. The author’s intention is to use this forum to bring to light archaeologists who work with disabilities on a

daily basis and basic legislation that governs treatment of disabilities in the workplace.

Worman, F. Scott (Missouri State University)

[90] *MSU-VCNP Archaeology Field Schools: Collaborative Experiments in CRM Training*

Field schools serve the vital functions of training students in research methods and introducing them to the realities of field-based investigations. Beyond that, they typically have been a venue for faculty to pursue academic research agendas. In the summers of 2015 and 2016, I led field schools in the Valles Caldera National Preserve (VCNP) that focused explicitly on preparing students for careers in Cultural Resource Management (CRM). I worked in collaboration with the Cultural Resources staff of the VCNP to design and complete projects that met their Section 106 and Section 110 compliance needs. The location of the field school in the Jemez Mountains facilitated student interactions with CRM professionals working in a wide range of contexts, including federal and tribal offices as well as museums and the private sector. I weigh the benefits and costs of a CRM-focused field school, emphasizing long-term student outcomes and exploring the specific challenges it presents for faculty and hosts. Finally, I discuss ideas about improving outcomes for all stakeholders.

Worne, Heather (University of Kentucky)

[273] *Care Provision for Victims of Violence in Late Prehistoric Tennessee*

This paper addresses care provision for victims of violent trauma during the Mississippian period in the Middle Cumberland Region of Tennessee. Previous research in the region has identified several cases of individuals surviving incidents of intentional violence. However, there has been little attention given to whether healthcare provisioning would have been necessary for their survival. This paper focuses on the injuries sustained by a middle adult male from a late prehistoric agricultural community in the region. The individual has well-healed blunt or sharp force injuries to multiple facial bones around the right eye orbit. All of the injuries appear to have been caused by a large thin or sharp weapon, such as an axe. Utilizing the Bioarchaeology of Care methodology, his injuries are assessed to determine the possible immediate and long-term impacts on his ability to perform daily activities within the specific biocultural context, and what type of care he likely received from other members of his community. This paper will also discuss some of the trends of non-lethal violent injuries and possible care provisioning throughout the region.

Worth, John (Univ. of West Florida)

[367] *From Accommodation to Massacre: Evolving Native Responses to Spanish Military Expeditions in the Interior Southeast, 1540-1568*

Between 1540 and 1568, three Spanish military expeditions penetrated the interior region of the southeastern United States, interacting on two or more occasions with several Native chiefdoms extending between Alabama and the Carolinas. The army of Hernando de Soto crossed this entire area in 1540, followed by revisits to the western portion of this region by members of Tristán de Luna y Arellano's expedition in 1560, and additional revisits in the eastern zone by Juan Pardo's expeditions between 1566 and 1568. While the Soto expedition was characterized by only short-term stays in any one location in this region, both the Luna and Pardo expeditions involved lengthier stays and thus more extensive interactions with groups previously visited by Soto. Careful comparison of documentary accounts, including several newly-identified sources regarding the Luna expedition, provides fresh insights into the evolution of native responses to these military expeditions across nearly three decades. Native strategies of accommodation and passive resistance ultimately evolved into open hostility depending on the size of the Spanish forces. This evolution ultimately culminated in the Native massacre of more than a hundred Spaniards in five remote forts, leaving the deep interior free of further European intrusions for more than a century.

[33] *What Makes a Forager Turn Coastal? An Agent-Based Approach to Coastal Foraging on the Dynamic South African Paleoscape*

Gram for gram, coastal shellfish have significant benefits over many terrestrial resources. They are higher in calories, fats, and proteins than most plants and are available in denser and more predictable patches than mammals. However, there are costs to foraging coastal shellfish. Foragers may have to travel significant distances to the coast or over-exploit terrestrial resources near the coastal strip. Further, coastal resources are temporally constrained on bi-weekly and daily tidal cycles. Human behavioural ecology (HBE) offers models to assess the caloric and time allocation trade-offs involved, but are insufficient to deal with the complexity of these spatially and temporally dynamic coastal-terrestrial foraging systems. Agent-based Models (ABMs) offer a powerful, underutilized method for building complex HBE models. We present an ABM of the "Paleoscape," a model of a South African coastal region, with agent foragers programmed with the logic of HBE. We model the spatial and temporal dynamics of this foraging system to understand the adaptive trade-offs of what makes a forager go coastal? We show that distance to the coast, costs of residential mobility, caloric returns of coastal vs. terrestrial resources, seasonality, population density, and anticipating tidal cycling all factor into the adaptiveness of a coastal foraging adaptation.

Wright, Aaron (Archaeology Southwest)

[84] *An Ecology of the Patayan-Yuman Dreamland*

The far-western Southwest presents a landscape of wide, once-perennial rivers cutting through a xeric terrain of lava plains and mountain peaks. For the Yuman-speaking tribes tethered to the waterways, this landscape is both physical and metaphysical, in that it is simultaneously the place where people, animals, and spiritual beings reside, as well as the canvas on which the acts of creation played out. Dreaming—traditionally the quintessential religious experience of the riverine Yuman tribes—is the pathway for individuals to transcend space and time and acquire spiritual knowledge and wisdom. While dreaming, one's spirit traverses the physical landscape to reach the sacred places where metaphysical agents and mytho-historical events are grounded. This paper demonstrates the relevance of traditional riverine Yuman religious belief and practice for understanding the relationships their ancestors, known archaeologically as the lowland Pataya, maintained with their surroundings. Our recent research into the geoglyphs, petroglyphs, and trails along the lower Gila River indicates these enigmatic facets of the archaeological landscape are experientially and narratively tied to the dreams of the historic Piipaash and Quechan and their Patayan ancestors. We suggest the practice of creating these designs served to map and materialize the dream experience onto the landscape.

[32] *Construction of Pleistocene Geochronologies in Central Africa: Luminescence Dating in Northern Malawi*

Advances in understanding the Pleistocene archaeology of Africa depend on well-dated models of human behavioral change. Portions of southern Africa with limestone caves and eastern Africa with volcanic tephra have datable materials (uranium and argon, respectively) beyond the limit of the radiocarbon clock (50ka). However, central Africa does not have such deposits and requires the application of alternative dating techniques. Extensive soil formation and cycles of erosion and deposition add further challenges within this context. This paper summarizes a decade of geoarchaeological research in northern Malawi, where a geochronology is built on Optically Stimulated Luminescence (OSL) dating of open-air archaeological sites on alluvial fans. Challenges in OSL dating rifting systems with heterogeneous geologies and dynamic deposition processes will be discussed. However, once considered, these data have proven invaluable in understanding human-induced landscape change and adaptive niche construction within the Pleistocene of the southern portion of the African Rift Valley.

Wright, Joshua (University of Aberdeen)

[161] *Place Making and Ephemerality*

At first the two ideas of this paper's title can seem contradictory, but as three separate words they come together. What is the valency between the hypothesised solidity of an archaeological place and the stream of events that go into making it, transforming it, and erasing it? The ephemeral nature of the archaeological sites created by mobile communities is often the first thing that is said of them and after that comes a long chain of strictures limiting what interpretations are possible. Here I propose a more positive outlook. Using case studies from the Eurasian steppe this paper will search for seemingly ephemeral places and find them as assemblages of many materials. Of primary interest to this discussion will be more mobile subjects ranging from sheep to metals and less mobile ones like stone or drainages. The subject here is not site location models, but an exploration of how places are crafted by the knowledge and action of many actors both ancient and modern.

[253] *Biomolecular Preservation in Dental Calculus from the Teotihuacan Ritual Landscape*

During the Classic Period (AD 1-550), thousands of people migrated to the ancient city of Teotihuacan. This population growth forged Teotihuacan into a center for economic, political, and religious activities for the Mesoamerican region. While archaeological evidence has provided a wealth of information about the state, little is known about its inhabitants. Several interdisciplinary approaches, such as chemical isotope analysis, have generated some data about some individuals, but genetic studies at Teotihuacan remain scarce due to the lack of biomolecule preservation. However, the DNA of dental calculus provides a new source of ancient biomolecules that may be more robust to contamination and degradation than the DNA found in dentine. In this study, we applied shotgun sequencing techniques to four dental calculus samples from two

localities at Teotihuacan. All four individuals lived during the Classic Period. Three individuals were interred within the Moon Pyramid, while one individual was interred within the nearby Plaza of the Columns Complex. Our results suggest that the biomolecular integrity of dental calculus is context-dependent. Although we failed to recover an oral microbiome for three samples, the recovery of one microbiome still expands the geographic and temporal dataset of ancient dental calculus.

Wu, Jing (School of Archaeology, Jilin University, China)

[416] *New Discovery of a Special Site of Liao and Jin Dynasties (907-1234 A.D.) in Jilin Province at Northeast China*

Around 2010, an ancient site was confirmed in the west area of Jilin Province at northeast China, which named Chun-Na-Bo Site Group (春捺钵遗址群). Without any systematical archaeological research, it was considered to have something to do with the Spring Fishing and Hunting Trip of the Emperors of Liao and Jin Dynasties. From 2013-2018, we carried out a lot of targeted investigation and excavation. This Site Group consists of four zones, which all located at grassland area near waters, and the ancient human's activity areas were all distributed on the soil platforms above the ground surface. There are more or less typical relics of Liao and Jin Dynasties in every soil platform, and hardly anything else of other periods. In some excavated soil platforms, we also discovered some special architectural and field life remains. Based on our work, we have two preliminary conclusions. First, the archaeological investigation shows that Chun-Na-Bo Site Group was different from most ancient sites in China. Second, to a certain extent, the characteristics of Chun-Na-Bo Site Group are similar to the historical records about the location and activities of Spring Fishing and Hunting Trip of the Emperors of Liao and Jin Dynasties.

[130] *Exploring the Emergence of the Dian (Shizhaishan) Culture: A View from Settlement Study*

As archaeological data from settlement sites of eastern Yunnan were largely absent until very recently, the Bronze Age culture in the area was interpreted through materials taken from burials around Lake Dian and nearby regions. These mortuary data provide a picture of socially stratified and materially resourceful communities ruled by warrior elites, and are thought to be the material remains of the Dian culture (also called Shizhaishan culture based on the name of the type site). While perceivable opulence in rich Dian graves allude to the advent of complex social formation and political consolidation occurring around 500 BC, questions about the reasons behind the social changes, as well as the process of such changes, are yet to be answered by information drawn from settlement studies. In the light of recent archaeological activities conducted in Dian basin and adjacent areas south of Lake Dian, important data are emerging that will hopefully assist in resolving current issues on the formation of Dian society. Using available stratigraphical and chronological data from these settlement sites, this work will explore issues relevant to the emergence of the Dian culture and society.

[10] *Evaluation of Pleistocene Mammoth Ivory Use and Radiocarbon Laboratory Results from the Holzman Site in Interior Alaska*

The recently discovered Holzman site lies along the west bank of Shaw Creek, a northern tributary of the Tanana River, Interior Alaska. Excavations beginning in 2015 revealed an expedient stone technology alongside well-preserved hearths, avifauna and large mammal remains including a mammoth tusk in deeply buried deposits. Evidence of food preparation and ivory tool manufacture has been dated to at least to 13,700 cal BP making Holzman one of the earliest in the Americas. Radiocarbon dates from separate laboratories are compared alongside a discussion on the importance of distinguishing between ivory scavenging and active hunting activities.

Wyllie, Cherra

[405] *Classic Veracruz Tuxtlas Polychrome Ceramics*

Tuxtlas Polychrome ceramics of south-central Veracruz, Mexico occupy a visible presence in precolumbian museum collections. Boldly rendered deities and zoomorphic figures are the focal point of bowls, plates, and vases, their images alluding to a complex supernatural world. While well represented among the corpus of Classic Veracruz artifacts, these vessels have been effectively ignored by archaeologists and art historians. This presentation attempts to rectify the gap in the material record, examining Tuxtlas Polychromes with regards to their archaeological contexts. Motifs will be considered relative to Classic Veracruz forms and iconography. The enigmatic imagery can often be viewed from multiple perspectives, providing what archaeologist Richard Burger calls "anotropic" readings. This examination is designed to lay the groundwork for future study.

Xian, Yiheng**[78]** *Identification of Turquoises from Different Mining Areas using Lead and Strontium Isotope Composition*

The Hekou Turquoise Mining Site in Shaanxi Province can provide significant clues to the provenance of turquoise in early China. In this study, we analyzed turquoise ore samples from other turquoise mines near Hekou Mining Site in eastern Qinling Mountains and established an origin identification model of turquoise ores using the ratio of lead and strontium isotopes. The lead and strontium isotopes in turquoise ore samples from five mines in the eastern Qinling Mountains were detected using High Precision Mass Spectrometer. These data could be used to explore the provenance characteristics of mines. The samples from the same origin had lead isotope ratios with comparatively good consistency. Turquoise ore samples could be classified into two groups according to the critical value of the lead isotope ratio ($^{207}\text{Pb}/^{208}\text{Pb}$), 0.410. The samples could also be classified into two groups based on the critical value of the strontium isotope ratio ($^{87}\text{Sr}/^{86}\text{Sr}$), 0.7105. In addition, this study found that the combination of the lead and strontium isotope ratios could appropriately distinguish the origins of turquoise ores from these mines. The identification result obtained with the established model indicates that some of Erlitou turquoise ores came from Hekou Turquoise Mine.

Xiaolin, He (Wuhan University)**[299]** *Arrangement of the Handicraft Industry at the Site of Taijiasi in the Shang Dynasty*

The Shang Dynasty-era site of Taijiasi was excavated from 2014 to 2017. Excavations revealed many remains of bronze casting and bone-tool manufacture. This paper focuses on the arrangement of the two different kinds of handicraft. Along with analysis of other house and sacrificial remains, archaeologists can investigate the basic standards of bronze casting and bone-tool manufacture in the Huai River Basin during the Shang Dynasty.

Xie, Liye (University of Toronto), Chun Fu Liu (University of Toronto) and Casey Lun**[361]** *Settlement Relocation and the Emergence of Early Urban Centers in the Heartland of Chinese Civilization, 2500-1600 BCE*

Settlement patterns and social structures shifted significantly around 2500 BCE in the late Longshan era, and again around 1600 BCE when an intraregional state identified with the historical Shang dynasty evolved in the Central Plain, heartland of

Chinese civilization. Our research examines the political transformation from pre-state to dynastic societies between 2500 and 1600 BCE from the perspective of urban formation.

We argue that the Taosi (2300-1900BCE) and Erlitou (1750-1520BCE) urban sites formed from the settlement relocation and nucleation of populations from multiple villages. Multiple lines of evidence support this argument. First, both the Taosi and Erlitou sites are far from previous regional centers. Second, both urban centers appear to have been politically important from their inception. Third, mortuary patterns, pottery assemblages, stone tools, house structures, and dietary traditions within each urban center appear exceptionally diverse, suggesting a complex population makeup.

Although the triggers to this nucleation process remain unclear, the construction of the urban centers involving groups from previously unrelated communities would have provided an environment for social re-engineering, even if the political outcomes were unintended. Therefore, settlement relocation and the construction of the urban centers contributed to the formation of dynastic polities.

[68] *Not Only of Obsidian: The Chert Assemblage in Late Postclassic Tlaxcallan*

Surface survey and excavations of Late Postclassic Tlaxcallan at the site of Tepeticpac recovered various lithic artifacts in addition to the chipped obsidian assemblage. Although the chipped non-obsidian artifacts were far fewer than obsidian artifacts, they were still found throughout the site in both surface domestic and excavated public spaces. Most of the chert recovered comes from Unit 7 on Plaza 4. The varied lithic assemblage at this locality suggests this area represents a public space where some of these items were traded. This presentation will focus on the chert assemblage at Tepeticpac and assess how this industry differed from obsidian chipped stone. More chert manufacture seems to have taken place from earlier stages of reduction than for obsidian, although there are no chert sources close to the site. Given the difference in the type of industry, chert seems to have had a different utility at Tepeticpac, rather than have served as an alternative material for the same uses.

[199] *Entangled: The Shifting Networks That Linked the Classic Maya of Belize's Mopan Valley to Adjacent Regions*

Some Mayanists have eschewed the notion that Classic Maya polities were territorially based, arguing instead that they were constituted through networks of political alliances that were continually reinforced through gifting, diplomacy, and warfare. That idea is our springboard for examining the changing ways in which the Classic-period kingdoms of Belize's Mopan River Valley—Buenavista del Cayo, Xunantunich, and Las Ruinas de Arenal—were entangled in broader political, social, and economic networks that were activated and materialized through the flow of people, objects, and ideas. These flows connected the rulers of these kingdoms to larger powers outside the valley, particularly Tikal, Caracol, and Naranjo—in relationships that varied from antagonistic to collaborative. Some flows penetrated deeper into Mopan Valley society, engaging non-royal elites and commoners as well. Furthermore, although we often focus on hierarchical, top-down flows, other networks were horizontal in nature, creating links between individuals and communities across the broader region. We sketch these various networks, highlight how they changed over time, and discuss how they inextricably linked the Mopan Valley of western Belize into larger dynamics of what is today the eastern Peten and western Belize.

[10] *Between a Rock and a Coastal Place: Analysis of Archaic Raw Material Use at Stock Cove, Newfoundland*

The Maritime Archaic (ca. 8,000-3,200 BP) were the earliest peoples to inhabit the island of Newfoundland. As they settled the island around 6,000 years ago, their ability to maintain lithic traditions were key to their success. Finding new sources of lithic material would have been necessary and that process would have varied greatly across the island. In southeastern Newfoundland, far away from key lithic sources on the mainland, this would have been even more important as exchange networks were increasingly stretched. This study examines raw materials recovered from the earliest documented site in southeastern Newfoundland, the Stock Cove site, through analyses of its debitage patterns during the Archaic occupation. The material provides an insight into landscape learning by its earliest inhabitants, site use patterns, lithic production

strategies, and more broadly, the peopling process of the region.

[358] *Supernatural Gamekeepers among the Ainu and Their Possible Parallels*

Supernatural gamekeepers of the Ainu appear in yukar divine songs. Mainly as master of deer (yuk kor kamuy) or master of salmon (cep kor kamuy), they have controlled the main suppliers of animal protein. On the one hand, they were believed to keep the animals in a storehouse or a bag, or to multiply them from bristles, scales or bones. On the other, however, if hunters or fishers catch too much game, they could hide the animals and prevent the human beings from destroying them. In this paper, I will compare the Ainu gamekeepers with parallel figures among neighboring ethnic groups as well as in Northeast Japan.

[74] *Transition from Hunting-Gathering to Agriculture in Amami and Okinawa Archipelagos, Japan*

Archaeological research in Amami and Okinawa archipelagos in the southwestern part of Japan started more than one hundred years ago. One of the most important archaeological themes in this region has been when food production began here. Archaeologists have agreed that the subsistence economy of the Gusuku period, prior to the Ryukyu Kingdom, was agriculture. Much less is known about the Shellmidden Period, which precedes the Gusuku Period. Large amounts of faunal remains and accidentally recovered plant remains prior to 1990s have been used to argue that the Shellmidden people relied on wild animals and plants, yet other scholars believed that Shellmidden people practiced food production because amounts of plant remains recovered from the islands had been so sporadic. Our results have strongly suggested that the Shellmidden people mainly relied on wild plants, and food production was introduced into this region ca. 8th to 12th AD. Two important findings are 1) hunter-gatherers lived on "small islands" for more than six thousand years and 2) transition from the former to the latter took place in the "small islands" context.

[31] *The Book Antler on the Sea and Community Perspectives from Sireniki, Anna's Home Village in Chukotka, Russia*

Nearly three decades after her dissertation fieldwork in the village of Sireniki, which she conducted in the late Soviet period, anthropologist Anna Kerttula de Echave continues to be closely entangled within the life and social relationships of the community. In many Sireniki households, Anna's book 'Antler on the Sea: the Yupik and Chukchi of the Russian Far East' is a proudly displayed heirloom. Its Russian translation was completed years ago by a self-taught local resident, and the book is highly regarded as an accurate and sensitively captured account that continues to be relevant for the concerns and experiences of the post-Soviet times. This paper shares the Sireniki community perspectives on Anna's contribution, documented by the authors in the course of ethnographic research in Chukotka conducted between the years 2001 and 2017. We focus on the core issues that Anna Kerttula de Echave tackles in her anthropological research and writing. In doing so, we aim to discuss the place of community-situated ethnography in today's anthropological landscape, and to turn the attention of the Arctic archaeology community to the issues of cultural resource management in Sireniki – the longest continuously occupied Yupik village in the Arctic and Anna's forever Chukotkan home.

Yan, Huifa (Renmin University of China)

[416] *Funerary Transitions in the Chu State during the Warring States Period (480-221 BC)*

The Warring States Period has been regarded as an essential period in terms of the transition of political structure. This transition leaves its influence on the forms of burials and tombs. This study aims to provide a new perspective on the political transition by studying the changes of remains of the elite tombs of Chu State during the Warring State Period. Different from the traditional Chinese approaches on tomb studies which focus on the general typology of burial objects, this study takes more factors, such as the buried locations, functions, and written records of burial objects into consideration in order to generate a more comprehensive classification system for the Ding bronze vessels buried in these tombs. This study suggests that the form of Chu burial standard had experienced an essential transition during the Warring State Period, which includes the emergence of new burial rituals and objects. While the new burial standard emerged, the old standard had not faded out, but instead coexisted with the new one. This implies the political transition during Warring State might also help generate new ideas on ideology.

[361] *The Northern Wei Temple Layout at the Yungang Grottoes in China and East-West Cultural Exchange*

Despite its critical role as a source for restoration works on Buddhist temples and pagoda, the Buddhist sites located in the upper plot of the Yungang Cave(雲岡石窟) have not been sufficiently studied. In this paper, location of sites and full information acquired through field trip and excavation data are presented. In particular, this paper addresses issues regarding the origins of a unique temple layout and paintings of No.33 upper cave and assimilation into Chinese style. In addition, what caused the east-west cultural exchange in Buddhist temples and the monks who had resided here, are discussed, based on the historical records stating temple names and archaeological data. It is thought that the Yungang Cave upper Buddhist temple site of cavern No.33 was established in the Northern Wei Period. Pagoda is positioned in the middle of the garden with a rectangular outline and surrounded by monk's residential pavilions. This arrangement type is distinguished from the one pagoda-one Buddha hall system represented by the Siyuanfosi(思遠佛寺) and Yongning temple(永寧寺) sites. So it is time to survey on the origins of this temple layout, background and east-west cultural exchange.

Yang, Liping (Shaanxi Province Archaeological Academy)

[214] *The Dissemination of Miaodigou Culture Painted Pottery*

The cultural sequence of the Wei River valley, as exemplified by Miaodigou Culture of the Middle Yangshao Period, represents a pinnacle as reflected in its masterfully crafted ceramics. The classical forms are pointed-bottomed amphorae, flat-bottomed bottles, coarseware jars, deep basins, and deep bowls. Of special importance are red vessels that have been painted with bird motifs, curved triangles, floral motifs, leaf motifs, eye motifs, crescents, whirls, bands, and net patterns. This painted ware is distributed almost throughout the whole Yellow River Valley. At the same time, the amphorae and painted vessels of the Miaodigou Culture had a marked influence on the ceramics of surrounding regions. In the east, this influence reached the sea at the mouth of the Yellow River. In the south, it crossed the Qinling Mountains to the northern and southern shores of the Middle Yangzi River. In the north, it arrived at the south-central part of Inner Mongolia and to Northeast China. And in the west, the Gansu and Qinghai regions received this influence. This makes it the largest archaeological culture in prehistoric China in terms of its distribution and influence as well as an important factor for the search of the origins of Chinese civilization.

[389] *Diet Reconstruction of Ancient Population from Banlashan Cemetery, a Neolithic Hongshan Archaeological Culture Site in China—Based on Stable Isotopic and Dental Microwear Analysis*

Hongshan culture is a famous archaeological cultures in the Neolithic Age in China, and its economic structure has always been the focus of academic attention. According to the bone material unearthed from the cemetery, the diet characteristics of the late Hongshan people can be effectively recovered through the integrating stable isotopic and dental microwear analysis. The result of isotope analysis showed diet structure of the Hongshan population should be subject to C4 plants or the animals feeds on C4 plants. The mean $\delta^{15}\text{N}$ value of delta was $9.1 \pm 0.3\%$, with little difference between individuals, indicating that individual food selection was relatively simple at that time, and animal protein accounted for a high proportion. For dental microwear analysis, which focus on the microscopic scratches, first or second permanent molars belong to 13 individuals are analysed, the ratio between the length of the horizontal scratches and the length of the vertical scratches of Banlashan population is 87.14%, which is close to the ration of Vedda people and Andamanese. The results of this study show that the reconstruction of ancient population recipes in a variety of ways is of great significance to the recovery of the economic structure and the status of social development.

[161] *Salutary Failures: Bronze Age Metallurgists in China and Their Faulty Seams*

Creativity and imagination are subjects which do not often appear in the archaeology of craft. Though archaeologists study innovation in relation to a craft's technological developments and discoveries, we approach such novelties as progress bound rather than creative pursuits. Craft workers are, after all, toiling for other people in exchange for their basic means of existence. This paper addresses the problem of creativity in archaeology and argues that making and imagination are not antagonistic and does not have to presuppose an opposition between mind and hand. Focusing on Bronze Age metalworkers from the Dian polity in Southwest China, this paper examines how mistakes and breakdowns in casting may provide a basis for understanding creativity in craftwork. Failures-in-making not only reflect individual differences in skill and learning. They can also demonstrate how "type forms," or generic categories of objects, are only viable things insofar as their makers commit themselves to taking some direction of action. The paper asks more generally how mistakes co-create a craft person's understanding of standard and judgement.

Yaquinto, Jessica (Living Heritage Anthropology) and Lyle Balenquah (Independent Contractor- Hopi)**[244]** *Passing the Microphone: The Heritage Voices Podcast as Community-Based Archaeology*

The Heritage Voices Podcast, hosted by the Archaeology Podcast Network, centers the voices of indigenous and traditionally associated peoples in discussions on anthropology, cultural resources and heritage, and land management. This includes a focus on community based archaeology and museums, collaborative ethnography, and tribal consultation. From the beginning co-hosts Jessica Yaquinto and Lyle Balenquah have approached the podcast in a community based manner in order to provide episodes that resonate with communities while being educational and engaging to all listeners. Podcasting provides a unique opportunity to both literally and figuratively pass the microphone to indigenous and other traditionally associated community representatives who are all too often marginalized or excluded from these discussions. The podcast provides an accessible opportunity for our listeners to understand the wide diversity of indigenous and traditionally associated community perspectives and how we can collaborate in our work to protect peoples' connection to place.

Yardumian, Aram**[359]** *Archaeology and Genetics in the South Caucasus*

Archaeology and genetics research all too often live separate lives within anthropology departments. Although the potential for corroboration and perspective-shift seems vast, the two disciplines require fluency in specialized technical registers that adds difficulty even to reading published papers. In addition, sometimes the lines of evidence seemingly contradict one another. Anthropological genetics work in the South Caucasus is sailing ahead, with analysis of both contemporary populations and ancient individuals underway at multiple institutions, and with new findings published regularly. This report will review some recent Caucasus-related genetics research, highlighting key findings and problems in matters such as population continuity, settlement routes and patterns, and connections to trends in greater Eurasian population dynamics.

Yarlagadda, Karthik (Department of Anthropology, University of Illinois, Urbana-Champaign), Kelsey Witt (School of Natural Sciences, University of California), Kristin Hedman (Illinois State Archaeological Survey), Kelly Swanson (Department of Animal Sciences, University of Illinois) and Ripan Malhi (Department of Anthropology, University of Illinois)

[109] *The Influence of Diet on the Ancient Dog Gut Microbiome*

Coprolites are recognized as an important source of archaeological data; they contain biological remains from the organism's diet, as well as genetic material from microorganisms, dietary components, and the host. Modern studies have shown that the gut microbiome reflects dietary trends; as microbial remains are also present in coprolites, these provide another angle for studying the diet and health of ancient organisms. To expand upon previous analyses of ancient dogs at Janey B. Goode, we turned to microbial analysis of a subset (N=8) of our previously sampled dog coprolites. We shotgun sequenced libraries constructed from the coprolites, in addition to bone and soil controls (N=5). For a comparative analysis, we additionally sequenced another set of modern dog samples (N=8). These modern dog samples reflect 4 individuals sampled twice, when fed a high- or low-protein diet. Comparing the final ancient and modern data sets reveals similarities in

trends of bacterial phyla in accordance with dietary patterns. We noted an increase in gut-associated phyla with increased ancient DNA preservation in the coprolites. Altogether, our data reflects the dietary conditions of these ancient dogs and helps us understand the relationship these ancient dogs may have had with the human individuals at the site.

[128] *Evaluating the Efficacy of Regression and Machine Learning Models to Predict Prehistoric Land-use Patterns*

Archaeologists continue to rely on predictive models that suffer from the same errors that have plagued the discipline for decades: small training sets, improper statistical techniques, and vague or only implicit theory. To address these shortcomings, we develop a framework for modeling archaeological site occurrences with machine learning. Drawing on insights from species distribution modeling in ecology, we evaluate the predictive power of four statistical modeling approaches—generalized linear models, generalized additive models, maximum entropy, and random forests—to predict Formative Period archaeological site locations in the Grand Staircase-Escalante National Monument. We assess each modeling approach using a threshold-independent measure, the Area Under the Curve, and a threshold-dependent measure, the True Skill Statistic. We find that the random forests approach produces the most accurate predictive models, followed by maximum entropy and generalized additive models.

Yegorov, Dmitry (Dmitry Yegorov), Steven Rosen and Ofer Marder

[95] *The Heat Treatment of Flint in the Middle Pre-Pottery Neolithic Site of Yiftahel (Lower Galilee, Israel) and Its Social Interpretation*

Recent examination of the lithic collection from the Middle Pre-Pottery Neolithic B (MPPNB) site of Yiftahel (10,100-9,250 BP cal.) has revealed a relatively large number of flint artifacts showing traces of intentional heating. Heat treatment of siliceous stones is a worldwide phenomenon that was mainly used during the initial stages of chaîne opératoire for the improvement of blank detachment process. Nevertheless, visual observations of the assemblage from Yiftahel supplemented by physical tests indicate that the heat treatment was performed during the later stages of reduction sequence and was mainly present on blades, before their transformation into tools. Careful and intentional annealing of this type of blanks probably allowed better control over the heat treating process and more successful propagation of pressure retouch during the final stages of tool fashioning. In some cases, heat treating also affected the color of the item making it visually more attractive. The smooth and aesthetic appearance of pressure retouch on the one hand and the appearance of “eye-catching colors” of the blanks on the other, perhaps increased the economic value of finished tools and influenced their spread within local exchange trade networks and perhaps beyond.

Presentamos los caminos que durante el Horizonte Medio integraron al valle de Sigwas, Vitor, Majes y Ocoña dentro de una dinámica de estudio de la visibilidad y ritualidad espacial. Para ello tomamos con ejemplo de discusión el sitio de Quilcapampa La Antigua, valle de Sigwas, Arequipa, Perú. La problemática que subyace a esta investigación se centra en comprender cómo fue la interacción entre las comunidades locales y el estado Wari a lo largo de las rutas de la región.

Yerka, Stephen [77] see DeMuth, Robert

Yerkes, Richard (Ohio State University)**[275]** *Were Neolithic and Late Prehistoric Fortifications a Deterrent to Escalating Conflicts in Early Agricultural Societies in Temperate Europe and Eastern North America?*

In Central and SE Europe from 5500-4000 cal. B.C.E., during the Neolithic (N) and Early Copper Age (ECA), and in Eastern North America during the Late Prehistoric (LP) period (900-1650 A.C.E.), there were similar socioeconomic changes in agricultural societies. Larger settlements with food storage were established, but interaction and exchange between groups was not always peaceful. "Trading and raiding" was marked by new production and distribution patterns, but also by increasing evidence for conflict and interpersonal violence. A common response to escalating violence in both areas was the construction of fortifications around settlements. Cross-cultural studies have shown that defensive fortifications have distinctive archaeological attributes not found in other enclosures. There is indisputable evidence for traumatic injuries and violent deaths in agricultural groups who fortified their settlements. However, is there any evidence that these fortifications were a deterrent to further conflict and violence? Evidence from agricultural tribes living in Neolithic villages in Belgium, from MLN and ECA settlements in Hungary, and LP villages in the Ohio Valley is compared to learn if this was the case. The labor and time needed to construct defensive ditches and palisades was substantial, but the benefits may have been psychological rather than strategic.

Yeshurun, Reuven (University of Haifa) and Catherine F. West (Boston University)**[415]** *Foxes and Humans at the Late Holocene Uyak Site, Kodiak, Alaska*

The red fox (*Vulpes vulpes*) is a generalist, omnivorous predator that is often drawn to human environments, exploiting anthropogenic refuse. Foxes may bear little or significant economic importance to prehistoric human foragers, depending on the environmental, economic, and cultural context. Here we investigate human-fox interaction at the late Holocene Uyak site (KOD-145) on Kodiak Island, Alaska. We apply zooarchaeological, taphonomic and stable isotope analyses to the fox remains and find that complete animals were processed for meat and pelts and then discarded. Stable isotope results support foxes as omnivores eating in both the terrestrial and marine environments, and a comparison of archaeological and modern foxes show more dietary variability in ancient foxes. Together, these data suggest that the Uyak foxes were drawn to the village as a stable source of food subsidies, eating discarded marine and terrestrial resources, and consequently were embedded in human subsistence as sources of meat and raw materials. The regular presence of foxes within the settlement could explain why the villagers, who already enjoyed an abundant supply of marine foods, included foxes in their diet.

Yezzi-Woodley, Katrina, Jeff Calder (Department of Mathematics, University of Minnesota), Peter Olver (Department of Mathematics, University of Minnesota), Martha Tappen (Department of Anthropology, University of Minnesota) and Reed Coil (Department of Sociology and Anthropology, Nazarbay)**[57]** *Improving Zooarchaeological Methods for Classifying Fragmented Faunal Remains Using Differential Geometric Methods and Machine Learning*

Accurately identifying bone fragments and the agents that broke them is essential to site reconstruction and improving our understanding of human evolution and behavior. Here we implement geometric invariants and machine learning on digital 3D models of experimentally derived bone fragments to classify them by breakage agent. We characterize the surface with far more geometric properties (such as total volume, surface area, higher moments, torsion and surface curvatures) than used by traditional zooarchaeological methods, while also expanding our sample to include several taxa and modes of breakage. Using surface curvature, preliminary results of hominin and carnivore broken elk bones exhibit exemplary pairwise classification rates (>92% in all tests) according to skeletal element, actor of breakage and, in the case of hominin broken bones, method of breakage. Several methods of machine learning are employed including KNN, decision trees, random forests, and neural networks. These methods quickly and efficiently capture and exploit a rich amount of shape information used for evaluating competing hypotheses regarding hominin behavior, surpassing the current state-of-the-art in zooarchaeology and taphonomy. Given the success of the preliminary research, we expect that individual specimens, not simply assemblage level trends, will be classifiable to breakage agent.

[420] *Coal Bed Village: Test Excavations of a Major Ancestral Pueblo Site in Southeast Utah*

Coal Bed Village (42SA920), located at the confluence of Coal Bed and Montezuma Canyons, is one of the largest Ancestral Pueblo sites in the state of Utah. The site was first documented by William Henry Jackson in 1875, but has never been systematically investigated. Rubble mounds covering the top, slope, and alluvial terrace below a small isolated mesita appear to be remnants from a large village probably dating to the A.D. 1200s (although surface ceramics suggest earlier use as well). Much of the site is currently threatened by erosion triggered by arroyo cutting from Montezuma Creek, leading to increased attention from archaeologists. In 2018, Brigham Young University and Weber State University held a joint field school at the site. In this presentation we discuss the preliminary results of our test excavations, surface collection, and aerial photogrammetry, all designed to better document the site and learn what is being lost to erosion.

Yoshimura, Kazuaki

[74] *A Study of the Armor Production System in the Middle Kofun Period*

Possessing complex three-dimensional structures, and created using the most advanced technologies, including technologies introduced from the Korean Peninsula, the armor of the Kofun Period in Japan represents the finest iron technology of that period. It is commonly accepted that armor was produced centrally under the Yamato royal authority and distributed to outlying areas. However, this hypothesis lacks details and the actual conditions of workshops and production organization, such as design and production batches, and division of labor are completely unknown. There has been little progress clarifying armor production units and manufacturing organization because the design steps and the first half of the production process are insufficiently studied. Through the collection and analysis of precise three-dimensional measurements, this project has confirmed that the riveted cuirasses of the Middle Kofun Period were made using two-dimensional templates at the stage of cutting out plates, and that multiple cuirasses were made using the same template. This presentation combines analysis of the units of armor design with analysis of the technological components of the production process to examine production batches and division of labor. Through analysis of tombs containing armor from the same production batches, a reconstruction of the armor production system is attempted.

Yost, Scott, Jeremy Loven (PaleoWest Archaeology) and Steven Gilbert (PaleoWest Archaeology)

[254] *Mortuary Customs at a Small Pueblo II Habitation Site in the Chuska Valley, New Mexico*

Recent data recovery investigations conducted by PaleoWest Archaeology as part of the Navajo-Gallup Water Supply Project uncovered four human burials at a small Ancestral Puebloan residential site (NM-Q-14-104) located in the Chuska Valley area of northwest New Mexico. Archaeological excavations conducted at NM-Q-14-104 provided an opportunity to examine the care and treatment of individuals interred in the burials and to explore potential differences in body/burial placement, skeletal health, and association of grave items based on the age and gender of the deceased. These observed mortuary customs are then contrasted with the burial practices utilized by the inhabitants of contemporaneous sites within the Chuska Valley to relate how typical or unique this case study is to the greater regional practices.

Young, Bailey (Eastern Illinois University) and Isabelle Catteddu (Centre National de la Recherche Scientifique, Paris)

[351] *INRAP and the Changing Early Medieval Landscape in France*

When the first “modern” monograph of a Merovingian settlement site excavation, Brebieres, near Douai, was published in 1974, it reinforced the then common impression among historians of a little-developed and unstable rural hamlets, inhabited by impoverished peasants with crude technologies—in striking contrast to the well-equipped and productive villa-centered landscapes of the Roman past. Recent decades of extensive and intensive preventive archaeology (much of it carried out since its creation in 2001 by INRAP – Institut national de recherches archeologiques preventives--) have shown this to be a much-mistaken impression, and are providing evidence that a classic medieval landscape of village clustered around castle and church-with-cemetery did not emerge rather abruptly, like “feudalism” around the year 1000, but resulted from slow and steady growth underway since at least the seventh century. This paper will draw on recent excavations, some largely

unpublished, to illustrate the emerging picture.

[404] *Starch and Phytolith Analyses from Ceramic Residues in the Llanos de Mojos*

The Llanos de Mojos in the Bolivian Amazon is a tropical savanna that saw increased archaeological attention beginning in the latter half of the 20th century. However, paleoethnobotanical research has been limited up until this decade despite significant results and great potential. Paleoethnobotanical inquiry in Mojos can enhance our understanding of human-plant interactions. Starch grains and phytoliths from economic plants recovered from ceramic residues provide a direct link to food preparation, consumption, and agriculture. This paper describes the results of analyses of 31 residue samples from ceramic food-processing graters and serving vessels recovered from Isla Santa Maria, a forest island near Santa Ana del Yacuma, during the 2018 field season. This presentation discusses how the methodology and preliminary results from the analyses are part of a larger investigation into the relationship of food and landscape in the West Central Mojos that combines GIS, landscape, and paleoecological approaches.

Young, Eric (OSD DPAA), Piotr Bojakowski (Defense POW/MIA Accounting Agency) and Richard Wills (Defense POW/MIA Accounting Agency)

[129] *Underwater Archaeology at DPAA: Efforts to Address U.S. Military Loss Incidents*

A significant portion of the Defense POW/MIA Accounting Agency (DPAA)'s unresolved loss cases involve incidents that occurred over water, at sea, or otherwise within a body of water. In the context of underwater forensic archaeology, addressing these cases require a complex process of historical and archival research; large-scale GIS analysis; investigation and correlation with known incidents; and site search, survey, and recovery activities to the extent possible. The end goal is to recover and identify the remains of unaccounted for individuals, or to otherwise resolve their fate. These efforts increasingly require a high degree of collaboration and coordination with individual historians and researchers, non-profit groups, universities, and academic organizations; local, state, and federal agencies; and foreign host nations and international organizations. DPAA continues to develop its underwater procedures and capabilities in its pursuit of this challenging mission.

Young, Michelle (Yale University) and Sadie Weber (Harvard University)

[64] *Rethinking Ecological Verticality for the Initial Period: A Case from South-Central Peru*

Murra's model of the vertical archipelago continues to reverberate in discussions of ecological exploitation across Andean regions, while other scholars have argued that such frameworks essentialize Andean societies by projecting ethnohistorical data onto the deep past. New ceramic, microbotanical, and isotopic evidence from Atalla and other sites in the Huancavelica region demonstrate a compelling case for the movement of peoples between this highland region and settlements on the Peruvian south coast. In this paper, we present evidence of interaction between the communities living in these disparate geographic regions to evaluate the utility of ecological verticality for understanding the sociopolitical landscape of south-central Peru during the late Initial period (1100-800 B.C.).

[261] *The Chaîne Opératoire of Late Archaic through Mesilla Phase Assemblages from the Placitas Arroyo Site Complex, Lower Rio Grande Valley, New Mexico*

The chaîne opératoire approach to lithic analysis has rarely been imported from the Old World and applied to analysis of New World lithic assemblages. However, that approach is appropriate for virtually any lithic technology, providing a structured methodology that shifts attention from typological studies to explicitly behavioral analyses, complimenting studies of both intrasite and intersite patterns of variability and change. Analysis of several assemblages from the Placitas Arroyo site complex reveals changing patterns of raw material procurement and selection, core reduction strategies, as well as tool production and discard. The most striking result thus far is the quite uniform emphasis on flake production from well-prepared cores, and the near absence of manufacture or maintenance of bifacial tools, especially projectile points. Associated with common ground stone artifacts, the flaked stone materials may well represent intensive food processing. Regardless, the technological patterns being revealed by the chaîne opératoire approach illustrate a productive new means to gain insights into changing behaviors in the Jornada Mogollon cultural tradition.

[65] *Authentically Inauthentic and Real Fakes: An Archaeology of Contemporary Stonehenge Replicas*

Stonehenge (UK) has inspired replicas on every inhabited continent, with nearly 30 in North America alone. Few could – nor are intended to – be mistaken for the real thing. We explore several contemporary Stonehenges, illustrating the range of forms, materials and motivations associated with such replicas. We focus on artworks - Deller's inflatable Sacrilege, the now-dismantled Stonefridge/Fridgehenge, New Mexico, and 1990s Scottish protest sculpture Carhenge; memorials such as Maryhill Stonehenge, Washington; and tourist attractions Stonehenge Aotearoa (New Zealand) and Esperance Stonehenge (Australia). In a digital age, analogue Stonehenges continue to be built and we argue that the most appropriate way to interrogate this phenomenon is to treat replicas as archaeological sites in their own right. The disciplinary concerns of archaeologists leave us well-placed to analyse the corpus of replica Stonehenges and interpret the materiality, use and meaning of these monuments, and the value placed on the material over the virtual. More broadly, the examples discussed suggest that regarding replicas as archaeological sites has cultural value, viewing contemporary monuments as expressions of societal values. At a time when we are increasingly being challenged to differentiate between real and fake, archaeology has an opportunity to contribute to wider socio-political discourse.

Young-Wolfe, Halona (State University of New York at Binghamton)

[250] *From the Ocean to the Mountain: Marine Shell in the Patipampa Sector, Huari, Ayacucho, Peru*

Excavations in the residential area of Patipampa in the city of Huari revealed a striking amount of marine shell. While a large percentage of this shell assemblage is *Spondylus*, other marine shell, such as mussel, is also present. The assemblage includes worked shell objects, unworked fragments and whole shells. The variety of marine shell at this highland site raises questions about the use, movement, and meaning of marine shell during the Middle Horizon. While the use of *Spondylus* in the Andes is well documented, much less is understood about how the Wari people obtained, utilized, and valued other types of marine shell. This talk uses the shell assemblage from Patipampa to explore the use and significance of marine shell in the Wari empire. Were shell items manufactured in the residential areas of the Huari capital? Was shell a high status item limited to the Wari elite, or does the Patipampa evidence point to a broader availability of shell objects? What can the Patipampa shell assemblage tell us about the movement of shell from the Pacific Ocean to the Andean highlands? And how are the histories of these objects entwined with the lives of people throughout the Wari empire?

[34] *The Establishment of the First 3D Fish Bone Reference Collection in China*

Zooarchaeological researchers in China have previously focused on mammal remains, as have many places around the world. However, mammal species are only one part of the animal resources that people used in ancient times, especially in

the areas by water. Young zooarchaeologists have begun to get involved in the work of identification and research on fish remains in China in recent years. However, the lack of comparative collections strongly affects the accuracy and the efficiency of the related research. We have started to collect fish specimens (both fresh water and marine species) to build our own fish bone collections. In order to share these collections with more zooarchaeologists in China, we use blue light 3D scanning to scan the main elements of the fishes we have in the collection. Blue light 3D scanning is very suitable for samples which are very small and thin and it works very well on fish bones that traditional 3D scanner cannot do. In this presentation, we want to share our experience in building our fish bone collection and current achievement of the 3D database.

Yu, Chun and Ya Wei Dong

[78] *Casting Experiment for a Small-Sized Bronze Statue of Buddha Dating to the Tang Dynasty*

The four-footed base is a specific structural feature of bronze statues of Buddha in China during the fourth to ninth century BC. This feature appears to have been made using the lost wax method, but experimental methods indicate that the four-footed base was made with the sand mold casting process. This was the traditional bronze casting technology of Shang and Zhou dynasties, and its form is rooted in a kind of furniture that was popular in Han-Jin period.

Yu, Pei-Lin (Boise State University)

[26] *On the Neolithic Edge: Predicting Crop Adoption by Paleolithic Foragers of Taiwan*

The adoption of agricultural crops by intensified foragers occurred throughout Southeast Asia, resulting in mixed and low-level economies. Behavioral ecology provides models for evolutionary decision-making for mixed forager-gardener economies. The Paleolithic to Neolithic transition in Taiwan is represented by a small but growing number of sites. The tempo and mode of adoption of individual crop types is not yet well understood. I use ethnoarchaeological research about ancient crop types still in cultivation in Taiwan to assess a prediction that crops were not adopted en bloc by foragers. In observing differing costs and benefits of individual cultivars, foragers would initially have valued characteristics such as adaptation to local conditions and resilience to stressors that were compatible with mobility needed to maintain access to wild mountain and aquatic resources, rather than crop productivity by weight. This paper will feature a listing of Neolithic Taiwan crop types in hypothesized rank order of adoption, and archaeological implications.

[321] *Phoenician Settlements: A Story of Integration and Cultural Assimilation*

Since the second millennium BCE, the Phoenicians linked east and west through their established trade networks across the Mediterranean. We investigate the extent of Phoenician integration with the communities they settled across the western Mediterranean. Skeletal samples from Phoenician burial sites in Lebanon, Italy, Spain, and Tunisia were collected. We obtained complete mitochondrial genomes on all collected samples and genome-wide data on a subset of these. We analyzed and compared ancient DNA results with genomes from populations across the Mediterranean. Our results indicate

evidence of continuity of genetic lineages from pre-Phoenician populations in all settlements except for the island of Ibiza where genetic discontinuity between the early Phoenician settlers and the island's modern inhabitants was observed. We also find evidence of new, unique lineages likely resulting from Phoenician trade networks or settlements strategies that included the translocation of women throughout the region as well as the assimilation of indigenous women in Phoenician settlements. Combined, this evidence suggests significant female mobility and genetic diversity in Phoenician communities, reflecting the inclusive and multicultural nature of Phoenician society. Our data demonstrate that both migration and cultural assimilation were common, resulting in surprisingly cosmopolitan communities in the past.

Zangrando, Atilio and Angélica Tivoli (Centro Austral de Investigaciones Científicas (CAD))

[364] *Colonization of the Southern Tip of the World*

In the last years of the 1980s, Luis Borrero elaborated an archaeological model of the peopling of Patagonia and Tierra del Fuego which still prevails. In particular, this model provides expectations for the settlement of Tierra del Fuego, which have not yet been completely depleted. From a biogeographical perspective, these expectations arise from the vicariance conception, where two separated stages in the history of human populations of southern South America were proposed by the formation of the Magellan Strait (Borrero 1989-90). Diverse cultural processes are involved. Hunter-gatherer populations arrived in Tierra del Fuego during the end of the Pleistocene. As shown by different archaeological contexts, coastal-marine adaptations took place some millennia later (~6000 uncal. BP). Coastal occupations can, however, be traced back to the early Holocene at the south coast of the island. In this paper, we analyze some implications concerning the peopling of Tierra del Fuego by addressing: a) the evidence in relation to settlement and subsistence patterns, and in particular the role of coastal environments in such process; b) problems of site formation and taphonomy, and c) the identification of archaeological discontinuities in the distribution of archaeological evidence.

Zaro, Gregory (University of Maine)

[337] *Late Antiquity Revealed: Assessing Urban Change at Roman Nedinum in Northern Dalmatia, Croatia*

In 2015, the Nadin-Gradina Archaeological Project (NGAP) began as a collaborative effort between the University of Zadar and University of Maine to unravel the long-term record of urban change in the Ravni Kotari region of northern Dalmatia, with a primary focus on the Nadin-Gradina archaeological site. Since its inception, the NGAP has confirmed a 2,500-year record of occupational settlement that includes Liburnian Iron Age origins, Roman establishment of the municipium Nedinum, and Late Antique settlement of the late 3rd through late 6th centuries. Following an apparent centuries-long period of abandonment, the hilltop town was reestablished during the Late Medieval and Venetian/Ottoman eras. In this paper, we present new archaeological evidence for the Late Antique settlement, a relatively underexplored period in archaeological studies of urban change in the Classical world, particularly among smaller provincial settlements. Drawing upon the results of our recent excavations, we review architectural and artifactual data in a regional context to offer insight into the broader debate of urban decline vs. transformation that so often characterizes Late Antique studies.

[110] *Establishing Provenance of Ochre from the La Prele Mammoth Site: A Geochemical Analysis*

Red ochre is a ferrous iron oxide mineral used for cultural expression and utilitarian tasks by hominins beginning 250,000 years ago. The use of ochre continued into the New World. While its use by Paleoindians has been noted, the function and significance of ochre for these groups is not well understood. To conceive the importance of ochre to Paleoindians, it is necessary to determine the distance Paleoindians were willing to carry it. Thus, geochemical analytical techniques were applied to determine the provenance of ochre from the La Prele Mammoth site (48CO1401) in Douglas, Wyoming. The La Prele site is a ~13,000 year old mammoth processing and campsite that contains scattered ochre nodules and a prominent ochre stain. Using ICP-OES and ICP-MS analyses, the geochemical signature of La Prele ochre was established and compared to four ochre sources in Wyoming. Based on this analysis, the archaeological ochre from the La Prele site is sourced to the Powars II ochre quarry 108km away. This is direct evidence that Paleoindians were willing to carry ochre within their mobile toolkits for long distances, which speaks to its significance. These geochemical analytical techniques

have potential for establishing provenance of ochre from other regions and periods.

[373] *Landscape Archaeology and Plant Use in Northern Durango, Mexico*

This paper presents the results paleoethnobotanical and architectural analyses at two prehispanic sites in northern Durango, Mexico. The sites, Corral de Piedra (PAS017) and Los Berros (PAS023), were recently excavated as part of the Proyecto Arqueológico Sextín which seeks to build a “deep chronology” in the Sextín valley located at the frontier between the “southwest” and “mesoamerica”. Here we contextualize aspects of everyday life related to the environment -built and not built- in order to consider how dwelling in the Sextin changed through time.

Zavodny, Emily (University of Central Florida)

[183] *Amber Runs through It: The Centralization of Wealth and Power in Late Prehistoric Lika, Croatia*

Prehistoric cultural and sociopolitical development in the mountainous region of Lika, Croatia is still poorly understood despite over a century of archaeological excavations. Traditional cultural-historical narratives based on grave good typologies suggest that a unified regional culture, the Iapodians, emerged at the end of the Bronze Age and rapidly expanded across the area. This interpretation has yet to be systematically tested, and so this study analyzes Late Bronze and Early Iron Age mortuary contexts and assemblages to better characterize regional trends towards centralization and integration. Large-scale sociopolitical and economic reorganization during this period is evidenced by the shift in burial practices from individual stone mounds to large communal cemeteries and the inclusion of large quantities of foreign goods, such as Baltic amber, in graves. Results suggest that communities began to participate in the new far-flung continental trade networks during the Late Bronze Age, and that some valleys were able to accumulate more wealth and power than others by controlling access to local mountain passes. These patterns suggest the beginnings of a regional hierarchy, but not yet the fully developed cultural and sociopolitical system known as the Iapodians.

[198] *“They came to loot our treasures”: Indigenous, Pirates, and Indigenous-Pirates on the Mexican Pacific Coast*

Recent studies show that the Spanish conquest of the Oaxacan Pacific Coast was shaped, and even orchestrated, by indigenous kingdoms (Zapotecs, Mixtecs) and allied groups (Pochutecs, Chontal) that vied for control over key trading ports. These same indigenous players continued their cycles of conflicts, alliances, and trade with other intrusive European powers—English, Dutch, and French—that disrupted the region’s delicate geopolitics throughout most of the Colonial period. In this presentation we explore the complex interactions between these so-called ‘pirates’ and the Chontal people. Both consisted of closed groups which operated on the margins of the Spanish empire. To elucidate this dynamic yet elusive period in Pacific and global history, we consider shifting settlement patterns, landscape modifications, historical records, linguistic evidence, and long-term social memory encapsulated in contemporary festivities.

[26] *The Role of Theory and Ethnographic Analogies in Understanding Paleoindian Mobility in the Great Basin*

Great Basin hunter-gatherers procured obsidian from more distant sources during the Pleistocene-Holocene Transition (PHT) than did their Holocene successors, suggesting a more mobile subsistence adaptation. However, this requires annual rounds and logistic forays beyond the scale of ethnographic, pedestrian foragers, and fails to explain evidence of broad-spectrum foraging that would not have required such extreme mobility to procure. Alternative explanations hold that social

exchange, rather than subsistence needs, shaped obsidian conveyance, and argue that the PHT adaptation can best be understood by direct analogy with ethnographic Great Basin foragers. But Paleoindians lived in climatic circumstances and at population densities utterly unlike ethnographic groups of the region. I argue that these contending interpretations rely on a questionable assumption that hunter-gatherer “bands” are organized as closely related households. An alternative approach informed by behavioral ecology and recent archaeogenetic and ethnographic evidence suggests that the Paleoindian pattern can be better understood in terms of high individual mobility, flexible group composition, and long-distance mating networks in a resource landscape of extremely low population density. Such an approach should be founded on the expectation that both social and subsistence incentives play critical but non-contradictory roles in structuring the mobility of low population density hunter-gatherers.

[239] *What Is ‘Good Hair’? – Personhood, Ritual, and Resurgence of Bodily Adornment among the Equestrian Blackfoot*

Painting and writing from Fort Union Trading Post, North Dakota in the 1830s, George Catlin greatly admired Plains Indian coifs, body paint, and insignia, painstakingly describing each individual’s appearance. Contemporary descendants of Blackfoot warriors whom Catlin painted, joyfully display their portraits as evidence of the ancestors’ bravery and status. Through portraits, photographs, and artifacts, this paper examines popular and unique objects and substances of bodily adornment, beginning with pre-contact burial customs and continuing through the Colonial and Reservation periods to: (1) scrutinize the interplay between deep tradition and European-influenced innovation in ritually and socially charged bodily adornment, and (2) examine the effects of Federal religious proscription on the persistence of traditional regalia among the reservation-era Piikani (Montana Blackfeet). The paper concludes with an assessment of the strategies followed by contemporary Blackfoot traditionalists to faithfully maintain or reproduce ritual regalia and its current ritual and personal significance.

Zeder, Melinda (Smithsonian Institution)

[352] *Documenting Domestication 2.0*

Published in 2006, the edited volume *Documenting Domestication: New Genetic and Archaeological Paradigms* presented case-study examples of cutting-edge approaches to documenting the domestication of plant and animal species. The twelve years since the publication of this book have seen remarkable advances in our ability to track domestication using archaeobiological, genetic, and archaeological markers. Perhaps more importantly, our understanding of this complicated process has also deepened over this time – how it begins, how it unfolds, and how the pace and direction of domestication varies in different plant and animal species, and in different cultural contexts. This presentation reviews these advances considering first the improvements in defining domestication. It then reviews the range of approaches to documenting its progress in both plants and animals. It stresses the importance of being able to tie individual markers explicitly and exclusively to some aspect of the domestication process. It also emphasizes the value of multi-marker approaches to documenting domestication that bring together genetic, archaeobiological, and archaeological data to monitor the process of domestication in plants and animals.

Zeidler, James (Colorado State University)

[314] *Jama-Coaque Ceramic Traits in Coastal Colima, West Mexico?: A View from the Jama Valley, Coastal Ecuador*

In spite of a long tradition of scholarship dedicated to the theme of prehispanic maritime contacts between the Pacific coastal areas of Ecuador and Mesoamerica, most arguments for these contacts have been based on a wide variety of trait comparisons between ill-defined cultural sequences in the respective contact zones, often spanning multiple centuries. In this paper, I examine specific ceramic traits found in well-dated archaeological phases of the long Jama-Coaque cultural tradition of northern Manabí, Ecuador, and show when and how some of these traits appear in coeval archaeological contexts (ca. 450-650 CE) at two archaeological sites in coastal Colima, Mexico. Two vessel forms in particular will be

examined: (a) shallow pedestal bowls (compoteras or cajetes); and (b) heavy ceramic seats or plates (asientos-platón) having either polypod supports or thick annular bases. Both of these vessel forms fall outside the canons of coastal Colima ceramic traditions and were correctly identified as intrusive by Mexican archaeologists. Comparisons of the nature and social complexity of the two contact areas are discussed and previous models of long-distance maritime interaction and exchange are reexamined in light of this specific example of maritime contact.

Zeitlin, Nicholas (University of Massachusetts, Boston)

[91] *The Socio-economic Dynamics of Iron Production in Viking Age Northern Iceland*

Understanding how an agricultural society organized the production of iron and the trade of farming implements allows us to describe how they managed natural resources and non-agricultural activities as a community. In the North Atlantic region known for its ephemeral material culture, slags and other metal smelting byproducts present a robust category of artifacts which can be analyzed. These materials including ferrous slags and other waste products, are often noted and discarded during survey focused fieldwork. Basic typological analysis allows for the identification of stages of production at a site. When placed into the context of a regional study, the degrees of specialization of sites can be determined. The Skagafjörður Church and Settlement Survey (SCASS) has identified several sites which include materials associated with iron production in the Viking and Medieval periods. This project presents methodologies, results and discussion of artifacts collected across multiple regions in the Skagafjörður Valley in northern Iceland. Results suggest small-scale production at the communal level distributed over the landscape using specialized activity sites.

[386] *Medieval Transylvanian Church Burial Patterns and Demographics*

The Papdomb archaeological site is located immediately outside the village of Văleni (Hungarian: Patakfalva), Romania in the historic region of Transylvania. Papdomb comprises the ruins of a medieval Székely church and its associated cemetery. Human interment within the walls of the church started in the second half of the 12th century and extended to the early 17th century with most the burials interred during the 14th and 15th century. Analysis found that 147 individuals were buried within the church and ranged in age from perinate to old adult. Males outnumbered females by nearly 2:1. Individuals were typically interred in an extended, supine position within a wooden coffin and rarely contained grave offerings. Evidence of ad sanctos, near the saints, burial was evident in that 38% of the burials were placed near the altar space at the front of the church. Additionally, the noble family crypt was near the pulpit area, also at the front of the church. In contrast, four examples of multi-person burial were recovered from the back of the church. This paper will highlight these specific examples while also offering general demographics and patterns.

[410] *Where Does One Site Begin and Another End: Defining Site Boundaries in the Coahuah Region, Q. Roo*

If we define a site as a place in which an indication of past human-related activities (such as artifacts or features) are located, and describe a boundary as a space where two or more settlements connect, bond together, or separate from each other, then how do we delineate boundaries between settlements? Above all how do we define the site boundaries in the archaeological record? This paper examines data collected from the transect which was cleared between two sites in the Coahuah Region; attempts to determine if the sites were a single aggregate or two distinct sites; and also attempts to define boundaries between these settlements. It proposes that in the investigated area certain topographic features such as small hills/rock outcroppings, deep soil pockets, and milpas serve as natural boundaries.

[195] *Detecting Transitions: Cultural and Environmental Changes Preserved in Archaeological Sediments from Western Liguria*

The reconstruction of Pleistocene human peopling along the Tyrrhenian coastline of Liguria is of critical importance. This region has yielded among the most recent evidence of Neanderthal occupation and the most ancient traces of modern humans in southern Europe. The reconstruction of the subsistence strategies of Pleistocene hunter-gatherer groups and the climatic conditions of the landscape they settled in is also very challenging. A geoarchaeological approach can help investigate the latter questions. In fact, anthropogenic sediments in rock shelters distributed along the extant coastline of western Liguria offer the opportunity to detect environmental changes and identify functional areas, possibly related to cultural transitions. In this contribution, we discuss preliminary results of a micromorphological investigation on sediments from two key sites of the region: the Bombrini rock shelter (Ventimiglia) and the Via S. Francesco open-air site (Sanremo). At Bombrini rock shelter, sediments preserve evidence of different degrees of weathering, with the older being more weathered than the upper ones. This suggests a progressive transition towards more cold conditions. At Via S. Francesco an analogue transition is also evident along with a main change in sediments supply, from sand dune to loess, thus suggesting a progressive decrease of the sea level.

[416] *Marxism in Chinese Archaeology*

Since the founding of the People's Republic of China, Marxism became a kind of official philosophical thinking embedded in all the humanities. Thus, in most Western archaeologists' minds, Chinese archaeology is a kind of Marxist archaeology, as Bruce Trigger described. We admit to this kind of definition, but the status of contemporary archaeology is already changed just as the transition with Marxism. There are three major stages of the transition which correspond to social and political changes. First was in the 1950s, when the basic theory was heavily effected by Soviet archaeology. Then, in the 1960s to 1970s, scholars were drawn into leftism. After that, Marxism seemed to be weakened in academic research; indeed the authority insisted that Chinese archaeology must be guided by Marxism. In general, the concept of social modes from Marx and Engels is always used in the analysis of subsistence strategies. Also, because of the similar pursuit in science, objectivity and techniques, Chinese archaeologists seems to be more interested in processual archaeology, as the practical archaeologists seek to find a base theory pattern in the new period.

[26] *Across Boundaries: Origin of Microblade Technology in NE Asia under a Macroecological Approach*

The spread of microblade technology has been explained using human migration and cultural transmission under the culture-historical paradigm of a "refugium model" that illustrates movements of foraging societies from Transbaikal eastward to the Paleo-Sakhalin-Hokkaido-Kurile (PSHK) Peninsula and to North China in the beginning of the Last Glacial Maximum (LGM). Environmental deterioration and human migration are cited as drivers of cultural and technological change. This study uses a macroecological approach based on Binford's Constructing Frames of Reference to examine impacts of the LGM on Paleolithic hunter-gatherers in NE Asia. Results from Binford's projections of ungulate biomass suggest that refugia did not exist in the PSHK Peninsula, thus origins of microblade technology were a more complicated cultural process. The appearance of microblade-based societies in NE Asia is not necessarily explained by human migration from the Altai Mountains or Transbaikal, since the shrinkage of ungulate biomass under environmental pressure and previous technology could provide adaptive advantages for people equipped with microblade-based weaponry. Viewing the appearance of microblade technology as a cultural process, rather than a historical event, can help archaeologists better explore these dynamics.

[78] *Hunting vs. Herding: The Eastern and Central Tibetan Plateau's Earliest Inhabitants*

Our understanding of when and how humans settled high altitude (>3000 m.a.s.l.) regions of the Tibetan Plateau has been greatly extended in the past decade. In this paper, we shift the focus from plants to animal resources, and explore the diversity of animal-based subsistence strategies used to adapt to challenging environments in both eastern and central parts of the plateau. Our findings demonstrate that wild animal resources were a significant, and perhaps the primary, contributor to subsistence strategies utilized by people who were arguably the earliest successful year-round settlers of the eastern Tibetan Plateau. It appears that domesticated herd animals, such as sheep, goat, and cattle or yak, were indispensable to the success of early year-round settlers of the central Tibetan Plateau.

[361] *A Study of Transition to Agriculture in the Ulanqab Region of the Southern Mongolian Steppe Zone of China*

Mongolia steppe is widely thought as a marginal zone for agriculture, yet the recent excavations of two inhabit sites and a survey with more than 1000m² in Ulanqab, central Inner Mongolia have found evidences that people made efforts to do food production during Neolithic period. By studying site structures and the form, composition and spatial distribution of lithic assemblages based on excavation and survey materials, I explored how the subsistence, mobility and social integration are interplayed to drive the changes of human adaption to the steppe environment across the time of the transition to agriculture. The preliminary results show that during early Neolithic period, a certain degree of population aggregation has developed prior to the development of food production and the mobility declined as the relative importance of food production increased. However, unlike central North China, such tendency did not develop into full-fledged agriculture. Low-level food production has been maintained in this region into the Bronze age and as Holocene Megathermal passed by, the relative importance of hunting has even increased and the stable sedentism has never been evolved.

[389] *Mobility, Land Use, and Technological Organization at the Site of Yangshang, Gansu, China*

The excavation in Yangshang site generated a high-resolution record in the West Loess Plateau of China, and demonstrated that ancient human occupied this region at least since MIS7. In looking for evidence of possible changes in the mobility, land use, and organization of lithic technology that may have been concurrent with the paleoenvironment changes identified in Yangshang, we concentrate on three lines of the evidence based on the lithic and fauna data revealed from L6-8 which contain large enough database to conduct necessary statistical analysis: typological analysis provides comparable data on lithic types across different periods which may reveal the provisioning stately among each main cultural layers; the lithic raw material economic analysis will focus on the variation of raw material frequencies and the consumption of cores and flake blanks; artifacts' volumetric densities from the sampled excavation units and vertical stratigraphic distribution intensities will provide information about the expansion and frequency of occupation during different periods. The primary aim of these attribute/metric-based analysis is to investigate the long-term evolutionary process in terms of the possible adaptive variation in stone tool manufacture and use patterns occurring over many thousands of years.

[360] *What's in That Incense Burner? A Study of Residues at Balamku*

It is so widely accepted that the Maya burned copal incense in their rituals that the assumption has gone unquestioned. During the 2018 season, the Gran Acuífero Maya Project began a multi-year investigation of the cave of Balamku near Chichen Itza. The cave contains a large number of incense burners filled with burned material that permits a far closer scrutiny of this aspect of Maya ceremonialism. The first preliminary examination of botanical material has found large quantities of charred wood that appears to be pine. This discovery has important economic implications because of the distance from the cave to the nearest source of pine. This and other contents will be discussed in my presentation.

[15] *Personal Ornaments and the Middle Paleolithic Revolution*

The Middle-to-Upper Paleolithic transition is a watershed. By the later Upper Paleolithic, all continents were occupied, all the world's ecosystems were exploited, and all aspects of ethnographically observed hunter-gatherer culture the archaeological record can preserve are indeed found. Prior to about 100,000 years ago, such is not the case. There is therefore little reason to question the notion that, in a geological or evolutionary time scale, that transition is a "revolution" in the sense of Gilman's (1984) "Upper Paleolithic Revolution:" a protracted process of technological improvement and demographic growth, combined in a feedback loop with developments towards more sophisticated modes of communication and social organization. However, we now know that body painting, personal ornamentation, object decoration and formal burial emerged as early as ~120,000 years ago. As otherwise implied by the fact that, in Europe, the beginnings of cave art date to >65,000 years ago, which implies Neandertal authorship, that emergence is more amenable to social- or demography-based explanations than to cognitive- or human taxonomy-based ones. Given that the association of formal burial with residential localities is strongly suggestive of formalized territoriality, this Middle, not Upper Paleolithic Revolution may well represent the emergence of ethnicity and ethnic boundedness.

[179] *Queer (Re)Collections: How Anatomical Collections Obscure Identities*

Anatomical skeletal collections have often been framed as encompassing “the poorest of the poor” or the most marginalized of a given society. This framework has shaped the way that these collections have been studied for decades. A queered understanding of how these collections were formed and who is actually encompassed within them reveals a much more nuanced understanding. These collections stand at the intersections of race, class, and gender and therefore an intersectional approach must be used in order to question the assumptions we hold about them. Using the George S. Huntington Anatomical Collection as an example, this paper takes a queerly-situated approach to understand the ways that anatomists, medical professionals, and now bioarchaeologists obscure the identities of the dead.

[58] *Feasts for the People, Crumbs for the Bird: Communicating Archaeological Data on Ancient Crop Diversity*

Food security and food adequacy are at the core of many sustainability debates. Growing urban populations and a simultaneous decline in staple crops are severe threats to both. While the relation between rising demographics and subsistence has been a focus of scholarly debate in anthropology, crop diversity in ancient agrosystems is generally not. These theoretical discussions have centered on calories per unit of surface area and starch is responsible for most caloric provisioning by plants. This paper draws on a microbotanical database for ancient Maya cities from three different geographical districts and varying time periods, therefore enabling comparative analyses between urban communities and tracing crop-diversity over time. Regarding outreach to local communities, our proposal relies on a double appeal as contemporary Yucatecos exhibit considerable interest in both ancient Maya culture and cuisine. We propose to organize gatherings that allow for informal exchange of ideas, structured presentations of diet-related research, as well as culinary experimentation with identified ancient plant-foods. Finally, our strategy to communicate nationally and/or globally builds upon the far-reaching impact of social networks by creating fact-based social media content that is consciously crafted to impact a broader audience whose information consumption patterns have changed dramatically over the past decade.

[403] *Site and Assemblage Integrity for Middle and Upper Paleolithic Levels at Lapa do Picareiro, Portugal*

Central Portugal is a critical area of study for addressing the replacement of Neanderthals by Anatomically Modern Humans in Iberia. This paper presents new data on lithic refitting and assemblage integrity from Lapa do Picareiro, a cave in central Portugal containing punctuated levels of occupation within a continuous sequence of deposition spanning the Middle and Upper Paleolithic. These levels contain lithic and faunal remains recovered using high resolution spatial recording methods. The lithic assemblages from Levels JJ, FF, DD, and W, each contain a numbers of refits, allowing us to demonstrate their intact stratigraphic position and to conduct spatial analyses of lithic reduction and activity areas in the Early Upper and Late Middle Paleolithic. Using lithic refits as a measure of site and assemblage integrity, this paper highlights the importance of Lapa do Picareiro as a key site for the study of the Middle-Upper Paleolithic transition in southern Iberia.

[233] *Coricancha: Between Historical Studies and 3D Scanning*

This paper stresses the importance of surveying precision for any studies related to Inca architecture and urbanism. Based on 3D laser scanning of the Coricancha complex, different cases are presented. The first case is an evaluation of hypotheses regarding the possible astronomical function of this temple. Among them, of particular importance is the one formulated by R.T. Zuidema and A.F. Aveni, according to which astronomical observations at the Coricancha constituted

the structural skeleton of a specific Inca calendar cycle of 328 days. This article presents a critical analysis of this hypothesis, based on precise measurements of the orientation of the temple carried out by the authors of the text. The second case, based on the same 3D laser scanning data, is a preliminary study on the Coricancha's metrology. The overall dimensions of the whole temple and particular buildings are discussed.

[20] *Tracing the Human Exploitation of Salmonids on the Pacific Coast of North America*

Pacific salmonids (*Oncorhynchus* spp.) are important economic and subsistence resources for contemporary and past indigenous peoples of the Pacific coast of North America. The seven recognised *Oncorhynchus* species each occupy different ecological niches and exhibit diversity in seasonal spawning and migratory behaviours. Although salmonid remains are ubiquitous at archaeological sites from California to Alaska, their remains are notoriously difficult to identify to species level using traditional zooarchaeological techniques. This prevents archaeologists from fully reconstructing human subsistence strategies, which were influenced by the seasonal availabilities of different species. While ancient DNA analyses have successfully separated species, these methods are destructive and cost-prohibitive. Geometric morphometrics (GMM) has proven successful in capturing subtle biological variations of closely related species and represents a cheaper and non-destructive alternative for the identification of archaeological *Oncorhynchus* species. Initial results, using modern wild specimens of known species as reference, verified by DNA analysis and ZooMS, demonstrate that GMM is effective in identifying certain species of *Oncorhynchus* with a high level of confidence. These results will aid in the refinement of past subsistence strategies surrounding this keystone species, and provide a deep-time perspective on both pre-industrial population baselines and native ranges for modern conservation policy and climate change studies.

[315] *Firmer Footings: Building Authority in Inca Colesuyu*

John Rick's 24 years of excavation at Chavín have had a broad and enduring impact on colleagues and students across the Andes. Here we build on John's specific interest in built space and its relationship to political hierarchy by developing two brief case studies in southern Peru and northern Chile that explore the architectural process as a central domain for the making and remaking of Inca authority. At Moqi, located in the Locumba Valley, construction of the imperial sector was preceded by intensive modification of the underlying hilltop. Builders in the local sector also modified the landscape, but in ways that differed from those employed by the Inca. Closing rituals conducted upon site abandonment in both the Inca and local sectors signal the importance attributed to the architectural spaces by the site inhabitants. Further to the south, in the Palca-Tacora corridor, a chain of Inca waystations (tambos) connected the altiplano with the Caplina and Lluta coastal valleys. Here the small yet formal tambos were carefully inserted into agro-pastoralist landscapes, suggestive of a complementary extensive strategy that reshaped the quotidian spaces of the local communities. Both cases highlight the 'capture' and shaping of the spatial domain in transforming Inca-local relationships.

[310] *Settlement Shifts and the Transformation of Power in Medieval Italy: Preliminary Results from the Excavation of the Castle of San Giuliano*

Northern Lazio, Italy, was a region of shifting boundaries in the Middle Ages. Across the medieval centuries, it encompassed the southern extent of Lombard territory, a southwestern edge of Byzantine lands, and a northern portion of the Papal States. Given the scant textual documentation of this region, archaeology is key to investigating changes in settlement patterns and economic interactions characterizing this dynamic period. We present data from three seasons of geophysics survey, drone photography, and open-area excavations at the medieval castle complex of San Giuliano. This site was part of a broad restructuring of the settled landscape of medieval Italy, in which people chose or were forced to move onto fortified hilltops. The San Giuliano Archaeological Research Project aims to test three explanatory models for the emergence of these fortified sites: 1) manifestations of state power, 2) privatized feudal enterprises, and 3) communal village-based initiatives. In this paper, we present our project's preliminary data concerning the spatial layout, political order, and economic organization of the castle, with particular attention to a hall at the heart of the complex. Fine glassware and ceramic servingwares, alongside zooarchaeological analysis of refuse in an associated granary, suggest that this was a feasting hall.

[199] *Political Alliances and Trade Connections Seen in Ceramic Record from the Classic Period: The Perspective of the Maya Site of Nakum, Guatemala*

Archaeological investigations at Nakum (an important Maya site located in northeastern Guatemala) brought about the discovery of many monochrome and polychrome ceramics in many different architectural contexts. The style of ceramics supplemented in many cases by mineralogical and physico-chemical analysis of ceramic samples indicate that Nakum was part of a broad and complex network of political and economic interactions between various sites and polities of the Southern Maya Lowlands during the Classic period. Here we report on the Nakum ceramics from the Late and Terminal Classic periods that show the connections that this center maintained with other important polities of Guatemala, Belize and Mexico.

[394] *Narratives in Clay and Pigment: Cultural Knowledge and Social Practices in the Sierra Mixe, Oaxaca*

The artistic expressions of the Ayuujk (Mixe) peoples are little known in Mexican archaeological research. In this presentation I discuss the possible narratives behind the presence of plastic art and rock art, unprecedented in Mesoamérica, located in the context of a subterranean landscape in the Sierra Mixe of Oaxaca. In particular I will focus on the repercussion that this research has in relation to the study of memorization techniques and transmission of knowledge. The documentation of such material culture in collaboration with members of the Mixe community has been enriched by information shared by some senior women and men of the local community. The recovered ethnographic data in this ongoing project allows us to understand the significance that stories today of mythic beings and heroes have in the collective imaginary of the Ayuujk people and the impact that the imagery discovered at the site have had to buttress the identity of the present-day Mixe population. I will also discuss the challenges behind the measures that have been discussed jointly to protect this cultural legacy.

Zuckerman, Jill

[265] *Early to Late Archaic Cultural Traditions in Southeast Massachusetts*

The Gulf of Maine Archaic Tradition is poorly represented in Southeastern Massachusetts. Following recent excavations in Somerset, hundreds, if not thousands of pieces of quartz chipping debris, cores, and expedient edge tools were recovered from a relatively small area of distribution. This large amount of non-diagnostic quartz debitage strongly indicates the presence of this Early Archaic tradition. In addition, a separate locus containing a Late Archaic component, yielded mainly Brewerton projectile points, and clearly modified tools and scrapers. Several other materials were represented in this locus including quartzites and rhyolites, but the presence of quartz drops significantly. This paper will discuss how these two loci

fit into our understanding of the indigenous cultural history of Southeastern Massachusetts.

[348] *Pushing and Pulling the Mississippian Moment Into the Western Great Lakes*

This paper provides a comparative review of the regional chronology, material culture indicators, and environmental data for three site-centered locales (Trempealeau/Fisher Mounds, Fred Edwards, and Aztalan) harboring Middle Mississippian components in southern Wisconsin and the Upper Mississippi River Valley. These data are used to discuss the introduction of Mississippian technological innovations, ideational systems, and new subsistence regimes into the western Great Lakes region during the late tenth and early eleventh centuries A.D. This process can be modeled as the result of a variety of causal factors that include demographic, cultural, social, political, and environmental referents. Moreover, data from the three locales discussed suggests that the particular mix of these factors and the degree to which one or more are paramount varies on a case-by-case basis. These factors reveal the differential negotiation of Middle Mississippian influences into the western Great Lakes.
