

The ANNUAL MEETING of the Society for American Archaeology provides a forum for the dissemination of knowledge and discussion. The views expressed at the sessions are solely those of the speakers and the Society does not endorse, approve, or censor them. Descriptions of events and titles are those of the organizers, not the Society.

ABSTRACTS OF INDIVIDUAL PRESENTATIONS

Abbott, David (Arizona State University)

[194] *What We Know and What We Wished We Knew about Hohokam Platform Mounds*

In January 1888, Frank Hamilton Cushing rode his horse atop the Hohokam platform mound at Los Hornos in the lower Salt River valley, and took note of numerous other mounds that dotted the valley's landscape. The monuments' spacing led Cushing to conceive of the valley-wide settlement as an integrated network for communication and irrigation management, and archaeologists have been trying to figure out the settlement structure and organization ever since. Today, the evidence from platform mounds fuels vigorous discussion of their significance from multiple perspectives. When synthesized, the mound data steer us towards refined insights about Hohokam communities.

[73] *Radiocarbon Dating the Iroquoian Occupation of Northern New York*

Fifty new, high-precision AMS radiocarbon dates have been obtained on maize, faunal remains and ceramic residues from 18 pre-contact Iroquoian village sites in northern New York. These dates add significant new information to the chronology of the Iroquoian occupation of the region. Once thought to span AD 1350-1500, these new dates suggest an AD 1450-1520 period of occupation. The evidence now points to their arrival in the region in the late pre-contact period from as many as four different origins. In roughly 70 years, they occupied 40-50 village sites. Village space among some of the village sequences tripled during this period, marked by increasingly larger and more fortified villages- some as large as 3 ha. During their time in northern New York, they were integral to social networks between ancestral Haudenosaunee, Wendat and other St. Lawrence Iroquoian groups. The new chronology points to population pressure and local warfare as being major contributors to their dispersal from the region by 1520.

Abo, Stephanie (Brigham Young University)

[397] *Chemical and Standardization Analysis Results on Fremont Snake Valley Black-on-gray Pottery*

Archaeologists widely argue that Fremont potters from the Parowan Valley, in southwestern Utah, manufactured Snake Valley pottery. For my research, I examined various properties of Snake Valley Black-on-gray (SVBG) ceramics using metric data, statistical methods, and newly obtained neutron activation analysis data. I compared my data results on SVBG sherds from archaeological sites within the Parowan Valley to my results on SVBG sherds recovered from archaeological sites over 200 kilometers to the north. My research expands on the limited knowledge of the painted variety of Snake Valley pottery; as well as provides insight into the overall understanding of pottery distribution among different geographical regions within the Fremont culture.

[421] *Indigeneity and Empowerment: The Politics of Ethnic Labeling in the Philippines*

The 300+ years of Spanish, and later, American colonial administration in the Philippines provided the backdrop to regionalism and distinct ethnolinguistic boundaries that borders into prejudice. This is highlighted by the acrimonious relationship between upland and lowland Filipinos, where the idea of being colonized/uncolonized became the foundation of their identities. As an example, this presentation provides a case study that argues that Philippine ethnolinguistic identities were crafted in the last 150 years. Of particular interest is the identity of the Ifugao, whose cultural identity is centered on their rice terracing tradition and the dominant historical narrative of being 'uncolonized'. Recent archaeological findings contest these descriptions as the shift to wet-rice cultivation and drastic landscape modification occurred soon after contact with the Spanish in the late 1500s. This presentation argues that current Philippine historical narratives perpetuate the colonial-era ideas that people outside the bajo de campana and/or the reduccion system were uncivilized.

[264] *Carlisle, NM: The Short Life of an Early Gold-Mine*

The Carlisle claim was located January 1881. The mine and town operated as the Cochise Company until 1883 when it was acquired by N. K. Fairbanks, the lard king of Chicago. Within a year, Fairbanks sold the mine and nascent town to a London consortium operating as the Carlisle Gold Mining and Milling Company, Ltd of London. With a 40-stamp mill, hotel, restaurants, and mercantile stores, all supplied with mule-drawn wagons, it was a booming operation. By 1885, the territorial census shows the mine and associated town having 198 people, exceeded only by Silver City's estimated population of 975 people. CGMMC continued to operate the mine through much of 1888, finally selling all assets to yet another British company, Gold Leaf, Ltd. late in the year. Despite misplaced optimism, mining at Carlisle had ceased by 1890, although sporadic efforts to resurrect the mine continued through 1942. This paper combines documentary studies, vintage photographs, and archeological research to present a comprehensive overview of the history of Carlisle and its inhabitants as it related to broader patterns of the rise and fall of mine development across the American West.

[38] *Prehispanic Chinampas at El Japón, Xochimilco: Structure and Chronology*

El Japón in San Gregorio Atlapulco, Xochimilco (Mexico City) was a Postclassic-Early Colonial chinampa community, previously reported and partially surveyed by Lechuga (1977), Parsons et al. (1982, 1985), Ávila López (1995) and González (1996). In 2013, investigators from the Instituto de Investigaciones Antropológicas, UNAM initiated a geoarchaeological, paleoethnobotanical and chronological study of the site which is severely threatened by encroaching urbanization and changes in land-use. The postclassic habitational platform is partially destroyed and a broad area of chinampas has been lost. Evidence from recent excavations of these chinampas indicate their initial occupation towards the end of the fifteenth century AD and abandonment after approximately two centuries. Geoarchaeological analyses and AMS dating suggest that chinampa construction in this area was more complex than anticipated, including the reutilization of mid-Holocene sediments from the documented preceramic occupation of the site in addition to the use of layers of diatomaceous sediments, the function of which is yet to be confirmed.

Acuna, Julian (California State University, San Bernardino)

[394] *Exchange, Crafting, and Subsistence at Early Formative Period La Consentida*

The Early Formative (2000–1000 B.C.) period in Oaxaca is generally regarded as a transitional period from the Archaic (7000–2000 B.C.). The early formative is characterized by a change in subsistence, social organization, and sedentism. This period included the emergence of La Consentida, the earliest known settled village in coastal Oaxaca. This paper presents an analysis of the chipped stone assemblage of La Consentida focusing on obsidian, the material most used at the site. I present technological considerations regarding manufacturing techniques and subsequent issues regarding technique implementation, in addition to the within-site distribution of lithics, and other artifact classes, at the site and relate this to manufacturing techniques and inferences towards social organization. Results indicate that obsidian was a favored material for lithic manufacture used in expedient lithic reduction. Additionally, the way in which lithics, and more importantly obsidian lithics, are distributed at the site indicates a purposeful designation for manufacture and use in specific locations. Therefore, ascertaining how the lithic artifacts were distributed throughout the site will help expand current understandings of Early Formative period exchange, crafting, and subsistence practices.

Adair, Mary (University of Kansas)

[80] *Context and Age of Early Maize (Zea mays) in the Central Plains*

Maize, or corn, was one of the dominate crops to many North American Plains tribes, contributing beyond subsistence to origin beliefs, rituals, ceremonies, and trade. Given this, archaeologists seek to recreate the evolutionary processes by which maize became an important element in the economy of Plains populations. Central to this understanding is documenting the arrival of this cultigen. Using microbotanical identifications from absorbed and visible cooking residues and tooth calculus, coupled with AMS dates, this paper summarizes what we currently know about the distribution of this crop in central Plains contexts dating from ca. 1900BP to 1500BP. These data add to a growing body of information on the northern and eastern dispersal of maize with incidences of maize starch and phytoliths occurring 700-800 years earlier than the direct dated macrobotanical remains. A suggested use of maize recovered from microbotanical analysis is offered.

Adam, Manda, Zachary Stanyard (University of Texas at Austin) and Fred Valdez (University of Texas at Austin)**[120]** *Detection of Water Management Systems Using LiDAR at Las Abejas, Belize*

In 2016, the PfBAP (Programme for Belize Archeological Project) employed airborne LiDAR (light detection and ranging) remote sensing technology to map the project area in northwestern Belize. The PfBAP has used LiDAR data to detect and analyze anthropogenic modifications created by the ancient Maya. With this data in hand, we have generated a map with which to locate and ground-truth such anthropogenic modifications. Using this map as a guide, we have identified potential areas for excavation, and have begun to enrich our understanding of how ancient peoples molded and modified their environments. This poster explores the detection of water management features on the landscape that have been identified using LiDAR data. Here the ancient Maya site of Las Abejas serves as a case study to develop and demonstrate methods of detecting water management systems.

Adams, Alisha (University of Otago), Sian Halcrow (University of Otago), Kate Domett (James Cook University) and Marc Oxenham (Australian National University)**[379]** *From the Mouths of Babies: Weaning, Diet, and Stress in Neolithic Northern Vietnam*

The Neolithic agricultural transition has been found to have a negative effect on human health in many parts of the world. However, numerous bioarchaeological studies in Southeast Asia have shown a different pattern of health changes. Changing weaning practices have been argued to have major effects on population health and fertility around this transition. However, the relationship between weaning and stress has been unable to be compared directly. The Neolithic site of Man Bac in Northern Vietnam is ideal to assess the relationship between weaning and stress at the agricultural transition, due to its large sample of excellently preserved infants and children, and previous research that has shown high levels of systemic stress. To see if there is a relationship between weaning, diet and stress, this research compares the timing of systemic linear enamel hypoplasias, identified through new microscopic topographic methods, and incremental isotopic weaning profiles of dentine, determining differences observed within the demographics of the site. Preliminary results investigating systemic stress during development of permanent and deciduous teeth are presented, arguing for inclusion of deciduous teeth as potential representations of gestational stress, and how the timing and prevalence of LEH correlates with age at death in the population.

Adams, Christopher (Gila National Forest)**[413]** *Prehistoric Copper Artifacts Found in the White Sands Missile Range*

Recent Office of Contract Archeology, University of New Mexico fieldwork on the White Sands Missile Range has resulted in the discovery of rare prehistoric copper artifacts. This preliminary investigation involved looking at several El Paso phase sites consisting of Jornada Mogollon adobe masonry roomblock complexes using the latest metal detector technology available. This is the first formal metal detector investigation on El Paso phase Jornada Mogollon sites adding to the so far sporadic evidence that the Jornada Mogollon were exploiting copper artifacts in the southern Tularosa Basin. This paper will bring to light that the Jornada Mogollon culture was utilizing copper artifacts during the period of A.D. 1250 to A.D. 1450.

Adams, Karen (Crow Canyon Archaeological Center) and Anna Graham (University of North Carolina, Chapel Hill)**[302]** *Domestication and Management of Indigenous Plants in the U.S. Southwest: Case Studies of Little Barley (*Hordeum pusillum* Nutt.) and a Wild Potato (*Solanum jamesii*)*

Although the histories of major New World plant domestications of beans, corn, squash, gourd, and tobacco are well-known, histories of regional plant domestications from local wild plants are not. In the pre-Hispanic U.S. Southwest, a wild late winter/early spring-ripening annual grass known as Little Barley (*Hordeum pusillum* Nutt.) became a crop of interest. One notable mutation, likely occurring regularly in nature but not normally perpetuated, resulted in unprotected hull-less grains that were easy to harvest and therefore appealing to humans. This crop was particularly important in the Hohokam Pre-Classical period. A case for pre-Hispanic management of a wild potato (*Solanum jamesii*) is based on the association of modern populations with archaeological sites, range extensions, and supportive plausibility arguments such as long dormancy, nutritional value, and broad use by historic groups. Case studies could also be developed for other wild plants (*Descurainia*, *Astragalus*, *Plantago*, *Salvia*) that researchers consider may have been domesticated or managed in the past. Such regional plant histories suggest that domestication/management may have been an easier/more common occurrence than previously realized.

[85] *Don't Leave Your Mark: Graffiti Mitigation Strategies at Arches National Park*

Over the past five years, there have been several high profile incidents of vandalism on public lands, including in multiple National Parks across the West. This presentation deals with one such incident that took place at Arches National Park in the spring of 2016. Visitors carved names deeply into the face of Frame Arch, a popular resting spot for visitors on their way to Delicate Arch, one of the most popular trails in the park. In October 2017, Vanishing Treasures conservator Rachel Adler tested a number of infill mixtures to disguise the carved graffiti. She completed the treatment in June 2018. The treatment was successful in minimizing the visual impact of the graffiti at the site, but was time and labor intensive, costing the park unanticipated funds. In addition, the compliance process brought to the forefront the enormous challenges parks face when deciding how and when to properly and legally treat graffiti. With incidents increasing every year, parks must develop a streamlined compliance process that is both sensitive to the resources and agreed upon by affiliated tribal communities. Arches has begun that process and hopes to implement these compliance procedures in the coming years.

Adler, Yonatan (Ariel University)

[384] *Between Archaeology and Texts: Early Jewish Ritual Law as a Test Case*

The late Hellenistic and Roman periods were formative for the development of halakhah—Jewish ritual law. Whereas texts have traditionally served as the primary basis for tracing the evolution of early halakhah, archaeology provides evidence on aspects of this history which are entirely unobtainable from the textual record. Through archaeology, we can trace how halakhah developed in the actual practices of ordinary Jews over time and across geographies. Together with the potential prospects, a slew of methodological pitfalls lie in the path of any attempt to correlate archaeological finds and halakhic praxis. We must be careful, for example, never to be too quick in finding intersections between archaeology and halakhic textual evidence; archaeological finds should never be forced into the straightjacket of the texts. Another salient and ever-present danger is anachronism – whenever earlier material finds are interpreted through the lens of later practices. Ritual purity and tefillin (phylacteries) provide two case studies for evaluating how archaeology may be both used and misused in the reconstruction of early halakhic development. A sober consideration of the benefits and hazards allows us to chart the path forward toward developing a useful “archaeology of halakhah” within the framework of a broader “archaeology of ritual”.

Adovasio, J. M. (Senator John Heinz History Center)

[222] *Perishable Technology and the Successful Peopling of South America*

Recent research demonstrates that perishable industries—specifically including the manufacture of textiles, basketry, cordage, and netting—were a well-established, integral component of the Upper Paleolithic milieu in many parts of the Old World. Moreover, extant data suggests that not only were these synergistic technologies part and parcel of the armamentarium of the first migrants to the New World, but, also, that these technologies played critical, and hitherto, largely unappreciated roles in the ecological success of Late Pleistocene populations, notably including the first South Americans. This paper examines the evidence for, and varied roles, of early plant fiber technology in highland and lowland South America and examines the adaptive qualities, potential impacts on social organization, and alteration of food procurement strategies implicit in this fundamentally crucial series of interrelated industries.

Agostini, Mark**[96]** *When Is Healing?: An Archaeological Case Study of the Chacoan and Post-Chacoan American Southwest*

For the Ancestral Puebloans, Chaco Canyon (ca. AD 800-1180), in what is now northern New Mexico, brought disparate communities together under a common cultural system by adjoining religious ceremonies, pilgrimages, and exotic goods with astronomical events, striking topographical features, and other socio-natural phenomena. While the presence of artefactual fossils and other exotic lithified material deposited at Chaco is well documented, the relational and semiotic meanings of these objects in the context of an ancient Chacoan cosmology remains largely under explored. We consider here how practices of healing, being fundamentally rooted in the optic, haptic, and auditory senses of the body, are bundled together with assemblages of material culture evoking a prototypic Pueblo cosmology at Chaco. Pairing museum collections and survey and excavation work with oral traditions, place lore, geomyths, and creation narratives from Pueblo and Navajo cultures, we present evidence for healing at Chaco Canyon and Post-Chacoan migrant sites through the pragmatic hypothetical identification of "medicine stones" by a broad consideration of morphological features and within a contextual relationship connecting these artifacts to subterranean structures known as kivas.

[96] *Chair***Aguilar, Felisa (Centro INAH Coahuila), Joaquín Arroyo-Cabrales (SLAA-INAH) and Eduardo Corona-Martínez (Centro INAH Morelos)****[88]** *INAH's Paleontological Council and Its Role in Preserving the Mexican Heritage*

The National Institute of Anthropology and History (INAH by its Spanish initials) is the federal institution dealing with the research, preservation, and protection of the historical, archaeological, and paleontological heritage from México. Although historical and archaeological heritage has already been under care for more than 40 years, it was not until March 2017 when it was decided to undertake the functions of the Paleontological Council (ConPal by its Spanish initials). Currently the ConPal is constituted by members from 10 academic institutions from all over the country, bringing together high knowledge and capability within the distinct topics of the paleontological field. Among the several functions that the ConPal members are pursuing, there is the development of the regulations under which the forthcoming projects in regard to the paleontological heritage will be reviewed. Furthermore, the necessity for writing guidelines and manuals for conservation and preservation of this heritage, coping with the present economic and social conditions of the country, is another goal for the members. Based on those considerations, we call for the archaeologist searching at deposits where fossil bones are to be found to comply with regulations set for by ConPal and help to save the Mexican Paleontological Heritage.

Aguilar, Fernando (POSGRADO EN ARQUEOLOGÍA/ENAH)**[307]** *Archaeological Survey in Delimited Units: The Altépetl of Ixmiquilpan in the Sixteenth Century*

Archaeological surveys at a regional scale have faced the dilemma of concordance between the archaeological sampling units, normally defined by physiographic elements of the landscape, and the use of significant components of the studied societies, for example, political units or symbolic landscapes. Research undertaken in the Valle del Mezquital has used the Macro and Semi-micro units, as were developed by Kent Flannery in the Valley of Oaxaca and by David Clark in Analytical Archaeology. Research has progressed in defining a Meso level for the sampling systems that we have developed from the ethnocategory of Altépetl, which integrates symbolic landscape and human occupation in a bounded geographic space. In this paper, we will present the accumulated knowledge for the Altépetl of Ixmiquilpan derived from archaeological surveys, excavation, documentary research in archives and ethnographic studies of the hñahñu population of the region.

Aguilar, Joseph (University of Pennsylvania)**[294]** *Partnership Building: Moving Beyond the Collaborative Model*

In North America, American Indian communities are engaging with archaeology in two distinct, and sometimes intersecting, ways: one is by working with governmental agencies in complying with local, state and federal laws meant to protect and preserve their cultural heritage, the other involves engaging with their cultural heritage through meaningful research, which often involves collaborating with academic professional and academic archaeologists. This paper will examine how Pueblo Indian communities in the North American Southwest are navigating their engagement with archaeology through compliance and/or research, and how both forms of engagement are providing means to assert tribal sovereignty and achieve social justice in their communities. Social justice in American Indian communities is often achieved by pushing the limits of colonial governments and their laws, and by changing the ideas and perceptions colonial governments have about native peoples. This paper will explore how this is happening among the Pueblo Peoples in the Southwest through strategic and meaningful engagement with archaeology and cultural heritage on all fronts.

Aguilar-Arellano, Felisa J. [56] see Arroyo-Cabrales, Joaquín

Aguilera, Elizabeth and Emily Umberger**[304]** *Coyolxauhqui's Serpents*

This study focuses on questions about serpents and gender associations in Aztec art--questions raised by a ceramic fragment located in storage in the Brooklyn Museum. On it Coyolxauhqui, the enemy of the Aztecs' supernatural patron, Huitzilopochtli, is depicted with two different types of imaginary serpents, a serpent belt like those worn by fertility goddesses, but double-headed (maquicoatl), and a fire serpent (xiuhcoatl) solar dart, piercing her torso, having been launched by her male rival. The juxtaposition of the two snakes in this image brings up questions about gender associations. In addition to examining serpents on different female images, e.g. the single-headed serpents on amacalli goddesses and the blood serpents on Coatlicue, we will look at others in sculpture—rattlesnakes, water snakes, feathered serpents, etc.

Aguirre, Alejandra (Proyecto Templo Mayor/UNAM) and Diego Matadamas Gomora (Tulane University/Proyecto Templo Mayor)**[255]** *The Miniaturization of Lithic Artifacts within the Offerings at the Great Temple of Tenochtitlan*

The offerings at the Great Temple of Tenochtitlan contain several lithic artifacts that were miniature versions of ornaments, weapons and attire, which were used to produce religious images. For the Mexicas, the act of placing small objects in offerings as gifts was loaded with symbolism. These miniaturized artifacts were deposited to create a microcosm within the reduced space that was the offering. Miniature objects would have held the same symbolic qualities as the normal-size objects they represented. In the present paper, we will study miniaturized lithic artifacts from offerings around the sculpture of the earth goddess Tlaltecuhli, located in front of the Great Temple of Tenochtitlan. We propose that these miniaturized artifacts were models used by the Mexicas to represent deities, as well as dead-warriors traveling through the underworld.

Ahlrichs, Robert (UW-Milwaukee)**[204]** *Archaic Copper Economy and Exchange in the Western Great Lakes: A Comparative Study from Two Wisconsin Localities*

This research presents the results of an analysis of a large privately curated collection of Archaic period (Old Copper Complex) copper from the Western Great Lakes. Results from metric, LA-ICP-MS chemical characterization, and radiometric dating analyses will be presented. The data set is drawn from a collection of over 2000 formal copper tools recovered by a single individual at two localities in Wisconsin, one in northern Wisconsin near the primary source of copper and one several hundred kilometers to the south. Results of these analyses will be compared between the localities with an emphasis on discerning the degree to which the two localities are connected within the Old Copper Complex.

Ahlstrom, Richard (HRA, Inc. Conservation Archaeology) and Heidi Roberts (HRA, Inc. Conservation Archaeology)**[86]** *The Jackson Flat Reservoir Project: Investigating a Basketmaker-Pueblo I Community in Kanab, Utah*

Data recovery for the Jackson Flat Reservoir, Kanab, Utah included the excavation of 60 habitations at six sites. Thirty-eight structures were radiocarbon dated, mostly with samples of maize from hearth and floor contexts, to the Early Agricultural and Basketmaker II through Pueblo I periods. We interpret the sites' Basketmaker III temporal components through the lens of events and episodes in this longer history, including an intrusion of San Pedro culture farmers around 1300 B.C., construction in late Basketmaker II of an oversized pithouse associated with the beginnings of a (small) multi-household community, that community's persistence through Basketmaker III, construction of attached-antechamber pithouses in late Basketmaker II–early Basketmaker III, a second, presumed central Pueblo intrusion marked by construction of classic Basketmaker III-style detached-antechamber pithouses in terminal Basketmaker III–early Pueblo I, and the continuing presence of a multi-household community through Pueblo I. We examine these developments in the context of relations and contacts between the bearers of the region's "Virgin Branch" archaeological culture and those of the Kayenta and other Ancestral Pueblo branches located to the east.

[240] *Resilience and Stable Shifts: Historical Ecology at Bay Point, San Miguel Island, California*

Faunal remains from two multi-component archaeological rockshelter sites on northeastern San Miguel Island are used to reconstruct aspects of nearshore ecosystems and investigate patterns in marine resource use through time. More than 90 ¹⁴C dates demonstrate that Daisy Cave (CA-SMI-261) and Cave of the Chimneys (CA-SMI-603) were occupied for most of the Holocene from ~11,700 to 1,000 cal BP. Stable isotope analysis of >100 archaeological mussel shells was used to reconstruct nearshore sea surface temperature (SST) for Bay Point, revealing environmental shifts during the Holocene. Analysis of fish bones identified >20 taxa that people used hook and line, nets, and other technologies to catch—with a consistent suite of nearshore and kelp bed taxa through time. Analysis of shellfish remains identified >50 taxa revealing a similar pattern with oscillations in sizes and relative abundances of major prey species through time. Faunal densities and relative abundances oscillate between components, but the fish and shellfish assemblages indicate relatively stable and resilient nearshore habitats throughout the past 10,000 years. These data contribute to our understanding of how islanders utilized and shaped marine ecosystems in the past and inform on the potential resiliency of marine fisheries.

Ainsworth, Caitlin (University of New Mexico)

[419] *Paquimé in Perspective: A Meta-Analysis of Turkey Remains from the US Southwest and Northern Mexico*

Excavations at the site of Paquimé in Northern Mexico, uncovered the interred remains of hundreds of common turkeys. Given both the size and unusual nature of this assemblage, studies of the Paquimé turkeys seem well suited to furthering our understanding of domestication, management, and use of the common turkeys in North America. Yet, while interest in zooarchaeological studies of turkeys has never been higher, the Paquimé avifauna remain little discussed outside the context of studies of the Casas Grandes system. This paper evaluates what is currently known about the turkeys of Paquimé, highlighting similarities and differences between this assemblage and ones recovered from sites in the US Southwest, and suggests ways in which data from this site might contribute to broader narrative regarding turkey husbandry and domestication in North America.

Ainsworth, Caitlin [25] see Kirk, Scott

Aitchison, Kenneth (Landward Research Ltd)

[65] *Intelligence and Predictive Analytics*

Labor market intelligence can tell us about the size, shape and dynamics of professional archaeology, as it is today and as it has been in the past. This valuable information helps individual archaeologists to see where they are in their careers, helps employers to recognize their place in the market and helps educators see where the students they have trained have made a difference. Predictive modeling takes the data gathered by labor market intelligence and creates a tool that employers can use to plan the development of their workforces, educators can use to plan future courses and individual archaeologists to plan their careers. Building on the authors' global experience of gathering labor market intelligence, this paper will look at how data can be used to support predictive analytics which go beyond describing the current and past state of affairs, and how this can create actionable, forward-facing predictions on how archaeology will change in the future.

[127] *Modeling Regional-Scale Vulnerabilities to Drought through Least Cost Analyses: An Archaeological Case Study from the Jemez Mountains, New Mexico*

We present a new approach for identifying archaeological proxies for community vulnerabilities to climate change: least cost analyses of water acquisition costs from archaeological sites to water. By automating the least cost

analysis through a custom Python script in ArcGIS Pro, we modeled the 1-way cost for water acquisition pairwise between 136 water sources and 5,480 archaeological sites across the Jemez and Pajarito Plateaus of the Jemez Mountains, New Mexico. We then compared travel times from water sources with different drought sensitivities to archaeological sites. This allowed us to explore diachronic regional-scale vulnerabilities in Ancestral Pueblo settlement patterns to hydrological droughts. Our research found that while hydrological droughts would not have made water acquisition costs prohibitive, they significantly increased costs. This problem was exacerbated on the Pajarito Plateau due to greater sensitivities in the geohydrological system to reduced surface water during droughts, and the decline of the dual residence pattern among Ancestral Pueblo communities. Therefore, hydrological droughts in concert with the socio-economic consequences of village aggregation in the 15th century cannot be ruled out as factors in the depopulation of Pajarito Plateau.

[416] *Foreseeable Tools: Lithic Use-Wear and Technological Organizations in Evolutionary Perspectives*

The paper explores some problems concerning the relationship between aspects of lithic technology and the cultural evolutionary theory. There are three fundamental realms in stone tool analysis, namely, typology, technology, and functional studies. These research phases are integrated into the study of “technological organizations” in the sense of Binford (1979). It is important to understand thus described variabilities in lithic industries from evolutionary viewpoints. In other words, why and how selection pressures have been in operation on such diversities in lithic technology needs to be pursued. The present study focuses on the Upper Paleolithic period in East Asia. Case studies in the northeastern Japanese archipelago and the middle Korean peninsula are evaluated on adaptive advantages of such industries as blank blades, backed knives, tanged points, and microblades. The results of detailed functional reconstruction based on microscopic use-wear analysis are combined with technology and morphology. Concrete data from microwear analysis of both high-power and low-power methods shed light on some modern human behaviors such as planning depth, hafting, and composite tool usage for foreseeable future activities by new arrivals of population to the most peripheral region of Asia.

Alaica, Aleksa (University of Toronto)

[356] *Quilcapampa and Points of Convergence in Middle Horizon Arequipa: Faunal Evidence for Extensive Interregional Interaction*

Quilcapampa was an important point of convergence for communities from around the southern Andean region with these people and/or their material culture suggesting extensive interregional interaction. The zooarchaeological work conducted on the vertebrate remains from Quilcapampa will be presented in this paper. The presence of camelids (llamas and alpacas) dominate the proportion of species identified. The skeletal elements used in the various parts of the site along with the age of camelid remains will be discussed in detail. There are multiple examples of pathologies along the toes of these animals that indicate habitual, long-distance movement was part of the life histories of these animal groups. The few bird remains that were identified suggest both coastal and local opportunistic hunting, which supports additional evidence from mollusk analysis demonstrating coastal materials were extracted and were brought to Quilcapampa. The zooarchaeological work conducted on this project is another important line of evidence to clarify the role and occupational history of Quilcapampa at the time of growing Wari influence in the region.

[200] *Revising Empire: Chimú and Inka Ceramic Morphology at Santa Rita B (Chao Valley, Peru)*

Populations in the Chao Valley of coastal Peru experienced successive waves of imperial expansion from about AD 1350 to the mid-sixteenth century. In relatively short order, the Chimú, Inka, and Spanish empires each established varying degrees of control over the valley. The site of Santa Rita B offers perspectives of how the annexation of the valley by the Chimú state established an imperial foundation that was strategically revised during the decades of Inka imperial rule. In this paper we discuss the evidence from Santa Rita B, which suggests that the Chimú conquest of the Chao Valley brought about a profound transformation of local identities and daily life as imperial subjects. We also investigate the distribution of the “Chimú-Inka” aesthetic in excavated administrative, ceremonial, and mortuary contexts at Santa Rita B. Given the uneven distribution of Inka-affiliated material culture at the site, we discuss the hybrid nature of Chimú-Inka pottery using preliminary results of a 3D scanning project to examine the impact of Inka conquest on local ceramic production practices and the social use of ceramics at Santa Rita B.

Alaniz, Guillermo Gerardo De (Instituto Nacional de Antropología e Historia [INAH]) and Karla Ortega (Proyecto Gran Acuifero Maya)

[360] *The Reemergence of Balamku as a First Order Sacred Landmark at Chichen Itza*

During the 2018 season, the Gran Acuífero Maya project began exploration of the cave of Balamku, located some 2.4 km east of Chichen Itza's site center. The cave is noteworthy in containing incensarios, manos and metates, and

other artifacts identical to those in the back passage of Balankanche, only in greater numbers. The similarity does not end there. Balamku, like Balankanche, was elaborated by a substantial amount of surface architecture and both were connected to the site core through sacbeob. When one considers the Osario complex, the many cenotes, and the huge number of sascaberbas converted into caves, it is clear that the site is integrated into the subterranean to an extent heretofore unappreciated.

Alarcón Tinajero, Edgar (University of Georgia), Christopher Morehart (School of Human Evolution & Social Change, Arizona) and Angela Huster (School of Human Evolution & Social Change, Arizona)

[374] *Approaching the Iconography of Epiclassic Censer Ornaments, a Typology from Los Mogotes, Estado de México*

Censers are a subset of Mesoamerican ceramics interpreted as ritual vessels used to burn incense. In ancient central Mexico, censers tend to feature mold made or handmade clay ornaments that were possibly part of iconographically composite vessels. A challenge in their interpretation, however, is that these complex vessels are often found in isolated fragments. At Los Mogotes, an Epiclassic period (ca. 600-900 CE) hilltop settlement in the northern Basin of Mexico, body sherds of censers and appliqué ornaments are part of the ceramic assemblage. This poster offers a preliminary classification and interpretation of motif classes – such as chilies, maize, and thunder – based on an analysis of ornaments from Los Mogotes. The spatial distribution of ornament types recovered across functional contexts is described: including public, domestic, and ritual spaces. Understanding the spatial distribution of ornament fragments can help ascertain the association of ornament types with once-complete composite censers. This is important because complete examples are rarely recovered. This analysis elucidates the classification of censers by approaching the repertoire of ornament symbols and their possible place in the ritual life of an Epiclassic settlement.

Alcantara, Keitlyn (Vanderbilt University Department of Anthropology)

[192] *Ingredients for Resistance: Foodways in Prehispanic and Colonial Tlaxcallan*

Known as the “traitors to Mexico” for their fateful alliance with the Spanish, the Tlaxcalteca are often denigrated in Aztec-influenced versions of Mexican history. In these accounts, Tlaxcallan’s alliance with the Spanish was assumed to be a sign of the population’s political and economic weakness; an escape plan from impending Aztec conquest. An examination of the state’s chronology points to a far more intentional resistance: settled in AD 1380, in less than 200 years, the Tlaxcalteca faced both Aztec (AD 1460-1519) and Spanish (AD 1519) colonial pressures, maintaining a measure of sovereignty not seen in other populations faced with the same fate. I argue that when confronted by Aztec and Spanish colonialism, the Tlaxcalteca maintained a sense of autonomy through political, economic and social structures that interacted to create a fiercely patriotic state, strengthened by internal cohesion. In this presentation, I support this hypothesis through the bioarchaeological analysis of food practices (dietary isotopes and phytoliths) from human burials at Tepeticpac, the urban core of Tlaxcala. The comparison between these bioarchaeological results and modern local food practices will demonstrate that food continues to play a central role in maintaining a sense of local cohesion and unique cultural identity in Tlaxcala.

[355] *Inka Provincialism and the Empire: Commensalism and Social Agency*

As a multiethnic empire, the Inkas maintained varying forms of relations with the provinces and outlying frontier regions. To maintain control, state power was often materialized in state architecture, prestige materials and standardized ceramic styles disseminating the imperial ideology. Despite this situation, recent research has revealed the rise of a variety of provincial styles as the product of wider processes of transculturation, hybridization and emulation. By comparing the variability, spatial distribution and temporal shifts in a set of imperial centers of the Collasuyu quarter, the goal of this presentation is to discuss the different ways in which indigenous populations were integrated into the state, and the role that imperial emissaries had in implementing a set of imperial institutions and practices. Among others, those centers include Oroncota (Yampara province), Kaata Pata (Kallawaya province) and Samaipata. By using ethnohistoric and archaeological information, the results will reveal the complexity of these relations, the different orientation and nature of commensalism celebrated in these state installations, and the varying ways in which competing royal families and Inkas-by- privilege implemented and interpreted the imperial agenda.

[383] *Notions of Value and Ahegemonic Archaeological Interpretation*

This paper takes up a theoretical exploration of the concept of “value” as it is articulated explicitly and implicitly within archaeological investigation. Recognizing that the issue is related to social science inquiry broadly, this paper looks to Bourdieu’s “Forms of Capital” to develop a framework for interpretation that does not rely on hegemonic considerations of value. The presentation draws on examples of proposed relationships between astronomy and ideology within Mesoamerican cultures to seed the more general and theoretical development of ahegemonic interpretive tools that variously may or may not be compatible with hegemonic approaches. Accordingly, the intent is to make intellectual space for articulation with approaches to archaeological data arising from Indigenous Studies,

Ethnic Studies and Feminist Studies.

[76] *Fabrics of the South American Desert Coast: The Study of the Marine Hunter-Gatherer's Plant Fiber Technology in the Atacama Desert*

This research aims to study the earliest fabric artifacts made by marine hunter-gatherers who inhabited the Peru-Chile desert coast. Thanks to the aridity of this area, I use a remarkable amount of well-preserved plant-fiber materials, most belonging to the world's oldest Chinchorro mummies buried more than 7,000 years ago. Fibers in these pre-ceramic materials are often identified based on mostly macroscopic methods, which often fail to accurately identify the plants used. To address this significant gap in knowledge, this study investigates the microscopic characteristics of fibers in order to reveal the range of plants employed in this technology. A high-resolution portable microscope is also used to observe artifacts' technical aspects related to epidermis extraction (cortication), splicing or spinning techniques, and other techno-textile attributes. Through the understanding of the manufacture of nets, ropes, and other plant-fiber items, I will interpret the social organization of the coastal population around this technology. I hypothesize that such processes and all related activities gave shape to a techno-social choreography on the coast. By this, I mean that the artisans' movements were guided by the rhythm of technical tasks and the seasonality of taskscape.

Aldenderfer, Mark (University of California)

[181] *Hearths and the Early Ritual Architecture at Middle Archaic Asana*

Around 7000 years ago, the inhabitants of Asana created what appears to be a kind of ritual structure. Larger and shaped differently when compared to the residential structures nestled around it, the construction contained a hearth wholly unlike those found in its neighbors. Those hearths lit the interiors of these houses, provided warmth, and were used as impromptu dumps for bone scrap and small lithic waste. In every sense, these hearths look wholly quotidian. In contrast, the hearth inside the larger structure lay largely on the surface, did not show signs of intensive burning, and was composed instead of large, fire cracked rocks or cobbles showing evidence of fire spalling. This hearth is hardly quotidian. No lithic or bone waste was found within it or anywhere else on the floor. But as many as five small clay "boxes" are embedded on the floor, and some contain small quantities of very fine wood ash.

If this structure serves a ritual purpose, what role did the hearth play? And what of the boxes? In this paper, I seek to reconstruct what may have taken place within this special structure.

[88] *Addressing Objects in Limbo: Using Digital Resources to Increase Access to Native American Material Culture*

Despite the passage of the Native American Graves Protection and Repatriation Act in 1990, a large amount of contested Native American material culture remains in archaeological collections across the country. Universities, museums, and government agencies may retain such objects due to issues with cultural identification, competing claims from multiple groups, or a lack of legal obligation. Although institutions might not be holding these items with malicious intent, their inability to grant access nevertheless serves to uphold colonialist ideals of ownership that deny Native groups control over their own narratives. This poster will examine how digital resources can increase the accessibility of these items stuck in limbo. To achieve this, the poster will provide analyses of multiple digital repatriation methods, including institutionally managed web pages, indigenous-centered online databases (such as the Mukurtu Collections Management System), and 3D-digitization technology. These analyses will place particular emphasis on the spiritual and political issues surrounding the digitization of Native American objects. After discussing the potential merits and limitations of each method, the poster will summarize the essential considerations researchers must make when implementing digital repatriation projects.

[302] *Domestication through the Bottleneck: Archaeogenomic Evidence of a Landscape Scale Process*

Domesticated crops show a reduced level of diversity that is commonly attributed to the 'domestication bottleneck'; a drastic reduction in the population size associated with sub-sampling the wild progenitor species and the imposition of selection pressures associated with the domestication syndrome. A prediction of the domestication bottleneck is a sharp decline in genetic diversity early in the domestication process. Surprisingly, archaeological genomes of three major annual crops do not indicate that such a drop in diversity occurred early in the domestication process. In light of this observation, we revisit the general assumption of the domestication bottleneck concept in our current understanding of the evolutionary process of domestication, and consider the implications of localized versus landscape scale models of agricultural origins.

Allard, Amélie (Royal Ontario Museum)

[414] *"The South Traders Carry All Before them": Colonialism, Waterways and Relationships in Ontario's Fur Trade*

The so-called "fur trade era" of northern North America was founded on a willful exchange between Indigenous peoples and European or métis-descended merchants. Waterways provided the main means of travel, permitting traders to spread their posts and influence across the landscape of the interior. Yet in its early years the London-based Hudson's Bay Company (HBC) operating in Rupert's Land made use of water in very different ways from its most direct competitor, the Montreal-based North West Company. In this essay, I examine the ways in which two existing collections from Ontario, one from HBC's Fort Albany and the other recovered from the French and Winnipeg rivers, inform our understanding of fur-trade era colonial relationships and the diversity of local responses to merchant capitalism. Using a comparative framework, I assess the differences between the two assemblages, in so doing highlighting how the two types of sites provide different glimpses in the ambivalent nature of intercultural relationships as evidenced by the different colonial approaches. I further argue that a perspective that takes into account non-human forces, such as water flows, provide unique opportunities to bring to the fore different facets of human interactions and how they are themselves entangled with non-human things.

[300] *A Metallurgical Study of Early Bronzes from Northern Vietnam: Some Thoughts on Methodology, Local Practices and Inter-regional Interaction*

This paper presents the results of the metallurgical analysis of 43 fragments of bronze artifacts recovered from Bronze Age sites in northern Vietnam. It represents the largest systematic study undertaken so far of early north Vietnamese bronzes using a range of archeo-metallurgical techniques. The artifacts, which are associated with the Dong Dau, Go Mun and Dong Son archaeological cultures, were studied using various techniques, including pXRF, SEM-EDS, and metallography. Although the sample size remains small, the compositional data on the copper, tin, lead and arsenic contents of different types of bronzes, combined with evidence of metalworking processes (e.g., hammering and heat-treatment), so far points to clear changes in metallurgical practice over the 1st millennium BCE, as well as differences with early metallurgical traditions in adjacent regions such as southeast and southwest China. The paper also reviews the uses and limitations of the different techniques used in this study of north Vietnamese bronzes.

Allaun D'Lopez, Sarah (University of Wyoming) and Ismael Sánchez-Morales (The University of Arizona)

[221] *Spatial Analysis of Surface Locality 5 at Fin del Mundo, Sonora, Mexico*

The Paleoindian presence south of the modern geo-political US-Mexico border is relatively poorly understood when compared to that of the rest of North America. A notable exception to this gap in knowledge surrounds the work at Fin del Mundo in Sonora, Mexico. This northern Mexican site is the subject of extensive survey and excavation, revealing the only known human (Clovis)-gomphothere (*Cuvieronius* sp.) association in North America and an extensive occupation record. This study emphasizes the expansive surface locality (Locality 5) at Fin del Mundo. I present the results of a spatial analysis of Locality 5 with an emphasis on the patterning of diagnostic Early Paleoindian and Archaic archaeological materials. My analysis in conjunction with ongoing analyses at Fin del Mundo and elsewhere in Northern Mexico will contribute to the local understanding of both Paleoindian and Archaic periods in the region as well as contribute on the greater scale to the knowledge of this important transitional period

in human history.

[169] *Pottery Production and Community Practices: Haudenosaunee in Central New York*

This paper focuses on the practices of potters within several communities in central New York State. This area was occupied during late prehistoric/early historic times and abandoned shortly after contact when populations were consolidating in greater numbers in neighboring regions. Occupants at two of these sites (Parker Farm and Carman) were engaged in subsistence and production activities, but with different emphases. Pottery production was more intensively practiced at the former site, while manufacture and trade in shell beads was evident at the latter. Previous efforts at detailed pottery analysis have been thwarted by the extensive fragmentation of pot sherds and avocational collection activities. These have posed methodological challenges for the comparative analyses of these and several nearby sites with the aim of identifying communities of practice associated with one of these activities, the production of pottery. For this analysis, attribute analysis of incomplete rim sherds suggests the presence of community practices for rim formation, design placement, design elements, and partial motifs. Comparisons between these sites and others with complete rims illustrate the potential and challenges of this approach.

Allen, Kathryn Grow (Eastern Oregon University)

[351] *A Case for Islam: Bioarchaeological Research on the Ottoman Period in Southeast Europe*

The introduction of Ottoman control and the arrival of Islam in Southeast Europe during the late medieval period greatly influenced both historical and modern populations. In spite of this impact, this cultural and religious influence remains a topic understudied in archaeology. With Christianity the dominant religion, other religious influences can be overshadowed, particularly those antithetical to normative views of Europe. The connection of this period to modern sociopolitical conflict in the Balkan peninsula also made it a contentious focus of archaeological analysis in the recent past. These reasons provide an impetus for expanding what we know about this cultural anomaly in medieval Europe. Making a case for Islam, this paper discusses the impact of conversion and migration processes during Ottoman expansion. These processes influenced regional demography, religious diversity, and the historical trajectory of Southeast Europe, proving their importance to medieval history. Ongoing bioarchaeological research highlighting demographic and biological diversity, migration patterns, and conversion practices, including the child tribute system or 'blood tax', highlight these influences. The combination and comparison of biological, archaeological, and historical data reveal avenues for future work on this understudied subject.

[29] *Human Ecodynamics in Central East Polynesia*

Our understanding of Pacific paleoenvironments, how they changed with human arrival, and further transformations in the post-settlement period owes much to the research and insights of Steve Athens. This paper considers palaeoenvironmental records from central East Polynesian islands in relation to human settlement, persistence, and ecodynamics.

Allen, Mitchell (University of California Berkeley) and William B. Trousdale (National Museum of Natural History, Smithsonian)

[399] *Timurid Period Rural Settlement in the Sar-o-Tar Desert, Afghanistan*

Archaeologists generally recreate settlement patterns based on vestigial remains of rural landscapes destroyed by later settlement, agricultural activity, or environmental degradation. The 14th and 15th century Timurid settlement of the Sar-o-Tar plain, east of the lower Helmand River in southwest Afghanistan, is a notable exception. Dry desert conditions allowed for occupation only during times when the extensive canal system, first developed 2500 years earlier, could be reexcavated and maintained. These same desert conditions—and intensive sanding that filled the empty buildings—prevented later agricultural activity, pluvial erosion, and even limited site looting in the six centuries after the area was abandoned. Thus, we have as close to a pristine environment from the 15th century CE as archaeology has had the opportunity to study. The 1000 square km is filled with almost untouched medieval houses, some standing three stories high, fortresses, mosques, mausoleums, canals, even field walls. The Helmand Sistan Project, working in this region in the 1970s, documented the Timurid remains of Sar-o-Tar through survey and limited excavation. This paper will summarize our findings of the Timurid period in Sar-o-Tar and suggest some general themes that may assist archaeologists working in less visible rural environments.

Allen, Susan (University of Cincinnati) and Martha Wendel (University of Cincinnati)

[404] *Landscape and Plant Use in High Albania: New Results from the Late Neolithic to Iron Age at Gajtan and Zagorës*

From 2013 – 2015, the Projekti Arkeologjik i Shkodrës (PASH) conducted a regional surface survey and targeted excavation at several settlement and tumulus sites in the Shkodër province of northern Albania. Two of these

settlement sites, Gajtan and Zagorës, are fortified hilltop sites that preserved intact deposits with well-preserved macrobotanical remains (wood, seeds). Gajtan, one of the largest hill forts in Albania, was occupied from the Late Neolithic to the Late Bronze Age (LBA). Zagorës was occupied slightly later, in the Eneolithic, continuing into the LBA. As part of the PASH focus on landscape archaeology, we discuss here evidence from the wood and seeds collected from flotation during the 2014 field season. Forest taxa represented include beech and fir, among others, while crop taxa are limited to the cereals einkorn wheat, spelt, hulled two-row barley, and millet, and the pulses lentil, pea, and bitter vetch. Analysis of this material provides insight into landscape dynamics, land use strategies, and plant use during these periods, revealing adaptive and resilient strategies.

Allgaier, Paul (University of Utah Archaeological Center) and Brian Coddig (University of Utah Archaeological Center)

[218] *Prearchaic Settlement Distribution in the Central Great Basin*

The first occupants of the Great Basin settled the region when highly profitable wetland environments were abundant, but their spatial distribution was highly variable. Results of our earlier work identified an interesting pattern driven by this variation: Prearchaic (>8000 BP) settlements in the Lahontan and Bonneville Basins were closer to pluvial lakes than would be expected by chance, while settlement locations in the central Great Basin were no closer than random. This find suggests there is a different driver of site location than just wetland environments in the central Great Basin. Here, we aim to identify other environmental factors that may be driving settlement distributions in the central Great Basin.

Allison, James (Brigham Young University)

[188] *Simple Statistics and Archaeological Problems*

Among Keith Kintigh's many contributions to archaeology was his emphasis on understanding the connections among quantitative methods, archaeological problems, and what archaeologists can reasonably infer from their data. In both publications and in the classroom, he demonstrated the value of simple computer simulations to understand quantitative measures and how they behave when applied to actual archaeological data. Archaeological research increasingly incorporates analysis of large databases and quantitative methods appropriate to "big data", but simple statistics are still important to archaeological research. This paper uses computer-intensive methods to demonstrate that archaeologists (and others) frequently misunderstand and misapply some of the simplest statistics used in archaeology: chi-square tests and related methods for examining cross-tabulated data (e.g., artifact counts by provenience). These tests rely on assumptions about sampling that are usually not appropriate for archaeology, and, when applied to archaeological data in textbook fashion, they often give wildly misleading results. Computer simulations provide a better understanding of the issues involved, and of how to use these (not so) simple statistics to provide valid insights about archaeological questions.

Almeida, Marcia Bezerra (Universidade Federal do Pará) and Clarice Bianchezzi (Universidade do Estado do Amazonas/PPGA/UFGA)

[2] *Flowers and Sherds: The Practice of Collecting Artifacts in Brazilian Amazon*

In this presentation we discuss the practice of collecting artifacts, considering the perspectives of the collectors and of the State in Brazil. We assume that collecting is an act that should be understood from a phenomenological approach. Our reflections take into account the affective relationships between the collectors and the artifacts, and also the tensions that arise when this practice is categorized by the paradigms of heritage preservation. Based on research conducted with human collectives involved with these practices in the Brazilian Amazon, especially, in Parintins/AM and Joanes/PA, we seek to highlight the role of collecting in their daily life and the relevance of their entanglement with the archaeological materiality to the constitution of a symmetrical policies and management practices.

Alonso, Alejandra and Gregory Smith (Northwest College)

[407] *A Preliminary Investigation into the Political Economy of Santa Cruz, an Associated Community with Ichmul de Morley, Yucatan, Mexico*

This paper centers on the analysis of shell, lithics, and ceramics recovered from the ancient Maya community of Santa Cruz, located 3 km south of the secondary site of Ichmul de Morley in northern Yucatán. Ichmul de Morley appears to have had an expansive growth during the Late and Terminal Classic periods that might have encouraged local development of nearby communities to which it was associated. We would like to identify the degree of sociopolitical integration at Santa Cruz within the landscape dominated by the political economy of Chichen Itza, easily the largest city in the vicinity. Santa Cruz seems to have been a community where economic activities were diversified and perhaps organized into specialized workshops, a pattern seen at other neighboring sites such as

Xuankal. The analysis of materials recovered through systematic surface collections may represent a good sample to identify aspects of production and multicrafting based on the type, function, and abundance of imported foreign items such as shell, chert, and obsidian artifacts. Future excavations at Santa Cruz aimed at differentiating residential and productive areas may increase our understanding of the varied economic strategies of communities affiliated to secondary centers such as Ichmul de Morley.

Alonzi, Elise (University College Dublin)

[334] *Fosterage and Mobility at the Early Medieval Irish Monastery on the Island of Illaunloughan: A Bioarchaeological Case Study*

Fosterage and mobility both require creating and breaking social ties. Early medieval Irish texts suggest that mobility and fosterage, which is the practice of children leaving home to be raised and educated, were means by which monastic communities gained members and sustained a prestigious social standing. Examining these practices through biogeochemistry can begin to elucidate the relationships between religious and lay communities in early medieval Ireland. This bioarchaeological case study focuses on the practice of monasticism at an early medieval Irish ecclesiastical site on the island of Illaunloughan, Co. Kerry. The monastic phase of the burial population at this site is notable because it contains only males and juveniles. Also, the monastery on Illaunloughan was located in the Corcu Duibne kingdom, which was well-documented to contain three distinct areas controlled by kin groups. Radiogenic strontium isotope ratios and oxygen isotope values, in addition to the contexts of the monastic phase burials, are used to estimate whether the studied individuals may have originated within or outside of the three areas of the Corcu Duibne region. This study provides insights into the lived experiences of both juveniles who were fostered at ecclesiastical sites and adult members of religious communities.

[174] *Subsistence Change during the Transition to Agriculture in Southern Belize: What Amino Acid Specific Stable Isotope Analyses Can Tell Us*

The impact of the agricultural transition in the Maya region is little understood. Excavations at two rockshelters in southern Belize, Mayahak Cab Pek and Saki Tzul, have uncovered intact deposits dating from Cal.12,000 to 1,100 BP with a continuous record of both human and fauna remains. Using carbon and nitrogen bulk tissue and carbon amino acid specific stable isotope analyses, we are able to identify periods of human subsistence change in both the carbohydrate and protein portions of the diet as well as shifts in animal foraging over the agricultural transition. These changes are inherently important for understanding the gradual adoption of maize, the decrease of the animal contribution to the diet over time, and the ecological changes in Southern Belize that occurred as humans transitioned from being hunters and gatherers to intensive agriculturalists.

Alt, Susan M. (Indiana University Bloomington)

[24] *Cahokia After Dark: Affect, Water, and the Moon*

Cahokia may not be the first place to come to mind when thinking about urbanism, but given new thinking and discoveries from a series of major excavations at and around this novel kind of city, views about the causes and consequences of American Indian urbanism are substantially changing. In part this is because we realize that urbanism is an experience found in the assemblage and rhizomatic connections of sensations, atmospheres, and affects of a time and place. This is just as true for Cahokia as for any urbanism. Urbanism at Cahokia was however, as much about experiences of the night as it was about the daytime. Interpreting Cahokia's archaeological data through a lens of ethnohistorical data, as evidenced by use and proximity to caves, caverns, and underground water, it becomes very clear that Cahokians actively sought, if not also recreated, experiences of the night. Very often, those experiences were tied to water and the moon. As I will argue, an understanding of the full assemblage of what made Cahokia urban requires a consideration of the full experience of the landscapes of the night.

[352] *Gene-Culture Coevolution and Breeding of Ornamental Plants Is a Specific Aesthetics-Driven Social Niche*

Agriculture, including plant and animal domestication and breeding, is traditionally and mainly directed towards supplying human needs for food and nutritional factors, both for improving food quantity and quality and for tolerance to various environmental stresses. Less explored are the needs and driving forces behind domesticating and breeding ornamental plants. In the following we examine the cultural-social aspects and specific social niches of ornamental plant domestication and breeding, analysing several specific case studies (rose, tulip, lawn/turf, bonsai). What drove people to domesticate, breed and cultivate cut flowers and a variety of ornamental plants, and for what purposes? Were social life and stature, or economic success, or recreational activities the driving force behind breeding? We suggest that human sense for aesthetics, combined with economic and social reasons, and in some cases religion, were the driving force behind ornamental plant agriculture. Similar examples occur in several domesticated animals (e.g. dogs, cats and fighting-oriented chicken breeds) where social and aesthetic considerations may be one of several breeding targets.

Altschul, Jeffrey (SRI Foundation/Coalition for Archaeological Synthesis)

[188] *Answering the Grand Challenges of Archaeology*

Keith Kintigh has been at the forefront of the digital revolution in archaeology. He was one of the first to recognize the potential and need of digital archives to house and make accessible the vast treasure trove of archaeological data. He has been a leader in developing tools to access and manipulate data from disparate data sets. Keith spearheaded the effort to define the Grand Challenges of Archaeology. And, he co-founded the Coalition for Archaeological Synthesis to answer the challenges and other major questions facing the discipline and society. In this paper, I explore the last initiative—the creation of a vehicle to conduct collaborative archaeological synthesis—in depth. The origin of the Coalition, its structure, and its vision to transform archaeological synthetic research are discussed. I close with the current status of where we are as a discipline in this process in what ultimately will be a defining part of Keith's legacy to archaeology.

[371] *Analyzing the Relationship between Peri-abandonment Deposits and the Eastern Shrine of Xunantunich, Group B*

Peri-abandonment deposits in the Maya region have been a source of contention in recent years given the varied artifact assemblages and the lack of clear understanding for their purpose. This research describes peri-abandonment deposits at Xunantunich, Group B, an elite residential plazuela group located approximately 150 meters from the site core. Excavations focused on Structure B-1, the eastern shrine where multiple, layered deposits of artifacts were discovered along the southern outside wall of the structure. Artifacts collected include faunal remains, ceramic sherds, and lithics, as well as materials that are ideologically significant to the Maya such as jade, obsidian, and eccentrics. Ceramic and lithic artifacts were analyzed in-field during the June 2018 field session and faunal remains were previously analyzed in 2017. By analyzing the artifacts recovered in the deposits and incorporating ritual and symbolic theoretical approaches this research contributes to understanding the relationship between the deposits and Structure B-1.

[71] *Uso de Dispositivos Open Hardware en Proyectos Arqueológicos en México*

Desde sus orígenes de relativamente baja tecnología, la arqueología ha evolucionado en una disciplina altamente tecnologizada, que emplea instrumentos para localizar, caracterizar y exhibir al sitios y yacimientos. Los arqueólogos con acceso a tecnología novedosa aumentan su productividad, dejando en desventaja a quienes usan procedimientos anticuados. En las dos últimas décadas se han desarrollado movimientos democratizadores de la tecnología como FLOSS (Free Libre Open Source Software) y Open Hardware, basados en el poder que las redes globales de comunicación dan a los amateurs para compartir ideas y proyectos. Ahora existen plataformas de prototipado electrónico como Arduino y Raspberry Pi, sistemas operativos como Linux y aplicaciones de gráficas de alta calidad. Empleando este andamiaje, han surgido innumerables proyectos que replican, a muy bajo costo y alta disponibilidad, equipo de detección y caracterización como drones (aéreos, acuáticos y subacuáticos), sensores

LiDAR, radares de penetración, medidores de resistencia de suelos y scanners 3D. Este trabajo recapitula el estado del arte de tales tecnologías; muestra los resultados de su implementación en Instituciones de Educación Superior (IES) del Estado de Quintana Roo, México; reporta su prueba por arqueólogos profesionales; analiza los resultados y presenta sugerencias para posibles líneas de trabajo a futuro.

[352] *Of Rabbits and Men: Using Ancient DNA and GMM to Investigate Rabbit Domestication*

Rabbits are one of the most recently domesticated animals, and yet, over thousands of years, they have lived in a diverse range of relationships with people. This close interaction is recorded in archaeological and historical records and reflected today in the diversity of breeds worldwide. Whilst extensive research has been done to understand the differences between wild and domestic rabbits, little is known about the incipient stages of rabbit domestication, and the question of where and when this process began has not been satisfactorily resolved. Recent findings have begun to challenge our previous knowledge about the origin of domestic rabbits and emphasise the relevance of combining both modern and ancient data. Moreover, multidisciplinary approaches involving both genetics and zooarchaeology have proven successful in clarifying the domestication of many species, and show strong promise in their application to rabbits. This project aims to address the question of rabbit domestication by samples covering a wide chronological period. By generating ancient and modern DNA sequencing data we can recover demographic and selection signals associated with domestication. These results can then be combined with GMM analyses to investigate concomitant morphological changes across time, and hopefully, provide novel insights into the domestication of this species.

[362] *The Value of Legacy Collections for Recognizing and Reducing Error in Artifact Analysis*

All data accumulated in field studies directed at the determination of formal variation in the archaeological record contain a source of variation that results from analytical error. This type of error, if of sufficient magnitude, may significantly affect interpretation. Recent ceramic and faunal analyses from the Southeast have identified important errors that could affect archaeological interpretations that fail to recognize such problems. By discussing these specific instances of analytical error we hope to assist analysts in avoiding such mistakes in the future while highlighting the importance of reanalyzing curated collections as a means of evaluating the occurrence and magnitude of previous error.

Amador, Julio (UNAM)

[84] *Sacred Places and Rock Art Sites in the Sonoran Desert: Defining Common Patterns*

Based on landscape archaeology, archaeoastronomy, the analysis of rock art iconography, and ethnohistoric and ethnographic documents, this paper proposes to define the factors that determine the sacredness of rock art sites in the Sonoran Desert. Well characterized common patterns can be found in most of the rock art sites that will be described, facts that confirm with certainty that we can speak of shared cultural traits within the region. As basic factors to be analyzed that can determine the sacredness of a rock art site, we can name: geomorphology; the presence of valued natural resources, such as water and wild flora and fauna; astronomical orientations of constructed structures; evidence of ritual activity; mythological narratives associated to the place; ethnohistoric and ethnographic documents related to religious beliefs and practices, in reference to the rock art sites; and iconographic and symbolic analysis of rock art images.

Amaroli, Paul (Fundacion Nacional de Arqueologia de El Salvador)

[412] *New Views on the Ancient City of Cihuatán*

Since half a century ago, it has been recognized that the Early Postclassic in the territory of western El Salvador represents a sweeping departure from its Classic period antecedents, as seen in the type site of Cihuatán. Its nature has been variously described as generically Mexican, or central Mexican and Gulf Coast, and even more specifically, as Toltec. Mass migration and integration with the Postclassic Mesoamerican world system have both been given as explanations for this "mexicanization". Recent investigations at Cihuatán and affiliated sites have provided new information serving to enrich the discussion of the origins and the sociopolitical organization of this Early Postclassic city and its realm. Study of a terminal context has provided a new view of how and when occupation abruptly ceased at Cihuatán. The foregoing also has implications for the interpretation of Cihuatán as ancestral to the historic Pipil.

[237] *Developing Comprehensive Agreements on a Designated Cultural Landscape*

The northern San Juan region in southwestern Colorado reflects the ancestral homelands for 26 federally-recognized tribes. BLM's Canyons of the Ancients National Monument is a designated cultural landscape per Presidential Proclamation and contains the highest archaeological site density in North America. Discoveries on the Monument are governed by NAGPRA, Section 106, and ARPA. Since 2013, the BLM has been consulting with tribes to develop a NAGPRA comprehensive agreement that outlines a programmatic approach to guide tribal consultation and disposition for new discoveries. From the beginning, consulting tribes have led the effort to develop a process that addresses tribal concerns while creating a more efficient decision-making process.

[32] *Calibrating the Chronology of Late Pleistocene Climate Change and Archaeology with Geochemical Isochrons*

Chronometric dating of Late Pleistocene environmental changes and archaeological sites can be refined by correlations with precisely dated volcanic isochrons, stalagmites, and marine isotope stages (MIS). Lake Malawi cores have volcanic ash from the Toba super-eruption, dated ~74 ka at levels previously dated to ~62.5 ka. Several types of core data show an extremely cold dry period spanning ~2000 years occurs directly above the Toba ash. This is consistent with ice core evidence for 18 centuries of extreme cold after Toba during Greenland Ice Stadal event 20 (GI-20s). A sand layer at Pinnacle Point 5-6 rockshelter on the South African coast contains Toba ash. This sand marks an abrupt drop in sea level ~74 ka. It may correlate with sand beds at Blombos and Klasies, and with Malawi and Greenland core evidence for severe climate after Toba. MSA backed blade technologies appear directly above this sand at 72 ka at PP5-6 and at Klasies. Howiesons Poort and similar technologies appeared at this time, suggesting that modern technological and socio-territorial organization strategies may have evolved in response to severe climate during GI-20s. Macroregional social networks may have developed at this time, and may have facilitated modern human dispersals out of Africa.

Ambrosino, Gordon (Los Angeles County Museum of Art (LACMA))

[43] *The Rock Art of the Fortaleza Ignimbrite: 4,200 Years of Landscape Inscription in the North-Central Andes*

The Fortaleza Ignimbrite (FI) is a geologic formation, situated at the headwaters of the Fortaleza and Santa Rivers in highland Ancash Peru. A 2014 survey of the FI by the Proyecto de Investigación Arqueológica Arte Rupestre del Alto Fortaleza (PIA ARAF) documented 192 rock art places on the FI, demonstrating correlations between specific images and production techniques with ecological tiers. Informed by these findings, the 2016 PIA ARAF field season focused excavations on three puna rock shelters that hold dense petroglyph panels and one collective tomb, with an associated pictograph panel, and which is located in the lower- altitude quechua ecozone, to place the FI's corpus of rock art in time. Survey data is paired with data from radiocarbon analysis, photogrammetry, digital illustration, and both ground and art panel stratigraphy to produce a typology and a spatio-temporal map for the rock art of the FI, spanning from 3,000 BC to AD 1820. These data are then cross-referenced with 16th-century Spanish ethnohistoric accounts from these river valleys to link specific motifs with named ayllu groups. These findings may offer insights regarding the temporality of other rock art sites as well as the nature of social emplacement in the region.

Ameen, Carly (University of Exeter)

[20] *Tracking Ancient Animals to Provide an Archaeological Perspective on Wild Mammal Management, Conservation and 'Rewilding'*

Human immigration and biological invasions are high-profile topics in modern politics, but neither are uniquely modern phenomena. Migrations of people, animals and ideas were common in antiquity and are frequently incorporated into expressions of cultural identity. However, the more recent the migration, the more negative modern attitudes are towards them. Native is perceived as positive and 'natural', while 'alien' is attached negatively to both cultural and environmental problems. Decisions about conservation and management are often driven by this perceived native or alien status. The zooarchaeological record offers the potential to establish the bio-cultural history of wild species and model these changing human-animal-environment relationships over millennia.

Using the Easter festival and its associated animals as a case study, this paper explores these dynamics by integrating biomolecular approaches with traditional (zoo)archaeology, art history, and citizen scientist initiatives to investigate the human-mediated dispersal of the brown hare and rabbit in connection with the Easter festival. The cultural, religious and temporal contexts of these 'alien' introductions are key factors for challenging widespread negative attitudes towards cultural and biological 'aliens'. This paper demonstrates how archaeological studies integrating faunal remains analysis with genomic and isotopic approaches can provide a foundation for building modern conservation policy.

Ames, Nicholas (University of Notre Dame)**[46]** *American Spaces, Irish Places: Assessing Three Urban Communities in 19th Century Irish-America*

American industry drew millions of Irish immigrants during the 19th and early 20th century, profoundly shaping the face of modern America. This research investigates how Irish communities in the U.S. responded to local conditions within different types of urban spaces, influencing the way communities and subsequent identities within Irish-America were formed. Focusing on three industrial cities – Pittsburgh, PA, Cleveland, OH, and Clinton, MA – I use historical newspapers, maps, archival records, city directories and oral histories alongside GIS and social networking analyses to comparatively map the physical changes of the 19th to early 20th century communities in response to these local historical and social pressure. Within this study I explore how ‘scales’ of urbanity influence community life, with Pittsburgh’s prominent steel industry contrasting the transport industry of Cleveland, and the mill town of Clinton embodying small-scale production. By investigating how cultural localism introduced by new (albeit historic) immigrants becomes transformed into social communities unique to each urban space, I aim to identify how different local conditions may be impacting how contemporary immigrant communities develop within different U.S. spaces today.

Anderson, Amber (Rochester Institute of Technology (RIT))**[288]** *Material Culture in Pambamarca Ecuador: Comparing Finds from Two Inkan Fortresses*

As the Inka expanded north at the end of the 15th century, they were met with fierce resistance from the País Caranqui societies in Northern Ecuador. A prolonged standoff occurred, visible in the plethora of fortresses along the northern frontier. Excavations completed by the Pambamarca Archaeology Project north of Quito at three Inka fortresses within the Pambamarca Fortress Complex (Pi10 [Quitoloma], Pi20 [Censo Pucara], and Pi23 [Campana Pucara]), indicate these sites were constructed quickly, were occupied, and “battle ready”. Material remains recovered consist largely of groundstone weaponry and ceramics, which this poster will focus on. Excavations at Pi10 and Pi23 were placed in residential and “elite” living areas, and analysis will show if these areas are as distinct materially as they are spatially, as well as determine if there is artifact homogeneity between the two forts. Preliminary analysis shows one site’s ceramics contained higher amounts of decorated wares, Inka imperial forms, and local exotic forms than the other, even though it was smaller, closer to enemy territory, and showed signs of being attacked. The hope is that studying the material remains can help us understand the occupants of these sites and how they are related to each other.

Wells (Indiana University South Bend, Indiana) and Stephen Yerka (Eastern Band Cherokee Indians)**[248]** *Late Holocene Human Population Dynamics in Eastern North America: Lessons from Site and Artifact Records in DINAA and Beyond*

Population trends in Eastern North America are explored using the incidence and distribution of diagnostic artifacts and components, using continental scale datasets like DINAA and PIDBA, and as developed by researchers at the locality, state, or regional level. Such research has a long history in the region, but only recently have sample sizes and geographic coverage been sufficient to permit fairly fine grained exploration of questions related to human demography, settlement range, interaction, adaptation, and movement. Site and artifact data are thus useful proxy measures complementing the radiocarbon record, which is also being used locally to examine these subjects. Together, these approaches offer insights as important about how the archaeological record was shaped in the present as they do about lifeways in the past. The evaluation of how visible and representative the extant site and artifact record actually is a critical part of this endeavor. Large-scale population fluctuations and movements, reflected in concentrations and abandonments of sites and artifacts, are common in the later prehistoric and early historic periods. The data also indicate similar trends occurred throughout the span of human occupation in the region, back to the Pleistocene, and these were neither uniform over space nor unidirectional in time.

Anderson, J. Heath [111] see Kate, Emily

Anderson, Kirk (Museum of Northern Arizona)**[254]** *Landscapes, Landforms, and Landform Elements: Putting the "Land" Back into Landscape Archaeology*

The Chuska Mountains are a landform that extends north-south for approximately 70 kilometers, marking the western boundary of the San Juan Basin. The low mountains, broad piedmont, and sluggish drainages grade towards Chaco Wash, the main drainage in the area. Alluvial and eolian landforms provide the locations for prehistoric habitations, commonly in active geomorphic settings. Keys to understanding the buried cultural landscapes are the surface expressions of landform elements such as small gravel bars, eolian dunes, bedrock knolls, clay-rich deposits, and exposed paleosols. The alluvial and eolian chronology spanning the Middle to Late Holocene is based on AMS radiocarbon, optically stimulated luminescence, and dendrochronology age estimates. Buried cultural landscapes are interpreted through chronostratigraphic analysis of dated thermal features, alluvium, eolian deposits, and soils. Certain places on the landscape were occupied for several thousand years, even though alluvial and eolian deposition was quite active. The last period of alluviation occurred about AD 1570 when a juniper forest was rapidly buried by well-stratified alluvial sands. The dynamic landscape preserved a history of buried archaeological stratigraphy that provides insights into climate-landscape-human interactions.

Anderson, Ryan (Santa Clara University) and Christopher Jazwa (University of Nevada at Reno)**[240]** *Natural and Anthropogenic Effects on Coastal Environments along the East Cape of Baja California Sur, Mexico*

Changes to coastal environments from natural and anthropogenic factors have influenced human subsistence and settlement patterns throughout the Baja California peninsula. These changes are visible both in the archaeological record and present-day human settlements. We discuss long-term human-environment interactions along the East Cape of Baja California Sur, an area that has received relatively little archaeological attention. Tourism and residential development throughout the cape have led to large-scale coastal changes through demolition, construction, and erosion, including the destruction of archaeological sites. The archaeological record of the cape region is focused around coastal subsistence. An initial assessment suggests that indigenous occupants of the region primarily oriented themselves along the coast and targeted a variety of shellfish species, particularly oyster. While many of the region's present-day residents continue to engage in small-scale subsistence and commercial fishing, others have adopted livelihood strategies to take advantage of the growing coastal tourism and real estate economies. This study will highlight how inhabitants of the region, past and present, have responded to environmental and social change through coastal adaptations and new livelihood strategies. This study provides an initial step for understanding human responses to coastal change in a relatively understudied area of Baja California Sur, Mexico.

Anderson, Sara (University of Nebraska-Lincoln)**[117]** *Examining Female Status and Craft Production in Chaco Canyon: Bone Spatulate Tool Use-Wear Analysis*

Chaco Canyon, located in present-day New Mexico, was a political and economic center for the Ancestral Puebloan culture between AD 800-1200 and remains an important cultural area in the American Southwest. Large-scale road networks facilitated the import of raw materials and craft goods and enabled the exchange of prestige items. Utilizing the Chaco Research Archive, I evaluate Ancestral Puebloan women's participation in prestige-driven craft production. Bone spatulate tools, including several that are distinctively embellished with turquoise, jet, and shell inlays, are found in association with female burials and other tools related to female activities at great house and small house sites, as well as in some outlier communities. I argue that these objects, commonly referenced as bone scrapers and/or fleshers have unique use-wear signatures that suggest their function and significance as tools utilized by Ancestral Puebloan women in their daily activities and participation in craft production. Utilizing legacy data in concert with new digital techniques and experimental archaeology, the androcentric and ethnocentric biases of past archaeological interpretations can be more closely examined. A thorough understanding of the functionality of these bone spatulate tools permits new archaeological interpretations of gendered craft production activities and women's status and prestige in Chaco Canyon.

[58] *On Using Archaeology within an Indigenous Rights-Based Approach to Sustainability*

In the U.S., indigenous communities often suffer poor health at far greater rates than non-native populations. Lower life expectancy and the disproportionate disease burden exist often because their local food diversity and sources have been diminished by restricted access and economic stresses. To remedy these health disparities, many indigenous communities are working towards reviving traditional foodways and regaining their rights to local and sustainable food sources. We argue that an archaeological understanding of prehistoric foodways can help to accomplish these community-set agendas in three ways. First, archaeological understandings can complement traditional knowledge to establish the cultural infrastructure needed to motivate and enrich these efforts. Second, archaeological data can be instrumental in the legal battles necessary to overturn governmental laws that prevent economically stressed indigenous communities from accessing traditional and local food sources. And lastly, indigenous communities can capitalize on archaeology's broad public appeal to advance public perceptions of their own sustainability efforts. To illustrate the utility of archaeology within sustainability discourses, we present a case study from southwestern Washington State. In it, we describe our on-going efforts to use archaeological investigations at Nukuanth Village to reinvigorate culturally important foodways that are in danger of being lost within the descendant community.

Antonites, Alexander (University of Pretoria)

[242] *Salt Production in the Iron Age of Southern Africa*

Salt production is directly associated with the spread and emergence of agricultural communities of southern Africa's Iron Age. It is also one of the few economic activities from the period for which direct in-situ production evidence exists. This paper presents research from excavations of salt production sites in northeast South Africa. Analysis of the context, concentration and intensity of production provide an understanding of how communities accessed resources and mobilized labor. These suggest that production was probably initially done by multiple small groups on a seasonal basis. Output was likely for own consumption rather than explicitly focused on trade. Over time though, production intensified and salt ultimately became incorporated into overlapping local and long distance trade networks that connected the interior of southern Africa with the larger Indian Ocean trading community. This research emphasizes the value of approaching resource extraction in non-state societies through distinct organizational principles often reserved for analysis of craft production in complex societies.

Antorcha Pedemonte, Ricardo

[68] *Enriched Spatial Syntax Analysis of Two Late Postclassic Terraces in Tlaxcallan, Mexico*

The work studies, from a human ecology perspective, the process of adapting the environment to the needs of the pre-Hispanic population of Tlaxcallan during the period of 1250-1519 A.D. It is proposed that the construction of the environment is the result of the interaction among ecological, historical, political, economic and symbolic factors which are intertwined to give shape and structure to the pre-Hispanic settlement of Tlaxcallan. The subject is addressed through the diachronic study of the environment constructed through the analysis of spatial syntax and architectural value, emphasizing the study of space by means of a comprehensive examination of cultural artifacts, architecture, and spatial configuration in two residential terraces with the aim of understanding the patterns of Tlaxcaltecs' social behavior and organization as reflected in the design, distribution, and use of spaces. The analyses show that the terraces of Tlaxcallan were multifunctional spaces, dynamic and in constant transformation, where people carried out domestic tasks and activities related to the economy of its inhabitants. It is found that urban design is the product of a particular historical process, involving a particular ecosystem, and a complex geopolitical panorama in the region, all of which were successfully addressed and overcome through policies of collective cooperation between the state and its inhabitants.

[98] *GIS in Vertical Spaces: An Examination of Location and Clustering of Mortuary Contexts at the Cliff Site of La Petaca, Peru*

Geographic Information Systems are often applied to archaeological contexts to analyze spatial patterns within a site and ascertain social structure and identity. Vertical sites, however, pose a problem for GIS since most analyses must occur on the horizontal plane. This is particularly troublesome for studying the Chachapoya, a Late Intermediate Period group of the northeastern Peruvian Andes whose methods for disposing of their dead involved highly visible spaces on cliff faces. The vertical nature of these sites make mapping using traditional methods a challenge. This project used high resolution photography in conjunction with ArcGIS to explore the notable mortuary complex of La Petaca, which includes over 120 burial structures distributed across a vertical rock face extending 1,200 m². Its size provides the opportunity to study the applications of GIS to vertically distributed archaeological sites and thereby ascertain the relationship between location and social, cultural, or familial affiliation so often examined on horizontal sites. By adjusting our perspective on 3-dimensional coordinate data, we can conduct spatial and cluster analyses that were previously unavailable for vertical sites. Results demonstrate that GIS analyses of

vertical sites yields reliable statistical data, supporting interpretations of social identity and cohesion within the Chachapoya people.

[309] *Preclassic and Classic Maya Exchange, Craft Production and Ritual Practices: A Diachronic Analysis of Lithic Artifacts around Ceibal, Guatemala*

I discuss the results of a diachronic analysis of lithic artifacts collected from Ceibal, Guatemala, in order to elucidate long-term patterns and changes in the Preclassic and Classic Maya exchange, craft production and ritual practices. The interregional exchange of large polyhedral cores of obsidian from the Maya highlands and local production of pressure blades began as a result of sociopolitical development in Ceibal by the early Middle Preclassic Real 3 phase (775 - 700 B.C.). New ritual practices developed at Ceibal during the late Middle Preclassic period (700-350 B.C.), possibly through political interactions and negotiation involving emerging elites and other diverse community members. Common objects in ritual deposits in the public plaza shifted from greenstone celt caches to other artifacts, including those made of obsidian. El Chayal obsidian was heavily used during the early Middle Preclassic period, but San Martín Jilotepeque was the principal source of obsidian in the late Middle Preclassic, Late Preclassic and Terminal Preclassic periods. Obsidian was imported mainly in the form of more prepared polyhedral cores that were reduced into pressure blades at Ceibal throughout the Classic period. At that time, El Chayal resumed its place as the principal source of obsidian.

[258] *What Can We Learn by Digging a Trench through a Hohokam Ballcourt?*

Ballcourts have come to represent the pre-Classic Hohokam more than any other architectural or artifactual class. These sizeable basin-shaped structures with earthen embankments were built at most of the large villages throughout southern and central Arizona between AD 750 and 1080. People watching or participating in the ballgame probably came together from several different villages, which would have provided opportunities for exchanging commodities both in the form of raw materials and finished goods. While they are one of the most recognizable forms of public architecture in the southern Southwest, there have been relatively few opportunities to excavate them. Recent excavations at a Hohokam village north of Tucson provided a unique opportunity to excavate a portion of a ballcourt. Although the project area was incredibly narrow—only 10-ft wide—and in a road right-of-way that had been leveled at the surface, excavations revealed more intact deposits than had been anticipated. This poster presents what we were able to learn about the size, orientation, and construction of a Hohokam ballcourt from minimal excavations in a disturbed context.

[313] *Archaeological Landscape Studies in Alkali Ridge and Montezuma Canyon during the Pueblo II and III Periods*

The Montezuma Canyon and Alkali Ridge areas occupy a cultural and ecological boundary between the Great Sage Plain of the central Mesa Verde region and the canyon lands of the western Mesa Verde region. However, physiological and ecological differences are apparent between the two localities despite their proximity; most of the Montezuma Canyon sites lie along the floodplain, while Alkali Ridge populations cluster along the mesa top. As such, the evaluation of ancestral Pueblo populations among these two variable yet proximal areas has great potential for modeling long-term social and environmental changes, particularly the emergence of village aggregation and regional depopulation between A.D. 1150 and 1280. An intensive remapping project from 2014-2018 in conjunction with on-site pottery analysis and the recording of potential agricultural and water management features provides us with a better understanding of how ancestral Pueblo people utilized and conceived their landscapes in these areas. Based on the results of the project, this presentation highlights “cooperative and competitive” aspects of landscape use by ancestral Pueblo people in the Montezuma Canyon and Alkali Ridge during the Pueblo II and III periods.

Araujo, Astolfo (Museum of Archaeology and Ethnology - USP) and Mercedes Okumura (Institute of Biosciences - University of São Paulo)**[268]** *Long-Term Cultural Persistence in Modern Humans: Some Case Studies from Early and Mid-Holocene Archaeological Traditions in Eastern South America and Theoretical Implications*

We will present chronological, morphometrical, technological, and subsistence data coming from eastern South America related to four Paleoindian cultural traditions occupying different areas since the beginning of the Holocene. All these four traditions present a remarkable cultural stability that shows few parallels in the archaeological record. Using these four case studies as a starting point, we can begin to question if innovativeness is inherent to individual human beings, or if it is an emergent property, linked to population size and social interconnectedness. These cases are of interest not only because they tend to challenge the notion that humans are always, necessarily extremely innovative beings, but also because they challenge the commonsensical notion that change and innovation is always "good" and "desirable". They also may serve to expand our knowledge and interpretive frameworks, going beyond current sociocultural / anthropological wisdom.

Arazi-Coombs, Sandra**[25]** *Tijeras Pueblo in Review: A Summary of Previous Research and Site Significance*

This paper provides an overview of the Tijeras Pueblo archaeological site, placing it within a broader academic and social context. The excavation history of the site will be discussed, along with previous research, and past and modern significance. In its current context, Tijeras Pueblo has become of center of archaeological and cultural education and a place where knowledge is both created and disseminated. Occupying a very public space in the community, the site and its collections have become teaching tools for a young generation of archaeologists, avocational volunteers, and the greater Albuquerque community. Continued collaboration with Isleta Pueblo also presents an opportunity for the site to be used as a platform for pueblo members to engage their own communities and maintain strong connections with their ancestral site.

[25] *Chair***Arbuckle, Benjamin (University of North Carolina at Chapel Hill)****[352]** *Predomestic Animal Management and the Social Context of Animal Exploitation in SW Asia*

More than a century of faunal work seeking evidence for the origins of domestic livestock in SW Asia has shed considerable light on the timing, locations and processes of animal domestication. The early stages in the shift from hunting to herding, however, remain difficult to identify and as a result both the mechanisms and motivations for early management remain unclear. A growing body of bioarchaeological evidence suggests that initial shifts from hunting to herding occurred well before the appearance of either the domestic phenotypes or demographic profiles commonly used to identify herd management, and were sporadic, hesitant, and based on dynamic local traditions of human-animal inter-relations. In this paper, I explore this current evidence for predomestic animal management in the terminal Pleistocene and early Holocene in SW Asia and address what this may tell us about the motivations for and social context of early animal management.

Arbuckle MacLeod, Caroline (University of British Columbia)**[52]** *The Value of Children in Ancient Egypt*

Children have long been considered one of the "invisible" communities of the ancient world. As they are infrequently mentioned in texts and incapable of constructing their own mortuary narratives, Egyptologists and archaeologists have contented themselves with only a basic understanding of the position of children in ancient Egyptian society; however, through the manipulation of economic information, in comparison with funerary evidence, it is possible to examine the "value" of children from ancient Egypt. This approach provides a new means to assess the position of these individuals, and to deliver a more nuanced and emotional understanding of children in the ancient Egyptian family.

Archila Montanez, Sonia (Los Andes University, Department of Anthropology) and Saul Torres (Department of Anthropology, Los Andes University)**[242]** *Pre-Hispanic Salt Production in Nemocon, Colombia. A Study of Environmental, Technological and Social Characteristics*

This investigation deals with environmental, technological and social characteristics of salt production among pre-hispanic societies that inhabited Nemocon region since 2350 BP. During this long period salt was obtained by means of boiling brine in ceramic pots. Salt have been considered as one of the key commodities in the region, particularly for the latest period (Muisca Period), when a broad network of trade and political interaction was developed in the Eastern Andes of Colombia. This research will allow us to fill gaps on the current information about organization of salt production, associated technologies and use of natural resources related with this activity. We are using two different spatial scales of investigation that combines regional survey and site-specific surveys using geophysical techniques (GPR and Electromagnetic Profiler) as well as excavations.

[332] *The Human Presence in the Americas during and before the Late Glacial Maximum under the Light of New Investigations at Chiquihuite Cave, the Older-Than-Clovis Site in Mexico*

The 2016-2017 excavations at Chiquihuite Cave (northeastern Zacatecas, Mexico) produced solid evidence in favor of a sustained human occupation of the Northern Mexican Highlands during and before the Late Glacial Maximum (LGM) (in process of publication at the time of the submission of this abstract); an occupation that lasted for thousands of years in the form of recurrent visitation of this high-altitude site at almost 3,000 m a.s.l. The multi-proxy evidence included an entirely new lithic industry and a long sequence of radiocarbon and luminescence dates. Explorations are scheduled to resume during the winter of 2018-2019 (dry season), with new excavations to be performed over a period of two months of continuous work inside the vast cavern. The goals of this new season are to corroborate the data obtained during previous fieldwork and replicate the intriguing evidence that set the early peopling of America to a much earlier date. This presentation presents preliminary results of these explorations that will contribute new evidence to the LGM occupation of the continent.

[76] *Bark Beaters and Cloth Production in the Classic Maya Area*

While bark cloth and paper are well known in the ethnographic and artistic records of Pacific and African cultures, due to preservation concerns these important plant based products have been challenging to investigate in the precolumbian cultures of the New World. Often our only proxy for bark cloth is the presence of stone bark beaters in the archaeological record. This paper presents a survey of bark beaters from the Classic Maya area, with attention to recent discoveries in domestic contexts that suggest bark cloth products had a variety of uses beyond their incorporation in sacred codices or almanac books. The ubiquity with which bark beaters are found in domestic settings, and their variation, can be seen as a reflection of the wide-spread usage of these tools across social classes. Bark cloth manufacture seems to have been incorporated into processes of domestic multi-crafting alongside other forms of textile and tool production. From this perspective these artifacts are strong indicators of the relationship between humans and plants in Classic Maya domestic life, and the many ways plants exerted their influence on the daily activities of household members.

[179] *Queering Colonization in Early Colonial Belize*

Archaeological narratives of colonial contact have dramatically shifted from a focus on colonizer/colonized dichotomies to discussions about plurality, ethnogenesis, and hybridity. However, much of the work in Mesoamerica continues to define the practice of colonization through a largely white and male lens. Colonial Belize came to

existence through the daily interactions and struggles of diverse groups of people, including British Baymen, pirates, smugglers, runaway slaves, and free people of color. This history has led to the distinct creole identity that forms the basis of much of Belize's modern national identity. Although this colonization is often described through the narratives of European actors (e.g. the fight between British and Spanish Crowns over the region), its history is better understood through the role and impact that subaltern peoples had in its construction. Using a queer intersectional approach, this paper examines the racial and gendered dynamics of colonial settlements in 18th and 19th century Southern Belize. Specifically, how did the influx of slaves, free people of color, and immigrants from other parts of the Bay of Honduras and Caribbean shape the colonial process? How do these historical processes compare to other British and Spanish settlements throughout Latin America?

[411] *WyoARCH: An Update on Digital Developments to Improve Professional and Public Interaction with Federal Repositories*

Both the Office of the Wyoming State Archaeologist (OWSA) and the Wyoming State Historic Preservation Office are shifting towards digital-only submissions for professional archaeological projects through two new and interconnected database-and-web-interface systems going live in 2018/19. This talk will focus on the benefits and drawbacks to the various public and professional audiences that these systems will impact, with particular attention to the WyoARCH project – the curation application being developed by OWSA and the Wyoming Geographic Information Science Center to better manage the University of Wyoming Archaeological Repository (UWAR). The WyoARCH project will impact not only how professional archaeologists submit data to UWAR and greatly increase the accuracy and amount of data curated by UWAR, but will provide public access to, and interactions with, artifact data through a collections search tool and a GIS-powered map visualization tool. As the only federally-approved archaeological repository serving the entire state of Wyoming, UWAR holds a wealth of information derived from primarily public lands that thus far been available to members of the public in a very limited capacity. This project seeks to correct this oversight.

[18] *Behind the Walls: LIP Architecture and Settlement Organization across the Peruvian Titicaca Basin*

At hilltop sites in the Titicaca basin, the good architectural preservation of house foundations, patios, walkways, tombs, and dividing walls offers a glimpse of the organization and day-to-day functioning of LIP communities. These architectural choices potentially had implications for the inhabitants in many realms: inequality and property, segregation and cohesion, privacy and knowledge of others' doings, patterns of movement including gendered "taskscape," and relevant social identities. But the spatial organization of residential architecture actually differs substantially in different zones of the Peruvian Titicaca basin. Here, I discuss the first steps of a project designed to consider and compare this variation using the drone-aided mapping of surface architecture at several LIP sites across the Peruvian Titicaca Basin. The interpretation of structures and spaces is aided by insights from a previous excavation project at the large LIP hillfort town of Ayawiri. Preliminary results show patterned differences that appear to reflect the size and composition of kin groups. These differences might relate to the preferences and practices of large ethnic groups in the region, and/or to different subsistence emphases on the spectrum from pastoralism to cultivation.

[415] *Deviant or Normal? Assessing Anomalies in Middle Stone Age Small Prey Exploitation*

Studies of forager economies in southern Africa have documented changes in subsistence strategies between the Middle and Later Stone Age. As evidenced by the disproportionate frequencies of faunal remains from large, gregarious grazers, the prevailing interpretation has been that MSA foragers hunted more large than small game in comparison to LSA foragers. Moreover, when small prey is in relative abundance at MSA sites, these faunas are dominated by slow or sessile organisms, whereas LSA sites typically feature faster moving/more difficult to capture prey. However, over the last decade deviations in the "typical" MSA small prey utilization pattern have emerged. Among these is the documentation of habitual utilization of difficult to capture small prey from MSA contexts at Die Kelders Cave 1. Are these deviations simply anomalies to be expected when considering human behavioral variability over time and space? Or do these represent a challenge to an optimal foraging perspective, particularly

when non-nutritional benefits are considered? Does a human behavioral ecology framework allow for more nuanced application when resource utilization deviates from traditional prey choice model predictions?

[56] *Taking It to the Tuxtlas: How the BoM Survey Shaped Gulf Lowland Settlements*

Robert S. Santley was a junior, third author of the path-breaking *The Basin of Mexico* (Sanders et al. 1979). Nonetheless, his contribution to the volume was substantial, including co-writing almost 50% of the entire 500+ pages of text and producing almost all of the drawings and survey maps (Sander et al. 1979:xiv). Santley soon turned his attention to the Tuxtla Mountains of southern Veracruz, ultimately directing what was one of the largest total coverage pedestrian surveys of a tropical rainforest environment in Mesoamerica (Santley and Arnold 1996). This almost-400 sq km survey pursued many of the cultural ecological issues that guided the earlier Basin of Mexico project, adjusting for the particular environmental conditions under which prehispanic civilization developed within the upland Tuxtlas. Here we address some of these issues, particularly the relationships between agricultural practices and settlement distributions/densities. Archaeological and ethnoarchaeological data from the region indicate a complex interplay of intra- and inter-community farming strategies, several of which set the Tuxtlas apart from settlements within the surrounding Gulf lowlands. We consider the implications of these strategies for the archaeological record of the Tuxtlas and highlight the intellectual impact of the original Basin of Mexico research beyond the Mexican highlands.

[100] *Persistence of the Anthropocene in the Maya Lowlands*

The Maya Lowlands have been a focus of human development across millennia, and the impact of Maya civilization on this tropical environment has been a focus of sustained research and intense debate. It has become common to discuss environmental crises and societal collapse in the region as analogous to contemporary socio-environmental problems. However, the Anthropocene in the Maya lowlands did not end with the collapse of Maya civilization, nor did environmental conditions ever “recover” to a pre-anthropogenic state. Here we briefly review past collapses in the region and their legacies and follow the evolution of the lowland Maya landscape from 900 A.D. up to 1950, the year when the Great Acceleration is conventionally agreed to have begun. Finally, we offer an approach to the last several decades in the region, focusing on the RBM (Mayan Biosphere Reserve) and the acceleration of anthropogenic forces seeking both to destroy and to protect this delicate and important landscape.

Arroyo, Barbara (Instituto de Antropología e Historia de Guatemala) and Gloria Ajú (Proyecto Zona Arqueológica Kaminaljuyu, Guatemala)

[303] *Interaction and Exchange at Kaminaljuyu: Trade and Ritual*

Kaminaljuyu, Guatemala, had a strategic location along important trade routes. Because of this, the site had the opportunity to access important goods such as obsidian, jade, cacao, salt, and other important goods. Some of the exchange might have involved the ball game. Recent findings from excavations near Ball Court B at Kaminaljuyu suggests the presence of non-local individuals that might have been involved in a ball game encounter at the site. The discovery of Pacific Coast pottery, candeleros, slate, jade, and other foreign goods, suggest that economic activities of long distance exchange of exotic products might have taken place connected to the ball game. This paper will present data on recent discoveries that suggest an extensive interaction network at the site during the Classic period. We hope to present data on Francisco Estrada-Belli’s analysis of least cost routes connected to this network.

Arroyo-Cabrales, Joaquín, Eduardo Corona-Martínez (INAH - Delegación Morelos) and Felisa J. Aguilar-Arellano (Consejo de Paleontología, INAH)**[56]** *Late Pleistocene-Early Holocene Archaeozoology and Paleontology at the Basin of Mexico: A Reappraisal 40 Years after Early Views*

Back in 1970s, a great effort was undertaken to synthesize the knowledge of human and environmental relationships in the Basin of Mexico, which could be extended to at least 24,000 years BP. Since then, further studies were warranted after initial results and research has been conducted using new techniques and analyses. Here, we report on that research from the archaeozoology and vertebrate paleontology realms. We reviewed all of the available publications and much “grey” literature to obtain the most complete list of animals occurring in the range time from about 30,000 to 6,000 years BP. A large vertebrate diversity was found for the Late Pleistocene, while such diversity has been depleted to the present, initially due to natural proxies, like volcanic events, but later mostly due to direct and indirect impacts from human activities. It is advisable that further interdisciplinary studies are undertaken, but also advisable that private developers need to rescue any bone remains that are found as a collaborative effort to enhance our knowledge on the region beyond biodiversity and propose conservation goals for the future.

Arthur, John (University of South Florida St. Petersburg)**[291]** *Pots, Ethnoarchaeology, and Snake-Oil: James Skibo's Lasting Impact on the Future of Archaeology*

James Skibo changed the way we study pottery. Jim's archaeological career incorporated many different facets of archaeological research including experimental archaeology, ethnoarchaeology, archaeology, and theory, all focusing on pottery research. One of his biggest influences is combining ethnoarchaeology and pottery use-alteration. Jim's ethnoarchaeological Kalinga research in the Philippines and his subsequent books (1992, 2016) has and will continue to provide a new perspective concerning how people use pottery to answer larger archaeological questions such as issues related to diet, social stratification, and cultural change. Besides contributing to the field, Jim's encouraging outlook when mentoring students, even students not at his university, such as myself, had a major positive impact on our careers. This paper examines Jim's contribution to ceramic ethnoarchaeology and his research on pottery use-alteration as it has been utilized in my own research among the Gamo living in southwestern Ethiopia. While some push snake-oil cures that fail to have a lasting legacy, Jim's research has already proven to have significantly influenced the field of archaeology, which will continue to grow with each new generation of scholars.

[13] *Discussant***Arthur, Kathryn (USF St. Petersburg)****[363]** *Transferring Technological Knowledge: Becoming Craft Specialists and Craft Items through Ritual Reproduction*

How do we identify the transfer of technological knowledge on the local scale and how it might change through time and in regional contexts? The Gamo of southern Ethiopia offer that their Indigenous way of knowing the world enlightens understanding of transformations in technology and technological knowledge. All matter—human and non-human move and transform, which is evidence of their life force. Humans and materials transform through reproduction, which instigates change. Reproduction may be through biology, earthly interaction, or ritual. Rituals of technology and human rites of passage parallel the Gamo perceived life cycle of birth, circumcision, seclusion, and death. Humans only begin to engage in the transformation of material culture once they have proceeded through puberty rites of passage and have become full members of society. The ritual processes of how a human proceeds through rites of passage determines their status as either farmer or craft specialist. Similarly houses, food, iron tools, pottery, leather goods, and stone scrapers transform through technological rituals accessing different statuses of prestige and different forms and locations on the landscape.

[190] *Footsteps of Hopi History or Inscriptions by Spanish Priests? The Elusive and Enigmatic Labyrinth Glyphs of the American West*

Meaning and function of rock art elements, especially when related to site location, have been discussed for years. Rock art can represent statements about group identity or social relationships and even demark boundaries or territories. Rock art is a visual legacy created to communicate and reaffirm symbols and metaphors of stories and worldviews projecting social concerns and cultural values. Rock art stores cultural meaning. A distinctive unicursal, 7-course, 8-walled labyrinth image is carved into the plaster on the wall above the second floor of the central room at Casa Grande Ruins National Monument. This same glyph has been reported on the Hopi Mesas, at Arroyo Hondo NM, inside the lower room of Montezuma Castle, inside the upper ruins at Tonto National Monument and at Minnie's Gap in Wyoming. Intriguingly, this image is also found across Europe and is reported to be at least 4,000 years old. How did it come to appear in the Southwest? Was it an independent innovation, or transplanted by Spanish priests among the converted? This image carries a lot of meaning and symbolism. My research focuses on the origins of this image in the Western U.S., its relative age, and its symbolic significance for Native peoples.

[87] *Best Strategies for Field-based Training in Data Recording and Management*

A student's first experience with archaeological recording is frequently in a field school setting. Yet, field school data recording practices can quickly evolve as archaeological projects integrate new technology, change excavation strategies, and investigate new research questions. How do these changes impact how archaeological data recording is taught, what data are being recorded, and in turn, how might this affect future data reuse? In the Secret Life of Data (SLO-Data) research project, we explored these questions through observations and interviews of archaeological field schools in Africa, South America, and Europe during the 2016-2018 field seasons. We specifically evaluated how field school participants trained in data recording and management, and the way data recording strategies were communicated, changed and implemented during fieldwork. This paper evaluates the relationship between training and data outcomes in both digital and paper-based data recording strategies. Examples from our research highlight ways that training and communication in the field may influence the consistency and re-usability of archaeological data. Through analyzing and comparing training and communication in data management at our field sites, we suggest strategies for field-based training that can help bridge the divide between data recording and reuse.

Austin, Kevin (Maya Research Program), Benjamin Baaske (Texas A&M University) and Robert Warden (Texas A&M University)

[63] *Re-excavating Xno'ha: Aligning Maya Architecture across Seven Years of Archaeological Research*

Maya architecture at Xno'ha has been recorded digitally every field season since 2012 by the Blue Creek Archaeological Project in conjunction with the Center for Heritage Conservation at Texas A&M University. Through the application of preservation technologies such as laser scanning, it is now possible to juxtapose completely excavated structures within the same digital model. Each structure is laser scanned once the excavation has either been completed or reached its furthest extent for the season. Combined with a coordinate system established using a Total Data Station, the 3-dimensional point clouds generated using the ever-changing laser scan technologies (Riegl, FARO 120, FARO 330) are aligned across multiple seasons of data collection. This allows structures excavated in 2012 to be placed in the same spatial context as structures excavated in 2018. Archaeologists can then analyze relationships between structures at the scale of the city, plaza, and group. For structures that have been excavated over multiple seasons, architectural phases can be examined 3-dimensionally in the same spatial context. Our outputs from Xno'ha indicate a highly sophisticated means by which we can begin to analyze Maya architecture in terms of construction, style, and meaning.

[217] *Investigating Ancient Maya Resiliency at Xunantunich, Belize*

Despite more than a century of intensive archaeological research, factors leading to the Classic Maya Collapse continue to be debated by Maya archaeologists. This presentation discusses the Classic Maya Collapse and its effects on the people of Xunantunich, Belize. Investigations from the 2018 field season, carried out by the Belize Valley Archaeological Reconnaissance project and the Xunantunich Archaeology and Conservation project, targeted minor architectural features, such as platforms and walls, to establish a chronology of construction and function for these features. Collected data demonstrate evidence of human response to collapse in the form of minor architectural development and reorganization of public space within Xunantunich's monumental center. This research provides a better understanding of how the ancient Maya restructured their physical environment during a time of substantial change.

[115] *Raise Your Glass to the Past: An Experimental Archaeology of Beer and Community*

A pint of beer is more than a "simple" beverage. The presence of ethanol resulting from the yeast-based fermentation contributes to making beer a unique form of embodied material culture that has fermented alongside humanity since well before written records. It is the most widely used psychoactive substance in the world, and is regularly discussed in anthropological literature as a stimulator of social relations. Beer also struggles today with the after effects of Prohibition on our North American conceptualizations of alcohol. In an attempt to unlink modern prejudices from ancient understandings, this experimental archaeology project both crafts an ancient beverage with the help of modern brewing expertise, as well as engages our local community with our recreation. To put faces back onto the past we must imagine ancient sites filled with people, practicing daily life, repeating habit and tradition, and at times, drinking beer. Our goal is not to recreate the most authentic beer recipe from the prehistoric past, but instead to reimagine the past in a way that engages our own modern public as well as the academic.

Baaske, Benjamin (Center for Heritage Conservation, Texas A&M University) and Joshua Kwoka (University at Buffalo)

[30] *E-Groups and Classic Maya Ritual: Recent Investigations at Tz'unun, Belize*

Maya E-groups served as foci of political and ritual practices from the Preclassic through Terminal Classic. In addition to the hallmark western pyramidal and eastern range structures, these groups are often populated by a number of ancillary structures. This paper details recent investigations of one such structure located at the site of Tz'unun in northwestern Belize. Excavations revealed this modest-sized building was likely a funerary temple with origins in the Late Preclassic. Multiple caches attest to its continued importance during the Early and Late Classic. The deposition of two large termination deposits marked the cessation of activities and abandonment of the group

during the Terminal Classic. Both the contents and symbolism of these ritual deposits are discussed.

Baaske, Benjamin [63] see Austin, Kevin

Babcock, Thomas

[303] *Archaeological Evidence and the Chronology of K'iche'an Dominance in the Guatemalan Highlands*

The K'iche'an ethnohistoric documents posit movement of Chontal-Nahuan groups into, and conquest of, the central Guatemalan highlands. A list of K'iche' rulers was used to establish a timeline for occupation of the archaeological sites of Chujuyub, Jakawitz, and Q'umarkaj. Accordingly coinciding with the fall of Chichen Itza around AD 1200, Chontal-Nahuan groups arrived in the Quiche Basin at Chujuyub. Intermarrying with local K'iche' they gained dominance, relocating to Jakawitz was around AD 1300, and subsequently Q'umarkaj was founded at around AD 1400. Occupation of Q'umarkaj ceased a short time after its conquest by Pedro Alvarado in AD 1524. Excavations at these sites yielded radiocarbon dates not supportive of this timeline. Subsequent reinterpretation of ethnohistoric documents argued in support of Toltec-related residence at Chujuyub around AD 500-800, with consolidation of power at Jakawitz, and regional hegemony at Q'umarkaj. The site of Jakawitz, however, lacked Mexican-style architecture and foreign trade goods when Mexicanized groups were hypothesized to begin dominating the region. This supports an alternative view that indigenous K'iche'an peoples developed in situ at Chujuyup between AD 500 and 800, establishing architecturally more complex Chitinamit around AD 800, and ultimately attaining regional hegemony at Q'umarkaj by AD 1300.

Baca, Katherine (University of Montana)

[121] *An Overview of Forensic Trophy Skull Analysis in Montana*

Retaining a skeletal element, especially a skull, whether it be for ancestor veneration, social memory, or as a trophy, is a common practice throughout human history. Keeping a cranium can reflect a lot of information about cultural beliefs concerning death, war, and victory at specific points in time. It is more common than one might think to come across these "trophy skulls" in archaeological and forensic contexts. Most often, they come to us, as Forensic Anthropologists, through a Medical Examiner's lab, usually under questionable or unknown circumstances. This poster reviews three separate cases of "trophy skulls" in Montana, including the findings of the biological profile analyses and the attempts to reconcile police reports and oral histories in order to reconstruct the life histories of the unknown individuals. The term of "trophy skull" is also approached from an anthropological viewpoint and an argument made for changing the terminology associated with these remains in an effort to better describe the likely circumstances of their creation.

[42] *Analysis of Settlement Patterns in Albania from the Iron Age through Greek and Roman Colonization and Integration (1100 BCE–395 CE)*

The Illyrians were an Indo-European group of people who inhabited a large expanse of the Balkans. As interactions with the Greeks and, later, the Romans increased, the sociopolitical organization of the Illyrians was undoubtedly affected. In this presentation, I present the results of my thesis research, the goal of which is to better understand how Greek colonization, followed by Roman incorporation, affected Illyrian settlement patterns in Albania. Utilizing a World Systems approach, I present colonies as semi-peripheral "cores" that act to draw people to them, like the case of towns during the industrial revolution in Europe. The data for the analysis were collected during the summer of 2017 via archival research and compiled into a gazetteer, which was imported into ArcGIS. A combination of quantitative and qualitative methods are used in ArcGIS along with appropriate statistical tests in order to analyze the different relationships between site location and proximity to colonies and other features of interest throughout time. The geospatial analysis reveals certain patterns that suggest a statistically significant difference regarding the dispersal of sites. Specifically, there was significant clustering around "cores" in the Greek and Roman periods and this clustering was predominantly located in southern, coastal Albania.

Badillo, Alex (Indiana State University)**[192]** *Quiechapa: A Window into the History of the Sierra Sur*

Southern Mexico has been the site of many large-scale regional settlement pattern projects that have been instrumental in developing the regional histories that contribute to our understandings of the sociopolitical and economic climate that was encountered by the Spanish upon their arrival nearly 500 years ago. It is because of these regional survey projects that much is known about areas of southern Mexico such as the Valley of Oaxaca and surrounding hinterland, the lower Río Verde Valley, the Mixteca Alta, and the Isthmus of Tehuantepec. In contrast, the archaeology of the southern mountains of the modern state of Oaxaca, also known as the Sierra Sur, is largely unknown. Recent settlement pattern research in the municipality of San Pedro Mártir Quiechapa provides a window into the settlement history of the southern mountains. In this paper, we present the Quiechapa region's settlement history spanning two millennia within the context of the broader macroregion discussing the events that shaped the sociopolitical and economic landscape before the arrival of the Spanish in A.D. 1521.

Baide, Alexis (Texas State University)**[172]** *Dabbing in Time: Using Tobacco Clay Pipes to Trace Changes in Leadership of the Dutch Caribbean Island of St. Eustatius from 1680 to 1800*

St. Eustatius (Statia) developed into a primary trading port in the northern Caribbean during the late 17th century and early 18th century. During this time, Statia experienced changes in leadership, tax policies, and social relations; however, the island leadership maintained trading allies from all nations. This project's research goal is to understand how the people of St. Eustatius were affected by globalism, and how the island's extensive trading activity influenced regional and global trading networks. Analysis of tobacco clay pipes from Ft. Amsterdam was conducted to determine if the ratio between the amounts of time the Netherlands were in charge of St. Eustatius was proportional to the amount of pipes found to be of Netherland origin. Documentation of changes in legal policies, historical data of Statia's commanding country, maker marks, and pipe diameters are used to determine the date and origin of each base/spur. The quantity of pipes of Gouda origin reveal Netherland's long-term occupation of the island had an effect on trade networks.

[308] *Exploring Kinship Ties through Mortuary Practice at Cahokia's Ridge-top Mounds*

Kinship, roughly defined, is a web of social relationships forming a central part of human lives. Kinship contextualizes patterns of behavior, familial ties, socialization, parenting, and relationships that extend beyond biological affinity. In this paper I explore how kinship ties (fictive or otherwise) transform in death through an examination of burial patterns at Cahokia's ridge-top mounds. Cahokia, North America's largest urban landscape north of contemporary Mexico, was a unique social and political behemoth located in the American Bottom floodplain of the Mississippi River. Crisscrossed by large earthen mounds, plazas, and neighborhoods, this urban landscape was populated by diverse groups of people. Mortuary practice at Cahokia manifests in diverse ways; of particular interest here are the ridge-top mounds that house hundreds of bodies buried in unique assemblages of persons and materials. Focusing on Wilson Mound, I explore how kinship ties transform and transcend our common notions of 'family' to include other-than-human persons in these complex relationships. Considering 'family' as inclusive of multiple persons, not all of which are human, engages the rich dialectic of social experience. Examining this in and through death can provide an understanding of how the living viewed their world and experienced social relationships.

Baisden, Rebecca

[90] *Fire Meets the Past: Archaeological Site Thinning on the Jemez Ranger District of the Santa Fe National Forest*

The Southwest Jemez Mountain Landscape Restoration project located in the Jemez Ranger District of the Santa Fe National Forest in New Mexico encompasses approximately 116,000 acres. To increase resilience against undesirable, large-scale fires, a number of landscape scale treatments were implemented, one being prescribed burning. As 90% of the 3,045 known archaeological sites are considered fire-sensitive, the Archaeological Site Thinning project was implemented in 2013. Now that over 1,500 archaeological sites have been treated, Jemez Ranger District archaeologists are able to compare and contrast the effects fire has on sites with various levels of fuels treatment as well as treatment needs across different fuel types.

[289] *An Exploration of Perimeter Wall Architecture at the Terminal Middle Horizon Site of Los Batanes, Sama, Peru*

Archaeological survey and excavation at the coastal desert site of Los Batanes, a Late Middle Horizon-Early Intermediate Period settlement of highlanders in the Sama Valley, southern Peru, have revealed mortuary and residential site components as well as a perimeter wall enclosing the site. Here I report on the findings of perimeter wall excavations in 2018 which exposed the stratigraphy of the collapsed wall and recovered ceramic and organic remains and a human burial. Using stratigraphy, ceramic typology, and radiocarbon dating, I investigate the chronology of the wall construction and collapse, and the relation to the interment. I also investigate the wall's function, taking into account such possibilities as defense, ritual, and settlement organization. The wall is considered in its local context as well as in the broader context of this period on the far south coast of Peru.

[400] *Site Stewards in Northwest New Mexico: Protecting Our Cultural Heritage via a Community-Supported Program*

In northwestern New Mexico, there are thousands of archaeological sites that span the complete cultural and temporal spectrum of human occupation in the region. Many of these cultural resources are located in remote areas and as backcountry sites, are often prey to looting and vandalism, particularly those exhibiting standing architecture and rock art. In many instances, these cultural sites are considered significant or "high value" as a result of their inclusion on the National Register of Historic Places and/or their potential for future scientific study. In order to preserve and protect our heritage sites, volunteer site stewards patrol and monitor these resources within the

framework of a program designed to deter vandalism of cultural properties and the looting and subsequent trafficking of priceless antiquities. Collaborating with the Bureau of Land Management and State of New Mexico Site Watch, the Northwest New Mexico Site Steward's Program is a volunteer organization, which has been operating independently in its current capacity since 1999. This paper provides insights into the "first line of defense" in the protection of our shared past through engaging the public in a community-supported program. In this context, examples of site types and respective impacts are discussed.

[252] *Recent Investigations in Rock Art Dating in Several Cuban Caves*

Cuba has many karst caves with pictographs, but there has been uncertainty about who created the rock art. The prehistoric population, historic indigenous groups pushed to the margins by the Spanish, and maroons or escaped African slaves are all possibilities. Cuban archaeologists have debated for decades which groups were associated with which rock art styles. The complexities of Cuba's history made dating rock paintings attractive as a method for determining origins. Recently, the first AMS radiocarbon dates for Cuban rock paintings were produced from one cave in Matanzas Province and three from the Las Charcas caves in Mayabeque Province. Samples from the Matanzas cave and one of the Las Charcas caves were consistent with carbon black and yielded reliable prehistoric dates. However, two other Las Charcas caves, located in close proximity, had dates much older than expected (on average 14,000 BP) and undoubtedly did not reflect true age. Compositional analysis indicated that resins from *Pinus* species as well as significant hydrocarbons were present. Further analysis of the hydrocarbons indicated these were probably gilsonite, a solid bitumen material present in the region—the first instance of the use of bitumen as a paint matrix for rock art that we have found.

[386] *Viking Age Port of Trade in Gotland, Sweden: Understanding Inter- and Intra-site Logistics through Faunal Analysis*

This study examines human-animal relations in the context of a Viking Age (9th to 11th century) port of trade and farming settlement of Ridanäs located in Gotland, Sweden. The objective is to gain an understanding of inter- and intra-site interactions through the faunal data. The primary questions focus on subsistence strategies, trade connections, socioeconomic conditions, and animal husbandry practices that were occurring at the archaeological site during the latter end of the Viking Age. These questions were answered through a zooarchaeological analysis of the faunal remains from two contexts at what is now known as the Fröjel Parish, Gotland.

Balco, William (University of North Georgia)

[321] *Inferring Social Change from Archaeological Survey Data: Monte Bonifato and Calatubo as a Case Study*

Recent archaeological survey at Monte Bonifato and Calatubo, two prominent sites in western Sicily, has facilitated a comparative study of the two sites via artifacts recovered from surface contexts. Settlement patterns, land-use, pottery production methods, and artifact-class densities are discussed, demonstrating the variety and scale of social transformation at and between each site. The results of this material culture study suggest occupation alternated between the two sites intermittently over a long period. We interpret this mobility as the result of socio-political stabilization and destabilization coupled with an increase in social, technological, and economic complexity over time.

[88] *Old Main: Archaeology of a 19th Century College Campus*

This paper synthesizes the ongoing archaeological research of one of the first academic buildings on the Alma College campus, located in central Michigan. Old Main was built in 1886, and destroyed by a fire in 1969. Although the building only burned down 50 years ago, the cause of the fire and exact location of the foundation remain a mystery. Throughout this paper I discuss and evaluate research questions and methods used in past seasons of the project. In 2014, 2015, and 2018, students and professors in the Alma College anthropology department conducted

archaeological excavations on the site of Old Main. Through a review of previous excavation reports, artifacts, maps, and other collected data, I explain how archaeological sites like Old Main are capable of providing information about 19th century college building construction, architectural materials, and renovations over time. I present results from a deeper analysis of Old Main's artifacts and the archival record, coupled with new information from oral history and community interviews. Finally, I show why archaeology matters in understanding the life and history of a 19th century campus.

[287] *Cerro Cumbray: A Chimu Frontier Outpost*

Cerro Cumbray is a Chimu hilltop settlement located near the modern town of Simbal, Peru. During the 2018 field season, the authors used aerial photography via drone to create a site map and conducted a limited pedestrian survey in order to better understand site chronology and context. While Cerro Cumbray lacks indications of large-scale fortification; the viewshed afforded by its location, its strategic position relative to the confluence of two rivers, and its natural fortifications in the form of cliffs imply a largely defensive motivation to the site's occupation. The mapping and survey data is used to identify habitation zones and activities within the site. At a larger scale, GIS software allows for the analysis of the role of the site within the Chimu defensive network of the Moche Valley.

[168] *Commensal Politics and Changing Neighborhoods: Preliminary Pottery Analyses of Cahokia's Spring Lake Tract*

In the Cahokian sphere, building termination was embedded within broader relational practices tied to politico-religious space and neighborhood dynamics. Drawing from our preliminary analyses of three buildings in the Spring Lake Tract of 'Downtown' Cahokia, we argue for an intentional closing down of these buildings using fire and earth. Focusing here on deposition of pottery specifically, we consider the ways in which community was (re)created through practices of building termination and commensal politics in neighborhood contexts. The termination practices we see at the Spring Lake Tract speak to broader relational aspects of community, transforming landscapes, and dynamic cities.

Bamforth, Douglas and Kristen Carlson (Augustana University, Sioux Falls, SD)

[409] *Documenting the Archaeology of Ethnogenesis at the Lynch Site (25BD1), Nebraska*

Maize farmers settled the Lynch site in northeastern Nebraska from the late 1200s through the 1300s during a period of significant drought and social, demographic, and economic changes linked to Cahokia's decline. Oneota groups expanded westward into the central Great Plains during this time as indigenous Central Plains Tradition farmers abandoned the western parts of their ranges and moved east. Lynch and other nearby sites show ceramic patterns suggesting that these two distinct groups may have lived side-by-side, forming new communities with distinct identities. The Lynch site is far larger than sites in the region before or after (it covers at least 69 hectares [170 acres]) and likely represents a fundamental social transformation in the region. Fieldwork in the 1930s and 1950s documents some aspects of the site and provides a baseline for current work. This paper presents the results of geophysical prospecting and new excavations. We document the presence of at least 1300 archaeological anomalies, suggest that the site may be even larger than previously thought, and discuss preliminary analyses of new collections.

Bandy, Matthew (SWCA Environmental Consultants) and Scott Ortman (University of Colorado)

[315] *Dates as Data 30 Years Later: An Alternative Perspective on Neolithic Demographic "Collapse"*

In 1987, shortly before I met John, he published the first systematic treatment of radiocarbon dates as a source of data on regional demography. In addition to pointing out the interpretive potential of these datasets, John also discussed some of their pitfalls and limitations; caveats that have often been overlooked by the many researchers who have followed behind. A recent analysis of European radiocarbon datasets, for example, has been interpreted as evidence of a continent-wide demographic collapse some centuries after an initial population expansion driven by the introduction of agriculture. In this presentation I will consider this proposal in light of the limitations of radiocarbon datasets that were recognized by John 30 years ago and propose an alternative model that also can account for the observed pattern.

Banerjea, Rowena [310] see Pluskowski, Aleks

Bánffy, Eszter**[275]** *The Diversity of the European Neolithic Transition*

The advent of the Neolithic period in Europe, as elsewhere globally, represents a powerful transformation in human history. In spite of important contributions, neither global explanations nor single-site-based case studies have so far led to a general model for the history (histories) of the transformation. This is what our new project intends to challenge. We plan to investigate Neolithisation in Europe at large in five regional case studies, 'Windows', chosen by their differences in temporal terms and in their character of transformation, but also by already existing archaeological, palaeo-environmental and bioarchaeological data. In close cooperation with researchers active in each region, the still missing parts will be completed. Three approaches will be combined: 1. all archaeological data; 2. off-site, non-invasive landscape analyses; and 3. human osteological, DNA, stable isotope and pathogen investigations. The ultimate goal is to understand the Neolithic transformation as a major historic turn with many faces, but all ending with similar results: a sedentary and food producing Europe. In the presentation, I give a draft of the project initiated by the German Archaeological Institute, Romano Germanic Commission, Frankfurt am Main.

Banikazemi, Cyrus (UIC)**[290]** *Color Me Red: A Preliminary Examination of Pigments in the Moquegua Valley, Peru*

This preliminary study explores how pigments were sourced and manufactured in the Moquegua valley of southern Peru. The ethnohistoric and archaeological records provide ample evidence of the economic, religious, and social significance of colors and pigments in the pre-Columbian Andean world; however, there currently exists little work dedicated to how these goods were sourced and combined to make a breadth of expressible colors. This research combines what we know from the ethnohistoric record with tests done using portable X-Ray Fluorescence (pXRF) focused on chemically profiling raw, processed, and artifact-associated pigments. Analyzing pigments as both a material for utilitarian production as well as an independently valued cultural resource is intended to highlight how this type of good was imbued with cultural meaning.

Banks, Jennifer (University of Iowa)**[207]** *Dismal River Housing: A Comparative Study of Apache Housing Structures*

Ancestral Apache sites located in the eastern Central Plains of Kansas and Nebraska date to AD 1500-1800, and are frequently associated with small, circular wickiup house structures. A number of these localities have a high degree of preservation that allows for a detailed study of the architecture and construction techniques of these people. This poster will use GIS analyses to summarize published data and results from recent fieldwork on household size and structure. This study will allow us to compare data from new finds to data from previously excavated sites. Because the presence of Apache groups on the central Great Plains is part of a larger migration involving many different groups, we hope that the study of ancient household architecture can tell us something about past social landscapes.

Banks, Kimball (Metcalf Archaeological Consultants Inc. & Combined Prehistoric Expedition Fdtn)**[167]** *Moderator***Bankston, Brittany (National Park Service)****[380]** *How Chaco Got the Point: Exploring the Technological Transition from Atlatl to Bow and Arrow at Chaco Canyon*

Recent scholarship has recognized that the foundational elements of the Ancestral Puebloan culture observed during the height of the Chacoan Phenomenon first began to appear during the Basketmaker III time period (AD 450-750), with the construction of kivas, the emergence of vast trade networks, and population aggregation. However, one interesting aspect of the Basketmaker III time period at Chaco, which had previously been overlooked, was the introduction of bow and arrow technology and how that played a role in the developing social configuration that led to the distinctive Chacoan culture. This study examined projectile points from previously excavated Basketmaker III sites in Chaco Canyon, now Chaco Culture National Historical Park, using the dart-arrow-index to identify evidence of atlatl or bow technology. A study in levels of point variability was used to determine how bow technology may have been introduced through the theoretical perspective of cultural transmission. Additionally, comparative studies of projectile points from Basketmaker III sites from the Four Corners area were also used to understand the broader technological trends and how that may have affected the technology seen at Chaco.

Banning, Edward (University of Toronto), Kevin Gibbs (University of California, Berkeley) and Philip Hitchings (University of Toronto)**[399]** *Wadi Quseiba and the Shellfish-Eaters? Searching for Late Neolithic Sites in Northern Jordan and Finding an Enigmatic Yarmoukian Site*

During 2012 and 2013, a survey of Wadi Quseiba's drainage basin in northern Jordan employed Bayesian search methods to find late prehistoric, and especially Neolithic sites that often escape more conventional surveys. This resulted in the discovery of some definite and "candidate" sites, one of which is a Yarmoukian site up to 0.5 ha in

size that was the subject of test trenching in 2014 and more extensive excavation in 2018. Paradoxically, the site exhibits abundant pottery with distinctive Yarmoukian forms and decoration, figurine fragments, pits, and both mud-brick and stone architecture, and large volumes of lithic debitage, but is missing some of the hallmarks of the period. Most notably, sickle elements are extremely rare and mammalian bone completely absent, while remains of river crab (*Potamon potamios*), freshwater mussel (*Unio terminalis*) and snail (cf. *Helix pomatia*) are the only fauna represented in the assemblage. Whether this is due to unusual preservation, disposal practices, or specialized non-agricultural activities at the site is the major question. It also demonstrates how new kinds of survey can lead to unexpected elements of ancient cultural landscapes.

Bansal, Suramya (Rock Art Research Institute, University of the Witwatersrand)

[95] *Practical and Interpretive Implications of Experimental Hand Imprints*

This research experimentally investigates and theoretically situates the distinct impression and expression of hand imprints (prints and stencils) in rock art studies. This hominin act of imprinting hands, which cuts across spatial and temporal boundaries, showcases essential behavioural and cognitive characteristics. The various intricacies involved in the present experiment have been helpful in digging out the underlying anatomical mechanics and adaptive chemistry of hands. These imprints, apart from expressing left or right orientation of hand, also incorporate hand ability, skill and preference linked to the broader concept of handedness. This opens interpretive challenges due to the undercurrents of mixed-handedness and ambidexterity along with an embedded socio-cultural matrix, if any. The exercise of replicating ways of making plain and decorated hand prints and hand stencils sheds new light on how best to theoretically situate them. The web of embodiment and lateralized symbolism, along with haptic and embodied cognition lenses, supports a framework for this qualitative and quantitative trait. The hand motif can have multiple symbolic meanings varying from one society and culture to another in historical and contemporary times. As a result of its diverse contextual and detailed dynamic manipulation, hand imprints definitely hold much more than meets the eye.

Barber, Michael

[133] *Time and Tide Wait for No Man: Responses to Sea Level Rise on Virginia's Eastern Shore*

With sea level rise inevitable, archaeologists can no longer cling to the 'Preservation in Place' paradigm as there will no longer be a place. The 'place' of the past will readily become the eroding beach and, eventually, sea bottom. The Threatened Sites Program of DHR anticipated the loss of shoreline sites in the early 2000s and funded survey of the

coastlines of both the Chesapeake Bay and Atlantic Ocean on Virginia's Eastern Shore. With the recent destruction of Hurricane Sandy, funding was made available through NPS grants adding survey work on both the Eastern and Western Shores. On the Eastern Shore, sites were re-surveyed and damage over a 15 year period evaluated. On the Western Shore, a predictive model was developed using a series of environmental attributes, historic cartographic data, and site survey. Significantly, the impacts threaten sites from the earliest episodes of Native American occupation to the more recent eras of the history of the Commonwealth. Accordingly, DHR is bringing together various strategies to better understand the full scope of the threat and to combat data loss. Realizing these are only the beginning of needed mobilization, this paper outlines some of the initiatives that are under way.

Barber, Sarah (University of Central Florida)

[197] *Constituting the Divine: Coastal Cuisine and Public Places in the Formative-period Lower Río Verde Valley*

Food was central to the constitution of sacred public spaces during the Formative period in the lower Río Verde valley on Oaxaca's Pacific coast. Public facilities at small sites and at the region's largest precolumbian architectural complex, the Río Viejo acropolis, were the location not only of collective food consumption but also of food preparation. Drawing on architectural and archaeological features, as well as analysis of fauna, flora and ceramics, we examine the context of cooking and eating in the lower Río Verde valley's public spaces during the Terminal Formative period. If cuisine is understood as a regionally distinctive way of preparing, presenting, and consuming food, then our data allow us to begin defining a civic-ceremonial cuisine for coastal Oaxaca. We propose that the generation of this cuisine—from preparation to discard—was closely bound with manifestations of the divine. The experience of Formative period civic-ceremonial cuisine was thus far more than the ingestion of calories for survival. Instead, it was a means of creating spaces where people, the divine, and other animate beings requiring sustenance could encounter one another and simultaneously constitute, negotiate and contest regional social affiliations.

[364] *Human Biogeography, Life Histories and Bioavailable Strontium in the Southern Andes (Argentina and Chile)*

While regionally focused in Patagonia, Luis Borrero's research has contributed to shape archaeological practice beyond this region, encompassing South America at large. As a regional case attesting his widespread and multifaceted intellectual influence, here we assess the spatial scales and geographical organization of past human societies from the southern Andes (Argentina and Chile, 32°-34° S), involving aspects of paleomobility, life histories, and patterns of highland occupation. We focus on the last 2500 years, a period characterized by intense socio-economic and demographic change. These issues are analyzed in a biogeographical framework inspired by Borrero's approach to the archaeology of large regions, where the concepts of nodal and internodal areas have a key role. To achieve this goal, we present the results of an ongoing project studying strontium isotopes (⁸⁷Sr/⁸⁶Sr) from plant, animal, and human samples. Strontium isotopes vary according to bedrock and can be used to infer the sources of dietary strontium, hence revealing human movements between geologically distinct areas across the Andes. By integrating these results in a biogeographic scheme informed by multiple archaeological proxies, we define scale of territories, behaviorally meaningful archaeological regions, and patterns of social interaction across regions.

Barbosa, Isabel and Patrick Mullins (University of Pittsburgh)

[287] *Salinar Phase Ceremonial Architecture in the Middle Moche Valley: A View from MV-67*

The Moche Valley site, MV-67, is composed of several sequential hilltop platforms, whose orientation and structure suggest a ceremonial function. Throughout the 2017 and 2018 field seasons, the authors used aerial drone photography to generate a three-dimensional map of the site and conducted surface collections in order to gain a greater understanding of the site activities and chronology. Based on these architectural and ceramic analyses, the densest occupation of this site appears to be Salinar (400BC–1BC) with a light Chimú (AD 900–1470) reoccupation in its lower terraces. These findings allow for more complete understanding of the site, and Salinar ceremonial architecture, particularly when examined in the context of the larger Moche Valley.

Barbour, Matthew (New Mexico Historic Sites), Audree Espada (New Mexico Historic Sites) and Ethan Ortega (New Mexico Historic Sites)

[367] *Life under the Franciscans: Giusewa Pueblo after 1621*

In 1621, Franciscan Missionaries arrived at Giusewa Pueblo. They came to convert the native Jemez peoples to Catholicism and with their aid built the Mission of San Jose de los Jemez. Two years later, the Jemez revolted burning the mission and abandoning the village. The subsequent three year war led to an estimated 3,000 Jemez casualties and forced resettlement at Giusewa. It was to be the first of many uprisings for the Jemez people. This presentation examines the results of the 2018 excavations at Giusewa Pueblo and the impacts of the mission system as related through archival documents, the archaeological record, and the oral tradition of the Jemez.

[158] *Changing Patterns of Plant Use at Formative and Classic Period Matacanela*

Although there has been much speculation about the nature of agriculture along the Formative and Classic period Gulf Coast of Mexico, the local and regional subsistence economies of these periods remain poorly understood, particularly for Classic-period sites. In this paper, we present the results of the macrobotanical analysis from the Matacanela Archaeological Project. Spanning the Middle Formative through Late Classic periods, plant data from the Matacanela site provide key insights into the nature of changing agricultural dependence through time and the organization of site-level plant food processing. An examination of presence and abundance of maize and coyol palm, in addition to a full analysis of assemblage diversity and equitability, suggest a restriction over time in the places in which these resources were processed and cooked. These patterns have broader implications for understandings of sociopolitical power, economy, and inequality in the Gulf lowlands.

Barg, Diana (Bureau of Land Management, Utah)

[21] *Looted and Recovered Artifacts: The Art of Deciding What to Curate as Demonstrated Through the Cerberus Collection*

The Bureau of Land Management (BLM) of Utah, much like other federal agencies with a law enforcement arm, recover looted or distributed artifacts through various scenarios including cases and forfeitures. The Cerberus Collection is BLM-Utah's largest collection obtained under these circumstances, consisting of 50,000 artifacts originating from the American Southwest and recovered as evidence or forfeited by defendants involved in the Cerberus case between 2007 and 2013. The high quality and large quantity of artifacts in the collection led the BLM to develop criteria for long-term disposition focused on determining which artifacts to curate, which to incorporate into educational collections, and which to return to tribes for use outside of the NAGPRA process. These decisions are currently being made by a specially designated team who are determining the best long-term dispositions for each artifact or artifact type. This is accomplished by assessing the quality, archaeological significance, regional origination, and rarity of the artifacts as they pertain to federal laws and regulations and Department of Interior policy. This process and the associated criteria developed by BLM-Utah will help set future precedent and serve as a guide to agencies in managing current or future collections generated under similar circumstances with related needs.

[265] *Patriot, Federalist and Masons, Politically Oriented Artifacts from the Revolutionary War to the Federal Period Occupation of the Anthony Farmstead in Southeastern Massachusetts*

Recent excavations of the mid-eighteenth to mid-nineteenth century Anthony Farmstead in the town of Somerset, southeastern Massachusetts, yielded thousands of period artifacts, including numerous objects reflecting the patriotism and political affiliations of its occupants and the region as a whole. Several members of the Anthony family were of military age during the American Revolution and records indicate they may have participated in the War for Independence. In the decades following the war on through the Federal Period, patriotic sentiments and a participation in the popular Masonic Order in the first quarter of the nineteenth century are prevalent at the Anthony home. This analysis attempts to contribute to the understanding of the founding generation of Americans during this formative period.

[263] *Plain Pots Do Travel: Insights into Mogollon Early Pithouse Period Pottery Circulation*

Ceramics in the Mogollon region, particularly the Mimbres Mogollon, have been the focus of numerous neutron activation analysis (NAA) studies to discern pottery circulation and social networks throughout the region. However, most of these studies have focused on the painted ceramics with little attention given to the undecorated ceramics. Generally, it is assumed that plain brown ware represents local production and, thus, offers little insight into issues of pottery circulation. Alternatively, this poster explores pottery circulation during the Early Pithouse period (AD 200-700) in the Mogollon region through NAA of plain brown ware and red-slipped ceramics from seven Early Pithouse sites from the Mimbres, Upper Gila, and Reserve areas of the Mogollon region. The results of these analyses suggest that social boundaries were open and fluid within and between the different areas of the Mogollon region during the Early Pithouse period. In addition, this study demonstrates the utility of compositional analyses on plain ceramics for providing insight into social boundaries and the circulation of pottery.

[354] *Varied Outcomes of the Colonial Encounter in Hawaii Island's Hinterlands*

Beginning in the late 18th century CE, the Hawaiian archipelago's sustained interaction with foreigners transformed the islands from independent kingdoms at the center of their world to a globalized frontier, trade entrepôt, military outpost, and, ultimately, an economic and political colony. At the same time, the seats of power and settlement patterns changed rapidly along with a contracting population, leaving many areas virtually abandoned. Consequentially, the notion of "hinterlands" may be applied to the islands during this period at several scales--globally, within the archipelago itself, and within each island's traditional land divisions. In many cases, the geographical marginality of these spaces afforded opportunities for a variety of social and cultural outcomes of the colonial encounter. A review of archaeological investigations within a few of these hinterlands on Hawai'i Island provides examples of several of these outcomes, including the persistence of traditional lifeways, acculturation and adoption of foreign mores, and the emergence of novel subcultural forms. Results from these studies imply that the influence of elites and core regions in Hawai'i's hinterlands was not always straightforward, and dependent on a number of factors.

[146] *Rags and Riches: Wealth Inequality at Late Classic Uxul, Campeche*

Many recent studies about the distribution of wealth in ancient Mesoamerican cities are revealing new insights into the ways socioeconomic processes were organized. Measures of inequality, like the Gini index, reveal patterns of wealth distribution and socioeconomic stratification, permitting research into the relationships between the rich and the poor. In this paper, using evidence from household contexts, I discuss the distribution of wealth and its implications at the Maya Lowlands site of Uxul, Campeche. A Gini index based on construction volume is used to examine wealth inequality at the site during the Late Classic. Modern economic models help reveal the nature of socioeconomic processes that were been responsible for these distributions. The paper goes on to examine the ways in which wealth inequality impacted the daily lives of the rich and the poor in Uxul, focusing on how their access to different types of resources was affected. Artifact assemblages reveal whether certain object categories were restricted for specific layers of society. A study of the origins of obsidian, using pXRF, shows whether people had access to the same exchange systems. The access people enjoyed to public spheres and services in terms of proximity and visibility is studied using GIS.

[141] *The Geology of Nephrite Jade in China and Its Sourcing for Archaeological Comparisons*

The occurrence of nephrite is primarily linked to ophiolite locations around the world and is associated with serpentinite (S-nephrite); however, most nephrite in China is associated with metamorphosed magnesian limestone (dolomarmble) deposits (D-nephrite). Characterizing D-nephrite by chemical variation rather than major mineral components has greatly improved in the last two decades. Analyses of D-nephrite sourced from different areas of China are beginning to show patterns that may help in linking archaeological artefacts to raw material sources. Unusual quantities of particular trace minerals (e.g. Wollastonite), elemental ratios (e.g. Mn/Fe), Rare Earth Elements (REE), and isotopes (e.g. strontium) are now known for several source deposits of both D-nephrite and S-nephrite in China. A few can be related to specific archaeological artefacts, though characterization of the latter is impeded by restrictions on destructive techniques.

[400] *Preservation or Perseveration: The Cost of Trying to Save Everything*

The National Register of Historic Places Criteria help to guide the valuation and protection of significant archaeological sites. Lithic and trash scatters are often recommended as eligible for the Register based on their data potential or left with undetermined eligibility, though relatively few of these sites are actually nominated for the Register or scientifically excavated. Such sites tend to be the most common on the landscape, though their potential to yield unique and significant data is often limited beyond what might be collected during a thorough initial recording. A case study from Bureau of Land Management lands in Owyhee County, Idaho, provides an estimate of the various potential costs and feasibility of protecting large numbers of sites to preserve presumed data potential. Development of updated regional context documents that detail past investigations and formulate modern research questions can improve eligibility determinations and focus data collection. Applying the National Register eligibility criteria in standardized ways and taking the least significant sites out of management can free up time and funding for outreach, scientific inquiry, and the preservation of sites with greater heritage and data values.

[306] *John Murra's "A Study of Provincial Inca Life" Project; The Archaeological Survey*

This paper examines an aspect of John Victor Murra's "A Study of Provincial Inca Life Project" (1963–1966), centered around the large Inca site of Huánuco Pampa. Archaeological survey was an important part of this multi-disciplinary endeavor. Probably for the first time, systematic reconnaissance was conducted in the Peruvian highlands. Methodology differed from that of the earlier, coastal Virú Valley survey which aimed to cover an entire drainage. In Huánuco, project archaeologists followed the route of a sixteenth century colonial inspector, Iñigo Ortiz de Zúñiga, attempting to locate settlements he mentioned. These were recorded, and sometimes test excavations were conducted. Ethnographers Emilio Mendizábal Losack and César Fonseca and botanist Robert McK. Bird collected data in those communities that were still occupied. This innovative fieldwork design allowed for diachronic comparisons. However, it did not permit full coverage or objective sampling. Although never published in its entirety, aspects of this survey were disseminated in scattered articles. Field notes and thousands of photographs are housed in the American Museum of Natural History.

[123] *Governing Powers: Conceptualizing Research Sovereignty in Archaeology*

Throughout the past decade there have been significant dialogue and debate surrounding Indigenous Archaeology and the perceived challenges of designing and carrying out research. Indigenous approaches demand an individualized place-based approach, eluding the ability to establish a specific methodology. This can result in challenges regarding accessibility for interested and/or curious researchers. This poster addresses Indigenous scholarship using a Research Sovereignty Model. Although this addresses only one facet of Indigenous research design, it provides a framework that is clearly defined, transparent, and accessible for project design and data management.

[103] *Transition and Resilience: Commoner Occupation in the Río Amarillo East Pocket of the Copan Valley during the Postclassic Period*

Recent and ongoing research at residential groups at the sites of Río Amarillo and Quebrada Piedras Negras is providing a better understanding of the lives of commoners and of the population dynamics during the latter part of the Late Classic through the Postclassic Period. These sites share the second-widest pocket of the Copan River Valley, and lie in the middle of one of the main trade routes between Copan and Quirigua. The excavations and mapping of the households groups distributed in this landscape provide an increased understanding of the people

who inhabited this area close to the Copan metropolis during a time of complicated political, economic, and environmental change. Of particular interest are some of the differences found in the material culture of sites that all lie within the visual limit of each other. This paper will discuss both results from specific households and those of a larger mapping program.

[395] *Public Archeology in Poland on the Example of the Leading Archaeological Reserves*

Since the 50s and 60s of the twentieth century in post-war Poland, human past researchers have paid more and more attention to shaping knowledge of the public by disseminating results of archaeological research. Today, the field of archeology called "public archeology" is characterized by the multifaceted nature of the problem. One of its issues is dissemination of research results. Reconstruction and demonstration of research findings in the field constitute the most attractive forms of making archaeological monuments public. Objects located outside museum exhibitions, in a place of actual archaeological research, are generally defined as archaeological reserves. This presentation will focus on the three leading cultural objects created in the most important archaeological sites in Poland. The first one is the "Archaeological Museum in Biskupin", where one can find full-sized reconstructions, mainly the fortified settlement of the Lusatian culture from the Bronze Age. The next object is "Archaeological Reserve in Krzemionki", representing the world's largest complex of the Neolithic flint mines. The last object is "Wietrzychowice" Cultural Park, created in Kujavia region, to protect and present five megalithic tombs of the TRB culture. The above-mentioned places of archaeological heritage protection will be thoroughly discussed in terms of "public archeology" methods implementation.

Barton, Loukas (University of Pittsburgh)

[35] *What More Can We Learn about Complex Prehistoric Phenomena from an Aged, Simple Model?*

The Ideal Free Distribution is a heuristic device used for understanding or explaining behavior as a product of density-dependent habitat selection. More recently, the model has been used to track the emergence of social and political complexity through change in the patterns of prehistoric habitat selection. There may be many other ways that the logic of this simple model might reveal complex sociocultural phenomena through observation of indirect or seemingly unrelated material remains. And yes, most archaeologists are exuberantly skeptical. Here I'd like to explore a variant of the model focused on choices about behavioral repertoires rather than resource habitats. In particular I explore the utility of the adjusted model for understanding subsistence transitions such as the shift from foraging to farming.

[22] *Off the Beaten Path: Employing an Archaeological Education in Non-traditional Careers*

What utility does an archaeological education provide students who choose careers off well-trodden archaeological paths? What do these students bring to their careers and society at large? This paper focuses on why academic training in anthropological archaeology can offer students a desirable and diverse smorgasbord of perspectives, skills, and knowledge that fits well with jobs and careers that may not initially jump to mind. The irresistible intellectual excitement of archaeology attracts students to a discipline that teaches them, through disciplined explorations, to envision places, people, and worlds at new scales. Archaeological education cultivates valuable skills in critical thinking, project management, and current technologies that are useful in many career contexts. Through archaeology, however, these skills are combined with a deeper understanding of how human societies have formed, functioned, and faltered. As a result, an archaeological education yields flexible, informed professionals who understand and embrace cultural diversity. Their dispersal beyond more traditional careers also enriches awareness in the public sphere about the importance of archaeology and cultural resource preservation.

Bartusewich, Rebecca (University of Massachusetts Amherst)

[301] *Political Change and the Social Power of Potters at Idalion, Cyprus during the First Millennium BCE*

On Iron Age Cyprus, the polities are described as "city-kingdoms" that are autonomous, independent, and led by kings. Idalion is one such polity located in the south central region of Cyprus. Using petrographic analysis, I investigated the way craft production was impacted by economic, social, and political power mechanisms to understand the power structures at Idalion through material culture. Idalion's political order is disrupted by Kition, its coastal neighbor, at least twice during the Iron Age, once about 500 BCE and again at the end of the 4th century BCE. Kition annexed Idalion and consequently Idalion potters lost their primary source of Troodos raw materials. After the approximate 200 years of Kition control of Idalion, only one or two groups of potters regained access to

igneous sources. In the first half of the first millennium BCE, potters were able to use their own social power and connections to access raw materials and standardize some of their wares but once political and economic control shifted to Kition, potters had to change their production mechanisms. Political and economic power before, during, and after the administration of Idalion by Kition had immediate and lasting effects on the social power of potters.

[15] *The Color of Personal Ornaments in Prehistoric Periods of the Levant*

Shell beads appear first in the Middle Palaeolithic of the Levant. Their use as personal ornaments is evidence for cognitive abilities and symbolic expressions, however, their colors are limited to white, red and black. Humans' transition from a foraging economy to agriculture in the Neolithic of the Levant brought with it the first use of stone beads and the first appearance of other colors. Stone and shell beads in the Neolithic came in many colors and shapes. Because beads in white, red and black colors had been used before, I propose that the occurrence of green beads was related to the onset of agriculture. A synthesis of personal ornaments of the Chalcolithic period, following the emergence of agro-pastoralism provides insight into the possible ways in which the society of used to decorate itself. The dominance of white, green and red beads, pendants, bangles, and amulets apparently had additional amuletic or apotropaic functions at the critical time of religion formation. A large variety of raw materials were procured and the interpretation of the shapes and colors of these artifacts is largely based on Ancient Egyptian historic examples and on ethnographic analogies.

[411] *The Afterlife of the Discovery of a Lifetime: Preservation of the Maya Murals of San Bartolo, Guatemala*

In 2001, rarely preserved Maya murals were discovered at the site of San Bartolo, Guatemala. Subsequent archaeological excavations revealed an elaborate artistic program of wall paintings and numerous hieroglyphic texts buried in successive architectural phases dating from ca. 400-100 B.C. The corpus of paintings found within the Las Pinturas pyramid includes in situ murals and over 7000 fragments from artworks that were intentionally broken into fragments and concealed by the Maya as they dismantled older architecture and built new construction. Today, the in situ mural chamber and the fragment collection have been carefully excavated, stabilized, catalogued, analyzed, and curated; many fragments have been reassembled. These outcomes are the result of a 17-year collaboration between an international team of archaeologists, conservators, artists, engineers, materials scientists, epigraphers, and iconographers. This presentation will detail how archaeology, art, and materials science provide evidence of how the San Bartolo murals were created, used, and cached, followed by a description of the materials and methods used to conserve the paintings. Challenges for ongoing preservation of the murals through establishing protection measures for the site and providing broad access to the fragment collection will be discussed in light of the extremely under-resourced cultural heritage institutions of Guatemala.

Bassett, Hayden (U.S. Navy, NAVFAC Atlantic), Christopher P. Chilton (U.S. Navy, NAVFAC Atlantic), Bruce J. Larson (U.S. Navy, NAVFAC Atlantic) and E. Clay Swindell (U.S. Navy, NAVFAC Mid-Atlantic)

[168] *Riverine Resource Subsistence in Early to Middle Woodland Saginaw Valley, Michigan: An Investigation of Site 20SA1427*

From the terminal Early to late-Middle Woodland periods (500 BC – AD 500), Native groups living in the central Saginaw Valley of Michigan dramatically shifted subsistence strategies from a reliance on medium to large game, to a focus on aquatic resources. Regional sites illustrate this shift, though from the point of deposition in central domestic spaces, rather than source exploitation areas. This poster details the investigation of site 20SA1427, a peripheral procurement and processing area for aquatic resources in support of a significant Eastern Woodland

domestic complex. Delineated and investigated using Ground Penetrating Radar (GPR) and deep subsurface testing, the site is characterized by intensive episodic use, integral to the settlement ecology of Early to Middle Woodland groups in the region. Reporting initial phases of fieldwork, this poster: 1.) provides an effective approach for survey of ephemeral, deeply buried sites; 2.) demonstrates the value of geophysical methods for identifying ancillary site components; and 3.) argues the analytical value of peripheral, resource-focused sites in understanding shifting dynamics at domestic centers.

Bauer, Hannah (The College of Wooster) and Olivia Navarro-Farr (The College of Wooster)

[371] *A Cross-Comparative Study of Problematic Deposits from M13-1 at El Perú Waka' and the North Acropolis at Tikal*

Archaeological research on problematic deposits has provided a generic category for otherwise unexplainable bodies of evidence for ritual activity. This research focuses on data from two similarly constituted problematic deposits in the Maya area, one very well known from the North Acropolis at Tikal, and one lesser known from civic ceremonial structure M13-1 at El Perú Waka', both of which are situated in Peten, Guatemala. Analysis conducted in 2017 and 2018 by the Waka' team on ceramic deposits recovered from this structure provides a more thorough dataset on remains previously identified as problematic deposits. Excavations in the North Acropolis of Tikal have yielded similar types of deposits associated with political centers and public spaces. By conducting a comparative analysis of ceramic data collected at these sites, I investigate how they are similar and different in nature, context, and content to further explore what problematic deposits look like in the archaeological record, and how this identification is limited in describing deposits that do not fit into narrowly defined categories of desecration or termination. Through this research, my goal is to contribute to the debate surrounding the classification of ritual remains in various contexts by careful comparative examination of these enigmatic deposits.

Baughner, Sherene**[83]** *Tutelo Resettlement in the Cayuga Heartland: Haudenosaunee Approach to Refugees*

The Tutelos were driven out of their homelands in North Carolina and Virginia by land-grabbing Europeans. The Tutelos fled to refugee settlements in Pennsylvania along with other displaced Native Americans from diverse Indian nations. In 1753, the Tutelos were offered sanctuary with the Cayugas, one of the Six Nations of the Haudenosaunee/Iroquois Confederacy. The Tutelos maintained their separate cultural identity, continued their own language and customs, and governed their internal affairs, while the Cayugas handled all “external” affairs such as diplomacy and trade with the colonists. The Tutelo village was Coreorgonel, near present-day Ithaca, New York. During the infamous Sullivan Campaign of 1779, Coreorgonel was burned to the ground, the Tutelos were forced from the region, fleeing westward toward Niagara Falls and ultimately resettling on the Six Nations Reserve in Canada. Archaeological work on an engaged, collaborative project with the Tutelos and Cayugas resulted in the design and opening of a commemorative park and a greater understanding of the long-term social impact of the humane treatment of refugees by the Cayugas.

Baumann, Steve**[85]** *When Contemporary Becomes Historic: Preservation Maintenance to Mission 66 Architecture at El Morro National Monument*

El Morro National Monument’s Mission 66 maintenance/utility complex is a distinctive Cecil Doty design uncharacteristic of Mission 66 program utilitarian buildings. Extending from the maintenance building is a service yard enclosed by a fence with battered stone masonry piers and vertical wood plank fence sections. A double-leafed gateway accesses the large trapezoidal yard. Because the maintenance/utility building was attached to the facade of the overall visitor center complex, the design required architectural distinction that is unusual for Mission 66 program maintenance buildings. The stone pier supported fence is a prominent feature of this design. After more than 50 years of use, expedient repairs and weathering, the now historic fence was ready for a preservation maintenance project. The funding goal to improve the condition and appearance of the fence included replacement of all original wood fabric and repointing of the piers. Improvement to the condition and appearance was achieved by El Morro’s VT program in 2018 while retaining most of the original fabric. Clever refitting techniques and careful assessment and conservation of original materials resulted in a VT project that exceeded funding goals and restored the appearance of this unique architectural element integral to El Morro’s Visitor Center\Maintenance complex façade.

[5] *Discussant***Bausch, Ilona (Kokugakuin University Museum)****[141]** *Cultural Biographies of Japanese Jades: Temporal and Spatial Variability during the Jomon Period*

Jadeitite from the Itoigawa source was highly valued among hunter-gatherers inhabiting the Japanese archipelago during the Jomon period, circulating widely from its discovery during the late Early Jomon (c. 4000 BCE) until the end of the period (c. 400 BCE). While there is some indication that raw material may have been valued in its own right, the overwhelming majority involves finished artefacts. Due to the presence of a drilled hole, these have been uniformly classified as ‘ornaments’ (‘large pendants’ during the earlier phase, small round and curved beads during the later phase), and—based on several well-published finds from mortuary contexts—interpreted as conferring magical and/or social power, worn as prestige objects by ‘leaders’ or ‘shaman’. However, diversity in shape, size, wear and depositional context demonstrate that there is much variability in function and social value. In some contexts, other minerals /rocks were substituted for jadeitite. Moreover, it is necessary to take into account the heterogeneity of Jomon societies through time and space, as well as varying levels of social inequality. This presentation will examine the diversity in Jomon jade artefact practices, discussing regional and chronological differences in production, use wear and deposition.

Baustian, Kathryn (Skidmore College)**[353]** *Bioarchaeological and Mortuary Indicators of Social Order in Mimbres Society: Seated Burials, Occupational Stress, Health, and Trauma*

The Mimbres culture of the American Southwest is most recognized for its beautiful black-on-white ceramics but recent research is revealing greater understanding of social organization, community interactions, and the response to social and cultural change. Bioarchaeological and mortuary data are contributing important evidence of power differentials and social relationships within communities. This paper presents data from burials and human skeletal remains to explore theories of cooperation within Mimbres communities. Of particular significance are burials exhibiting bodies in upright seated positions and the inclusion of high numbers of mortuary goods, particularly decorated ceramic bowls. Seated mortuary positioning is not typical for the region and may have been reserved for community members who held specific social roles or elevated standing. Previous research has linked household clusters and seated burials to social memory and land tenure. Skeletal observations of occupational activity, pathogen exposure, stature, and trauma also indicate that Mimbres people engaged in more cooperation than competition.

[241] *Cultural Resource Management at an USACE Research Laboratory: Methodology Development in CPP Rapid Response*

The CRM team at the U.S. Army Corps of Engineers (Corps) Construction Engineering Research Laboratory (CERL) provides research in archaeology, Native American issues, historic buildings and landscapes as well as environmental planning. Our team provides direct technical and subject matter expert support to military installations and Corps districts. Additionally we conduct original research in methodologies to streamline the CRM process in conjunction with the U.S. Military mission. These efforts include national contexts, programmatic solutions to CRM issues and guidance on the deployment on new technologies. One ongoing effort, presented in this paper, is the development of a globally applicable decision matrix that will facilitate the rapid response to developing or ongoing man-made or natural disasters that impact cultural sites. Cultural Property Protection (CPP) approaches need to be cost-effective and scalable to challenging circumstances that may include serious shortages in time and trained personnel, and the need to work in harsh and even potentially dangerous conditions. The matrix under development takes into consideration the amount of time, resources, and trained or untrained personnel available and what data collection methodologies can be best deployed to achieve maximum results with the available resources.

[122] *Kiva Collaboration – The Toriette Lakes Great Kiva Project: Excavation, Oral History, Augmented Reality and Other Things We Should All Be Doing*

The Toriette Lakes Great Kiva near Reserve, New Mexico was the subject of a 2018 field project under the auspices of the Denver Museum of Nature & Science. This high altitude, threatened site appeared to be a shallow, disturbed, somewhat isolated, square great kiva of unknown date. Survey, excavation, and remote sensing have refined this interpretation. This poster provides an overview of summer fieldwork, contextualizes the kiva within its surrounding landscape, reports on collaboration with Zuni cultural leaders, and makes a preliminary appraisal of its architectural features. Data are presented with augmented reality – multimedia effects (audio, video, graphics) that are keyed by viewers' devices; this makes for a 'smart' poster that has minimal text, ever changing content, conveys data through multiple sensory modalities (which can be ADA accessible), and offers a snazzy alternative experience to a typical academic poster.

[35] *Reflections on the Life, Career and Influence of Stephen D. Fretwell*

Steve Fretwell served as a Visiting Maytag Professor at Arizona State University in the Biology Department in 1976-1977. He was a well-published, aspiring young evolutionary ecologist and taught several courses and seminars. I was a first-year graduate student in anthropology at that time and had the opportunity to take Animal Ecology and Mathematical Ecology from him. He later served as a member of my doctoral committee. I worked with him in the field in Kansas and Nebraska and had many discussions with him on science, ecology, spirituality and life. I here share some of my reminiscences on his work and career and reflect on his influence in evolutionary ecology and archaeology.

Bayman, James**[246]** *From Hohokam Archaeology to Narratives of the Ancient Hawaiian 'State'*

Interpreting the political economies of early complex societies that lacked texts is a profoundly difficult challenge for anthropological archaeology. Such models compel archaeologists to examine material evidence of agricultural intensification, community organization, craft specialization, monumental construction, and mortuary practices. In this comparative study, I consider such evidence to examine the political economies of ancient societies in two regions: the Arizona desert and the Hawaiian archipelago. A comparison of archaeology in the two regions confirms that Southwestern scholars have underestimated the degree of social stratification among the Hohokam -- if we accept claims that ancient 'states' developed in the Hawaiian Islands. This finding underscores the limitations of using conventional archaeological correlates to characterize ancient societies elsewhere in the world.

The islands of the Lesser and Greater Antilles were permanently settled as early as 8000 ybp, but the earliest human presence in the Bahama archipelago is dated ~1200 ybp, some 6700 years later. It has been noted that a connection between climate variations in the Caribbean/West Atlantic region may be the key to understanding the timing of the expansion into the Bahamas and shifts between Lucayan archaeological periods. Periodic climatic fluctuation in the Caribbean/Western Atlantic region follows similar trends when observed at a millennial resolution, however at multi-decadal and centennial scales, the timing and location of precipitation and temperature regimes vary. Climate proxies such as Fe, Sr:Ca, Ca and $\delta^{18}\text{O}$ from the pan-Caribbean show whether specific regions in the Caribbean and Western Atlantic experienced similar or different climate patterns, and if those patterns correlate. We have assembled a synthesis of high resolution paleoclimate records from Mesoamerica, South America, Puerto Rico and the Bahamas to create a framework that can be used to view human decision making processes regarding migration, colonization, resource procurement, trade, settlement and sociopolitical relationships in the Caribbean/Western Atlantic around the time of the Medieval Climate Optimum.

Speth (2017) proposed that the consumption of putrid meat and fish might be a dietary item that is underexplored in the Upper Paleolithic food menu. In this presentation we explore ways to identify the consumption of putrid foods. We compare the results from our study of $\Delta^{15}\text{N}$ observed in mammal muscle tissue decomposing during winter with published stable isotope data of prehistoric arctic and subarctic groups. Our modern muscle tissue study indicates that during the first 40 days when daily temperatures average 9.3 °C, no significant difference is observed from the starting $\delta^{15}\text{N}$ value (mean $\Delta^{15}\text{N} = 0.1\%$). However, from days 41-76, there is a significant increase in $\Delta^{15}\text{N}$ with an

average increase of 1.7‰ despite no significant change in the daily temperature average or max daily temperature, 10.0 and 25.6 °C, respectively. Ethnohistoric accounts indicate that putrefied meat and maggots were consumed as a delicacy by arctic and subarctic groups. While muscle tissue does not seem to contribute significantly to elevated $\delta^{15}\text{N}$ values, maggots associated with decomposing meat do have significantly higher $\Delta^{15}\text{N}$ values, up to a 4.6‰ increase within 136 days of decomposition. Consumption of putrid meat and associated maggots should be considered when constructing prehistoric food menus.

[162] *Early Native and African Marooning in Northern South America and the circum-Caribbean*

This paper explores the dual development of African and Native American maroon societies in early Spanish America. Although marronage was widely practiced by Native Americans and Africans, maroon history has been largely defined by African agents. In the early colonial period Africans and Native Americans robustly participated and interacted with each other. This history of native and "mixed-race" marronage can provide new insights to African-Native relations and their role in structuring colonial society.

[19] *Is Archaeology Up to the Pepsi Challenge?: The Identification of Marginalized Populations in CRM Archaeology*

The determination of the ethnic or cultural affiliation of an archaeological site, Indigenous or otherwise, is often considered one of the primary starting points for the interpretation of 19th-century archaeological sites. This determination is a significant step in the archaeological process and establishes the primary set of theoretical and comparative literature that will be used to contextualize the archaeological patterning. Furthermore, this determination often acts as a gateway that determines descendant communities can, or must, be engaged as part of the archaeological process. This paper uses examples drawn from the CRM context in Ontario, Canada, to highlight how these determinations are made, as well as underlying weaknesses and assumptions, within the process. The CRM context provides a unique lens into these issues as it often results in the identification and study of a large number of archaeological sites outside of conventionally known enclaves of study.

[367] *Blue Tunics and Royal Lions: Colonial Period Changes in Clothing and Changing Conceptions of Indigeneity in the Spanish Colonial Americas*

This paper addresses the impact of conquest and colonialism on indigenous Andean peoples' clothing styles and textile motifs in the central Andes, using examples from elsewhere in Latin America and beyond to contextualize documented patterns. Comparing Prehispanic and colonial period examples, I use several classes of material culture to shed light on sociopolitical organization, gender, and ethnic identity. Specifically, I explore the impact of Spanish public policies, gender roles, and social ideals on the maskaypacha scarlet forehead fringe, the form and decorations on male Inkan unku tunics, and gendered costume changes. All of these examples reveal patterns in indigenous clothing that can be linked to colonial period conceptions of indigeneity.

Bebber, Michelle

[116] *A Comparative Functional Analysis of Old Copper Culture Utilitarian Implements via Artifact Replication, Materials Testing, and Ballistic Analyses*

North America's Old Copper Culture (4000-1000 B.C.) is a unique event in archaeologists' global understanding of prehistoric metallurgic evolution. For millennia, Middle and Late Archaic hunter-gatherers around the North American Upper Great Lakes region regularly made utilitarian implements out of copper, only for these items to decline in prominence and frequency as populations grew and social complexity increased during the Archaic to Woodland Transition. Yet, it may be reasonably asked whether these demographic and social factors are the only, or predominant, factors contributing to this evolutionary pattern. To answer this question, an extensive archaeological experimental program was initiated which compared replica copper tools (spear points, knife blades, and awls) to analogous ones made of stone or bone in order to assess whether relative functional efficiency also contributed to the decline of utilitarian copper implements. This series of experiments consists of a controlled ballistics study, a cutting efficiency and durability study, and a punching efficiency study using an Instron materials tester.

[150] *A Zooarchaeological Analysis of Diné Hunting Traditions*

Throughout history, the Diné have worked to manage the arrival of new people, ideas, and resources into their communities. Following the introduction of Old World domesticates to northwestern New Mexico during the Gobernador phase (c. 1700-1775), Diné groups increasingly incorporated sheep-based pastoralism into their earlier hunting-gathering-farming way of life. The re-examination of faunal remains and lithic artifacts originally recovered from seven Diné pueblitos by the BLM (Marshall 1995) shows that this period of transition overlaps with shifting

hunting practices and ritualization. Rituals coinciding with this shift allowed for a more efficient hunting tradition and perhaps the creation of stories and prayers suited for their subsistence strategies. Given that hunting strategies are dependent on the geography of the area, season and the type of game exploited, this project opens the door to a broader discussion of Diné hunting efficiency, mobility, and traditional relationships with wild game as they relate to the adoption of new cultural influences during the Gobernador period.

[158] *Vestigios de lo olmeca en la montaña. Contexto y contraste del depósito de hachas de piedra verde de Matacanela*

En el año 2015, Venter dirigió un programa de excavación arqueológica en Matacanela. En la unidad 2, realizada al oriente del conjunto arquitectónico principal, se registró una secuencia estratigráfica que permitió documentar y distinguir dos momentos de ocupación en el área del sondeo, la más antigua data al periodo Formativo medio (900-400/300 aC). En este contexto, se recuperó un depósito que incluye un fogón conmemorativo asociado a una "vasija volteada" con tres hachas pequeñas de piedra verde en su interior. En la ponencia, se discute la asociación de las hachas, la vasija y el fogón como un depósito relacionado al sistema ritual y de representación olmeca del sur de Veracruz. Aunque evidencias del Formativo han sido registradas al oeste del Lago de Catemaco, Matacanela provee una oportunidad para entender la incorporación de las prácticas "olmeca" en las poblaciones locales de la sierra y su gradual transformación hacia los patrones sociales del periodo Clásico en Los Tuxtlas.

[326] *Tracking Early Human Presence in North America and Beringia during the Late Pleistocene through Bayesian Age Modeling*

The timing of early human presence in the Americas is a debated topic in First Americans research. The variable of time is, after all, fundamental in the study of human dispersal; it forms a base with which to elucidate spatio-temporal patterns, study applicable bio-cultural processes, and frame environmental data. As such, this investigation analyses current chronometric and archaeological records from North America and Beringia, using a Bayesian age-modelling approach. The incorporation of 42 archaeological components from across these regions into five categories - pre-Clovis, Beringian Tradition, Clovis, Clovis-coeval, and Western Stemmed Tradition - allow for a region-wide analysis that produces a clearer image of early human dispersals into the American continent. Results obtained are framed against current data on faunal extinctions, ancient DNA, and climatic records.

[353] *The Labor of Building a Community: Collective Organization and Mortuary Practices in Copper Age Iberia*

The Iberian Copper Age (c.3200-2250 BC) witnesses a suite of interrelated changes, including expansion of exchange networks, intensification of agriculture, increases in population density, and greater investment in site infrastructure. Accordingly, it is noteworthy that third millennium collective mortuary practices hark back to the Neolithic, even at some of the unprecedented "mega-sites" that appear during this time. Some of these mega-sites show indications of the emergence of institutionalized inequalities through increasing spatial and material attention to the individual, and inter-tomb variability in the quality and quantity of grave goods. In contrast, the 113 ha enclosure settlement of Marroquies lacks clear or overt evidence for domestic or mortuary inequality. Here, bioarchaeological results suggest that village inhabitants led relatively similar lives in terms of diet and disease, most individuals had local strontium isotope ratios, and males, females, adults, and subadults were all incorporated into

mortuary practices. Skeletal analysis thus indicates that within third-millennium Iberia there were multiple ways to build a community, from large-scale centers that emerged in tandem with indicators of increasing social inequality, to other mega-sites where archaeological and bioarchaeological evidence suggest a more cooperative approach.

[353] *Why Heterarchy? A View from the Tiwanaku State's (AD 500-1100) Labor Force.*

When past peoples congregated to form complex societies, a question arises as to under what circumstances would heterarchical, reciprocal labor be emphasized over top-down hierarchical configurations? In the Central Andes of South America, modern indigenous people practice reciprocal labor with groupings organized around family hamlets and kin networks in an ayllu (i.e., kinship, administrative, and political) system. Heterarchical teamwork to till fields, plant, and harvest makes logical sense with smaller groupings of people spread across a wide area. The Tiwanaku state within this same region had an estimated 40,000 people living within a few hundred square kilometers of each other. Archaeological and bioarchaeological evidence point toward a shared, reciprocal, and heterarchical labor force that emerged as one basic tenet of this civilization. Exploring questions about heterarchical labor, this research evaluates activity evidence from Tiwanaku skeletal remains from before, during, and after the emergence and expansion of the Tiwanaku state. Results show that people may have labored less extensively and repetitively on heavy effort tasks like farming after the advent of the state. Obligations within something like an ayllu network during state times may have strengthened social obligations and kept this expansive state functioning for over 500 years.

[305] *Monuments to Symbolic Behaviour in the Dampier Archipelago, Western Australia*

The Dampier Archipelago in Northwest Australia is famous for containing dense concentrations of spectacular rock art that reflect varied and changing landscape use over time. Standing stones are another important site type found throughout the archipelago and they range from single, isolated stones to large clusters of propped or chocked uprights. These features are underexamined despite their prevalence, and can be found in association with a range of other archaeological material including: rock art, stone structures, quarries, artefact scatters and middens. This paper explores the spatial patterning of standing stones in conjunction with rock art and other archaeological material. The variety in location and extent placement suggests that these features were being used both in association with, and independent of other symbolic forms of communication such as rock art. Being both visually impressive and visible over reasonable distances means these features could have functioned to signal across significantly larger distances than the rock art. This does not preclude previous interpretations of these features as Thalu or increase sites; instead, it provides a more nuanced understanding of these features in context as another medium for inscribing the landscape.

[410] *Skull Offerings: The Koxol Offertory Assemblage in the Maya Area*

Skull offerings among the ancient populations of Mesoamerica are well documented by archaeological, ethnohistorical and iconographic sources. New finds in 2017, in the Lowland Maya Classic site of Naachtun (Guatemala) required intersite comparisons beyond the few well-known cases such as Uaxactun E-Group's deposits. The association of a cached human skull and a pair of ceramics was defined by William Coe as Tikal's Koxol so-called "offertory assemblage". The human remains in these peculiar deposits are obviously linked either to sacrificial, burial or post-interment practices, but even at this scale of analysis, no attempt was ever made to undertake a systematic study. As a consequence, this paper represents the first step in the remarkably difficult task of understanding the sense and meaning of these very peculiar Maya offerings, and of caches in general, often described in the literature, but actually very poorly understood. A careful selection of truly isolated skull offerings revealed a broadly shared ritual tradition among most of the Maya area. On the basis of a corpus of 73 deposits from 27 Maya sites identified to date, this paper aims at classifying the variations of this skull offertory assemblage and to follow its distribution in the Maya area through time.

Beggen, Ian and Kelsey A. Schmitz (East Carolina University)

[216] *Interpreting Resharpener Patterns of Paleoindian and Early Archaic Projectile Points from the Carolina Piedmont*

Resharpener occurs throughout the use-life of a tool and may indicate the intention to rejuvenate the blade edge or the reconfiguration of a tool for a new function. Analysis of this aspect of projectile point maintenance can reflect variation in resource use strategies amongst the users of these tools. This study concerns the differences in resharpener patterns of four projectile point styles from the Paleoindian and Early Archaic periods of the Carolina Piedmont, known as Hardaway Dalton, Hardaway Side-Notched, Palmer, and Kirk. In this research, we analyze the evidence of retouch or resharpener on these points to infer how mobility patterns, resource use, and land use changed during the Paleoindian to Early Archaic transition in the Carolina Piedmont. We contextualize these data concerning resharpener patterns into the different landforms at which the points were found as well as their unique geographic locations across the landscape. In utilizing two different methods of assessing projectile point resharpener, along with geospatial and statistical analyses, we infer how mobile hunter-gatherer groups adapted and modified their usage of the landscape during the earliest occupations of the Carolina Piedmont. These data contribute to the overall research concerning hunter-gatherer lifeway variation across long periods of time.

[136] *Archaeologists as Indian Advocates? Lessons from Skinner, the Little-Weasel, and Moorehead, the Indian Commissioner*

Archaeologists who study the Native past have a responsibility to the Native present. But our academic training does little to prepare us for advocacy work. Personal interests, ethics, and the precariousness of employment often dictate what can be done. Doing nothing is easier and safer than speaking out, but idleness reinforces the irrelevancy of archaeology to contemporary social issues. Recalling the advocacy decisions of two archaeological ancestors, Alanson B. Skinner and Warren K. Moorehead, helps us to consider how and when archaeologists should act beyond their own job descriptions. Skinner's attempts to educate the white public and Moorehead's work to guide governmental policies were not flawless. But their willingness to do something helps us reconsider if we, as

individual archaeologists, are doing enough.

[289] *Evaluating Wari Impact on Regional Trade Networks: Patterns of Obsidian Exchange in Cusco, Peru before and during the Middle Horizon*

The Middle Horizon (600-1000 CE) in the Central Andes was a time of important changes due to the expansion of the Wari and Tiwanaku states. Many scholars have argued that these polities, the Wari in particular, had a major economic impact on local communities, including the disruption of regional exchange networks and the reorientation of long-distance trade to the benefit of state elites. Obsidian data are particularly well suited to test this idea since provenience studies can trace the exact origin of obsidian artifacts. In this paper, we present new obsidian data from three sites in the Cusco region dating from the Late Formative to the Middle Horizon (Ak'awillay, Yuthu, and Bandojan) to document the organization of trade networks through time and Wari impact on the local economy. A portable X-Ray Fluorescence (XRF) spectrometer was used to determine the provenance of obsidian items recovered in horizontal excavations. Results indicate the emergence of trade with Wari-affiliated partners in the Middle Horizon, but also continuity in exchange networks through time, including those associated with the Titicaca

Basin despite Wari presence in Cusco. These data suggest that, like other early states worldwide, the Wari polity had a limited impact on regional trade.

[256] *Power from the Periphery: 40 Years of Insight on the Maya Lowlands from Southeast Mesoamerica*

For more than 40 years, Pat Urban, Ed Schortman, and their student-colleagues have toiled long and hard in the blazing heat of Northwestern Honduras to understand the “non-Maya” populations resident in Southeast Mesoamerica. Their work stretches from the beginnings of complexity in the Middle Preclassic period (600 B.C.E.) through the Contact and Early Colonial periods (C.E. 1550) in the Naco Valley, Cacaupala Valley, and Santa Barbara region of Honduras. Through this exposition of more than 2,000 years of human experience, Urban and Schortman have produced results that not only bring Southeast Mesoamerica and its peoples into sharp focus, but also provide insights into practices linked to craft production, political organization, systems of ritual and belief, interregional interactions, and daily life in the “high-culture” Maya Lowlands to the north. In this paper, I explore their contributions to Maya studies, and archaeology more broadly, by posing the question, “What wouldn’t we know about the Maya if Pat and Ed hadn’t spent so much time studying the “non-Maya?” I complement a review of their published work with reflections from their colleagues on the “other” side of the Motagua River.

[256] Chair

Beller, Jeremy (Department of Anthropology, University of Victoria.)

[338] *Lithic Procurement at a Levantine Desert Refugium during the Middle Pleistocene*

Recent excavations at Shishan Marsh 1 in the Azraq Basin, Jordan have uncovered several artifact-bearing layers that date to the late Middle Pleistocene (300-220kya; 130-120kya). A paleoecological assessment of sediments from this period indicates predominantly arid and warm conditions in the region, similar to those of the present. Hominins living under these conditions were forced to contract around a receding spring- and wadi-fed water source or refugium for subsistence. Consequently, Shishan Marsh 1 presents the opportunity to investigate lithic procurement strategies practiced by Lower/Middle Paleolithic hominins in a water-stressed environment. Chert is the dominant type of lithic material of the hand axe assemblage. A provenance study of potential raw material sources in the region and the hand axe assemblage was conducted using ICP-MS. The results indicate that local procurement was the predominantly strategy. Various wadi sectors likely operated as secondary sources as well, transporting nodules towards the refugium.

Bello, Charles (Federal Emergency Management Agency (FEMA-DHS))

[17] *Opening Remarks to the Session and A Case Study of Tribal Involvement with Research into the Indian Division of the Civilian Conservation Corps (1933-1942)*

The CCC and other federally sponsored work programs provided needed employment during the Great Depression and have been examined by scholars in a range of fields. Archaeologists have examined CCC projects as examples of early scientific excavations that trained many American archaeologists, setting the stage for Cultural Resource Management practices of the modern day. Archaeologists have also examined CCC sites as archaeological projects in their own right – excavating camps and work areas as significant resources – many CCC projects are now eligible for the National Register of Historic Places. However, few are aware that a parallel program, Indian Emergency Conservation Work, later subsumed into the CCC as the Indian Division (CCC-ID), offered similar programs for Native American young men and performed extensive conservation work on reservations. This project outlines preliminary efforts of working with Tribal governments to recognize and document CCC-ID sites and reveals the complicated, and in some cases negative, relationships that tribal governments and individual tribal members had with the CCC.

[313] *Obsession with an Icon: Sandals, Sandal Imagery, and Social Identity Across Thirteenth Century Cultural Landscapes in Southeastern Utah*

Ancestral Pueblo people in southeastern Utah seem to have been obsessed with sandals and their depictions during the thirteenth century. Recent research has documented hundreds of sandal depictions on plaster and rock surfaces in the area dating to this period, but how should archaeologists interpret these data? This presentation investigates how people in the southeastern Utah used clothing and representations of clothing in other media, to signal important aspects of social identities in the thirteenth century. Recent field- and collections-based research of plaster building murals and rock art depicting sandals and other types of clothing, and actual twined sandals and other woven garments from southeastern Utah and the larger region are outlined. Next, cross-media approaches and clothing theories are applied to the study of identity expression, in an effort to understand some of the ways that Ancestral Pueblo people materialized concepts of personhood, group and community-level identities, and religious

ideologies across diverse classes of decorated media during this era. Finally, the ways that changes in clothing styles, and their depictions, signaled major developments in the ways people expressed aspects of group affiliation and social position across the area, just prior to the depopulation of the region are addressed.

[354] *Moving within the 'A'ā: The Influence of Liminality in the Hinterlands of Manukā, Ka'ū, Hawai'i Island*

Situated at the transition between windward and leeward sides of the island of Hawai'i, Manukā is a tapestry of environmental and sociopolitical gradients perpetually reconfigured by the lava flows from Mauna Loa. As a geographically liminal region, place-names describe it as where "the trade winds of Ka'ū give way to the gentle breezes of Kona." The result is a high ecological diversity providing numerous agricultural opportunities, albeit within small and widely dispersed clusters. However, the discontinuous and diffuse nature of environmental resources in this region mandated novel subsistence and settlement strategies, solutions which were enabled by the sociopolitical liminality of Manukā, residing in the boundary between rival cores. This facilitated fluid regional political affiliations, allowed non-elite mobility, and empowered local agency and innovation in social and subsistence practices. This paper explores notions of social and spatial liminality and deploys these concepts to define a model of hinterlands based on regional dynamics within an island setting. It does so through a preliminary geospatial analysis of settlement patterns, networks of movement, and symbols of authority and community. The results assert hinterlands as spaces for active and creative social negotiation within existing political structures and networks.

[402] *The First Paleoeological Analysis Derived from a Small Vertebrate Assemblage from the Byzantine Galilee and the Implications for Settlement Patterns*

The flourishing of settlements in the Levant during the Roman-Byzantine period has been attributed to an increase in humid conditions between 300–700 CE with a concomitant increase in tree cultivation. Small vertebrates which provide high-resolution paleoecological proxy are rare in the Byzantine period overall and totally absent from Galilean sites. This paper examines an assemblage of micro-vertebrates (<1 kg live weight) retrieved from a 5th c. CE cistern sediment found at the Galilean village of Horvat Kur (www.kinneret-excavations.org). It represents the first well-dated Byzantine small vertebrate assemblage from the Galilee. The assemblage is heavily dominated by several species of shrew, non-commensal murids such as *Apodemus*, and a low proportion of grassland species (e.g., voles), all consistent with a closed wooded environment. Furthermore, the fauna does not appear to reflect an anthropogenic habitat e.g., agricultural fields. This reconstruction points to a Mediterranean woodland and scrubland surrounding the periphery of the site. This contrasts recent palynological research which may be explained by the different spatial and temporal resolution presented by the two proxies. The difference underlines the importance of multi-proxy approaches in resolving the local paleoecology in historical periods.

[386] *A Geometric Morphometrics Approach to Test Microlith Variability at Cabeço da Amoreira Shellmidden (Muge, Portugal)*

Geometric microliths are one of the most important lithic technological adaptations of the Mesolithic in Westernmost Europe. At Muge shellmiddens, previous studies have revealed great variability in the morphology of these implements, especially the triangles, although the reason for such variability is still unclear. Three hypotheses have been suggested to explain this: 1) idiosyncratic cultural behaviour; 2) successive application of maintenance retouch (Frison effect); 3) or the application of each morphology for different functionalities. Drawing upon recent developments on Geometric Morphometrics analysis, this poster presents new data on the morphometric variability of geometric microliths from Cabeço da Amoreira, one of the largest shellmiddens at Muge. Our goal is to test one of the three mentioned hypotheses, specifically the one that argues that identified subtypes are a consequence of discard at different points along a continuum of remodification and reduction. With this study, we expect to contribute to a better understanding of Mesolithic lithic technology and offer new interpretations to the economic and technological strategies of the last hunter-gatherer communities in the Western Atlantic facade of Iberia.

[314] *Puertos, materiales y productos de intercambio*

Desde los primeros estudios arqueológicos desarrollados en el occidente mesoamericano han sido encontrados diversos rasgos culturales, vocablos y artefactos similares a materiales existentes en el noroeste sudamericano. Destacan entre ellos los materiales Capacha, los de tumbas de tiro y la metalurgia, aportando evidencias claras sobre los intercambios mercantiles y culturales que existieron en el Pacífico intertropical americano, desde el golfo de California hasta el norte de Perú. Hay dos lugares costeros que aportan evidencia de la presencia sudamericana en el Occidente de Mesoamérica, ellos son Playa del Tesoro y Punta Mita, ubicados en las bahías de Manzanillo y Banderas respectivamente. Ambos muestran claramente los puertos que fueron utilizados en estos intercambios, junto con los materiales arqueológicos de influencia sudamericana encontrados en las excavaciones. De igual manera, la investigación en estos sitios proporcionó información acerca de la explotación de los ecosistemas de costa y estuario, en especial sobre la captura de los géneros preciosos de concha, como *Spondylus*, *Strombus*, *Pinctada*, *Púrpura* y otros más, los cuales fueron la base de su riqueza y en gran parte de los intercambios mercantiles.

Bement, Leland (Oklahoma Archeological Survey, OU), Kristen Carlson (Augustana University) and Dakota Larrick (University of Oklahoma)**[322]** *Discard, Stockpile, or Commemorative Cairn: Interpreting the Bison Skull Pile at the Ravenscroft Late Paleoindian Bison Kill, Oklahoma Panhandle*

Bison crania without mandibles form a vertical cluster in the earliest of two arroyos at the ~10,400 year old Ravenscroft bison kill site in the Oklahoma panhandle. The skulls were stacked on the arroyo floor, eventually forcing subsequent kills to relocate to an adjacent arroyo. A combined total of five winter kill events have been documented in the two arroyos. Skulls representing four of five events, including at least one skull from a kill in the adjacent arroyo, populate the accumulation. Reasons for stacking the skulls are considered, including discard, deliberate stockpiling for future retrieval, persistent cairn building to commemorate multiple successful bison hunts, and "bison calling" to ensure future successes. Archaeological, ethnographical, and historical examples from around the world fuel the discussion.

Bemmann, Jan (University of Bonn)**[101]** *Cities in the Heartland of the Mongol Empire*

From 2016 to 2018 the two largest cities of the Mongol Empire, 13/14th century, in nowadays Mongolia were mapped using a SQUID-(Superconducting Quantum Interference Device)-magnetometer coupled with a DGPS. Thanks to this pioneering technique it was possible to create a high precision topographic and magnetic map in one go. For the first time it is possible not only to compare the maps of two cities – Karakorum the first capital of the Mongol Empire and Khar Khul Khan Balgas – but also to analyze the function of the city, its size, the density and size of buildings, the infrastructure (roads, fortification, gates, markets), the spatial organization of religious activities, the connection and dependence of the city from the moving court of the emperors, the social organization that means the question of different quarters, and not the least to deal with the question where the cemeteries are. Thanks to these new maps it is also possible to differentiate between four types of permanent settlements or settlements with permanent structures in contrast to campsites in Inner Asia.

Benavides, Oswaldo**[228]** *Discussant***Benden, Danielle (Driftless Pathways, LLC)****[89]** *A Career to Celebrate: The Achievements of S. Terry Childs and Her Impact on Archaeological Collections*

For many years, S. Terry Childs has led the charge on all things related to archaeological curation and collections management. With a keen focus, she has carried the torch on training and practice, shining a light on archaeological collections and the need for their long-term preservation. She has moved the needle on training for management and care of archaeological collections with her online course. She played an instrumental role in the passage and implementation of federal curation legislation, 36 CFR Part 79, the Curation of Federally-Owned and Administered Archaeological Collections and has worked tirelessly on the promulgation of the federal archaeological deaccessioning regulations. Furthermore, she regularly encourages colleagues to utilize collections for research, public education, and exhibition, and has long been an advocate for making collections accessible to various stakeholders, including descendant communities. She conducts her own collections-based research focused on metallographic and chemical analysis of iron and copper artifacts from Africa. Her life's work has done more for the care and management of archaeological collections than any other, and for that we honor her.

Bendrey, Robin (University of Edinburgh) and Guillaume Fournié (Royal Veterinary College)**[20]** *Cause and Effect: Human-Animal Relationships and Zoonotic Brucellosis in Long Term Perspective*

Zoonotic diseases remain a persistent global challenge, with some 60% of human pathogens of zoonotic origin. They disproportionately impact the world's most vulnerable populations, particularly those living in close proximity with their animals and who have less access to health information and care. Archaeology's cultural and biological datasets have the potential to provide long-term perspectives on change in the complex socio-ecological systems that define evolving disease ecologies. In this paper we consider zoonotic brucellosis in archaeological perspective, focussing on the relationships between humans and goats. Brucellosis likely emerged as a zoonosis with caprine

farming, yet evidence is elusive in the archaeological record. We explore the potential impact of goat domestication on brucellosis disease dynamics and human infection risk. Results are presented of a model developed to simulate the transmission of *Brucella melitensis* within early domestic goats in the Early Neolithic Zagros mountains. These show that the pathogen could have been sustained even at low levels of transmission within these populations and also inform on contributing cultural practices. We evaluate our results within the context of holistic 'One Health' views of the complexity of zoonoses and consider how archaeology can contribute long-term perspectives to the health impacts of current trajectories.

[25] *Tijeras Pueblo - Challenges and Opportunities of Managing a National Register Property within a US Forest Service Administrative Site*

The Sandia Ranger District administrative site has been in continuous use since the 1920s and is co-located with Tijeras Pueblo, a National Register historic property. The District office, only 20 minutes outside of Albuquerque, is one of the most heavily visited Ranger Stations in the Region. The history of development of the site and ease of access to Tijeras Pueblo present opportunities and pose challenges for the ongoing management of the administrative site and Tijeras Pueblo. Much of the Ranger Station's core infrastructure was put in place prior to current historic preservation regulations. As a result, ongoing maintenance of the Ranger Station is complicated by the presence of buried utility lines within the Pueblo's archaeological deposits. Ease of access and high visibility of the Pueblo contributed to its early recognition as a significant archaeological site resulting in a long record of research that continues to this day. This research history and associated public engagement has contributed to public and tribal partnerships ultimately yielding a strong interpretive program around the Pueblo. This paper will highlight these and other opportunities and challenges posed by the co-location of the administrative site and Tijeras Pueblo.

Benedict, Laura and Virginia Lucas (University of Nevada, Las Vegas)

[260] *Faunal Exploitation Practices of Prehistoric Peoples: A Comparative Study of Three Rockshelter Sites along the California Wash in Southern Nevada*

The archaeology of the California Wash in southern Nevada, north of Las Vegas, is not yet well understood, particularly when compared to contemporaneous occupations. Previous excavations at three sites located in the Dry Lake Range along the Wash resulted in the recovery of a number of artifacts, including lithics, ceramics, and faunal remains that enhance our understanding of Prehistoric and Protohistoric occupations of the California Wash. Excavations in the 1970s, in preparation for the construction of the Navajo-McCullough Transmission Line, yielded faunal remains from three rockshelter sites. Dates indicate a middle Pueblo II occupation at two sites, 26CK1081 and 26CK1112, as well as dates extending into the Paiute occupations. Early analyses indicate that these sites were likely used as processing areas for agave and yucca. In addition, 26CK1112, has a Late Archaic occupation. Analysis of extant collections, curated at the Las Vegas Natural History Museum's Southern Nevada Federal Repository, allows researchers to apply modern analytical methods to older data in order to gain a better understanding of past subsistence practices. This poster presents the results of our analysis, and discusses the implications for understanding Late Archaic and Puebloan occupations in southern Nevada.

[378] *Modeling Mobility in Inland Waters*

While rivers, lakes, lagoons, and estuaries were commonly navigated in prehistory, the only well-established methods for modeling aquatic human movement are restricted to the open sea. A small handful of researchers have proposed methods and/or attempted to simulate travel in rivers and lakes, but these methods have not been consolidated into a user-friendly, GIS-based format. This avenue of research is difficult since variables such as vessel type, mode of propulsion, assumed navigational skill, type of inland water body, surface current patterns or flow rates, wind patterns, and seasonality, among other factors, all need to be appropriately addressed in these simulations. Adapting the methods used for simulating intentional and drift maritime voyages and learning from past attempts at simulating navigation in rivers and lakes, I propose procedures that can be applied in standard GIS software to model human movement in inland waters. I demonstrate these procedures using case studies from my research in Southern Central America.

Benfer, Bob (University of Missouri-Columbia)

[181] *Astronomical Meanings in Hearths from the Middle Pre-ceramic Villages of Paloma and the Late Pre-ceramic Site of Buena Vista in Central, Coastal Perú*

Hearths from over 50 domestic structures at the stratified Middle Archaic fishing villages of Paloma, Chilca Valley, Peru, were found within circles of house poles. Domestic structures were burned and abandoned, sometimes with

an old male burned on top. Burials in the last occupation were placed with males towards the entrance, females towards the rear, and children in a line towards the Milky Way extreme. The entrance was towards the December solstice sunset. Two valleys north, in the Chillón, the Late Preceramic monumental site of Buena Vista had two ventilated hearths, one in a Mito Temple. The Mito offering chamber was finally filled with debris of a feast. Another ventilated hearth was too badly looted to make the determination of final use. The Mito Temple was associated with the rise of the Andean Fox constellation on the December solstice and equinox and shortly after twilight, with the rise of the sun over a rock carved into a human head. An alignment to the equinox was to a stone pillar carved into the shape of a condor. The structures containing the other ventilated shaft were oriented to the major lunar standstill, as was the principal pyramid containing the Fox Temple.

Benitez, Robert

[247] *The Coevolution of Niche Construction and Niche Adaptation in the Hominin Lineage: Toward Understanding Culture*

One of the most significant, yet understudied, subjects in paleoanthropology is the emergence of culture and its resulting transition from biological evolution to human-specific biocultural evolution. Scholarship on this topic has historically been lacking partly due to an absence of a coherent framework that incorporates biological (i.e., fossil) and cultural (i.e., archaeological) datasets. The extended evolutionary synthesis (EES)--with its emphasis on niche construction, developmental plasticity, and reciprocal causation--provides paleoanthropologists an opportunity for integrating the fossil and archaeological record. Here, we use EES as a preliminary interpretive structure for examining the origins of culture and biocultural evolution. Our approach is based on the conceptualization of biocultural evolution as dynamic feedback loops of niche construction and niche adaptation. We apply this concept to the Plio-Pleistocene record and demonstrate how different hominin niche construction behaviors (e.g., perturbation, relocation) create varying patterns of inheritance (e.g., cultural, ecological) and potentials for novel cultural and biological adaptations. The coevolution of hominin niche construction and niche adaptation also appears to intensify in its potency over evolutionary time, which may explain the adaptive success of our species. We close with a discussion of implications for our proposed research agenda.

[240] *Investigations of a Submerged Prehistoric Midden on Hjørnø, Denmark: Climate, Sea Level and Culture*

Shell middens, or shell-matrix deposits, occur in large numbers across the coastlines of the world from the mid-Holocene onwards, often forming substantial mounds, but they become smaller, rarer or absent as one goes back into earlier periods, suggesting a world-wide process of economic intensification. Since sea levels were generally lower during these earlier periods, a critical question is whether shell middens could have existed on now-submerged palaeoshorelines, and if so, whether they could have survived the potentially destructive impact of sea-level rise. Here we present results of a systematic investigation of a rare example of a known underwater shell midden at the Mesolithic site of Hjørnø in Denmark. In doing so, we offer a proof of concept that shell middens can survive submergence and can be detected. Our results provide encouragement to the search for submerged shell middens in other parts of the world and at greater depth, and a suite of methods for their investigation.

[171] *Paleostorms and Precolonial Societies: Hurricane Deposits in Inundated Archaeological Sites in Northwest Florida*

How people respond to their environment is an ongoing theme in archaeological research. However, it is not well understood how people in the past responded to rapid high energy events such as hurricanes and if planning for these events did or did not occur. To understand how hurricanes affected people in the past, we need to first be able to see hurricanes in the archaeological record. Multiple inundated archaeological sites in Northwest Florida contain Holocene deposits composed of interspersed sand and peat layers not seen in any earlier deposits. This poster looks at these sand layers through proxy evidence: microfossil, isotopic, and grain size analysis to determine if these sediments are marine sediments and therefore likely from a hurricane. These potential hurricane deposits are examined at two sites (Page-Ladson and Sloth Hole) and compared to regional paleostorm records to discuss site formation processes and human responses during the Holocene.

Bentley, R. Alexander (University of Tennessee)

[27] *Kinship and Migration in Prehistoric MSEA: Insights from Isotopic Analysis over the Years*

Kinship is an important but often under-researched aspect of the rise of complex societies. Whereas early

agricultural communities in Neolithic Europe and East Asia were patrilineal and patrilocal, the nature and impact of prehistoric kinship systems in Mainland Southeast Asia (MSEA) is becoming better understood. This paper will review over a decade of previous work isotopic work on Neolithic skeletons from Thailand and Vietnam that suggests the origins of complex societies in parts of MSEA might lie in matrilineal kinship systems. Isotopic evidence has suggested matrilocality among Neolithic to Iron Age skeletons at some, but not all, sampled sites in northeast Thailand. There is an exciting future ahead for multi-method investigations into prehistoric kinship and social differentiation in MSEA.

[378] *Putting a Man in the Machine: Experimental Archaeology and Computational Modeling*

In recent years, numerous studies have shown the importance of the links that existed between the various islands of the Caribbean archipelago in pre-Columbian times. The notion of connection has thus become the central paradigm of the approach of these island but not isolated societies. Thus, until now little addressed, the question of assessing the navigational capacities of these populations, which can be described as genuine maritime societies, has become central to their study and, in particular, to our understanding of their specific relationship to space. The first numerical simulation studies based on the study of drift phenomena did not or only slightly integrate the anthropogenic factor into their approach to the subject. The objective of this presentation will be to show how, both the evolution of our questions and the development of new types of simulations require us to take this factor into account more effectively. We will try in particular to show how the establishment of a dialogue between numerical modeling and experimental archaeology can only be extremely fruitful in this field.

[183] *Farmers and Late Holocene Climate Change on the Edge of the Qinghai Plateau*

In the late Holocene, a cooling and drying climate, greater intergroup contact, and increasing sociopolitical complexity prevailed across Eurasia. On the eastern edge of the Qinghai Plateau, at the edge of the East Asian summer monsoon zone, millet farming societies faced local, cyclical changes to moisture and vegetation between 3000 and 2000 BCE. This study examines human skeletal remains from three sites in the warm steppe zone around 2200 masl, to study the impact of the climate and social changes on human health and diet from the late Neolithic (2600-2000 BCE) to the middle Bronze Age (1500-1000 BCE). Changes in oral health are consistent with an increasingly diverse agropastoral subsistence system; osteoarthritis, frailty, and childhood growth disruptions remained constant; and non-specific markers of infection and childhood anemias declined. Biodistance analysis suggests that there was some population movement into the area from further north, though the populations in this study were still closely related. The flexibility of agropastoral food production, the introduction of new plant and animal species, and economic specialization at different altitudes could account for the apparent success of the people of the eastern Qinghai Plateau in adapting to late Holocene climate change.

[182] *Subsistence and Exchange in the Chincha Valley (Peru) Using Portable X-Ray Fluorescence Spectrometry*

The Chincha Valley was one of the most productive regions on the southern coast of Peru, yet little is known about the subsistence practices of the pre-Inca communities that existed in the inland valley of Chincha during the Late Intermediate Period (AD 1000-1476). The Chinchas formed a powerful socio-economic entity within the Chincha Kingdom in part of the southern region of Peru nearest to the Pacific Ocean. This research tests the hypothesis that individuals relied more heavily on a food-based exchange networking system with coastal rather than highland populations, using a portable X-ray fluorescence spectrometer to measure strontium, barium, calcium, and other elements in twenty-six human bones from four tombs in the Chincha Valley as a case study. Although the use of a non-destructive pXRF has become a very beneficial tool for the analysis of archaeological materials, relatively little has been done on human bone to elucidate subsistence practices, mainly due to limitations of surface analysis on potentially degraded and/or contaminated material. In addition, newly created bone standards are used to calibrate and enhance the validity and reliability of our data.

Berikashvili, David (International Archaeological Center of the University of Georgia)**[359]** *Samshvilde and the Medieval Kingdoms of Kartli*

Samshvilde, a settlement in southern Georgia, is a complex and multi-period archaeological site. The city occupies a strategic and impregnable location on a basalt cape flanked by the gorges of the Khrami and Chivchava rivers. This distinctive landscape position, combined with environmental conditions that include a mild climate and an abundance of natural resources, have attracted human occupation for millennia. Samshvilde and its surroundings may have been inhabited since the Neolithic era, but the urban complex dates mainly to the medieval period, under Armenian and then Georgian control, when it became the region's main fortress and political-economic centre. Proximity to the northern branch of the Silk Road further increased the site's importance. Samshvilde was therefore a place where various ethnic groups and cultures converged. Despite the site's importance and longevity, until recently there has been little concerted archaeological study of Samshvilde. In 2012 the Samshvilde Archaeological Expedition was initiated by the University of Georgia and has taken a multi-disciplinary approach to the site. Future expansion of the project is envisaged through cooperation between the University of Georgia and research institutions and individual specialists who will bring new perspectives to the study of the medieval occupation in the Armenian-Georgian border region.

[387] *Urban Planning and Access to Water in Pompeii*

The process of urbanization and urban planning plays an important role in understanding how people utilize their space to access resources. Pompeii's water system includes a combination of household water collection features, primarily cisterns. However, an aqueduct system was installed in the first century AD providing new access to water leading to a variety of water utilization strategies, including piped water for public and private use, long-term water storage, and even elaborate water displays amongst the wealthier citizens. Several houses were analyzed using GIS Distance Analysis to determine cost-effective pathways for lead pipes connecting the aqueduct and water tower systems to individual houses. In addition, this study also looked at how water was collected and accessed within properties by analyzing the spatial relationship between household water features and important domestic spaces.

Berquist, Stephen (University of Toronto) and Alexei Vranich (University of California, Berkeley)

[233] *The Terraced City*

Standing architecture is an important and impressive part of Inca Cusco, but comprises only a portion of the pre-Columbian built environment. Developing a sense of the grand plan of Cusco involves forgetting our fascination with the standing architecture and concentrating on recreating the three-dimensional form of the terraces that formed the surface of the city. The common representation of Cusco as a flat gridded city not only misrepresents the actual form of the capital, but also obscures its unique qualities. Harvesting the necessary data to form a three-dimensional model that accurately represents the topography and the genius of Inca planning and construction requires the use of aerial photography, historic maps and photographs, present (modern and colonial) building form and elevations, ground inspection of visible remains, and an understanding of basic construction methods of Inca terracing. In this format a series of large-scale basic urban design canons become evident and provided insight into the manner that the city was conceptualized and designed. Specifically, this research supports and expands on the historic claims that the capital was remade early in the imperial career of the Incas, and in that process certain elements of its pre-imperial form were preserved and transformed.

[369] *Ceremonial Depictions of Bighorn Sheep Anthropomorphs in the Jornada Mogollon Region*

The Jornada Mogollon region is known for its rich body of rock art. Researchers have suggested that elements such as cloud terraces, masks, goggle-eyed figures, and horned serpents are associated with ceremony. Although hundreds of bighorn sheep images exist in the regional rock art these figures are not usually mentioned except in a general inventory of frequently found motifs. Nonetheless, there are some unusual anthropomorphs with bighorn sheep headdresses that suggest a possible ceremonial use. These images appear mostly in the eastern Jornada Mogollon as delineated by Lehmer in 1948. Other highly stylized bighorn sheep images as well as artifacts and a few examples of bighorn sheep on Mimbres pottery contribute to the evidence that bighorn sheep also had ceremonial use.

[413] *The Landscapes of the Cottonwood Springs Pueblo, Southern New Mexico*

LA 175 (Cottonwood Spring Pueblo, A.D. 1000-1450) is one of the largest multi-component settlements associated with Cottonwood Draw on the west side of the San Andres Mountains in southern New Mexico. It has been the site of multiple field excavations by New Mexico State University anthropology students. The pueblo complex consists of multiple pueblos, artifact concentrations, and agricultural features that straddles a prehistoric cultural boundary between the Mimbres Branch of the Mogollon Culture on the west and the Jornada Mogollon Branch to the east and south. The Cottonwood complex provides an opportunity to look at how and why a series of population aggregations and abandonments occurred. The site and surrounding areas are made up of basin and range transitions to more rugged mountainous terrain. With this terrain are both physical and ideational landscapes, including extensive rock art images. Given the complexity of the archaeological record and the extensive use of the entire Jornada Basin, the question addressed in this paper is why and how does LA 175 fit into the larger physical and ideational landscapes of the western San Andres mountains.

[32] *Late Pleistocene Archaeofauna from the Kasitu Valley of Northern Malawi: Palaeoenvironments and Evolution of Faunal Communities in the Zambezi Ecozone*

The Zambezi Ecozone of east-central Africa comprises faunal communities that include elements from both southern and eastern Africa. The region has long served as an important crossroads for faunal exchange, but its timing and implications for hunter-gatherer behavior are unknown. Late Pleistocene faunal assemblages from east-central Africa are rare, and none have been reported from Malawi, which occupies a key position between north and south. Here, we report the oldest archaeofaunal assemblages from Malawi, recovered by the Malawi Ancient Lifeways and Peoples Project in 2016 – 2018. These assemblages from the rock shelter sites of Hora 1 and Mazinga 1 span the Late Pleistocene (>30 ka) and Early Holocene (~8 ka), providing a rare opportunity to examine the evolution of faunal communities across the transition from the last glacial. We discuss the taxonomic composition of the Pleistocene assemblages relative to modern and Early Holocene occurrences. Zooarchaeological findings are complemented by light isotope analyses of land snail shell, ostrich eggshell, and mammal teeth for paleoenvironmental reconstruction, and strontium isotope ratios for spatial provenience. This work represents the first step towards a better understanding of the region's biogeography, which provides an essential framework for investigating the behavioral adaptations of Stone Age foragers.

[197] *The Oaxacan Cuisine at Achiutla during the Early Colonial Period: A Story of Resilience*

Using paleoethnobotany, this paper examines the Mixtecs' reaction to the arrival of Spanish at Achiutla, located in the Mixteca Alta. Faced with many challenges during the Early Colonial Period (1521–1600 AD), we examine how Mixtecs' inhabitants of Achiutla negotiated the arrival of new, introduced foods in the region. To do so, we compare the plant consumption at two residential terraces occupied during the Postclassic (900–1521 AD) and Early Colonial periods. The plants were identified following an analysis of macrobotanical samples (carbonized seeds) collected from soil samples and microbotanical samples (phytoliths and starch grains) obtained from unwashed artifacts. Although Spanish colonialism fostered considerable upheaval in many aspects of daily practice, our data indicate few if any changes in indigenous foodways at Achiutla immediately following the conquest. This pattern is particularly striking given that evidence shows that Mixtec families here adopted many other items of foreign material culture, suggesting that practices related to food consumption might have been some of the most enduring or resilient aspects of domestic life, perhaps reinforcing ideas of cultural identity.

Besser, Alexi (Department of Biology, University of New Mexico), Emma Elliott Smith (Department of Biology, University of New Mexico), Jonathan Dombrosky (Department of Anthropology, University of New Mexico), Thomas Turner (Department of Biology, University of New Mexico) and Seth Newsome (Department of Biology, University of New Mexico)

[174] *A Southwestern Producer Essential Amino Acid d13C Library: Potential Archaeological Applications*

Well-defined patterns in essential amino acid (AAESS) d13C values of autotrophs (plants and protists) and heterotrophs (bacteria and fungi) that can synthesize AAESS de novo provide enhanced discriminatory power to trace energy flow through freshwater and adjacent terrestrial foodwebs. This method may be useful for studying the impacts of (pre)historic human activities on aridland rivers like the Middle Rio Grande (MRG) in New Mexico, USA. However, no study has generated a library of producer AAESS d13C patterns in either freshwater or terrestrial ecosystems at the landscape scale. We generated AAESS d13C patterns for 15 producer taxa, including instream

algae and riparian trees from the MRG and C3 forbs/shrubs, C4 grasses, and CAM plants from the northern Chihuahuan Desert, New Mexico (n = 120). This AAESS d13C library will be invaluable for characterizing the nature and timing of key ecological shifts throughout the millennial-scale history of human occupation along the MRG. Pilot AAESS d13C data show that a diverse fish assemblage recovered from prehispanic Ancestral Pueblo sites in the MRG derived a substantial portion of their AAESS from C4 plants, which suggests that terrestrial energy inputs into riverine food webs was higher in the prehistoric MRG relative to today.

[80] *Zooarchaeological Investigations at the Boarding School Site (24GL0302), Glacier County, MT*

This paper presents an analysis of the faunal assemblage recovered from excavations at the Cut Bank Creek Boarding School Site (24GL0302), located on the Blackfeet Indian Reservation in Glacier County, MT. Excavations at the site took place following the inadvertent discovery of a large bone bed initially unearthed by the construction of the foundation for a new school being built by the Tribe on the site. The assemblage represents contexts associated with both the adjacent Late Precontact period bison kill site first excavated by Thomas Kehoe in the 1950s and the historic occupation of the site during its use as a boarding school for Blackfeet children during the first half of the 20th century. Through these remains, this paper provides new insight into both the Precontact and historical role this continually used landscape played in the lives of the Blackfeet people.

[357] *Discovering Buried Pasts: Illinois Transportation Archaeology and the Rediscovery of America's First Native City*

Archaeology and transportation share a 60-year partnership in Illinois during which large-scale approaches to data recovery have become standard practices. These practices were recently employed to expose 28.5 acres of a precolumbian mound complex that is an integral part of Greater Cahokia. Investigations at East St Louis were undertaken as part of the construction of the Stan Musial Veterans Memorial Bridge linking the cities of St. Louis and East St. Louis. Excavations exposed 4% of the mound center revealing 1,501 domestic and elite buildings, the base of an unrecorded mound, plazas, monumental posts, and several thousand pit features as well as a late Victorian neighborhood buried under 1 to 3 meters of modern industrial rubble. This research demonstrated the urban composition of Greater Cahokia and won recognition from both the Federal Highway Administration and the Chinese Academy of Sciences noting it was one of the top 10 international discoveries of 2015.

Bews, Elizabeth

[42] *Cooperation, Co-funding, and Confusion: EU Funding for Bulgarian Archaeology*

In the post-Brexit era, the impact of EU policies and funding on archaeological and cultural heritage projects has come under renewed scrutiny by those in both the public and private sectors. Academic and commercial institutions alike are now questioning the influence that membership in the EU, and its corresponding funding, has on the ways in which archaeology and heritage are practiced in member states. Using ethnographic data gathered in Bulgaria and at the EU headquarters in Brussels, this paper examines the relationship between EU funding and Bulgarian archaeological practice. Bulgaria is a suitable case study for assessing EU heritage practices because it recently marked ten years of membership in the Union, and therefore sufficient time has passed for funding to impact practice. Specifically, this paper focuses on Bulgarian archaeologists' participation, or lack thereof, in EU-funded archaeological and heritage programs. I demonstrate that while there is a mutual entanglement between the EU and Bulgarian heritage practitioners, there is also considerable friction in how they interact with each other.

Beyin, Amanuel (University of Louisville)**[32]** *Revealing Hominin Occupation of the Western Margin of the Red Sea Basin: Recent Progress*

The western periphery of the Red Sea (WPRS) occupies a pivotal location as a potential biogeographic corridor for hominin movement between Africa and Southwest Asia. Its long, coastal niche that once extended into the Danakil Depression would have made the WPRS a natural destination for hominins dispersing from the interior East African landscapes. From there, some populations would have launched a northward coast-wise dispersal up to the Levant. Unfortunately, the immediate peripheries of the basin, especially the African side had seen little prior Paleolithic research, hindering well informed assessment of its contribution to hominin survival and dispersal. This paper will discuss recent progress made in revealing the Paleolithic potential of the WPRS by presenting results of field investigations recently carried out on the Red Sea coast of Eritrea and the Sudan. These recent projects have recorded sites spanning the Acheulean up to the Later Stone Age cultural phases. Paleolithic data from the Eritrean and Sudanese coastal regions has direct relevance for clarifying the potential role of the WPRS as a viable ecological niche and dispersal corridor for Pleistocene hominins.

Bhattacharyya, Tiyas (University of Oregon), Alison K. Carter (University of Oregon), Miriam Stark (University of Hawaii) and Sophorn Kim (Ministry of Culture and Fine Arts, Battambang)**[300]** *Angkor from the Outside In: Household Archaeology in Battambang, Cambodia*

The exploration of residential spaces through the study of household archaeology helps create a better understanding of society from multiple perspectives. Previous work on Angkorian households has focused on sites that were within the capital. There has been a record of archaeological occupation within Battambang Province from the early Holocene. Battambang is also currently a major rice producing area within Cambodia, making its agricultural contributions a point of interest when studying this region's past relationship with the Angkorian heartland. Our fieldwork was centered around the 11th century temple of Prasat Basaet and focused on understanding the nature and timing of occupation in this area. Household archaeology within Battambang provides an opportunity to study how distance from the Angkorian capital may have affected how people lived. This paper presents the preliminary results from the excavation, provide a comparison to earlier work, and explore prospective research opportunities.

Humans are distinct in their ability to transfer information between individuals with remarkable fidelity. Although this feature defines our lineage, the antiquity of this distinction is not well known. This is due to difficulties in deciphering levels of information transfer in Paleolithic assemblages. Recently, several new techniques were developed to investigate this phenomenon in stone artifact assemblages. These methods take account of the nuanced details of how artifact manufacture is learned. One such method is the "Behavioral Approach to Cultural Transmission". This method has been widely applied because of its ability to measure aspects of information transfer in a variety of contexts. Despite its widespread use, we know very little about how features of raw material may influence the variables used in this method. Here we investigate patterns of information transfer in controlled knapping experiments. We conduct mechanical tests of raw materials to understand how and why different raw material properties influence the variables used to determine information transfer. In particular, aspects of the platform maintenance domain are sensitive to differences in raw material hardness and elasticity. A detailed understanding of

the impact of raw material properties will allow a broader application of this approach to various assemblages.

[369] *A Keelboat Petroglyph in the Northern Bighorn Basin of Wyoming*

Wyoming's Big Horn Basin is one of the areas where Dr. Larry Loendorf has worked for years. This paper talks about a new rock art site in north-central portion of the Big Horn Basin. In 2015 two ranch women Lynette Kelley Cook and Phyllis Preator contacted the author about rock art in the northern Bighorn Basin, particularly any boat petroglyphs. They took the author to the recently discovered site in early 2016. This is the only known petroglyph that depicts a Rocky Mountain Fur Trade keelboat. The author first published this discovery in the 2018 issue of the Rocky Mountain Fur Trade Journal. This paper discusses the discovery of the site, background of other boat drawings in the Upper Missouri River area, the early use of keelboats, and the rock art at the site.

[215] *Comics, Colonialism, & Pseudoarchaeology: The Case of "La Crane de Mkwawa"*

Archaeologists are frequently represented in comic books as caricatures, where adventure and profit are exaggerated and the interpretation of finds is oversimplified. In this paper it is argued that these misrepresentations of how and why we do archaeology directly reinforce pseudoscientific explanations of the past, as well as contribute to the ongoing colonialism of indigenous peoples by exoticizing their identities and denying their voices. The narratives and places focused on in these pseudoarchaeological comics also emphasize the colonial heritage and contemporary practices of our discipline. This argument is primarily examined in relation to the author's own work on the historical, colonial narratives of Hehe Chief Mkwawa from the Iringa Region, Tanzania - a narrative that has local and national significance which has also been retold in comic book form. Additional comic texts are presented as examples of how this medium of science communication can be effectively and ethically utilized.

[53] *A Mid-16th to Mid-20th Century Glass Bead Sequence for South America*

Glass trade beads recovered during excavations by Smithsonian archaeologists Betty Meggers and Clifford Evans in Brazil, Guyana, and Ecuador can be readily placed in time using bead chronology studies developed in North America. The bead assemblages from their South America excavations date to multiple time periods, including the mid-16th, early-17th, mid-18th, mid-19th, and the mid-20th centuries. Nearly every one of the South American bead varieties are present in North America with the exception of 16th century transparent green donut-shaped beads that appear to have been made by piercing a globule of hot glass. Meggers' and Evans' excavations are used to establish a glass bead sequence for South America.

[54] *Big Data, Big Challenges: The Preliminary Results of the Moche Valley Ancient Settlement Survey (MVASS) on the North Coast of Peru*

We present the preliminary results of the Moche Valley Ancient Settlement Survey. MVASS involves systematic recording of all known prehistoric sites in the Moche Valley (2,708 km²) and creation of an open-access GIS environmental and archaeological database. The project involves archival research, drone mapping of key sites, and additional pedestrian survey. To date, we have created a GIS database with information on more than 1,200 sites. The data set includes sites recorded during the Harvard Chan Chan-Moche Valley Project as well as subsequent surveys of the middle and upper Moche Valley. In addition, we completed three seasons of drone-mapping and extended pedestrian survey into the highlands. Our goal is to understand the social history of the Moche Valley across the long span of the prehistoric era.

[416] *Genetic Species Identification of Large Birds from the Dadiwan Neolithic Site in Northern China*

We present information and insight drawn from the Neolithic of northern China (ca. 8,000 – 5,000 BP) about the manner by which large, meaty birds (including potential precursors of the domestic chicken) were drawn into the human biome. Long before they were essential staples, they (along with a range of different, but similar birds) were an occasional, and strategic feature of low-level agricultural life, itself marked by cyclical variations in the relative importance of domestic taxa. Here we analyze ancient DNA to identify the species of eight bird samples from the Neolithic components of the Dadiwan site. DNA was well preserved in each, with six of the samples yielding mitochondrial DNA sequences indicating they were of the common pheasant (*Phasianus colchicus*). Further genetic differentiation of four of these specimens indicates them to be one of three subspecies: *Phasianus colchicus pallasi*, *Phasianus colchicus strauschi*, or *Phasianus colchicus alaschanicus*. Importantly, no chickens were identified.

Binning, Jeanne (California Department of Transportation)

[67] *Identifying Pressure Flakes Generated during the Reduction of Small Bifaces: The Results of a Blind Test*

Frequently, in the reported results of the analysis of flaked-stone artifact assemblages, pressure flakes, ostensibly from small bifaces (arrow points, dart points, and knives), are distinguished. This category of debitage is difficult to identify unless the knapper who created the pressure flakes used the Ishi pressure method (this approach creates a distinctive morphology) or the analyst identifying the pressure flakes used fractography to make the determination. Specific morphological attributes that have been used to distinguish pressure flakes from other debitage categories are also found on small, percussion-created flakes. To better understand what attributes would permit the recognition of pressure flakes, a blind test was conducted. Three lithic analysts were each provided with 20 flakes to evaluate (n=60). Some of the flakes provided were created via percussion reduction and some were created via pressure flaking with an antler-tipped pressure tool. Each analyst was asked to determine which of the 20 flakes resulted from pressure removal and which did not. The implications of the results of this experiment are discussed.

[73] *Major Implications of the Dating Iroquoia Project: Rethinking Coalescence, Conflict, and Early European Influences in the Lower Great Lakes Region*

This paper details the preliminary results of the Dating Iroquoia project and reviews some of the most significant implications of our revised radiocarbon chronology as they relate to current understandings of Iroquoian cultural development. First, a brief review of traditional approaches to chronology-building in Northern Iroquoia and associated temporal schema are outlined. Next, the results of our dating program are presented and timeframes for key sites and site sequences summarized in the context of how our new chronology serves to reframe existing understandings of Iroquoian archaeological history. The major component of these findings includes a shift in the

timing of coalescence and conflict from the mid-fifteenth century to the early-to-mid sixteenth century. These results have significant implications for understanding the directionality of conflict, understandings of "traditional" enmity between the Huron-Wendat and Haudenosaunee, factors contributing to confederacy formation. Major insights also stem from identifying how community-level events diverge from regional culture-historical schema, including the timing and processes through which European goods appear in certain site sequences. The conclusions outline directions forward for the project and future research plans.

Bird, Ashlee (University of California, Davis)

[14] *Synthetic Spaces and Indigenous Identity: Decolonizing Video Games and Reclaiming Representation*

In her essay "Tradition and Performance", Stephanie Nohelani Teves details the importance of living Hawaiian tradition and identity, embodied by Kanaka Maoli performers. These performers preserve, shape, and embody indigenous tradition and knowledge, as well as personify what it means to be indigenous in Hawaii in that particular cultural moment. The topic of the survivance of tradition and indigeneity through the vessel of a synthetic indigenous identity is the topic that will be explored in this paper. Branching from the discussion of Tanya Tagaq's creation of a synthetic indigenous self through her music, this presentation will discuss the creation of alternate forms of indigenous synthetic selves through native produced and developed video games such as *Never Alone (Kisima Ingitchuna)*, as well as the work I have done with ROM Hacking *Super Mario Bros.* and my own game design, and their importance to the furthering and shaping of synthetic tradition. This presentation will demonstrate that indigenous identity cannot only be created through games, but entire worlds and teachings surrounding community, collective knowledge and oral tradition, and indigenous ways of knowing can be created within this digital medium, and thus embodied by the player.

Bird, Broxton [348] see Wilson, Jeremy

Bird, Darcy (Utah State University) and Jacob Freeman (Utah State University)

[248] *Managing the Current Mass Extinction for Human Populations*

Recent analyses of large sample of radiocarbon ages illustrate the potential of these records to investigate general problems in human ecology. While much of the current literature focuses on the relationship between local ecology shifts and population booms or busts, no one has yet to address the general ecological problem of stability. Stability measures the severity of booms and busts in a population/system over time. We propose plant and animal species richness affects the stability of human population systems. Human population stability is necessary for sustained economic and socio-political growth. We propose a model that describes the effects of species richness on the long-term stability of human societies, controlling for other ecologically relevant variables. We will evaluate this model on a regional US and Canada scale and on a global scale. In this way, we can then analyze human population stability in North America within the context of global population stability.

Birge, Adam (University of Texas at San Antonio)

[345] *The Materiality of Movement and Rhythm in Sajama, Bolivia*

Movement and the rhythm of life, from procuring food to trade and ritual, are major structuring forces of human lives. However, examining these practices archaeologically can prove difficult due to the minimal and/or short lived evidence of routes. The Sajama landscape of the Carangas provides an example of these difficulties, but also how it may inform topics of identity, memory, space, and power. In the past, movement through llama caravans and ritual processions patterned the landscape through pukaras, villages, rest areas, and other features. This movement in Sajama is examined through settlement patterns, construction of outlying features, place memory, the continued use of routes, and the importation of goods. In movement, the Carangas negotiated colonial encounters with the Inka and Spanish empires through the reuse of place and the creation of new spaces that impacted Inka and Spanish colonial projects in the region. Today movement still impacts practice through identity and tourism.

Birkett, Courtney (Fort Eustis Cultural Resources Program)

[169] *From the Unknown to the Known: Reexamination of a Small Prehistoric Site in Southeastern Virginia*

Fort Eustis, a small military installation in southeastern Virginia, has over one hundred sites containing prehistoric components, most of which yielded no diagnostic artifacts when identified at the survey level. These sites were subsequently labeled as camps of indeterminate time period and assumed to have little research potential. Reinvestigation of one of these supposedly insignificant sites yielded a large quantity of debitage, along with ceramic sherds, concentrated within a very small area. This unexpectedly productive site lets us refine our understanding of what activities were undertaken in small temporary camps and of how the landscape was used during the Woodland period. The results of this excavation also demonstrate that the information potential of a site may not be exhausted by a few shovel test pits.

Birkmann, Joseph (University of New Mexico), Christopher Merriman (University of New Mexico) and Nicholas Hlatky (International Archaeological Research Institute)

[124] *Late Archaic (San Pedro Phase) Occupation in Niagara Canyon, Chiricahua National Monument: Results of the 2017 UNM/NPS Excavations*

In the summer of 2017 a joint crew of UNM/NPS researchers undertook test excavations at two Late Archaic loci within Niagara Canyon, a small watershed in the northwestern corner of Chiricahua National Monument. Located 0.6

kilometers from one another, both sites (CHIR00032 and CHIR00040) have yielded an impressive array of San Pedro phase lithic artifacts. The San Pedro phase dated between 3200 and 2500 b.p. is associated with some of the earliest farming communities in Southern Arizona and has been the subject of several major CRM investigations within the greater Tucson area. While our sample of San Pedro village localities has grown substantially over the past two decades, our sample of smaller foraging and hunting camps utilized during this period remains small. Sitting along the margins of the Chiricahua uplands and lacking any evidence for maize agriculture, both CHIR00032 and CHIR00040 represent likely foraging/hunting camps, providing valuable new data on upland land-use and farmer - forager lifeways during this period. This poster provides a brief introduction to the site as well as a summary of the results of the 2017 investigations.

Bischoff, Robert (Arizona State University)

[313] *San Juan Red Ware Distribution Patterns and Social Networks in Southeastern Utah*

San Juan Red Ware was produced primarily in southeastern Utah beginning around AD 750, and these vessels were traded throughout the Four Corners region of the U.S. Southwest. Its distribution in southeastern Utah demonstrates intriguing patterns of consumption, as some areas within the production zone of this ware either did not participate in red ware exchange or only participated in limited exchange. Prior studies indicate this ware is closely connected to identity and was likely introduced to the region by migrants to the area. This paper examines both the distribution patterns of San Juan Red Ware and the social networks of southeastern Utah to investigate patterns of exchange in this area involving this ware. This analysis highlights the diversity apparent in the region and demonstrates the complexity of social networks found therein.

Bishop, Andrew [128] see Harris, Jacob

Bishop, Anna

[146] *Preliminary Results from La Luna: A Late Classic Residential Group at El Zotz*

This paper will discuss the preliminary results of excavations at La Luna, a residential group outside of the El Zotz core. Initial investigations from this Late Classic complex yielded a large volume of high-quality polychrome sherds and prestige items that are inconsistent with the simple architecture of the group. The source of these materials and the processes involved in their deposition are considered here through the analysis of ceramics from both a midden and architectural fill. Stylistic, glyphic, and modal attributes are combined with observations about sherd preservation to shed light on how the population at La Luna used these materials, and how the prestige items affected the social status of this community.

Bishop, Caitlin (California State University, Chico) and Katherine Jorgensen (California State University, Chico)

[116] *Shattered: Conducting Experimental Archaeology to Better Diagnose Contact Period Lithics*

Contact period studies tend to focus on the interactions between indigenous peoples and non-native peoples and the commerce produced from said interactions. As such, a plethora of information can be gleaned from the study of tools and materials procured during this time period with a focus on changes in tool form or material choice, if any. As a result of these encounters, lithic substitutes made of glass, ceramic, and metal have emerged within the archaeological record. Is the material substitution a result of reduced access to traditional lithic sources or do these alternate materials prove as, or more, efficient than stone? This experimental study will explore the fracture mechanic properties of glass and ceramic compared to that of lithics to determine the efficiency, success, and resiliency of these lithic artifacts and those who created them. The results of this study will provide further insight into how the relationship between Euro-American expansion and Native populations transformed lithic technology.

Bishop, Katelyn (University of California, Los Angeles)

[260] *Birds in Ritual Practice and Ceremonial Organization in Chaco Canyon, New Mexico*

Birds have remained one of the most symbolically valued animals in human cultures, from prehistoric past to ethnographic present, and across the globe. Especially in the North American Southwest, whole birds and their parts have been an integral part of Pueblo ceremonial life for centuries. Their ritual and symbolic value has been demonstrated both archaeologically and ethnographically, where birds have been ritually interred and their feathers and claws used in the manufacture of ceremonial paraphernalia. This poster explores the use of birds in Pueblo II period (AD 900-1150) Chaco Canyon, New Mexico. Seven museum collections from across the country were examined to produce a single dataset that presents all avifaunal remains recovered from multiple excavations conducted over the last 120 years in Chaco Canyon. Preliminary results are presented from this research, which also includes the analysis of objects of bird imagery, such as effigy vessels, figurines, and painted designs. Results not only speak to the use of birds in Pueblo II period Chaco Canyon and the nature of ritual practice and ceremonial organization, but also demonstrate the value of (re)examining museum collections from historic excavations, and uniting multiple collections into synthetic databases that focus on one material type.

Bishop, Ronald L. (Smithsonian Institution)**[191]** *Fred Lange: Archaeologist-Collaborator*

From his early work at Bandelier National Monument in 1959, research in Wisconsin, Southern Illinois, Colorado, California, Barbados, and especially Costa Rica and Nicaragua, Fred Lange has left an unmistakable mark of professionalism on the archaeological record. And, he has done it with numerable field-based teaching opportunities and through extensive collaborations. The latter, especially, are not easy to maintain over several decades. In this presentation I look back on four decades of my collaboration with Fred, drawing attention to overarching characteristics of his involvement and attempting to ignore some events best forgotten. During almost 60 years he has achieved a stunning career dedicated to enhancement of archaeological knowledge and promotion of public awareness of archaeological research.

Bishop, Ronald L. [349] see Rich, Michelle

Bisson, Michael (McGill University)**[399]** *Tool Fragments from the Late Lower Paleolithic of Tabun Cave, Israel*

The Acheulo-Yabrudian (A-Y) is the final manifestation of the Lower Paleolithic of the Levant. This paper reports on numerous A-Y tool fragments discovered among the small finds collected during the Jelinek excavation of Tabun Cave, Israel. Tabun is the longest stratified Paleolithic sequence in the Eastern Mediterranean and includes all three facies of the A-Y. As expected, tool fragments from the Yabrudian facies were broken scrapers and spalls from scraper edges that renewed the scraper with a single oblique blow. The Amudian facies included fragments of utilized and backed blades. Acheulean facies produced biface tips created by end-shock during manufacture or resharpening, deliberate tip removal to renew the edge of the tool, and breakage during use of the handaxe as a wedge. Microwear on tool edges is described. The implications of that wear for activities carried out at the site and for taphonomic conditions in the Tabun deposits are discussed.

Bisulca, Christina (Detroit Institute of Arts), Marilen Pool (Arizona State Museum) and Nancy Odegaard (Arizona State Museum)**[41]** *Indigenous Use of Mesquite Exudates in Arizona*

The mesquite tree (*Prosopis* spp.), endemic to the desert regions of the American Southwest, has been utilized by indigenous peoples for centuries. The anthropological literature often cites the use of the mesquite gum in the material culture of the O'odham as a paint, adhesive and dye, and also notes its medicinal applications. Most described is the use of mesquite gum as a black paint on red wares. However, mesquite trees actually produce two chemically distinct exudates: a polysaccharide gum and a polyphenolic termed a "kino". In this study raw materials and artifacts in collections were analyzed, including mesquite "gum" collected by Frank Russell (1868-1903), an anthropologist who did fieldwork in Gila River. Results show that in most instances it is the kino, not the gum, that is used in material culture. This talk will cover the difference in chemistry and physical properties of these exudates, and discuss their uses in light of historic descriptions. Based on these accounts, it is evident the O'odham distinguished between these two exudates and used them selectively.

Bitencourt Mañas, Diego (University of São Paulo, Department of Ecology, LAAAE), Bruno Trípode Bartaquini (University of São Paulo, Museum of Archeology), Rui Sérgio Sereni Murrieta (University of São Paulo, Biosciences Institute), Marcia Maria Arcuri Suñer (University of São Paulo, Museum of Archeology) and Ignacio Alva Meneses (The Museum of the Royal Tombs of Sipan, LAAAE)**[46]** *Thinking about Ecotopes: Two Thousand Years of Landscape's Continuities and Discontinuities in the North Coast of the Central Andes*

This work seeks to analyze the continuities and discontinuities on the landscapes occupied by ancient Moche (an archaeological culture which flourished on the north coast of the central Andes between the first and eighth centuries) and contemporary populations. We intend to refine the discussion about the effectiveness and limitations of the ecotopes concept – considered by Ethnoecology as "minimum landscape unit" or "type of place". About 230 Moche fine-line ceramic vases – selected from the collections held by the Larco Herrera Museum (Peru) and the Ethnological Museum of Berlin (Germany) – were analyzed. In addition, we carried out ethnographic research among the living populations in the district of Mórrope (Lambayeque). This included interviews, ecological participative mapping and guided tours. Our results point to four main types of landscapes in ceramic iconography: green hills, dry forests, deserts, and flooded zones. The use of plants as ecological markers proved to be very efficient, especially for the green hills portrayed in the vessels. The most important ecotopes are still identified by the local population and, in some cases, with high degree of details and confidence. However, all the ancient rite practices portrayed on the vases have disappeared.

Biwer, Matthew [356] see Melton, Mallory

Biwer, Matthew (University of California, Santa Barbara)**[356]** *An Analysis of Botanical Remains from the Site of Quilcapampa*

This paper presents the results of the recovery and identification of plant remains from the site of Quilcapampa La Antigua. Located in the Department of Arequipa, Peru, Quilcapampa provides evidence of cultural material associated with the Wari Empire (AD 600-1000). This presentation focuses on the plant remains recovered from the 2015-2016 excavations. The well-preserved botanical remains from Quilcapampa provide a wealth of information, including local food production strategies and spatial organization of the processing, cooking, and discard of plant resources. My analysis of foodways at Quilcapampa provides context for plant-based activities at the site. Finally, I provide a brief discussion on how the plant remains situate Quilcapampa in relation to other Wari sites in the south-central Peruvian Andes.

Blaber, Thomas

[46] '77 to '17: *Re-investigating the Perimeter of St. Catherines Island after Four Decades*

In 1977 Drs. Chester DePratter and David Hurst Thomas began a complete perimeter survey of St. Catherines Island. In their initial survey they identified more than 100 new archaeological sites that were either visible on the surface or eroding out of the bank of the island. Many of these sites were not investigated again until January 2017 when archaeologists from the American Museum of Natural History began an 18-month systematic survey that followed and expanded upon the original 1977 survey. This poster will show the objectives, methodology and initial findings of this investigation.

[286] *Pre-Inca to Inca Demographic Shifts in the South Central Andes Using Stature Estimation*

During times of social upheaval, such as the implementation of new imperial rule, major demographic changes can occur in populations. One osteological aspect that can be scored are changes in stature through time due to new stressors, inequalities, immigrations or migrations, and/or other such phenomena. This study aims to discover if there were major demographic shifts in stature for communities in the Andahuaylas region of the southcentral Andes dated between the Late Intermediate Period (LIP, AD 1000-1400) and Late Horizon (LH, AD 1400-1532). During the LIP, the Chanka cultural group were the prominent population, but then the Inca expanded into the region during the LH. The LIP sample population consists of Chanka individuals at the site of Cachi (n=37). The stature variation of the Chanka at Cachi will be compared to the newly excavated individuals at the complex site of Sondor (n=11), which has evidence of both LIP Chanka and LH Inca occupations. Using the Chanka at Cachi as a baseline, this project is the first step in understanding what happened to the local culture of the Chanka at Sondor and how the Inca influenced them.

[421] *Illicit Landscapes and Illegal Economies in 19th Century Southern Belize*

This paper examines how peripheral landscapes, along the coast and cayes of Southern Belize, shaped the region's early colonial period (AD 1544-1840). Specifically, who were the people who settled southern Belize and how did the economies and industries that formed around them critically impact both Spanish and British colonial projects, particularly in their forms of resistance both overt and covert? Deemed "off-limits" by the colonial powers, the southern Belize wilderness provided protection and refuge for a wide array of Spanish and British colonists, pirates, runaway slaves, and indigenous Maya. Although archaeologists have long dealt with evidence of smuggling and piracy, these have been treated as unimportant or subordinate to the processes of colonization. As Hartnett and Dawdy (2013) note, ignoring their role in state-making is nonsensical. While peripheral landscapes were often precarious and violent, these spaces provided at least a temporary refuge for those fleeing the state. Research conducted as part of the Southern Belize Historical Archaeology Project focuses on the identification and recovery of archaeological sites associated with the early Colonial period as well as documenting how these illicit landscapes were integral in the formation, maintenance and construction of divergent economies and new ways of life.

[277] *Changing Stone Tool Technologies during the Middle Pleistocene at Amanzi Springs, Eastern Cape, South Africa*

The Acheulian site of Amanzi Springs, first excavated by Ray Inskeep and Hilary Deacon in the 1960's, has featured prominently in syntheses of the Earlier Stone Age in the Eastern Cape Province of South Africa. The site is comprised of eleven spring eyes and the unique depositional contexts and ground-water chemistry at Amanzi Springs have preserved botanical remains in association with stratified artefact accumulations. Originally assigned to the late Acheulian based on artefact typology, the absence of an absolute chronology for Amanzi Springs has limited its potential contribution to our understanding of spatial and temporal patterns of hominin occupation and technological organisation in this region during the Middle Pleistocene. Here we report on recent excavations at a newly discovered spring eye at Amanzi Springs, referred to as Area 7, which contains a stratified sequence of Earlier to Middle Stone Age artefacts, associated with preserved wood and macrofossil remains. Work at this new locality at Amanzi Springs aims to develop a robust, high-resolution chronology, providing an opportunity to examine technological change in an open-air context during a time period that is not well documented in the southern regions of South Africa.

[271] *Reconstructing the Ostra Collecting Site Using Virtual Reality*

Virtual reality (VR) provides a powerful platform to disseminate, showcase and protect archaeological research; it is a relatively inexpensive tool that can be applied to the discipline of archaeology by offering a new way to analyze and visualize archaeological sites as they once were. VR can immerse the user in the simulated environment, allow them to walk around, pick up and move objects, and experience the stratigraphic layout of the site as a whole rather than as individual units. As part of an ongoing project, a phase one initiative was carried out to collect data from the field in northern Peru in the form of aerial and ground-level images. These data, along with radiocarbon and OSL dating techniques and paleogeographic reconstruction, will be used to create a virtually simulated reconstructed environment of the mid-Holocene Ostra Collecting Site when it was in use. This VR simulation will help answer questions about site logistics and possibly military tactics.

[87] *Podcasting and Two-Eyed Seeing: Digital Practice, Community Engagement, and Reconciliation in Archaeological Discourse*

Community or public archaeology has been the focus of professional effort and academic examination for decades. Most of this has a goal of creating public value, and takes the form of 'outreach' from a presumed disciplinary core, potentially downplaying conflict within the discipline. It is also a vehicle for engagement, and more recently, a means for drawing descendant communities into archaeological fieldwork. While recently many projects have extended public understanding beyond fieldwork, lay interest in archaeology is often framed through discovery and adventure, making careful discussion of 'whose past' difficult. As we broaden our ideas about 'public', consider indigenous ways of knowing, and integrate new digital tools and practice, public 'outreach' might be transformed into a locus of reconciliation, and re-conceptualized as a place for exploring and evaluating the very epistemologies that underpin 'conventional' archaeologies, opening new possibilities for engagement and involvement in the discipline. In this paper, we describe a developing podcasting project that explores these underpinnings by engaging and building capacity within communities (publics, both indigenous and non-indigenous) through concepts like two-eyed seeing, to create intellectual space for examining archaeology on indigenous terms, for training young archaeologists and potentially, for transforming the discipline.

[421] *Bottles, Blue Jeans, and a Boat: Material Traces of Contemporary Migration in Western Sicily*

The Sicilian Channel receives global attention as a major migratory route for undocumented people entering Europe clandestinely, a tragic nexus of transnational displacement and desperation. While the plight of massively overloaded and unseaworthy boats of people justifiably receives media attention, there is a less documented movement that occurs and has occurred for thousands of years: small boats expertly transporting handfuls of people back and forth across the Channel between Tunisia and western Sicily. Material traces of these border crossings share some features with the migrant material culture strewn along the border zone of the Sonoran Desert of Arizona. These include migrants' strategic triangulation of speed, invisibility and survival in deciding what to bring and the tactical triage of gear en route. Further, the political and economic injustices that are catalysts for the movements are comparable, as is the criminalization of the migrants which has done more to endanger than dissuade them. However the exigencies of sea crossing require a distinct set of material culture and technologies of mobility, shedding new light on migrant choices and challenges. This paper explores the material vestiges of these cross-Channel migrations through assemblages identified during fieldwork along the southwest coast of Sicily in

Summer 2018.

[121] *Altered States: Evaluating Postmortem Modification of Dental Tissues*

Teeth are the most likely skeletal elements to survive taphonomic insult, but are not impervious to diagenetic changes. The bulk of dietary, migratory, and climatic studies pursued by bioarchaeologists are reliant on unaltered preservation of dental tissue. Yet, contextual value of depositional environments is often overlooked. Though study of the physical, chemical, and microbial alteration of dental microstructures from archaeological and forensic contexts has long been pursued, such studies are poorly integrated. Estimating discrete parameters influencing dental taphonomy is difficult in inhumation experiments alone, and only obliquely inferred from descriptive studies. Here, we present a model-based approach for taphonomic alteration which explores discrete parameters in a controlled experimental fashion, using proxy mechanisms (temperature, humidity, pressure, pH and matrix composition) to measure mode and tempo of change in histological context. We apply this experimental approach to dental tissues to visualize introgression of tracer compounds and create an integrated classification of empirical referents for evaluating biominerals recovered from archaeological and forensic contexts, as well as parsing diagenetic from biogenic histological variation. These models can provide deeper explanatory power about the impact of specific taphonomic variables on DNA preservation, modification to calculus and isotope analyses, and inclusion of depositional micro-artifacts upon tissues.

[348] *Migration and Climate Change in Mississippian Archaeology: An Introduction and Brief History*

This paper introduces the symposium "Migration and Climate Change: The Spread of Mississippian Culture ca. A.D. 1050-1400." I provide a brief history of migration and climate change research in the archaeology of Mississippian societies. These earlier research efforts -- the theoretical contexts in which they occurred, the critiques they encountered, the insights they produced, and the limitations of their methods -- serve as a prologue to the papers in the symposium.

Bloch, Lindsay (Florida Museum of Natural History, UF)

[362] *Rose Red-Filmed by Any Other Name: Pottery Typology and Genealogy in the Southeastern US*

Working with legacy collections, it is common to come across labeled artifacts or reports listing now defunct names. Over the years, archaeologists have chosen to define ceramic assemblages based on any number of attributes; often the primary consideration being the site or region in which they were first discovered and described. These names are time capsules, capturing typological moments in the history of the discipline. Ware types have been devised, revised, split, combined, and ignored. A select few are canonized. Here, I revisit a pottery type collection assembled in the mid-20th century, tracing the sherds and their names back to founding figures and institutions of Southeastern archaeology. The process of reclassification according to modern conventions is an opportunity to examine typological legacies and dead ends, critically examining the naming structures that underlie our analysis and interpretations.

[253] *Presence of the Mycobacterium Tuberculosis Complex (MTBC) in Ancient Skeletal Samples from Ukraine*

This research aims to investigate biocultural interactions by studying ancient disease among the Tripolye, a Neolithic group dating to 4,900-2,900 calBC, and one of the first agricultural populations in Eastern Europe. The Tripolye lived at higher population densities and had closer contact with bovines than the hunter-gatherers that came before them. This research seeks to provide the biocultural context for tuberculosis transmittance from cattle to humans. The identification of the insertion sequence IS611 has been targeted to identify the presence of tuberculosis. Here I present data that builds upon previous identification using gel electrophoresis with aDNA sequencing analysis to further establish and clarify the specific strain of IS6110 from the site. Gel electrophoresis showed banding patterns of the genetic element suggestive of the presence of IS6110 in three out of four samples of bones with lesions characteristic of tuberculosis. Newly obtained sequencing data elaborates on these findings and provides specific strain identification from the Mycobacterium tuberculosis complex. Through this investigation, we can achieve a better understanding of cultural processes on human health, the antiquity of tuberculosis, and European prehistory.

[197] *Foodways and Human-Animal Relations at Early Formative Etlatongo: An Ontology of Differentiation*

The origins of Oaxacan cuisines can be found in the later half of the Early Formative period, a time of emerging socio-political complexity. The incorporation of maize as a dietary staple and less reliance on wild plants and animals were part of a profound change in subsistence practices and conceptions of food in much of Mesoamerica. We argue that newly excavated zooarchaeological data from Etlatongo, in the Nochixtlan Valley, indicate that changes in Early Formative foodways both reflect and contributed to emerging socio-political differentiation. Focusing on the Cruz B phase (1150-850 uncal BC), we explore intra-site comparisons, contrasting public and domestic spaces. Commensal events provide an arena to explore the ways in which animals were prepared and consumed, as well as the incorporation of particular animal species and parts of the carcass into specific deposits in the public space at the site. We also track the changing nature of ceramic vessels and figurines with the start of the Cruz B phase, looking at dramatic shifts in inventories of vessel forms and figurine imagery. Changes in foodways and human-animal relationships represent an important transformation in ontologies, reflecting greater differentiation within societies and the world in which they were situated.

[209] *Multiproxy Reconstruction of Human Diet in the Northern Great Basin: Coprolite Research at the Paisley Caves*

Human coprolites from archaeological contexts can provide valuable information about human health, dietary

practices, and land-use patterns. Traditional coprolites studies have focused on identifying animal macrofossils and plant macrofossils and microfossils, but more recent research has shown the utility of biomolecular research (e.g., lipids, aDNA) for providing important additional information in multi-proxy studies of human diet and health. Because there are so many important constituents in coprolites it is important to establish best practice guidelines for the multi-proxy analysis of these remains. This poster describes recent methodological studies using coprolites from the Paisley Caves, south-central Oregon. The Paisley Caves have produced a large assemblage of human and non-human coprolites from terminal Pleistocene through late Holocene contexts, offering an important resource for a diachronic study of human occupation and subsistence in the region. These coprolites also provide a valuable resource for establishing best practice methods for coprolite analysis. This research is part of a broader project investigating site formation processes and human occupation of the caves using biogeochemical, plant micro- and macrofossil, and sediment micromorphological analyses.

[406] *The Flaked Stone Economy of Los Mogotes: Access and Exploitation during the Epiclassic Period*

This study examines the flaked stone economy at the Epiclassic site of Los Mogotes, located north of the Basin of Mexico in central Mexico. We quantified obsidian and chert artifacts based on form and material in order to examine the nature of the regional lithic economy during this time. The findings suggest were dependent on long-distance exchange for already manufactured goods. Despite being close to high quality obsidian sources in Pachuca, Hidalgo, Los Mogotes relied on grey obsidian from sources located farther away. The obsidian assemblage exhibits little evidence of primary production and suggests a down-the-line model of exchange of tools, many of which were later reworked into secondary or tertiary items. This pattern contrasts with evidence of primary production using more locally available chert. These findings conform to broader regional trends observed at contemporaneous sites during this time and shed light on the ways in which regional economic systems re-organize.

[86] *The Climates of Pueblo Emergence*

In this paper, we explore the emergence of the first Pueblo Canon — how the period of initial Pueblo exploration in the northern upland Southwest coalesced into the suite of material and social patterns archaeologists readily identify as Basketmaker III. Steadfast development of temperate maize varieties set the stage for upland expansion; a warming climate invited migration by maize farmers; strikingly high birth rates among the immigrant population filled the readily available farming niche; and the Canon emerged as both the process and the product of social consensus and community formation, seeded by core concepts from Basketmaker II ritual practices and social identity. We present a new synthesis of high- and low-frequency temperature reconstructions from tree rings and pollen to identify environmental conditions structuring this emergence. Ultimately, we develop an account of a people prepped and fettled, a culture socially and economically primed for expansion and the development of Pueblo identity.

Boehm, Andrew (Museum of Natural and Cultural History, University of Oregon)

[274] *Perishable Tools from Fort Rock Cave, Oregon*

The dry caves of central Oregon provide exceptional preservation of Paleoindian-aged perishable artifacts. Excavations at Fort Rock Cave, Oregon by Luther Cressman, Stephen Bedwell, and, most recently, Thomas Connolly and colleagues have produced a sizeable number of perishable and rare artifacts, as well as large faunal and lithic assemblages. Notably, this site has produced the oldest dated shoes in the world, at 10,500 to 9,350 cal B.P. While the sagebrush sandals, cordage, and other woven materials from the site have been well reported, the plant and bone tools have not. This presentation details the perishable tools from the Fort Rock Cave excavations, including material identification, metric, and use-wear analyses. A detailed study of the perishable tools provides valuable insight into the diversity of activities of early Great Basin peoples, as well as recognition of the variety of raw materials utilized for tool making, most of which do not generally preserve.

[102] *From Present-Day Fields to Ancient Samples...and Back Again: Strategies for Establishing Principles of Interpretation in Plant Stable Isotope Work*

Plant stable isotope analysis presents a series of 'middle range' challenges for archaeologists, but also unique opportunities for reconstructing ancient agroecologies. Here we focus on the potential and limitations of modern crop studies for informing interpretation of archaeobotanical cereal and pulse $\delta^{13}\text{C}$ and $\delta^{15}\text{N}$ values as evidence of crop

growing conditions. From experience gained in modern crop and weed surveys in Europe, Western Asia and North Africa, we consider several issues, such as the complementarity of experimental and 'traditional' farming studies, integration with other ecological indicators such as weed functional traits and the challenges of comparing modern and ancient crop varieties. We also suggest how a growing body of archaeobotanical stable isotope data can shed light on some uniformitarian dilemmas, as well as prompting new questions. Interpretation of ancient values appears most robust when supported by distinct lines of evidence subject to different sources of error and ambiguity, and with emphasis on exclusion of unlikely scenarios.

[276] *Archaeology of Resistance? Barbuda in the Aftermath of Hurricane Irma*

Barbuda, a small island in the Lesser Antilles, was directly hit by mega storm, Hurricane Irma, in September of 2017. 90-95% of the modern structures were either completely destroyed or lost their roofs, windows and doors. Additionally, there was tremendous loss to both intangible cultural heritage and heritage sites. Erosion in coastal areas decimated more than 25 feet of coastal archaeological sites. Historic sites that survived more than 200 years lay in collapsed ruins. While Barbudans were forcibly evacuated the day after the storm, stunned, trying to take in all the loss and determining ways to move forward, the central government in Antigua began around the clock excavation for a large airport. With no protocols for a proper Environmental Impact Assessment, prime agricultural land, pristine protected forest, watersheds and wetlands, along with archaeological sites, fell victim to misplaced agendas that prioritized uninformed capitalist ventures instead of helping local recovery. We will take a critical look at the state of archaeological sites and the place of heritage and heritage sites in an area of heightened political tensions and conflicting agendas towards development.

Bogucki, Peter (Princeton University)

[196] *The Lengyel Interaction Sphere in East-Central Europe during the Fifth Millennium BC*

Sites of the Lengyel Culture are found from the Drava River in Croatia to the lowlands of northern Poland during the fifth millennium BC. While the Lengyel Culture is clearly in the great "Danubian" tradition as a successor to the first farmers of this area several centuries earlier, it appears in a multitude of regional variants defined by pottery and other material culture. Linking these groups are manifestations of ritual mortuary behavior and distribution of exotic materials that comply with the criteria set forth decades ago by Caldwell for "interaction spheres" in which local traditions in crafts and subsistence underlie the acquisition and display of exotic materials by nascent elites. Seeing the Lengyel Culture in all its forms within the interaction sphere framework perhaps can provide an improved understanding of its concurrent diversity and uniformity.

[351] *The Missing Medieval in the North Atlantic*

Archaeological research in the North Atlantic has overwhelmingly focused on the long-term political and environmental impacts of the Viking Age colonization of these remote, marginal islands. In places like Iceland, these impacts were profound and resulted in the radical transformation of the previously uninhabited island and the establishment of a farming landscape that has endured over the past millennium. This remarkable continuity can give the illusion of an unchanging and stable society and aspects of the archaeology, such as the enduring settlement pattern and relative paucity of preserved artifacts, make investigation of the medieval period difficult. The archaeological emphasis on the impacts of Viking Age colonization and the development of a basic Icelandic ecological pattern has resulted in a flattening of time between the Viking Age and the historically documented early modern period that tends to elide the Middle Ages as a distinct period. This paper will address the methodological difficulties of accessing and interpreting medieval Iceland and suggest ways to move forward.

Boles, Oliver (University of Pennsylvania), Emily Hammer (University of Pennsylvania) and Kathy Morrison (University of Pennsylvania)

[92] *Pastoralism and Anthropogenic Land Cover Change (ALCC) Mapping*

PAGES LandCover6k explores the relationship between past human activity and variability in the palaeoecological record to produce global maps of anthropogenic land-cover change based on sound archaeological knowledge and palaeoecological proxies, maps which will be available for use by the climate modelling community to better understand past climate dynamics. As a first step, we are producing global maps of human land use at various points across the last 6000 years. The vast majority of global land use is today dedicated to food production via

livestock and crop cultivation. While the potential impacts of the latter are relatively well-understood – land is cleared of existing vegetation and replaced by domestic species – the changes effected by animal husbandry are far more diverse, ranging from the ephemeral to the devastating. In order to successfully and usefully map the implications of such economic practices, it is necessary to understand both the diversity of pastoralism, from mixed agriculture to nomadic herding. This paper discusses the various impacts that pastoralism can exert, framed in the context of how we can reasonably expect to chart and delimit these practices; specifically, we consider the relationship between pastoralism and ALCC, and implications for PAGES LandCover6k.

[362] *Creating Context: Analyzing Legacy Documentary Data to Understand the Emergence of Enslaved Societies at Flowerdew Hundred Plantation*

By late 1619, 15 of the first 25 enslaved Africans imported into British North America were laboring at Flowerdew Hundred, a thousand acre plantation on the James River in Virginia. They joined indentured Europeans, neighboring Weanock Indians, and elite European landowners in shaping the mid-17th century expansion of plantation settlements across the Chesapeake, an expansion which led to the emergence of a tobacco plantation labor force comprised almost entirely of enslaved Africans and their descendants by 1700. Since the 1970s, archaeological research at Flowerdew has produced hundreds of thousands of artifacts and dozens of linear feet of unbound field records and maps. A new project led by the Digital Archaeological Archive of Comparative Slavery (www.daacs.org) is re-analyzing collections from four of the earliest and most significant 17th-century archaeological sites at Flowerdew. We describe the protocols used to parse these documents into a relational PostgreSQL database that allows us to directly link legacy field data to related artifacts, images, and maps. We also illustrate how the standardized digital data produced by DAACS will enable students, scholars, and the public to advance our understanding of the multicultural dynamics behind the emergence of a slave society in British North America.

Bolte, Christina (University of West Florida) and John Worth (University of West Florida)

[367] *A "Snapshot" of the Mid-Sixteenth-Century Colonial Culture of New Spain: the 1559-1561 Tristán de Luna y Arellano Settlement on Pensacola Bay*

Since the 2015 discovery of the 1559-1561 Tristán de Luna y Arellano Settlement on Pensacola Bay, archaeological investigations have yielded material traces of a distinctively "New Spanish" colonial culture. In 1559, a mere 38 years after Cortes' conquest of Mexico, Luna was dispatched from Veracruz with 12 ships, 1,500 colonists, including 200 Aztec Indians, and an abundance of supplies to establish a settlement on Pensacola Bay. After just over a month, a hurricane struck the settlement, destroying seven ships and the majority of the colony's food stores. Over the next two years, the Viceroy of New Spain sent four relief fleets to Pensacola that included items produced in Mexico, as well as items adopted by resident colonial Spaniards (whether Spanish-born or New World-born) from indigenous Mexican cultures. Utilizing documentary evidence and artifacts recovered from the Luna settlement site, this paper characterizes a "New Spanish" assemblage, explores the adoption of Aztec or other indigenous food and material culture, and the continued incorporation of indigenous Aztec people into exploratory expeditions launched out of New Spain (including the 1540-1542 Coronado expedition), offering a "snapshot" of the colonial culture of New Spain and providing some instructive insights into Spanish-Aztec relations during the mid-sixteenth century.

Bomberger, Joseph

[414] *Seneca Pigeon Hunting on the Allegheny National Forest*

The passenger pigeon, *Ectopistes migratorius*, is an extinct subspecies of pigeon that was used as a staple food source by the Haudenosaunee. The largest passenger pigeon flocks were described by eyewitnesses as covering hundreds of miles and their peak population has been estimated in the billions. During the nineteenth century, Euroamericans industrialized the hunting of passenger pigeons, leading to extinction in the twentieth century. The development of railroads facilitated these industrialized hunting practices. Low birth rates and high casualty rates combined to eliminate the passenger pigeon, once the most common bird in North America. The pigeon was important to the Seneca. While there are a variety of ethnographic accounts describing the Seneca hunting in northwest Pennsylvania, archaeological evidence is scant. This research aims to establish a site signature for Seneca pigeon hunting camps on the Allegheny National Forest, corroborate documentary and ethnographic data, and identify landforms that were favored by the Seneca. The research will not focus on identifying all the camps in the region but may aid future researchers in doing so. These camps could yield data about trade and hunting practices in addition to adding important cultural data about the Seneca.

[135] *ARPA and Confidentiality in the Digital Age*

The Archeological Resources Protection Act (ARPA) and 54 U.S.C. 307103 (Title 54) exempt archeological site location data and other site information from the Freedom of Information Act (FOIA). The digital age, however,

provides site looters with a new range of tools to discover archeological site locations on federal and tribal lands. At times, our own agency archives have inadvertently published archeological site reports on line, while a number of third party archives continue to make sensitive reports available. Maps from online sites such as Google Earth provide means for looters to locate sites from their home computers. Digital communication and social media sites such as chat rooms and Facebook allow looters to share location information and even encourage each other to loot sites during government shutdowns. Federal archeologists need a better understanding of digital media in order to remove inappropriate material from the web and more vigilantly monitor potential site looting activities.

[393] *Building Histories of Territory Formation: The Case of Southern Jê Expansion, Santa Catarina, Brazil*

In this paper we discuss the expansion process of southern Jê groups since 1400 BP until today. Working with Zedeño's proposal of territorial history (Zedeño 1997), we explore the available archaeological and ethnographic data to propose phases of establishment, maintenance and transformation of territories occupied by Southern Jê groups since, at least, 1400 BP. To do that we explore the interaction dynamics between Southern Jê groups with different cultural groups that inhabited the same or adjacent region during this period: hunter-gatherers related to Umbu tradition, fisher-hunter-gatherers related to Sambaqui occupation, Guarani groups, and Europeans after AD 1500. We focus in the region that nowadays corresponds to Santa Catarina State and we use published data as well as new data from recent excavations realized by the LEIA/UFSC.

Bondura, Valerie (Columbia University)

[193] *The View from Here: An Introduction to Nuevomexicano and Chicana Theory for Archaeology*

This paper is an introduction to an organized session on Chicana Archaeology. It argues for the ethical and intellectual imperative of drawing Chicana Studies scholarship in to archaeological method and theory. Archaeological frameworks for studying culture contact, ethnogenesis, and identity have tended to bypass theory that falls under the umbrella of Chicana Studies. While archaeology has rightfully moved to incorporate Native Studies and Indigenous ontologies into our method and theory, other traditions and scholarship have been neglected. In approaching Hispanic/ized communities, archaeologists have focused on Spanish colonialism, emphasizing the performance and transmission of a "Spanish" identity in new contexts. This approach has the effect of devaluing or ignoring Hispanic heritage that can only be tangentially related to peninsular Spain. This, in turn, reifies a long-standing stereotype that portrays Hispanic-descent communities in the U.S. as both foreign and lacking a distinct cultural heritage. Thus, archaeologists have been complicit in the writing of historical narratives that have dismissed, devalued, or excluded Chicana communities. This paper, based on five seasons of fieldwork in the southern Sangre de Cristo Mountains, outlines relevant frameworks from Chicana Studies for archaeological research, drawing especially on nuevomexicano thought from the northern Rio Grande region of New Mexico.

[182] *Local Mortuary Practice and Inca Imperial Conquest in the Middle Chíncha Valley, Peru*

I investigate the relationship between local mortuary practice and imperial conquest in the middle Chíncha Valley of Peru, a landscape that was incorporated into the Inca Empire in the 15th century. Indigenous groups developed strategies for dealing with invasive imperial control. One strategy was mortuary practice, a means of expressing relationships among the living and the deceased. Such relationships can form the basis of society, knit together extended family groups, and enable the continuation of cultural practices and identities. To what extent did indigenous people transform their mortuary practices during periods of conquest? To address this question, I examine indigenous mortuary activities in the study area that date to the Late Intermediate Period (AD 1000–1400) and Late Horizon (AD 1400–1532). I report 25 14C dates associated with two distinct grave types: above-ground and subterranean mausolea (chullpas) and subterranean cists. I employ Bayesian modeling to analyze these dates. Results demonstrate that local groups maintained, transformed, and innovated their mortuary practices as they were brought under Inca rule. These data carry implications for understanding how societies are reconstituted through mortuary practice during times of profound sociopolitical change. These implications are drawn out in this paper.

[131] *The Patient Work of Patient History: The Creation of Medical Records for Eighteenth and Nineteenth Century Interments at the First Baptist Church of Philadelphia Burial Ground*

As of Fall 2018, the remains of approximately 500 individuals have been recovered from a disturbed burial ground site at 218 Arch Street in the historic "Old City" district of Philadelphia. These are a fraction of the larger interred population. The Arch Street Project's historical research team uncovered incomplete records for burials at the site totaling 2699 between the years 1702 and 1859. From among these records names and dates of death for 1659

individuals have also been recovered, along with assorted demographic, cultural, and medical information. Over the course of the past year, ASP researcher focused on seeking out further medical information for all known individuals buried at the site.

This paper describes the results of research conducted by the historical team of the Arch Street Project into the medical records of the 1659 individuals identified to have been interred at 218 Arch Street, Philadelphia. The resultant medical histories, gathered from physicians' daybooks, account books, personal memoirs, and death records, are an unprecedented record of health and health care for early Philadelphia. This research model promises to inform similar burial site recoveries in the Philadelphia area and across the Eastern United States.

[392] *Pitchstone in Prehistory: New Insights into the Mesolithic and Neolithic use of Pitchstone in Scotland*

Pitchstone is a glassy volcanic rock similar to obsidian but in Europe, its geological occurrence and its use as a raw material for prehistoric chipped-stone assemblages are much more restricted. In northern Britain where good quality flint is scarce, pitchstone circulated widely in the Neolithic with artifacts made from this material being found over 400 km from the primary sources on the Isle of Arran in western Scotland. In contrast, during the preceding Mesolithic pitchstone use was much more restricted geographically.

This paper:

- Reviews current knowledge on the use of pitchstone by Mesolithic and Neolithic societies in northern Britain, and present.
- Discusses new XRF analyses of pitchstone samples from geological sources on Arran and archaeological sites on Arran and the Scottish mainland.
- Presents the first use-wear analyses of Neolithic pitchstone assemblages from Scotland. A major challenge of this research was to design and conduct experiments in producing a definitive complex of wear patterns and to compare them with archaeological pieces.

Bonzani, Renee (University of Kentucky)

[158] *Carbonized Wood Remains from the Matacanela Site, Veracruz, Mexico*

This paper describes the carbonized wood remains recovered from fifty-five heavy fractions of flotation from seven units and fifty light fractions of flotation from six units collected during the excavations of the Matacanela Site in Veracruz, Mexico. Environmental comparisons are made to the forest composition in the natural reserve at Los Tuxtlas (la Estación de Biología Tropical Los Tuxtlas) and ethnobotanical uses of the identified wood taxa are discussed based on information from the Huastec Maya from the northeastern part of Mexico within the states of Veracruz and San Luis Potosí (Alcorn 1984: 747-748). Differences in wood composition within the site of Matacanela are also presented.

Booker, Emily (Brown University)

[301] *Cypriot Clay Bodies: Contact, Corporeality, and Figurine Use in the Cypriot Late Bronze Age*

The clay "Astarte" figurines of Cyprus' Late Bronze Age are enigmatic and well-known, and their emphasis on female reproductive organs lead most scholars to argue for fertile functions. Yet how were these figurines actually used? And how do they fit within the much larger repertoire of Late Bronze Age figurines both on Cyprus and within the wider eastern Mediterranean?

This paper examines clay figurine use, reuse, and deposition on Late Bronze Age Cyprus, and, more broadly, the multifaceted ways Cypriot figurine production and use incorporate and respond to increased contact with the Aegean and Levantine coast. It takes a contextual approach to figurine analysis, looking for patterns in production, style, body attributes, assemblage, and fragmentation of both anthropomorphic and non-anthropomorphic figurines at a number of well-excavated sites on Cyprus.

Through a material and context-focused analysis that considers issues of corporeality and materiality, it becomes clear that there are far more complex meanings and functions for Cypriot figurines than just female fertility. Clay figurines provide a focused lens into the ways people interact with objects, create or adjust identities, and perceive of their place in the world around them.

[351] *Comparative Eurasian Statecraft: al-Andalus in the context of the Medieval West*

Attempts to describe and explain differences between Western and Asian state structures have a long history, starting with Marx's Asiatic Mode of Production and Wittfogel's Oriental Despotism. The bottom-up approach offered here argues that differences between the two forms are due largely to the way primary producers are organized locally, which in turn affects how the state extracts surplus from producers. This case study, based in political ecology and landscape archaeology, compares state development north and south of the Pyrenees in the second half of the first millennium AD in al-Andalus, the Córdoba Caliphate took the form of a highly centralized Middle Eastern style polity, complete a separate, self-sufficient palace complex with resident full-time craft specialists producing sumptuary pottery, silk, bronze and ivory crafts, all centered around one of the largest cities in the world at the time. The state funded itself with taxes drawn from tribally organized land tenure and primary production. North of the Pyrenees, contemporary polities consisted of long chains of personal dependence that stretched from the monarch to primary producing households, with minimal urban development and sumptuary craft production. Here, an ever-weakening rent-based state culminates in a near complete decentralization of power among local and regional lords

[246] *Building Collapse: Hierarchy and an Anarchic Social Movement in the Hohokam Classic Period*

Archaeologists have offered multiple explanations for the dramatic architectural, subsistence, and political shifts that happened at the end of the Hohokam Classic period. Many of these explanations are good at exploring potential factors leading to these changes in regional contexts, like the Phoenix Basin where it is often discussed as a large-scale collapse. However, these explanations are often less applicable in other areas of the Hohokam world. Is there a unified explanation, or even a series of inter-related explanations, for this cultural transition that occurred in multiple regions within the Hohokam world, such as the Phoenix Basin, Tonto Basin, Tucson Basin, Safford Valley, San Pedro Valley, and the Papagueria? Is there an inference to the best explanation? In this paper, we will compare previously proposed models for Hohokam Classic period "collapse" to evaluate how they apply across different regions. These will be compared to O'odham oral traditions. Finally, using indigenous and anarchist political theories and a social movement framework, we will explore a potential explanation.

[197] *Food from the Barranca: A 13,000-Year Perspective from the Yuzanú Drainage of the Mixteca Alta*

Barrancas are marginal spaces in the cultural ecology and cultural perceptions of modern-day inhabitants and visitors of the Mixteca Alta. They tend to be little-contested commons where the poor graze their animals, hunt, gather fuelwood and occasional culinary curiosities. They rarely figure in the villagers' get-rich schemes or outsiders' research and development programs, with the partial exception of those showcasing environmental degradation. Using the results of geoarchaeological survey and excavation in the vicinity of Yanhuitlan, we point to the radical transformations in streamside ecology wrought by climate change and human management and argue that in the past the barranca was often a place of plenty, playing a central role in food procurement and production. Paleoindians camped along wet meadows grazed by large herbivores. Their Archaic successors used barranca floodplains as places for seasonal congregation and managed their vegetation communities by intentional burning. Cross-channel agricultural terraces were built by the Formative and by the Postclassic formed monumental staircases planted in staple foods, with both property rights and the movement of water receiving close scrutiny. It

was only with the catastrophic channel deepening and widening in the wake of Colonial terrace collapse and overgrazing that the barranca began to lose its allure.

[303] *Settlement Fission in the Western Guatemala Highlands*

This paper examines dynamic changes in Maya settlement patterns through a comparison of expansion and contraction of settlement patterns during the pre-Columbian, historic, and contemporary periods. In particular, it looks at when and why settlements are formed, within what is generally considered to be a single sociocultural context—the Huista region of western highland Guatemala. Data from archaeological investigations, historical documents, and ethnography are collated to demonstrate that there are discontinuities in the settlement pattern, in ways that are occasionally predictable, and that the etic organization of archaeological data into hierarchies of sites may underestimate this change. The paper provides a contribution to the discussion of how settlement patterns, as reflections of populations, change over time in a landscape, postulates some predictable patterns of settlement expansion and contraction, and comments on the necessary limitations of using the ethnographic present as an analogy for interpreting pre-Columbian archaeological data.

Borrero, Luis (CONICET) and Fabiana Martin (CEHA, IPA, Universidad de Magallanes)

[26] *Fragmented Records: Fuego-Patagonian Hunter-gatherers and Archaeological Change*

One common assumption in the interpretation of Fuego-Patagonian archaeological long stratigraphic sequences is that they represent occupational continuity. Several archaeological markers, including chronological and stratigraphic gaps, as well as recent molecular results erode that assumption, inviting us to consider more complex occupational histories. Abandonment, displacement and extinction are important processes that must be taken into account. One important consequence of considering these processes is related to our understanding of past human lifeways during the last 11,000 years, usually encapsulated within the rather rigid categories of maritime and terrestrial hunter-gatherers. A variety of analyses within a wider framework are required to analyze the changing distribution of archaeological traits.

[134] *Methods for the Application of Structure from Motion (SfM) 3D models for the Recording and Consolidation of Archaeological Architecture.*

Photogrammetry is the process of generating 3-Dimensional digital models from still photographs. The process is applied in a variety of field and lab settings for documenting the archaeological record. Currently, there is a need for focus on individual applications and the development of a standard methodology to ensure consistent and comparable 3D models. We present our system for incorporating photogrammetry into the documentation of architecture, developed at the site of Nim li Punit, Belize, during our 2018 field season. The archaeological excavation of architecture involves the documentation of the pre-excavated building, the liberation of earth and material overburden, the documentation of all in situ construction (including wall fall, fill stones, and standing architecture), the drawing of consolidated architecture, and the documentation of the final state of the post-excavated buildings. The generation of 3D models greatly assists in all facets of the excavation, documentation, analysis, and consolidation processes.

[194] *A Monument of Memories: The Pueblo Grande Platform Mound*

Located at the head of a large canal system in Phoenix, the Pueblo Grande platform mound is one of the largest structures ever built by the Hohokam. This building is nearly 4 m in height, 4,000 m² in area, and incorporates 16,000 cubic m of rock, trash, soil, and structural remains in its cell-like design. Although built in stages, this platform mound was clearly a massive undertaking that had social and ritual importance, possibly representing a symbolic mountain. We argue that the mound was used as a center for food storage, feasting, and ceremonial activities relating to rain and agricultural fertility and was central to the social and ritual functioning of the village and related agricultural territories. It was built to emphasize the importance of land ownership and honor the memories of the ancestors who settled that location several centuries before the mound was constructed. This paper will discuss ethnographic information about the role of platform mounds and describe the special artifacts and architecture that suggest the Pueblo Grande platform mound had a ceremonial function, and then place the platform mound within a regional context during a time of increasing competition for fertile farmland and irrigation water.

Boswell, Alicia (UC Santa Barbara) and Joanne Pillsbury (Metropolitan Museum of Art)**[363]** *Technical Knowledge, Metal Artisans, and Moche Visual Culture: A View from Piura, Peru*

Technical knowledge is passed along through individuals and the exchange of objects. While technical studies of artifacts illuminate the physical evidence of evolutions in manufacturing processes, what are the mechanisms via which ideas are exchanged? What is the role of human agency, and what are the sociopolitical contexts in which technical innovations occur? From sixteenth-century sources, we know that when the Incas conquered the Chimú they kidnapped the metalsmiths and forcibly relocated them elsewhere. How far back does this practice of “craftsperson capture” extend? This paper focuses on the Moche, predecessors of the Chimú. Moche artisans developed a suite of sophisticated technologies, including different ways to gild and plate metals. While it may be possible that in the southern Moche region rival polities “borrowed” artisans as attached specialists, our recent research suggests that at least in the case of Piura, on Peru’s far north coast, the introduction of Moche metalwork may have been less direct. Elite metal regalia in the two regions exhibit similar forms and Moche iconography, but the technical features of the Piura tradition are sufficiently different to suggest that in this case, objects and non-specialists likely played the role of transmitters rather than technical specialists themselves.

Boudreaux, Edmond, Brad Lieb (Chickasaw Nation) and Stephen Harris (University of Mississippi)**[414]** *Native Communities after Contact in the Blackland Prairie of Northeast Mississippi*

Hernando de Soto and his army spent the winter of 1540-41 in the Blackland Prairie region of Northeast Mississippi, wintering in a significant settlement of the native polity of Chicasa. The Spanish noted two other polities known as Saquechuma and Alimamu in the area. A high density of Late Mississippian through Early Contact period sites in the Blackland Prairie may correspond to these native polities, but the area appears to have been abandoned by the late seventeenth century. Little is known about what happened to native peoples in the Blackland Prairie during the decades after their contact with Soto. In this paper, we report on recent work at the Stark Farm site, located in Oktibbeha County. This work is the result of a collaboration between Chickasaw Nation which is native to this area, and several universities in the Southeast. The results of metal detecting, magnetic gradiometry, shovel testing, and excavations indicate that Stark Farm is a dispersed settlement of widely scattered households that date to the fifteenth through early seventeenth centuries. These investigations suggest significant continuity in native lifeways in the first generations after contact.

Boudreaux, Sarah (University of Texas at San Antonio)**[30]** *Ceramic Technological Trends in the Three Rivers Region: A Late Classic Maya Overview*

It is now well recognized that Late Classic Maya communities were highly variable politically, economically, and environmentally. Researchers often assume that community and household variation are corollary with the broader political climate—and this remains under problematized. Thus, research that explores differences in household provisioning practices across communities is needed to rectify this situation. The incorporation of a broad, multi-community comparative data-set will facilitate a greater understanding of the sociopolitical dynamicity on multiple social and economic levels within the study area of the Three Rivers Region in Northwestern Belize. This paper will focus on ceramic distribution patterns and technological programs (including production) from sites in the Three Rivers Region, specifically from the Programme for Belize property.

[345] *Chair***Boulanger, Matthew (Southern Methodist University), Ryan Breslawski (Southern Methodist University) and Ian Jorgeson (Southern Methodist University)****[365]** *A Systematic Approach to Quantifying Diversity in the Morphology and Spatial Distribution of Eastern Paleoindian Projectile Points*

For nearly 100 years, archaeologists have commented on the perceived morphological diversity in projectile points dating to the Paleoindian period in eastern North America, though the significance of this diversity and what explains it remain underexplored topics. Hesitancy to address these broader questions is, we argue, attributable to several factors including: Poor or inconsistent definition of “diversity,” absence of a replicable and systematic method of classification, and substantial biases in the spatial scale and distribution of archaeological data. Several studies have grappled with the first two of these issues. But the third concern remains problematic, because while archaeologists are often interested in addressing questions at several spatial scales, our data are often aggregated by modern political units and show clear distribution biases from historical and modern land-use patterns. Here, we build on prior work on projectile-point forms in the East and integrate an explicit geographical component aimed at minimizing recovery and visibility biases at spatial scales—and in units—defined by the research question, rather than by modern administrative boundaries. We also explore hypotheses concerning environmental and biogeographic factors may best explain morphological diversity in these stone tools.

Bousman, Britt [338] see Morris, Sarah

Boutin, Alexis (Sonoma State University)**[317]** *Bioarchaeology as Archaeology: Past Practices and Future Prospects*

This paper reflects on bioarchaeology as archaeology (after Armelagos 2003) by tracing the discipline’s past and identifying current research trends. Bioarchaeology’s roots run deep into the 20th century, but it was only in the late

1970s that it received its name in the U.S. and began to blossom as a discipline. The first generation of bioarchaeologists set the tone for this synergistic field, drawing on biocultural models, archaeological contexts, and clinical research. Because of their training in human skeletal biology, bioarchaeologists traditionally felt a professional kinship with biological anthropologists, which was reinforced by having to “choose sides” within the four-field structure of American anthropology. On archaeological projects, bioarchaeologists were commonly identified as specialists, whose reports were frequently relegated to the appendices. But second- and third-generation bioarchaeologists are reclaiming their archaeological heritage: training in human osteology is essential to a career in cultural resources management; overt theoretical orientations are now prioritized; and a new emphasis on community engagement recognizes the diverse groups who have a stake in the study bioarchaeological research. The paper will conclude with an example of how research on affective interpretations of bioarchaeological data should be of interest to, and benefit, all practitioners of archaeology.

[312] *New Insights from Old Collections: Investigating Bird Bones from Pacific Northwest Shell Middens*

Julie Stein has been a leader in facilitating research on legacy collections in the Pacific Northwest Coast. Although challenges exist when working with existing collections in museums and repositories, re-analyses of these assemblages have the potential to provide valuable information and support the conservation ethic in archaeology. We highlight examples of zooarchaeological projects conducted on legacy shell midden collections in the region, focusing on our recent synthesis of Native American bird use along the Oregon coast. We present data on three legacy collections: Umpqua/Eden (35DO83), Whale Cove (35LNC60), and the Dunes Site (35CLT27), and compare these data with 23 previously analyzed assemblages. We evaluate potential bird procurement strategies, including nearshore and offshore hunting, hunting on breeding colonies, and collecting beached carcasses, using statistical tests and comparisons with contemporary surveys of naturally beached birds as observed by COASST (Coastal Observation Seabird Survey Team). While 71% of the identified bird remains belong to just three families (Anatidae, Alcidae, and Procellariidae), closer analysis reveals the incredible diversity of birds used by Oregon coast peoples. The assemblages vary considerably in terms of taxonomic diversity and composition, leading us to conclude that people used birds opportunistically, likely incorporating multiple strategies for procurement.

[290] *Where-felines? An XRF-Based Sourcing of Tiwanaku's Chachapuma Sculptures*

Turnovers in political and religious authority in the ancient Titicaca Basin correspond with significant, intentional shifts in material procurement practices. During the 5th century AD, the developing Tiwanaku elite asserted a new ideological hegemony through a novel monumental and iconographic tradition. Tiwanaku masons also switched from the red, locally sourced sandstone common in earlier ritual constructions and began quarrying, among other stones, volcanic andesite and basalt for use in temple walls and free-standing sculpture. Prior studies have used XRF based compositional analysis to locate the quarries of prominent temple stones and anthropomorphic monoliths. The results have shown how this highly visible change propagated a rejection of prior cosmology and naturalized the new order by incorporating the animate, symbolically potent environment into a constructed landscape. This study applies the same techniques to locate the quarrying sites for a set of stone sculptures called “chachapumas,” or were-felines, that hold decapitated human heads and were once situated at the entrance to temples in the Tiwanaku capital. The chachapumas’ violent imagery is a drastic departure from pre-Tiwanaku art and has a clear implication of power, so we consider them key to a better understanding of the emergence of Tiwanaku hegemony.

Bowen, Kristin (Bureau of Reclamation)

[254] *Managing the Navajo-Gallup Water Supply Project: A Federal Archaeologist's Perspective*

The Omnibus Public Lands Management Act of 2009 authorized Reclamation to construct the Navajo Gallup Water Supply Project (NGWSP) to provide a long-term water supply to the Navajo Nation, the Jicarilla Apache Reservation, and the City of Gallup. This project was subsequently expedited as the DOI's highest priority infrastructure project by Presidential Memorandum making it an out of the ordinary compliance project. The NGWSP goal of fulfilling long-outstanding water rights claims is complicated by the location and the density of the archaeological resources in the Greater Chaco Landscape. Being a congressionally mandated project brings additional complications to the large project such as determined starting and completion dates that have to be met as well as budget caps. Additional unique challenges are faced when constructing a project in a sovereign nation, as there is mixed land status, but the majority is on Navajo Nation land. Reclamation has made a concerted effort to manage this project with archaeological best practices with a high level of involvement with descendant communities. This project is a prime example of the unique challenges that federal cultural resource managers can face, and this paper is intended to give guidance for professionals who find themselves facing similar situations.

Bowers, Jordan (University of Texas at Austin)

[386] *Exploring Settlement Connectivity in the Lower Ave River Valley (Northwest Iberia) during the Iron Age Using Least-Cost Path Analysis*

During the Late Iron Age, the Ave River Valley of Northern Portugal was one of the most densely populated areas of the Castro Culture, an archaeological culture in Northwest Iberia. Settlements at this time varied in size from small agricultural sites to large urban hillforts. In this poster, I explore the movement of people, and, by connection, goods and ideas, between the settlements of the Lower Ave River Valley. I use GIS to identify least-cost paths between settlements over land, rivers, and a combination of these two that include natural barriers to travel, such as steep slopes and river cataracts. The goal of this project is to better understand the connections between settlements and their inhabitants, as well as barriers to connection during this time period.

[305] *Images-in-the-Making: Process and Vivification in Pecos River Style Rock Art*

The Lower Pecos Canyonlands of southwest Texas and northern Mexico are home to one of the most sophisticated and compositionally intricate rock art traditions in the world—the Pecos River style. This style is characterized by finely executed, polychromatic figures woven together to form mythic narratives. Artists depicted and vivified the actors in these narratives by means of semantically charged attributes, such as color, paraphernalia, and body adornments. However, also integral to image-making and equally charged with meaning is the mural's placement on the landscape, its interaction with the rock surface, the interplay of light and shadow, the order in which artists applied paint to the wall and modifications made to painted image through incising and rubbing. By analyzing these aspects of the image-making process we can begin to identify choices made by the artist in the production of the art. These choices reflect the framework of ideas and beliefs through which the artists interpreted and interacted with the world. Images-in-the-Making will demonstrate the effectiveness of this approach using examples from Pecos River style rock art.

[157] *Introduction: Out-of-the Box Archaeology Session*

In 2017, a group of leading archaeologists published a manifesto calling for the advancement of synthetic archaeology. In their manifesto, they wrote that “Among the benefits that archaeologists should deliver to the public are rigorous, evidence-based narratives of what happened in the past and how these events shaped today’s world” (p.11000). We took this task to heart. But instead of emphasizing the synthetic nature of archaeology, we wanted to highlight its relevance. We choose to do this through the presentation of highly innovation projects that choose to work on issues not usually associated with traditional archaeology. This group of papers will demonstrate how rigorous archaeological methods may be applied to issues highly familiar in our daily lives and provide significant insights that are relevant, fascinating and informative of human culture and human behavior. These are not your grandfather archaeology but projects and ideas that are truly out-of-the-box.

Boza Cuadros, Maria Fernanda (Syracuse University)

[53] *Mirages of the State: Maritime Landscapes of Southern Peru at the Beginning of the Republic, 1821-1879*

The intersection of trade regulation and geopolitical reconfigurations that followed Independence from Spain in 1821 gave the Peruvian coasts new importance in the Post-Colonial Period. Global commodity trade was an inherently

maritime endeavor and aided in the consolidation of a new oceanic world in the Pacific basin during the mid-nineteenth century. Importantly in the case of Peru, the first boom-and-bust cycle of the Republic was bird guano from the nearby Pacific islands. The ports, coves and other coastal areas gained new importance as the country's political economy underwent a maritime turn. In this paper, I employ a landscapes perspective and build on archaeological, cartographic and documentary data to understand this maritime turn as it unfolded along the southern coast. This region, which today spans southern Peru and northern Chile, experienced a faster post-independence economic recovery than the rest of the country in good part due to its links to foreign traders. As it is shown here, the southern ports became loci of contestation where the pulses of capitalism took local form, notions of power and authority were reformulated, and national belonging took new meanings.

Bracken, Justin (CUNY Graduate Center)

[345] *How Monumental Architecture Directs Movement: Defensive and Hydrological Features at Muralla de León*

Tracking patterns of everyday movement by individuals within a local population offers deep insight into the spatialized social structure of the group, providing information such as who interacts with whom, which areas are public and which are private, and the tightness or openness of different social circles. Like most human activity, though, movement is ephemeral, leaving only indirect traces of its existence. While archaeologists cannot hope to reconstruct daily movement within societies from the distant past on a granular, individual level, increasingly robust approaches are being developed to assess the bigger picture. Everyday paths of travel are strongly influenced by the natural and human-altered local terrain, which imposes barriers and conduits to movement in ways both physical and conceptual. The work presented here begins by addressing the physical impact of constructed monumental features upon such paths. An encircling rampart wall and associated hydrological features at the site of Muralla de León are the focus of the study, which uses Least Cost Path and other GIS analyses to understand their tangible alteration of potential movement. This first analysis is then measured against parallel conceptual interpretations of the space.

[259] *Remaking the Mazeway: Pueblo Bonito House Society, Redux, at Wallace Ruin*

In contrast to the ubiquitous Ancestral Pueblo practice of residential burial, at least 32 deceased were transported 10 kilometers or more for deposition within the Wallace Ruin great house. This Chacoan outlier, situated near Mesa Verde, Colorado was a ritual-economic center c. AD 1060-1150. Upon the collapse of the Chacoan system, habitation of this building, three great houses nearby, and all domiciles within several kilometers ceased. Between c. AD 1180 and 1220 a minimum of six rooms were used as a Pueblo III mortuary facility for a series of primary burial deposits. The interrogation of this anomaly involved a bioarchaeological approach that included spatial and statistical analyses of mortuary location choices. The diachronic analysis of c. AD 1050-1300 data from roughly 100 San Juan Region sites and about 1200 primary burial deposits revealed several ways in which post-AD 1180 mortuary decisions involving Wallace Ruin departed from longstanding communities of practice. The evidence detailed here supports the proposition that the Pueblo III use of this former Chacoan great house entails a Mesa Verde region reformulation of ancestor veneration protocols established by Pueblo Bonito house societies during Pueblo II times.

[120] *The Use of Geophysics to Image Structures at Broyhill Mound (31CW8)*

Geophysical surveys were conducted at the Broyhill Mound, a protohistoric late Burke village in the foothills of the Southern Appalachians ~30 km northeast from Fort San Juan/Berry (1566-1568), to guide investigations. The site was first discovered by John Rogan for Cyrus Thomas in 1883, and then rediscovered by Richard Polhemus in 1964 and Appalachian State University in 1995. Field schools have expanded these tests in 2012, 2014, 2016, and 2018. In 2012 a 3-D model of GPR data showed the presence of subsurface intrusions and initial results suggested a large deep anomaly at a depth of 50 cm BS. In 2018 a magnetic susceptibility survey was conducted across this same area. Field school excavations exposed a 7m diameter protohistoric Happy Valley Phase structure with a semi-subterranean floor and associated post holes – which are yet to be excavated. This investigation and these results are presented herein.

[135] *New Perspectives on Cultural Heritage Protection Informed by Public Opinion Surveys*

Despite past cultural resource protection efforts, looting remains a prevalent issue throughout the U.S. While the laws may be adequate, current methods of and emphasis on detection and enforcement of these crimes are not. This paper discusses new perspectives on cultural heritage protection based primarily on the results of two surveys. The first involved Wyoming archaeology advocates and members of the public within highly-looted parts of the state and focused on assessing public perceptions and attitudes towards archaeology in Wyoming. The second is the 2018 American Perceptions of Archaeology Survey conducted on behalf of the SAA. Such concepts include a new, organized approach to methods for detecting looting; Archaeological Violation Investigation and Damage Assessment training for those involved in detection and prosecution efforts; incentivized detection and prosecution efforts and media focus on successfully prosecuted cases to emphasize the impacts and seriousness of ARPA punishments and make them more common-knowledge; incorporation of Native perspectives establishing a tangible connection to the collective past; influencing societal norms through ethics/morals-based educational efforts targeted at the future generation; and the continuation and expansion of site stewardship programs.

[360] *The Planned Conversion of a Sascabera into a Man-made Cave: Evidence from Chichen Itza*

During the construction of a plaza group on a 5 m high raised platform, a sascabera was excavated into the hill that formed the nucleus of the group. The original circular opening in the cap rock was carefully maintained. When the platform was completed, the northern end of the sascabera was filled with rubble and smoothed to form the base of the platform. A floor-to-ceiling retaining wall was built against the rubble to protect the southern portion. The circular entrance now permitted entry into the cave-like chamber. The planning was such that the opening and chamber were placed in the center of the plaza on the platform. A capstone in the form of a possible turtle was found near the entrance. Over 2300 sherds were recovered from the small chamber. A number of sherds were covered with calcium carbonate, indicating that they had been redeposited from a cave. Additionally, a stalagmite in the form of a phallus was found. Clearly, the Maya had plans to create a cave from the time that the sascabera was begun and presented a clear message of their intent by caching vessels from another cave in this space.

[252] *The Process of Interpretation: The Antiquity of the Namurlanjanjyngku and Post-Contact History in Yanyuwa Country, Northern Australia*

The search for meaning in rock art has been the focus of scholarly attention and debate for decades. A common feature that unites many of these studies is what the enquiry produces – for example, what a motif represents. However, studies focussing on the processes by which meaning is generated are, comparatively speaking, fewer in number. In this paper, we explore how Yanyuwa Traditional Owners from northern Australia engage with meaning and interpretation of radiocarbon dates for motifs linked to well-known spiritual beings. Our case study is a large sandstone rockshelter on the west coast of Vanderlin Island called Kammandaringabaya. Here, hand prints and hand stencils cover the shelter walls and roof, and are said by Yanyuwa to be the work of the namurlanjanjyngku. In 2017, we began a collaborative dating project aimed at identifying the antiquity of the namurlanjanjyngku. While Yanyuwa understandings of the namurlanjanjyngku and their rock art are embedded in narratives concerning events from the Dreaming, Yanyuwa interpretations of the relatively recent radiocarbon dates (post-European arrival) add another layer of meaning to the site that continues to not only reinforce the complex relational structure the motifs are embedded within but also engagement with Yanyuwa post-contact history.

[414] *The Materiality of Authority: 17th Century Native Leadership in Colonial New England through the Lens of Value Theory*

The practices of men and women leaders in Native Southern New England pose a number of interesting questions for scholars interested in the intersection of materiality and value. In the 17th and early 18th century, Native leaders claimed authority through descent, colonial patronage, and/or religious practice. Central to their success moreover, was presentation and performance, marked by the deployment of distinctive dress and other salient objects. This paper employs documentary, archaeological and comparative ethnographic data to explore the variety of ways in which Native leaders negotiated the upheavals of the early Colonial period through strategic performative display.

[368] *Trans-Holocene Human Impacts on Endangered California Black Abalone (*Haliotis cracherodii*) Population Structures: Historical Ecological Management Implications from the Northern Channel Islands*

Black abalone (*Haliotis cracherodii*) were an important subsistence resource in southern California for 10,000 years, first for coastal Native Americans, then as a commercial shellfishery. By 1993, however, black abalone populations declined dramatically, resulting in the closure of the California fishery. Recently, black abalone are showing signs of population rebound along some Channel Island shorelines, including the presence of juveniles and increasing densities. We analyzed black abalone size data from San Miguel Island at prehistoric and historical archaeological sites spanning the last 10,000 years and compared these populations to those described by Channel Island National Park biologists between 1985 and 2013. We found a statistically significant relationship between SST and black abalone size distributions during the ancient record, along with dramatic shifts in population size structure towards larger individuals between the nineteenth century and modern periods. Our study provides a deep historical perspective of abalone population size distributions, patterns within these distributions through time, and parallels to modern abalone populations, and may help managers determine whether the current (and future) size and age structure of black abalone populations around the northern Channel Islands are "natural" and healthy.

[32] *Mochena Borago Rockshelter and the Southwest Ethiopian Highlands as a Late Pleistocene Hunter-Gatherer Refugium: The Current State of Research*

One of the long-term goals of the Southwest Ethiopia Archaeological Project (SWEAP) is to test the hypothesis that the SW Ethiopian highlands were a major refugium for plants, animals, and hunter-gatherer groups during the very arid periods of MIS 4 (~72-59 ka) and MIS 2 (~27-12 ka). In highland Wolaita, SW Ethiopia, Mochena Borago Rockshelter (MB) allows us to explore the archaeological record of these critical time periods. Within the 70-m wide shelter, excavations since 2015 have focused on the central area, revealing deposits that clearly date to >50 ka, and probably much earlier. Framed by current knowledge of early Late Pleistocene paleoenvironments in the Horn of Africa, we review recent research at MB, including 1) problems and prospects of chronometrically dating >50ka deposits by obsidian hydration, argon/argon and tephrochronology; 2) analysis of lithic (flaked stone) assemblages from these deposits, which represent Mode 3, 4 and 5 technologies (including Nubian), but have lower proportions of obsidian and higher percentages of non-obsidian volcanic toolstone than younger contexts in the MB Pleistocene sequence; 3) higher frequencies of ground stone artifacts, many of which are stained with ochre most likely retrieved from the shelter walls; and 4) current and future archaeobotanical research.

[23] *Comparing Middle Woodland and Mississippian Period Agglomerations in the Eastern Woodlands of North America*

Large aggregated settlements have been a persistent feature of the settlement landscape of the Eastern Woodlands of North America for more than 3000 years. By the turn of the first millennium ephemeral agglomerated settlements become common settings for the enactment of practices and traditions that presage the next thousand years of cultural development. The Middle Woodland period (ca. A.D. 1-600) featured sites that hosted macroband aggregations. These included large-scale seasonal events as well as repeated visits to and utilization of the same locations in the landscape. This included the construction of monumental architecture (mounds) and earthworks and group-affirming mortuary practices. Later, in the Mississippian period (ca. A.D. 1000-1550), people came together again into relatively permanent large, aggregated settlements that have traditionally been characterized as chiefdoms. In this paper, we take an approach that draws upon the global literature on and theoretical perspectives that have been applied to ephemeral agglomerated settlements to explore qualitative and quantitative differences between Middle Woodland and Mississippian period aggregations. Our results suggest that these cases are more similar than they are different in terms of: 1) What brought people together, 2) The practices that facilitated and maintained them, and 3) Why they eventually dissolved.

[175] *One Thing Leads to Another: Causal Triggering among Archaeological Events*

A causal connection between archaeological events is frequently little more than a convenient assumption. The repeated occupation of a site, the occurrence in time and space of a ceramic ware, or the phases of settlement construction are all assumed to reflect some causal sequence, but it is far from clear how we should detect and quantify such causation. Without direct evidence of causation, it is difficult to argue for ancestor-descendant relationships, compromising our ability to make evolutionary inferences. This paper extends self-exciting point process models for estimating causal dependencies between events in space and time. We argue that ancestor-

descendant relationships are more plausible when we can demonstrate spatio-temporal statistical dependence between events. We explore this problem using a large radiocarbon database from North America to estimate the date of first human colonization.

[247] *Building Expectations to understand the Evolutionary Significance of Archaeological Assemblages*

Although the past thirty years has witnessed tremendous advances in our understanding of the geographic and temporal scope of the Paleolithic record, we still know remarkably little about the evolutionary and ecological consequences of changes in human behavior. Are there events in human evolution that dramatically change how humans interacted with their surrounding environment? Recent inquiries have suggested that human evolution reflects a long history of interconnections between human behavior and their surrounding ecosystems (e.g. niche construction). Yet developing expectations to identify such phenomena is remarkably difficult. These long-term dynamics require an understanding of emergent phenomena that alter selective pressures over multiple generations. Generative models show remarkable promise for probing these potentially unexpected consequences of human-environment interaction. Here we describe preliminary agent-based models that can be used to develop predictions about how changes in human land use can be detected. In particular, we describe models that can be used to develop expectations for empirical measures of archaeological lithic assemblages. We explore other potential proxies of behavior and how modelling may provide expectations for a variety of different phenomena.

[355] *Comparative Analysis of Imperial Inca Pottery from Ecuador using INAA*

An enduring question in Inca archaeology concerns the issue of imperial pottery production. Inca ceramics, which are found across an enormous expanse of Andean South America, are known for their high degree of uniformity in vessel form, proportionality, and embellishment. How did the Inca manage the production of their signature style and achieve the level of standardization that they did? Early thinking assumed that imperial pottery was mass-produced in highly controlled workshops in the capital city of Cuzco and exported from there to points around the Empire. Subsequent studies at provincial Inca sites hinted that state pottery production and distribution was a more regionalized affair. Recent analyses of paste types and clay sources from various sectors now confirm that Inca pottery production was largely de-centralized and occurred at any number of locales throughout the Empire. The present study contributes to this picture by reporting on the compositional analysis of Inca ceramics from several key Late Horizon sites in Ecuador. Our findings indicate that imperial style wares in the northern Andes were manufactured locally in different regions. Further, within each region, these wares were produced in multiple paste recipes, implying a lack of centralized control of the manufacturing process.

Braymer-Hayes, Katelyn and Shelby Anderson (Portland State University)

[10] *A Spatial Analysis of Ceramics in Northwestern Alaska: Studying Pre-Contact Gendered Use of Space*

Activities and production among ethnographic Arctic peoples were primarily divided by gender. This research examines whether or not gendered division of labor extended to use of space in Birnirk and Thule era (1300-150 BP) houses through analysis of ceramic distribution patterns. We assumed that ceramics are an appropriate proxy for women's activities within the house, based on strong associations between women and ceramic production and use in the ethnographic period. We evaluated the spatial density of ceramics and other gender-specific artifacts using the HDBSCAN (Hierarchical Density Based Spatial Clustering of Applications with Noise) algorithm in Python, a programming language. HDBSCAN identifies discrete clusters of artifacts, as well as the stability of the cluster. We did not find evidence of gender specific use of space or specific activity areas within the house. There were confounding factors, including issues of sample size, house size, and depositional processes. Ceramics mostly clustered in house entrance tunnels, which is likely the result of cleaning or storage activities. In main rooms, clustering of all artifacts was idiosyncratic; male and female artifacts were not spatially segregated. While the results were inconclusive, they still are an important contribution to addressing questions of gender in the Arctic.

Breault, Sarah and Jeffrey Blomster (The George Washington University)

[398] *Feasting and Performativity at Late Formative Etlatongo*

Previous research on feasting in antiquity has demonstrated the importance of surface appearance and vessel form to interpret the performative aspects of rituals such as feasts. As part of the hosts' strategies, of particular importance are vessels that invoke exotic imagery and/or outside groups through iconography and or aspects of overall vessel design. Recent excavations at Etlatongo discovered a large cache of Yucuita phase (500-300 BCE) ceramics deposited following a feast; many vessels bear a strong resemblance to those produced at Monte Albán, an early urban center founded during the same period. The presence of goods that are distinctly similar to those from Monte Albán suggests a link between the hosts and urban center. This paper explores the significance of iconographic elements, with particular attention to their visibility and intended audience. Vessels were visually analyzed with particular attention paid to technique, angles of best visibility, and overall size of the vessel, complete design, and individual elements. This study contributes to ongoing discussions of iconography and leadership strategies in the Mixteca Alta at this time, and to considerations of the role played by objects in feasting and performing.

Breetzke, David**[145]** *"Quickly, bring me some wine, so that I may wet my mind and say something clever." Understanding the Viticulture Industry in Kentucky, Ohio and Indiana*

The agricultural industry in America was one of the most profitable industries of our past. This paper will focus on one important aspect of that industry. The viticulture industry was firmly established in Ohio, Indiana and Kentucky from as early as the 1800s. Unlike most agricultural industries, preparing, cultivating and harvesting grapes took the right property, great skill and a passion for wine. Even though the viticulture industry was ultimately crippled by a silent killer, remnants of this dynamic industry still remain. The purpose of this paper is to lay the ground work for research and recordation of this valuable Midwest agricultural industry.

Bremer, Jon (Santa Fe National Forest) and Anne Baldwin (Santa Fe National Forest)**[90]** *Managing Between Earth and Sky: Forested Landscape Cultural Resource Management in the Jemez Mountains*

Human use of the Santa Fe National Forest extends well back into the past. This use remains unbroken from the earliest occupation of the land by humans into the present. Unlike many other areas there has been no hiatus of human use. The ties of modern American Indian populations, the earliest of European occupations in the western United States and conquest and occupation by eastern American populations have all made their mark on the lands of the Santa Fe resulting in a dense and complicated archaeological record. This record provides challenges and opportunities for land managers seeking to meet the demands of local populations for traditional resources and facing the pressures of increasing visitation. This portrays the history of cultural resource management on the Santa Fe National Forest and presents trends in historic preservation on the Forest in collaboration with tribes, local communities and interest groups.

Brenan, Julia (Memorial University)**[87]** *Access to Information: The Case of Birch Island*

The recent archaeological project on Birch Island, Labrador, highlights questions of how digital data are used to gather and convey information to stakeholder communities, in particular, Indigenous groups with limited internet access in some remote locations. This paper questions if representing the research in a digital format is more effective than traditional alternatives that require less digital literacy and specialized equipment to access heritage. This will be done through data obtained during fieldwork and a review of the literature. Finally, this paper questions who has ownership over, and access to the digital data and how will these data be preserved and perpetuated after the project is over.

Brenan, Julia [271] see Lewis-Sing, Emma

Brennan, Ellen (National Park Service)**[21]** *Field-Based Decisions on Collection of Archaeological Materials: Monitoring and Ethics*

Cultural Resource Managers are faced with increasing challenges regarding collection of archaeological materials from site contexts. Increased visitation, information sharing through social media, and emerging forms of recreation taking people to previously unexplored areas, contribute to challenges to preserving previously unknown archaeological sites and the materials they contain undisturbed. Federal land managers are directed to manage archaeological resources in situ, "unless the removal of artifacts or physical disturbance is justified by research, consultation, preservation, protection, or interpretive requirements" (NPS Management Policies 2006). To our tribal colleagues artifacts represent tangible evidence of their ancestors. Such items also represent intangible connections to past ways of life and add an ephemeral quality to archaeological sites that is irreplaceable. Materials gathered during data recovery projects are always curated for future study and use. Those from unexcavated archaeological contexts must be carefully evaluated to determine if collections should be made. Grand Canyon National Park cultural resource managers use monitoring information and field-based decision making to guide our actions regarding collection and curation of archaeological materials in otherwise in situ archaeological contexts.

[128] *Evaluating Differential Animal Carcass Transport Decisions at Regional Scales using Bayesian Mixed-Effects Models*

Zooarchaeologists frequently face the problem of explaining uneven skeletal element representation, with explanations involving either non-human taphonomic agents or differential carcass transport decisions made by humans. Existing statistical methods for evaluating these explanations are generally applicable at the assemblage level but are not suited for larger spatial scales encompassing multiple assemblages: inferences about the dietary variables underlying regional skeletal element patterns are complicated by inter-assemblage variability in sample size, in taphonomy, and in the underlying transport behaviors of interest. Bayesian mixed-effects models offer a way to address these issues, allowing for analyses of the dietary variables that structured transport decisions across assemblages of varying sample sizes and taphonomic histories. An example application is provided with the late Pleistocene record of anthropogenic bison assemblages in North America, which have been long argued to reflect transport decisions differing from those in the Holocene. This approach is generalizable to any regional archaeofaunal record containing a common prey animal that humans procured and differentially transported, and therefore, could be applicable to the archaeological investigation of hunting economies in a diversity of contexts.

[181] *The Legacy of Early Fire Rituals: The Social and Spatial Prominence of Hearths after Kotosh at Hualcayán, Peru*

Scholars have long considered how the use of ritual hearths in early Andean temples, specifically those part of the Kotosh Religious Tradition, was central to early complex social practices in highland Peru. But what is the legacy of hearths as ritual spaces, objects, and tools for the transformation of materials in places where Kotosh was eventually rejected and replaced? To explore this question, this paper examines hearth rituals at Hualcayán (Ancash, Peru) spanning 1800–1 BC. Hualcayán's early temple was a mound featuring Mito-style Kotosh enclosures

where burning was an intimate rite visible only to people gathered within. By 1200 BC, people covered their last Kotosh enclosure and later burned fires in exclusive performances atop a small prominent platform—a practice that endured in the same location between 900 BC and at least AD 200, or during and after Chavín's religious influence. Fire also became important to other Chavín-era ritual activities, such as to produce ash for interring children in the mound. Thus, although hearth ceremonies changed drastically, fire maintained ritual prominence. This paper reviews these ritual and spatial patterns of burning at Hualcayán in order to reconsider the centrality of ceremonial hearths after Kotosh during Central Andean Formative Period.

[145] *Toward a Household Archaeology of the Onöndowa'ga:' (Seneca Iroquois) White Springs Site, circa 1688-1715 CE*

The Onöndowa'ga:' (Seneca Iroquois) White Springs site near Geneva, New York, was occupied circa 1688-1715 CE. The town, approximately 3.4 hectares in size and likely palisaded, was founded in the aftermath of the 1687 French-led Denonville invasion that destroyed several Onöndowa'ga:' towns and most of their agricultural fields. Cornell University-sponsored fieldwork took place at the site from 2007 to 2015, focusing on the impact of warfare and adverse political-economic conditions on Onöndowa'ga:' community structure, house forms, and material practices. Portions of four longhouse structures were uncovered during these excavations, including well-contextualized samples of material culture and faunal and botanical remains, creating the opportunity to compare households across the site. The material traces of everyday practice within these domestic spaces attest to the economic and political strategies and cultural practices of household units within a community under duress. External spaces of activity associated with specific longhouses allow investigations of public activities and community-strengthening practices among the tightly-clustered households. This study presents preliminary findings on the domestic areas of the White Springs site, exploring these spaces as sites of household-centered and community-oriented responses to warfare and challenging conditions.

[308] *Maize, Womanhood, and Matrilineality: A Study from the Mississippian Site of Moundville, Alabama*

Ethnohistoric and ethnographic evidence demonstrates that various factors can influence kinship patterns, but among the most influential are those related to subsistence. However, such findings are rarely applied to the prehistoric American South, where researchers largely project the matrilineal descent of historic Native groups into the pre-Columbian past. While the widespread practice of this matrilineal descent does suggest prehistoric origins, the notable shift from small-scale horticulturalists and agriculturalists of largely endemic plants during the Woodland period to large-scale agriculturalists of the introduced maize plant in the Mississippian period deserves closer attention. Here, I use complementary lines of archaeological evidence to suggest the practice of matrilineality in the Mississippian Black Warrior River Valley of west-central Alabama replaced an endemic Late Woodland system of patrilineality. I suggest that this change was triggered by the widespread adoption of a number of practices related to maize agriculture that can broadly be summarized as "Mississippian womanhood."

[83] *Memories of the Past and Its Impact in the Present: Conceptions and Misconception of the Irish Immigrant Experience in the United States*

Alienating immigrant groups is not something unique to this generation. Immigrants to the United States, long before labeling human beings legal or illegal was commonplace, have been deemed either desirable or undesirable, moral or immoral, valued or value-less. Such categorizations have had a debilitating impact on the daily lives of immigrant collectives. To unmask this neglected and overlooked aspect of the immigrant experience in the U.S., archaeology must bring to light not only the impact of U.S. policy alienating immigrant communities over time, but more importantly its material signature as it reflects the experiences and daily lives of immigrant collectives. The aim of this presentation is to highlight my research of the 19th and early 20th Irish immigrant laboring communities in the United States as an entry point confronting the exclusionary nature of U.S. immigrant policies over time. Moreover, the paper includes a discussion of the research's potential to be used in confronting present-day issues of alienating U.S. policies and public sentiment, as well as provide an intimate human portrait to the thousands of people cast aside.

[154] *Home-making in the Khorezm Oasis (Karakalpakstan, Uzbekistan)*

A key feature of mobile pastoralism is the circulation of kin groups within a landscape, where movement is structured at least in part by the repeated return to places of social and ritual significance. Cultural anthropologists describe these as practices of “belonging made by moving,” where notions of lineal descent, home, and homeland are spatially and temporally inscribed on a landscape through the act of returning to dwell in places of ancestral significance. In this paper, I explore how the semi-settled, agropastoral populations of Central Asia’s Khorezm oasis may have practiced similar forms of home-making since the 1st millennium B.C. In Khorezm, mobility is enacted over the longue durée, with evidence of return documented in the recurrent re-inhabitation of settlement sites by both the living and the dead. I argue that these acts of return are more than pragmatic uses of landscape features for quotidian ends, and I highlight various sources of evidence that indicate such spaces are marked repeatedly in ways that make claims to kin, clan, and the household. Evidence of home-making through re-inhabitation practices in Khorezm serves as yet one more example of the ways this oasis may be viewed as part of the steppe world.

[350] *The Role of Women Following a Community Archaeology Project in Agua Blanca, Ecuador (1979-2018)*

The Agua Blanca community has participated in one of the most successful and sustainable community archaeology projects in Ecuador. Since the start of excavations in the Manabí region in 1979, archaeologist Collin McEwan and Maria-Isabel Silva have worked collaboratively with community members to excavate, interpret, and present findings about the Manteño culture of coastal Ecuador. When McEwan and Silva left Agua Blanca in 1995, the community assumed full agency over these projects in a sustainable community tourism practice. Much has changed in Agua Blanca since the project’s inception in 1979, including gender relations and women’s involvement in the project. My paper discusses how a shift in the women’s participation has shaped the successful development of the community archaeology project, and why it’s important for archaeologists to engage with such issues in future community collaborative research over time. Further, I seek to understand how the women perceive themselves as contributors to the project through craft production, decision making, and engagement in cultural activities.

[310] *The Use and Benefit of Integrated Geophysical Survey in the Study of an Irish Early Medieval Site Rath Maol*

This paper addresses the value of an integrated geophysical survey approach, which includes the application of GPR, DGPS, and magnetic gradiometry, to identify archaeological areas of occupation non-invasively. This approach was applied to RathMaol, as part of a larger ongoing research project, Castles in Communities, which encompasses several medieval sites, in the Connacht region of Ireland. These sites present the opportunity to study wide swaths of landscape as they changed over time, in a region that encountered both conflicts between local Gaelic lords and colonization by invading Anglo-Normans.

Integrated geophysical surveys allow for an improvement in our understanding of archaeological sites without the invasiveness of excavation and provide the opportunity to make educated decisions for targeted excavation. Here we present how integrating GPR and magnetic gradiometry, after adjusting for surface elevation changes, is used to analyze the interior and surrounding features of RathMaol. These geophysical techniques were merged and interpreted jointly to produce images of the stratigraphic units and objects found within and around Rath Maol to determine their extent and composition. The success of the data analysis methods performed at this site shows the interpretive potential of non-invasive geophysical techniques, both in Irish contexts and around the world.

[30] *Connecting Archaeology and Ecology in Northwest Belize*

Some archaeologists believe that a key to the success of ancient Maya civilization was sophisticated tailoring of agriculture and forestry to varied environments. Some archaeologists and ecologists also think that ancient forestry is reflected in the tree species composition of modern forests. Based on studies in northwest Belize we suggest, first, that correlations among modern, landscape-level variation in soil, slope, and forest types show clear potential for sophisticated management. Second, we suggest that ancient Maya alteration of soil and slope by construction, agriculture, and erosion has broadly affected the forest that regrew on the ancient landscape. Third, we think studies to date that attempt to link modern forest composition to ancient forest management are flawed or open to interpretation, or show local effects on composition, at most. We present a framework for research on the effects of ancient land use on the modern Maya forest, including: 1) studying more post-conquest documents for information on historical Maya forestry, 2) systematic sampling for ancient plant remains along environmental gradients, 3) ground and remote-sensing studies to link tree species and forest types to landscape variation, and 4) "species distribution modeling" to compare likely composition of pre-ancient Maya forest with post-ancient Maya forest.

[368] *Using the Present to Uncover the Past: Reconstructing the Ecology and Behaviour of Extinct Large Mammals on the Palaeo-Agulhas Plain (South Coast, South Africa)*

Understanding the ecological role of extinct large mammals is an ongoing challenging research problem. The use of species traits (physical and behavioral) to characterize functional communities is becoming common in ecological modelling and is key to understanding the ecological role that species would have filled under historic conditions. This same approach may help elucidate the ecological role of extinct species. Here we illustrate this approach with extinct species of the Palaeo-Agulhas Plain (PAP) during the last glacial maximum. Using functional groups representing an array of characteristics displayed by similar species (e.g. social behaviors, stress response, forage choice, and interpretation of the landscape) we can understand the ecological niche that the extinct species of the PAP would have filled. To relate current behavior of large mammals to those that are now extinct we determined functional groups of extant species (southern and east Africa) using Principle Component Analysis combined with a hierarchical tree analysis. We then linked the extinct species of the PAP, through known taxonomic and feeding guild traits to the extant functional groups. This provides us with an understanding of the ecological and behavioral characteristics of extinct large mammals and the integral part these species played in the PAP landscape.

[101] *The World of the Living and the World of the Dead - A Bronze Age Monumental Landscape in Central Mongolia*

The Bronze Age landscape in Mongolia is characterized by valleys with regularly arranged groups of monuments which are believed to represent the focus of a community. Depending on the ecology of the area the distance between such site clusters varies. This even distribution is punctuated by large concentrations of monuments at distinct places. Over the past years we have been conducting an in-depth-investigation of such a special locale, the cemetery of Maikhan Tolgoi located in the Upper Orkhon Valley of Central Mongolia. Additional surveys informs us about the spatial patterning of sites in the Upper Orkhon Valley as well as the locations of campsites. With our bioarchaeological approach we furthermore explore the social units who built this cemetery and discuss whether and in how far they are similar or distinct from the normal groups of monuments.

[368] *Population Reconstructions for Humans and Megafauna Suggest Mixed Causes for North American Pleistocene Extinctions*

Dozens of large mammals such as mammoth, mastodon, and horse (i.e., "megafauna") disappeared in North America at the end of the Pleistocene with climate change and "overkill" the most widely-argued causes. However, the population dynamics of humans and megafauna preceding extinctions have received little attention, even though such information may be especially telling, as we expect increasing human populations to drive megafaunal declines if hunting caused extinctions. We present a novel test of this hypothesis here by using summed calibrated radiocarbon date distributions and simulations to reconstruct population levels of megafauna and humans. These results suggest that the causes for megafauna extinctions varied across taxa and by region.

Brouwer Burg, Marieka and Meghan Howey (University of New Hampshire)

[365] *Unbinding Diversity Measures in Archaeology Using GIS*

Several papers in "Quantifying Diversity in Archaeology" identified space as a critical factor in structuring diversity and called for whole landscape, regional-scale analyses to improve archaeological approaches to diversity. The capabilities of today's geospatial technologies were unimaginable at the time but now, the desire to analyze diversity across multiple sites from entire regions is easier to realize computationally. Nevertheless, key challenges identified by some of the papers in the original volume persist today. Of particular interest here is the challenge mounted by Cowgill: we need to understand what diversity means and how the categories we use to compute diversity are related to actual variation in past behavior(s) of interest. This paper will explore interconnections between ethnocartography and GIS and how combining indigenous cultural perspectives with spatial technologies can facilitate understandings of how sites may have been distributed in different "categories" across landscapes. Further, as Hurst Thomas wrote in his chapter, archaeologists need to understand the "strategic decision-making behind the mosaic of prehistoric cultural geography." By centering the experiences of people producing and, importantly, perceiving the variation extant in their landscape we aim to explore such cultural geographies and illustrate our ideas with case studies.

[134] *More Than Pretty Pictures: A Decade of Aerial Imagery and Photogrammetry in Northern Ecuador*

Since 2007 our team has been conducting low level aerial reconnaissance in the northern highlands of Ecuador, a challenging environment with low air pressure, frequent high winds, misting rain, and rapidly alternating intense sun and enveloping low lying clouds. We struggled with our kites that initial year but managed to build the first high-resolution aerial map of an Ecuadorian Inka fortress. During subsequent years, the switch to drones and improved photo-analytical capacity opened a new world of visualization to us and our colleagues, though never without challenges from the difficult environment. Beyond the beautiful images of the Inka fortresses, mound sites, and haciendas that we were mapping, however, was the power of photogrammetry and 3D modeling in building not only precise images but offering a better overall structural understanding as well. Complex slope models and volumetric cut and fill calculations were among the analytical techniques we could bring to the first complete maps of the large earthen mound centers at Cochasquí and Zuleta, for example. Ultimately, the ability to analyze landscapes in real time became our standard, and in conjunction with powerful subsurface tools such as radar and magnetometry, such visualizations have become an essential tool for our investigations.

[272] *A Summary of Results of Survey of the Northern End of Guadalupe Mountain, Rio Grande del Norte National Monument*

For many years archaeologists working in the northern Rio Grande of New Mexico and southern Colorado have encountered a very fine-grained, dark gray or black material that has been identified as dacite. Dacite has previously been recognized as occurring in the Taos Plateau Volcanic Field at San Antonio Mountain and Newman Dome, and recent survey of 720 acres of the north end of Guadalupe Mountain in the Rio Grande del Norte National Monument found it naturally outcrops there as well. This paper presents the results of the survey with a discussion of settlement patterns, site formation processes, and differential uses of various lithic materials in the context of this lithic raw material source.

[393] *Building Nearest Neighbor Models of Hunter-Gatherer Settlement Systems Using Four Case Studies for the Northwest Coast of North America*

Spatial analysis of settlement patterns have traditionally focused on hierarchical city states. Seldom do settlement pattern studies use spatial statistics to characterize hunter-gatherer settlement systems. Through the application of nearest neighbor analysis this paper characterizes the settlement patterns for four sub-regions of the Northwest Coast of North America. The four case studies come from published datasets for Prince Rupert Harbour, the Outer West Coast of Vancouver Island, the Fraser River Canyon, and the Northern Coast of Vancouver Island. With each of these case studies and much of the Northwest Coast in general resources and habitable areas are highly localized and circumscribed. By virtue of living around large bodies of water, access to land becomes a resource itself. Many nearest neighbor models assume a homogenous landscape. The spatial models presented in this paper attempt to account for this heterogeneity considering rivers and bodies of water spaces that cannot be inhabited. By controlling for these external variables, point pattern analyses have the potential to describe the settlement distribution of groups in the Northwest Coast and, by comparing these results to other culture groups and time periods, aid in disentangling the relationship between political structure and settlement organization.

Brown, Kaitlin (University of California, Santa Barbara) and Linda Scott Cummings (PaleoResearch Institute)

[397] *Food Residue Analysis on Soapstone Cooking Vessels in the Chumash Homeland: Implications for Changing Foodway Patterns during the Mission Period across the Colonial Landscape*

This paper discusses the results of pollen, phytolith, starch, and organic residue (FTIR) analyses conducted on soapstone cooking vessels in museum collections uncovered in the Los Angeles and Santa Barbara areas, California. The vessels were excavated from distinct chronological and spatial contexts in the Chumash homeland: a pre-Mission period site (CA-LAN-243), inside the indigenous adobe apartments at Mission La Purisima (CA-SBA-520), and a historic Chumash village outside the mission space (CA-SBA-209). We show changing patterns in Chumash foodway practices during the Mission period, which include not only the consumption of new foods but also the incorporation of new subsistence technologies. In the pre-Mission period, the Chumash used soapstone vessels to cook ground grass seeds and roots/tubers. However, during the Mission period, the Chumash began to cook corn (*Zea mays*) in soapstone bowls in the mission, while outside the mission, at site CA-SBA-209, we found evidence of wheat that was cut with a threshing sledge—an introduced Spanish technology. These findings parallel recent colonial studies that evaluate the changing socio-political landscape and highlight the dynamic interplay of Spanish and Native interactions in the creation of new practices and shared social identities.

Brown, Linda (University of New Mexico) and Kitty Emery (Florida Museum of Natural History, University of Florida)**[358]** *Negotiating with the Lord of Wild Animals: Maya Ritual Practices and the Distinctive Life-Histories of Animal Bones*

In various contemporary Maya communities, hunting involves careful negotiations among various active agents – human and other-than-human – involved in the hunt. A pivotal actor in these negotiations is the deity known as the Lord of Wild Animals, the supernatural gamekeeper of the wild species in the forest. Hunters must maintain strong reciprocal relations with the Lord of Wild Animals, who must be approached, propitiated and appeased via proper ritual channels before and after a hunt. Ethnographic records of the activities and objects associated with the hunter's ceremonial obligations suggest that despite regional variability, some actions and objects are consistent across the Maya area. Among these is the special treatment and disposition of bones from successfully hunted creatures. Archaeological iconography documents a great antiquity for these negotiations suggesting that material markers, in the form of evidence for distinctive animal bone life-histories, might also be recognized in the archaeological record. In this paper, we examine contemporary hunting-related ritual practices and how they might impact deposition and recovery of materials including animal bones and associated artifacts. We use these data to suggest archaeological material markers that could point to the role of supernatural animal guardians in the past.

Brown, M. Kathryn (The University of Texas at San Antonio) and Jason Yaeger (University of Texas at San Antonio)**[345]** *The Sacred Landscape of Xunantunich, Belize*

Early Maya communities centered themselves within a broader sacred landscape imbued with meaning through ritual practices. Centuries of movement through the landscape converted spaces into places that were deeply rooted in cosmology and social memory. Ritual practices at the center of the community and important places in the cardinal or inter-cardinal directions were integral to establishing the community's sacred center and maintaining cosmological order. These important places include natural features such as hilltops and caves, as well as constructed features such as platforms and pyramids. In this brief presentation, we discuss the sacred landscape of Early Xunantunich during the Preclassic period and highlight changes and transformations that occurred during the Classic period.

Brown, Marley**[295]** *Convergent Pathways of Enslaved Materialities: The Case of Eighteenth-Century Bermuda and Virginia*

2019 marks the four hundredth anniversary of the arrival to the first Africans to Jamestown, Virginia's founding colony, individuals captured by English privateers from a Portuguese slaver on its way to Vera Cruz, Mexico. Many captives in the same cargo were taken the same year to Bermuda, England's other colony controlled by the same joint stock company. What happened to the Africans brought to these earliest of England's New World colonies? Archaeological evidence recovered over the last thirty years from excavations in Tidewater Virginia and Bermuda demonstrate a complex dialectic of accommodation and resistance in the material lives of the respective enslaved populations of the two colonies, a dialectic that can be best interpreted using a conception of the "innovative materiality of revitalization" first developed by Matthew Liebmann for understanding the fate of the Jemez during the period of the Pueblo revolt. This model helps explain both the increasing participation in the transatlantic consumer economy by Virginia and Bermuda enslaved people, and their important revival of West African ritual practices. The value of this model to these case studies supports a more unified approach to the study of both indigenous historical archaeology and that of the African Diaspora.

Brown, Mary and Alexander Kurota (Office of Contract Archaeology)**[413]** *Limonite as Evidence for Pottery Manufacture at Jornada Mogollon Sites*

Recent fieldwork at Cottonwood Spring Pueblo and other Doña Ana and El Paso phase sites in New Mexico's southern Tularosa Basin consistently reveal evidence of pottery manufacture. Pieces of natural and worked limonite have been found in proximity to jar fragments with a yellow coat of paint on their interior and sometimes exterior surfaces. Chupadero Black-on-White, El Paso Polychrome and El Paso Brown jars appear to be the primary types used to hold paint during the process of decorating vessels. Once fired, limonite turns red, which was used to produce either the red paint or red slip for creating El Paso Bichrome and El Paso Polychrome painted designs.

Brown, Matthew and Véronique Bélisle (Millsaps College)**[289]** *A Study of Social Inequality at the Andean Prehistoric Site of Ak'awillay*

While most research on emerging inequalities in prehistoric societies has focused on the elaboration of inequality in villages and polities on the periphery of large states, less attention has been placed on settlements existing outside

influential regional centers. In this paper, we present the case of the Andean Middle Horizon (600-1000 C.E.) site of Ak'awillay, one of the largest villages in the Cusco region at the time of Wari colonization. Ak'awillay presents an interesting case to study the elaboration of inequality because of its long tradition of interaction with the nearby Cusco Basin, its low incidence of violence during the Middle Horizon, and its apparent isolation from Wari colonists. In this paper, we compare two domestic groups excavated at Ak'awillay to verify the existence of an elite group and assess wealth and prestige differences between the two areas. Analysis of ceramic and obsidian densities, ceramic distribution, architecture, and burial offerings reveals minor wealth differences, suggesting that inequality was not fueled by the manufacture and exclusive circulation of sumptuary goods. However, the presence of a public building that likely held feasts points to differences in prestige that relied on the production of food and beverages.

Brown, William (Department of Anthropology, University of Washington)

[127] *Inferences about and Inferences from: A Comparison of Kernel Density Estimation and Latent Mixture Modeling in Demographic Temporal Frequency Analysis*

Temporal frequency analysis (TFA) comprises methods both for the characterization of temporal distributions of archaeological samples and for drawing inferences about their underlying data generating processes (DGPs). In motivation, these two activities resemble descriptive and inferential statistics, respectively. However, several sources of uncertainty confront archaeological chronometry, necessitating engagement in statistical inference at both levels. Perhaps because of this, the demarcation between 'inferring about' and 'inferring from' in TFA has frequently been blurred, accounting for some of the contention surrounding interpretations of temporal distributions rendered through histogram aggregation, probability summation, and most recently kernel density estimation (KDE). In TFA's demographic applications, 'inferring from' is arguably the more relevant activity, incentivizing efforts to identify methods specifically well-suited to DGP recovery. While KDE has often been favored over parametric methods in this capacity for its purportedly superior ability to accommodate inconveniently complex DGPs, it also only yields single-shot estimates thereof. Furthermore, it requires single-point measures of, or guesses at, the timestamps anchoring archaeological samples to the timeline, at odds with probabilistic chronometry. Here I advocate an alternative approach – latent mixture modeling – which resembles KDE in form, flexibility, and output, yet which is better-suited to probabilistic chronometry, likelihood-based model-fitting, and uncertainty quantification.

Browne Ribeiro, Anna (University of Louisville)

[393] *Amazonia as a Perpetual Elsewhere: The Possible and the Permissible in "Natural" Landscapes*

Amazonia is the consummate, perpetual, wild jungle. Despite a century of archaeological research pointing to rich, complex, and culturally diverse ancient societies, and twenty years of mounting geoarchaeological evidence for densely settled Precolumbian towns, many people still imagine Amazonia as a pristine, primordial forest. In this paper, I dig deep into ideas about forests, climate, and moral geographies, which continue to govern how we think about places like Amazonia. I examine how archaeological tendencies toward ecological analysis – among our most grounding and dependable tools – can lead to determinative thinking about possibilities for sociality in particular places. Beyond a critique of ecological determinism, my analysis traces the history of moral geographies. Once sustained by beliefs in the influence of celestial bodies or beings on their terrestrial counterparts, 18th-Century moral geographies found purchase in scientific regional classifications grounded in botanical, climatic, and geographic knowledge. Enlightenment-period narratives about Eurasian societies foregrounded civilization, while in the Americas, nature and catastrophe prevailed. Taking Amazonia as a case study, I consider the extent to which archaeological arguments about places considered "natural" balance explanations emphasizing ecology and catastrophe with those grounded in indigenous knowledge or sociality. Can we, as a discipline, write new moral geographies?

[372] *Obsidian Geochemical Sourcing at Huntichmul, Kiuic and Escalera Al Cielo in the Puuc Region, Mexico*

In recent years, the use of portable X-Ray Fluorescence (p-XRF) spectrometers has become increasingly common to determine the geological sources of obsidian artifacts. This study used p-XRF to obtain trace elemental data for 354 obsidian artifacts from the sites of Huntichmul, Kiuic and Escalera Al Cielo in the Puuc region of the northern Maya lowlands. These sites were heavily occupied during the Late and Terminal Classic periods [700-1050 AD] and research is ongoing. The elemental data for each artifact was compared to that of 31 known sources from Mexico, Guatemala, and Honduras in order to determine the geological source. The source data were then combined with chronological data obtained from the ceramics associated with each excavated context in order to compare the various obsidian sources utilized at each of the three sites. Results suggest that a variety of sources were used at each site and provide further evidence regarding the nature of obsidian exchange networks in place in the Puuc during that time.

Brucker, Ryan [94] see Sisneros, Brienne

Bruin, Alison**[171]** *Supply and Demand: Colonoware Creation and Spanish Ideals at San Luis de Talimali*

Colonoware is a type of ceramic frequently recovered from Spanish Colonial period sites in North America. Often colonoware is considered evidence of technological acculturation and Spanish- Native American interactions on the Spanish colonial frontier. The demand for ceramics outpaced the available supply and thus local indigenous potters made colonoware from local clays in desired or needed European styles. The degree to which the colonoware vessel forms identified at San Luis de Talimali, an Apalachee-Spanish site in La Florida, derive from Iberian ideals is tested using the Ceramic Organization in the Spanish Atlantic form classification system developed by Katheryn Ness.

Brumbaugh, Laura**[259]** *The Influence of Trade Networks on Great House Location in the Mesa Verde Region*

During the transition between the Pueblo I (A.D. 750-950) (PI) and Pueblo II (A.D. 950-1150) (PII) time periods in the Mesa Verde region, some PI settlements became the locations of PII great houses. No clear patterns have been discerned concerning why only certain PI communities generated great houses, but recognizing trends that distinguish these communities from others may provide insights into the processes of community formation in PII. This poster will discern potential motivations for great house location choice, which may encompass many factors: trade networks, landscape features, environmental factors, existing communities, and many others. Specifically, this research tests the hypothesis that PI trade networks were a factor in location choice. To do so, sites in the Mesa Verde region with both PI and PII great house occupations are compared to a control group of PI sites which did not have PII occupations. The frequencies of non-locally sourced materials in the artifact assemblages of these sites are analyzed. The results of this analysis are anticipated to indicate any significant differences in trade items found at the PI/PII sites compared to the sites with no PII occupation, to draw conclusions regarding the influence of PI trade networks on great house location.

Brunette, Jeremy (Los Alamos National Laboratory)**[90]** *Resetting the Anchor: Reconsidering a Historic Ranch in Remote Northern New Mexico*

This poster outlines a re-examination of historic Anchor Ranch on the Pajarito Plateau in north-central New Mexico. Anchor Ranch was developed as a modern, working cattle ranch on the western end of the Pajarito Plateau during the early twentieth century, and featured all of things you imagine when considering a cattle ranch at that time: cowboys, barns, tractors, livestock and fields growing cattle feed. The Ranch served a second purpose that is more difficult to see on the surface. The Ranch housed Alexander Ross Jr., who was intellectually disabled. This role was necessitated by the eugenics movement, in which people with intellectual disabilities were believed to be the source of social problems and were commonly institutionalized to be kept away from society. The buildings at Anchor Ranch were destroyed as part of the development of Los Alamos National Laboratory. This poster looks at the landscape and artifacts from Anchor Ranch with Alexander Ross in mind, and considers whether someone with an intellectual disability can be seen in the archaeological record.

Brusgaard, Nathalie (Leiden University)**[43]** *Rock Art, Animals, and Desert Landscapes: A Case Study from the Black Desert of Jordan*

In the late 1st millennium BC and the early 1st millennium AD, nomadic groups inhabited the Black Desert of northern Arabia. These desert societies are elusive, having left behind few material remains and archaeological research having been scarce. What we know about them has been based almost solely on the inscriptions they carved into the basalt rocks. Yet the nomads also carved a wealth of pictorial engravings, figurative rock art depicting wild and domestic animals, hunting, pastoral, and fighting scenes, and geometric symbols. Until now the rock art has been under-studied and under-utilised as a source of information about these societies. This paper presents the results of the first-ever systematic study of the 'Safaitic' rock art of the Black Desert. It discusses the content of the rock art, how it was produced and consumed, and its relationship to the landscape. These results reveal how the rock carvings played an essential role in connecting people to each other and to place in the desert landscape. This paper also discusses how the rock art challenges traditional dichotomies about herder and hunter relationships with animals and their environment.

[394] *The Offerings of Cerro de la Virgen, Oaxaca, Mexico: Ontological Perspectives on a Unique Assemblage of Ritual Deposits*

The recent ontological turn in archaeological research has resulted in a proliferation of theoretical approaches inspired by non-representational and non-anthropocentric scholarship. In relational ontologies such as those of Pre-Columbian Mesoamerica, objects could possess a life force that allowed them to engage with other animate beings, to animate other entities, and to manifest powerful deities or ancestors. Like humans, some other-than-human entities experienced a life cycle marked by ritual acts, such as birth and death ceremonies, as well as the intake of spiritual sustenance required to maintain their animacy. In this paper, we explore how two categories of other-than-human actors—public buildings and cached objects—became entangled in ways that actively enabled or constrained social life. We focus on offerings excavated from 2013-2016 at the coastal Oaxacan site of Cerro de la Virgen, located in the lower Rio Verde Valley. During the Terminal Formative period, residents placed offerings of ceramic vessels, stone objects, and human bodies into the fill of many of the site's public buildings. Based on archaeological evidence and statistical analyses, we argue that certain offerings of cached objects and materials were placed to ensoul, sustain, or terminate the structures into which they were placed.

[365] *Introduction to Session with a Discussion of Measuring Stone Tool Diversity*

It has been thirty years since the publication of *Quantifying Diversity in Archaeology* and this edited volume has proven to be an important benchmark in archaeological diversity studies. We review the impact this volume has had on quantitative archaeological research across a number of subfields. We then provide three examples of our work in the subfield of stone tool studies that have used diversity measures to investigate Paleoindian stone toolkits. First, we describe our study of Paleoindian end scrapers from sites in the Great Lakes region in which we used diversity measures to infer mobility strategies. Second, we discuss our efforts to reassess the hypothesis that the southeastern United States possesses greater Paleoindian point diversity than other regions. Our research supported this hypothesis and suggested that finer regional distinctions in point diversity could be made. Third, we summarize our study that compared the diversity of early Paleoindian point classes between the western and eastern halves of North America. Our findings suggest that Paleoindians in the East used a more diverse set of points than in the West and we posit that environmental heterogeneity in the East promoted increased experimentation with point designs.

[168] *Just a Grog Sherd Livin' in a Shell World: Mississippian Microhistories of Practice in Ceramic Production*

Carbonized shell temper has traditionally been seen as one of the defining hallmarks of Mississippian Period societies in the Midwestern and Southeastern US. The Lower Mississippi River Alluvial Survey (Phillips, Ford, and

Griffin 1951) solidified the importance of shell temper in distinguishing Mississippian Period sites and occupation levels from earlier ceramic practices that used grog and crushed stone as tempering agents. The continued use and superficial application of Phillips, Ford, and Griffin's (as well as others) ceramic types and downplaying (or ignoring) of multiple and mixed tempers in the analysis of ceramic assemblages has perpetuated the perception that shell was king during the Mississippian Period. Drawing on digital microscopy, we present ceramic evidence from Alabama, Indiana, and Missouri identifying the presence of grog and mixed tempering practices at the bookends of the Mississippian Period. We argue that the presence of these tempers were part of the human-ceramic entanglements that part of the processes of Mississippianization.

Buchert, Martha, Emily Schach (Arizona State University) and Donna Nash (University of North Carolina-Greensboro)

[290] *Spindle Whorl and Textile Production in the Moquegua Valley*

Spinning and weaving are important ancient traditions in the Andes, evidenced by both the textiles and the tools found in archaeological contexts. Andean textiles and related tools denote layers of production, status, and trade relationships. A rueca (spindle whorl) is a utilitarian tool for turning fiber into yarn. Different types, weights, and sizes of ruecas can produce different kinds and qualities of thread and, thereby, different qualities of the end-product textile. Using a sample of ruecas from the Terminal Terrestre in Moquegua, Peru, I attempt to correlate the physical characteristics of the spindle whorls with the caliber of the material they might have created. These data may not only reveal the possible types of textiles each culture associated with the site made, but also potential exchange patterns between groups in the Moquegua Valley.

Buckley, Gina (The Pennsylvania State University) and Spencer Seman (The Field Museum)

[373] *For Richer or Poorer: A Comparison of Residential Mobility Patterns between Socioeconomic Groups at the La Ventilla District of Teotihuacan*

Excavations from the La Ventilla 1992-1994 project resulted in the recovery of over 400 individuals across four apartment compounds or frentes, the common household structure at Teotihuacan. Of these compounds, Frente 2 (El Conjunto de los Glifos) has been identified as a higher-status residential community while Frente 3 (El Conjunto de los Artesanos) consisted of lower-status, working-class individuals. Strontium ($^{87}\text{Sr}/^{86}\text{Sr}$) isotope ratios from human tooth enamel are examined from over 100 individuals to identify long- and short-distance mobility patterns across Frentes 2 and 3, and to directly test the hypothesis that lower socioeconomic classes of people were more mobile than those of higher status. Finally, new data are directly compared to past migration research at the Tlajinga district of Teotihuacan, one of the poorest communities at this site.

[34] *Technological and Methodological Developments in Approaches to Species Identification: Advancements in Zooarchaeology by Mass Spectrometry (ZooMS)*

ZooMS, or 'Zooarchaeology by Mass Spectrometry', is a relatively recently developed method in the field of archaeology, with the ability to identify large numbers of fragmentary animal bone to genus or species level. Most importantly, its advantages over ancient DNA-based approaches of identification are that it can be substantially cheaper to run experimentally, and is more likely to yield higher success rates deeper into the archaeological record and in warmer environments. This presentation will discuss the potential technological developments that ZooMS is amenable to, alongside the range of method development that has occurred over the past decade. In particular, this involves the increasing compatibility with other analytical methods commonly used in archaeological science towards a unified methodology for both isotopic and DNA-based methods, but also developments in bioinformatics approaches to dealing with large numbers of samples and sometimes unknown range of fauna, that will ultimately be needed to best inform questions regarding cultural and ecological relationships between humans and animals. Through several case studies, including those relating to the less frequently analysed faunal groups, such as micromammals, herpetofauna and fish, the potential impact that ZooMS can have on the field of zooarchaeology will be discussed.

[307] *Arqueología del agua y las montañas: paisaje y patrón de asentamiento en la costa este de Los Tuxtlas*

Desde el año 2008 arqueólogos de la Universidad Veracruzana han realizado el estudio sistemático del corredor costero que se encuentra en la parte noreste de Los Tuxtlas. Bajo cobertura total del terreno, se ha recorrido una extensión de 300 km², desde la Laguna de Sontecomapan al norte, hasta la Laguna del Ostión al sur, incluyendo las laderas de los volcanes de Santa Marta y San Martín Pajapan. Gracias a estos estudios, se han identificado patrones de multiculturalidad que responden al emplazamiento de un sistema portuario marítimo que se desarrolló en la zona y que estuvo interconectado con diversas partes del Golfo de México. En esta ponencia se hará un

recuento de los métodos y técnicas utilizadas, así como de los resultados que se tienen hasta el momento, derivados de estos estudios.

[268] *About Peopling and Rivers: Connections and Boundaries in the Early Peopling of Eastern South America*

Several papers have discussed the role of rivers in the process of knowledge, occupation, and dispersion of human groups in unfamiliar or inhabited landscapes. Most of the time the rivers are seen as displacement axes, facilitating the connection between distant points in a short time. However, at the same time as connecting elements, rivers can play the role of barriers, be they geographical or cultural. In this presentation we will explore the role of rivers in the settlement process of eastern South America, with emphasis on the Tocantins River. This river, part of the Amazon basin, crosses a great extension of plateaus from central Brazil flowing into the right bank of the Amazon River, the meandering plains of the South American lowlands. With this trajectory the Tocantins River crosses distinct environmental areas like savannas and the Amazon Rainforest. Associated with the geomorphological and ecological changes, we identified in the archaeological record the existence of a cultural boundary that points to the existence of different dynamics of mobility and territoriality, both focusing on the Tocantins River Valley. We intend to present this context and explore its implications for the discussion of the ancient settlement of eastern South America.

[232] *Grasses Are Always Greener: The Technology of Herding and Mobility among Neolithic Pastoralists in South Arabia*

The development of pastoralism still features a number of gaps in the archaeological record. Principally, herders invest in the maintenance of a resource base capable of supporting their herds. While pursuing these resources through both intensive and extensive land management strategies, they impact vegetation communities and the future viability of husbandry of both animals and plants in a given location. Microfossil proxies of animal diets can inform on these practices, and when considering time, their effects. In mountainous southeastern Yemen, a rock-shelter encampment was discovered dating to the Early to Mid-Holocene featuring domestic animal remains earlier than any others in the south Arabian region. Through the later phases at this site, Manayzah, a number of superimposed burned dung mats were noted, suggestive of livestock corralling. Phytolith analysis of these levels both in intra-site terms in comparison to other combustion features supports a model of grazing and supplemental foddering of mixed herds. Broad similarity of assemblages and statistically distinction of these elements provide evidence of continuity in pastoral practice, despite multiple phases of occupation and abandonment.

[183] *Believers in the Highlands: Burying the Muslim Dead at the Qarakhanid Site of Tashbulak*

Islam spread into Central Asia via the Arab invasions of the 7th century CE. According to current historical narratives, Islam's first footholds were lowland urban centers, with Islam only slowly infiltrating the highlands. New research, presented here, challenges the idea that highland areas were a barrier to Islam. This paper presents a study of the cemetery at Tashbulak, a Qarakhanid site in the Malguzaar Mountains of southeastern Uzbekistan. The Qarakhanid state (9th-13th c.), the first nomadic Turkic polity to convert to Islam, held its power in the highlands of Central Asia, during the period when Islam was thought to be practiced primarily in the lowlands. Burials at Tashbulak are some of the earliest directly dated Islamic burials in the region, and adhere to Islamic burial practices documented in mortuary communities across Central Asia. Through the burial of the dead in visibly Islamic fashion at Tashbulak, this Qarakhanid population expressed a dual nomadic and Islamic identity. The highland location of Tashbulak was not a barrier to Islam, but instead allowed the Qarakhanids to integrate their nomadic heritage with the practice of Islam, and assert a claim to the region rooted both in their ancestry and the divine.

[417] *Sedimentary, Molecular, and Isotopic Characteristics of Bone-Fueled Hearths*

Molecular and isotopic analyses of sediments from archaeological combustion features is a relatively new area of study. Applications have the potential to inform us about ancient pyro-technologies and patterns of animal exploitation in a wide range of human contexts but may be particularly informative with regards to ancient hunter-gatherers. Our analyses of sediments from experimental bone and wood fires, and from controlled laboratory heating sequences, provide information on the formation and location of biomarkers from pyrolyzed animal fats in hearth sediments. This information is compared to comparatively recent archaeological combustion features from northern Alaska (ca. 1150 – 4500 BP) and much older contexts including El Salt, a Middle Paleolithic site in Spain. Integrating sedimentological, molecular, and isotopic data can improve the recognition of bone fires in a range archaeological sedimentary contexts, even where bone preservation is poor.

[74] *The Study of Excavated Documents in Japan*

Traditional understandings of the history of writing in Japan have been both greatly enriched and substantially challenged by materials recovered from archaeological excavations. In particular, the continued recovery from archaeological contexts of the inscribed wooden documents known as mokkan has ensured that the history of Japanese writing will continue to be rewritten to accommodate new insights provided by this growing archive. As a full-fledged sub-discipline within Japanese historical document studies (J. shiryōgaku), the study of mokkan incorporates an understanding of archaeological methods and an awareness of the nature of historical written cultures in East Asia. This paper will examine the importance of archaeological data and approaches in this particular sub-field, and how the progress made in Japanese mokkan studies has contributed not only to the re-interpretation of the history of writing in Japan but to the study of early writing through excavated documents in the larger East Asian context. In addition, this paper argues that the manner in which mokkan studies has utilized archaeological data to answer particular historical questions can be a model for future interdisciplinary research which draws upon the vast body of data generated by decades of Japanese archaeology.

[419] *Raising a Rafter: Networks and Ancestral Pueblo Intensification of Turkey Husbandry in the Northern Rio Grande Region, New Mexico*

Zooarchaeological research in the Northern Rio Grande shows that turkey husbandry became increasingly important to the Ancestral Pueblo during the Classic Period (AD 1350-1600). During this time, immigrant and local communities coalesced into increasingly larger villages and towns, with abundant evidence for turkey husbandry. Turkeys served as a critical resource for both subsistence and ritual uses. Through ethnographic and archaeological data and modern animal sciences research on turkey raising, we explore the role of intensive husbandry at certain Ancestral Pueblo sites within broader economic networks. These socio-ecological models are then tested against the archaeological record of Sapa'owinge (LA306), a large Ancestral Pueblo community with extensive evidence for large scale turkey husbandry.

Burger, Richard (Yale University) and Lucy Salazar (Yale University)

[64] *Discovery at Cardal, Peru of an Initial Period Polychrome Frieze of the Manchay Culture*

During the 2018 field season, the authors unearthed a portion of a large polychrome frieze at the U-shaped civic-ceremonial center of Cardal in the Lurin Valley of Peru. This talk provides a brief description of the excavations and its discovery. The frieze was located on the lower terrace of the right arm of the platform complex and was buried by the construction of a later circular plaza. The frieze consisted of incised and painted motifs on the plastered interior face of an earlier circular plaza dating to approximately 1100 BC. The frieze was subsequently covered by a layer of thick clay plaster painted with red pigment. Two sections of the frieze were exposed by removing this final layer and they reveal monstrous supernaturals combining arachnid, feline and avian elements. The content of the frieze confirms the distinctive nature of the religious iconography of Manchay culture centers.

[397] *Mission Period Glass Beads from the Northern Channel Islands of California*

Glass beads were an important trade item and symbol of culture contact for Native Americans in coastal California and the Channel Islands where people had manufactured shell and stone beads for some 10,000 years. Glass bead assemblages from the northern Channel Islands, Santa Rosa, Santa Cruz, and San Miguel, all entered the collections of the Smithsonian's National Museum of Natural History during the 1870s, via four collectors. The glass beads are consistent with the late eighteenth--early nineteenth century time frame of the Mission period. The assemblages differ somewhat from Mission sites on the mainland, with the colors blue and green predominating on the islands, followed by red and white beads, along with some black beads. The opacifiers used in the manufacture of white drawn glass beads are also examined with pXRF to assist with the dating of the white beads. As other studies have shown, the material culture of the Channel Islands, notably glass beads and shell beads, provides insight into changes to and the maintenance of traditions outside the direct sphere of Spanish influence. The information derived from these assemblages shows the value of re-examining older museum collections, especially ones that were obtained before the emergence of scientific excavations.

Burgio-Ericson, Kinton (University of New Mexico)

[414] *Unpacking the Dishes: The Agency of (mis)Translation in the Hybrid Ceramics of Seventeenth-Century New Mexico*

Equally of New Spain and the Pueblo Indian world, seventeenth-century New Mexico presents a fraught social context where diverse materials and imagery became entangled through the creativity of Native artists. Archaeological remnants testify to ceramics' importance in these exchanges, including combinations of Euro-American forms with Indigenous materials, techniques, and iconography. Hopi women were among the finest of these artists, producing what archaeologists call "San Bernardo" wares, after a local Spanish mission. They drew upon Mexican majolica forms and motifs, which they reconfigured through their own traditions and iconography. Artists transformed Spanish imagery into religiously significant symbols pertaining to the Pueblo world, enacting a strategy of (mis)translation and artistic agency, which simultaneously visualized and concealed new meanings in plain sight. Based on primary research of an unpublished collection of San Bernardo hybrid ceramics from the ancestral Zuni pueblo of Hawikku, this study demonstrates the persistence of Pueblo imagery and worldviews, but also agency that artists exerted through (mis)translation to evade Spanish recognition and control. Drawing on material culture theory, critical translation studies, and art historical iconography, this essay applies a discursive model to the study of these ceramics and the creative expressions of their painted motifs.

[309] *Urbanization, Minor Temple Construction, and Local Community Formation at Ceibal, Guatemala*

Excavations and geospatial analyses of outlying residential settlement at Ceibal, Guatemala, shed light on the relationships between ritual and urbanization during the Preclassic period. The site epicenter, which consists of an E-Group assemblage carved out of bedrock, was established around 1000 BC. The settlement slowly grew during the late Middle Preclassic period (ca. 700-350 BC). However, over the course of the Late Preclassic (ca. 350-75 BC) and Terminal Preclassic (ca. 75 BC-AD 175) periods, as Ceibal grew into an urban center, minor temple-plaza complexes were constructed at regular intervals in outlying residential areas. These complexes were not built contemporaneously, and vary in their size, shape, and construction materials. This evidence suggests localized groups of people built their own temples as they moved into new areas of the site, and thus, that ritual practice was a key consideration in early urban planning. Furthermore, in contrast to previous periods, rituals performed in public, semi-public, and domestic contexts became remarkably similar. Ritual may have simultaneously differentiated local communities while also promoting social cohesion among the entire Ceibal population. This trend continued until the end of the Terminal Preclassic, when outlying communities buried their temples and depopulated the site.

[216] *Targeting Coastal Plains Chert in the Wacissa Quarry Cluster, Northwest Florida, USA: A LIDAR-Based Geomorphic Model for Locating Chert Quarries*

Although archaeological research in northwest Florida has yielded a rich assemblage of stone tools produced by late Pleistocene and early Holocene hunter-gatherers, little research has been undertaken to quantitatively define and describe the variable chert resources from which these tools were made. This paper presents the framework for a new geomorphic model for locating terrestrial and inundated chert quarries in northwest Florida using terrestrial LIDAR and underwater pedestrian survey. In environments with limited topographic variability, erosional relics of chert formation are easily exploited by LIDAR, and high-definition elevation models can be used to inform field survey strategies both terrestrially and underwater. This model also allows for the implementation of systematic and geographically-representative sampling strategies. The Wacissa chert quarry cluster in northwest Florida has historically been undersampled, presenting an ideal case study for testing the effectiveness of this model in an archaeologically-relevant environment. Regional chert-formation processes will be discussed and compared to their known geomorphic corollaries to determine which LIDAR anomalies warrant survey, and the results of ground-truthing this model will also be discussed. Newly-sampled quarries will be compared to the existing body of local raw-material data to assess the effectiveness of this model for describing chert variability and abundance.

[155] *Moving up in the World: Comparing Magnetic Gradiometer Survey Results from Monumental Sites Using Small, Medium, and Large Magnetometer Systems*

The problem with monumental earthwork sites in Ohio is that they are, well, monumental in scale! These large sites, many topping 50 ha in area, are a major challenge for geophysical surveys because they simply require too much time to completely survey. However, recent advances in instrumentation and computers is making it possible to survey vast areas (well over 50 ha) in a mere fraction of the time it once took. In this paper I compare and contrast the magnetic gradiometer survey results from three fluxgate instruments used at several monumental earthwork sites in Ohio, including a handheld Geoscan Research FM256 (single gradiometer), a Foerster Instruments push cart (4-probe gradiometer), and a multichannel (5-16 probes) Sensys gradiometer system. I explore some of the issues and benefits encountered as we have moved from small, careful gridded surveys with handheld instruments to large, rapid surveys with multiprobe systems guided by RTK GPS. Though large multiprobe systems have been in use elsewhere in the world for some time, their application in the USA is only just getting under way. The discussion will include topics such as survey speed, data processing, and anomaly characterization/comparisons across the three instruments.

[80] *Exploring Cultural Identity at the Nostrum Springs Stage Station in Northwestern Wyoming*

Stagecoaches have been key players in the imagination that is the "Wild West" since the late 19th century. They live on today as one of the main symbols of the mythic American West, perhaps most easily recognized in the form of the Wells Fargo stagecoach that appears in parades across the country. Typically missing from narratives of the American West, which tend to focus on violence, romance, and adventure, are stories of the everyday lives of westerners. This paper focuses on one place, the Nostrum Springs Stage Station in the Red Canyon of northwestern Wyoming, in order to discuss how the methods of historical archaeology can and cannot be used to explore cultural identity, an important aspect of everyday life in the past. The focus of this research is on the Shoshone, who called Red Canyon home long before the stage arrived, and the Nostrums, the family with Swedish heritage who homesteaded in Red Canyon around the turn of the 20th century. These types of investigations are important because the idea of America, which is constantly being renegotiated, often rests on the ideals of an America that never was, marginalizing various groups in the process.

Burnett, Paul (SWCA Environmental Consultants)

[128] *Evaluating Archaeological Predictability Across the Western United States*

Human behavior is patterned in relation to the environment, and these patterns are approximated by the archaeological record. Similarly, the ability to discover archaeological material is patterned in relation to the environment. Geographic Information Systems and statistical software have been used to develop multiple discovery-based spatial probability models across millions of acres in the western United States. Some models work better than others. However, why some models are better at predicting archaeological sites has not been an explicit focus of previous research. One hypothesis is that some archaeological landscapes are more conducive to modeling than others. Holding predictive methods constant, this study evaluated differences in model performance across various landscapes. Understanding the major archaeological and environmental parameters driving model success and failure is important considering the potential cost and time involved in model development. Bare ground visibility, topographic variability, and the use of categorical variables such as landform, plant communities, and soil types are major environmental parameters influencing model performance, as are the availability, accuracy, and distribution of site and survey data. By defining the underlying factors driving model success and failure while holding the statistical techniques constant, we gain new insight into the interpretation of archaeological landscapes through modeling.

Burnette, Dorian (University of Memphis), David Dye (University of Memphis) and Arleen Hill (University of Memphis)

[348] *Climate Change, Population Migration, and Ritual Continuity in the Lower Mississippi Valley*

Tree-ring reconstructions of cool- and warm-season moisture reveal several multi-decadal droughts that impacted the northern Lower Mississippi Valley between AD 1250 and 1450. These chronic droughts contributed to the regional abandonments and population migrations southward out of the Cairo Lowland and adjacent areas into

extreme southeastern Missouri, northeastern Arkansas, and western Tennessee. In addition, the climatic events appear to have been a major factor in the collapse of the political economy, resulting in subsequent downriver migrations of Mississippian polities. While transformations in political, religious, and social practices would have taken place, it is equally apparent that long-term continuities existed in ritual practice based on a large corpus of whole ceramic vessels from the region.

[357] *Archaeology Field School Meets Transportation Data Recovery: An Alternative Mitigation at the James W. Hatch Site (36CE544), Centre County, Pennsylvania*

Data recovery investigations at the James W. Hatch Site in Centre County, Pennsylvania via a collaboration between PennDOT, the Federal Highway Administration, and Juniata College demonstrate the potential for transportation archaeology to provide insightful data on prehistoric lifeways. The project provides a glimpse of prehistoric utilization of Bald Eagle Jasper informative at the local scale where its predominance and use define the Houserville Archaeological District, and regionally as the Bald Eagle formation jasper displays an isotopic “fingerprint” distinct from those of Eastern Pennsylvania and other quarries in the northeastern United States. Given the local jasper’s prominence as the preferred lithic raw material in the district, contiguous block excavations and microwear analyses reveal a significant amount of onsite activities include various forms of butchery, hide preparation, and bone, antler, and shell working in addition to secondary reduction and biface production. Iron isotope studies funded by the project show promise as a robust means of geochemical discrimination and sourcing. The innovative collaboration resulted in a cost-effective alternative mitigation for College Township’s bicycle path, and provided undergraduates and graduate students high-impact experiential learning in the form of an intensive archaeological field school.

Burrillo, R. E. (SWCA Environmental Consultants), Joan Brenner-Coltrain (University of Utah), Michael Lewis (University of Utah) and William Lipe (Washington State University)

[313] *Landscape and Agriculture in the Bears Ears Formative*

For non-industrial communities, subsistence strategies are tightly constrained by ecological factors. Prehistoric peoples in the Bears Ears area were entirely dependent upon maize—a cultivar adapted to low-altitude, subtropical conditions in Mesoamerica—by at least 400 BC. Given the differences in altitude and aridity compared with its point of origin, successful maize farming in southeast Utah relied heavily on detailed and thorough knowledge of the local environment. Ongoing research in settlement patterns and water chemistry throughout the Bears Ears area has revealed shifting strategies by Ancestral Pueblo maize farmers that demonstrate precise articulation with shifting climatic factors through time across the landscape.

Bursali, Ayse (University of Notre Dame) and Ian Kuijt (University of Notre Dame)

[8] *From Homes to Ruins: Ethnoarchaeology and Small-Scale Village Dynamics at Post-19th Century Kizilkaya, Central Turkey*

Drawing on interviews with former residents of the abandoned Turkish village of Kizilkaya, as well as photogrammetry and other visual research, in this poster we consider how this post-1800 rural village was organized around the household, the mosque, access to the river, and raising and caring for animals. The rural village of Kizilkaya, located in the Cappadocia region of Central Anatolia, was abandoned in 1963 due to the risk of major rockfalls from the high cliffs above the village. At one point the village consisted of 123 households and was home to around 983 people, who built stone buildings on top of intricately carved underground cave systems. Some of the buildings have been completely destroyed to construct new houses as part of the relocated village 500 meters away. In other cases, however, multi-storey house complexes are still well preserved and roofed. Drawing upon microhistorical research and ethnographic data, in the presentation we explore how the household and village community were organized, consider the material footprint of the household including use of intermural and extramural spaces, and the extent to which past use of space is visible in the archaeological record.

Burtchard, Greg

[29] *Buck Lake, Archaeological Research, and Subsistence and Settlement Patterns at Mount Rainier National Park*

For the past two decades, research directed at establishing onset of human use, patterned use of montane habitats, integration into lowland subsistence and settlement systems, and temporal change has been imbedded into CRM practices at Mount Rainier National Park. Once thought to be of little value to precontact people, high elevation landscapes on Mount Rainier, and Pacific Northwest mountains generally, are now known to have been a part of regional land-use systems for at least 9,000 years. Focusing on research at Buck Lake, a deeply stratified site on the NE flank of Mount Rainier, and on patterned distribution of precontact sites in the park, this paper considers the role of mountain environments in precontact Pacific Northwest land-use systems. Of particular concern are why montane environments were sought out in the precontact past; when routine human use of these landscapes began; how and why such use was environmentally patterned on the mountain; and whether or not montane land-use patterns changed through time. The paper emphasizes the importance of environmentally-based subsistence/settlement models with empirical test implications to guide research in CRM (and other) archaeological investigations; and to provide frames of reference to evaluate results and refine ongoing research objectives.

Burton, Nicole [251] see Maher, Ruth

Burt, Amanda (Indiana University)

[80] *Unlikely Allies: Modern Wolves and the Diets of Pre-contact Domestic Dogs*

Assumptions of prehistoric domestic dogs as scavengers has been pervasive in archaeology and beyond. This project clarifies these assumption by investigating the dietary behavior of prehistoric domestic dogs via dental microwear data or features on the tooth surface that indicate types of food consumed. In order to understand the array of possible domestic dog dietary behavior, I compare their diets to their unmodified wild progenitor, the grey wolf. The use of three-dimensional tooth surface data coupled with scale sensitive fractal analysis allows for an unbiased interpretation of these surfaces. A robust baseline of wolf dietary behavior via their microwear has been collected from a large collection of modern wolves housed at the Draper Natural History Museum. Curated domestic dogs from archaeological sites located on the North American Plains and Rocky Mountain foothills are evaluated to interpret feeding practices employed by their human caregivers to contribute to a better understanding of human-to-canine provisioning strategies in the past.

Bussiere, Lauren (Texas Archeological Research Laboratory, University of Texas at Austin)

[395] *Answering Pseudoarchaeology from the Repository*

As an archaeological repository, the University of Texas at Austin's Texas Archeological Research Laboratory is simultaneously a public-facing entity and a gatekeeper, standing between the public and a massive corpus of sensitive archaeological evidence in the form of held-in-trust archaeological collections and records. It is therefore not surprising that TARL receives a significant number of public inquiries, and that some of these express interest in topics outside the archaeological mainstream—including claims of giants, supposed evidence supporting hyperdiffusionist views, and accusations that our institution is hiding “the truth.” In this presentation, inquiries of a pseudoarchaeological nature received by TARL staff over the past several years are analyzed in order to provide insight into the types of inquiries we receive, who is reaching out to us, what their expectations or desired outcomes might be, and how we tend to respond. Exploring the repository's roles and responsibilities in this ongoing public conversation is an important task as we confront common misperceptions and work toward improving public education in archaeology.

Bustamante, Shunashi Soledad Victoria [197] see Gonzales, Alicia

Bustard, Wendy

[21] *Competing Cultures: A New Age in Chaco Canyon*

Chaco Culture National Historical Park was founded to protect and preserve the cultural remains of an indigenous society whose high point was between 850 and 1150 CE. For the first 80 years of its existence, the park's museum collection policy was straightforward because the artifacts recovered represented the Native American occupation of the land. That changed after the 1987 Harmonic Convergence, which was celebrated in part in one of the park's great kivas. Suddenly, a new cultural use of the park, with its attendant offerings left in archaeological sites, forced park managers to re-examine collection policies. At the same time, Native American descendant communities were finding their political voices and making themselves heard by federal land managers. Managing the physical manifestations of competing cultural uses has evolved over time at Chaco, in response to descendant communities, 'new age' practitioners, and researchers.

Bustos, David (National Park Service, White Sands National Monument)

[187] *Widespread Distribution of Fossil Footprints in the Tularosa Basin: Human Trace Fossils at White Sands National Monument*

White Sands National Monument (WNSA) is well known for the world's largest gypsum dunefield, but the geological elements that created this dunefield also persevered one of the largest (in area and number) assemblages of human foot prints in the world. Tracks are revealed under specific moisture conditions, linked to near-surface geophysics. Human and megafauna tracks have been found throughout the world, but most footprints sites are limited in spatial extent and thereby preclude paleo-tracking. What sets the prints within the boundary of White Sands National Monument (WNSA) apart is not only the sheer number of tracks with densities often >10 per square meter, but the spatial area over which they are distributed. At WNSA individual humans and animals can be tracked over kilometers and seen in many places interacting. These interactions are numerous and work to date has only begun

to reveal some of these interactions. The fossil footprint data available on human - megafauna interactions provides a whole new class of information in early archaeology of the New World. This presents a tremendous opportunity to broaden our understanding for topics such as group size, hunting strategies / behavior, and group composition.

[346] *Crushing Traditional Hohokam Ceramic Typology: Grog Temper in the Early Formative Period*

Preliminary analysis of ceramic artifacts from Early Formative contexts at AZ T:12:70(ASM) (Pueblo Patricio) in Phoenix, Arizona, identified grog (crushed sherds) in addition to local tempering materials. Four sherds selected for petrographic analysis from radiocarbon-dated contexts confirmed the identified material is grog. Subsequent single-grain optical stimulated luminescence dating provided additional evidence of the four sherds' early production date. Previous work viewed the use of grog in ceramic production within the lower Salt River Valley as very common in Classic and historic time periods and very rare to nonexistent in others. This study conclusively contradicts previous thought and expands the known time range of this technology. This evidence of prehistoric ceramic container production variability within the lower Salt River Valley offers another avenue for exploring Hohokam origins and development.

[368] *Where Did the Fish Go? Use of Archaeological Salmonid Remains to Guide Recovery Efforts in the American West*

Given the scale of habitat loss from development associated with the Industrial Age, archaeological faunas pre-dating the modern era often represent animal populations extirpated from their former ranges. For example, anadromous salmonid populations in the Pacific Northwest of North America have become extirpated from much of their range in the past 100 years largely because of dams built for hydroelectric power and flood control. As the costs for mitigating environmental impacts from dams exceed the benefits, decisions are being made to remove these obstructions and support fish recovery in some river basins. Archaeological salmonid remains represent an important source of information that can guide recovery efforts. Analysis of aDNA provides insights on species and sometimes sub-populations that once occupied a system. Incremental analysis of otoliths can indicate life history of pre-development salmonid populations. Moreover, archaeological records can help establish whether salmonid populations even migrated into basins under consideration for "restoration", given that habitat losses often preceded biological surveys. Research from projects in the Klamath and Columbia River basins (California, Oregon, Washington, Idaho, British Columbia) highlights the value and potential of archaeological records towards recovery of extirpated fish populations in the American west.

[390] *An Undisturbed Earlier Stone Age Locality on the Southern Coast of South Africa, Exposed by Fire*

The Knysna Estuary and River Basin on the southern coast of South Africa provided attractive resources for Pleistocene foragers. Isolated Earlier Stone Age (ESA) finds, including large bifacially flaked core tools, are commonly found in upland areas around the basin, particularly during construction projects, but dense vegetation cover has thus far prevented the identification of the source sites for these finds. In 2017, extensive fires devastated Knysna, removing all surface vegetation across large parts of the region, including dense shrub cover. Here we report a concentration of ESA materials, including more than 100 stone tools, exposed by the fires in the undeveloped part of the Featherbed Private Nature Reserve in Knysna. Our survey results indicate the presence of well-preserved cores, handaxes, and flake cleavers. We selected 25 large core tools for on-site analysis to compare to other known South African ESA sites. Additionally, we identified a large core re-fit. Considering the poor representation of the ESA in coastal South Africa, it is critical to study this region to shed light on early hominin behavior. This paleoscape offered early hominins rich foraging opportunities across several ecotones, which gave rise to novel and innovative adaptations during the middle and late Pleistocene.

[317] *Public Outreach and Community Engagement with the Tombos Archaeological Project in Sudan.*

Public outreach and community engagement has become a larger focus of efforts in recent years for the Tombos Archaeological Project. Field seasons regularly include public lectures for adults in the community and children at the Tombos elementary school. We produced a pamphlet with information on the Tombos site (English/Arabic). We also created a website for the project (www.tombos.org), with Arabic translations. This website includes information about our ongoing research, publications, team members, and active blog that is updated regularly, especially during the field season. In consultation with the Tombos community, we created teaching materials for the local elementary school. The teachers specifically requested materials that could be easily transported from one classroom to another. We designed and printed three large posters on durable weatherproof canvas that can be hung on these topics: archaeology, Nubian history, and Tombos research. These posters were well received, which we hope can assist the teachers given that no resources (textbooks, etc.) are provided in Sudan for learning about Nubian ancient history. Efforts have been made to disseminate our research in public venues and provide osteological training for Sudanese antiquities trainees. We established the American Sudanese Archaeological Research Center was established in 2017 (501c3 non-profit, www.amsarc.org).

Byock, Jesse (UCLA)**[310]** *The Mosfell Excavations: Viking Archaeology in Iceland*

Presents recent findings of the Mosfell Archaeological Project (MAP) in Iceland's Mosfell Valley (Mosfellsdalur). Reviews excavations at Leiruvogur Bay at the coastal mouth of the valley and at Hrisbrú, the farmstead of the Mosfell chieftains. These two Viking Age sites formed a 10th century Icelandic harbor and inland (hinterland) administrative unit. MAP is a large interdisciplinary archaeological project, employing the tools of history, anthropology, environmental sciences, forensics, botanics, and saga studies. We research human adaptations, social development, and environmental change in the Mosfellsdalur region. Sites extend into the surrounding highlands and at the lowland coastal areas. We define this geographic and social landscape as a "valley system," whose community took shape following Iceland's 9th-century settlement. MAP is developing a concept of 'Valley System Archaeology,' especially suited to Icelandic and North Atlantic sites. I will focus on the Viking Age harbor at Leiruvogur, a finding that may adjust the early historical understanding of the Reykjavik area. The harbor connected the community to the wider Viking world. Finds include a well-preserved longhouse from Iceland's settlement period, a pagan cremation site, a conversion-era stave church, an early Christian graveyard, and stone ship-like monuments. The mortuary practices show a mixed pagan and Christian community.

Byrd, Rachael (University of Arizona, Arizona State Museum)**[382]** *Going the Distance: Tracking Migration through Population Structure in the Southwest US (2100 BC–AD 1680)*

People who migrate are forced to adapt, interact and re-organize themselves in dynamic ways not yet fully understood. This study tests three archaeological migration models spanning 3,500 years of agricultural village occupation in the Southwest United States (US) involving migration into uninhabited landscapes, internal frontiers, and diaspora. Following the Relethford-Blangero analytic model, phenotypic variation and biological distances are calculated based on craniofacial measurements collected from 1261 individuals. Results indicate two distinct Basketmaker II early ancestral lineages, including evidence of migration from Early Agricultural to Western Basketmaker II sub-regions. Increased settlement density pushed people into internal frontiers, leading to newly established groups experiencing gene flow, while other communities were impacted more by bottleneck effects (genetic drift). Long-distance diaspora issued forth heightened variance at both origin and destination sub-regions, such as the Kayenta and Mogollon Rim Pueblos. Migration patterns shifted when people became more geographically constrained and localized as population sizes began to decline 150 years before Hispanic contact.

Bythell, Abigail (University of North Carolina at Charlotte), Sara L. Juengst (University of North Carolina at Charlotte) and Richard Lunniss (Universidad Técnica de Manabí)**[286]** *Ritual and Death: A Paleopathological Analysis of Skeletal Remains from Salango, Ecuador during the Guangala Period (100 BCE-800 CE)*

There are many questions that have yet to be answered about the prehistoric people of Ecuador, especially along the southern coast. In particular, more studies are needed in order to understand how people lived and interacted with each other and the landscape at the important ritual site of Salango. Salango was occupied from 4000 BCE through Spanish contact (~1500 CE) and was an important ritual center for people throughout this time period. However, to date, there are few bioarchaeological studies investigating how the people buried there lived their lives. This study uses bioarchaeological data from human skeletal remains excavated from Salango in order to make interpretations about the lives of people buried at the site during the Guangala culture period (100 BCE-800 CE). Analyses indicate that the study group underwent significant biological stress, based on skeletal markers of malnutrition and chronic infection. Because of the ubiquity of these stress markers and the associated mortuary setting, we suggest that the people living in this region during the Guangala period experienced a marked change in health and possibly altered the nature of ritual activity at the site in response.

Cabaniss, Andrew (University of Michigan)**[337]** *Overlapping Traces: Categorizing Ceramic Use-Wear across Functions*

Practitioners of ceramic use-wear analysis often document qualitative patterns to distinguish between past behaviors as well as taphonomic processes. If comparisons can be operationalized in a quantitative framework, analyzing assemblages across sites at a regional scale could inform our understanding of normative patterns of use as well as the diversity of use practices. Previous quantitative work has mostly compared alterations at the level of entire vessels or at the level of individual locations within vessels. This has set the stage for more holistic analyses that attempt to recognize diverse patterns statistically. I use a statistical dimension-reduction method to identify different patterns of use-wear traces among a collection of “miniature” cookpots at two Classical period sites in Greece, Athens and Olynthos, as part of a larger project to document diversity in the use of cook pots in domestic settings. By modeling vessels as a combination of overlapping patterns of use it is possible to distinguish several distinct modes of vessel alteration. Comparisons between contexts at each site support the multifunctionality of “miniature” cookpots.

Cabrera Romero, Martha (Universidad Nacional de San Cristobal de Huamanga)**[24]** *Every Day Hath a Night: Nightlife and Religion in the Wari Empire, Peru*

What was daily life like after sundown in the ancient city of Wari, Peru? What events took place and who was involved in them? In this paper, activities of the night and the sacred rituals that occurred in the ancient capital of the Wari Empire are explored from evidence that denotes the advanced practice of astronomy. The observation and movement of the stars, the phases of the moon, and the position of the planets can be seen only when the sun is hidden. The presence of megalithic tables, little pots dug into the rock, and evidence of intense burning associated with ceremonial enclosures in the city were some of the constituents of nocturnal rituals. These activities are associated with representations of nocturnal deities or the underworld that are known in the Andean world as ccoa (winged feline), the amaru (snake) and the owl, which at night had absolute control over life and death.

Cagnato, Clarissa (University Paris 1-Panthéon Sorbonne)**[309]** *Preclassic Maya Plant Use along the Usumacinta River: A Microbotanical Approach*

Paleoethnobotanical evidence, in conjunction with other archaeological data, provides key information regarding ancient practices. This paper presents the results of microbotanical analyses —specifically the study of starch grains—carried out on diverse Preclassic Maya archaeological materials (grinding stones and ceramics) recovered from centers along the Usumacinta River, namely at Ceibal (Petén, Guatemala) and Aguada Fénix in Tabasco, Mexico. Preliminary analyses suggest that the early inhabitants of both regions consumed a variety of plant foods, including maize (*Zea mays*), chili peppers (*Capsicum* sp.), and manioc (*Manihot* sp.). Overall, these microbotanical studies not only reveal some of the plants used in the past but also provide information regarding the range of tools used to process them.

Cajigas, Rachel (University of Arizona)**[49]** *Early Agricultural Practices at La Playa, Sonora, Mexico*

This poster presents results from geoarchaeological research on earthen irrigation canals at La Playa (SON F:10:3), in Sonora, Mexico. La Playa’s agricultural field system is associated with the Early Agricultural period (2100 B.C. – A.D. 50), which is characterized by the development of agriculture in the southwest United States and northwest Mexico. A combined dating strategy using Optically Stimulated Luminescence (OSL) dating on canal sediments and

radiocarbon dating on charcoal and semi-aquatic snails was used to date canals. The dates are between 450 B.C. – A.D. 550, a significant period both culturally and environmentally. These dates cluster at the transition between the Cienega phase of the Early Agricultural period (800 B.C. – A.D. 50) and the Trincheras period (A.D. 150 – 1450). During this time, a variety of paleoenvironmental proxies from the southwest region indicate a period of unusually wet winters followed by a drying trend. At La Playa, these dates correspond with a period of peak groundwater discharge and low energy overbank deposition followed by major erosion. The environmental and geochronological data indicate that early agricultural practices were correlated to changing environmental and depositional conditions on the La Playa floodplain throughout the Early Agricultural period.

[199] *A Tale of Two Cities: Holtun, Holmul, and Permeable Ceramic Boundaries between Guatemala and Belize*

In this paper we use frequency distributions of ceramic types and modes to identify and assess the presence and strength of permeable ceramic boundaries between sites in the northeastern Peten and west central Belize in the early Middle Preclassic through Postclassic periods. We use the data to argue there was no immutable geographical, social, or political boundary between Guatemala and Belize, but there existed a series of temporally and geographically specific permeable ceramic boundaries marked by the ebb and flow of types and modes across the contemporary geopolitical border. These permeable ceramic boundaries certainly could have reflected ephemeral socio-political boundaries, but they could also have represented ancient technoscapes unaffiliated with socio-political processes. Ceramic data from Holtun and Holmul, two sites in different sub-regions of the northeastern Peten with long periods of occupation, are used to substantiate our argument.

Callaghan, Richard (University of Calgary), Alvaro Montenegro (Dept. of Geography, The Ohio State University, Col) and Scott Fitzpatrick (Dept. of Anthropology, University of Oregon, Eugen)

[314] *The Effects of ENSO on Travel along the Pacific Coast of the Americas*

For decades, prehistoric contacts have been suggested between Ecuador and western Mexico, occurring from 400 BC, if not earlier, to the sixteenth century based on similarities in mortuary behaviors, ceramic technology, language, and ethnohistoric accounts, and other lines of evidence. However, the frequency of these patterns and the degree to which they were sustained is currently unknown. In this paper, we harness newly collected climatic data and computer simulations of seafaring to build on a previous study that examined the difficulty of maintaining sustained contact between these two areas and the level of seafaring capabilities and navigational and wayfinding skills that would have been necessary to make these trips. The present analysis, which also incorporates the effects of ENSO variability on winds and currents, provides a more robust framework for which distributions of cultural traits, genes, and languages can be compared, allowing for a better understanding of presumed patterns and mechanisms of prehistoric contacts.

Calleja, Maryann

[142] *The Invisibility of Violent Women*

We are all capable of violence. Violence utilized by men is rarely—if ever—questioned, but for women it is presumed a tool employed only by exception. Individuals and groups of both sexes have used violence to many ends. Though sex may influence the context and mode of employment, the capacity for violence is unaffected. Whether through direct, cultural, or structural violence, as individuals or in large-scale conflict, women can and have used violence to their advantage. They have fought on battlefields, perpetuated matriarchies, resisted authority, and maintained social order through the use or threat of violence.

Still, an inflated disparity between violent men and women exists in the archaeological record. To minimize this imbalance, research on violence must consider much more than just skeletal trauma. A biocultural approach can integrate archaeological context with evidence of biological stress to examine the social or cultural origins of indirect violence. Researchers must also account for sociocultural limitations that may have reduced the open expression of violence by women, thereby obscuring archaeological evidence of such behavior. Additionally, the paucity of published alternative interpretations and tendency of adherence to more conventional analyses have nearly rendered the violent women of the past invisible.

[202] *An Iconographic Analysis on the Offering H Polychrome Knives of Templo Mayor of Tenochtitlan*

The Mexicas were one of the civilizations that achieved a striking power of acquisition during Postclassic Mesoamerica. Through trade routes reaching down to Central America, they were able to procure exotic materials and artifacts not accessible in the basin of Mexico. One of these exotic materials was flint, a cryptocrystalline stone that forms in limestone areas. The Mexicas procured this rock to manufacture flint knives also identified as sacrificial knives and, based on historical accounts, Mexica priests used them to perform human sacrifice. At the Templo Mayor of Tenochtitlan, archaeologists have discovered three different types of these highly specialized lithic artifacts deposited in the offerings. In offering H, excavators retrieved for the first time, 33 polychrome flint knives ornamented with unknown iconography of geometric motifs. This paper will present the iconographic analysis on the offering H polychrome knives.

[69] *Healthcare and Citizenship in the Context of World War II Japanese American Internment*

During World War II, approximately 120,000 individuals of Japanese heritage were incarcerated by the United States government. One-third of those unjustly incarcerated were legal American citizens. This talk examines the types of medicine and healthcare made available to imprisoned Japanese Americans based on their citizenship status. Japanese Americans who had American citizenship were generally imprisoned in War Relocation Authority (WRA) prisons, while Japanese Americans who were unable to obtain citizenship due to the exclusionary laws of the time and who were considered "dangerous" were incarcerated in Department of Justice prisons. The latter prisons were required to follow the conditions outlined in the Geneva Convention, which stipulates the types of healthcare prisoners of war and non-citizens in enemy territory were to receive. How did a prisoner's citizenship standing affect their access to medical facilities and proper medical care at these two types of prisons?

[196] *Recent Archaeological Research at Dún Ailinne, an Iron Age Royal Site in County Kildare, Ireland*

Dún Ailinne is an Iron Age (ca. 600 BCE-400 CE) site in County Kildare, Ireland. It is considered as one of the Irish "royal" sites. These sites are mentioned in the early medieval literature and are large sites surrounded by an inverted bank and ditch and containing monumental timber architecture. David Anthony's first excavation experience took place at Dún Ailinne during the 1972 season as part of the 1968-75 excavation program directed by Prof. Bernard Wailes. This presentation will discuss the 2006-2008 magnetometry and targeted topographic survey at Dún Ailinne and the subsequent excavation seasons in 2016 and 2018. The new research has led to the identification and excavation of new structures and features, as well as new radiocarbon dates for some of the original archaeological phases. We will also briefly explore Prof. Wailes' impact on David Anthony's subsequent research.

[118] *Integrating Public Archaeology and Technology to Convey the History of the Mt Tabor AME Zion Church and Its Community*

The Mt Tabor AME Zion Church is located in Mt Holly Springs, Pennsylvania and is a standing log cabin structure that dates to 1871. There is an active descendant African American community around the Mt Tabor AME Zion Church that is proud of their heritage and would like to tell their story. The main goal of this project is to interpret survey data from the church property to the public in the most comprehensive manner possible. This is done using technology such as geophysical survey, 3D scanning, and 3D printing, paired with traditional techniques of excavation, archival research, and an oral history. By combining innovative techniques (geophysics and 3D scanning,) with traditional methods of archaeological testing, archival research, and oral history this research will collaborate with the Mt Tabor community to preserve and interpret the history of the Mt Tabor church and its landscape. The results of this research will be displayed in this presentation.

Campbell, Wade (Harvard)

[150] *Na'nilkad béé na'niltin: The Early Navajo Pastoral Landscape Project (Phase 1) – Experimental Ethnoarchaeology on the Navajo Nation*

The non-coerced adoption of sheep by Diné (Navajo) communities in northwest New Mexico during the 17th century and the subsequent rise of an intensely pastoral lifeway stand out as unique developments among Native societies in the American Southwest. By applying a three-phase research design that melds experimental ethnoarchaeology with geospatial modeling and site-focused geoarchaeology, “The Early Navajo Pastoral Landscape Project” (ENPLP) seeks to better understand the history of this shift and how early Diné groups responded to the various social and economic impacts associated with incipient pastoralism.

This paper discusses the ENPLP's first phase of research – a six-month long program of participant-observation and archaeological reconnaissance at a sheep camp on Black Mesa, Arizona, Navajo Nation. The resulting dataset, which combines archaeological site data with ethnohistorical research, illustrates the complexity of late 19th/early 20th century Diné herding practices and will form the basis for a series of geospatial analyses and archaeological fieldwork investigating 17th century Diné pastoral land-use practices in the Dinétah region of northwest New Mexico.

[410] *The Temple of the Inscriptions at Palenque: Improving Architectural Analysis, Conservation Assessment, and Public Dissemination via Terrestrial LiDAR and 3-D Mapping*

The Temple of the Inscriptions—K'inich Janab Pakal's funerary building—is an outstanding evidence of Palenque elite's grandiose architectural programs in the 7th century AD. Are terrestrial LiDAR and drone-based 3-D mapping viable techniques to inform a new architectural analysis on the construction of this iconic temple? Can digital monitoring based on terrestrial LiDAR provide conservators with a solid framework for enhancing the protection of Pakal's funerary crypt, which is rapidly deteriorating? In 2018, scholars from UC Merced and UNAM in collaboration with INAH, began a project of intra-site digital documentation at Palenque, including 3-D scanning and drone surveying. This paper presents the preliminary results of the project including new digital drawings and 3-D animations of the Temple of the Inscriptions produced via LiDAR point clouds and aerial 3-D maps. Our approach exploits 3-D models and digital documentation to improve comparative architectural analysis at Palenque to shed new light on the earlier phases of the Temple of the Inscriptions. This paper also addresses how surface change detection in multi-temporal hi-resolutions LiDAR scans can enhance monitoring and understanding of the deterioration of Pakal's funerary crypt, when combined with temperature and humidity logging conducted year-round in the chamber.

[360] *Caves beyond the Dripline: Reconceptualizing the Subterranean-Surface Dichotomy*

As cave archaeology emerged as a specialty in the 1990, an unfortunate consequence has been the reification of the distinction between surface and subterranean archaeology. We would note that there have always been problems with this dichotomy. Andrews (1970), for instance, mentions that the entrance to Balankanche Cave was in the middle of a plaza surrounded by four vaulted range structures. Plainly, the formal boundary of the cave was defined by the architecture outside of the cave. Good and Obermeyer, as well as Tucker and colleagues have documented plazas built out from cave entrances leaving no doubt that in the indigenous conception, the cave extended beyond the dripline. Recent cave surveys conducted in 2016-2017 as part of the Proyecto de Arqueología y Paisaje del Centro Sur de Michoacán noted plazas associated with caves at varying degrees of proximity. When viewed as a group, a clear pattern emerges. This presentation seeks to critically examine the Subterranean-Surface dichotomy to recognize features that functioned as extensions of cave space while not being outside of the cave.

Canaday, Timothy (Salmon-Challis National Forest), Bryan Hanks (University of Pittsburgh), Marc Bermann (University of Pittsburgh) and Rosemary Capo (University of Pittsburgh)**[409]** *Spatial Identification and Characterization of Native American Pithouse Villages along the Salmon River and Its Tributaries Utilizing Multi-Method Geophysical and Geochemical Survey*

Collaboration between the University of Pittsburgh and the Salmon-Challis National Forest has focused on a multi-year campaign of geophysical and geochemical surveys. This work has employed a suite of techniques to develop a better understanding of prehistoric social organization and a comparative spatial study of early village sites along the Salmon River and its major tributaries in the Frank Church - River of No Return Wilderness of central Idaho. The combination of geophysical survey and soil chemistry (fluxgate gradiometry, earth resistance, electromagnetic conductivity, soil magnetic susceptibility, pXRF analysis, and soil extraction geochemistry) has provided a high-resolution, minimally-invasive approach to site characterization and is assisting with the management and protection of important archaeological sites and cultural heritage connected with early indigenous populations of this region.

Cancino, Ignacio (Stanford University)**[315]** *Dating Agricultural Fields and Canals in the Queneto Quebrada, Viru Valley*

The results and analysis of radiocarbon dates from canals and agricultural fields are presented and discussed. The radiocarbon samples were obtained from these agricultural features and associated structures located in the Queneto Quebrada in the Viru Valley. The evolution of agricultural techniques in the north coast and responses to environmental changes and climate variability are discussed.

Cannon, Kenneth (Cannon Heritage Consultants), Houston Martin (Cannon Heritage Consultants) and Molly Cannon (Museum of Anthropology, Utah State University)**[9]** *Exploring Surface Spatial Patterns of Ethnic Chinese Artifacts along the Central Pacific Railroad, Box Elder County, Utah*

Immigrant Chinese workers represented the dominant work force in the construction of the Central Pacific Railroad (1863-1869). The archaeological record they left behind provides an important snapshot of the lives of these largely male work camps in the isolated desert of northwestern Utah. Funded by the National Park Service's Underrepresented Community Initiative and the Utah Division of State History, we conducted two years of intensive inventory of two work camps, four section stations, and two towns that date between 1869 and 1910. The fieldwork involved detailed mapping and recording of the surface distribution of ethnic Chinese artifacts at these various sites. The distribution of ethnic Chinese artifacts, particularly ceramic tableware, indicates a pattern of spatial, and probably social, segregation. However, the surface artifacts also provide a starting point for exploring more sophisticated questions of the living and working conditions at these range of sites and how the workers' social and economic conditions may have changed during the period of construction and after completion of the Transcontinental Railroad.

[152] *Made in a Marketplace: A Comparison of Stone Tools Crafted from Local and Non-Local Raw Materials in Classic Maya Marketplaces of the Mopan River Valley, Belize*

Is a stone tool crafted from a raw material found naturally occurring only outside the geographic zone and political control of a settlement, but made in the site's central marketplace, a non-local or local good? In this paper, I present examples of such a situation at two Classic Maya marketplaces located in the Mopan River Valley, Belize, where stone tools, made from locally available chert and limestone, and non-local obsidian were produced and exchanged side-by-side. I suggest that, multiple factors, including equitable access to an exchange good through a marketplace, the frequency of consumption, the type of raw material, and the residential history of the producer-vendor and consumer, can influence perceptions of what is a local or non-local good.

[238] *Deep Histories of Conquest: Mesoamerica, Iberia, and New Spain*

As the discipline best suited for studying changes in human societies over long periods of time and the materiality of our existence, archaeology offers a valuable perspective on historic cross-cultural encounters viewed as deep history with tangible ramifications. At the quincennial of Spain's invasion of Mesoamerica, the Aztec-Spanish war, and the transition to the new colonial regime of New Spain it is worthwhile to apply an archaeological lens to these events framed in a comparative, trans-Atlantic perspective with temporal depth. In this paper I work towards a deep history of the "conquista" by considering parallels and divergence in the long-term development of Mesoamerican and Iberian societies, their traumatic collision of five centuries ago, and their physical entanglements and legacies in landscape, symbolism, technology, and other dimensions of society. I focus especially on the deep roots of key factors often cited in older and contemporary historical accounts, including the diffusion of maritime and military technologies and plantation crops and economies; Mesoamerican micro-patriotism and indirect imperialism versus early modern Spanish ethno-nationalism and direct territorial control; and the clash and syncretic accommodations of absolutist and incorporative religious systems.

[118] *The Mesoamerican Laboratory Ceramic Type Collections Project at Harvard University's Peabody Museum of Archaeology and Ethnology*

The Mesoamerican ceramic collections at the Peabody Museum represent the work of an array of influential scholars who collected and analyzed them, many of whom were pioneers in ceramic analysis, including Alfred Kidder, Eric Thompson, Anne Shepard, and Gordon Willey. Archaeologists in many cases still use the methods established by these scholars, and we often find pottery sherds in the Mesoamerican Laboratory that were illustrated in Peabody Museum monographs and other publications. These collections also represent the very limited number of ceramic collections that exist outside Mesoamerica, and in some cases are no longer accessible within their home country. The current project works to improve intellectual and physical control of collections housed in the Mesoamerican Laboratory through curatorial study and reorganization, so they can be used effectively by current and future generations of scholars, faculty, and students. In keeping with the Peabody Museum's priorities, the project enhances knowledge of the collections through academic research on the "who/where/what/when/why" for each collection and highlights their historical value and scholarly significance. This poster outlines the project's methodology, particularly the individual consideration applied to each collection to determine the best approach to reorganization, and how it may impact future use of the collection.

Card, Jeb (Miami University) and Salem Arvin (Miami University)**[112]** *3D Reconstruction of Early Spanish Colonial Hybrid Ceramics from Ciudad Vieja, El Salvador*

The primary serving vessel at the sixteenth-century Spanish colonial site of Ciudad Vieja, El Salvador, is an indigenously produced brimmed plate made in the form of Italianate majolica. These vessels were produced in a Mesoamerican technological tradition and were painted with a modified version of designs found on pre-Hispanic Pipil pottery in southeastern Mesoamerica, yet they display remarkable attention to minor variations of form found in contemporary Italianate plates. Approximately 600 fragmentary examples of this form have been found at Ciudad Vieja, making it one of the largest collections of ceramics sometimes labeled as "hybrid" or "colonoware", but only two partially complete examples have been recovered from the site. A sample of 84 fragments, representing most of the morphological variation in the larger population, were laser-scanned to produce 3D representations. These models were then used to produce 3D reproductions of the whole vessel for examination virtually and in physical 3D printed examples. This project not only allows analysis of these fragments as a more comprehensible whole, they are useful for classroom exercises and broader public outreach.

Caretta, Nicolas (UASLP), Finn Ole Nielsen (Bornholm Museum), Michael Thorsen (Bornholm Museum) and Poul Otto Nielsen (National Museum Denmark)**[386]** *Vasagård Archaeological Project: A Causewayed Enclosure and Timber Circles in the Island of Bornholm, Denmark*

Vasagård site is located on the southern side of the island of Bornholm, Denmark. Vasagård is separated by the 100m Læså valley from two nearly identical Neolithic sites and consists of a tomb system where a dolmen and a passage grave can be found close to the settlement. The grave system and causewayed enclosures are dated from 3500 BC., and constitute the most north-eastern occurrence of this complex type in Europe. Contemporary to the palisade enclosures timber circles have been found, as well as three hundred small and flat, engraved stones, (broken and complete) and large quantities of animal and carbonized seeds placed as offering. The engraved stones were marked with patterns of radiating straight lines and have been named "sun stones" or "solar stones" by the local archaeologist. Archaeologists from the Bornholm Museum have proposed that these artifacts were likely part of the rituals carried out by Neolithic sun-worshipping societies about 5,000 years ago. Analysis of these materials that has been discovered will present us with a clearer view of the first communities that settled in the island and the origins of agriculture, farming and ritual in Bornholm.

Carhuanina, Diana (Qhapaq Ñan)**[355]** *La Cerámica Inca en Vilcashuamán: Hacia el Análisis de sus Estilos*

En el marco del Proyecto del Tramo Vilcashuamán-La Centinela (Qhapaq Ñan-Sede Nacional) desde el año 2017 se vienen realizando investigaciones arqueológicas en la Zona Monumental Vilcashuamán (Ayacucho, Perú), interviniéndose con pozos de prueba en los sectores Templo de Sol y Ushnu. Además, se realizó un reconocimiento de los alrededores del sitio teniendo como eje central la ciudad de Vilcashuamán.

La presente ponencia presentará los resultados preliminares del análisis del material cerámico, donde se observa la influencia del estilo inca en la cerámica local para el Horizonte Tardío. Se identificaron algunos fragmentos que siguen manteniendo características de tradiciones alfareras locales incorporando elementos de la cultura Inca o incluso imitando sus formas.

Si bien Vilcashuamán es un sitio con una planificación netamente Inca y se encuentra en uno de los principales caminos que interconectaban al Cuzco con otras partes del Imperio Inca, la presencia de cerámica Inca Imperial es escasa.

[406] *Not Only an Archaeological Rescue: Canal de Ohtenco, Case Study of Iztacalco's Agricultural System*

"Chinampas" typically are associated with Xochimilco's agricultural system. However, recent work by INAH's 'Dirección de Salvamentos Arqueológicos' was undertaken at Iztacalco due to modern population growth. Iztacalco is 15 km from Xochimilco but no information existed about the preHispanic population or the site's economic activities. Therefore, this research offers important data to study their agricultural system and the species the cultivated. Iztacalco was an islet where variable water levels inhibited permanent settlement but allowed agricultural. According to the analysis of soil samples, they cultivated an extensive variety of cultigens, such as *Chenopodium* sp., *Amaranthus* sp., and *Cucurbita moschata*. This project allowed us to employ new technology, such as drones, to produce 3D reconstructions of canals and chinampas. These data allow us to compare the chinampas of Iztacalco with ones excavated in Mexicaltzingo and in area of Mexico-Tenochtitlan, near the modern area of the city's main Central de Abastos.

[207] *Ethnogenesis at the Lynch Site (25BD1), Nebraska through Pottery Analysis*

The Lynch site occupied in the late 1200s saw substantial environmental and population shifts in the context of profound regional sociopolitical and demographic changes. Oneota groups expanded into the east-central Great Plains at the same time that indigenous Plains farmers abandoned the western parts of their ranges and moved east. Interactions between these groups remain poorly understood. Lynch ceramics demonstrate patterns suggesting that these two distinct groups may have lived side-by-side, forming new communities with distinct identities. The assemblage from the Lynch Site (25BD1) includes classic Oneota shell-tempered pottery that is likely imported, classic Oneota and Central Plains Tradition pots made locally, and pots that blend elements of Oneota and CPT styles.

[10] *The Inland Life of Southeast Alaska*

The focus of archaeological research in Southeast Alaska has long been on coastal sites. Over the past decade new inland sites have been recorded on Prince of Wales Island, including the first early Holocene lakeshore site. Waterfalls presenting natural fish barriers to migrating salmon also preserve evidence of Holocene human activity far removed from early Holocene paleoshorelines. Resource use of the island interior in recent centuries is documented by culturally modified trees found far inland. Future research should target inland procurement strategies for a fuller understanding of the seasonal round through time.

[88] *Bison Kill Sites in South Dakota, 9,000 B.C. – A.D. 1875: A National Register of Historic Places Multiple Property Listing*

The state of South Dakota currently has over thirty recorded bison kill sites. With development, agricultural practices, and natural erosion a threat to many of these sites, the need to identify, evaluate, and protect these and other unrecorded bison kill sites within the state is imminent. To aid in this process, staff from programs of the South Dakota State Historical Society are conducting research on previously recorded bison kill sites within the state and are developing a statewide bison kill site multiple property submission for the National Register of Historic Places. Using a thematic approach, the multiple property listing outlines the environmental, ethological, and cultural contexts of bison (*Bison* spp.) kill sites in South Dakota from the Paleoindian Period to the Reservation Period. The listing also defines the property types associated with bison kills within the state and delineates each property type's significance and registration requirements. The multiple property listing provides cultural resource managers with a standardized approach to identifying and evaluating bison kill sites in South Dakota, thereby facilitating the consideration of these important cultural resources in federal and state undertakings.

[325] *New Investigations at Russell Cave, Alabama*

Russell Cave (1Ja181), located in Jackson County, Alabama, contains one of the longest prehistoric occupational sequences known in the southeastern U.S., spanning approximately 9,000 years. Excavations were conducted by the Chattanooga Chapter of the Tennessee Archaeological Society (1953-1955) the Smithsonian Institute in conjunction with the National Geographic Society (1956-1958) and finally by the National Park Service 1962. Original analyses focused on ceramics, lithics, human skeletal remains, and faunal remains. These analyses along with radiocarbon dates have helped to define the archaeological framework of the cave as well as that of the greater Southeast. The era of the early excavations did not address plant use at the site or study the complex stratigraphy. Recently the Sewanee field school, in collaboration with archaeologists from NPS-SEAC, conducted the first excavation of the cave in over 50 years. Here we present the preliminary results of the focusing on the first float samples analyzed from the cave, new radiocarbon data, and geoarchaeological analysis of the well-preserved anthropogenic deposits.

Carney, Molly (Washington State University)

[211] *Alternative Recipes: Exploring the Diversity of Foods Prepared in Prehistoric Earth Oven Cooking*

Camas (*Camassia* spp.) was among the most important foods for many cultural groups of the Pacific Northwest in the past. The Pend Oreille Valley in northeastern Washington and the Kalispel people were particularly known for their large camas fields and the archaeological record of the valley is replete with earth oven features. Archaeological site 45PO422, located along the Pend Oreille River on Kalispel ancestral lands, was an earth oven site, presumed to be the location of significant camas processing. Bulk soil samples, archived for the past 20 years, were floated and processed for the identification of charred plant remains. A total of 17 plant species were identified to the genus or lower taxonomic level. Culturally important plant taxa include nodding onion (*Allium cernanum*), kinnikinnick (*Arctostaphylos uva-ursi*), berry (*Vaccinium* sp.), chokecherry (*Prunus virginiana*), hawthorn (*Crataegus* sp.), and pine (*Pinus albicaulis*, *Pinus contorta*, and *Pinus ponderosa*). This work supports the Kalispel Tribe's long-term interests in understanding its history of food selection, food security, and food safety.

[191] *Field Investigations at El Quebracho, a Sapoa-Period Site in the Boaco Department of Central Nicaragua*

Along the Fonseca River, southwest of the City of Boaco, Republic of Nicaragua, is the small community of El Quebracho. Within grazing parcels are remnants of a site dating to the Sapoa Period. Little is known archaeologically in the Boaco Department. Field investigations during January 2017 included reconnaissance survey, detailed mapping, and surface collection. A geophysical survey using magnetometry and ground penetrating radar was employed to create remote sensing site imagery. Findings at El Quebracho consist of cobble architecture, including an array of scattered mounds varying in size that may have been arranged around plazas, a characteristic Mesoamerican pattern. This suggestion of Mesoamerican influence at the site of El Quebracho is supported by a surface-collected Plumbate ceramic fragment. A total of 14,452 square meters were subject to geophysical remote sensing survey. Based on present knowledge, the site of El Quebracho was occupied from A.D. 1000 to 1350. Site integrity and collected surface material stimulate further interest for archaeological research in central Nicaragua.

Carpenter, John (Centro INAH Sonora) and Guadalupe Sanchez Miranda (Centro INAH Sonora)

[16] *Resilience in an Arid Environment: Long-Term Climate Change and Human Adaptations in Sonora*

Recent interdisciplinary investigations have revealed that the Sonoran Desert region is not only one of the earliest regions occupied in the Americas, but also demonstrates one of the longest continuous occupation records. The earliest Sonorans were proboscidean hunters in the Late Pleistocene, highly-mobile Archaic foragers and hunters in the Early and Middle Holocene and maize farmers in the Late Holocene. Several archaeological sites in the Sonoran Desert region have a well-preserved archaeological record with stratigraphic deposits that cover the last 15,000 years. Based upon multiple sources of evidence (pedological data, pollen samples, macrobotanical remains, and cultural materials) primarily from the La Playa, Fin del Mundo, El Aigame and El Gramal sites, along with Uto-Aztec linguistic models, we explore the mechanisms implemented by the inhabitants of the desert to survive the climatic oscillations recurrent during the Holocene and how these adaptations permitted them to thrive in their cultural landscape. This paper summarizes the longue durée of climate change and human occupations and their varied adaptations represented in the archaeological record of Sonora, Mexico.

[197] *Tools for Change: Food Preparation Techniques during State Formation at the Tilcajete Sites*

Cooking and eating are practices with cultural significance beyond sustenance. Understanding foodways during times of sociopolitical transformation can provide a window into how people foster, resist, and mediate social change in daily life. The context in which food is produced, prepared, consumed, and shared provides insight into people's changing practical concerns as well as the social and symbolic significance of foodways and eating. In this paper, we examine food preparation in household contexts during the Middle and Late phases of the Formative period in Oaxaca, Mexico (500-100 B.C.). This was a time of significant sociopolitical change in connection with the founding of Monte Albán and the emergence and growth of the state.

We investigate households from the Tilcajete polity in the southern Valley of Oaxaca. Excavations at two consecutive occupations have demonstrated changes to domestic architecture that suggest an increase in household size. In this study, we compare food preparation features and implements including groundstone tools, ceramic cooking vessels, and hearths from both occupations. We evaluate patterns in household food preparation tools to determine whether people continued to reference traditional cooking techniques or created new styles of food preparation in response to shifting household composition and broader societal change.

[370] *Stable Isotope Analysis of the San Pedro and Cienega Phases at the La Playa Site (SON: F: 10: 3), Sonora, Mexico*

Previous stable isotopic studies of bone from 12 dated individuals from the site of La Playa in Northern Sonora suggest a diet dominated by C4 and CAM resources. For collagen $\delta^{13}\text{C}$, an average value of -8.5‰ ($n=5$) was recorded in the San Pedro phase (1200 BC to 800 BC) which shifted to an average value of -10.0‰ ($n=7$) in the Cienega phase (800 BC to AD 150). However, carbon from bone apatite shows no change over time. There is an unexpected decrease from San Pedro to the Cienega phase in $\delta^{13}\text{C}$ collagen values suggesting changes in C4/CAM protein intake. In contrast, other data (e.g. maize ubiquity values) suggest a dramatic increase in corn consumption between these two phases. One possible explanation is a shift in protein sources, with greater reliance of distant marine resources during the Cienega phase. However, while the high nitrogen ($\delta^{15}\text{N}$) values are consistent with the use of marine resources (11.3‰ to 13.2‰ , $N=12$), there are no differences between the phases in $\delta^{15}\text{N}$. We provide new stable isotope analysis on 17 additional humans, as well as selected fauna from La Playa, to explore explanations for directional shifts in diet as well as the elevated $\delta^{15}\text{N}$ signatures.

Carpio, Edgar

[270] *El Diablo Rojo: An Olmec Rock Painting in Amatitlán, Guatemala*

Known as "The Red Devil" or the "Muñeco", a rock painting in Olmec style, located in the municipality of Amatitlán, department of Guatemala. This was reported at the end of the 70s of the last century and has been visited on numerous occasions by various specialists. In this paper we will present a synthesis of its discovery and the investigations carried out, as well as a description of its current status, indicating whether changes have been observed over time since it was reported. We will also try to raise some interpretation that will bring us closer to establishing what was the purpose of its creation and why in that precise place.

[372] *Ancient Maya Quarries: Limestone, Chert and Lidar*

Lidar has dramatically expanded our view of the ancient Maya landscape. We have used lidar to study the key natural resources of limestone and chert- their location, extent, and relationship to other ancient Maya features. Limestone was a key building material and chert was the source for most chipped stone tools. Lidar-derived imagery and hydrological modeling informed our reconnaissance surveying at the ancient Maya site of Yaxnohcah, Calakmul Biosphere Reserve, Campeche, Mexico. We located extensive areas of limestone quarry pits adjacent to residential ruins. Excavation showed many of these quarries were converted to residential water reservoirs. We located linear, limestone, quarry scarps a half kilometer in length. Lidar shows the scarps are aligned with civic-ceremonial groups, some groups more than three kilometers distant. We located small zones of chert quarries and chert pavements. One zone is a cluster of semi-circular quarries at the intersection of upland and bajo. The zone of chert nodules was quarried in multiple individual semi-circles, rather than one large quarry. This may give an indication of the organization of this economic activity. Limestone quarries appear to be quite extensive, chert quarries quite limited.

[332] *Perspectives on Pits of the Western Stemmed Tradition: An Analysis on the Contents of Feature 59 at the Cooper's Ferry Site*

Excavation of a pit feature designated as Feature 59 (F59) from the Cooper's Ferry site (10IH73) in western Idaho offers a unique opportunity to explore more about the Western Stemmed Tradition (WST) and how people used pits in the Far West. This project analyzes the contents from within F59. These contents include the skeleton of a wolverine (*Gulo gulo*) specimen found at the bottom of F59 in association with one WST projectile point. Furthermore, a biface, unifaces, blades, cores, modified flakes, and debitage, as well as other fragmented faunal remains, were excavated from F59 as well. A radiocarbon assay taken from a rib of the wolverine suggests an age of 9,620 ±30 radiocarbon years before present. Conducting analyses on F59 and its contents will further knowledge regarding how people used pits in prehistory at the Cooper's Ferry site while also furthering research on domestic lifeways of the WST.

Carroll, Jon (Oakland University)

[409] *A Multispectral Survey of the Historical Landscape of Chateau de Balleroy, Normandy, France*

Chateau de Balleroy located in the Calvados region of Normandy, France, played an important role in launching the career of Francois Mansart, popularizer of the Mansard roof. Historic architectural features, subsurface archaeological features, and graffiti were documented using drones and multispectral imagery. The analysis of these data enhances our understanding of how the people marked and modified the Chateau and its associated landscape at multiple sociospatial scales over the last four centuries.

Carroll, Mary (National Park Service)

[237] *Understanding Section 3 of NAGPRA*

The Native American Graves Protection and Repatriation Act (NAGPRA) became law on November 16, 1990. In the 29 years since NAGPRA was enacted, much attention has been paid to Native American human remains and other cultural items subject to NAGPRA already in museum and Federal agency collections. However, there's another aspect of NAGPRA that impacts Federal agencies and their work. Section 3 covers the ownership of cultural items subject to NAGPRA inadvertently discovered or intentionally excavated on Federal lands after November 16, 1990. But what is actually required under Section 3? This paper will set the context for the "Beyond Collections" symposium by providing a brief summary of Section 3, including what must occur in order to allow archaeological excavations; what must happen at the time of an inadvertent discovery; who is entitled to custody/ownership of the human remains, funerary objects, sacred objects, and objects of cultural patrimony; and what dispositions of "unclaimed" cultural items are allowed.

[113] *The Use of Geospatial Technology to Identify Patterns in the Distribution of Artifacts at the Ancient Maya Site of Pacbitun, Belize*

The archaeological site of Pacbitun is located in west central Belize between the ecozones of the Belize River Valley and the Mountain Pine Ridge. The ancient Maya occupied the site from the beginning of the Middle Preclassic (900 – 300 BC) and continuing through the Terminal Classic (AD 800-900). The use of geographic information systems (GIS) is becoming increasingly useful in the world of archaeology. Throughout the past ten years various artifacts that have been designated as "special finds" have been recovered from the site core and periphery, and based on context have been identified as either elite or commoner. These special finds belong to all material culture categories - bone, ceramic, and lithic – and have been found in isolated mounds, courtyards, plazas, temples, and palaces. In order to generate a better understanding of the significance of these special finds, either singly or in concentration/association, we use a GIS technique called heat mapping. Heat mapping will visually demonstrate any recognizable patterning of low or high frequencies of the special finds. This GIS technique will allow us to determine the kinds of activities (e.g., ritual, household, storage, midden) that were performed in different contexts through time at the site.

[27] *Mind the Gap: Occupation at Angkor Wat and Implications for the Decline of Angkor*

The Angkor Empire controlled or influenced much of mainland Southeast Asia from the 9-15th centuries CE. Traditionally, scholars have dated the end of the Angkor Empire to 1431 CE, when the capital was sacked by the kingdom of Ayudhaya in Siam (Thailand). More recent archaeological work has also demonstrated a strain to the water management network due to a series of droughts and heavy monsoons in the 14-15th centuries, which also contributed to a decline of elite socio-political power and depopulation of the region. In this paper, we add to the evolving narrative regarding Angkor's collapse by presenting radiocarbon dates from three field seasons of excavations on occupation mounds within the Angkor Wat temple enclosure. These radiocarbon dates show a 13-15th century GAP in occupation at the site. We contextualize these dates with other published radiocarbon dates from across Angkor as well as historic and art historic/architectural sources to demonstrate the complexity of the Angkorian "collapse" and to complicate narratives regarding the transition from the Angkorian to the Post-Angkorian period.

Carter, Benjamin (Muhlenberg College)

[314] *Spondylus as a Driver of Long-Distance Exchange*

For many years the shellfish, *Spondylus*, has been seen as a driver for long distance exchange. Overfishing of the highly sought *Spondylus* pushed harvesters farther and farther north, possibly as far as West Mexico, in search of the red, orange and/or purple shell and promoting interaction between distant and disparate peoples. Yet, the overfishing hypothesis has been only partially tested. Current understandings of *Spondylus* ecology indicate that the shellfish may have been much more easily acquired and broadly available than originally thought and therefore much more difficult to deplete. The presentation will address the effects of updates to *Spondylus* ecology as well as the current archaeological evidence for overfishing and long distance exchange of *Spondylus*. I propose additional ways to test the hypothesis. Though clearly an important component of long distance exchange, it now appears less likely that *Spondylus* was a primary driver.

[256] *Discussant*

Carter, Nicholas (Harvard University) and Lauren Santini (Harvard University)

[384] *Epigraphy and the Archaeology of Settlement in the Dolores Region, Peten, Guatemala*

This paper summarizes recent research into the timing, distribution, and causes of ancient Maya settlement in the area of Dolores, Peten, Guatemala, in the western Maya Mountains. Integrating evidence from hieroglyphic inscriptions, ceramic studies, and GIS modeling of least-cost pathways and viewsheds, I propose an archaeological narrative for the Late Classic period in which kingdoms outside the Dolores area intervened there, including through the sponsorship of religious cults and local dynasties, in order to secure control of travel routes important in the procurement of cacao and other valued crops. As the Calakmul hegemony broke down under pressure from Tikal, local kingdoms contended for dominance, repeating in miniature some of the strategies used by larger Maya polities.

Cartier, Meghan (California State University, Fresno)

[406] *The Sighing, Bleeding, Feasting Soul: Speech Scrolls in Mesoamerica*

Speech scrolls are common elements of Mesoamerican codices and their frequent use and incorporation into a wide array of human and anthropomorphic entities highlights the need for a formal study of these elements of iconography. The use of speech scrolls is not ubiquitous simply because of their function as a marker of speech in service of a larger motif or series of events, but because they are integral to the underlying cultural and cosmic foundations of these motifs. Be it as a simple volute or an intricate swirl of precious items, depictions of speech are more than mere markers of verbal communication. Speech scrolls connect the images and figures depicted to larger cosmic concerns of the soul, earthly and heavenly structure, authority, death, and sacrifice. Analysis of speech scrolls in ritual contexts illustrates the multi-layered and interdependent relationship between tangible and imagined corporeal forms with the unseen supernatural foundations underlying concepts of ritual actions and bodily performance. Through examination of speech scrolls in the Borgia Group codices, with particular focus on the ritual sequences in the Borgia Codex, connections between the depiction of speech/breath and Nahua ideas of the tripartite soul, cosmic structure, and ritual power are revealed.

Cartwright, Rachel (University of Minnesota)

[50] *Playing at Death: A Discussion of Hnefatafl Pieces in Viking Burials*

Board games, from a psychological standpoint, have been seen as a reflection of skill, cunning, wisdom, and intelligence. Since most board games were developed in order to hone one's skills in a certain area of life, the presence of them in graves should indicate a level of intellectual prowess. However, from an archaeological viewpoint, the presence of board games in burials has been seen as a signifier of high social status. Often this has been assumed given the relative expense of the materials used in the creation of board games excavated in burials. During the Viking Age (AD 793 to 1066) Hnefatafl, a tactical game much like chess, was a popular board game, with

evidence of the game appearing throughout Scandinavia and the British Isles. This paper will combine the psychological and archaeological in an attempt to better understand what Hnefatafl pieces found in Viking Age burials signify about the individuals with whom they are buried.

Carvalho, Milena (University of New Mexico)

[144] *A Stable Isotopes Analysis of Ungulate Remains from Lapa do Picareiro: An Assessment of Refugia Concepts during the Middle Paleolithic and Transition to Upper Paleolithic*

Neanderthals and anatomically modern humans (AMH) adapted to a series of environmental changes during the Late Pleistocene and may have sought refugia in the southern reaches of Europe in response to environmental degradation. Explanatory models such as the Ebro Frontier Model propose that Neanderthals were adapted to woodland environments while AMHs preferred open landscapes. This model suggests that Late Neanderthal survival in southern Iberia may have been the result of Neanderthals seeking refuge during the relatively mild conditions during MIS 3 on the peninsula. Heinrich Events, especially H4, however, may have created harsh climatic conditions that may have reduced Neanderthal populations below survival thresholds. Thus, reconstructions of paleoenvironmental conditions to which Neanderthals and AMHs were subjected are key to understanding whether both groups periodically sought refuge in Iberia. Here, we present a paleoenvironmental study using stable isotopes analysis of carbon and oxygen of red deer and ibex tooth enamel from Mousterian and Early Upper Paleolithic levels from Lapa do Picareiro (Portuguese Estremadura). These data are then compared to previous isotopic data recovered from red deer and rabbit tissues as well as other paleoclimate indicators from Picareiro to assess whether central Portugal acted as a refugia during periods of unfavorable climates.

[266] *Fluid Borders: Personal Ornamentation and Waterways in Bronze Age Northwest Europe*

This paper explores the role played by waterways in the social exchange characteristic of Bronze Age Europe. It uses personal ornamentation as a proxy for social groupings, based on strong theoretical arguments establishing the necessity of a common 'grammar' to the relay of information via physical adornment. This analysis considers the form, design, and deposition of objects of personal ornamentation in Ireland, Britain, and northern France, with particular focus on the Irish Sea, the Channel, and the major rivers of each respective region. While modern Western thought tends to conceptualize bodies of water as barriers, suggested by their frequent designation as political borders, preliminary data suggests that waterways in the Bronze Age functioned as facilitators of social exchange, as reflected in patterns of personal ornamentation.

Casana, Jesse (Dartmouth College)

[77] *Resurrecting Lost Landscapes: Global-Scale Archaeological Prospection Using Cold War-Era CORONA Satellite Imagery*

Declassified CORONA spy satellite imagery, collected from 1960-1972, has proven to be a uniquely valuable resource for discovery, mapping, and interpretation of archaeological landscapes. These high-resolution, stereo photographic images preserve a picture of sites and cultural landscape features that have been impacted or destroyed by recent industrialization, urban expansion, and agricultural intensification in many parts of the world. However, there are significant technical challenges in integrating unusual cross-path panoramic CORONA imagery into modern GIS platforms, creating hurdles for archaeological research. The paper presents results of the CORONA Atlas Project, an effort that is making orthorectified CORONA imagery available across much of the globe as well as providing tools for archaeological analysis. Using examples from China, Iraq, Pakistan, Peru and elsewhere, findings illustrate some of the tremendous opportunities for archaeological prospection that CORONA imagery makes possible, while also highlighting a range of new challenges presented by the sheer magnitude of available data and the complexity of its interpretation and analysis.

Nuno Bicho (ICArEHB - University of Algarve)**[144]** *Assessing the Spatial Patterning of Middle Paleolithic Human Settlement in Westernmost Iberia*

Currently available data on the Pleistocene human occupation of the westernmost territories of Iberia attests the presence of Middle Paleolithic industries from c. 240 ka cal BP until c. 38 ka cal BP. Previous studies focusing on this timeframe have suggested that Middle Paleolithic populations were highly mobile and predominately utilized locally available raw materials, with many of cave and open-air sites being located near springs or fluvial settings. Other than these observations, no specific studies have focused on exploring the factors influencing human site location choice during that time range. Employing statistical and GIS approaches, this paper will provide an initial assessment of potential spatial patterning in human settlement during the Middle Paleolithic of Central and Southern Portugal, evaluating (1) whether the location of preserved sites was random or spatially biased and, if the latter is true, (2) what landscape features have a greater influence on site location choice, and (3) if there have been any changes in the influence of these features over time. Our data will help to shed light on the particularities of Neanderthal adaptations in a region regarded as refugium during periods of unfavorable climate during the Middle Paleolithic.

Casco, Antonio García [37] see Pouncett, John

Caseldine, Christopher (Arizona State University)**[194]** *Dispersed Centrality: A Ceremonial Organization Underpinning Hohokam Platform Mound Ceremonialism*

The period between the collapse of the ballcourt system (ca. A.D. 1070) and the formalization of Civano phase platform mounds (ca. A.D. 1300) has long perplexed Hohokam scholars. Before and after this period, members of Hohokam society gathered together at centralized locations to participate in and observe public activities and ceremonies. Given a possible long history of centralized public ceremonialism during the Hohokam cultural sequence, above the scale of the household, it is unlikely that such activities ceased between the ballcourt system collapse and the Civano phase. In this paper, I will introduce the concept of "dispersed centrality". Public ceremonialism was likely socially-central throughout the entire Hohokam cultural sequence, but centralized nodes of ceremonies also were present at various levels of the community and not just at locations of monumental architecture. To support my argument, I will provide settlement and artifact data from the Casa Grande community and from Phoenix basin settlements. These data suggest that platform mounds were the most conspicuous manifestation of centralized ceremonialism during the Civano phase, but public ceremonies also occurred at lower levels of social organization.

Casserly, Anna-Marie (University of Kentucky) and Briana Moore (University of Kentucky)**[353]** *Analyzing Stress, Discovering Cooperation: A Case Study of a Late Archaic Sample from the Green River Region of Kentucky*

While considerable portions of bioarchaeological work have been dedicated to examining evidence of violence and conflict, little research has been devoted to understanding collaboration in the past. Analysis of stress biomarkers, particularly that which utilizes an osteobiographical approach, provides one potential avenue for finding evidence of cooperation in prehistoric societies. The Late Archaic communities of the Green River region of Kentucky present an ideal population for a case study on collaboration in forager groups. By analyzing osteological stress markers, this examination seeks to realize the potential for using these stress biomarkers, contextualized through mortuary analysis, to better understand cooperation as a social process. By exploring experiences of stress throughout the life course of adults, researchers have the potential to see how cooperation manifests differentially even for individuals within non-ranked societies.

Casson, Aksel (Slippery Rock University)**[119]** *Role-Playing Games in the Introductory Archaeology Classroom*

The use of role-playing games (RPGs) in university courses is increasingly common in the humanities and social sciences, most notably within the discipline of history. Here I describe my efforts to construct a series of mini-RPGs for an introductory archaeology course, with units designed around key behavioral developments: the emergence of technology, culture, agriculture, cities, and cooperative behavior. These units are inspired by Robert Kelly's book, *The Fifth Beginning*.

Castañeda, Amanda (Shumla Archaeological Research and Education Center) and Charles Koenig (Shumla Archaeological Research and Education Center)

[305] *Petroglyphs in the Lower Pecos Canyonlands: Preliminary Analysis of Context, Style, and Chronology*

Petroglyphs have been an understudied form of rock art in the Lower Pecos canyonlands of Texas, in large part due to the small number of sites known to include carved, incised, or pecked designs. The most famous petroglyph site in the region is Lewis Canyon, where over 1,000 figurative petroglyphs were pecked into the limestone bedrock. Aside from Lewis Canyon petroglyphs have been considered uncommon in the region. While petroglyphs may be far less pervasive than the hundreds of pictograph sites, Shumla has recently documented over 15 additional sites containing figurative petroglyphs. Interestingly, these newly identified petroglyphs are starkly different than the imagery at Lewis Canyon. This paper describes the documented petroglyph assemblage, and puts forth preliminary thoughts about the context, style, and chronology of these features. It is important that we begin to recognize the patterns and variation that exist among the petroglyphs of the region as well as compare these with petroglyphs in the immediate surrounding areas of Texas and northern Mexico.

Castañón-Suárez, Mijaely (Instituto Nacional de Antropología e Historia), José Luis Punzo Díaz (Instituto Nacional de Antropología e Historia) and Lissandra González (Instituto Nacional de Antropología e Historia)**[307]** *Distribution Analysis of Archaeological Ceramics on the "Malpaís de Tacámbaro Site", La Garita Sector, Michoacán, México*

In this paper we will present the results of the geostatistical analysis of the ceramics recovered during the archaeological prospecting works at Malpaís de Tacámbaro site in the La Garita sector. This is a big settlement located on top of a volcanic flow in the municipality of Tacámbaro, the south central of Michoacán. The goal of this study is to identify the characteristics of occupations and the use of space at this part of the site. The vast majority of materials belong to the early Urichu (900-1000 / 1100) and late Urichu (1000 / 1100-1350) phases, so we will present as well a general overview of the distribution of the ceramic materials of this period recovered in the region of the Balsas river Basin, during the works of the Proyecto Arqueología y Paisaje en el Área Centro Sur de Michoacán (PAPACSUM) from 2014 to 2018.

Castillo, Feren [200] see Prieto, Gabriel

Castillo, Karime (UCLA-Cotsen Institute of Archaeology)**[407]** *Colonial Glass Production in Mexico City: A Study on Technology Transfer and Adaptation*

The technology to make glass was brought to Mexico by Spanish glass artisans shortly after the Conquest in the sixteenth century. In the process of transferring their technological knowledge to the New World, these glass artisans encountered several challenges as they established workshops in Mexico City and Puebla, but were able to adapt the technology to the local conditions and resources. Through a multidisciplinary approach incorporating archaeology, history, and materials science principles and methods it is possible to investigate the transfer, adaptation, and development of European glass technology in colonial Mexico. This paper presents the results of the analysis of the chemical composition of archaeological glass from Mexico City showing how a foreign technology was adopted in a colonial context and adapted to the resources available in New Spain.

Castillo, Luis Jaime (Universidad Católica del Perú)**[1]** *Discussant***Castillo, Víctor (University of Arizona)****[303]** *Conquest as Revival in the Sixteenth-century Maya Highlands: Excavations at Chiantla Viejo, Guatemala*

Archaeological investigations at Chiantla Viejo, in the western Guatemalan highlands, focused on studying how public ritual in spaces for communal gatherings mediated changes and continuities in small Maya communities during the Spanish conquest. Excavations revealed a short occupation at Chiantla Viejo at the very end of the Late Postclassic period, as well as episodes of abandonment and reoccupation of the site during the first decades of the colonial era. These episodes included the destruction and remodeling of some structures and the building of a new architectural complex of small ceremonial platforms in the plaza. Archaeological evidence from Chiantla Viejo and Zaculeu, along with data coming from archival research, suggests a steady revitalization movement of ancient ritual architectural traditions along the basin of the Selegua River during both the K'iche and Spanish invasions of the Mam-speaking area of western Guatemala. Investigations at Chiantla Viejo also highlight methodological issues for the study of Late Postclassic and early colonial sites in the Maya Highlands.

Catenacci, Senna (University of Michigan) and Briana Doering (University of Michigan)**[10]** *Evaluating Late Holocene Stone Tool Production at Delta Creek, Alaska*

This project aims to better understand the lifestyles of nomadic hunter-gatherers in Alaska by analyzing early Holocene lithic material from the multicomponent Delta Creek site (XBD-110). This was achieved by conducting a

functional lithic analysis of the tools and lithic debitage found within the rich early Holocene component, dated to 9,435±100 calibrated years before present. The results of this lithic analysis give insight into important information about mobility and diet during one of the earliest periods of Subarctic prehistory that can be compared to contemporaneous sites in the Tanana Valley. A greater understanding of subsistence during this period can help us to potentially understand the movements and habits of hunter-gatherers from this important time period, and thus allow us to create a more detailed picture of how hunter-gatherers moved across this changing landscape and what motivated their subsistence decisions.

Cates, Kari and Cyler Conrad (Los Alamos National Laboratory)

[90] *Long-Term Changes in Human-Animal Relationships on the Pajarito Plateau*

Previous research from the northern American Southwest suggests that human populations gradually transitioned their animal-based diet away from artiodactyls to a focus on lagomorphs and turkeys throughout the Basketmaker to Pueblo periods. Faunal data from the Coalition period on the Pajarito Plateau suggests that a similar pattern was present throughout the 1150s-1300s A.D./C.E. In this poster, we examine several zooarchaeological metrics to identify whether a similar pattern of human subsistence change occurred throughout the entire Developmental to Classic period (600-1600 A.D./C.E.) on the Pajarito Plateau. Given the long-term human occupation of this region in the northern Rio Grande of New Mexico and the diversity and availability of wild game populations, this analysis provides an important investigation for determining the exact processes of human occupation, landscape and subsistence use and turkey husbandry and management prior to and during the Ancestral Pueblo era.

Cathers, Aaron (McMaster University)

[116] *Determining the Provenance of Freshwater Sponge Spicule Inclusions in Pre-Columbian Amazonian Ceramics*

Decades of archaeological research in the Amazon Basin have shown that micron-sized freshwater sponge spicules (siliceous skeletal elements) feature prominently in many pre-Columbian ceramic traditions. This distinct technology allowed potters to craft fracture-resistant vessels and contributed to the stylistic particularities of their wares. Though several early ethnographic accounts show that indigenous potting communities acquired spicules for temper by collecting and burning dried sponges, recent archaeological work has demonstrated that potters in the past could also have exploited spicule-rich clay sources formed by the natural decomposition of sponges. To resolve this question, scanning electron microscopy was performed on a sample of Paredão Phase (700-1100 AD) spiculate sherds from the Central Amazon of Brazil and compared to experimental ceramics that tested between these potential production scenarios. Based on the presence of previously unrecorded sponge gemmules (reproductive buds) that rarely survive sedimentation, preliminary results suggest that Paredão potters manually added spicules to their clays. This research provides insights into the technological and stylistic practices of Paredão potters and contributes to our broader understanding of the social dynamics and land-use practices associated with ceramic production in pre-Columbian Amazonia.

[224] *Revealing a Medieval Village: The Advantages and Limitations of Applying Geophysical Techniques*

Geophysical surveys have become a common feature in archaeological investigations in Ireland and the United Kingdom. The collection of data sets tend to be carried out rapidly and in many cases results can be immediate, however the interpretation of this data is not necessarily consistent nor are the formative processes of many of the geophysical signatures well understood. After four years of intensive application of ground penetrating radar integrated with magnetic gradiometry in rural Roscommon County, the Castles and Communities (CIC) field school and research project has attempted to better understand the relationship between these two techniques and seek methods which allow a more reliable means to draw conclusions. This paper will report on the preliminary findings from the 2018 field season where an excavation unit was able to expose the cross section of a number of the more

common geophysical features. Based upon these preliminary results the scope, usage, and shifting patterns of activity may allow clearer insight into the life and ultimate abandonment of a medieval village.

[301] *New Revelations on Mediterranean Bronze Age Iberia through Network Inference*

The Valencian Bronze Age, located in the modern-day province of Valencia, Spain is an overlooked player in Mediterranean prehistory. The inhabitants are the indigenous peoples and precursors to the Iberians, so famously cited by the Romans, yet so little cited despite being demonstrably connected to the trends of the “outside” world. This research explores the social structures of the Valencian Bronze Age through the use of social network analysis. Information on hundreds of Valencian sites is available, and multiple lines of data (ceramic, metal, and bone) are used for network inference on over 300 sites. This presentation will introduce a form of network inference based on Information theory, a strategy from bioinformatics where it is commonplace to infer social connections from interactions that are not directly observable. Thus, this research demonstrates how to integrate hundreds of bits of disparate archaeological information over an entire region and move toward characterizing social structure in a reproducible and comparable way, without benefit of the written record or observable events. Additionally, and possibly most importantly, it makes new discoveries about social processes through time and space in Iberian prehistory and the Mediterranean.

[48] *Barn Owl (Tyto alba) Pellets as Environmental Proxies*

Non-cultural deposits and animal accumulations have been important for reconstructing past environmental conditions. In western North America, packrat middens have been analyzed to infer past vegetation communities, precipitation rates, and other environmental variables. In this poster, we analyze owl-generated pellets deposited over a 1,500-year period at Barn Owl Cave, Santa Barbara Island. The goal of this study is to determine whether these deposits can be used to infer past environments based on the proportional abundance and types of prey species found at the site through time. Age and size profiles and statistical analysis of prey mice were calculated for deposits dated to the protracted drought of the Medieval Climate Anomaly and the appreciably cooler and wetter Little Ice Age. We predict that our results will 1) reveal greater densities of younger mice during periods of increased precipitation; 2) lower densities of mice during drought cycles; 3) greater percentage of adult mice during periods of drought; and 4) prey switching from mice to sea birds and lizards during dry conditions.

[95] *Putting the Mold to the Test: The Application of Experimental Archaeology to Compare the Mold and Potter's Wheel in Bronze Age Anatolia*

Moving across Syria-Mesopotamia to Anatolia and finally to the Aegean, potters during the Bronze Age gradually began to shift their ceramic repertoire from hand-made and coil-made ceramics to wheel-made pottery. Despite this rise in innovative manufacturing technology (the potter's wheel), some sites in Western Anatolia, namely Seyitömer Höyük, exhibit ceramics that are made using semispherical molds. Specifically, at the Seyitömer Mound archaeological evidence has suggested that potters preferred utilizing molds rather than the potter's wheel to produce standardized pottery at a fast rate. In recent years, with the discovery of wheel-made pottery, particularly in the Levant and Aegean islands, scholars have turned their focus to assessing the fabrics of these ceramics using

petrography and X-radiography for identifying forming techniques, and ethnographic studies for understanding the production and transmission of knowledge. Despite their numerous publications, these authors have heavily focused on the rise of the potter's wheel and neglected the use of mold technology. This paper discusses preliminary results yielded from experimental archaeology with the help of traditional potters in Turkey using both the mold and potter's wheel in order to recreate various forms of Bronze Age ceramics.

[317] *Archaeology of Death across the International Border: Research among the Hohokam and Trincheras Archaeological Groups*

In this paper, I will explore similarities and differences between mortuary practices and concepts of embodiment of the dead from Hohokam Classic Period (AD 1150 to 1450/1500) sites in the Tucson Basin and from the Cerro de Trincheras, Sonora (ca. AD 1300 to 1450). I will discuss challenges and opportunities for conducting bioarchaeology research across the international border where archaeological practices and treatment of human remains have varied across time and space. The Hohokam and the Trincheras Tradition of northern Mexico are two relatively close archaeological culture areas operating within different social networks. Both the Classic Period Hohokam from the Tucson Basin and the Trincheras people cremated their dead as the main funerary custom. Very different from the Hohokam from the Phoenix Basin where inhumation was their main funerary custom. Results from burial treatment research on remains from Cerro de Trincheras and the Tucson Basin Hohokam suggest that they are fundamentally similar in how they treat the bodies of the dead and likely also concepts of embodiment, but different in how the dead are transformed through the life and death continuum. These are different from the Phoenix basin where probably concepts of embodiment were changing at a different rate.

[358] *Tukano, Embera, and Achuar (Shiwiar) Supernatural Gamekeepers/Animal Masters: Environmental Impacts of Native Beliefs in a Changing World*

This paper investigates the belief in Supernatural Gamekeepers/Animal Masters of wildlife in three South American indigenous societies: the Tukano of Colombia, the Embera of Colombia, and the Achuar of Ecuador. Findings show that Supernatural Gamekeepers/Animal Masters are believed to grant success to hunters who adhere to prescribed restrictions. Specifically, among the Tukano, local petroglyphs and pictographs are believed to be the abode of the Master of Animals. At such rock art locations, Tukano shamans relay hunters' petitions to this supernatural who grants success to foragers who do not exceed their allotted bag limits. Likewise, among the Embera, shamans mediate between hunters and the Supernatural Gamekeeper who grants success to those who refrain from harvesting in designated "no take" zones. Among the Achuar, a Supernatural Gamekeeper named Amasan grants hunters success as long as they take only what is needed. Findings indicate that belief in Supernatural Gamekeepers/Animal Masters fosters sustainable game harvests. However, as socio-economic and demographic conditions change in the Neotropics, continued belief in Supernatural Gamekeepers/Animal Masters may actually facilitate the overharvesting of wildlife by native peoples.

[232] *What's in the Menu? Harappan Culinary Practices during the Urban Phase of the Indus Age*

The study of ancient food residues does not only provide information on the ancient diet but also sheds light on the nature of food selection, processing, storage and finally the discard of food wastes. The presence of large quantities of animal bones, primarily from cattle/buffalo and sheep/goat in all Harappan settlements suggest that these two categories of primary domesticates played a major role in the Harappan diet. Many have argued that as most of the cattle lived into adulthood, they might have played a vital role in secondary consumption, such as for milk and for labor-oriented exploitation. On the other hand, sheep/goat, primarily goats, were consumed predominantly for meat. These conclusions have been based on the mortality age-profile pattern of zooarchaeological studies. With the recent advancement of lipid residue analysis from the archaeological pottery, lipid residues were extracted and analyzed from 59 archaeological pottery sherds excavated from Kotada Bhadli, a rural Sorath Harappan settlement

located in Kachchh, Gujarat. The results from this pilot study for the first time provide direct evidence on the nature of human preferences, processing, and consumption of milk and meat that were most likely a major part of the Harappan menu.

Chalfin-Smith, Eliot (Bates College) and Beverly Johnson (Bates College)

[123] *Temporal Studies of Salmon Isotopes at Temyiq Tuyuryaq*

This research is part of a larger collaboration with the Togiak community to excavate, analyze, and interpret the stable carbon and nitrogen isotope composition of archaeological salmon bones excavated from the Temyiq Tuyuryaq site. Sources of carbon, fueling the base of the food web and the trophic level of the salmon, are sensitive to shifts in climate and changes in food web dynamics as well as subsistence practices. This research explores reconstructed fish diets relying on archaeological data along with contemporary samples, a temporal span representative of variability in climate regimes and subsistence practices. Our research will contribute to a better understanding of fishing/subsistence pressures on a cultural continuum of more than 1200 years. Collaborations with the Togiak community will ensure relevance to contemporary fishery understanding, management, and predictions based on subsistence practices and cultural identity.

Challis, Sam (Rock Art Research Institute, South Africa) and Brent Sinclair-Thomson (Rock Art Research Institute, University of the Wit)

[347] *Runaway Slaves, Rock Art and Resistance in the Cape Colony, South Africa*

The protracted colonisation of southern Africa's Cape created conditions of extreme prejudice and violence. Like the Caribbean equivalent, however, the Cape conditions presented opportunities for the colonised to escape. Slaves, the unwilling migrants to the Cape comprised of all sorts from the Dutch and British colonies: people with Malay, Malagasy, West African and local African heritage combined to form the labour force for the colonial project. Escaped, or 'runaway' slaves joined forces with groups of 'skelmbasters' (mixed outlaws) who themselves were descended from San-, Khoe-, and Bantu-speaking Africans (hunter-gatherers, herders and farmers). Together they mounted a stiff resistance that held up the colonial advance for many decades. Engaging in guerilla-style warfare they raided colonial farms for cattle, and especially horses and guns. The ethnogenesis of such raiding bands is increasingly coming to the attention of archaeologists discovering the art they made of themselves in the hidden rock shelters of the Cape Fold Mountain Belt, and in the Maloti mountains of today's Kingdom of Lesotho. The 'reverse gaze' provided by this painted record gives us the perfect opportunity to view something of the slave and indigenous resistance from outside the texts of the colonial written record.

Chamberlin, Matthew (James Madison University)

[65] *Symbolic Conflict and Mobility in Village Formation*

This paper considers whether processes of symbolic conflict propel change in the spatiality of social groups from ethnographic and archaeological vantage points, particularly with respect to the mobility of agents positioned differently within and at the edges of nascent communities such as small villages. Of special interest is the interaction between cultural producers and actors marginal to the dominant culture in the context of historic processes of village formation.

[154] *The Square or the Round? Agro-pastoral Household Structure in Southeastern Kazakhstan*

The Iron Age agropastoralists of the Talgar region built a variety of houses including rectangular double-walled mud-walled houses, semi-subterranean pit houses, mud brick platforms, and central circular rooms with multiple plastered floors. In earlier periods of prehistory the description of transition from mobile to sedentary year-round habitations often signaled the transition from round houses to rectangular, agglomerated rooms or households. A discussion of the spatial layout of Iron Age villages and hamlets at three excavated sites in the Talgar region also considers the nature of household organization, gendered space, and settlement form in communities that practiced both transhumant farming and the cultivation of wheat, barley, and the two millets. Ethnographic analogies drawn between Kazakh yurt organization and the ancient Iron Age house forms will be explored as part of the 'nomadic tradition' within a settled community. The dispersed spatial organization of the Talgar settlements contribute to a larger regional perspective on the nature of landscape use by the Saka and Wusun confederacies of the Semirech'ye Region.

Chang, Nigel (James Cook University)

[27] *Individual, Family, Site, 'Community' or Region? Thinking Across Spatial and Social Scale in Prehistoric Laos and Thailand*

Prehistory is made up of individuals and families going about their daily lives. Surely, no one in NE Thailand 3000 years ago was thinking deeply about how to craft a 'state' from small semi-agricultural villages. However, it can also be argued that large scale social and technological change and Asia-wide population movement were driving a shift towards the 'rise of the state'. How do we reconcile these different scales of analysis? Is this simply a clash of philosophies that contrast an emphasis on individual agency with 'processual' law building? Can new insights be developed by working across scales (and between philosophies)?

This paper focuses on two areas of intensive archaeological research; the Upper Mun River Valley (UMRV), NE Thailand and the Vilabouly Complex, Savannakhet Province, Lao PDR. In each area individuals can be identified in grave contexts and both areas are tied to significant regional innovations; metallurgy in Laos & intensive agriculture in Thailand. Crucially, a number of related sites have been investigated in each area allowing us to consider 'local cultures'. Is it this intermediate social and spatial scale that will be the key to integrating, rather than polarising, our analyses?

[244] *Tribal Consultation: What We Lose When It's "My way or the highway"*

Over my years as Director of the Cultural Rights and Protection Department for the Ute Indian Tribe, I have seen tribal consultation in many different forms. In my presentation, I will be talking about tribal consultation as collaboration and how we can all move forward together. As Tom King (2004) notes, tribal consultation should not become a "dictatorship". Consultation should not mean one party wins and one party loses, but rather where both sides' perspectives have been represented and considered. Both agencies and tribes need to be ready for an open-minded give and take. Furthermore initial meetings should be brainstorming sessions rather than the parties having developed ideas that prohibits meaningful dialogue. Finally actions should not be taken in the tribes name, without the tribes involvement. When tribal consultation is approached as collaboration, we can all win.

[352] *An Agroecological Perspective on Crop Domestication in Western Asia*

Domestication has been discussed inter alia as a syndrome, a case study in niche construction and a reversible process. These perspectives frame new understandings of how management practice shaped domestication processes. For plants, recent experimental work has also been important for clarifying the effect of domestication on key parameters such as yield, as well as the importance of certain growing conditions for achieving this potential. Here we present recent work at Oxford on the agroecology of Neolithic-Bronze Age cultivation in western Asia, especially from the perspective of early weed flora. We find indications of increasing labour inputs per unit area through the Neolithic ('intensification') but a reversal of this tendency as agrosystems became more extensive in the Bronze Age ('extensification'). These agroecological trends, in turn, correspond with changes in domestication traits, including grain size.

[363] *Niche Construction and Iron Smelting Technology: Some Thoughts on the Development of Regional Metallurgical Economies*

Linking the evolution of smelting technology to the development of regional economies remains one of the greatest challenges for archaeometallurgy. It is neither possible to explain technological evolution without reference to its costs and benefits in a given socioeconomy, nor explain the economic patterns of a society without regard to production systems and their associated changes. Metallurgical production is an example of cultural niche construction, through which producers continuously modify the selective context of their future technological

behaviour and that of other members of society simply by adding more and different products into circulation. Modelling and testing hypotheses about the relationships between changes in metallurgical technology and the development of economies is not a new goal. However, investigative tools and data volume have only recently reached sufficient maturity to see it realized. This endeavour requires the consideration of technological transmission, production quantifications, livings earned through production, and characterization of socioeconomic networks. Using examples from archaeological and experimental investigations of ironmaking systems in the UK and Sudan, this paper discusses the prospects for exploring the interconnectedness of evolving metallurgical practice and developing socioeconomies. It highlights the importance of experimentation and the construction of large open databases for identifying and explaining interconnections.

[113] *Maya Inequality at Caracol, Belize: District-Level Urban Analysis within a Garden City*

In 2009 and 2013, LiDAR data collected for Caracol, Belize revealed the anthropogenic landscape of this Maya city. These data have advanced our understanding of water management, agriculture, markets, urbanism, and inequality at Caracol. Now with the analytical unit of the district – an urban administrative boundary of urban service provisioning within a city – the variation between these administrative units can be investigated. Beyond Gini indices and Lorenz Curves of household areas and volumes, this research analyzes the population densities within districts with respect to the urban service facilities located within these district nodes. These formal plazas, ballcourts, monumental reservoirs, and E-groups provide a built environmental indicator of specialized urban function with widespread distribution. Urban districts reconstructed through least cost area allocation and nearest neighbor analysis in contrast with the sampled plazuela density at Caracol demonstrate the variation in urban density present within one Maya city. While density drop-offs are often used to identify the boundaries of Maya cities, density variation within the city is rarely discussed. The LiDAR dataset in conjunction with 35 years of excavation data uniquely allow the Caracol Archaeological Project to analyze inequality at the intra-site level within this garden city.

Chase, Amanda

[290] *Use-Wear Analysis of the Middle Horizon*

Use-wear analysis is a qualitative method of study that observes abrasion patterns on material remains. Wear traces can come from stirring, lids, storage techniques, and other culinary practices. Apparent wear patterns and abrasion coarseness are features that help infer the use of different vessel forms. I applied this technique to vessels from the Wari-affiliated sites of Cerro Baúl and Cerro Mejía, which were occupied during the Middle Horizon (600-1000CE). I examined over one hundred vessel rims for traces of wear from the use of lids and other forms of apparent use-alteration. Abrasion information was qualitatively and quantitatively collected from wear location, depth, length, width, and patterning. Use wear was split into four characteristics: soft wear (i.e. resulting in a buffered texture), coarse abrasion (e.g. gouges, scratches), no use wear, and not enough evidence (i.e. too much post-depositional erosion to ascertain apparent use wear pattern). The two-tailed t-test show significant similarities of rim diameters between sites; however, use-wear percentages taken from alteration characteristics show wear pattern differences between sites. The analysis documented rim-wear consistent with patterns of abrasion consistent with the use of lids, which provides insight into culinary and storage practices of the Middle Horizon.

Chase, Arlen

[58] *Ancient Maya Sustainability at Caracol, Belize: Implications for Past and Future*

Long-term archaeological research at Caracol, Belize has revealed a sizeable city with over 100,000 inhabitants at A.D. 650 that practiced intensive agriculture within its urban boundaries. Over 160 square kilometers of the landscape within Caracol was anthropogenic, having been rebuilt to both provide agricultural sustainability for the city's inhabitants and to control the flow of rainwater over the karstic environment. Archaeological data shows that their landscape adaptations underlay half a millennium of sustainable occupation (here defined as the ability to feed family units and provide needed quotidian and prestige items to households). Yet, today this landscape is unpopulated and completely covered by jungle canopy. With few exceptions, the subsequent modern-day populations that occupy the country of Belize import much of their food from elsewhere, but new services and technologies provide modern populations with lifestyles that were unavailable to ancient populations. These changes need to be factored into any consideration of applying past sustainability practices to the future. The ancient Maya technologies that promoted sustainable agriculture and habitation in largely rainfed environments that lacked standing and running water have not been replicated by modern people, but hold the potential to significantly improve modern lifeways.

[299] *Material Properties, Sensory Experience, and Production Techniques in Early Chinese Bronze Casting*

The extraordinary bronze ritual vessels of Shang- and Zhou-period China were produced by casting in multi-part ceramic molds. Laboratory analysis of casting-mold fragments has found that these molds were made from an unusual ceramic material—a paste that was quartz-rich, clay-poor, highly porous, and therefore quite unlike pottery clays in terms of its composition. A program of replication experiments has allowed this casting-mold paste to be reproduced and assessed in the laboratory. This paste possesses specialized engineering properties that would have significantly improved the reliability of the casting process. However, the handling characteristics and tactile qualities of this paste are also very different from those of familiar pottery clays. This presentation describes the qualitative, sensory characteristics of casting-mold paste and explores the ways in which those qualities likely shaped foundry workers' interactions with this material as well as their choices regarding production techniques.

[3] *Linking Southwest Heritage through Archaeology: Engaging Diverse High School Students and Their Communities*

Through programs like Linking Southwest Heritage through Archaeology (LSHTA), the National Park Service (NPS) reaches out to diverse neighbor communities and highlights their cultural heritage. LSHTA introduces local high school students and educators to NPS units, other heritage sites, and archaeology-related labs on the University of Arizona campus. In combination with these visits, program participants learn about Southwest United States history through an archaeological lens. The emphasis of LSHTA is to participate in: 1) experiential informal education activities that provide students with hands-on, in-the-field opportunities, such as participation in excavation experiences, site tours, and tours of archaeological laboratories; 2) visits to traditional and local communities to learn about their heritage programs; 3) interpreted visits to NPS and other heritage sites; and 4) positive experiences on a university campus that open up windows for potential educational and career opportunities. This process allows students to gain a deeper knowledge of the diversity of their own and others' Southwest culture.

[15] *Hands Stenciling: Men & Women as Healing Process?*

The checking of thousands of hands stencils from Borneo's caves and rockshelters, followed by the application of Manning's formula measuring at least the 2D/4D ratio, inasmuch as other world data from Africa and South America, witnessing the men and women presence, have led to the hypothesis of an healing process representation. Discussion concerning Manning's ratio and functional goals of hand stenciling will be therefore open.

Chechushkov, Igor (University of Pittsburgh)

[48] *Gone with the Wind: The Modelling of the Wind Conditions of the Prehistoric and Historic Communities around the World*

Climatic conditions determine the ways in which local communities live to a great extent. The wind is responsible for the everyday life experience by bringing precipitation, moving dust and fire. The general assumption of the current research is that in the past people chose to live in relatively calm spots of the local landscapes to prevent themselves from unpleasant or dangerous conditions. To test this hypothesis, the current research draws settlement data from around the globe. The average annual value of wind speed and the dominating wind direction are the input values to calculate the wind speed at the local terrains. The individual wind models are based on a digital elevation model with a resolution of 100 m by 100 meters. A specialized software package (WindNinja) is used to compute the models of wind speed for each cell of the DEM. In the Southern Urals, the chosen settlement spots are optimal in the given environment to maintain the highest possible temperatures and prevent heat loss in the cold months. Together with the erected wall and densely packed houses, this strategy allowed the inhabitants of the settlements to protect their livestock in the harsh winter conditions.

[286] *Under Pressure: Evidence of 'La Vida Cotidiana' in Cranial Shape Typology at Jarana, an Inca Site in Southern Perú*

This poster details the results of cranial modification typology research conducted at Jarana, a Late Intermediate and Early Inca administrative site located in the San Juan de Churunga river valley of southern Peru. Cultural cranial modification was particularly widespread among pre-Hispanic societies in the Andes. The practice is commonly interpreted as a deliberate expression of identity, with different cranial shapes used to delineate social groupings within a society or to emphasize differences between cultural or political groups occupying a region. Crania at Jarana were expected to display similar modification patterns indicative of social differentiation. However, while Jarana shows a site-wide uniformity of general cranial shape, there is significant variation in the location of the posterior pressure plane, causing most of the crania to appear to have occipital modification that is shifted either to the right or to the left. This variation is not associated with any known demographic patterns within the population. This significant and seemingly random variation in occipital pressure placement during shaping could indicate that cranial modification at Jarana is a byproduct of daily life practices associated with the care and transport of infants rather than a deliberate visual cue to delineate social groupings.

[299] *A Design Diagram and Production Process for Ground Stone Tools at Wufengbei Site during the Liangzhu Culture Period (5300-4200 BP) in China*

The Wufengbei Site is located in the Mudu Ancient City Neolithic sites at Suzhou, Jiangsu Province, southern China. Excavations in 2016 yielded a total of 3850 pieces of lithic artifacts. Based on the concept of Chaîne Opératoire, artifacts were classified and analyzed by the hierarchical dynamic typology and use-wear analysis. The results display a whole and clear life history of the ground stone tools, including procurement, manufacture, utilization and discard. Using the abundant chisel sample from Wufengbei site as an example, it is suggested that two techniques existed. Through reconstructing those techniques archaeologists can uncover the apparent design diagram and production process of ground stone tools created by the people of Mudu Ancient City.

[46] *Spatial Analysis in Pre-Columbian Nicaragua*

This poster presents the result of a systematic spatial analysis of lithic and ceramic artifacts and how ratios thereof change over time in order to assess the applicability of the social-risk model originally proposed by Manuel Antonio Román Lacayo (2013) in explaining patterns of population aggregation observed during the Sapoa period (800-1350 CE) in Nicaragua. Regional systematic pedestrian survey has revealed an unprecedented change in demographic distribution, indicative of a change in pre-Columbian sociopolitical arrangement in Masaya, Nicaragua. He proposed a model focusing on social risk induced by deteriorating climate as the major factor driving social change in order to offer possible explanations of this demographic change. In this poster, I present expectations about spatial distributions of lithics and ceramics according to the social-risk model and test them against empirical archaeological evidence. These pertain to how humans interact with environmental change and how this interaction could have motivated social transformation.

[398] *Meat and Potatoes: A Mixed 7,000-Year-Old-Diet*

This presentation examines the diets of 16 prehistoric burials at Soro Mik'aya Patxja, a high-elevation Archaic Period site occupied 7,000 years ago in the Peruvian Andes. Stable carbon and nitrogen isotopes were analyzed to infer the prehistoric hunter-gatherer diets during a period that preceded the domestication of tubers, quinoa, and vicuña. Plants such as tubers played a more important role than originally thought in ancient hunter-gatherer diets. Vicuña were also an equally important and abundant food source as well. Analysis of prehistoric diets can give insight to the domestication of these important meat and plant resources. The results confirm previous studies, which have suggested a mixed diet of C3 plants and camelids.

[389] *Probable Pathological Evidence of Adult Scurvy, Dating Back to about 200 B.C. in Yuci, Shanxi, China*

Scurvy is a disease resulting from inadequate intake of vitamin C. This can happen to all age groups but has a relatively high prevalence in children and subadults. Subadult scurvy has been studied thoroughly over the past decades; however, little research has been done on adult scurvy. This is because scurvy presents ambiguously in adults; in addition, scurvy is hard to distinguish from anemia, non-specific infection and similar diseases. Till now, there are no confirmed scurvy cases found in archaeological contexts in China. The authors examined the skeletal series from the Mao'er Hill site, Yuci, Shanxi (3rd century BCE to 2nd Century BCE) and found one potential case of adult scurvy. This individual showed the typical traits of scurvy on his cranium, mandible, and lower limbs. By focusing on this site, the authors aim to discuss the nutrition, diet, and health conditions of this ancient population during the transition period from the Qin to Han Dynasties.

[26] *Living in the Marginal Land of Agriculture: The Adaptive Changes and Risks in the Ecotone of North China*

Ecotones are characterized by diverse resources which would attract hunter-gatherers and early practitioners of food production, but they also have a disadvantage that the resource boundary easily changes with climatic fluctuation. Long-term climatic changes, as well as annual seasonality, would produce significant influence on adaptations of local groups. In North China there is an ecotone between the Mongolian grassland and the deciduous forest zone of the northern plain, and it can be divided into two subzones. This research studies adaptive changes and differences of both subzones during the prehistoric period, focusing on the cultural influence that resulted from long and short-term environmental changes. Explanations are offered for different features of archaeological records in site abandonment, artifact assemblage (especially stone tools), and settlement pattern. Combined with the most recent discoveries, this study shows that Neolithic cultures emerged in both subzones, with the coming of the Holocene Optimum, then formed a mixed economy including early farming and hunting-gathering in a state of unstable sedentism. Interestingly, both subzones apparently had a catastrophic event occur almost simultaneously, in which sites were abandoned entirely and suddenly, possibly due to serious infectious disease.

[114] *GIS Approaches to Modeling the Shifting Andean Coastline through the Holocene*

The long-term study of changing social and ecological patterns along the Andean coastal strip throughout the Holocene requires the identification of archaeological sites and their data of various ages. The presence of a broad continental shelf offshore of much of the Peruvian Andes has meant that early sites on this shelf have been inundated by early Holocene sea level rise. The rates of discovery of early and middle Holocene sites along the coast can be greatly assisted by the estimation of previous coastline locations, with an understanding that where the continental shelf is narrower, early sites will be more likely to exist on the shore today (as opposed to being inundated). Here we present ongoing GIS analysis of paleoshorelines, taking into consideration both sea level rise and coastal uplift over the Holocene. We seek to create relatively fine grained reconstructions of changing coastline, identifying no-longer existing bays and inlets which may have been attractive to early human occupants. This work will produce much more detailed models of Holocene sea coasts than have previously been proposed, and will form the basis for predictive locational models of site location for future research.

Cheng, Wen Yin

[299] *Exploring Production Methods of Casting Molds and the Artisans Who Made Them*

The production of Shang dynasty bronze vessels is based on the artisans' mastery of loess material and how they manipulated them to produce the casting molds. From the beginning stage of raw material procurement to the firing of the molds, these steps all left marks in the molds' microstructure and physical build up. The key to our understanding of bronze vessel production lies in the production of bronze molds, but also in cases where the artisans left their marks. In order to see the artisans through their work, the ideal artifacts to analyze are the molds themselves, the marks left behind and preserved within the loess. These tell the story of the artisans and their

relationship with the raw materials. Through petrographic analysis of the molds housed at the Royal Ontario Museum, the correlation between the various steps of production and the artisans who made them can be further discussed.

[41] *The Pickett's Mill Farmstead: An Archaeology of the Inarticulate Whites*

Archaeologists often use both archaeological data and historical records to assist in their reconstruction of the past. However, historical records are usually written by a small portion of the population and this written history is usually about themselves and not a representation of the whole. The inarticulate Whites are a group of European descent people that are not represented in written history. This is because the written history of the South is that of the Planter class and also because the inarticulate Whites passed down their histories and traditions orally. Unlike their plantation owning neighbors, they are typically land rich but cash poor farmers. In popular history, they are usually depicted as dirty, lazy, and uncultured. But the analyses of the material possessions of the inhabitants of the Pickett's Mill farmstead in Paulding County, Georgia, paints a different picture. This paper will utilize this archaeological data to illuminate the lifestyle of its inhabitants as well as contribute to the fragmentary history of the inarticulate Whites of Upland Georgia.

[333] *The Transition from the Middle to the Late Neolithic in the Yilan Plain, Northeast Taiwan (ca. 4,200 ~3,700 B.P.)*

This paper discusses the transition from the Middle to the Late Neolithic period in the Yilan Plain, Northeast Taiwan (ca. 4,200~3,700 B.P.) with a specific focus on analysing the material objects excavated from two sites, the Tatsuwei site (4,200-3,700 cal. B.P.) and the Wansan site (3,900-2,500 cal. B.P.). Previous research emphasized the importance of environmental change and the agricultural activity during this transitional period. However, I try to argue that the transition might signify the process of the formation of new social relations. I demonstrate that people began to form smaller social groups in the Late Neolithic period and that the social differentiation became more evident. The difference between the sites clearly displays two contrasting ways of organizing society. The difference is discernible from the comparisons of the tools associated with the subsistence activities, the production and use of nephrite objects, the lithic and ceramic resources utilized, the ornaments people used to adorn themselves, the styles of daily articles they preferred, and the way they interacted with their landscapes. The result of these analyses suggests that the society might have undergone a great transformation during this transition period.

[236] *Vibrant Ruins and the Construction of Casma Ancestralized Landscapes: Preliminary Insights from the Lower Nepeña Valley*

In coastal Ancash, archaeologists have been puzzled by the presence of Casma style objects (~AD 800-1300) at archaeological sites with earlier cultural components. This has led to significant cultural historical and chronological confusion including the classification of several Early Horizon sites (800-200 BC) as centers of the Casma Polity. Field research and excavations in the last two decades have helped disentangle those components and document the extensive reuse of abandoned buildings, fortifications, and other ruins by late prehispanic groups including the Casma. Yet, little attention has actually been given to the motivations, meanings, and broader structuring impact of those material engagements. This paper examines the vibrancy of the built environment in the lower Nepeña Valley as seen through its reuse by groups producing Casma style things. I am particularly interested in exploring mortuary practices, in particular the placement of Casma dead within the lower Nepeña, and how those helped in the social construction of ancestralized landscapes. I detail a model that integrates the material vibrancy of things, monuments, and landscapes in shaping the aesthetic attentiveness of Casma makers, especially potters, architects, and sculptors. Results are discussed in light of the sociohistorical conditions surrounding the emergence of Casma style cultural manifestations.

One of the richest repertoires of Mesoamerican flower imagery comes from the Pacific coast of Guatemala. In this paper, I trace the temporal variations in religious beliefs and imagery related to portentous places of beauty known that modern scholars designated as “flower worlds.” Lush vegetation and birds were important themes in the area, beginning in the Late Preclassic sculptures of Izapa. During the Early Classic, a new and elaborate set of icons and meanings appeared in Teotihuacan-style cylinder tripods and censers from the coastal plain of Escuintla. Reinterpreted by coastal artists, flower world images reappeared with a novel range of religious connotations in the Late Classic sculptures from Cotzumalhuapa. The enduring presence of related beliefs is made evident by ethnographic attestations from modern communities in adjacent highlands, particularly Santiago Atitlán. The pervasiveness of flower imagery is surprising in a region that witnessed considerable ethnic and cultural changes. Building on earlier work, I highlight some of the lesser-known representations, tracing common threads and shifting meanings that can be perceived in the works of coastal artists across millennia.

Chiou, Katherine [102] see Szpak, Paul

Chiou, Katherine (University of Alabama)**[302]** *Variety Is the Spice of Life: Chili Pepper Domestication and Agrobiodiversity in the Americas*

Chili peppers (*Capsicum* spp.) are one of the extremely rich and varied crop genetic resources of the Americas. The independent domestication of five chili pepper species (*C. annuum*, *C. baccatum*, *C. chinense*, *C. frutescens*, and *C. pubescens*) across the Neotropics beginning around 10,000 BP was an intricate co-evolutionary process between these piquant plants and humans. As the predominant spice in pre-Columbian cuisines, an important medicinal ingredient in indigenous pharmacopoeias, and a frequent participant in ancient rituals, prehispanic remains of chili pepper have been recovered from numerous archaeological sites across North, Central, and South America. Although the practice of cultivating and consuming chilies survived the ravages of conquest and colonization, beginning in AD 1492, demographic collapse, forced relocation, and changes in land tenure disrupted existing agricultural practices—impacting *Capsicum* genetic diversity in ways that we are only beginning to comprehend. In this paper, I present an overview of the current state of research on the historical trajectory of chili peppers, highlighting the potential contributions of archaeobotanical data to the broader discussion on plant domestication and agrobiodiversity in the past and present.

Chirikure, Shadreck (Department of Archaeology, University of Cape Town, South Africa), Munyaradzi Manyanga and Genius Tevera**[24]** *After Dark: The Nocturnal Urban Landscape of Great Zimbabwe*

What was night life like at Great Zimbabwe? While this question excites imagination in numerous ways, in fact and myth, not much is known about nocturnal life in this ancient African urban landscape. Most archaeological reconstructions of urban life at Great Zimbabwe create the erroneous impression that the inhabitants of the town lived during only the day and never at night. Consequently, an unquestioned assumption is that most of the evidence at the site points to daily activities. And yet, the sum of human life combines daily and nightly existence and

quotidian practices. This paper deploys comparative insights from ethnographies and oral history to interrogate the archaeology of Great Zimbabwe to initiate a conversation on life after dark during the flourishing of this multi-building and multi-period settlement. We suggest that sunset at Great Zimbabwe opened the door to subsistence practices, economic pursuits, rituals, games, relaxation, music and other forms of entertainment. Often, these activities were seasonally scheduled and were performed either individually or collectively, cross-cutting gender and class divisions.

Chirinos Ogata, Patricia (University of California, Santa Barbara)

[53] *Labor and the Japanese Diaspora: The Archaeology of Issei Workers in Peru's Coastal Haciendas*

Between 1899 and 1923, more than 15,000 Japanese men travelled across the Pacific to work in agricultural estates (or "haciendas") along the Peruvian coast. Lack of land and opportunities in large regions of rural Japan pushed people to look for other options abroad, while Peruvian companies required a sizable workforce to sustain the coastal "agricultural revolution" at the beginning of the 20th century. The haciendas constituted the first locus of interaction between the issei workers arriving to the country and the local communities; however, an archaeological approach to these facilities and their surrounding landscapes has been so far neglected. This paper presents preliminary survey and surface collection results from one of these coastal haciendas. Results show that a focus on the materiality of labor in the context of the Japanese immigration to Peru has the potential to connect daily life at the haciendas and the larger social and economic processes, as well as to enrich the study of cultural encounters in the context of the Japanese diaspora.

[106] *Preliminary Results of Petrographic and Chemical Analyses of Lapita Pottery Assemblage Excavated from Kurin Site, Mare Island, Loyalty Islands, New Caledonia*

In this paper, we will illustrate the number of possible pottery-making locations that we have identified so far from the Lapita pottery assemblage excavated at Kurin site, Mare Island, Loyalty Islands, New Caledonia. We first examined the non-plastic inclusions to determine whether minerals and rock fragments identified through a petrographic microscope may occur naturally within a given geological region of New Caledonia, and use index minerals and rock fragments to separate various possible pottery production locations within such large geological regions. We then compare samples from multiple sites that have been assumed to be produced from the same location to determine whether there is a consistency in terms of temper types within a particular production location. In addition, we compared chemical compositional data of these samples in order to better differentiate local vs. non-local samples. We are able to identify multiple possible locations on both northern and southern Grande Terre for the 29 samples that we processed. In the end, we will summarize our preliminary results and discuss possible exchange networks observed.

Chiykowski-Rathke, Tanya (Santa Clara University)

[245] *Loss of Color: Pigments in the Trincheras Tradition*

Archaeologists have largely defined the Trincheras Tradition by pottery, in particular the distribution of purple painted ceramics. The purple pigment, found in both specular and non-specular forms, was part of a bichrome and polychrome regional tradition that flourished across the Sonoran Desert between 700-1200 AD. Many abrupt changes occurred around 1200 AD, including mass migration and the founding of Cerro de Trincheras. One such change was the de-coloring of Sonoran ceramic traditions. After 1200 AD, Trinchereños (Trincheras Tradition peoples) stopped producing locally decorated pottery. This change does not mean Trinchereños lived in a colorless world. Rather than participate in the proliferation of Salado polychrome ceramics, Trinchereños imported vibrant vessels from Paquimé/Casas Grandes. Colors and symbolism from preceding periods continued to signal important social information, including in the vessels used for secondary cremation burials. The ways in which Trinchereños modified their use of pigments over time shows changing relationships within their natural and cultural worlds.

[301] *Over Land, Sea and the Space Between: Evidence for Multi-Scalar Interactions between Eastern Mediterranean and Central European Communities during the Bronze Age*

The Bronze Age in both the Mediterranean and Europe represents a period during which new socio-economic relationships were being forged that inextricably linked far-off communities. Within these discursive social networks, new commodities were traded over long-distances, new markets emerged, and along with novel opportunities for social differentiation reflected in new forms of material culture. The role of metals as the prime mover in these interactions has been much discussed. Such economic transactions likely were highly formalized, occurring with variable levels of reciprocity, and serving as an arena for the negotiation of social and political alliances, smaller-scale exchanges of a range of commodities, as well as the transfer of ideas, news of the world that lay beyond, and technical skill. This paper considers the range of material exchanges and movement of intangible information between communities in the Mediterranean and Central Europe that would have relied upon and reinforced the social networks established by long-distance trade of materials during the Bronze Age.

[420] *Re-examination of the 1975 – 1977 Excavations of the Pueblo I-II Components of Cave Canyon Village, Montezuma Canyon, Utah*

Brigham Young University's Archaeology Field School conducted three seasons of fieldwork from 1975 - 1977 on the Basketmaker III and Pueblo 1 – Pueblo II Ancestral Puebloan components of Cave Canyon Village in Montezuma Canyon, southeastern Utah. The excavations provided data, including radiocarbon, archaeomagnetic and dendrochronological dates, on the Basketmaker and Puebloan components of this extensive village. This data is re-examined considering recent studies in and near Montezuma Canyon. East and downhill from the Basketmaker III component, Cave Canyon Village was also extensively occupied during the late Pueblo I – Pueblo II periods. In 1975 an L-shaped above-ground pueblo and three associated pit structures/kivas were excavated. In 1977 a backhoe trench discovered five contiguous pit structures/kivas directly east of the 1975 excavations along an east-west trending ridge. Two of these kivas were excavated in 1977 as well as portions of an above-ground room block adjacent to one of the excavated kivas on the easternmost portion of the Cave Canyon Village ridge. Cave Canyon Village appears to be strategically located in Montezuma Canyon to take advantage of arable land and other resources.

[190] *Finding Context for Rock Art Images in the Southwest*

This paper will demonstrate how cultural and chronological context for rock art images can be established using Polly Schaafsma's *Indian Rock Art of the Southwest* book. I had photos of rock art from the Navajo Reservation I could not place in any tradition. Number one shows two dark red masked figures from Slim Canyon nearby Canyon de Chelly. A comparison with Schaafsma's rock art styles suggests they may be a late regional variation of the San Juan Anthropomorphic style. Number two is a petroglyph of a bighorn sheep dominating a human and polychrome pictographs of anthropomorphs with zigzagged torsos from Mystery Valley next to Monument Valley. They can be assigned to the Kayenta regional style between c. 1050-1250 A.D. and its cultural context. Number three is a white abstract panel found in an unexplored Ancestral Pueblo shelter between Navajo National Monument and Navajo Mountain, which can be related to blanket designs in Schaafsma's documentation.

I will further interrogate the blanket design, whether it was the representation of a textile or the result of an interaction by its makers with the rock as a social agent who was being dressed. Visual evidence supporting the latter is implied in the design.

Chu, Alejandro

[355] *Advances in Mineral Characterization of the Late Horizon Pottery from Incahuasi, Cañete*

In this paper I will present preliminary results from the materials excavated of the Incahuasi site located at the middle Cañete valley. Research suggests that this portion of the valley, an area stretching from Caltopa at the low-mid valley to Pacaran at the upper-mid valley, was an Inca province with Incahuasi as its provincial capital. Ceramic materials recovered from excavation at different site sectors show a relatively low proportion of Inca style pottery, with a complete lack of specimens of Cusco Imperial style, and the prevalence of the local Guarco style in jars and cooking pots. Stylistic variation and compositional analysis done with Mössbauer spectroscopy and x ray fluorescence (XRF) will be presented in a discussion about the relationship between Inca and local Guarco ceramics, a very different phenomenon that is being found at the Incas coastal sites of the Cañete valley.

[313] *Cultural Landscapes, Past and Present: Cultural Resource Management Perspectives From Recent Work in Southeastern Utah*

The spectacular prehistoric ruins and natural environment of southeastern Utah comprise elements of multiple, overlapping cultural landscapes. Archaeologists focus on past cultural landscapes and seek to understand broader cultural processes by studying the many well-preserved locations of prehistoric activity. But the region is not locked in the past; it is a dynamic modern cultural landscape important to a variety of groups including descendant Native American communities, recreationalists, and extraction industries that seek resources such as gas or coal. Recent cultural resource management projects in the region provide perspectives on how the cultural landscape of the present is affecting the irreplaceable landscapes of the past.

Ciofalo, Andy (Leiden University) and Corinne L. Hofman (Leiden University)**[37]** *Culinary Contributions: What's Cooking on Griddles in the Northern Caribbean*

Precolonial foodways in the northern Caribbean have received restricted investigations. This paper is a synopsis of microbotanical residues extracted from clay griddles (flat cooking plates) excavated from three archaeological sites: El Flaco, La Luperona, and Palmetto Junction. Social identities are strongly linked to cultural practices surrounding culinary habits. Thus, we aim to untangle some of the life-ways maintained within and between cacicazgos of the Greater Antilles and a habitation in the southern Bahamas, which adds to holistic interpretations of patterned interactions within this area. The archaeological sites of La Luperona and El Flaco are located in northwestern Dominican Republic (8 km distance from each other, and 18 km from the coastal zone), and have been interpreted as interacting and permanent habitation sites occupied during the 13th to 15th centuries. The comparison of foodways is with the coastal site of Palmetto Junction, located in Providenciales, Turks & Caicos Islands, which appears to have been consistently utilized for 200 years contemporaneously with the other sites. This research adds another dimension to previous general archaeological comparisons between the Greater Antilles and The Bahamas. The survey of foodways amongst sites located in contrasting ecological niches exposes different adaptation strategies and likely transported landscapes.

Ciolek-Torello, Richard (Statistical Research, Inc.)**[246]** *Platform Mounds and Pueblos: A Focus on Diversity and Function*

A unique set of architectural forms, known as platform mounds, emerged in the Phoenix Basin during the early Classic period, presumably evolving from older Hohokam dance mounds. Usually surrounded by walls enclosing compounds, platform mounds initially served as the focal points of dispersed rancheria-style villages composed of clusters of smaller residential compounds. By the late Classic period, platform mounds had developed into much larger residential structures that presumably housed the elite members of hierarchically organized communities. The emergence of these platform mound communities in the Phoenix Basin was closely tied to the expansion of irrigation systems, and probably represented the organizational development required for the management of these systems. Similar platform mound-village agricultural systems developed in surrounding areas such as the Lower Verde Valley, Tonto Basin, Tucson Basin, and San Pedro Valley. The term platform mound and its associated model of hierarchical settlement, however, has been applied to a much greater diversity of architectural forms and settlements in these surrounding areas where Hohokam and Puebloan cultures commingled. This presentation explores the diverse form, construction history, and function of these structures and their social and economic implications.

[90] *Just Up the Hill and Not Down the Line: Ancestral Pueblo Obsidian Use at the Source*

The rich obsidian deposits found in the Jemez Mountains were utilized by all peoples in prehistory, including the Ancestral Pueblo groups who called the mountains home. For most of the geochemically-distinct geologic deposits of obsidian originating in the Jemez, raw materials can be found in secondary gravel deposits far away from the primary locations. However, one of the major geological sources of artifact-quality obsidian, Cerro del Medio (Valles Rhyolite), is geographically limited to a relatively small area within the caldera at the very center of the Jemez Mountains. Presence of this obsidian at sites close to the center can demonstrate direct access and use of this area by Ancestral Pueblo groups. We use geochemical sourcing methods to trace obsidian artifacts found at sites across the eastern flank of the Jemez Mountains (the Pajarito Plateau) to their geological sources. We also compile published sourcing data from the last few decades of archaeological work in the area. Adding current results from portable XRF instrumentation to legacy datasets enriches the picture of obsidian utilization patterns during the Ancestral Pueblo period in the Jemez Mountains.

[186] *Built Environments in the Middle and Early Upper Paleolithic*

Hunter-gatherers are mobile because their resources shift based on season or by ecological zone. This mobility means that their built environments are ephemeral and their mark on the land is light. Many of the traces of structures or land modifications are therefore invisible within the archaeological record. This invisibility only increases as we go back in time as preservation diminishes. We do have a few sites where the remains of the built environment of Middle and Upper Paleolithic foragers is preserved. These sites suggest that there are major differences in the elaboration of living spaces between these two time periods. However, these differences could be explained by many factors, including duration of occupation, group size, site preservation, and, of course, cultural or cognitive differences between Neanderthals and anatomically modern humans. In this paper, I will present the current state of research and the explanations for why these differences may have existed.

Clark, Bonnie (University of Denver)

[316] *A Barrack, a Stone, and Families in Exile: A Case Study of Historic Obsidian Sourcing*

The sourcing of lithic raw material often challenges preconceived notions of the relationships between people, places, and objects for time periods prior to written records. But what of historic obsidian? What can sourcing reveal about the more recent past? This paper presents the case study of a most amazing historical mystery involving exile, incarceration, and the healing power of stone. In 2014, archaeologists on the High Plains of Colorado discovered a roughly shaped piece of obsidian in a most unlikely site, a WWII-era Japanese American internment camp, called Amache. XRF analysis by Fryxell winner Steven Shackley suggested the raw material likely derives from Glass Mountain, Siskiyou County, California. Glass Mountain rises above Tule Lake, another of the 10 primary camps where Japanese Americans were confined during of the war. This artifact's journey to Colorado has sparked the imagination of those beyond the archaeological community. A former internee of a third camp and her grandchildren chose this artifact for inclusion in an exhibit of objects from Amache. In addition to presenting the XRF and archaeological data, this paper also explores how science can be translated into a public conversation about people, places, objects, and our shared, if troubled, past.

[395] *Archaeology for the Incarcerated*

Anthropologists have long defended the social value of their work beyond the immediate acquisition of new knowledge. In archaeology, community engagement and public outreach are now common and desirable. In general education, we tout the powers of archaeology classes to inform students of where we have come from, to appreciate diversity, and to be more compassionate. A form of outreach we rarely talk about, however, is to the incarcerated. Despite the overwhelming evidence of the benefits of offering higher education to inmates, fewer college programs are offered to prisoners today than there were 25 years ago. In this paper I present observations of my time teaching

archaeology courses in a Texas prison, supported with research, and the unique effects it has on my students. Though it poses many unique challenges, I argue that teaching our discipline in a prison setting can help dismantle racist beliefs, build strong, positive identities, and inform people of pressing contemporary issues through references to the past. In conclusion, I argue that we should advocate for more prison education as part of our outreach efforts, and that it is equal in value to the public engagement we promote among the un-incarcerated.

[110] *Archaeological Maize: Does It Vary across Space and Time?*

Recovery of maize cobs as part of the archaeological record yields a rich potential for discerning connections between people, places, and through time. Started almost three decades ago, the study of maize cob phytolith morphometrics has now produced a sufficient dataset for comparison of phytoliths from reference cobs spanning ancient varieties and more recent maize populations from living tribes with archaeological cobs. Some relationships are surprising, while others are expected. This paper delves into the explanation of the best phytolith “face” to measure, the meaning of shape versus size measurements, and statistical comparisons that show regional relationships between Fremont cobs and suggest the possibility that remote granaries contained different types of maize. Similarities between cobs from southeastern Colorado and eastern Utah were surprising. This study, which started in the Southwest, has now expanded onto the Great Plains with the addition of tribal maize as references.

[244] *Braiding Knowledge: Opportunities and Challenges for Collaborative Approaches to Archaeological Heritage and Conservation*

Recently, archaeologists have turned to more collaborative and participatory approaches and are considering more centrally the impact and relevance of archaeology to the contemporary world. The past is deeply rooted in communities, and integrating local understandings and interests in cultural heritage with archaeological interpretation and presentation is essential to cultivating meaningful partnerships with Indigenous and local communities. Such methodological innovation requires an expansion of explanatory spaces to accommodate epistemologies and worldviews that can be radically different. Relying on Anishinabe traditional knowledge, Sonya Atalay has developed and productively applied the concept of “braided knowledge” to community archaeology and brought to the foreground the challenges of cross-threading distinct ways of knowing and doing in engaging with the past, and the critical need for structural changes in the discipline to reflect these practices. In this paper, we provide an orientation to diverse methods of knowledge production and sharing in archaeological research and conservation, considering both successful synergies and epistemological incommensurabilities. We start with a discussion of “braided knowledge” and contextualize the challenges at hand, reviewing recent approaches and interpretive frameworks. We then share examples of attempts to braid knowledge through collaborative cultural heritage projects organized by InHerit in the Maya region.

[366] *The Old Stone Age in the Shammakh-to-Ayl Archaeological Survey Area, West-central Jordan*

Chipped stone artifacts are nearly ubiquitous throughout the Middle East, and Jordan is no exception. Virtually indestructible, they testify to a human presence that extends back as far as 1.5 million years. They are commonly found on the deflated uplands of the west-central Jordan horst, an up-thrust block where ancient sediments and soils have been stripped away by millennia of aeolian erosion. Difficult to date and to determine site compositional integrity, a quasi-Bayesian methodology is deployed here to survey data from which 108 250 x 250 m squares were selected randomly with an overall sampling fraction of 1.2%. The total area surveyed (c. 590 km²) was divided into three zones corresponding to natural phytogeographic, altitudinal and precipitation boundaries. Ten analytical units were defined and artifacts collected were cross-classified by zone and by weathering, density and retouch indices. The work showed that, on average, there was relatively good correspondence between the three indices and fair-to-good segregation amongst the analytical units by zone. Lower Paleolithic collections were confined to the northern part of Zone 3. Middle Paleolithic collections dominated overall while Epipaleolithic collections were virtually non-existent. Implications for forager mobility and factors related to sampling error are discussed.

Clark, Jamie (University of Alaska Fairbanks)

[415] *Can HBE Help Explain Variation in the Presence of Blue Duiker (*Philantomba monticola*) throughout the Middle Stone Age at Sibudu Cave (South Africa)?*

Blue duiker (*Philantomba monticola*) is a small, forest dwelling bovid present throughout Central and southern Africa. The species remains an important source of bushmeat in Central Africa, and in southern Africa, its exploitation dates at least as far back as 77,000 years ago. At the Middle Stone Age site of Sibudu Cave (South Africa), blue duiker is variably present throughout the sequence—its frequency increases from 17% of the total number of identifiable specimens (NISP) in the pre-Still Bay (~77 ka) to 41% in the Still Bay (~71 ka); it begins to decline thereafter, and by the late and final MSA (~48ka and ~38 ka, respectively) it accounts for <2% of the NISP. Under traditional optimal

foraging models, blue duiker (~5 kg) would typically be low-ranked prey. In this paper, I will explore whether the evidenced variation in blue duiker at Sibudu fits the expectations of optimal foraging theory. In so doing, I will also address how (and if!) we can parse apart the relative impacts of variation in 1) the local environment, 2) human occupation intensity, 3) human mobility patterns/landscape use, 4) weaponry systems, and 5) non-human predator activity.

[316] *Looking through the Glass: How Large-Scale XRF Obsidian Sourcing Has Expanded Our View of Late Pre-Hispanic Regional Networks in the U.S. Southwest*

Over the past three decades, the Geoarchaeological XRF Lab, founded and directed by Steve Shackley, has defined and established unique chemical fingerprints for nearly all of the obsidian sources used by Native Americans in the pre-Hispanic U.S. Southwest. Sources and sub-source localities can be reliably identified using XRF spectroscopy, a precise and replicable analytical technique when properly utilized and standardized. XRF analysis is inexpensive allowing the sourcing of large sample sizes, especially considering Steve's well-known generosity in reducing rates for underfunded archaeologists. This paper highlights one important contribution of Steve's research: obsidian procurement and exchange during the late pre-Hispanic period (1300-1450 CE), when there was a dramatic increase in the use of this raw material. Over 10,000 obsidian artifacts from nearly 200 settlements dating to this interval have been sourced allowing us to reconstruct socioeconomic networks at a regional scale. We compare terrain-adjusted "catchment zones" for each widely used source with the dominant source utilized by each settlement from which we have data. This analysis allows for easy visualization of conformity and deviation from closest source use expectations. Catchment zones for underutilized sources are then removed for larger regional comparisons of primary use sources.

Clark, John (Brigham Young University)

[255] *Experiments in Replicating Eccentric Workshop Debris*

Elaborate Maya eccentrics were made from two kinds of blanks: large pieces of tabular flint and large flakes harvested from thick, roundish nodules. Preforms from these blanks were made by direct or indirect percussion, probably with wooden tools that allowed for the removal of super-flat, wide, long flakes. I describe experiments of making obsidian eccentrics with tropical hardwood tools from different forms of blanks. One goal of the experiments was to determine whether different beginning forms would generate different kinds of flakes, or different relative percentages of flakes of different kinds. Tabular blanks require a preliminary step of converting squared edges into acute ones. The thinness of tabular pieces constrains how much additional thinning can occur. Blanks of thick flakes lack these constraints. I describe flake removed from blanks of different forms that may be debris diagnostic of the manufacture of large eccentrics and bifaces in an effort to establish debitage signatures of their production.

[12] *Hot Spots: A Proposed Strategy for Reducing the Risk of Wildfire to Cultural Resources*

Climate change during the 21st century presents a significant challenge to the mandated protection of cultural resources. In interior continental areas such as the Northern Rockies, increased wildfire activity due to longer fire seasons has the potential to damage if not destroy sites. Here we propose a strategy that will take proactive measures to reduce risk to cultural resources from wildfire, thus increasing efficiency in using heritage and fire resources for protecting sites at risk. The strategy proposes to use the best available science to prepare in advance for heritage sites that are most at-risk from wildfire. We present an example of applying wildfire projections for the 2040s and 2080s that quantify the change in area burned at the scale of Bailey's ecosections, allowing the identification of areas of future high-fire risk under climate change. We then would use GIS to overlay within-ecosection fuel type to refine the risk map of cultural resource sites. We would next prioritize those sites in areas of high-fire risk according to significance, vulnerability, etc. Finally, we would develop management plans to reduce impacts from wildfire. We conclude with a discussion of approaches that can be taken to further downscale wildfire projections.

[411] *From Storage Boxes to Research Options: Cataloging Collections at ASU's Research Lab in Teotihuacan, Mexico*

At Arizona State University's (ASU) Research Lab in Teotihuacan, Mexico, countless boxes represent almost limitless opportunities for research. As the initial director, George Cowgill generously provided archaeologists with free storage space. However, decades have since passed without appropriate oversight, organization, and documentation. This means that before any assessments or analyses can take place, there needs to be a catalog of

the collection. To this end, we (a pair of museum studies graduate students) spent a month during the summer of 2018 working at the lab. Specifically, we worked with a collection of mural fragments excavated in 1984 by René Millon and his team as part of an international collaboration to determine the provenience of the looted murals Harald Wagner bequeathed to the de Young Museum in San Francisco, CA. While Millon successfully determined the murals' site of origin, the fragments remain unanalyzed in storage boxes. In an effort to make them accessible for future research, we lightly cleaned the fragments, established a procedure for describing their appearance and condition, photographed noteworthy pieces, and repackaged the fragments for more appropriate storage. Ultimately, the goal is to create a database that can be accessed online by potential researchers to inspire future studies.

[110] *Domestication of the Cochineal*

Identifying the specifics of location and time of the cultivation and domestication of the cochineal beetle (*Dactylopius coccus*) in the New World has eluded archaeologists and ecologists for decades. The cochineal's production of red dye from its rich storage of carminic acid has made this insect a notable element in the lives of pre-contact Mesoamerican and South American peoples for dyeing textiles, cosmetics, and food. The main debate centers around whether the beetle was first domesticated in Mexico and traded into South America, or if the reverse is more accurate. In this study, we will attempt to use mitochondrial and genomic markers among domestic and wild samples of this species from Peru, Oaxaca/Mexico, and New Mexico. The results of our inquiries using these carefully curated samples will yield additional information regarding the effects of domestication on native species in a deep-time context, in addition to revealing data about the current genomic diversity among cochineal stock.

[219] *Quarrying, Cutting, and Shaping: A Look into the Lives of Ancient Maya Limestone Producers*

The organization of labor in Classic Maya society has long been studied from a top-down approach. The construction of public works is seen as a facet of state economy, while the physical evidence of human effort—monumental constructions—are understood as visible manifestations of labor or service-based taxes. The argument for collective or rotational labor organization—well supported in the cases of public architecture, especially road systems—overlooks the people responsible for quarrying, cutting, shaping, and transporting limestone for monumental art and architecture. Recent excavations into residential groups within and on the edges of quarries at the site of Xultun, Guatemala, however, provide evidence of the social and economic role of the individuals who worked, and potentially managed, local limestone quarries. Xultun offers new possibilities for reevaluating existing models of labor organization focused on energetic analyses and ethnographic analogies by contributing direct archaeological evidence of the raw materials, tools and techniques, and residences of laborers engaged in monumental construction projects.

[244] *A Weaver's Work: The Concurrent Advancement of Tribal Sovereignty and Archaeological Practice in Southern California*

Reflecting on work within a Serrano community and their ancestral territory, in this presentation, I will discuss how community-based conceptions of self and landscape, cultural mores related to the treatment of ancestors and artifacts, and the application of knowledge transmission protocols inform and direct not only the archaeology performed on behalf of the Tribe, but also archaeological praxis and the implementation of environmental, historic preservation, and human rights laws across much of Southern California. Working alongside a native sovereign nation as it participates in, undertakes, and guides the performance of regulatory-based archaeology in the United States requires one to operate in a liminal space where multiple worldviews meet and seek to co-exist. In such a landscape where realities, understandings, and constraints have collided continually for over two decades, much has been learned about how to create a space where a multi-vocal, equitable convergence of knowledge can be encouraged and generated anew. Discernment has also been gained about how to ensure this kind of shared understanding does not devolve into "value-added" Western science or an anesthetized form of data transmission and integration that does injustice, if not outright harm, to original thoughts and unique values that must be honored.

Claypatch, Hunter (Binghamton University)

[202] *Mesoamerica en la frontera: Understanding Large-Scale Connectivity Using Hohokam and Trincheras Pottery Designs*

More than merely a physical barrier, the international border between the United States and Mexico has become an ideological boundary that shapes modern perceptions of prehistoric cultures and limits the transfer of academic knowledge. Such is the case in the study of the prehistoric Hohokam and Trincheras traditions. Archaeologists have argued for nearly a century that the Hohokam tradition of southern Arizona is more closely related to Mesoamerica than to the Ancestral Puebloan culture further north. These assertions are made despite little comparative work between Hohokam material culture and the Trincheras tradition of northern Sonora. In the spirit of "crossing boundaries," this presentation compares Hohokam pottery designs with those produced by the Trincheras tradition. I will argue that similarities in pottery designs demonstrate deep social connectivity within the two groups. Despite these similarities, many Mesoamerican-influenced design elements found on Hohokam pottery are lacking on Trincheras pottery. These differences provide important evidence for reconstructing trade routes from central Mexico to the modern border region.

Clayton, Darci (Trent University)

[66] *Tools of the Trade: An Analysis of Lithic Biface Variability in South Central Ontario*

This presentation will discuss the results and conclusions of my Master's thesis research, which addresses cultural interaction patterns and corresponding lithic hafted biface manufacturing traditions in the south-central portion of Ontario. It focuses on the analysis of morphometric and raw material variability in lithic hafted bifaces from the Middle Archaic (7000 – 5000 B.P.) through the Late Woodland (1300 – 500 B.P.) temporal periods in Kawartha Lakes and Trent River Drainage region. Informed by Cultural Transmission Theory (Boyd and Richerson 1985; Shennan 2000), I will show how raw material and the degree of morphological variation that is associated with each temporal phase can contribute information towards the extent to which lithic hafted biface variability is linked to interactions with the surrounding areas of New York, Quebec, Northern Ontario, and SW Ontario, and how these social networks may have changed through time.

[38] *Urban Growth and Land Use at Chicoloapan, an Epiclassic Town in the Southern Basin of Mexico*

The extensive surveys of the 1960s that culminated in Sanders, Parsons, and Santley's pivotal 1979 volume put numerous archaeological sites on the map and advanced knowledge of the changing sociopolitical landscape of the Basin of Mexico through time. Data resulting from this work, including estimates of site size, spatial organization, and environmental context, have been fundamental for reconstructing the rise and fall of states in a region that is among the world's key 'laboratories' for the study of long-term social change. In this paper, we discuss current research in the Chicoloapan-Coatepec valley of the southeastern Basin. Here, sprawling Epiclassic towns, documented by Parsons as part of the Basin of Mexico regional settlement surveys, developed in the years surrounding the decline of Teotihuacan. By the early 600s CE, the settlement at Chicoloapan had grown from a small village of a few hundred people to an urban community of several thousand, featuring civic architecture and new forms of leadership. Drawing from archaeological, geophysical, and paleoethnobotanical data, we consider how local residents modified the surrounding landscape to accommodate rapid population growth and to innovate new modes of sociopolitical interaction.

[89] *Duck. Duck. Goose? A Ceramic Survey Grows into a Primer on Variability*

A systematic survey of archaeological vessels in the collections of the Museum of Indian Arts & Culture in Santa Fe revealed almost 100 bird form jars, frequently referred to as duck pots or shoe jars, from New Mexico and its border environs. The survey found, among other things, that not all of the Museum's "duck pots" represent ducks. Dove-shaped jars were identified, along with at least one example of a swallow or swift. A preliminary assessment indicates that production, beginning by at least 700 AD, has shifted back and forth between utility wares and painted wares, and suggests that peak periods of manufacture may have occurred during the PII period in northwestern New Mexico (primarily painted wares) and during the PIV period along the upper Rio Grande (primarily plain wares). The study demonstrates the advantages museum collections provide for a broad overview of the persistence and variability of certain vessel forms and iconography through time and across space within a geographic region.

Clindaniel, Jon (Harvard University)

[98] *Colors of the Inka Khipu: Demonstrating a Link to Textile Production*

Deciphering the meaning of khipu cord colors has long been a topic of debate amongst scholars of the Inka khipu. Were colors used to signify information that could have been interpreted generally (and thus be deciphered today)? Or were color signs primarily used as mnemonic, logical structuring devices that were specific to the individual who produced them and the khipu they were employed on? Such questions have broad implications for understanding non-numerical Inka khipu signs and determining whether or not it is even possible for modern scholars to decipher color signs. Analyzing artifacts collected by Samuel Lothrop in 1941 from a Late Horizon Nazca province grave (now in the Peabody Museum at Harvard University), I find a close link between the colors of khipu cords, textiles, and textile production tools from the grave. Extrapolating from this finding and my additional research into khipu cord colors from across the Inka empire, I suggest that khipu color signs were part of a broader universe of color signs than were contained in any particular khipu or individual mnemonic code. Furthermore, I discuss the implications of my findings for deciphering Inka khipu color signs and better understanding Andean color semiosis as a whole.

Cobb, Allan**[360]** *Breathless in the Underworld: The Effects of Low Oxygen, High Carbon Dioxide, and High Carbon Monoxide on Cave Ritual*

The Maya explored caves with torches and burned copal with wood fires during ceremonies. These activities, in a confined space such as a cave, used up oxygen and produced carbon dioxide and carbon monoxide. The effects of high carbon monoxide and carbon dioxide on the human body are well studied by OSHA and documented in environmental and medical research. These effects include shortness of breath, dizziness, mental confusion, blurred vision, and weakness, producing a trance-like state. Studies show the effects of high carbon dioxide have been compared to the effects of alcohol and the presence of carbon dioxide increases the uptake rate of alcohol by the body. The decreasing oxygen levels during ceremonies would also set a time limit on rituals, as torches would cease to burn when oxygen levels reached about 18%.

The air in caves is already higher in carbon dioxide than outdoors. The mild effects of it are immediately noticeable and could have been part of the experience the Maya were looking for during ceremonies. Caves with carbon dioxide levels that were too high would prevent use due to torches not burning but caves with slightly lower carbon dioxide levels would speed the process of reaching an altered state of consciousness.

Cobos, Rafael (Universidad Autónoma de Yucatán)**[307]** *Mapping the Ancient City of Chichen Itza, Yucatan, Mexico*

A systematic mapping program conducted at Chichen Itza, Yucatan, Mexico, revealed a considerable amount of archaeological as well as non-archaeological features distributed over the surface of several areas located in the site's periphery. This program relied upon the traditional mapping method consisting in clearing the vegetation in the area selected to be mapped, a detailed record of the archaeological evidence using sketch-maps, and upon an extensive and detailed mapping program utilizing total stations theodolites and the Cartesian coordinate system. The details achieved at Chichen Itza using the traditional mapping method indicate that the use of LiDAR technology will definitely assist at the very onset of the research project before the mapping teams begin their activities in the field. In other words, LiDAR technology could provide excellent information on the presence and spatial distribution of archaeological and non-archaeological features in areas that still need to be surveyed and mapped. In Chichen's case, LiDAR cannot deliver detailed surface information related to features such as cisterns, metates, causeways, wall widths, and accesses associated with ancient structures.

[47] *Eroding Chances: Planning for the Impacts of Climate Change on Vulnerable Coastal Sites in the Arctic*

The impact of climate change on archaeological and other heritage sites continues to grow. Arctic regions are particularly threatened, given the remote, vast, and ecologically diverse nature of the region coupled with the pace of Arctic climate change. Furthermore, archaeologists must grapple with many unknowns in the Arctic, as many regions are only minimally investigated for archaeological sites. Possible approaches to these problems include developing desk-based predictive models to inform targeted field investigations and undertaking site level assessments to identify potential climate change threats. Working with the National Park Service in northwest Alaska, we developed and tested methods for: a) identifying the most vulnerable coastal archaeological sites, and b) standardizing site level assessments of present and future climate change impacts. We present initial outcomes of our site prioritization effort and discuss how lessons learned from this effort can inform future climate change planning and assessment activities both in the Arctic and more broadly.

[86] *Basketmaker III in the Central Mesa Verde Region: Transitions, Social Dynamics, and Population Growth*

The Basketmaker III period (A.D. 500 to 725) in southwestern Colorado was a time of fundamental social and demographic change. The area witnessed dramatic population growth after A.D. 600 that was due to immigration and increases in fertility. This growth was accompanied by changes in settlement patterns and social dynamics. This paper examines this dramatic demographic transition and the associated social dynamics by analyzing site distributions and the size of sites present in the area during this period. These data are then evaluated against fertility estimates, tree-ring data, and other lines of evidence to model when the initial migration took place, what numbers of people were involved, and the role migration may have played in the process of population growth. These results provide new insights into how this pivotal period shaped the broader trajectory of ancestral Pueblo cultural development.

[192] *Urban Landscapes in Late Postclassic Western Mesoamerica: A View from Angamuco, Michoacán*

When Cristóbal de Olid arrived in Tzintzuntzan, Michoacán c. 1522 CE, he encountered the powerful king (irecha) of the Purépecha (Tarascan) Empire who controlled approximately 75,000 km² of western and central western Mesoamerica. Never defeated by the Mexica, the Late Postclassic (1350-1530 CE) Purépecha Empire may have been one of the most politically and economically consolidated empires at that time in Mesoamerica. Previous

research has examined imperial control of resources and trade within the Lake Pátzcuaro Basin heartland, and yet comparatively little is known about Purépecha urbanism and daily life. How were communities living on urban landscapes? How did settlement and consumption patterns change before and after imperial consolidation c. 1350 CE? This paper addresses these questions by discussing urban landscapes in Purépecha western Mesoamerica, some of which have only been documented recently. I focus on the site of Angamuco, a 26 km² urban landscape that provides important insight into local socioeconomic and political practices during the Postclassic period. Increased understanding of pre-Hispanic complexity in this part of Mesoamerica is critical for assessing the impacts of colonial encounters throughout the Americas.

[184] *Can the Field School Be Improved? Lessons Learned through Education Research of an NSF Research Experiences for Undergraduates*

For many undergraduate anthropology majors, participation in an archaeological field school is the entry point to a professional career in the discipline. Despite the importance of field schools, few scholars have investigated the learning outcomes students gain or lasting impacts, either negative or positive, from participation in field-based research. We report on the educational design, learning objectives, and results of two years of formative and summative assessments for an interdisciplinary, archaeology and ecology, research program. Our learning objectives include promoting scientific literacy and communication, critical thinking and STEM skills, and capacities in archaeological and ecological interdisciplinarity. Using developed rubrics that account for both critical thinking and STEM understanding, self-administered competency surveys, and items from the National Assessment of Education Progress and the American Association for Advancement of Science, we found significant gains in nearly all identified learning objectives. Students had growth in program specific content, STEM skills and discipline specific skills, STEM critical thinking skills, and scientific communication skills. We hope to expand upon these quantitative assessments to develop future qualitative research on student field school experiences.

[319] *Missionization and Indigenous Foodways: Analyzing Mission-Era Shell Middens on St. Catherines Island, GA*

In the 17th century the Mission de Santa Catalina de Guale was established on St. Catherines Island, GA, creating a pluralistic community of aggregated indigenous populations and Spanish missionaries. Previous discussions of the effects of Guale-Spanish interaction and the resulting redirection of indigenous labor upon traditional foodways on St. Catherines Island have lacked data regarding the invertebrate component of Guale diets during the Mission era (ca. 1565-1680 CE). This paper presents zooarchaeological analysis of invertebrate fauna recently collected from shell middens in five Mission-era pueblo neighborhoods on St. Catherines and discusses the significance of intra-community variation in molluscan collection and consumption. Stable isotope analysis conducted on oyster samples from the Mission-era will provide another avenue for examining the variation in collection practices between neighborhoods. The paper will also compare the summed Mission-era results to similar data from the Irene Period (ca. 1300-1580 CE) to assess the temporal change and continuity in indigenous subsistence strategies during missionization. This paper aims to look at what the maintenance and alteration of traditional Guale foodways reflects about the effects of colonization on their daily practices, identity, and social landscape.

[128] *Application of a Novel Machine Learning Methodology to the Study of *Dipodomys* spp. Response to El Niño Southern Oscillation Events throughout the Holocene*

El Niño Southern Oscillation (ENSO) events influence climatic variation on a global scale, considerably impacting modern human and animal populations. There is, however, a dearth of literature regarding the long-term effects of ENSO variation on prehistoric vertebrate populations. Here we examine how kangaroo rat (*Dipodomys* spp.) species abundance from Abrigo de los Escorpiones, a trans-Holocene rockshelter located on the Pacific coast of Northern Baja California, vary as a function of wet El Niño events. This study uses a Random Forest algorithm machine learning methodology to establish species level identification of *Dipodomys* spp. remains based on variation in cranial morphometrics. This novel technique to zooarchaeological research significantly improves upon more traditional statistical techniques, such as linear discriminate function analysis and principal components analysis, by more accurately predicting species identifications and by interpolating missing data more effectively. Through the use of open source statistical software, this study demonstrates the utility of machine learning techniques to perform archaeofaunal species identifications, which may serve as an invaluable addition to the zooarchaeologist's toolkit. Moreover, as future ENSO strength and frequency is projected to vary with changing global climatic regimes, this study has important implications for understanding vertebrate population responses to these changing climatic events.

Coleman, Caitlin (ASI)

[104] *The Evolution of Public Communications in the Ontario CRM Industry*

In Ontario's Cultural Resource Management industry, we are experiencing a profound change in how we communicate with the public. Where once we relied on newspapers, academic journals, and museums to disseminate our knowledge, we can now communicate directly with the public through social media. This change has led to new questions about what information we should be sharing with the public, while also balancing the needs of descendant communities, our clients and government frameworks. Social media is democratizing heritage, and creating a more complex landscape for the CRM industry to navigate. Descendant communities and the wider public have been given a greater voice about their own cultural history, while critical heritage theory has questioned the importance of the expert in the process of heritage evaluation and management. I will trace how these changes to our public communications have evolved in Ontario's CRM industry, and look ahead to where these changes may lead us in the future.

[247] *Niche Construction and Cultural Complexity in Small-Scale Societies*

Identifying the factors that influence variation in cultural complexity among groups is an important task for archaeologists. In this paper, I argue that niche construction may be one of these factors. I begin by showing that empirical work on the drivers of technological complexity in small-scale societies suggests that there is a marked difference between hunter-gatherers and food-producers. For hunter-gatherers the primary driver of technological variation appears to be environmental risk, whereas for food-producers the primary driver seems to be population size. In the second part of the paper, I suggest that this pattern makes sense if cultural complexity in small-scale societies is affected by both environmental risk and population size but their relative importance is dependent on the amount of niche construction the members of a society engage in. When niche construction is limited, environmental risk dominates, whereas when niche construction is extensive, population size dominates. In this part of the paper, I also show that the results of recent modelling work suggest that this hypothesis is plausible. In the final section of the paper, I discuss the implications of the niche construction hypothesis for the interpretation of the archaeological record.

Collazo López, Julissa (University of Puerto Rico, Rio Piedras Campus)

[418] *Material Culture Associated to Elite Females in 16th Century Puerto Rico*

This paper presents a case study on how to approach the study of elite women in Puerto Rico during the 16th century using primary sources and archaeological evidence. The main objective of the research was to reconstruct aspects of the daily life of women through their cultural assemblages, as recorded during the early colonization of Puerto Rico. Primary documentation produced by the Royal Treasury of Puerto Rico, one of the first colonial institutions in the Island, was incorporated as a key source for establishing the types of objects associated to women. Two types of documents were consulted: registries of vessels and passengers for the first half of 16th century (1510-1545), and litigation documents for the later part (1573-1599). These sources permit answers to questions related to the types of objects associated to women, and how these in turn can be used to identify status, occupations, and household related activities. The interpretation of this data was compared to existing archaeological collections from 16th century Spanish Caribbean sites and used to characterize a "female elite material culture".

Collins, Benjamin (University of Manitoba)

[15] *Who Let the Beads Out? The Importance of Bead Manufacture and Exchange at Grassridge Rockshelter, South Africa, and Implications for Understanding Holocene Social Networks in Southern Africa*

Ostrich eggshell and marine shell beads have been linked to the establishment and maintenance of hunter-gatherer social networks in southern Africa, but studies focusing on the methods of their manufacture and especially the social contexts surrounding their manufacture are often overlooked. This research presents a detailed technological study of the ostrich eggshell and marine shell beads from the Holocene occupations at Grassridge Rockshelter, located in the understudied interior grasslands region of South Africa.

Ostrich eggshell beads are ubiquitous at Grassridge, and marine shell beads are also present. The density of ostrich eggshell beads at Grassridge suggests that bead manufacture was an important activity at the site and necessitates a discussion of the social implications and gender roles inherent in bead making. Moreover, the presence of marine shell beads indicates connections to the coast, which was at least 200 km away. In this regard, and considering the other artifact assemblages present, Grassridge and the surrounding area are suggested to represent an important social nexus between hunter-gatherer groups located in coastal, montane, and other interior region.

[373] *What Once Was Lost, Now Is Found: Investigating the Relationships of Lower Dover in the Belize River Valley*

Located on the Belize River across from Barton Ramie, preliminary investigations of the recently discovered site of Lower Dover began in 2010. The primary foci of excavations were to situate Lower Dover in the sociopolitical landscape of the Belize River Valley. Initially, investigations focused on the monumental architecture of the site's epicenter, as well as the plazuela groups adjacent to the site core. Lower Dover is uniquely oriented north to south unlike other sites in the Valley, reflecting its rapid construction in the Late Classic period. The ceremonial center consists of four courtyards and two open access plaza groups surrounded by a set of smaller plazuela groups whose relationship to the center has yet to be established. Most recently, continuing excavations have centered not only on the site core, but also on periphery settlement groups. This poster presents an overview of the ongoing research being conducted at Lower Dover.

[191] *Intersocietal Trade and Exchange Networks in Greater Nicoya*

Forty years of geochemical sourcing studies on obsidian artifacts and ceramic sherds from archaeological contexts throughout Pacific Nicaragua and northwestern Costa Rica demonstrate more than 1,300 years of shifting intersocietal trade and exchange dynamics. In the present analysis we mapped the distribution of 3,902 obsidian artifacts from 47 sites and 559 ceramic sherds from 50 sites dispersed across the study area. All data were then interpreted in relation to their respective procurement and manufacture sources. Diachronically calculating the network of least-cost paths—on land and water—that interconnected these sites with known obsidian and ceramic sources produced probable simulations of the travel infrastructures (e.g., footpaths) that facilitated the regional movement of trade goods. To test and refine these simulations, the total documented distribution of key diagnostic ceramic types and obsidian from sites within the study area were added to the database. The resulting simulations include data from approximately 540 archaeological sites and maps out a partial pattern of intersocietal trade and exchange relationships for each of the following time intervals: AD 1-300, 300-500, 500-800, and 800-1250. The final model demonstrates the ability for GIS modeling to significantly enhance our understanding of pre-Columbian economic exchange at multiple scales of analysis.

[89] *Caribbean Archaic Faunal Exploitation: Analysis of Museum Collections*

The Yale Peabody Museum curates one of the world's largest and most comprehensive archaeological collections from the greater Caribbean region. These collections were acquired during a multi-decade research program on the culture history of the region. While the focus of that research was chronology and artifact analysis, the collections contain unmodified faunal remains, both vertebrate and invertebrate, that can provide data on a variety of research topics. This poster describes the history of recovery of collections from Cuba, quantified vertebrate faunal data, and radiocarbon dates. Because of relatively limited access to archaeological sites in Cuba during the past 50 years, the data from museum collections help fill gaps in our knowledge of Caribbean prehistory.

Coltman, Jeremy (University of California, Riverside) and Karl Taube (University of California, Riverside)

[28] *From Chichen Itza to Tulum: The Late Postclassic Maya Feathered Serpent of the Northern Maya Lowlands*

Most representations of the feathered serpent at Chichen Itza depict a plumed rattlesnake, a being of wind and carrier of rain, with Central Mexican origins dating back to Early Classic Teotihuacan. In Classic Maya art, feathered serpents are not rattlesnakes and lack plumage aside from a quetzal crest, an attribute which continues into Late Postclassic representations but is unusual for Chichen Itza. Following the decline of Chichen Itza, feathered serpents in the Maya area do not appear with quetzal plumes covering their bodies but continue to appear in unique and striking ways. This paper will explore the Late Postclassic Maya feathered serpent through stone sculpture, murals, graffiti, and codices.

[66] *Small Mammal Isotopes as Proxies for Climate over the Holocene Period on the Eastern Snake River Plain, Idaho*

Reconstructing the prehistoric environment is vital to our understanding of past human use and occupation of a landscape. While many reconstructions, typically based on chemical and biological signatures found in sediment and ice cores, are available, we currently lack suitable records for Idaho's eastern Snake River Plain. This is mainly due to the scarcity of suitable sedimentary archives in this region. To overcome this problem, we explore the utility of stable-isotope-ratio analysis of small mammal bone from cave sites as a proxy for climate and vegetation change. We present C, N, H, and O isotopic data from bone collagen and C and O from bone apatite from two sites representing the last 10,000 years. The results highlight the potential for small mammal isotopes in evaluating environmental change, providing support for additional research into this arena.

[87] *Archaeological and Digital Ethics as a Critical Component of Digital Literacy*

While digital literacy typically refers to one's ability to utilize and navigate various digital platforms, recent literature demonstrates a need to broaden our framing beyond the development of practical skills to include understanding the impact of those technologies in contemporary society. This is of increasing importance as digital media become part of the standard archaeological toolkit and as we venture into largely unknown territory with emerging platforms/technologies (social media, drones, 3D modelling, 3D printing). Pulling from literature on "critical making" in the digital humanities and reflecting on scholarship on digital literacy in archaeological and heritage contexts, I frame digital and archaeological ethics as a critical component of digital literacy. This would have significant implications for digital archaeological pedagogy/curriculum and could also reframe how we evaluate competencies with various technologies. It will also likely impact conceptions of capacity building and collaboration with various archaeological stakeholders, particularly as more community-engaged projects advocate for co-production. Being digitally literate, as I frame it, would prioritize identifying the purpose, intent, and impacts of using digital technologies prior to digitization as well as knowing when digitization may not be appropriate at all.

[90] *Preserving Cultural Resources on the Santa Fe National Forest: a Collaboration between Federal Archaeologists and Volunteers*

The Santa Fe National Forest manages 1.6 million acres of public land in northern New Mexico, and a large portion of the forest encompasses the Jemez Mountains. Archaeologists have surveyed approximately 16% of the forest and documented roughly 10,000 archaeological sites within the forest boundary. The Santa Fe National Forest employs eight permanent archaeologists to ensure the cultural resources on the forest are inventoried and protected. The forest also relies on the efforts of volunteers to assist with this monumental task. The Santa Fe National Forest Site Stewards, a non-profit volunteer organization, and other valuable volunteers help to monitor priority sites, assist with identification and documentation, and research these irreplaceable cultural resources. The collaboration of professional archaeologists and volunteers improves the preservation of cultural resources and exemplifies a shared responsibility for our collective past.

Conger, Megan (University of Georgia)**[73]** *Telling Localized Indigenous Histories of Trade through AMS Dating and Bayesian Chronological Modeling in Southern Ontario, Canada*

Late sixteenth-century chronology of Indigenous sites in Southern Ontario has, until recently, relied upon relative means such as ceramic seriation and trade good chronologies. Bayesian chronological modeling of high-precision AMS radiocarbon dates is increasingly being applied to sites believed to date to this time period. The results are forcing archaeologists to reconsider the timing and tempo of the cultural and sociopolitical processes which define our accepted narratives. In this paper, I present modeled AMS dates for sites in Wendat, Tionontate, and Attiwandaron community relocation sequences demonstrated to date to ca AD 1580-1600. I compare the assemblages of European-manufactured goods between these sites with those expected from Glass Bead Period I (ca 1580-1600) sites, and suggest that the differences I find relate to issues of both access to European goods as well as differing Indigenous attitudes toward engagement with European-manufactured materials and people. I also compare assemblages of Indigenous-manufactured goods between sites to further assess the degree to which the Indigenous communities in question were interacting with one another. I conclude by considering the benefits of employing intensive radiocarbon-dating programs on protohistoric and early historic-era Iroquoian archaeological sites, in terms of testing existing chronologies and telling more accurate Indigenous histories.

Conlee, Christina (Texas State University), Bryan Heisinger (Texas State University) and Nora Berry**[211]** *Prehistoric and Historic Settlement in the Pine Creek Drainage, North-Central Oregon*

Located between the Great Basin and the Columbia Plateau region, north-central Oregon is a region of cultural and geographic boundaries. Full coverage pedestrian survey was conducted in the eastern Pine Creek drainage basin to record prehistoric and historic sites in order to understand how past people used, and lived on, the landscape. Several sites and isolates were recorded that span a period from the Late Archaic (3000 BP) to the mid-20th century, although settlement of the area likely occurred much earlier. Documented sites include locations for harvesting biscuitroot (*Lomatium cous*) and for quarrying chert.

Conley, Daniel and Rissa Trachman (Elon University)**[371]** *Investigating Market Activity at the Ancient Maya Site of Dos Hombres, Belize*

Finding evidence of an ancient Maya marketplace is difficult due to the perishability of telltale materials such as food, textiles, and wooden stalls in the tropical environment of northwestern Belize. Therefore, multiple lines of evidence including material culture, stratigraphy, soil chemistry, and spatial analysis are essential in identifying possible market activity areas. An area hypothesized to be an area of market activity at Dos Hombres was tested through analysis of landscape features, systematic excavation, and phosphorus testing of soils. In a 20 by 20 meter area adjacent to the large and publicly accessible Plaza A, six 1 X 1 meter units were excavated systematically. Stratigraphic analysis revealed a shallow clay matrix that evened the ancient activity surface over bedrock and a very high density of ceramic sherds, lithic debitage, obsidian flakes, faunal items, and tools. The present data suggest heavy foot traffic indicated by trampled ceramics, high quantities of small lithic flakes related to frequent re-sharpening of tools possibly for producing items for market sale, and finally, indicators of imported items, such as marine shell. This data indicates a strong correlation with the hypothesis, that this area did serve as a locus of market activity at the site.

[224] *Castle Ballintober, County Roscommon, Ireland: The Castles in Communities Project*

The Castles in Communities program at Ballintober Castle in County Roscommon, Ireland has been studying the construction sequence of the castle and the newly discovered deserted medieval village in the hinterlands. As we work with the community of Ballintober we are faced with a conundrum of how best to present our results as they conflict with the locally promoted idea that the castle was constructed by the Irish O'Connor clan in the 13th Century rather than the Anglo-Norman baron Richard DeBurgh. However, we do argue that by re-taking the castle from the Anglo-Norman invaders the Irish were mounting a formidable resistance to colonial rule. Results show a vibrant community and intensive Irish re-building efforts well beyond the Pale. This paper addresses questions of heritage construction and working with communities to research important aspects of resistance to colonial power.

[417] *Molecular and Isotopic Analyses of Charred and Uncharred Sediments: Investigating Environmental Signatures at the Middle Palaeolithic Rock Shelter of Abric del Pastor (Alcoy, Spain)*

Our understanding of Late Pleistocene Neanderthal habitats is largely based on anthracological and palynological reconstructions set within broader global climatic frameworks. This approach has yielded important environmental information, however, so far it has not been possible to identify fluctuations in climate or vegetation at less than a millennial scale. At this resolution it is difficult to investigate localised microclimates or ecotones which could have been favourable to human occupation during periods of global climatic downturn. This represents a considerable drawback to the study of Neanderthal environmental interactions and the role of climate in Neanderthal social and cultural evolution. Molecular and isotopic analyses of sedimentary organic matter, in particular charred sediments from archaeological combustion features, represents a promising avenue of research for investigating palaeoenvironmental dynamics at a high spatial and temporal resolution. Here we present preliminary results from Abric del Pastor, a rock shelter in the Alcoy region of Spain which has yielded evidence for multiple Neanderthal occupations. Molecular and isotopic analyses of both charred and unaltered sediments, is coupled with soil micromorphology to provide high resolution palaeoenvironmental signatures framed within a broader reconstruction of site formation processes.

Connor, Kimberley (Stanford University)

[83] *Immigrant Diets and the Making of Australia*

In Australia, Casella and Fredericksen have argued, places of confinement have a disproportionate importance in the national mythology because they are material representations of classic Australian heroes: the convict, the outlaw, and the larrikin. Criminal or mischievous acts are recast as rejecting an unjust social system or an imperial oppressor. By differentiating themselves from their English antecedents, Australians are able to create a unique identity. That institutions of immigration are now part of the commemoration process is somewhat ironic, since in the nineteenth century they were designed to promote, and even enforce, the reproduction of English norms in the colonies. Using the case study of the Female Immigrant Depot (1848-1886) housed in Hyde Park Barracks, Sydney, this paper discusses attempts to shape and condition the diet of the emigrant working classes through institutions of immigration. In the depot, the inmates' diet became a reflection of ruling class imaginaries for what the labouring masses should eat and, by extension, how they should behave. At the same time, faunal analysis suggests the limited success that the authorities had in controlling diet within the institution and highlights the strategies inmates used to resist the regulations imposed upon their food and their lives.

Conolly, James (Trent University) and Daniel Smith (Trent University)

[73] *An Updated Radiocarbon Chronology of the Middle to Late Woodland Transition in Southern Ontario: Regional Variation in the Dynamics of Cultural Change*

The Middle to Late Woodland transition in southern Ontario extends over approximately 500 years and encompasses several changes in subsistence and settlement patterns, ritual practices, and ceramic and lithic

crafting traditions. The last major review of the radiocarbon chronology related to these changes was over 20 years ago. New data combined with methodological advances in analytical modelling of radiocarbon dates encourages the revisiting of the chronology of this period to build on our understanding of patterns of change. In this paper I update the radiocarbon chronology of the transition, identify regional variation in the timing of key elements of cultural change, and discuss how the patterning informs understanding of the emergence of Late Woodland village communities during the twelfth century.

Conrad, Cyler (Los Alamos National Laboratory)

[419] *Ancestral Pueblo Turkey Management on the Pajarito Plateau (C.E. 1150-1600)*

In this paper we use bone apatite and collagen stable isotope analysis to examine long-term Ancestral Pueblo turkey management strategies on the Pajarito Plateau in the northern Rio Grande of New Mexico. Since previous preliminary research within this region identified the presence of domesticated turkeys (aHap1) consuming C4-based diets (presumably maize) during the Coalition period (C.E. 1150-1300) at the multi-room pueblo site of LA 4618 (Rawlings and Driver 2010; Speller et al. 2010), our analysis takes a diachronic approach by investigating three main questions: 1) Do Coalition Period turkey diets from additional sites on the Pajarito Plateau match the pattern found at LA 4618?, 2) Do turkey diets change overtime between the Coalition to Classic Period (C.E. 1150-1600)?, and 3) Do turkey diets shift in tandem with known periods of variability in precipitation within the prehispanic northern Rio Grande? Our results suggest that turkey diets shift over time, possibly due to variability in rainfall and thus the ability to feed turkeys maize, but equifinality and the history of zooarchaeological research within this region continue to influence these results and interpretations.

[44] *Ceramic Resource Selection and Social Violence in the Gallina Area of the American Southwest*

This research examines the relationship between social violence and ceramic resource procurement. Do people in middle-range societies alter resource use in response to conflict? Specifically, does social strife influence the distance to which potters in middle-range societies will travel to collect ceramic resources? Distance and quality are primary elements in clay selection. Pottery production occurred throughout the American Southwest under conditions of pervasive conflict in the 13th century A.D. Conflict in the Gallina area is evidenced by defensive architecture, such as towers and cliff houses, burned structures with human remains, and human remains with embedded projectile points and skull trauma. Two sites in the Gallina area were chosen, one with a defensive setting and architecture the other with an open site plan and no defensive structures. Ceramics from each of the sites and the clay resources in proximity to the sites were examined to see if conflict affected resource selection. Numerous field and laboratory analyses provided information about the mineralogy, chemistry, and performance characteristics of the available clays and the ceramics themselves. The combined results of the laboratory tests, mineralogical studies, and chemical comparisons indicate that Gallina potters did not alter their resource selection in response to social violence.

[315] *Is 'Dates as Data' Just a Zombie? Breathing New Life into Radiocarbon Summaries by Assessing Local Landscape Taphonomy*

A rapidly growing corpus of examples demonstrate that the 'dates as data' approach to archaeological radiocarbon assemblages that John Rick pioneered still shambles around the intellectual landscape of archaeology. It has belatedly spawned a variety of attempts to grapple with prehistoric demography, confronting to varying degrees some of the methodological and conceptual difficulties that John pointed out three decades ago. This paper examines one of those difficulties: the effects of taphonomic processes on use of radiocarbon dates as a population proxy. We show that the widely used global correction can be misleading, and demonstrate an improved spatially-explicit method that synthesizes local geomorphic data to weight dates by the relative frequencies of landforms of varying ages.

[124] *A Brief History of Apache Occupation at Chiricahua National Monument*

Chiricahua National Monument, located in southeastern Arizona near Willcox, holds evidence for thousands of years of Native American occupation. Relatively recent in this timeline is occupation by the Chiricahua Apache. Up through the 19th century, the Chiricahua Apache ranged over a significant part of the Southwest, including northern Mexico, southwestern New Mexico, and southeastern Arizona. Chiricahua National Monument, as well as the surrounding Chiricahua and Dragoon mountains, are strongly associated with the Chiricahua Apache. This importance was recognized by the US government, and a Chiricahua Apache reservation was formed in 1872 near the monument, lasting until 1877 when the Chiricahua Apache were forcibly relocated to the San Carlos Reservation in east-central Arizona. This poster presents the archaeological evidence of Chiricahua Apache occupation, along with historical records and oral histories, within and around Chiricahua National Monument. Recent archaeological investigations focusing on the Chiricahua Apache have uncovered artifacts pertaining to subsistence, material wealth, raiding, and warfare. The National Park Service, along with archaeologists, historians, and indigenous scholars, has worked to rediscover the material details of Chiricahua Apache life during the 18th and 19th centuries.

Cook, Gordon [111] see Hamilton, Derek

Cook, Katherine**[87]** *Digital Communities of Learning: Bridging Technology, Pedagogy, and Community-Engaged Practice*

At the junction of contemporary approaches to digital and community-engaged scholarship, there is an augmented spirit of openness and collaboration that has the potential to reconfigure authority, ownership and power in connecting with the past by transforming digital training and capacity building. However, the complexities of ethics, digital literacies, protection and inequity also raise difficult questions about what learning archaeology should look like in the 21st century, for students, professionals, and communities alike. This paper will use case studies developing hybrid interventions in public archaeology through collaborations between students, museums and descendant communities to draw inspiration from the ways in which maker culture(s), hackathons, and coding communities can be deployed in combination with critical inter-community dialogue, digital literacy training, and community outreach to disrupt traditional archaeological practice, education and dissemination. These experiences demonstrate the value of the process of doing collaborative digital archaeology as dynamic and meaningful opportunities for collective and inclusive teaching and learning. A critical assessment of the practicalities, infrastructure, and disciplinary structures that create both opportunities and barriers to building diverse and inclusive communities of learning is pivotal to re-envisioning publicness, openness and collaboration to decolonize the digital and make contemporary archaeology innovative but sustainable.

Cook, Michael (Michigan State University) and Kurt Rademaker (Michigan State University)**[285]** *Raw Material Sourcing of Two Terminal Pleistocene Sites in Southern Peru*

I present a raw materials analysis from two terminal Pleistocene-aged sites in southern Peru: Quebrada Jaguay 280 (QJ-280) and Cuncaicha. Each site's debitage assemblage contains multiple lithic raw material types, including obsidian, chalcedony, petrified wood, jasper, and andesite. While the obsidian has been sourced to the highland Alca volcanic field, no formal provenance studies have been previously undertaken for the non-obsidian raw materials. Our team carried out field survey of the mid-altitude Pampas region between the coast and highlands, and discovered a vast lithic landscape with primary reduction and workshop sites. We identified and sampled over 20 different types of silica rocks naturally cropping out. I then classified the raw materials comprising both the QJ-280 and Cuncaicha debitage assemblages. When compared with geologic hand specimens from the Pampa outcrops, a majority of the identified raw materials appear at one or both sites indicating that both highland and coastal populations were utilizing the mid-altitude region for lithic procurement. This poster summarizes the non-obsidian raw materials at both sites and suggests their likely source locations. The combination of newly identified sites and raw material sources allows for improved regional path modeling and strengthens our understanding of the Terminal Pleistocene coastal-highland connection.

Cook, Robert [168] see Hinkelman, Sarah

Cook, Robert (Ohio State University)**[348]** *Migration and Ethnic Hybridity: Examining the Middle Ohio Valley Mississippian Periphery*

Recent research on the Fort Ancient culture of the Middle Ohio Valley has considerably improved our understanding of the motivation for and subsequent role of Mississippian migrations along a Mississippian periphery. A plethora of new radiocarbon dates on multiple media, strontium and biodistance analyses of human bone, and PDSI reconstructions of climate change have allowed for new insights into the origins of Fort Ancient culture in southwest Ohio and southeast Indiana. In short, Mississippian migrants appear at the onset of the cultural tradition in this area, around the time when prolonged droughts were occurring in neighboring Mississippian regions. The migrants (identified biologically) are accompanied by clear examples of Mississippian pottery (plain, shell tempered, Ramey) and housing forms (wall trenches). Moreover, closely following these events, we see the development of hybrid pottery forms that blend aspects of the new and old (Woodland) traditions into what we have long recognized to be

Fort Ancient.

Cook Hale, Jessica (University of Georgia)

[240] *"...As the Waves Make Towards the Pebbled Shore": Site Formation Processes on Drowned Coastal Sites and Implications for Preservation, Discovery, and Interpretation*

Submerged prehistoric sites left behind by coastal groups have the potential to answer multiple critical questions concerning human activities, but locating, excavating, and interpreting such sites brings with it challenges unlike those encountered in coastal settings that remain (for now) terrestrial. Without a firm grasp of estuarine and marine sedimentological processes, archaeological investigations will lack interpretive rigor. Just as we extend the paleolandscapes onto the continental shelf, so we must also extend geoarchaeological methodologies. To illustrate this point, I present here two case studies that demonstrate how these aquatic processes act on features and artifacts: one sedimentological in nature, and the other geochemical. The first case study examines the effects of two hurricanes on features within a submerged, formerly coastal site; the second addresses geochemical corrosion on lithics deposited in fresh, brackish, and saltwater contexts. Each case study also highlights potentials for additional datasets associated with relative sea level changes and climate changes.

Cool, Autumn (PaleoWest Archaeology) and Rebecca Schwendler (PaleoWest Archaeology)

[400] *Civilian Conservation Corps Archaeology and Preservation Near Castle Rock, Colorado*

In 1934, Civilian Conservation Corps (CCC) Camp DPE-203-C/SCS-7-C was established along McMurdo Gulch near Castle Rock, Colorado. Over the next seven years, CCC enrollees dramatically transformed the surrounding landscape with diverse water and erosion control features. The conservation techniques the CCC shared with local farmers and ranchers overhauled agricultural practices and reinvigorated the Depression-era economy. Today, suburban housing developments are encroaching on this historic vernacular landscape. Since 2014, PaleoWest Archaeology has worked with SLV Castle Oaks, LLC (SLV), the U.S. Army Corps of Engineers, and the State Historic Preservation Officer to record and preserve the remains and legacy of CCC Camp DPE-203-C/SCS-7-C. Combining archaeological inventory, historical research, engineering drawings, and public education, PaleoWest has identified the camp and dozens of features and guided preservation and interpretation efforts. Extensive and complex, these CCC features should not be considered mere remnants of the past, but integral elements of the modern landscape.

Cooley, Delaney (University of Oklahoma)

[80] *Athapaskans on the Plains: A Glimpse of Dismal River Lithic Technology*

Recent interest in early Athapaskan population movements has led to the reconsideration of Dismal River sites on the Central Plains during the mid-16th to 18th centuries. Although most archaeologists recognize Dismal River people as ancestral Apache, an unclear archaeological record and outdated evidence has led to continued debate. New syntheses of Dismal River chronology, ceramic technology, architecture, and subsistence supports an Athapaskan affiliation. However, lithic data are missing from recent discussions. I examine evidence for lithic procurement and production at three Dismal River sites in Scott County, Kansas, and relate my findings to broader discussions of Dismal River identity and Athapaskan communities across North America.

Cooney, Kathryn

[142] *Do Women Rule Differently? Lessons from the Ancient Egyptian Patriarchy*

Historians often make blanket assumptions that female kings of Egypt ruled differently from men. Hatshepsut is often said to have been a pacifist, not leading her country into invasions abroad. Cleopatra's rule has been characterized as drama-seeking, manipulative, not to mention hormonally imbalanced in the writings of countless Classicists and historians. Nefertiti is remembered as nothing more than a pretty face, but if recent Egyptological investigations are correct, she was much more than that. But did (and do) women really rule differently from men? Is it sexist to even ask this question? And what should we expect from these rulers who are only placeholders and stopgaps in an authoritarian, patriarchal system like ancient Egypt?

[321] *Fire or Stone? Applications of Infrared Spectroscopy and the Grinding Curve Procedure to Differentiate between Pyrogenic and Geogenic Calcites at Crvena Stijena Paleolithic Rock Shelter, Montenegro*

It is becoming ever more clear that cooperative efforts amongst researchers trained in a wide variety of archaeological and geoarchaeological specialties during the planning, excavation, and interpretation of an archaeological site are crucial to a successful study. Middle Paleolithic deposits in Level XXIV of the rock shelter at Crvena Stijena, Montenegro are the focus of such a team-based approach, which includes new microarchaeological methods to understanding site formation processes and hominin pyrotechnology. The idiosyncratic nature of cave and rock shelter sites can make their history, structure, and functions difficult to reconstruct. This is especially true when interpreting the evidence for pyrotechnological activities, which has been subject to diagenetic processes. Application of the grinding curve methodology to Fourier-Transform Infrared (FTIR) spectra of calcitic sediments (Regev et al. 2010) and analyses of sediment samples from micromorphology blocks have yielded encouraging results, enabling the differentiation between geogenic and pyrogenic calcites. This is particularly useful when trying

to reconstruct site formation processes, in addition to providing information on site use patterns and offering insight into Neanderthal behavior.

Cooper, Jason (WSDOT)

[366] *Neolithic Tales from the Eastern Mediterranean Basin: A Graduate Student's Experience under Dr. Alan H. Simmons at the University of Nevada Las Vegas in the 1990s*

The Las Vegas Valley in southern Nevada experienced unprecedented growth in the 1990's. The University of Nevada, Las Vegas (UNLV) was not immune to this progress and as a result began to attract the attention of top researchers, professors, and graduate students out west. The moment I arrived at UNLV in January 1994, through my graduation in 1997 and subsequent participation on several fieldwork efforts that crossed Y2K, Dr. Alan H. Simmons generously afforded me countless opportunities to better myself as an archaeologist and anthropologist. From the Hashemite Kingdom of Jordan (Wadi Shu'eib and Ghwair I) to the island nation of Cyprus (Kholetria Ortos), evidence of a complex Neolithic package emerged across the Eastern Mediterranean Basin in various ecological landscapes. Dr. Simmons taught me many things in both the classroom setting and in the field, but no more important than not to drink his cognac when he wasn't looking even though it was Christmas. And the other important life lesson I learned from Alan, don't ever house sit for a professor on sabbatical.

[113] *Woot There It Is: Ground-Truthing LiDAR Survey Results at El Peru-Waka', Petén, Guatemala*

In 2016, a 91 square kilometer lidar survey was completed of the region surrounding the Classic Maya center of El Peru-Waka', as part of the PACUNAM LiDAR Initiative. Visual analysis was then conducted from 2017-2018 by members of the Waka' Archaeological Project (PAW) to identify new and previously recorded structures and other settlement features visible in the LiDAR DEM. During the 2018 PAW field season, pedestrian ground-truthing of a 30 km section of the LiDAR DEM was carried out to confirm the earlier visual analysis. Over the course of the field season, the ground-truthing team was able to visit 126 groups to the west and south of the El Peru-Waka' site core. Although many features were clearly visible in the LiDAR data, the survey team also recorded numerous false positives and false negatives. This poster will present the preliminary results of this research and the impact of false positives and false negatives on evaluating structure density estimates based on LiDAR surveys in the Maya lowlands.

Cooper, Zachary (University of Colorado, Boulder)

[311] *Fields, Shrines, and Paths—Ancestral Tewa Landscape Usage at Cuyamunge*

Over the past five years, collaborative work between the Pueblo of Pojoaque and the University of Colorado, Boulder at the ancestral Tewa site of Cuyamunge has revealed a network of agricultural fields, shrines, and paths. Studies suggest that shrines have been used as a centerpiece of Puebloan ritual observances for at least 4,000 years. Given the richness and complexity of the Tewa shrine system, this paper addresses only the archaeologically identifiable shrines located within the boundaries of Cuyamunge. I use ethnographic knowledge derived from many years of collaboration with members of the Pueblo of Pojoaque as a basis for interpreting the relationship between agricultural fields, shrines, and paths. More specifically, I identify patterns in the archaeological record that reflect explanations rooted in Tewa ethnography for both shrine selection and placement within the village itself.

[86] *The Indian Camp Ranch Community: a Two Hundred Year-Long History of a Basketmaker III Community in Southwest Colorado*

Basketmaker III is a formative period in Ancestral Pueblo history but has rarely been researched at the settlement level. Crow Canyon Archaeological Center's Basketmaker Communities Project investigated a concentration of 79 Basketmaker III sites in a square kilometer area of southwest Colorado and found evidence of an intentionally organized community. Results suggest this community was founded by immigrants and integrated by group ritual at a central great kiva. This paper presents the history of the Indian Camp Ranch (ICR) community from its inception in the late sixth century A.D. to its florescence in the early eighth century A.D.

[143] *Continuity and Hiatus in the Archaeology of Mobility: A Case Study from Southern Peru/Northern Chile*

Despite excellent work in the field over the past two decades, the tensions between continuity and rupture in archaeological accounts of the colonial 'transition' in the Andes have tended to remain under-theorized. Drawing on recent fieldwork in Tacna (southern Peru) and Arica (northern Chile), I explore a case study focused on the Inca tambo (waystation) and its afterlife during the colonial period. As a key Inca institution that would be adopted and remade as part of new colonial regimes of mobility, the tambo offers interesting possibilities for exploring the transition. Yet the tambos in the research area were primarily built in the 15th and 19th centuries and apparently separated by a substantial hiatus of several centuries. This absence drove methodological changes towards a wider spatial scale of analysis and a refinement of survey resolution to pick up other traces of the early colonial period. This discussion raises wider questions in turn both about the ways we engage with multiple temporalities and about our relationships with other disciplinary perspectives on the Inca and colonial periods.

Cordero, Maria-Auxiliadora (University of Pittsburgh)**[29]** *Looking for Sites in All the Wrong Places: Finding Evidence of Preceramic Occupations in Northern Highland Ecuador*

J.S. Athens and colleagues recently published evidence of early maize (6,600 CAL BP) from a lake core in northern highland Ecuador. Deposits with maize phytoliths and pollen were interspersed with ash layers from volcanic eruptions. The various geological processes that have shaped the environment would have had a great impact on the people growing corn in the region, and on their dwellings or campsites. Thus early sites are difficult to find. The usual reconnaissance and survey methodologies rarely turn up evidence of preceramic materials, which would be deeply buried or obliterated by landslides, volcanic ash, and other volcanic debris. The identification of the earliest remains in the region usually happens by serendipity. J.S. Athens's work inspired me to embark on a project (assisted by a geologist) designed to identify possible sites that may reveal the presence of those early horticulturalists. My recent fieldwork, which aimed at finding those kinds of remains, has uncovered lithic materials not associated with ceramics that may be an indication of early sites.

[350] *Chair*

Cordero, Robin (Office of Contract Archeology, Univ. of New Mexico)**[20]** *The Effects of Sedentism and Increased Agricultural Production on Migratory Bird Flyways: A Case Study from the American Southwest*

Recent studies in avian biology have highlighted the plasticity of avian migratory flyways and location of wintering grounds for a range of taxa in response to agricultural production. This research provides a test of these studies to assess if pre-contact migrations in the American Southwest could have caused a shift in the wintering grounds of migratory birds along the Rio Grande Flyway. Prior to the 13th century, Puebloan farmers residing along in the Middle Rio Grande Valley of New Mexico resided in small, dispersed hamlets. Crop production appears to have been limited primarily to gardens. Towards the end of the 13th century, the Middle Rio Grande Valley saw a significant increase in Puebloan farmers migrating into the Albuquerque valley and settling on the Rio Grande floodplain in communal structures with up to 1,200 rooms. This shift in settlement patterns resulted in one of the densest concentrations of people and agricultural fields in the Eastern Pueblo region. This research will demonstrate how this change in settlement patterns resulted in a significant shift in the wintering grounds of birds long the Rio Grande Flyway.

Cordova, Carlos**[38]** *Long and Short-term Lacustrine and Fluvio-lacustrine Dynamics in Relation to Prehistoric Settlements: The Case of Lake Texcoco*

Despite the existence of archaeological data from surface surveys and excavations, the extent and dynamics of the lake and its shores over time are poorly known. Archaeological works often refer to a model of distribution of the Basin of Mexico's lakes that is to a large extent fixed the time of the conquest (1519-1521) on or models that are erroneous. Geomorphological, sedimentological, archaeological, and historical data reveal that the levels of the lake were highly variable on a seasonal, decadal, and centennial basis. This paper examines some lacustrine and perilacustrine localities that reveal several problems often ignored such as low lacustrine sedimentation rates, recent advance of deltaic lobes, and a very low topographic gradient that hinders the definition of features such as paleoshores and paleobeaches.

[38] *Chair*

Cordova, Carlos [320] see Vyazov, Leonid

Cordova, James (University of Colorado, Boulder)**[243]** *Flowers and Floral Imagery in New Spain's Visual Production and Religious Spaces*

Colonial Mexican portraits of priests, nuns, and children donning elaborate floral trappings indicate their subjects' holiness and connect Euro-Christian and Mesoamerican ideas of sacredness, nobility, and a propitious afterlife. Their rich visual display explicitly highlights the virtuousness and unblemished souls of their subjects, and, in the case of funeral portraits, they must have signified a heavenly afterlife. Similarly, many murals in early colonial Mexican churches and convents highlight floral imagery and conjure a paradisiacal garden that links Euro-Christian and Mesoamerican ideas of an afterlife set in a garden or flower world. This paper examines these connections and argues that indigenous painters (tlacuilos) and flower artists (xochimanque) worked with priests and nuns to create these cross-cultural works. Furthermore, taking a cross-cultural perspective allows us to consider colonial-era flowery trappings and floral murals as more than simple representations of religious individuals and paradisiacal settings, but also as visual devices that could activate the sacredness of individuals and religious settings. In these cases, some key aspects of the indigenous Flower World overlapped in a visually harmonious manner with Euro-Christian concepts of flowers, the "odor of sanctity," and the heavenly afterlife.

Corl, Kristin [263] see DeBry, Robert

Corl, Kristin (University of Texas at San Antonio)**[413]** *Community Identity in the Jornada: Untangling Patterns of Aggregation and Abandonment at Cottonwood Spring Pueblo (LA 175), an El Paso Phase Village*

Ongoing excavations at Cottonwood Spring Pueblo (LA 175) suggest population aggregation within the El Paso Phase (A.D. 1300-1450) Jornada Cultural Region may have consisted of distinct self-identified groups integrated into one multi-ethnic community. Comparing the excavations at Area A, a large plaza orientated pueblo, and Area E, a series of linear pueblo room blocks, a number of significant differences in construction, use, and abandonment activities have become apparent using room comparisons. I explore these identifying differences through the case study of Room 3 Area A and Room 1 Area E at Cottonwood Spring Pueblo. Many differences seen within Cottonwood Spring Pueblo such as layout, wall and room construction, frequencies of ceramic types, depositional artifacts associated with room closure and structural abandonment can be seen on a larger scale between El Paso Phase Pueblos located on either side of the San Andres/Organ Mountain divide. Cottonwood Spring Pueblos' location, straddling a cultural boundary between the Jornada and Mimbres branches of the Mogollon, indicates differences within this multi-ethnic aggregated community will be important to understanding population aggregation and social identity during this late Pueblo period across the region.

Corrales-Ulloa, Francisco (Museo Nacional de Costa Rica)**[314]** *Long-Distance Contacts along the Coast of Greater Chiriquí*

The location of the Greater Chiriquí archeological region in southern Central America and the available and valuable resources in it (gold, coastal resources) were favorable for the emergence of a complex society that interacted with long-distance contacts for the acquisition of exotic goods. I highlight several places within Greater Chiriquí that were important for navigating along the Pacific coast and that could have been points of reference for longer distance movement. Among these are: Caño Island, Burica Peninsula, and the islands of the Gulf of Chiriquí. The role of islands as a "port of trade" where exchanges between different ethnic communities were made without entering the main centers of power on the mainland have been considered as a possibility. Likewise, our current data from the two proposed subregions of the Greater Chiriquí (Chiriquí and Diquís) indicates two different preferences regarding the origin of extraregional ceramics: Chiriquí with Gran Coclé in Central Panama and Diquís with Guanacaste in northwestern Costa Rica. While it is true that there is relatively little evidence of long-distance contacts in Greater Chiriquí, the examination of its geographical location and extraregional contacts can contribute to the understanding of those.

[268] *Archaeological GIS Approaches to a Regional Analysis in São Paulo State, Southeastern Brazil*

Being a science that intends to understand the past through artifacts, Archaeology tends to make inferences about human behavior assessing historical events with reference with time and space. Considering that the results of archaeological studies are rich in spatial information, the use of Geographic Information Systems (GIS) seems to be an excellent combination between technology and archaeological data. This presentation seeks to explore some of the resources of GIS applied in archaeological sites located in São Paulo State, in southeastern Brazil, as a powerful analytical tool for understanding the occupation of groups in a potentially promising area, but still little considered in Brazilian Archeology. Fully aware that these constructs are purely theoretical, those tests of empirically data can be used to verify if the patterns in the simulation match the patterns in the data, and that can be helpful to support explanatory hypotheses.

[30] *Ancient Maya Mobility: Hinterlands Sacbe Systems*

This paper will discuss investigations of two sacbeob in the hinterlands in northwestern Belize. These features connect ancient Maya household groups, aguadas, quarries, terraces and ritual features. The study of ancient causeway systems is crucial to the understanding of mobility, sociopolitical, and economic networks in the hinterlands. The dataset was analyzed in ArcMap 10.5.1 to evaluate the placement of these cultural features on the landscape. The use of LiDAR and photogrammetry technology allowed for classification and post-processing of data that revealed a massively modified landscape and enhanced our research capabilities. The analysis included spatial relationship between nearby settlements, hydrological innovations, landscape modifications, and energetic breakdown of construction methodology and labor estimates.

[216] *Modeling Diachronic Paleoindian Landscape Use in Indiana: A Spatial Analysis of State-Level Data*

In this paper, we expand upon our analysis of all recorded early Paleoindian sites in Indiana by incorporating spatial data from middle and late Paleoindian sites. Our analysis of both site locations and least cost paths between tool stone resources and sites with identified raw material types indicates that temporal differences exist for where Paleoindians placed themselves on the landscape. Due to changes in professional reporting standards through time, our site data often require individual evaluation to determine landform location, artifact typologies, and raw material types. Where applicable, we make use of gray literature to provide additional data and site context or to check that the provided data are correct. Our findings are part of a long-term project to construct a Geographic Information Systems database of Paleoindian sites that can be queried for data relevant to a better understanding of the Paleoindian presence in Indiana. We hope that the project can collaborate with similar projects in surrounding states.

[129] *Getting the Job Done: Case Resolution in the Field, from Investigation through Recovery, at Site GM-05585, a Low-Angle B-17G Crash Site in Sachsen Anhalt, Germany*

The DPAA case resolution process involves a number of important steps that occur before a recovery team is sent into the field to excavate an incident site, and typically includes a combination of historic research, witness interviews, field investigations, and archaeological survey. The goal of this process is to identify and formally evaluate each potential recovery target, which serves to establish well-defined excavation objectives. In addition, the specific attributes of each site are continually revealed in more detail with every successive field effort.

The sustained investigation and recovery work conducted at Site GM-05585, associated with the loss of a B-17G bomber over Germany in November of 1944, provides an excellent example of this iterative process, during which the site was transformed from a simple dot on a map to a well-defined archaeological entity, detailed through the integration of high-resolution field data and historic aerial imagery. Following field investigation work conducted in

2010 and 2011, which led to the initial identification of the low-angle site, Site GM-05585 was successfully excavated and closed during the course of three recovery missions conducted during 2015 and 2016. These efforts led to the subsequent identification of several missing U.S. service members.

Cossin, Zev, Ariel Charro (Universidad San Francisco de Quito), Jane Poss (Columbia University) and Siobhan Boyd (Gardiner Museum)

[350] *Working toward Collective Benefit? Reflections on Community Based Participatory Research in Cangahua, Ecuador*

The Pambamarca Archaeological Project (PAP) has conducted research in the Cayambe region of Ecuador for nearly two decades. In that time, PAP has trained scores of national and international students and actively incorporated local community stakeholders in efforts like the development of small-scale heritage tourism projects. It became clear that these efforts could be re-framed to accomplish the goals of a “community based participatory research” (CBPR) program that conducts research “with, by and for” local communities. In 2018 we laid the groundwork for a CBPR program in Cangahua to more effectively work toward those goals. From the perspectives of both project and community members, this paper reflects on the steps taken and considers the messy process that often results when attempting to push CBPR from theory into practice. In particular, we discuss the opportunities of community-driven research plans, building capacity through archaeological training of community partners, and the rich exchanges between international field school students and local organizations. Other questions remain: How does one balance the diverse perspectives, constituencies and social circumstances of local communities that are never monolithic? How do archaeologists balance methodological rigor with multivocal knowledge sets and community-driven agendas toward a practice that provides collective benefit?

Costa, Angelica (University of Central Florida), Lane Fargher (Centro de Investigación y de Estudios Avanzados de) and Aurelio López Corral (Instituto Nacional de Antropología e Historia)

[68] *Embodying Collective Identity: Analysis of Late Postclassic Facial Ornamentation Practices in Tlaxcallan, Mexico*

In pre-Hispanic central Mexico, communities practiced various forms of embodying social identity through the use of facial adornments. Ornaments were placed in the ears, nose, and lips to materialize aspects of both self and collective identity, such as age, gender, status, kinship, and ethnicity. Recent research at the Late Postclassic (AD 1420-1521) city of Tlaxcallan has provided insight into how facial ornamentation varied within the central highlands of Mexico. Typological analysis of ornaments and figurines recovered at Tlaxcallan and comparative examinations between Tlaxcalteca and Aztec historical documents has provided evidence to support varying embodiment practices between these groups. Despite their shared Nahua identity and close proximity, the Tlaxcalteca and the Aztecs chose to emphasize significantly different aspects of identity within their own social hierarchies. The persistent conflict and varying political organization between these communities is reflected in their embodiment practices. Thus, these objects have the potential to reveal how larger sociopolitical interactions can affect local collective identities. Additionally, it highlights specific concepts of inclusivity and exclusivity within these two societies. Through this comparative analysis, we hope to provide a better understanding of how the Tlaxcalteca and the Aztecs chose to distinguish themselves within this relatively small region in central Mexico.

[271] *Wicked Problems in Archaeology: Applying a Social Impact Framework and Entrepreneurship Mindset to Cultural Heritage Management*

Archaeologists operate within a conflicted position in the commercial business of cultural heritage management. As collaborators with industry and as players within a state bureaucracy, they are beholden to regulations and complicit in the destruction of sites. While archaeologists aim to produce practical benefits for society in general, or at the very least, minimize the impacts on heritage and communities, commercial archaeologists must recognize their position in the neoliberal framework and leverage their role to produce economic outcomes for Indigenous communities involved in commercial archaeological engagements. Archaeologists must seek alternatives to the wicked problems of inequality and disadvantage in Indigenous communities. Applying a social impact framework and an entrepreneurial mindset to cultural heritage management can produce social outcomes and systemic change, rather than focus on single-issue activities and projects. By advocating for collaborative, holistic and adaptive problem solving approaches which emphasize empathy and a more compassionate form of capitalism, archaeologists can pursue innovative solutions which close the gap on social inequality while achieving the commercial outcomes expected of them.

Costin, Cathy (California State University, Northridge)

[363] *Post-Fire Incising as a Means of Controlling Esoteric Knowledge in the Andean Formative*

Post-fire incision as method of surface “decoration” is extremely rare in the Central Andean region. This technique was used almost exclusively by the Cupisnique culture on the Peruvian North Coast during the Formative Period, primarily on ritual pottery. The technique was much more commonly used further north, in what is today Ecuador, where it was used on a wide variety of ceramic object types over many hundreds of years. Several Ecuadorian ritual materials and practices appear to have been adopted by the Cupisnique at the same time we begin to see other

evidence for incipient social stratification on the Peruvian North Coast. I argue that the adoption of post-fire incision – almost always overlooked by Cupisnique scholars, who focus their attention on the iconographic and formal aspects of ritual pottery – actually provides a fundamental clue about sociopolitical dynamics during the development of complex societies in the Peruvian Formative. In this paper, I show how shallow post-fire incising could have been used by Cupisnique ritual specialists to control access to esoteric knowledge related to community well-being and claims to power, privileging a small group of incipient elites in this enigmatic society.

Coupal, Isabelle (University of Montreal)

[359] *Modelling the Skeleton of Future Bioarchaeological Research in Georgia*

In recent years, the Republic of Georgia has fostered a growing interest for archaeological research in the Southern Caucasus region. This trend has been stimulated both by a strong local contingent of archaeologists, of two generations and of two different systems, and the increasing participation of foreign scientists. This active academic scenario is witness to a welcoming atmosphere to researchers since the fall of the Soviet Union. While collaborative international research is successful in Georgia, allowing for an unprecedented level of cutting-edge archaeological research, its current role as a meeting place for Western- and Soviet-educated scholars in the various disciplines for skeletal analysis, hinders research. In this presentation, I will outline the main research themes and methodologies specific to each intellectual tradition which has tackled skeletal and mortuary analysis in an attempt to understand how this divide was created. I will then present an assessment of the current state in the fields of bioarchaeology and physical anthropology, with examples from recent excavations. I wish to offer avenues for more thorough collaborations using decolonizing methodologies.

Coutros, Peter (University of Puget Sound)

[82] *Bone Tool Technology in West Africa: Contributions from the Diallowali Site System, Senegal*

Worked bone has a long history across the African continent, occurring as early as the Middle Stone Age in eastern and southern Africa. However, since the beginning of the Holocene, barbed and un-barbed points – associated with the so-called 'African Aqualithic' peaking at 9,000 BP – have likewise been recovered from sites within Sahelian and Saharan zones of West Africa. Despite the ubiquity of bone implements throughout the region, the majority of documented examples occur in the central Sahara, Mauritania, and northern Mali. This has led, unfairly, to their designation as a Saharan phenomenon. Indeed, Senegal has produced an impressive, although somewhat limited, assemblage of worked bone, most notably from the coastal shell midden of Khant. However, recent excavations at the Senegalese site of Diallowali (c. 3000 BP), have yielded an extensive assemblage of worked bone implements (n=159). In this paper, we present the analysis of the Diallowali assemblage, placing it within the broader context of trade, migration, technological developments, and shifting environmental conditions across the region.

[117] *Some Like It Hot: Prehistoric Heat Treatment of Petrified Wood*

Prehistoric petrified wood artifacts found at the Rainbow Forest Site at Petrified Forest National Park often exhibit heat treatment. Prehistoric heat treatment of petrified wood has shown significant changes in color, texture, and workability. This experimental archaeology project focused on heating petrified wood flakes in a ceramic kiln at different temperatures to determine the effects of heat treatment on color, texture, and workability. Ultimately, this project aimed to determine a temperature range and time range to heat treat petrified wood that would allow the workability to improve.

[355] *Geometric Morphometric Perspectives on Vessel Shape Hybridity in Inka-Chimú Ceramics*

The Inka conquest of the Chimú Empire on what is today the north coast of Peru brought a region with well-established economic and political practices under the rule of a highland polity that developed under distinct social and ecological conditions. Many aspects of Inka rule in Chimú territory were adapted to the existing imperial order, and this paper discusses the aesthetic articulation of Inka ceramic shapes and decoration in pottery that was produced in existing north coast workshops. Chimú-Inka pottery has long been understood as a hybrid style that combines north coast potting traditions with Inka stylistic features, although the degree of continuity and change has never been formally described. Using data from high-resolution 3D scans of Chimú, Inka, and Chimú-Inka vessels in publicly-held museum collections, we present data from a geometric morphometric analysis to consider how selected vessel categories evolved following the Inka conquest of the north coast. Quantitative evidence of continuity and change in production practices, aesthetic features, and vessel shapes reveal new perspectives on the impact of Inka rule on ceramic production, as well as the social practices in which decorated pottery communicated status and identity.

[264] *Exploring Gender, Trade, and Heirloom Micaceous Ceramics at Los Ojitos, New Mexico*

Hispanic homesteaders brought Sangre de Cristo Micaceous ollas to their new homes at Los Ojitos (LA 98907), a village site occupied between 1865 and 1950 on the Pecos River in east-central New Mexico. A subset of these ceramics resembled previously identified historic-period micaceous types from northern New Mexico. However, many sherds deviated significantly from established type descriptions, reflecting local or regional trade and manufacture. The relatively low frequencies of micaceous ceramics recovered in excavations at Los Ojitos, including sherds painted with store-bought tempera paint or found in stratigraphic context with 20th-century artifacts, suggest these ceramics became harder to replace in the late 19th century on the periphery of the Hispanic New Mexican homeland. As curated heirlooms, micaceous ceramics may have taken on new meanings for women in the Hispanic New Mexican diaspora as reminders of intergenerational relationships and cultural identity, while performing as tools crucial to the maintenance of familiar domestic practices.

[36] *Traditions and Community: Hornos and Communal Feasting among the Hohokam*

Earth ovens (hornos) have been documented at many sites across the Hohokam region of south-central Arizona. These features were commonly used to cook large amounts of food at public gatherings. They were part of a long-standing tradition of communal feasting that served, among other things, to promote social solidarity. Excavations by Northland Research at two Hohokam village sites in the Phoenix Basin contribute to a fuller understanding of the role of communal feasting in the emergence of the regional ballcourt system. We examine horno usage at these two sites just before the appearance of ballcourts, ca. A.D. 700-800, and just after, ca. A.D. 800-900. Similarities between Hohokam communal feasting and the living tradition of communal feasting among members of the Salt River Pima-Maricopa Indian Community are also discussed.

[322] *Paleoindian Intercept Hunting in the Bethel Locality, Western Oklahoma*

The narrow divide between the Canadian and Washita rivers in west central Oklahoma is the location of multiple historic transportation routes. The Rock Island Railroad, U.S. Highway 66 and Interstate Highway 40 all parallel the route of the early historic California Road. These routes followed a game trail which was a focus for prehistoric hunting. Prominent buttes provide overlooks while spring-fed and wooded canyons offered protected camping and hunting opportunities. This combination of landscape features along the narrow Bethel divide made the locality ideal for pedestrian bison hunting. We argue that this locality was used intensively from early prehistory through the contact period for intercept bison hunting. Here we summarize the Paleoindian evidence representing a wide variety of point types and including more than 500 specimens. Point types and lithic materials in the Bethel locality are documented as are typological classification challenges for this sample.

[310] *Using Zooarchaeology to Study Urban Origins in Antwerp, Belgium: Evidence from the Burcht and Gorterstraat Sites*

The development of urbanism in northwestern Europe has been of interest to medieval archaeologists and historians since the days of Henry Pirenne, and these questions have been central to anthropological archaeology throughout the 20th and 21st centuries. One of the critical features of early cities is that they are home to craft specialists and others who are not primarily engaged in farming, fishing, and other methods of food procurement. Recent archaeological research in the city of Antwerp has shed light on the earliest periods of urbanism within the city. Animal bone remains from the 8th-to-10th-century Burcht sites and the 10th-century Gorterstraat site can be used to identify the roles of animal husbandry, hunting, and fishing in the subsistence economy early medieval Antwerp. Our data suggest that hunting of animals such as red deer, roe deer, beaver and wild boar played a greater role in the earlier Burcht assemblages, and that animal husbandry and fishing played a larger role in the somewhat later Gorterstraat economy.

[207] *Alm Shelter: A Preliminary Report on a Deeply Stratified Rockshelter in the Bighorn Mountains of Wyoming*

Alm rockshelter, located at the mouth of Paintrock Canyon in the Bighorn Mountains of Wyoming, contains a well-stratified cultural sequence spanning roughly 11,000 years (Late Paleoindian through the Late Prehistoric). Preliminary analyses demonstrate that the site was occupied and used variably over this time, particularly in periods of population growth and decline that are associated with periods of increasing and decreasing aridity. Here we present a preliminary report on the excavations, completed in summer, 2018. The focus of the research is on how use of the site changed over time in relation to changes in climate and regional population density. Increased aridity in the Early Holocene appears to have resulted in increased site use while decreased aridity resulted in a decline in activity. The current research presents the preliminary analysis of lithic materials recovered from 2014-2018 excavations.

[263] *The Cultural Importance of Obsidian in the Upper Gila Area*

Obsidian is a common flaked stone raw material in archaeological sites in the Upper Gila area of southwest New Mexico. Recent excavations at the Cliff phase Salado (AD 1300-1450+) site of Gila River Farm recovered numerous examples of flaked stone tools, projectile points, and debitage, including many obsidian examples. Previous studies have examined reasons obsidian was favored for tool making, including its relatively easy workability and the proximity of an important obsidian source area (Mule Creek) to Upper Gila Cliff phase villages. This project goes beyond these important economic considerations to more deeply examine the cultural contexts influencing why people choose to use obsidian. Drawing on ethnographic materials, historical records, and unrestricted versions of the oral histories of modern pueblo groups and other indigenous people of the region (including Apachean people) reveals a clearer picture of why obsidian was and is used in the Southwest. This approach allows us to gain a more nuanced understanding of the importance of obsidian, including developing the idea of "sacred sites" or traditional cultural properties related to raw material gathering and former ancestral ranges.

Cramb, Justin (University of Georgia)

[354] *Coral Islands, High Islands: A Case of Continued Contact and Cultural Divergence in East Polynesia*

Polynesian atolls are often viewed as outlying provinces or "outer Islands" as compared to larger high islands. These often remote and diminutive coral islands are, and were, home to relatively small populations. Many coral island groups trace ancestry to, and had sustained contact with, high islands. These past connections and modern sociopolitical ties make it easy to view coral islands as off shoots of larger polities, and to project the social, political, and economic forms found on high islands onto them. Manihiki and Rakahanga, in the northern Cook Islands, are coral atolls with modern sociopolitical, linguistic, ancestral, and oral-historic ties to the high island of Rarotonga in the southern Cook Islands. However, recent excavations and zooarchaeological analysis on Manihiki and Rakahanga support and further contact-era ethnohistoric accounts that suggest the in-situ development of novel sociopolitical structures, as well as innovative resource management strategies. This is manifest in the importation, differential management, and extirpation of multiple domestic taxa, as well as the cycling habitation, subsistence, and political forms that developed as the coral islanders culturally diverged from, yet appear to have remained in contact with, high island groups.

Crandall, James (University of Florida) and Anna Guengerich (Vanderbilt University)**[98]** *Spatial Temporalities and the Ritualized Remodeling of Chachapoya Architectural Space*

How social space is produced in archaeological contexts is often studied as the result of the gradual accumulation of social practices. However, as a complement to these generative processes, sudden events also have radical impacts on how space is signified, expressed, and experienced. This paper addresses recent research in the Chachapoyas region of the eastern Andes. We discuss the widespread practice of periodic remodeling within Chachapoya architectural spaces as a part of socially significant ritualized events. These events include the deposition of human remains, offerings, and the termination of floor use within architecture often identified as households, in some cases possibly with the aim of de-animating powerful household objects. These practices are discussed via recent evidence from the sites of Bovéda, La Joya, and Purun Llacta de Soloco, three of the largest Chachapoya communities. The changing nature of social space at these sites is suggestive that the eventful remodeling within Chachapoya architecture was often attuned to particular cultural temporalities and notions of value.

Crater Gershtein, Kathryn, Reuven Yeshurun (Zinman Institute, University of Haifa) and Yossi Zaidner (Zinman Institute, University of Haifa)**[402]** *Zooarchaeology and Taphonomy of Unit III in the Middle Paleolithic Site of Neshar Ramla*

The Levantine Middle Paleolithic period plays a crucial role in human origins research, encompassing vast cognitive and technological developments. Faunal remains are an important source of knowledge regarding hunting patterns, reflecting both human behavior and subsistence strategies. This paper addresses questions of hunting, transport, butchery patterns and use of space as they occurred at the Middle Paleolithic open-air site of Neshar Ramla in central Israel. The site consists of a well preserved 8 m thick sequence yielding rich lithic and faunal assemblages, combustion features, manuports, and ochre. Detailed taphonomic and zooarchaeological analyses of a sample from Unit III (OSL dated ~130ka years ago) revealed an anthropogenic accumulation dominated by ungulate and chelonian taxa, associated with various combustion and other features. Prey species include mostly spur-thighed tortoise (*Testudo graeca*) and aurochs (*Bos primigenius*). Other species represented include wild equids (*Equus* sp.), and mountain gazelle (*Gazella gazella*), Mesopotamian fallow deer (*Dama mesopotamica*), wild boar (*Sus scrofa*). The new data from Neshar Ramla Unit III conforms with taxonomic patterns of Middle Paleolithic open-air sites, where large ungulates dominate. However, bone material is better preserved and more abundant than what has been at observed at other open air sites in the Levant.

Crawford, Dawn (Southern Methodist University), Brigitte Kovacevich (University of Central Florida) and Zachary Hruby (Northern Kentucky University)**[255]** *Domestic Contexts for Chipped Stone Eccentrics in the Maya World*

While most ceremonial lithic items, or eccentrics, are found in elite burial and ritual caches, others are found in more mundane contexts, such as fill and household middens. We examine artifacts recovered from households at the sites of Cancuen, Piedras Negras, Ucanal, Tikal, among others, and explore the possible meanings of chipped stone eccentrics outside of civic-ceremonial contexts. Elaborately flaked stone implements found in domestic spaces are often formally similar to eccentrics found in public offerings, but they also differ in some key ways. A detailed technological and iconographic analysis may determine whether those found in residences can be classified as eccentrics, or perhaps should be interpreted differently depending on form and context. Diverse household contexts across the Maya region suggest that there may not be a single use or meaning of eccentric flints in domestic spaces.

Crawford, Gary (University of Toronto) and John Whitman (Cornell University)**[74]** *New Research Directions in the Archaeology and Linguistic History of the Hokkaido Ainu*

Research in Hokkaido since the 1980s has amassed a body of data related to ancestral Ainu material culture, settlement, chronology, and subsistence. Palaeoethnobotanical data have been instrumental in conceptualizing the Satsumon and Ainu as populations with a complex history that included dry-field (rain-fed) agriculture rather than hunting-gathering alone or the diverse mix of wet-rice and dry-field production elsewhere in Japan. This complex history, partially revealed by the history of agriculture and the dispersion of crops to and within NE Japan, involved long term, continued involvement and interactions with the rest of Japan. Furthermore, significant discontinuity marks the transition from Epi-Jomon to Satsumon so the Ainu are no longer considered an isolate of remnant Jomon (from a cultural perspective) in the Northeast. This raises issues pertaining to indigeneity, language, identity, historical ecology, and agricultural history among others. We examine the congruence of the formation of Ainu culture from the perspective of recent linguistic research with archaeological developments. Dialect comparative research indicates that the Ainu language family is relatively young, perhaps no more than 1K years. Rather than simply a surviving Jomon language, Ainu has features of a contact language or lingua franca, consistent with the non-Jomon origins of Ainu culture.

Creager, Brooke (University of Minnesota)**[50]** *The Key to It All: Anglo-Saxon Female Identity*

Keys are made to open locks: they are practical and necessary, so why were they deposited in Anglo-Saxon female

burials? Anglo-Saxon female identity has been tied to domesticity and family, which has been interpreted based on grave goods. Recent reevaluations of 10th c AD Scandinavian culture has revealed a more complicated gender role for women than previously imagined. The females of the early Anglo-Saxon period should be similarly reassessed. Female adult burials are found with keys deposited that pose a mystery as to their function and purpose. The interpretation generally consists of a symbolic association with the home and their role within it, thus explaining why keys are found only within adult female burials as keepers of the home and caretakers. The simple explanation of keys should be reassessed in light of their common association with amulet bundles and richer burials. This paper will challenge this traditional view with a new perspective tying the key burial phenomenon to the larger changes in female identity over two centuries.

[388] *High-Density Urban Living at Middle Bronze Age Kurd Qaburstan, Iraq*

In Upper Mesopotamia the Middle Bronze Age (2000 – 1600 B.C.E.) marked the regrowth of cities following the decline or collapse of cities at the end of the Early Bronze Age. Researchers question the degree of continuity in urban space across these periods and some have suggested that Middle Bronze Age cities were “hollow,” containing relatively small built-up areas alongside large areas of unbuilt space. In this model, powerful rulers with great aspirations built city walls around vast areas but urban growth failed to fill the space. The present study tested this model with a magnetometer survey at Middle Bronze Age Kurd Qaburstan near Erbil, Iraq. The results reveal a high density built environment with a semi-structured street plan, systematic fortifications, and a range of public and private, small-scale and monumental structures scattered throughout the city. These spatial characteristics echo Early Bronze Age urban planning, and suggest that there was socio-political, economic, and demographic continuity across time in the Bronze Age. This poster offers a tour of the Kurd Qaburstan magnetometry data that illustrates urban form, planning principles, and selected structures.

Creel, Andrea (University of California, Berkeley)

[399] *Ritual and Community on the Edge of Empire: Roadside Traditions in the Sinai*

Roadside ritual in marginal landscapes is rarely considered in archaeological literature. Yet, roadside ritual played a fundamental role in facilitating travel and constituting communities in the past. The rise of imperial hegemony bounded and funneled flows of people and material in new ways, which intensified interaction at roadside ritual sites. This talk explores the 8th century BCE site of Kuntillet 'Ajrud in the northeastern Sinai as a case study in understanding the complexities of roadside ritual in marginal landscapes under the shadow of encroaching empire. I model Kuntillet 'Ajrud as a ritual node in a potent meshwork of pilgrimage, liminality, and the suprahuman, specific to its local context in an arid and marginal landscape. My analysis traces how visibility, movement, and accessibility generated an atmosphere of ritual power and constituted community. This discussion includes the site's topography, architectural allusions to fortresses and city gates, and images and inscriptions that evoke notions of divinity, royalty, authority, music, prayer, dancing, fertility, water, life, birth, masculinity, femininity, tradition, and protection. Rather than treat rural roadside ritual as peripheral to constitutions of identity, community, and empire, I demonstrate that this phenomenon generated and sustained innovation and connectivity for local and non-local communities

[175] *An R Package for a Generative-Inference Based Cultural Evolutionary Analysis*

Since the seminal works by Neiman (1995) and Shennan & Wilkinson (2001), evolutionary archaeologists and anthropologists have been trying to infer social learning strategies by analysing the temporal frequency of different cultural variants in a population. These early applications directly employed methods developed in population genetics to test whether observed frequency distributions deviate from those expected under neutral evolution, regarded as functionally equivalent to unbiased learning. Instances of significant deviations were then regarded as evidence of alternative modes of social learning, most commonly conformist or anti-conformist biases. Recent research, however, highlighted the problem of equifinality in such cultural evolutionary studies, i.e. situations where various learning processes can result in very similar population-level characteristics. This R package implements a generative inference framework aimed at analysing which of the social learning strategies considered are consistent with the available data and which are not.

[89] *Na Ko'i O Wai'ahukini: Adze Size and Sources of Toolstone at Wai'ahukini Rockshelter*

The Wai'ahukini Rockshelter (H8/50-Ha-B21-006), located near South Point on the Island of Hawai'i, was initially

investigated by K. P. Emory, W. Bonk, and Y. Sinoto in the 1950s. The collection has since been curated at the Bernice Pauahi Bishop Museum in Honolulu, HI. Excavation recovered as many as 18 complete ko'i, or adzes, and many fragments. Three of the complete ko'i are small (<5 cm long), possibly intended for finish carving, or ko'i kiconi, as opposed to the larger adzes used to fell trees, till fields, or hollow out canoes. The ko'i and other stone tools and debris have been studied for their geochemical source by Lunblad et al. (2014), which determined nine sources of toolstone for the site. This research takes a closer look at the geochemical test results to determine if there are differing source localities for the small ko'i versus the large ko'i. This research is part of a collaborative project, the Kamehameha Schools Archaeological Collections Curation Program, between the Bishop Museum and Kamehameha Schools that involves interns from Hawaii curating and researching existing collections from Kamehameha Schools lands.

Crider, Destiny (Luther College)

[56] *Advances in the Study Archaeological Ceramics of the Epiclassic-Early Postclassic Basin of Mexico*

The Basin of Mexico survey and related archaeological projects in the region provided not only a ceramic chronology, but also a legacy of archaeological materials available for continued research. Two key goals of the Basin of Mexico survey focused on relations among settlement clusters and the character of human relations with the natural environment. With an emphasis on Epiclassic-Early Postclassic periods (Second Intermediate Phases One and Two), I evaluate some key propositions reported by Sanders, Parsons, and Santley (1979) and provide discussion from my two decades of utilizing ceramic materials from Basin survey and other related projects. I provide discussion on how attribute-based study of archaeological ceramics, when combined with spatial and temporal associations, can provide a robust approach to address economic, political, and social relations among communities. Compositional studies have been developed and new methods and approaches continue to refine interpretation of production and exchange, however the complexity of Basin geological patterns require continual assessment and innovation in using sourcing data. Ceramics can inform on a range of issues from population migration, changes in cuisine, innovation and emulation in technology and crafting, and local access to clay and mineral resources on the landscape.

Crisà, Antonino (University of Warwick, Department of Classics and Ancient History)

[321] *Erotic Tokens for Sex and 'Special' Services: New Spintriae from Archaeological Contexts*

The project "Token Communities in the Ancient Mediterranean", held at the University of Warwick, is currently examining token production on a wide scale, assessing new finds from European museums. Roman "tesserae" (tokens) may be defined as monetiform objects produced and used instead of money in specific civic contexts. As a Research Fellow in the on-going project, I am now analyzing token circulation in Roman Sicily and exploring collections in local museums. The scope of my paper is to present the production and spread of a specific class of materials, the so-called "spintriae," or erotic tokens. Each token shows a Latin numeral on the obverse and a sex scene on the reverse, similar to those shown on Pompeii's brothels paintings. Thus, scholars interpret spintriae as tickets for admission to brothels and to obtain specific sex services. First, I will examine a record of finds from European collections, which will allow us to identify specific series and dies of spintriae. Then, I will assess some new archaeological finds from Italy and Sicily, which are extremely rare discoveries. Finally, such tokens represent a vital insight into the daily-life of the Romans, offering many data on numismatics, history, the arts, and social studies.

Crist, Walter (American Museum of Natural History)

[301] *Social Approaches to Board Games in Mediterranean Archaeology*

Board games in the archaeological record have only recently begun to be examined with reference to social aspects of play. When approached from an anthropologically informed perspective, board games can provide information on social change and human interaction that is otherwise not available to archaeologists. Because games function as a type of social lubricant, they help people to bridge social distance in order to build relationships that are necessary for economic, social, and political transactions. This has implications for the study of social complexity, intercultural interaction, long distance trade, and social networks that are only beginning to be understood.

The ancient Mediterranean world and its adjacent regions have produced some of the richest evidence for ancient games, but they are only beginning to be explored in this light. This paper serves as a summary of some of the work that has been done up to now and gives a social framework to the study of ancient games, ranging from Algeria to Azerbaijan and from the Bronze Age to the Byzantine Empire.

Critchley, Zachary (Binghamton University)

[250] *A Decorated Bone Pendant from Patipampa*

The 2018 Patipampa excavations at Huari resulted in the discovery of a wealth of remarkable artifacts with potentially far-reaching implications for our understanding of Middle Horizon iconography, including a small bone pendant from a possible gallery space. This bone pendant was noted for a carving representing the Rayed Head, an important icon which was one of the three principal figures of the Southern Andean Iconographic Series, or SAIS. This depiction has a number of notable characteristics, including stylistic variations in the rays and surface coloration made from copper and cinnabar. This paper will be an element-by-element iconographic deep dive into this depiction, tying this piece of non-ceramic art into the greater SAIS landscape and determining what insights this can provide into Patipampa's place in the greater Huari sphere of influence and beyond, including stylistic influences as well as material procurement.

Crock, John (University of Vermont)**[33]** *Maritime to the Max: The Keys to Success for Small Island Populations in the Caribbean*

The land-sea dichotomy has structured many historic debates surrounding coastal populations in the pre-Columbian Caribbean. Settlement, subsistence, exchange and cultural affiliation have all been measured on a terrestrial versus marine continuum which often undervalues the primacy of the sea in supporting and motivating the colonization, migration and expansion of island populations. Particularly for small island populations in the Lesser Antilles, the productivity of local marine environments is argued to have been essential for attracting and sustaining coastal populations and a highly specialized maritime adaptation is argued to have mitigated risks, including those associated with limited terrestrial resources.

Croes, Dale (Washington State University) and Ed Carriere (Suquamish Elder and Master Basketmaker)**[95]** *Generationally-Linked Archaeology: Northwest Coast of North America Example*

Ed Carriere and I have spent the last four years doing what is often called experimental archaeology, replicating 2,000 year old baskets from the Biderbost wet/waterlogged archaeological site east of Seattle, Washington and reporting this in our new book: *Re-awakening Ancient Salish Sea Basketry*. After pondering what and why we were doing this, Ed as a cultural expert and myself as an archaeological scientist, decided our approach was more than experimental archaeology, and beyond ethnoarchaeology and the direct historical approach. Through our lives we approached the artifacts of basketry from different perspectives and temporal directions. I focused from deep-time forward, statistically tracing ancient traditions over the course of more than 3,000 years, while Ed worked from the present backwards, initially from what he learned from relatives and museum examples and now through archaeological examples from over 200 generations of his ancestors/grandparents. After viewing ancient baskets in museums, Ed created what he calls his "Archaeology" baskets, with rows/"layers" of weaves starting with those from 4,500 to 3,000, to 2,000 to 1,000 years ago. Our work tests my hypotheses explaining on-going cultural continuity in three regions of the Pacific Northwest, and especially in Ed's inner Salish Sea region. We will show replicas.

Crosby, Hunter**[180]** *From Monument to Park: Early Infrastructure and Tourism at Petrified Forest National Park*

On December 6th, 1906, Petrified Forest National Monument was created under the Antiquities Act, based on President Theodore Roosevelt's recommendation that, "...the mineralized remains of Mesozoic forests...are of the greatest scientific interest and value and...that the public good would be promoted by reserving these deposits of fossilized wood as a National monument with as much land as may be necessary for the proper protection thereof." Petrified Forest would hold National Monument status until December 9th, 1962, when it would be established as a National Park. I will attempt to identify building foundations and scatters associated with early Monument and Park infrastructure through geospatial analysis, survey and historical records. I will then assign a date range to each location, associating each with the National Monument period, the National Park period, or both. Finally, geospatially situating each location within current and past Park and Monument boundaries as well as in relation to historic roads, railways and towns will allow for an analysis of the ways in which Monument and Park personnel managed the lands they were responsible for. Additionally, this analysis will shed light on how early visitors experienced the phenomenon of tourism in the Painted Desert.

Cross, Austin (Department of Anthropology, Florida State University)**[171]** *At What Expense? An Expended Utility Study of Bolen Projectile Points in Northern Florida*

Schott and Ballenger's (2007) work analyzing the expended utility of Dalton bifaces looked at the difference between the potential utility of an artifact and its residual utility to understand the use-wear and resharpening processes that shaped the artifact, and applied their findings to reconstructing the population-level use of the artifacts. This research applies these same methodologies to a sample of Bolen projectile points from northern Florida. I utilize various metrics of lithic analysis to study the points from a region of northern Florida where artifacts with similar temporal contexts are abundant, but actual archaeological contexts are oftentimes unable to be discerned. The goal of this study is to apply geometric morphometrics to these Late Paleoindian and Early Archaic projectile points, in order to understand larger-scale cultural behavior, potentially at the regional level, if not at least across multiple sites within the study area. Methods of analysis such as expended utility, principal components analysis (PCA), multivariate analysis of variance (MANOVA), and other similar ways of analyzing stone tool assemblages through geometric morphometrics are all applied to the Bolen assemblage used in this study.

Cross, Kathryn (Southern Methodist University)**[9]** *The Archaeology of Late-19th and Early-20th Century Freedman's Towns in Dallas, Texas*

In Texas, emancipation of slaves was formally announced in Galveston on June 19, 1865. In the decades that followed "Juneteenth," freed men and women established hundreds of communities across the state in search of land, loved ones, opportunity, and freedom. Such rural settlements have been the focus of both historical and archaeological research. Yet some families chose to settle the margins of cities. Dallas was once home to several Freedman's Towns. The most famous, established ca. 1869, is known only as Freedman's Town/North Dallas. This community, located in what is now the Uptown district, was largely destroyed by urban redevelopment in the 1970s and 1980s. Much like this community, the physical reminders and collective memory of many other Dallas Freedman's Towns are rendered invisible by city growth, gentrification, and displacement. For stakeholders, a multi-dimensional approach that includes archaeology, archival research, and oral history is key to understanding the lives and experiences of Freedman's Town inhabitants and their descendants, as well as the recent history of African

American groups in Dallas.

[161] *Rice Cultivation and the Craft of the State*

19th century oral histories from the highlands of Madagascar traced a history of sovereignty and governance through a narrative of major landscape transformation. The construction of dikes, canals and rice fields around the capital city was figured as part of the work of building the kingdom. This was an expansive and expanding craftwork that in remaking the landscape also remade relationships between its inhabitants, human and nonhuman alike. In this presentation I reflect on how this narrative sits with other formulations that have explored the development of sociopolitical complexity in relation to the construction of large irrigation works. How might attending to the craft of rice agriculture open alternate avenues for thinking through these complex relationships?

Crowley, Erin (University of Minnesota)

[266] *A Model for Mobility in the Irish Iron Age*

The Irish Iron Age (~700 BC – AD 500) has been a point of consternation for archaeologists, with large ceremonial centers but scanty settlement evidence. While, during this period, more densely populated and proto-urban settlements emerged in Britain and the European Continent, settlements in Ireland diminished in scale. It was initially proposed that the dispersed and ephemeral nature of Irish settlement was the result of demographic and/or climatic decline. New studies, however, suggest that Iron Age settlement was characterized by nomadic pastoralism rather than by collapse. In order to understand how mobility shaped Iron Age archaeology and society, this paper compares ethnographic and archaeological studies of other agropastoral and pastoral-nomadic societies, including those from the Eurasian Steppe and the highland Andes. Where comparisons to contemporary European societies have constrained our understanding of Irish communities, a broader theoretical and geographic perspective may highlight aspects of the archaeological record that have previously been overlooked. This paper, therefore, assesses and compares theoretical definitions of an archaeology of mobility and examines what features we might identify in the Irish landscape that would clarify our understanding of Iron Age settlement and socio-political organization.

[245] *Flying Colors: Local and Non-local Birds in Chaco Canyon Archaeological Sites*

Bird species found in archaeological contexts throughout Chaco Canyon, New Mexico, include a range of local and non-local birds, as well as game and non-game birds. We analyzed the set of 5,350 identified bird bones and compared species composition to the local and regional avifaunas that we expect to have occurred ~1000 years ago in Chaco Canyon and nearby riparian and montane habitats. Species composition differed strikingly from the surrounding avifauna. For example, some abundant local birds are not present in archaeological contexts, and some rare non-local birds are present. These differences persisted after controlling for body size and local abundance, and excluding raptors, fowl, and exotic imported species. We examined the possible importance of feather color and pattern in explaining the non-randomly selected set of birds in the recovered sample. Comparison with ethnographic accounts suggests long-term continuity in species selection, likely related to feather use.

[126] *Burning beyond Color: Analysis of Bone Calcination in Cremated Burials from Bronze Age Hungary*

Trade and movement may have been great factors in the changing societal landscape of Bronze Age Hungary, leading to possible inequalities among the people. Examination of burials can help us get to know the relation between a community and their dead which may reflect social connections within the living community. The Békés 103 site located in southeastern Hungary was in use as a cremation cemetery from the Early Bronze Age through the Late Bronze Age. This study focuses on the bone color analysis of 20 human burials with differing ages and sexes. Munsell Soil Color Charts were used to objectively score the color of the bone fragments which may be able to indicate the temperature of the funeral pyre. Preliminary results suggest that subadults and females had a higher calcination percentage than adults or males, respectively. The amount of calcination amongst groups may indicate differences between mortuary practices in the Békés 103 cemetery which may reflect similar differences within society.

[311] *Survey of a Coalition Site at Pojoaque Pueblo*

The area surrounding the current village of Pojoaque Pueblo has been inhabited in a series of population surges and wanings since at least the Developmental period. During this history the immediate area has been occupied by at least 4 Pueblo villages (including the modern village of Pojoaque Pueblo) all in close proximity to each other. This area has been tied by Tewa tradition to migration processes which coincide with archaeological evidence depicting the interaction of different peoples coming together. During the summer of 2017 I conducted a survey of a Coalition era village located on Pojoaque tribal lands and next to the current village of Pojoaque as part of my thesis project. This village (LA 12271) provides evidence for cultural changes taking place right at a crucial time when possible immigrants from the Four Corners were arriving and interacting with local Rio Grande peoples. The survey conducted demonstrates a Pueblo community in transition.

[236] *The Middle Horizon Occupation of Pan de Azúcar de Nivín, Middle Casma Valley, Peru*

Since 2017, the Proyecto de Investigación Arqueológica Nivín has conducted architectural mapping, limited test excavations, surface collection, and analysis of associated materials from sites located in the middle Casma Valley. The research goals are to clarify the cultural affiliation of the groups that occupied the Nivín region, examine the material expressions of cultural identity in the area, and to focus on the ways local groups articulated their material culture with broader sociopolitical phenomena in the region. Stylistic analysis of pottery fragments combined with the architectural layout indicates the presence of Middle Horizon and early Late Intermediate components at Pan de Azúcar de Nivín. Radiocarbon measurements preliminarily place the occupation of the site between 950 and 1150 CE. In this paper, I will introduce the study region, the work conducted during the last two years, and discuss preliminary results. These results are based on the attribute analysis and distribution of the ceramic fragments collected from the surface and excavations at different architectural features within Pan de Azúcar de Nivín. Finally, this research provides an opportunity to define and compare Pan de Azúcar de Nivín with other neighboring Middle Horizon and Late Intermediate Period groups, in particular the Casma.

[192] *Implications of the Spanish Colonization in the Evolution of Dental Morphological Structure in Maya Populations from Yucatan*

Dental morphology among the Prehispanic Maya population has been characterized by a certain degree of stability. Isolation-by-distance models do not fit well into Mesoamerican populations, due to a relatively homogeneous dental structure. This was true also in the Yucatan peninsula, despite the fact that it did not represent a region of passage of migratory waves. Population movement and dynamics were fairly intense as a consequence of trade and political relationships. However, the entry of foreigners from different parts of the world since the Spanish colonization has slowly led to changes in the morphological structure of the dentition. Here, data on dental morphology and anatomical variants from Prehispanic, colonial and modern populations from the northern Lowlands are presented. Prehispanic collections are representative of local people; the colonial sample shows the presence of non-locals from the Old World. The modern collections are from individuals of Maya origins, so they provide the direct evidence of the effect of admixture on dental morphology. Results indicate a chronologically-related distribution, witnessing the morphological and orthodontic changes that characterize the modern population; yet only few traits seem to clearly discriminate groups, among which stand shovel shape, microdontia and cusp number of mandibular first molars.

[158] *El contexto arqueológico del Complejo Escultórico de La Victoria-Matacanela, Los Tuxtlas, Veracruz*

En 1907 Eduard y Caecilie Selser, visitaron la Finca de Matacanela, ubicada en la porción sureste de la orilla del Lago de Catemaco en Los Tuxtlas, Veracruz. En los terrenos de esta finca, la pareja de alemanes recuperó una serie de monumentos que fueron trasladados a la entrada de la finca, lugar donde Frans Blom los observó y describió en 1925. En el año 2014, basándose en los trabajos de Gursney y en la búsqueda de patrones culturales relacionados a la función de los monumentos, Budar propuso que se trataba de un conjunto escultórico que posiblemente estuvo ubicado al NW del conjunto central investigado por Venter. En 2017, cercano al lugar propuesto, pobladores de la zona realizaron el hallazgo fortuito de un monumento que guarda similitud con los recuperados por Selser y fue creado el proyecto La Victoria-Matacanela para la investigación de su contexto. En esta ponencia se proporciona información acerca de la investigación sistemática del contexto del monumento y se explica cómo se integra y se asocia a los demás elementos del complejo escultórico, recuperando de esta manera información que ayuda a comprender la dinámica política de la región de Los Tuxtlas.

[130] *Scientific Analysis of Metals from the Yinsuodao Site, Yunnan Province*

Up to now, the Yinsuodao site is one of the earliest Bronze Age sites known in Yunnan Province. This work will present the results of metallographic and lead isotope analyses of a number of metals discovered at this site. The metallographic studies suggest that the metal technology at Yinsuodao represents an incipient stage in the evolutionary course of its copper-base industry; the lead isotope studies point to the possibility that the raw materials used to extract copper for bronze making at Yinsuodao may have shared the same source(s) with the metals discovered at Haimenkou, an early Bronze Age site in a nearby region.

[45] *Identifying Archaeological Dacite and Andesite Sources in Southeastern Colorado*

Widely utilized raw stone material common in archaeological sites in southeastern Colorado has been determined to be a combination of dacite and andesite. Samples from two Sopris phase (1000-1200 CE) sites in southeastern Colorado were submitted for pXRF analysis to determine the mineralogical composition of the material.

Archaeological dacite and its sources have been identified in areas west of the study area near the Taos Plateau; however, the material from both Sopris phase sites is from an unidentified source. This poster presents possible sources for the material as well as explores the importance of dacite as a raw stone material source in the region.

[271] *Runa: Indigenous Identity and Heritage in the 21st Century*

The right of indigenous peoples to define their identities and to lobby for national policies that respect their views and lifeways, highlights the need for national curricula in schools and colleges globally to include more inclusive approaches to the teaching of subjects like history and archaeology. In many countries with significant indigenous populations such as Ecuador, indigenous children learn little or nothing about their own cultures or histories in the formal educational system. Results from a recent survey of three indigenous communities in the Ecuadorian Andes demonstrate that less than 10% of respondents had learned anything about their culture, what constituted their ethnicity, or received any understanding of their archaeological and historical background through the formal educational system. The overwhelming majority had learned what it meant to be 'indigenous' - 'Runa' through their family and community traditions. Results from the survey also demonstrate the destructive impacts of global culture, technology, medicine, tourism, and evangelisation campaigns to ancestral indigenous belief systems and traditions, which had, until recently, survived nearly intact over the course of 500 years.

Curry, Anne

[272] *Indicators of Athabaskan Presence in Rio Grande Del Norte National Monument*

Recent archaeological survey conducted within Rio Grande del Norte National Monument indicates the use of the area by Paleoindian, Archaic, and Pueblo groups. However, evidence has been found which may also indicate an Athabaskan presence at Cerro del Aire and Guadalupe Mountain. Though Athabaskan groups began arriving in the area near Taos Pueblo in the late 1400s or early 1500s, their impression on Cerro del Aire has seemed ephemeral at best. This paper will explore the evidence which suggests the presence of Athabaskan or other Plains Nomad groups at Cerro del Aire and the surrounding area. The evidence was collected during recent survey in the area and includes lithic tools and metal tinklers. Remains of tipi rings have also been found at nearby sites that had been recorded previously. Considering the presence of an Athabaskan or other Plains Nomad group extends our understanding of the use of this area in the prehistoric and historic past.

[336] *Notorious and Profitable: Exploring Fresno's China Alley*

Brought to California's Central Valley by the opportunity to mine for gold and the construction of the railroad, Chinese immigrants created a fast-growing and prosperous Chinatown in Fresno. So infamous was this neighborhood in the late 19th and early 20th centuries that journalist and researcher Schyler Rehart stated "[t]he Chinese gambling dens of West Fresno were considered the most notorious and profitable of any in the nation." However, historical and archaeological research conducted on a recently unearthed feature in the commercial center of Fresno's Chinatown reveal a more complicated picture of these Overseas Chinese, who were inexorably tied to the burgeoning agricultural industry of the region.

Curta, Florin

[351] *The (Missing) Archaeology of the Early Medieval Nomads*

The goal of this paper is to take a fresh, critical look at the work done on medieval nomads, especially in Eastern Europe, over the last three decades or so. It will focus on three crucial aspects. First, the relation between pastoralism (a separate problem for medieval archaeology) and nomadism, and the question of how medieval pastoralism can or cannot be used for "tracking" nomads. Second, the archaeology of campsites and nomadic settlements, and the serious problems of identification raised by the archaeology of the steppe lands north of the Black and Caspian Seas. Third, the over-emphasis on burial sites, particularly on the secondary burials in prehistoric mounds has effectively obscured the symbolic meaning of those sites, to the point where nomadism is now associated only with burials of humans and/or horses in "kurgans" in the steppe. Without necessarily offering solutions, the intention is to raise those problems as directions of future research on the early medieval nomads.

[401] *When Good Projects Go Well: A Partnered Project in Southern Oregon between the Confederated Tribes of Grand Ronde, a Private Land Owner, and Associated Federal Agencies*

When a private landowner consistently finds artifacts on their property and wants to be open to outside research opportunities, it can be difficult to find the funds necessary for a thorough cultural resource inventory when there is no development project associated. Encouraging education as a tool to promote advocates for the cultural resources, developing trusting relationships are needed. A partnership with cultural resource staff from the Confederated Tribes of Grand Ronde, federal agency archaeologists, and technical specialists strengthened with an ongoing dialog with the landowner provides the resources needed to study a complex precontact site spanning across a landscape that continues to support culturally significant natural resources. Integrating low-impact archaeological methodology, such as using data recovery tools with minimal impacts, the Tribe's heritage is integrated into archaeological practice to ensure a long-term protection of cultural resources. Focusing the discussion around people practicing on the landscape brings Tribal cultural knowledge to archaeological study for a private landowner to be a cultural resource advocate and further encourage the growth of cultural awareness.

[200] *A Worm's Eye View of Chimú Domestic Practice*

Andean household archaeologists have sometimes been slow to adopt a range of specialized methodologies that have become commonplace in regions such as Europe and the Near East. Dr. Bradley Parker's recent work brought microartifact studies to the attention of archaeologists working in the Andes. In this paper, I reconsider household assemblages from Pedregal, a Chimú farming community in the Jequetepeque Valley, Perú, from a microartifact perspective. I compare spatial patterns revealed by >1mm microartifact assemblages from soil samples to macroartifacts recovered from the same excavation contexts to evaluate a microartifactual methodological approach for reconstructing Chimú domestic practice.

Cutrone, Daniel (California State University, Dominguez Hills) and Madalyn Bills (Edge of Cedars State Park)

[220] *The Enshrined Pueblos of Montezuma Canyon*

A long-standing goal of Southwestern archaeology is to understand the reason behind settlement location and why some locations seem to be given elevated status. The Spirit Bird Cave Model presented at the 2003 SAA Annual Meeting pointed to the fact that sacred geography incorporating features of the physical geography played an important role in settlement planning and location. Recent fieldwork suggests settlement location in and around Montezuma Canyon in southeast Utah followed a similar pattern related to physical landscape and sacred space. It is suggested here that several large pueblos within the Montezuma Canyon system are "enshrined" and marked by the physical landscape following modern Puebloan cosmological ideology.

Czerniak, Lech

[275] *The Early Neolithic LBK Communities in the Tusznicza River Valley. Social Aspects of Settlement Changes*

A group of LBK settlements located in a valley of the Tusznicza river is one of the best recognized settlement complexes in Central Europe. Settlements that are a part of it are characterized by a quite differentiated built-up area arrangement and houses changeability over time, which I will interpret referring to social changes. The more complex interpretation of the phenomenon of changing the built environment requires a different look at what houses and households in the LBK were. To me, a vision of a house inhabited by only one generation by a nuclear family suited the concept of LBK communities as peaceful farmers. Discoveries of objects that testify to armed conflicts within the LBK, and results of the research on diet, finally invalidated this picture. The latest research also showed that the potential reasons for conflict could have been rivalry and inequality between the households relating to access to the most valuable agricultural areas. We gain additional interpretation possibilities of this phenomenon while looking from the above perspective at changeability in the LBK built environment. Therefore, we can look at the changing picture of LBK village built-up areas as an arena of rivalry between households and its changeable effects.

[289] *Animals for the Ancestors: Comparing Animal Use in Funerary Rites at Ancient Hualcayán, Peru (AD 1–1000)*

This poster presents recent analysis of faunal materials from three distinct funerary structures at Hualcayán, Ancash, Peru, in order to assess differences in taphonomic environments and funerary practices through interred faunal remains. This study compares species representation, bone modifications, and fragmentation from Early Intermediate Period and Middle Horizon communal and commingled tombs. The contexts examined represent three different ways of treating the dead between AD 1-1000 and include a semi-subterranean tomb and its associated patio, an above ground burial structure (chullpa), and a modified cave (machay). 5,223 fragments of animal bone were identified and examined for modifications and treatments. Of the fragments examined, 66 showed evidence of modifications such as cut marks, burning, and shaping into tools and ornaments, including imported Spondylus shell and processed felid remains. Artiodactyla, specifically llama and alpaca, was the predominant domesticated taxon, particularly in the subterranean tomb. In the more exposed chullpa and the machay tomb environments, there was greater evidence for wild species, some intrusive but others intentionally interred based on the presence of modifications and cut marks. While this may be a result of the open tomb environment, evidence of modifications may also suggest an increased concern for wild fauna and imported materials.

[42] *ESR Dating Herbivore Teeth within the Mousterian Layers at Šalitrena Pećina, Serbia*

Overlooking the Ribnica River near Breždje in the Dinaric Mountains, central Serbia, Šalitrena Pećina records a continuous Late Pleistocene sedimentary sequence records over the Middle/Upper Paleolithic (MP/UP) transition. In the cave entrance, six sediment layers reach ~ 1.5 m thick. Layer 2's Neolithic artefacts overlie Layers 3-4's Gravettian artefacts. Layer 5 yielded distinctive Aurignacian artefacts. Layers 6a-e contains reddish brown sandy silt with 20-40% éboulis, hearths, and a Levallois industry having déjeté and transversal sidescrapers in the upper zones and bifacial artefacts at the bottom. AMS 14C has dated Layers 3-4 at ~ 24-25 ka, Layer 5 at ~ 31 ka, but most of Layer 6 exceeds the 14C dating limit. Since ESR can date tooth enamel from ~ 5 ka to > 2 Ma, with ~ 2-5% precision, five herbivore teeth from Layer 6 have been dated by standard and isochron ESR. For the volumetrically averaged sedimentary dose rates, > 30 sediment samples from 10 horizons within 30 cm of the teeth were analyzed by NAA. Cosmic dose rates were calculated by ramped box averaging, using geologic data about its sedimentary cover. Ten independent ESR dates for teeth from Layer 6d-e correlated with MIS 5b to early MIS 4.

Dale, Emily (Northern Arizona University)

[189] *In Small Things Collected: Domesticity in World War Two Era Flagstaff*

From the 1980s to 1990s, Northern Arizona University ethnomusicologist Joann Kealiinohomoku collected artifacts she found in the backyard of her Flagstaff home and kept them in a variety of food jars. While Dr. Kealiinohomoku had no discernible methodology in collecting the artifacts and left behind no notes or evidence of their original context, the collection still conveys meaningful information about mid-century Flagstaff. The majority of the artifacts date to the original 1940s and 1950s occupation of the house, and contains myriad artifacts related to the domestic aspects of Flagstaff life during this period. This paper explores how disconnected artifacts can tell a connected story of childhood, foodways, and other domestic activities.

[322] *Assessment of Late Quaternary Bison Diminution Using Linear Discriminant Analysis*

The proximate cause of reduction in the overall size of late Quaternary bison is the focus of continued debate. Some researchers contend that size reduction did not occur despite well-documented changes in climate and vegetation, while others link directional change in body size to changes in forage quality and availability or human predation. Historically, assessments of bison size have used standard measurements, ratio diagrams, univariate and bivariate plots, and summary statistics to 1) distinguish males and females, and; 2) generate mean body size data. Application of Linear Discriminant Analysis to 1,000+ calcanea from 30+ localities is used to eliminate the subjectivity of sex determination and, in turn, supply a refined understanding of spatio-temporal patterns in bison body size. Results confirm that late Pleistocene animals were substantially larger than their late Holocene

counterparts.

[180] *Flakes Everywhere: Lithic Analysis Results from the Petrified Forest Boundary Expansion Project 2013-2017*

During the Boundary Expansion Survey Project in Petrified Forest National Park of Northeastern Arizona the most common artifacts were the much maligned flake and stone tools. These are not surprising given the area is a large stone tool source in the remains of one of the largest deposits of petrified wood in the world. Petrified Forest was a magnet for its plentiful, high quality petrified wood in addition to being a migration corridor. This study will present analysis on the field data collected as part of the project from the 284 sites. The survey by design covered many different landscape settings allowing for a comparison of lithic toolkit variation. Similarly, sites were recorded from Early Archaic to Pueblo IV facilitating a different view of the lithic production and use. The unique opportunity afforded with this multi-year study offers these types of large scale comparisons that will only add to our understanding of the prehistoric use of Petrified Forest National Park.

[182] *The Chincha Valley, Peru: Analyzing Its Settlement Patterns and Urban Centers*

The study of settlement systems is an important component in archaeologists' efforts to understand how valley-wide or multi-valley polities change over time. Settlement studies often rely on site size, site location, site layout, and site chronologies to determine the changing relationships among sites and to explore changes to political and socioeconomic organization. This presentation discusses (1) the degree of centralization of the Chincha polity through time and (2) the changes that occurred during the Late Horizon (AD 1470-1532, the time period of Inca occupation). The Chincha Valley provides a rich opportunity to explore settlement systems due to its history of archaeological surveys and excavations. In addition to utilizing the data from those surveys and excavations, I draw on other cases throughout the world and my own excavations at the site of Las Huacas in the Chincha Valley. Data from Las Huacas' Complex N1 demonstrate that large-scale changes occurred in the economic organization and activities conducted there during the Late Horizon. The presentation concludes by comparing the Chincha case to the north coast of Peru.

Damick, Alison (Columbia University) and Arlene Rosen (University of Texas-Austin)

[311] *Agriculture and Landscape Change in the Tesuque Valley*

The relationships of people with their land over time leaves visible and invisible traces. As archaeologists we are confronted with landscapes that are the resulting accumulation of these traces over time, such that they may no longer resemble the place that people of the past interacted with. Place is not just a geographic location but a complex network of human and non-human actors coming together to constitute a set of geomorphological, ecological, and social relationships. To better understand those relationships and past land use choices, we must first reconstruct what the past landscape looked like.

This paper presents preliminary results of a geoarchaeological and microbotanical study to address this problem in the Tesuque Valley in northern New Mexico. The Tesuque Valley hosted the ancestral settlement at Cuyumungue and the ancestral and current settlements at Pojoaque. In cooperation with Pojoaque Pueblo and the Cuyumungue project, samples were taken from geological sections in Tesuque Creek and its tributaries to reconstruct the environmental history of the area in relation to varied historic agricultural and land use practices over time. This paper presents the preliminary analysis of those samples.

[211] *Tobacco Smoking in Northwestern North America: Synthesizing the Results of Organic Chemical Residue Analyses*

The past several years have seen a number of studies—largely based at Washington State University—incorporating organic chemical residue analytical methods to address questions regarding past smoking practices in Northwest North America. In this poster we summarize the results of these studies, which cover a geographic range from northern California to southern British Columbia, and synthesize them, presenting the current understanding of smoking practices in the region's past. Of particular interest is the northern limit of tobacco (genus *Nicotiana*) use, given its limited natural range and importance in the beliefs and practices of many present-day Native people in the Northwest. Evidence of past tobacco use at several locations in the region is contrasted with the current natural distribution of the genus.

Damp, Jonathan**[320]** *Real Alto and the Origins of Valdivia*

Recent geomorphological analysis of shoreline deposits in Manabí and Santa Elena provinces (Ecuador) provides evidence of significant mid-Holocene marine transgression. Newly obtained radiocarbon dates from relict coastal features places these changes to the Valdivia Phase (4400 to 1500 cal BC). Arguments for and against this phenomenon are reviewed with regard to the role of Real Alto in Early Formative settlement. Finally, ramifications of mid-Holocene shoreline change are discussed with regard to the origins of Valdivia in Southwest Ecuador.

Dancey, William**[257]** *Discussant***Danella, Erika (Quinnipiac University), Kylie Williamson (University of Florida), Jaime Ullinger (Quinnipiac University), Julia Giblin (Quinnipiac University) and László Paja (University of Szeged)****[126]** *Distribution of Cranial and Postcranial Elements in Bronze Age Cremation Urns from Eastern Hungary*

Located in the Kőros region of Hungary, the site of Békés 103 contains a Bronze Age cemetery in which the majority of burials are cremations deposited in ceramic funerary urns. Previous literature suggests that the measurement of skeletal weight across microstratigraphic levels within an urn can shed light on the process of how the bones were placed in the vessel. In this study, we investigated the correlation between cranial and postcranial weight throughout micro-excavated levels in order to examine skeletal element distribution within the vessels (n=25). Instead of concentrating the cranial elements at the top or bottom of the urn, our analysis indicates that the cranial and postcranial elements were scattered throughout the vessel. Therefore, our results suggest that there was not a systematic arrangement of cranial versus postcranial elements within the urn. Overall, this study aids in enhancing the understanding of Bronze Age cremation practices in southeastern Hungary, which can ultimately contribute to the study of social complexity and inequality in prehistory.

Danis, Ann (University of California, Berkeley)**[83]** *"But We Are Not Broken": Practices of Home in San Francisco Bay Area Homeless Encampments*

In January 2018 United Nations Special Rapporteur on Adequate Housing Leilani Farha visited Oakland, CA homeless encampments. Farha reportedly remarked, "every person I spoke to today has told me, 'we are human beings.' But if you need to assert to a UN representative that you are a human, well, something is seriously wrong." The conditions of camps in California, which can range in size from a few to hundreds of tents and shelters in alleyways, underpasses, and other undesirable locations, are "systemically cruel." US law, local policy, and police practices criminalize sitting, lying, and even sharing food in public spaces, and creates challenges to even the most basic of human rights for people experiencing homelessness in the San Francisco Bay area. Decades of encampment at the Albany Bulb, however, complicate conventional assumptions about the livability and precarity of self-designed shelter and self-organizing communities. This paper discusses archaeological work documenting the 2014 eviction of the Albany Bulb, as well as the process and building of a recently completed tiny-home village in West Oakland, to argue for material attention as a method to support the humanity of people living as refugees in their own homes.

Dardeniz Arikan, Gonca (SUNY Buffalo)**[242]** *Salt of the North-Central Anatolia (Turkey)*

Salt, which is a very important dietary component for humans and animals, occurs in Anatolia (Turkey) in beds and masses of rock salt or as evaporate. It has a practical value for activities like food preparation, tanning, drying meat, or pickling as well as bearing a symbolic value and magical attributions. Research has focused on locations and various procurement methods at certain locales of Anatolia (ex. Salt Lake, Turkey) mostly from a perspective of human interaction with salt via archaeological and ethnoarchaeological evidence. This paper will extend value of salt to animals at highland communities in the north-central Anatolia and will focus both the economic and symbolic significance of salt at the region. By using archaeological, ethnoarchaeological and textual evidence, I will reassess the use of salt at the region by particularly concentrating on the Bronze Ages.

[307] *A Methodological Challenge: Understanding the Population Dynamics in the Lerma Floodplain through the Case of Tres Mezquites, Michoacan*

Alluvial plains in Mexico are still little explored. At first glance their archaeological potential is difficult to appreciate because they are areas of both sedimentary accumulation and destruction caused by intensive agriculture. To compensate these limitations in the Lerma alluvial plain (Michoacan, Guanajuato), we combined several survey (satellite imagery, informant, systematic and geophysical prospection) and registration methods (entity, structures, artifacts densities). The complementarity of these methods allowed to produce an archaeological map that was sufficiently relevant to provide a reasonable idea of the settlement pattern and the chronology of occupation in the alluvial plain. Although the geo-archaeological study showed intrasites succession of rapid sedimentary accretion during prehispanic and later occupations, the fieldwork seasons conducted between 2014 and 2018 highlighted a dense network of settlements on the riverbanks, in various areas of the plain, and at the foothills. This map is not intended to be representative of true occupational intensity and to reflect with exactitude the privileged areas of settlement through time, but it shows that the taphonomic limitations did not prevent the detection of a sufficient number of prehispanic sites to suggest that the floodplain had been very densely populated at least since the beginning of our millennium.

Darvill, Timothy (Bournemouth University, UK)**[155]** *Woodhenges in Northwest Europe*

Circles, variously of wood and stone, are a major feature of the ceremonial centres dating to the third and early second millennia BC in northwest Europe. Some, such as Stonehenge, are very well known and complicated in their design and layout. Many others are more modest in scale and form. Geophysical surveys and development led archaeology have revealed the existence of many more timber circles than once thought, complementing the distribution of the more durable stone circles. Here we investigate the range of structures represented and their place within extended ceremonial centres in Britain and beyond.

Darwent, Christyann (University of California, Davis), Genevieve LeMoine (Peary-MacMillan Arctic Museum, Bowdoin College), John Darwent (University of California, Davis) and Hans Lange (Nunatta Katersugaasivua Allagaateqarfialu)**[251]** *The Inglefield Land Archaeology Project in NW Greenland, 2004-16: Mitigating Cultural Resources in the Era of Climate Change*

With support of the NSF Arctic Social Sciences program, we undertook seven field seasons (2004-2016) investigating the 4000-year history of human habitation of Inglefield Land, with particular attention to the Inughuit and their interactions with Euro-American Arctic explorers in the mid-19th to early 20th centuries. We recorded over 2350 new archaeological features, excavated a dozen house structures across the region, and provided field experience for 20 Greenlandic and US students. The focus of our most recent field seasons has been on recovery of the rapidly eroding site of Iita; a location that is unique in the High Arctic for its buried stratified deposits recording the last 1000 years from Late Dorset, through Thule/Inughuit. It is this recent history that is the most vulnerable to declining permafrost and erosion, and thus we propose a model for mitigation of cultural resources in this region from the perspective of cultural heritage management.

Dávalos Navarro, Dolores**[258]** *Status Differentiation in the Mortuary Practices and Architecture of Paquimé, Chihuahua, Mexico*

The site of Paquimé in Chihuahua, Mexico, is part of the debate of social organization of prehistoric pueblos. Using statistical and Geographic Information Systems this research attempts to determine the degree of status differentiation and intra-site organization of the site by revisiting published archaeological data and using a revised classification and seriation of mortuary patterns and architecture. Furthermore, this study considers the variation in the funerary practices in Paquimé and the spatial correlation of the data with architectural features to see if the burial furniture, grave goods, architecture and artifacts showed variation within spatial units that can be related to status differentiation. The study also compares the site of Paquimé with Grasshopper Pueblo in east-central Arizona. Previous studies suggested that the population at this site had a similar organization to the historic Puebloan communities in the north of Arizona and New Mexico of organized in kinship groups with distinctions based in age,

gender and some ceremonial statuses. Preceding architectural comparisons between both sites showed differences in activity areas, group storage and communal or integrative areas. Does Paquimé share similarities with contemporary Puebloan communities like Grasshopper Pueblo or were there diverse social organizations in the Southwest/Northwest during the Late Pueblo period?

Davenport, James (University of New Mexico) and Marie-Claude Boileau (University of Pennsylvania)

[355] *Reconstructing the Chaîne Opératoire of Inka and Local Pottery from Pachacamac, Peru Using Compositional Analyses and X-Radiography*

In the Inka Empire (Tawantinsuyu), Inka polychrome pottery was used for state-sponsored purposes. This pottery was not produced solely in the imperial core and distributed to provincial contexts, but rather was produced by a diverse range of potters recruited from subject populations across the empire, working both part- and full-time for the state. These potters made pottery in their traditional and imperial styles, as well as hybrids between the two. Despite being made by a variety of producers, Inka Polychrome Pottery was highly standardized in form and decoration. This project investigates the production of both Inka polychrome and local pottery from the regional center of Pachacamac, the political center of the Ychsma polity and an oracle and pilgrimage center that was subjugated and expanded by the Inka during the Late Horizon (CE 1400 – 1532). Using compositional analysis of pastes and pigments with Neutron Activation Analysis and Laser Ablation-Inductively Coupled Plasma-Mass Spectrometry, morphometric analyses of form, and analysis of forming technique and sequence through X-radiography, this research attempts to reconstruct the chaîne opératoire (operational chain) of this pottery, which in turn reveals information about who these potters were and what their relationship was with the empire.

Davies, Benjamin (The University of Auckland)

[378] *The Highways and Byways of the Winds: Exploring Sailing Capability and Climate Variability in Pacific Interaction*

Current debates over migration and mobility in Pacific prehistory hinge on the capacity of mariners to sail to windward. With this ability, voyages between any two points were possible, with ease of travel conditioned on the favorability of winds. Without it, movement in any given direction was dependent on winds traveling along a similar path, a coincidence that would have been variably predictable over space and time. These factors, played out on the physical geography of the Pacific, would have made some routes more accessible than others and contributed to greater or lesser possibility of sustained interaction between islands. In this study, the capacity to make use of the winds on different paths between islands is modeled under a range of climate conditions. Large global climate datasets of daily are selectively sampled to capture winds under different kinds and phases of the El Niño Southern Oscillation, and model calculations are made for angled passages between islands. From these models, networks emerge illustrating how assumptions about the capacity to sail to windward (or lack thereof) can influence connectivity. Implications of these networks for explaining patterns of migration and interaction in Pacific prehistory are considered in terms of contemporary archaeological data.

[303] *A Ruler Stela in San Pedro La Laguna? Preclassic Stone Monuments of the Lake Atitlan Basin, Guatemala*

Ruler stelae are a well-known class of monument in the Southern Maya region but have so far been recovered only from only the largest sites, such as Kaminaljuyu, Takalik Abaj, and Chocoma, all of which are considered to have been regional capitals. The recovery of a basal fragment of one of these monuments near the small tourist town of San Pedro La Laguna is therefore surprising. However, the presence of three other monuments of probable Late Preclassic date in the vicinity and others just around the corner in Finca Chacayal, suggests that this monument does belong here. In the current paper, I explore the contexts and meaning of these monuments and their significance for our understanding of the Late Preclassic period in the southwestern highlands.

Davis, Dylan (The Pennsylvania State University), Matthew Sanger (Binghamton University) and Carl Lipo (Binghamton University)

[325] *Shell Rings and Settlement Organization in the Coastal American Southeast: New Insights from Remotely Sensed Data*

In 2018, we identified over 50 new potential shell rings in Beaufort County, SC using LiDAR and automated feature extraction algorithms. Further analysis of this data has confirmed the archaeological nature of several of these deposits. This poster details further analysis of these features. We find that the majority of these rings are significantly smaller than previously identified rings in South Carolina and the spatial patterning of these features paints a picture of clustered settlement distribution. Areas with the highest density of shell rings are located in closer proximity to water and in higher elevations than rings located in lower density areas. Additionally rings that are in close proximity to other rings have higher volumes of shell per unit of area than rings that are further away from other rings. Overall, this information suggests that where shell rings are clustered together, their overall size is

smaller but their volume of shells is greater, whereas rings that are more dispersed are larger but contain a smaller volume of shells per unit of area.

[97] *Not Just Blowing Smoke: Tobacco and Society at Ancient Moundville*

In the Southeastern United States and elsewhere, indirect evidence of tobacco use is all too often inferred when archaeologists recover smoking pipes. Thanks to the combined efforts of archaeologists and chemists, we have recently begun using gas chromatography/mass spectrometry (GC/MS) analysis of residues scraped from the bowls of sooty pipes to make the connection directly. This paper is a spin-off of that larger effort to plot tobacco use in the Pre-Columbian Southeast through space and time. It focuses specifically on the dozens of pipes recovered from the Mississippian period Moundville site of west-central Alabama. Pipes are not common at Moundville, but they have been found in nearly all areas of the site – from household contexts in its crowded low-status neighborhoods, to its more sequestered precincts on and around mounds on the north side of the site. Their distribution, the varied contexts of their recovery, and their array of forms add detail to our understanding of tobacco's important role in the social, political, and religious lives of the Moundville people.

Davis, Kaitlyn E. (University of Colorado, Boulder)

[311] *New Information from Old Collections: The Wendorf and Ellis Collections from Cuyamungue and Pojoaque Pueblos*

Over the past five years, the University of Colorado, along with the Pueblo of Pojoaque and the Colorado Archaeological Society, have been analyzing the ceramics collected by Fred Wendorf at *Cuyamungue* Pueblo (LA38) and Florence Hawley Ellis at *Pojoaque* Pueblo (LA61) in the 1950s. Just through visual macroscopic analyses and measurements, we have been able to learn about changes in occupation of these two pueblos, changes in standards of living or household wealth, incorporation of Spanish foods and products, food preparation and cooking practices, and changes in style over time. Specifically, we have been able to quantitatively assess changes in material conditions of life through tabulating changes in the ratio of fine-wares to cooking-wares, as well as identifying and tabulating trade wares. With regards to incorporation of Spanish products, we have been able to track the adoption and incorporation of wheat and other Spanish foods into the Pueblo diet, through analyzing and quantifying changes in vessel form and use-wear through time. This paper will present the methods and findings from these analyses, highlighting the potentials for gaining new knowledge by re-visiting and re-analyzing old collections with new questions.

Davis, Kara (DPAA) and Jeneva Wright (DPAA)

[129] *Sustainable Archaeology: Accelerating DPAA's Mission through Technological Advancement, Partnerships and Collaboration, and Meaningful Public Engagement*

Fielding new capabilities and leveraging untapped resources for the acceleration of operational mission tempo has become a central imperative for the Defense POW/MIA Accounting Agency's (DPAA) fullest possible accounting mission. Since 2015, DPAA's Partnerships and Innovations Directorate has been a key enabler in addressing this priority, bridging technology and resource gaps, and building a broad network of partnerships across all fields of competency. By joining forces with partners, DPAA can leverage innovative resources and expertise to promote DPAA's ideals and values, achieve mutually aligned goals, and strengthen visibility and impact of call to action. This poster showcases key DPAA partnerships, and highlights lessons learned in locating aircraft crash sites, conducting excavations, and building collaborations towards ongoing mission sustainability.

Davis, Mary A. (UW-Madison)

[152] *Defining and Exploring Local Production in the Indus Civilization: A Focus on Gradation and Value*

The Indus Civilization of Bronze Age Pakistan and Northwest India (c. 3800-1900 BCE) had a complex system of productions, consumption, and exchange at local, regional, and interregional scales. I join my recent research of intra-site production patterns and regional GIS analysis material exchange with the current body of research concerning craft production, based upon experimental and ethnographic studies, and geologic and other provenance studies. The resulting picture indicates that there are many degrees of products "localness", resulting from complex chaîne opératoires and communities both bounded and unbounded by geography and polities. Moreover, the geographic origin of raw materials does not always correlate with artifact frequency or valuation, challenging narratives of the local and exotic dichotomy.

Davis, Steve (University College Dublin) and Knut Rassmann (Romano-Germanic Commission)

[266] *Beyond Newgrange: The Late Neolithic Complex at Brú na Bóinne, Co. Meath in Light of Recent Discoveries*

The Brú na Bóinne World Heritage Site is known globally for its middle Neolithic passage tombs, in particular the 'megatombs' of Knowth, Dowth and Newgrange. However, the area also possesses one of the highest densities of late Neolithic monuments in the henge tradition anywhere in the world. These comprise a variety of forms, from timber avenues to '4-poster' structures, palisaded enclosures and conventional henge-like monuments. The remarkable summer of 2018 has provided stunning new detail on some of these sites, alongside a longstanding research programme focused on remote sensing in Brú na Bóinne using lidar and large-scale geophysical surveys.

This paper will review our current understanding of the late Neolithic complex at Brú na Bóinne in light of recent discoveries, and attempt to contextualise some of this extraordinary variety in a more regional framework.

Davis, Thomas (Tandy Institute of Archaeology SWBTS)

[366] *Hippos, Cows and CAARI: Alan Simmons' impact on Cypriot Archaeology*

When Alan Simmons first arrived on Cyprus in 1985, the Cypriot Neolithic was considered a poorly understood and uninteresting backwater lagging behind the developments of the Levant mainland. IN the mid-1908s, The Khirokitia Culture (KC) was thought to be the first PPN occupation on Cyprus. First identified in the 1930s by the Cypriot archaeologist P. Dikaios, the KC (8000 BP) lacked island precedents and was thought to have been imported wholesale from the Levant. Alan Simmons pioneering work at Akrotiri Aetokremnoss definitively demonstrated a robust occupation on the island nearly 12,000 years BP. Prof. Simmons impacts on Cypriot archaeology go far beyond his highly significant scholarship on the Neolithic. His scholarly work deals with the data of the entire island, despite the modern political differences. He has reached across the communal divide and included Greek and Turkish Cypriot students and colleagues on his excavation teams. He is a strong voice for prehistoric research in the large world of ASOR, a group not uniformly open to prehistorians. Finally, he has made invaluable contributions to the growth and health of the Cyprus American Archaeological Research Institute (CAARI) for whom he currently serves as a trustee.

Dawson, Emily (University of Texas at Austin)

[193] *A Global Taste: Rethinking Foodways in Colonial New Mexico*

"I was a global creature before globalization became a buzzword; I am a Heinz 57, a mestizo with my taste buds on several continents" (Arellano 2014: 10).

Previous research on colonial-era foodways in New Mexico has often focused on the arrival and use of Old World foods as a way to maintain a distinct Spanish identity. Yet, many of the earliest colonists, despite claiming a peninsular identity, were born in Mexico and had mixed ethnic heritage. Later settlers continued to have highly diverse ethnic backgrounds, including indigenous Mexican, Native American, African and European, further complicating our notion of what "Spanish" meant during the colonial period. This paper considers what moving beyond the traditional Spanish versus Indigenous notion of foodways in New Mexico would mean for developing a Chicanx Archaeology of a Spanish land grant community. I present preliminary phytolith data from an ongoing study that offers insights into the ways that members of the community utilized both native and foreign plant species in their daily lives.

[149] *Drawing the Line: Does Sexual Harassment Training Work?*

Training is a favored weapon in the arsenal of those attempting to combat workplace harassment. Every year, university employees across the United States numbly click through sexual harassment training modules; after the March 2018 resignation of Forest Service Chief Tony Tooke due to allegations of sexual misconduct, the Forest Service modified its harassment training; in 2017, after revelations of a culture of harassment in the National Park Service, the NPS committed to improving its harassment training programs. Given that harassment training is deployed as both a prophylactic against and a cure for harassment, its usefulness merits consideration. Is sexual harassment training effective in addressing workplace cultures of harassment? This paper examines three sexual harassment trainings for archaeologists—one from a government agency, one from a university, and one used by a private CRM company—with the aim of assessing the adequacy of those trainings in addressing the root causes of sexual harassment.

[362] *Who Tells Your Story? Utilizing Legacy Collections to Serve a Living Culture*

Unlike most archaeological collections, those held and curated by the Seminole Tribe of Florida (STOF) represent a living culture, and tribal understanding of those archaeological collections is a fluid, dynamic entity. The unique

relationship between the Tribal Historic Preservation Office (THPO) and STOF requires an adherence to and respect of cultural traditions and viewpoints. As the key stakeholder, the Tribe's needs are the most fundamental aspect when sharing the Seminole story and voice. Reexamining legacy collections within the framework of serving the tribe works to not only shed light on history, but also to further our understanding of how to mitigate current preservation issues. Within the last ten years, the tribe has aimed its focus towards understanding and managing the damage created by climate change. For the THPO, this means reorienting our research and analytical focus to look forward, asking how we can utilize legacy collections to shape a knowledge base for the future. We seek to explore how revisiting legacy collections within our own holdings works to serve the best interests of the tribe, as well as give service to the past in order to challenge our own perception of archaeology in reference to a living culture.

De Carteret, Alyce (LACMA)

[162] *The Colonial Peten: An Ethnohistory of Indigenous Sovereignty and a Failed Spanish Colonial Project*

Colonialism—to speak generally—can be characterized as endeavors that aim not just to entangle, but to wholly incorporate, disparate regions under the control of a foreign body. Indigenous disentanglement from these exploitative projects has taken many forms—daily negotiations, subtle refusals, outright rebellions. In the Peten, Guatemala, strategies of resistance to Spanish Colonialism meant disengaging completely from it and asserting indigenous sovereignty. The Itzá and Kowoj Maya, who made their home in the Peten, famously fell to the Spanish in 1697, 172 years after Hernán Cortés first visited the region. This date marks the siege of the Itzá capital of Nojpeten by conquistador Martín de Ursúa y Arizmendi, an event that titled Grant Jones's landmark volume, *The Conquest of the Last Maya Kingdom*. Yet, even after this date, the Kowoj and Itzá Maya continued to assert their sovereignty and resisted Spanish control. Spaniards faced rebellion in sparsely populated mission towns that they could not keep settled. The Peten, at the edges of empire, remained in many ways outside of Spanish dominion. This paper recounts the colonial history of the Peten, telling the story of enduring indigenous sovereignty and a failed colonial project.

De Koning, Sarah (University of Western Australia) and Peter Jeffries (Murujuga Aboriginal Corporation)

[305] *Murujuga Dynamics of the Data*

Current archaeological research projects are creating ever-larger quantities of data which needs to be analysed, and stored for long periods. Murujuga: Dynamics of the dreaming has moved to paperless collection techniques to enable the rapid collection of field data and the seamless transfer of this to data repositories. This paper addresses the current standards of data collection, analysis, and long term archival storage developed by the Centre for Rock Art Research and Management Database (CRAR+M). As the digital repository for ongoing research projects by a variety of CRAR+M researchers, the CRAR+M Database contains the largest collection of rock art and related data in Australia. Researchers store their data, with information accessible to relevant staff and students, as well as collaborating Aboriginal communities and research partners. The development of protocols is vital to ensure the cultural safety of partner Aboriginal community members accessing this information. This paper examines the workflow employed when collecting, analysing, and archiving archaeologically gathered cultural information, and the partnership with the Murujuga Aboriginal Corporation (MAC) rangers in repatriating this data in a culturally appropriate manner for their use in a managing the extraordinary rock art in Murujuga National Park.

De La Fuente, Guillermo

[298] *Chaîne Opératoires and Technical Identity in Aguada Portezuelo Pottery: An Approach through Ceramic Petrography (Catamarca, Argentina)*

The Aguada Portezuelo ceramic style (ca. AD 600 – AD 900) from Northwestern Argentine region, presents a highly stylistic variation and complexity in the forming techniques used by ancient potters, concerning surface treatments and the decoration applied to ceramic vessels. One of the most important features in these ceramics, is its highly marked polychromy. Here, we present the results obtained through an extensive ceramic petrography study of surveyed materials from La Viñita archaeological site (Dept. Capital, Catamarca, Argentina). Special attention is paid to the reconstruction of the chaînes opératoires involved in the elaboration process (ceramic pastes, primary and secondary forming techniques, firing temperatures) of this pottery. Additionally, we explore the concept of technical identity and its relationship to the different technical gestures and technical actions performed by ancient potters.

De La Rosa-Díaz, Jesús (University of Zacatecas, México) and Ciprian Ardelean (University of Zacatecas, Mexico)

[374] *Valle de Bonanza (Zacatecas, Mexico): Desert Varnish and Technology in a Surface Lithic Assemblage*

Valle de Bonanza (northeast of the Mexican state of Zacatecas) is a surface-only archaeological site located in a highly eroded desert landscape on the edges of a vast endorheic basin in Concepcion del Oro county. The site consists of a sand-and-dust surface affected by intensive deflation that caused the formation of a palimpsest of crudely made flaked stone artifacts belonging to a diversity of epochs and traditions. This study focuses on two lines of research: i) the technological analysis of the specimens in order to define the technical approaches and possible cultural affiliations; ii) the study of patinas present on the exterior of a large percentage of the sample. We observe at least two types of patina or desert varnish, which were presumably generated under different environmental and depositional conditions. Considering that all lithic specimens belonging to more recent recognizable traditions lack any sort of patina, we worked from the hypothesis that the varnish-covered specimens belonged to older periods presenting considerable differences between them both. In order to achieve these goals we employed certain microscopic and archaeometric techniques presented in this poster.

De Leon, Jason (University of Michigan)

[157] *Old Methods and Theories in the Ethnographic Present: Why We Need An Archaeological Sensibility in the 21st Century*

Archaeologists often look to sociocultural anthropology for either ethnographic data that support interpretations of the ancient past or for the latest “cutting edge” theory that can be directly grafted onto a data set. In essence, archaeologists excel at mining the ethnographic literature for analogies or new social theories. However, few ethnographers dare to venture into the archaeological literature or attempt to explore the potential of that sub-discipline’s methods or theories for understanding the contemporary moment. This is surprising given the growing sociocultural interests in actants, landscapes, materiality, and corpses. Using data from the Undocumented Migration Project, a long-term interdisciplinary research endeavor focused on understanding the violent social process of clandestine migration from Latin America to the United States, I argue that traditional archaeological methods and theories can provide new insight into modern sociocultural phenomenon. Moreover, I posit that an “archaeological sensibility” (i.e., an analytical viewpoint that takes a rigorous approach to both the physical and sociopolitical aspects of materiality) helps to erase the stifling borders that often exist between subdisciplines while pushing for new and organic forms of interdisciplinary research.

[38] *Household Lake Exploitation and Aquatic Lifeways in Pre-Aztec Central Mexico*

Lake exploitation was central to ways of life and culture in the Basin of Mexico. Evidence of lake exploitation, however, is often difficult to document archaeologically. Thus, discussions of production and exchange in pre-Aztec times usually focus on more durable goods such as ceramics or obsidian. In this paper, I explore archaeological evidence for the exploitation of lake resources in the island site of Xaltocan in the northern Basin. Xaltocan’s island location provided abundant locally available resources including waterfowl, fish, reeds, and insects. People would have been attracted to the site because of the wealth of resources offered by its lacustrine setting, enabling Xaltocan to grow into an important regional center controlling much of the northern lake bed in pre-Aztec times. Evidence suggests that Xaltocan’s commoners were actively processing lake resources during the Early Postclassic (AD 900-1200). However, as a result of political, social, and environmental changes, patterns of lake exploitation shift over time.

De Marigny, Elizabeth (Department of Anthropology, The University of Texas at Austin)

[386] *Applications of Behavioral Economics: Understanding the Effects of Roman Conquest on Late Iron Age Castro Culture Ceramic Production*

Through a comparative analysis of ceramic materials from three archaeological sites, including Bracara Augusta, the Citânia de Briteiros, and the Cividade de Bagunte, this research explores the effects of Romanization on the production and use of ceramic materials from the Castro Culture of northwest Portugal. This research applies several principles from Behavioral Economics to study the possible mechanisms that influenced consumer decision making as well as the risk tolerance of a producer’s willingness to engage in production-related activities whose outcome is uncertain (Cosgel 2009:85). As imported Roman wares were introduced, there was a growing demand by local groups to obtain these items. As these ceramic forms became esteemed, social preference for them would have increased. A potter’s choice to begin producing imitation wares carried a low risk tolerance because the demand for low cost imitations likely would have been profitable. Thus, the production of imitation wares indicates that local potters were adapting to a changing economy as well as changing social preferences. This research aims to demonstrate how the effects on production and use of pottery within this region derived from both social and economic demands.

[396] *Maya Funerary Practices and Their Significance in Reproducing and Maintaining Social Status and Identity: Evidence from Copan, Honduras, and Palenque, Mexico*

Susan Gillespie remarked the importance of human body and funerary ritual in the process of transmission of

memory and legitimation of social status among Maya royalty. Would this process be visible in domestic contexts, too? To answer this question, I chose to study domestic funerary record, context where an archaeologist can find the reflection of collective ideas and individual attributes of deceased. Through the analysis of several pre-Hispanic Maya burials I will try to demonstrate that funerary activities were, in part, a means to mark or re-define social status; this was possible by merging collective ideas and individual characteristics of deceased considered important to living people. Evidence from Copan Valley shows Late Classic period Maya seem to have been mainly concerned with question of family membership and age, related to social status. Therefore, the Maya used bodies of specified individuals as a means to convey messages. Kings or members of royal families were persons whose bodies were charged with symbols representing dynasty properties and memories. In domestic burials, individuals holding social positions or presenting peculiar biological characteristics were treated in specific ways. Ostentation of such attributes allowed members of their social groups to legitimize their position in the social continuum.

417] *Lipid Biomarkers Analysis in Cueva Pintada de Gáldar (Gran Canaria, Spain): A Study of Possibly Charred Organic Sediments*

Cueva Pintada de Gáldar is a pre-European archaeological complex in Gran Canaria that was discovered in 1873 and nowadays is an Archaeological Park and Museum. It comprises a hillside with numerous dwellings, some of them partially carved into the hill, and "Cueva Pintada", a ritual cave at the core of the settlement. The complex constitutes a referential archaeological monument in Gran Canaria and in aboriginal times, it was possibly of importance to the island's pre-European society. Although the site's material record has been extensively studied, including pottery, lithics and faunal and shell remains, the anthropogenic sedimentary record remains unexplored. Our team is currently carrying out integrated microscopic and biomolecular studies to gain further behavioral information. As part of this research program, we analyzed two samples of black, apparently charred sediment from one of the dwelling. Here, we present the results from lipid biomarker analyses of these two samples.

[71] *La gestión del patrimonio arqueológico desde el modelo municipal de Mérida, Yucatán: Análisis y perspectivas*

La gestión del patrimonio cultural en México y particularmente el arqueológico, representa retos diversos para lo cual la participación de todos los niveles de gobierno y sociedad civil es crucial, más ahora en la que el estado sociopolítico y económico nacional plantea grandes disyuntivas. Crear y generar estructuras e instrumentos que permitan el fortalecimiento y coadyuvancia para la protección, conservación, difusión y divulgación del patrimonio arqueológico, es decir, su puesta en valor, debe ser una vía a tomar en cuenta con más fuerza. En el municipio de Mérida, Yucatán, desde 1998 se han creado y fortalecido áreas con el fin de coadyuvar en tareas que aporten en la gestión del Patrimonio Cultural. En el caso del patrimonio arqueológico, y en el contexto de la normativa federal, se han explorado instrumentos y acciones encaminadas a la visibilización de dicho patrimonio en los programas de desarrollo urbano y el crecimiento de las manchas urbanas, así como la puesta en valor de sus ejemplos edificados, resultando en un modelo a considerar, con sus ventajas y desventajas.

[46] *Ancestral Puebloan Settlement Patterns of Redwood Llama Ranch: Analysis of GIS and Fieldwalking Survey*

Archaeological survey of 800 acres at Redwood Llama Ranch in southwest Colorado documented over 50 previously unrecorded archaeological sites. A 2016 survey, completed as a settlement pattern study using a landscape archaeology framework, explored the extent of Ancestral Puebloan habitation and activity within this property situated in a canyon and on the above mesa. The results of this study, as determined through pedestrian survey and GIS analysis, revealed three main phases of occupation between the late Pueblo I and early Pueblo III periods. These three phases saw a general trend of expansion from habitation mainly surrounding the canyon rim to a final movement both outward onto the rolling mesa top and into the depths of the canyon before its abandonment in the AD mid-1200s. The evidence for these trends was provided through diagnostic ceramic and lithic material as well as architectural remains. This progression reflects regional tendencies and provides a basis for a dialogue on effects of climate, aggregation of communities, transfer of knowledge, and contact throughout the Four Corners region.

Dean, Emily (Southern Utah University)

[223] *Involve Me and I Learn: Archaeology, Experiential Education, and Collaborative Research with SUU Undergrads*

By partnering with federal land agencies, local landowners and developers, regional non-profit organizations, state museums, and county libraries, Southern Utah University (SUU) archaeology students gain access to valuable

experiential learning opportunities, build their professional resumes, practice service learning, and help educate the public about the importance of preserving the past. This presentation focuses on SUU's forays into community archaeology and public-private partnerships in the Colorado Plateau region, specifically discussing our past archaeological field schools in Kanab and New Harmony, Utah, and our ongoing collaborative work with the Colorado Plateau Archaeological Alliance in the Vermillion Cliffs Wilderness Area, Grand Staircase Escalante National Monument, and Nine Mile Canyon. In addition to conducting fieldwork, our undergraduate students help design and serve as docents for local exhibits on archaeology and anthropology. Beyond contributing to our understanding of the ancient inhabitants of the region and providing professional development opportunities for our students, we find that these projects help foster friendly cooperation between 'the public' and academic and government researchers in a region where local distrust of 'government' is all too common.

[194] *Archaeomagnetism and Hohokam Platform Mounds: Reframing the Classic Period Chronology*

In this paper, we present an overview of changes during the Hohokam Classic period relative to the platform mound developmental sequence as documented during the 1968 and 1984 excavations at Las Colinas Mound 8 and the 1973 excavations at Escalante Ruin Group. Using the archaeomagnetic data collected from Las Colinas Mound 8 and the Escalante platform mound, we establish chronological mileposts during the Classic period corresponding to the mound construction sequence. We then propose a working chronology for the Hohokam Classic period framed relative to the platform mound developments: Pre-Mound, Mound 1 (Soho), Mound 2 (Civano), and Post-Mound. Turning next to the large body of archaeomagnetic data from Classic period contexts in the Phoenix basin, we link individual contexts to this working chronology and explore trends and developments in architecture and material culture over the course of the Classic period.

[33] *The People of the Lagoon: Sambaquis and Ecological Management on the Southern Brazilian Coast*

Sambaquis (shellmounds) are conspicuous structures at ecologically productive and diversified coastal settings along the Brazilian extended seashore. We have studied one of those hot spots in some detail. At Santa Marta lagoon area, on the southern coast, mound builders have long occupied this dynamic Holocene setting (circa 8 to 1 ky BP), thriving into dense and territorially stable social organizational structures. This long and apparently undisturbed convivial with an ever-changing environment and its ecology seems to have led to technological refinement and resource management and intensification. We consider some evidence in this regard, and a few exploratory ethnographic proxies.

Debowski, Sharon and David Doyel (Arizona State Museum)

[366] *The World as His Oyster: Our Journey with Alan Simmons*

Our journey with Alan Simmons began in Tucson, Arizona as graduate students at different institutions working for the Arizona State Museum. Through time we grew together personally and professionally and maintained contact even though often separated by space. Alan recognized early on that to get ahead he had to act on opportunities that came his way, a characteristic that would help define career. We worked together for the Navajo Nation Archaeology Program located on the Colorado Plateau, an arid region of striking beauty with a splendid archaeological record and still-living Native peoples. Here, Alan was able to pursue his interests in the Southwestern Archaic period and the origins of agriculture; among his contributions was the discovery of maize pollen in an early temporal context that was reported in *American Antiquity*. Subsequent opportunities took him to Kansas and Nevada. For years he worked in both the New and Old Worlds, but eventually the sway of the Old World won out and by the time he joined the faculty at UNLV in the early 1990s he had returned full time to his interests in the Near East and the Mediterranean. It has been a journey of places, people, work and fun.

[263] *An Alternative Explanation for a Modified Rabbit Innominate Spatulate Tool*

Bone tools are not always recognized in a zooarchaeological analysis, and often once identified, the function or use is even more difficult to define. A modified rabbit innominate found by the authors in two Jornada-Mogollon sites presented here is one such example. The authors aim to both increase awareness of these tools, and present an alternative functional use than currently proposed. The form of identified tools fit well with Shaffer's (1990) description of a modified rabbit innominate spatulate tool identified in the NAN Ranch and Pottery Mound assemblages. Use-wear analysis, suggested that these tools may have been used to process animal hides or

scrape food from inside a ceramic vessel. We suggest an alternative function for this tool type; using experimental and observational techniques, we show if slightly modified, the transverse profile of the iliac blade is a perfect fit to the rim flair on several types of pottery prevalent in the Mimbres/Jornada-Mogollon region. Suggesting this tool, uncommonly, is not only representative of a manufacture process, but can also be seen as an extension of a cultural tradition selectively expressed by members of the larger population.

Decker, Jeremy (US Army Corps of Engineers)

[241] *The Cerrito Site Monitoring Study: Adaptive Management of Recreation within a Significant Archaeological Site*

In an effort to better understand the impacts of opening recreational hiking trails near significant archaeological sites, the US Army Corps of Engineers, Albuquerque District, has initiated a study to monitor visitor access to the Cerrito Site, an early historic Ancestral Puebloan site at Abiquiu Lake in northern New Mexico. The study uses trail cameras and repeated monitoring of artifact distributions across the site to determine impacts from hikers, and to provide insight into future adaptive management practices to preserve and protect this important archaeological site. The data from this project will be used to inform future management decisions related to the preservation of archaeological sites in heavily-trafficked recreation areas.

[290] *Tiwanaku Pastoralism, Highland Bofedales, and Grasslands in Far Southern Peru: Creating a Strontium Baseline and Isoscape to Understand Cultural Connections*

Camelid pastoralism was an economic mainstay of the Tiwanaku Empire (~AD 600-1000). Communities of colonists in Moquegua, Peru were connected to their Tiwanaku capital near Lake Titicaca through an informal trade route traversing the altiplano. One component of Tiwanaku hegemony involved the movement of goods via llama caravans between the capital and the colonies. If Tiwanaku pastoralism was focused in the highlands, then camelid herding was part of an economic system integrating disparate, but interdependent, communities. Alternatively, pastoralism focused at lower elevations would suggest the colonists created economic autonomy. The analysis of carbon, nitrogen, oxygen, lead, and strontium isotopic signatures in animal bone is useful for discerning animal origins and movement. Radiogenic strontium isotopes are particularly useful markers of animal provenance. To determine the origin of archaeological animals, the strontium signature of local habitats and the spatial and temporal variability of strontium is needed. To establish a strontium isoscape for the trade route, we surveyed over 27,000 square kilometers and variably sampled water, sediment, plants, animal bone and dung from thirty-one highland bofedales and grasslands. We report the results of the strontium isotopic analyses of these materials and their implications for Tiwanaku pastoralism, culture contact, and use of environmental habitats.

[85] *Repeat Laser Scanning for Deformation Analysis in Prehistoric Earthen Architecture Rockshelter Sites: A Case Study at Tonto National Monument*

Terrestrial laser scanning has emerged as a versatile tool and standard practice for the documentation, analysis, and storage of spatial information related to cultural resource management. While laser scanning surveys are completed with multiple outcomes in mind, cultural resource managers often maintain the expectation that the data collected can be readily compared to previous or subsequent surveys to assess spatial dynamics within the site. This presentation explores a case study at the cliff dwellings of Tonto National Monument, using two sets of data collected at an approximate interval of 13 years. The presentation discusses the advantages and challenges of performing data comparison in a rockshelter context, including registration and georeferencing techniques, error budget calculation and verification, and the effects of significant changes to instrument specifications between data collection epochs.

[363] *The Origin and Spread of Antimony as a Raw Material in Metal and Vitreous Materials Making: From the Bronze Age to the Roman Period*

Antimony has a long history of use in metallurgy and glass making. The first attestation of Cu-Sb alloys dates to the 5th millennium BC (e.g. Nahal Mhismar), while its widespread adoption started around 3500 BC. Metallic antimony objects are reported in Mesopotamia (e.g. Tello, Tell Leilan, Assur, Hasanlu, Carchemish) and more abundantly in the southern Caucasus (e.g. Chambarak) from 3000 BC onwards. Sb was also commonly used as an opacifier and colourant in glass made in late Bronze Age Egypt and Mesopotamia. From the Greco-Roman period onwards, antimony is used as a decolourant in the large-scale glass industry, while its occurrence in metallurgy is much more rare.

Many questions pertain on the geographical location and nature of Sb extraction and on the nature of its adoption in several technological processes. This paper identifies the primary origin of the Sb raw materials used, tracing sources through a mineralogical and chemical characterisation of different Sb-rich ores from various regions. It compares the origin of the mineral resources used for the glass craft with the development of metallurgy, in order to reveal the interrelation of these two industries.

DeLance, Lisa (University of La Verne)**[411]** *Multi-Sited Field Curation Methods: The Belize Valley Archaeological Reconnaissance Digital Archive Project*

Since 1988, the Belize Valley Archaeological Reconnaissance Project has actively excavated archaeological sites throughout the Belize River Valley, resulting in a plethora of archaeological material elucidating nearly 3,000 years of human occupation. Beginning during the 2017 field season, the BVAR Digital Archive Project aims to curate, consolidate, and centralize 30 years of archaeological material and artifact analyses into a single database. Field curation methods include: assigning site specific accession numbers and object identification numbers to each special find, photographing, and entering provenience information for each artifact into a centralized database using the PastPerfect® Museum Software platform. This approach allows researchers to examine regional trends in the creation and usage of artifacts while also making the information readily accessible to researchers. Although in its infancy, the BVAR Digital Archive Project has already elucidated artifactual connections between archaeological sites and time periods within the Belize River Valley, providing researchers with a more holistic, regional picture of Ancient Maya lifeways.

Delgado Espinoza, Florencio and Josefina Vasquez Pazmino (University of Florida / Universidad San Francisco)**[350]** *Community Archaeology in Coastal Ecuador: Balancing Interests*

More than 20 years ago, research in Agua Blanca, Manabí, changed the way in which archaeology in Ecuador was performed. Local community involvement in archaeology research took an active role. Since then, both Indigenous and peasant communities have called upon archaeologists that can collaborate with them on studying the past they consider as theirs. In many instances, results are perceived as key on land claims and identity building. The archaeology faculty at the Universidad San Francisco de Quito created the program "Arqueología Comunitaria" in 2012 which basically engages in collaborative efforts that are above all the result of community initiatives. Here we present three cases to show how academic interest on archaeological research and community interests can be negotiated from the beginning to the end of the projects.

Dello-Russo, Robert and Vance Holliday (University of Arizona)**[187]** *Paleoindians Beyond the Edge of the Great Plains: The Water Canyon Site in Western New Mexico*

Preserved in the complex cut-and-fill stratigraphy of an alluvial fan, the Water Canyon site represents one of the most notable and rare Paleoindian sites in the American Southwest west of the Pecos River for having an in situ, stratified multi-component Paleoindian record. Paleoindian cultures currently represented at the site include Clovis, Folsom, Cody-Eden, probable Allen-Frederick, and an unnamed Late Paleoindian. In addition, the preservation at the site of an extensive buried wetland deposit provides a robust proxy archive for the reconstruction of the paleoenvironment over the terminal Pleistocene-to-early-Holocene transition (~13,100 - ~8300 cal yr BP). Archaeological remains within this deposit currently include two Cody-Eden *Bison antiquus* bone-beds – one the remnants of a kill with an associated in situ Eden point and the second an open-air processing locale - and an Allen-Frederick era *Bison antiquus* bone bed (processing area) with associated flaked and ground stone artifacts and an ephemeral hearth. Research challenges include accurate determination of age for Eden kill bone-bed in Locus 5 and nature and extent of Clovis processing area in Locus 6.

Delsol, Nicolas (University of Florida)**[153]** *Maya Butchers in Santiago de Guatemala: A Technological Analysis of the Disassembling of Cattle in Colonial Guatemala*

In colonial Guatemala, cattle constituted a vital element of Hispanic lifestyles through the supply of meat but also by providing basic materials necessary to a multitude of crafts. By the mid-sixteenth century, this flowering industry was thriving thanks to the rapid growth of herds. While the butchering techniques were likely to have been imported from the Old World together with the livestock, the historical documentation suggests that Native wage laborers provided the bulk of slaughterhouse workforces. In this paper, I will explore the extent to which butchery practices differed from the pre-Columbian ways of disassembling the animals and what the likely consequences of colonization were on the Maya butchers. I use technological approaches (*chaîne opératoire*) combined with zooarchaeological (butchery marks), ethnographic, and historical evidence to investigate how these new practical constraints and rules concretely affected the gestures and even the body techniques of the workers. This paper will also highlight how a detailed analysis of the butchery marks and the reconstruction of the gestures and implements are likely to provide information on several aspects of the craft such as the settings of the butchering facilities and the rate of work.

DeLuca, Anthony (University of Texas at San Antonio)**[221]** *Tying Sacred Places to the Landscape in Jalisco, Mexico*

People in the Tequila valleys region of Jalisco, Mexico constructed unique circular, ceremonial, monumental architecture. The public architecture has been previously argued to represent the Mesoamerican cosmos with the central altar representing a sacred mountain. I explore whether this public architecture shared in the Mesoamerican tradition of tying sacred spaces to sacred places on the landscape through the construction of sightlines towards prominent elevations on the landscape. I conduct a series of GIS viewshed analyses to look for common mountain features shared by two or more sites located in different areas of the Tequila valleys. I then tested the results of my analyses to look for statistically significant patterns in the direction of orientations towards mountains, distance from mountains to sites, and number of orientations per site. The aim of this study is to provide a preliminary assessment of whether certain alignments predicted by evidence elsewhere in Mesoamerica may be ruled out in this region of Jalisco.

Delvaux, Thomas [37] see O'Mansky, Matt

Demarest, Arthur (Vanderbilt University)**[303]** *All Roads Lead to the Verapaz: The Northern Highlands as a Nexus of Classic Period Exchange*

Prior to the Vanderbilt projects the Alta Verapaz was one of the least explored regions of the highlands with previous research limited to some test pits and cave explorations. With few known impressive constructions or monuments, the Alta Verapaz was assumed to be peripheral to both highland polities and the lowland Classic Maya cities. Vanderbilt excavations and cave explorations along the Verapaz corridors, however, demonstrated that important exchange routes with the Central Highlands, Baja Verapaz, Quiche, and lowlands passed through the Alta Verapaz. Abundant imitation Tzakol ceramics in caves on principal routes suggest lowland cultural, not political, dominance of Early Classic period Verapaz routes. In contrast, 2017-2018 investigations of Verapaz sites revealed that in the Late Classic period Alta Verapaz sites exercised control of the routes, as well as production and interregional distribution of figurines and ceramics and exchange of jade, obsidian, and pyrite with ethnohistorical evidence suggesting probable production and exchange of cotton, cacao and quetzal feathers. These explorations, projects, and compositional analyses show that the southwestern Late Classic lowland Maya border region was culturally in the shadow of the Verapaz highlands. Ongoing investigations in terra incognita are changing models of economic power in the highlands and beyond.

[165] *Discussant***Dempsey, Anna (University of Nebraska-Lincoln) and Leigh A. R. Cominiello (Crow Canyon Archaeological Center)****[261]** *Laying the Groundwork: A Preliminary Analysis of Manos from the Basketmaker Communities Project*

The data potential of grinding tools has been neglected by archaeologists since the beginning of research in the American Southwest. The study of ground stone provides an excellent opportunity to examine important aspects of life in the Pueblo past, including food production and gender, and therefore should not be overlooked. This paper uses methodology adapted from Jenny L. Adams's *Ground Stone Analysis: A Technological Approach* (2014) to analyze manos collected by the Crow Canyon Archaeological Center during their Basketmaker Communities Project. Artifact attributes such as increased coarseness, design, use-life, and efficiency were examined. Comparisons were made between the mano assemblages from six sites within a 1,200-acre project area. These consist of three Pueblo II period sites and three Basketmaker III sites, including the Dillard site, which is a large, multi-habitation site with a great kiva. The results not only show a diachronic change in mano forms and use-life but reveal a difference in grinding needs between an atypically large site and more average-sized sites.

[77] *Examining Archaeology, Society, and the Promise of Integrating 'Big' Data from Archaeological and Non-archaeological Sources*

In order for digitally published data to be useful it has to be useable, and in the case of big-data, interoperable with other data sources. This paper explores one way in which this can be accomplished through an examination of how archaeological site densities across the eastern and midwestern United States relate to social factors such as poverty, income, racial demographics, and historically disadvantaged regions over the past five decades. These analysis was accomplished through the use of data gleaned from county level summary statistics from past United States Decennial Censuses from 1960 to 2010 and the Digital Index of North American Archaeology (DINAA). (DINAA is a collaborative, multi-state effort to create an open, secure, queryable database of archaeological site data/densities across North America). Combining these datasets, while seemingly straightforward, was particularly difficult due to issues of standardization across DINAA's various partner states. Through this analysis, we hope to demonstrate the ways in which archaeology as a discipline is a reflection of American society, and identify potential biases in archaeological practice. Additionally, this paper illustrates the need for data publishers to utilize common identifiers in the structure of their published data.

[219] *Preparing for Life on the Move: Lithic Platform Characteristics and Forager Mobility*

Lithicists use various attributes of chipped stone tools to characterize hunter-gatherer technological organization, which is thought to be partly determined by mobility patterns of these groups; thus, lithic attributes serve as proxies for the amount and type of mobility practiced. In particular, lithic platform preparation has received attention as an important, reliable indicator of extra care taken to better utilize lithic cores for the production of stone tools. Greater preparation is indicated by increasingly complex platform types: cortical, simple (or plain), complex (or faceted/rounded), and abraded (or ground). In this study, we examine lithic assemblages from three rockshelters in southern Belize, each of which contain cultural materials dating from the Late Paleoindian/Early Archaic transition (~10,000BP) through Late Archaic (5000-2900 BP) time period. This era witnessed a transition from a foraging lifestyle to a horticultural one, and saw the first stratified societies emerge from otherwise egalitarian roots. Because mobility plays such a crucial role in these processes, a clearer picture of both can be gained by assessing the changes to mobility that accompanied them. By analyzing platform types in each assemblage, we trace changes in lithic technological organization and mobility through time over the course of a dynamic 7000-year period.

[191] *On the Shoulders of a Giant: Unpacking the Ceramic Economy of Greater Nicoya*

All important things are built 'on the shoulders of giants,' and in Greater Nicoya our giant is Frederick W. Lange. Over the years Fred has broken a lot of ground, likely an equal number of quills, architected our principal paths of inquiry, and inspired more than one generation of archaeologists. Through our own narrow lens, however, his greatest contribution came the day he conceived of the Greater Nicoya Ceramic Project (GNCP). We begin with a brief historical overview of Fred's many contributions to ceramic studies, with an emphasis on the ways in which the GNCP has set the stage for and guides our own compositional research. As a complement to instrumental neutron activation analysis (INAA), ceramic petrography helps to visually characterize or 'make real' the abstract, intangible data generated by the GNCP. Using case studies from Nicoya, Costa Rica, and Granada, Nicaragua, we unpack the evolution of pre-Columbian ceramic economy research in Greater Nicoya. From sherds to neutrons to volcanic debris, we have moved from once viewing the ceramic archaeological record as a sea of somewhat homogeneous ceramic debris to a nuanced appreciation of major ceramic-producing zones, centers, and individual communities, and how they interacted with one another across time.

Dennison, Meagan (University of Tennessee, Knoxville)

[34] *Stable-Isotope Analysis and Dental Micro-Wear Texture Analysis of Domestic Dogs from the Tennessee River Valley*

In the Southeastern United States, the relationship between indigenous peoples and their domestic dogs is known to be long and complicated. Dog burials and dog skeletal remains are ubiquitous from archaeological sites in the region from as early as 7,000 years ago through the Historic Period. A previous paleopathology study of Archaic, Woodland and Mississippian dogs from the Southeast (Warren 2004) revealed lifestyle changes of dogs through time, perhaps related to changing human settlement patterns. In general, these past dogs likely served an integral role in foraging and hunting, and as social companions, garbage disposers, and alarms/guards. Dietary analyses of archaeological dogs can reveal a more nuanced understanding past dog-human interactions by detailing the management practices of dogs (Guiry 2012). This paper presents the results of dental micro-wear texture analysis and stable-isotope analysis of more than 50 individual dogs from the Tennessee River Valley and the Etowah Mound Site in Georgia. Each dog was recovered as a burial, therefore skeletal and mortuary data are also used here to explore the treatment and management of dogs during the Archaic, Woodland and Mississippian Periods.

[300] *Kilns, Chiefs, and Trade: Precolonial Tradeware from the Philippines and Fujian examined through LA-ICP-MS*

Before the expansion of European interests into East Asia, a maritime network was established between imperial powers and Southeast Asian polities that connected artisans, merchants, chiefs, farmers, foragers, and others. This Early Historic period was a time of important developments that set the stage for later exchange systems. Given the size and complexity of this system, a scalar approach that examines local, regional, and interregional systems, can help to explain the process involved. This presentation will consider both production and distribution by examining polities in the Philippines and Kiln locations in Fujian, China through the comparison of tradeware chemical signatures obtained through Laser Ablation Inductively Coupled Plasma Mass Spectroscopy (LA-ICP-MS). Contrasting how tradeware vessels were obtained, distributed, and used within and between three Philippine polities (Manila, Cebu, and Tanjay) will highlight the different political structures and means by which individuals could have engaged with the system. Secondly, this research will examine the differentiation and overlap of kiln sites from southern China (Dehua, Lulin, Gou Tou Shan, and Zhangzhou wares). This research highlights the potential of a chemical approach and produces results which show the interaction of local kilns and polities within a larger regional and interregional framework.

[149] *From Margin to Center: Bias and Discrimination in Archaeology*

That archaeology is welcoming to only a narrow subset of society -- that is, cisgender, heterosexual, able-bodied, white men -- and far less so to most of us is an open secret. #MeToo stories; the blinding whiteness of the academy, the field, and the museum; and the prohibitive costs of many field schools exemplify archaeology's culture of discrimination. This paper seeks to flesh out our anecdotal experiences with data. In what ways, forms, and under what conditions does archaeology discriminate against underrepresented groups? How does bias affect career pathways? What interventions might we, as archaeologists, make to address inequity? This paper will provide an overview of the state of North American archaeology for marginalized people. By understanding the scale and structural factors of the systemic discrimination that is pervasive in our discipline, we can take the first steps toward concrete solutions.

[46] *Dynamic Cultural Landscapes: Testing an Alpine Archaeological Probability Model for Efficacy in the Northern Absaroka-Beartooth Wilderness of Wyoming and Montana*

This study tests the efficacy of an established alpine archaeological site probability model by applying it to the alpine regions of the Northern Absaroka-Beartooth Wilderness (NABW) of Wyoming and Montana. Created by Paul Burnett and Lawrence Todd, the model was specifically designed for the southern portions of the greater alpine region of the Greater Yellowstone Ecosystem (GYE). Testing the model in a new location aids in verifying the model's utility and potential to discover additional variables that improve the model's efficacy at predicting site locations. The variables used in the model presumably help track differences in landscape use over time and account for the ways evidence of prehistoric human activities is distributed in the alpine region. This model and its variables have proven effective in predicting the occurrence of archaeological materials in the alpine.

[9] *Importation of Salted Atlantic Cod (*Gadus morhua*) into San Francisco, California during the Gold Rush-Era (ca. 1849-1855)*

Records from the Gold Rush San Francisco Bay Area indicate that food items were imported to offset the depletion of once abundant wild food sources. Fish were a large part of human diets during the Gold Rush, and while we know that Pacific cod (*Gadus macrocephalus*) were fished later in the 19th century, it is unclear whether they were fished during the Gold Rush era due to difficulty in commercially capturing these fish at the depths at which they reside. We analyzed vertebrae recovered from this era to determine whether Atlantic cod (*Gadus morhua*) were important to offset food scarcity. Ancient DNA methods were used to extract and analyze DNA from five vertebrae. A region of

the mitochondrial genome known to distinguish Pacific cod from Atlantic cod was then amplified, and the products were sequenced. Four of the five samples were identified as Atlantic Cod, while the fifth sample was only identifiable to the genus level (*Gadus* spp.), suggesting that this species of fish was, in fact, imported to the San Francisco Bay Area during the Gold Rush era.

[107] *Mission to Survive: Catholic Education, Childhood, and Community on the Grand Ronde Reservation*

One of the treaty rights guaranteed by the United States government to the more than two dozen Tribes and Bands that were removed to Grande Ronde, Oregon, in the nineteenth century was a formal education. Over the years, that education has taken many forms as children from Grand Ronde have attended several different schools, both on and off the Reservation. These included Chemawa Indian Boarding School, the Government-run Agency school, and multiple iterations of a Catholic school. This presentation will address new and ongoing research on the schooling that took place at St Michael's Parish from the 1860s through the early twentieth century. Remote sensing and geophysical survey have revealed new information about the different structures that were part of the early Catholic community and historical Reservation landscape. These are complemented by archival documents, which illuminate the perspectives of some of the first priests and nuns who came to Grand Ronde. Together with oral histories and community members' stories, these sources offer a fuller understanding of the history and legacy of education at Grand Ronde.

[33] *Foragers, Herders and Harvesters: Modeling Shifts in Late Holocene Subsistence Strategies on South Africa's West Coast*

The Western Cape coastline of South Africa has been inhabited by hunter-gatherers for over 120,000 years, making it an excellent place to test models of human behavioural ecology. Of particular interest is the transition at 2000 years ago from a sedentary maritime strategy focused on intensive mussel exploitation (Megamidden Period) to three concurrent approaches using high levels of mobility: a generalist foraging strategy (wide diet breadth); the introduction of herding; and mass harvesting coastal and terrestrial resources. Each of these strategies has various social implications including ownership and storage versus sharing, and yet to date there is very little evidence for competition for resources or boundaries. Populations maintained opportunistic immediate-return strategies rather than reverting back to the logistical strategies of the Megamidden period. After decades of research on this arid coastline, it remains uncertain if these represent one, two, or even three different cultural groups. What is clear is that the greatest focus on marine resources occurs during periods that are cooler and wetter than today (high productivity) and yet they are expressed in very different forms: the Megamidden period occurs during the Neoglacial and mass harvesting during the Little Ice Age.

DeWitte, Sharon (University of South Carolina)

[310] *Sex-Specific Patterns of Survival in the Context of Urbanization and Environmental Change in Medieval and Post-medieval London, England*

Medieval and post-medieval populations in England experienced several crises, including famines and plague epidemics. These occurred at a time of increasing social inequality, urbanization, and shifting climatic conditions. This study examines temporal trends in survivorship (as a proxy for health) by sex from 1000-1739 AD using a sample of 1250 adult skeletons from London cemeteries dated to the following periods: 1000-1200 AD (n = 275), 1200-1250 AD (n = 271), 1350-1540 AD (n = 310), 1569-1670 AD (n = 212), and 1670-1739 AD (n = 182). There is significant variation in mean survival time for both sexes across these periods. Estimated survivorship declined prior to the Black Death. Survivorship is highest just after the Black Death, c. 1350 - 1540. Survivorship drops in 1569-1670 but appears to improve for males, but not females, thereafter. These results suggest that improvements in health, which could have occurred because of improvements in standards of living following the Black Death, might have been lost as the population and available resources achieved a new equilibrium from 1569-1670. The apparent upward trend in male survivorship in 1670-1739 might reflect gendered differences in access to resources or exposures to stressors at this time.

[131] *Searching for Biomarkers in Dental Calculus in the Arch Street Project Skeletal Remains*

The human remains from the Arch Street assemblage offer a unique opportunity to use nondestructive sampling techniques to study the population from the later 18th to early 19th century of Philadelphia. Many of the human remains contain at least partial dentition with calculus deposits present. The calculus is sampled and pathogenic biomarkers identified. Pathologies that are typically retained for a longer during illness such as tuberculosis and syphilis may have manifested in the calculus deposits. These results can help provide us with an idea of the overall health of the population of the cemetery during its active span (ca. 1702-1859) and perhaps provide insights into the rise and fall of certain pathologies as America approached the industrial revolution. This paper presents procedural methods of sampling as well as preliminary results from the analysis.

Di Naso, Steven (Indiana State University), David Dove, Winston Hurst and William Lucius

[420] *San Juan Redware Economy: Tracking the Pottery of Montezuma Canyon to the Great Sage Plain*

Montezuma Canyon, in extreme southeast Utah, was home to large populations during the Basketmaker III through PIII period (AD 500-1300). Potters located throughout this deeply-incised, 73 km long north-south running canyon, produced San Juan Redware pottery in abundance well-beyond the needs of the village. Archaeometric evidence indicates that locally produced pottery at some sites moved in all directions and vessels were being carried out of the canyon as far as 75km away. Through analysis of pottery and clay found proximal to major sites, we traced the pathways of hundreds of sherds from producer to consumer. Population centers in southwestern Colorado imported large numbers of redware vessels from southeastern Utah, including those found in Montezuma Canyon. Although previous research may have identified patterns of interaction between villages through identification of geochemically-similar pottery recovered from sites in southeastern Utah and elsewhere, this research established provenience between the cultural landscape (ceramics) and the geographic landscape (clay). Thus, we identified villages that produced San Juan Redware and villages that consumed it within, and outside of, the canyon. By establishing the geochemical fingerprints of sherds and clay we continue to illuminate patterns of prehistoric exchange and social interaction among the Anasazi.

[69] *The Case for Radical Inclusivity in Museums*

Museums were created for educated, wealthy, able-bodied white men. This legacy of exclusion is one that museums find difficult to accept and then rectify. As museum goers begin to expect more and incoming museum professionals demand change, these institutions have gradually begun to shift elitist paradigms into one of accessibility and inclusion. With one no longer Americans having a disability, museums can no longer afford to ignore this vibrant and intersectional community. I will share case studies of museums that are working to welcome visitors with disabilities into their spaces and engaging them cognitively, socially and intellectually. I will show that as programs become inclusive to the disabled community, they also become better for all visitors. Both practical and institution-wide examples will be shared to show that access is for everyone and can be obtainable at institutions of any size, budget and type. I will also present what the future of museums could be if we embrace radical inclusion in our programs, exhibits, building and attitudes.

[103] *The Beginning of a New Epoch: The Transition to Post-dynastic Life in Río Amarillo, Copán Valley, Honduras*

Contrary to what is reported for post-dynastic Copan, where evidence supports abandonment and reoccupation of the area by a new population, in the Río Amarillo area of the eastern section of the Copan Valley ceramic evidence supports a continual occupation that clearly displays an overlap of types and modes from both Late Classic and Early Postclassic periods. Outside of Río Amarillo's Central Area and in many of the nearby Quebrada Piedras Negras domestic groups, we have found the coexistence of Copan's ceramic assemblages with some local ceramic expressions, especially of a domestic ware that has not been reported in Copan. This type appears to have been produced in the area during the Late Classic period, persisting into the Postclassic with some modal changes. We also have some examples of vessels with a typical Late Classic Copan ceramic paste, which was used in Postclassic-produced vessels. In this paper, we will review all the ceramic data collected after seven seasons of

research and propose a pattern for the transition between different social organizations in the Rio Amarillo section of the valley.

[369] *The Soundscapes of Baja California Sur: Preliminary Results of the Arroyo de San Pablo Rock Art Canyon*

When the first Spaniards arrived in the Baja California Sur the area of the Arroyo de San Pablo in the Sierra de San Francisco was populated by the Cochimi people. It has been argued that at least for the latest Holocene the archaeological record is connected with the groups that inhabited the area. It is possible, therefore, that the rock art that was painted in the many canyons in the Sierra de San Francisco was created by them. Yet, radiocarbon dates have produced dates as early as the 6th millennium BCE. In this paper we would like to reflect on whether the ethnohistorical information about the communities living in the area when Spaniards arrived can inform us about the religious world in which the paintings were produced. Through this analysis we particularly would like to understand the way in which sounds may have helped Cochimi people to enhance the effect of the paintings and compare this with the results obtained by our archaeoacoustic tests in the Arroyo de San Pablo undertaken in March/April 2018.

DiBenedetto, Katelyn (University of Nevada Las Vegas)

[366] *Landscape and Super-Regional Scale Interaction within the Aceramic Neolithic of Cyprus*

Over the course of Dr. Alan Simmons' career, his work has challenged us to reconsider the Pre-Pottery Neolithic (PPN) time and time again. His early work on subsistence among the PPNB peoples of the Negev helped researchers to consider a PPNB without farming or villages. Throughout the late 1980s and 1990s, his work with Dr. Gary Rollefson at 'Ain Ghazal led to greater considerations for both larger villages and divergent lifeways during the Aceramic Neolithic. In light of megasites like 'Ain Ghazal, Dr. Simmons' work at Ghwair I contributed to scholars considering the complexity of smaller, remote sites. Finally, his more recent work on the island of Cyprus has helped us to better understand domestication, village life, land and water management, and regionalism within the PPN and earlier times. Inspired by the legacy of our mentor, in this paper we briefly consider how our recent dissertations on the Pre-Pottery Neolithic of Cyprus challenge our understanding of human interaction on the landscape within Cyprus as well as the nature of interaction between the PPN peoples of Cyprus and the mainland overtime.

Dickson, Catherine and Shawn Steinmetz (Confederated Tribes of the Umatilla Indian Reservation)

[19] *On the Rez, It's All Our History*

Tribal members understand history, perhaps better than most communities. It's the concept of prehistory that brings blank stares. As a non-tribal member archaeologist working for a tribe, it's my job to ensure places in the tribes' past (both distant and recent) are adequately addressed under cultural resource laws. This effort often requires reminding agencies and project proponents that not only do tribes have a pre-contact history (Of course!), but they also have a contact-era history (Hmm, maybe) and a post-contact history (Certainly not!), as well as a present (Sure!). In this paper I'll discuss places known to have been used by tribal members in the historic era, places that without the proper context archaeologists would definitely interpret as "historic" and therefore of no concern to tribes. Examples include homesteads, railroad construction, agricultural sites, and CCC projects. The discussion will raise questions about the usefulness and consequences of assigning sites to these categories.

Diederichs, Shanna (Crow Canyon Archaeological Center)

[86] *Ancestral Pueblo Essentials: Evidence for Layered Social Institutions during the Basketmaker III Period in the Northern Southwest*

A range of evidence suggests that the Ancestral Pueblo tradition of the northern Southwest crystallized during the Basketmaker III period in the sixth and seventh centuries A.D. As farming was adopted and populations expanded, social problems related to conflict mitigation, land tenure, and private property required new social institutions, the invention of which are reflected in the settlement distribution and public and household architecture of the period. This paper summarizes patterns from studies across the region which, together, reveal a layered landscape of practices operating at the household, lineage, community, and ideological scales. Social institutions resulting from these Basketmaker III period practices become essential elements of Ancestral Pueblo tradition and history over the next six hundred years.

[208] *Two Recently-Discovered Early Historic Examples of Chili (Capsicum annuum) from Arizona*

Specimens of chili (*Capsicum annuum*) are absent from prehistoric sites in the southwestern United States, but they are common in Spanish Colonial contexts. Building on a relatively recent review of northern Mexican prehistoric chili cultivation by Paul Minnis and Michael Whalen, we examine two recent chili finds in Arizona. The two finds may provide hints of the way chili use was transmitted from colonizing Spaniards to indigenous cooks, resulting in the emergence of a new aesthetic of cooking. By the mid-nineteenth century, an emergent "southwestern" style of food preparation involving the combination chilis with Iberian foods and native North American foods is evident.

Diffey, Charlotte [102] see Bogaard, Amy

Dillehay, Tom**[162]** *Anti-colonialism, State Development, and Araucanian Resilience in the South-Central Andes*

This presentation centers on indigenous proto-state or polity formation in the early Spanish period in the south-central Andes and the sociocultural conditions that shaped a specific type of archaeological record, an unostentatious material culture for a polity-level of society. The historical focus is on the Araucanians or Mapuche in the sixteenth to early eighteenth centuries, when they successfully resisted nearly all engagement with the Spanish for more than 250 years. The Araucanian polity is an interesting case for several reasons: it was comprised of locally and regionally hierarchically nested parts made up of patriarchal elite and non-elite grassroot levels and complementary sacred and domestic areas; it employed a dynastic telescopic patrilineal structure to politically managed its administrative growth and development; and it manufactured standardized and generally unostentatious architecture, symbols, and material goods to effectively manage the rapid incorporation of fragmented groups into a new indigenous state. The new state required explicit social interactions and engagement with ideological, ceremonial, and warring worlds, a process that not only "made" individual subjects, but "made" the society and its reconstituted communities, and eventually "made" the polity.

Dillian, Carolyn [17] see Bello, Charles

Dillian, Carolyn (Coastal Carolina University)**[316]** *Obsidian Characterization in East Africa*

Steve Shackley's wide-reaching research includes X-ray fluorescence analyses of obsidian from East Africa. He and co-authors explored sources of obsidian from sites in Ethiopia, providing data that informed many later studies in a relatively unknown region for obsidian studies. Our work on obsidian from mid-Holocene sites in the vicinity of Koobi Fora in northern Kenya has yielded evidence of regional interactions that at least partially relied on watercraft, raising questions about use of lacustrine resources more broadly for hunting-fishing-gathering peoples. These data broadly inform our understanding of the transition from hunting-gathering-fishing to pastoral economies throughout the mid-Holocene in East Africa.

[20] *The Significance of Robustly Identifying Microbes in Archaeological Samples of Humans and Domesticated Animals*

Genetic species identification of archaeological specimens is difficult due to low DNA content and degradation. Yet specific and accurate identification of microbes is essential not only for identifying how diseases affect human health, but also the health of domesticated animals. Therefore, we created a method for identifying microbes via aDNA, that quantifies the confidence of the performed identification. We present two case studies to highlight the utility of our pipeline in archaeological studies of microbiomes.

By using ancient dental calculus samples from an English Victorian-era population, we have attempted to identify bacterial species within the sequences generated from the substrate. Thus far, we have detected positive signatures for the causative agents of diphtheria and pertussis. Our findings highlight the potential of ancient dental calculus to act as a reservoir for respiratory pathogens, that can be indicative of the health status of past human societies.

In search for ancient animal pathogens, examining the non-endogenous DNA of ancient chicken, pig and dog

samples allowed us to identify the causative agents of diseases, that became prevalent in a post industrial revolution world. These findings are indicative of how human activity can reshape the landscape of animal diseases, through altering the natural environment.

[35] *Revisiting the Ideal-Free Settlement of the Caribbean Islands*

The settlement of the Caribbean Islands represents one of the most expansive and significant overwater population dispersal events in the history of the New World. While it is generally accepted that the Caribbean was settled from northern South America beginning in the mid-Holocene and involved a series of episodic voyaging events, more precise aspects of the timing, patterns, and causes of this island colonization process remain unresolved. Here, we build on previous applications of the Ideal-Free Distribution model to help explain island-scale geographic patterns in settlement. Our approach combines a newly created large radiocarbon dataset of over 2,000 radiocarbon dates with Bayesian chronological and spatial modeling to explore the relationship between habitat suitability and patterns of initial colonization and temporal lags in settlement (i.e., Allee effects). Results provide greater insight into how and when the Antillean chain of islands were settled prior to European contact in the 15th century and help to resolve some longstanding chronological disparities of when some islands were colonized at different points in time, but not others.

[398] *Classic Maya Food Systems and the Sociality of Diet in the Usumacinta Region*

The ancient Maya utilized a range of landscape modifications for agricultural production, including terraces and raised fields. These agricultural strategies were tied into food systems that also included taxation and tribute, all significant components of a political economy that may have reflected autonomy, exploitation, or both. Using a paleoethnobotanical approach, here I investigate evidence of agricultural production in the Usumacinta region. I also focus on social aspects of food practices, and the ways in which such practices may have been altered as smaller sites became subject to the rule of Piedras Negras. This results in a contribution to current understandings of Classic Maya agricultural production and food systems. I frame my research relative to contemporary and historical data on farming, diet, and food plants, including present-day discussions of food sovereignty.

Diserens Morgan, Kasey (University of Pennsylvania)

[105] *Building a Façade: When Political Involvement Changes the Narrative, Fabric, and Value of Historic Sites*

This paper explores the ways in which local government involvement in the restoration of historic structures and archaeological sites can change the ways in which they are valued and used by local communities. How do opinions surrounding heritage change when people are confronted with differing actors imposing differing values on historic properties? How do tourism and heritage managers contribute to the continued othering of narratives that run counter to a nationalized and standardized view of indigenous histories? I focus on a recent government restoration program of ten historic structures located in Tihosuco, Quintana Roo, Mexico. The program was initiated without significant input from those that live in the houses, and even less input was garnered from other members of the community. For the government actors, this project was a political tool, with the potential economic benefit of creating a small-scale tourist attraction in town. I documented both the changes made to the buildings, but also the changes in the attitudes about the government, the houses, tourism, and the legacy of their history.

[22] *Excited about Archaeology: Opportunities for Students at a 4-Year University*

Despite rising tuition costs and decreasing budgets, students at 4-year public institutions still seek out opportunities to engage in archaeological fieldwork, laboratory and museum research, regardless of whether they plan to go on to graduate school in anthropology or to pursue careers outside of academia. An appreciation of cultural resources and environmental change over time serves students in good stead in a variety of career paths related to sustainability, environmental protection and cultural heritage. Students at 4-year undergraduate schools may have a difficult time finding the money and time to travel far for field school or internships, but offering projects close to home serves the dual purpose of gaining valuable experience attainable but also in helping to educate students about the cultural resources found in their immediate area. These experiences make the students more competitive if they plan to go to graduate school, but are also applicable outside of academia. The multidisciplinary nature of archaeological fieldwork and research coordinates with STEM, social sciences and humanities in a way that has the potential to enrich both the students as well as local communities, wherever they are located.

[92] *RTI Photography Part of a Greater Whole in Archaeological Documentation Methodology*

Digital photography has ushered in many new methods of documenting archaeological resources in the past 15 years. Many of these new methods have been flawed because of a misunderstanding of the potential of the digital technologies and the analog methods they replace. Reflective Transformation Imaging (RTI) photography is a relatively new technique to document geometric surface textures and gather high resolution dynamically lit surfaces of archaeological resources but it is not a replacement for onsite drawing and mapping. Nor is photogrammetry a replacement for mapping; these are all components in a greater strategy of archaeological documentation, blending analog (traditional) methods with digital technologies to enhance our understanding and public accessibility to the archaeological resources we all share. Digital file management and migration is a concern regarding these new techniques and recognition of redundancy is necessary. A greater discussion of traditional methodologies and emerging technologies and practices is needed to ensure a complete, accurate, and archival record of the resources documented by archaeologists today. In this paper we will highlight a case study of traditional and digital documentation from Xunantunich, Belize.

[200] *The Politics of Archaeology: Reflections on the Early Decades of the 21st Century*

In 2003, Bradley Parker co-organized a workshop at the University of Utah exploring the politics of archaeology, with emphasis on the Middle East. Both at the workshop and in the resulting edited volume, *Controlling the Past, Owning the Future: The Political Uses of Archaeology in the Middle East*, contributors considered the actors who were appropriating and managing archaeology with a predominant focus on nation states or nationalistic movements representing emerging new states (e.g., the Palestinian Liberation Organization). Since then, many new, non-state actors have come to the fore and are taking leadership positions that influence the politics of archaeology. Operating in many arenas, such actors are appropriating ownership, management, preservation and investigation of the archaeological record at all scales. In this paper, we will explore the changes these actors are making in three different operational areas: cyberspace, research funding and advocacy. Our goal is to reflect on the work done at the University of Utah workshop and to provide an updated perspective on the intermingling of archaeology and politics of the 21st century.

[210] *Implications of Stable Isotope Values from the Skyrocket Site (CA-Cal-629/630)*

This poster summarizes the analysis of 60 AMS ^{14}C dates, including the associated stable isotopes of $\delta^{13}\text{C}$, $\delta^{15}\text{N}$, and $\delta^{34}\text{S}$ for human burials from the Skyrocket archaeological site (CA-Cal-629/630). Located 40 miles east of Stockton, California, these burials span a period in which there was a change in subsistence, as evidenced by material culture, macro-botanicals, and pollen. The change detected here began 2,500 years BP and, in particular, $\delta^{34}\text{S}$ values suggest a reduced reliance on acorns and development of a more diversified economy.

Dodge, Robyn (The University of Texas at Austin) and David M. Hyde (Western State Colorado University)

[30] *Ongoing Research at Hun Tun and Medicinal Trail Community: The Ancient Maya Hinterland of Northwestern Belize*

This paper discusses features and material culture from two hinterland settlements located in northwestern Belize, Hun Tun and the Medicinal Trail Community, east of the ancient Maya urban center of La Milpa. Residential groups include formal courtyards with "expensive" structures at one end of the continuum to numerous informal clusters of mounds at the other end. Also present at these two settlements are numerous cultural landscape modifications such as terraces, depressions, chultuns, chich mounds and linear berms. The ancient residents of these communities were non-elite agriculturalists and crafts people. Archaeological evidence shows that substantial internal social stratification occurred throughout both sites indicating a complex social structure among ancient Maya commoners in the hinterlands. The function and interpretation of these two hinterland settlements will be discussed, and the role they played in contributing to the larger, regional influence of the La Milpa polity.

[373] *Staying Afloat: A Comparative Case Study of Angkor Wat and Tikal's Management of Water*

This presentation is a large-scale comparative case study of two distinct regions to see how their use and control of water was similar given their environments but different from social, political, and cultural perspectives. Specifically, I examine the sociopolitical nature of Angkor Wat as an expression of ancient Khmer culture and the Classic Maya city of Tikal, Guatemala. These two elaborate polities emerged in similarly challenging environmental settings, which impacted the way they utilized and manipulated water as a natural resource, vital to the success of their civilizations. Both societies had advanced hydraulic infrastructures for managing water for domestic and ritualistic purposes, and they were both located in semitropical regions with dense rainforest. By utilizing GIS and remote sensing, I incorporate geological principles of spatial analysis to examine water control from a remote perspective. I discuss how advancements such as LiDAR have impacted our understanding of these societies in a holistic sense, with specific reference to water control. I discuss the iconography intrinsic to public architecture at both polities to explore how the idea of water was presented in a religious manner.

Dodson, Timothy (Arkansas Historic Preservation Program)

[22] *A State Agency's Perspective*

I offer a perspective of why archaeology should be a part of all students' educational journey as a way to cultivate critical skills and educate well-rounded, successful members of society. As an individual in charge of assessing the effect of local, state and federal undertakings on cultural resources, I continually stress that valuing, protecting and studying cultural heritage does not impede progress but enrich it.

In this paper, I offer examples of how archaeology engages the public and the hiring of individuals with archaeological education by government agencies, not only increases their ability to assess heritage sites, but allows them to better represent their constituents. This better representation, leads to better designed, more meaningful undertakings.

[313] *Protecting Cultural Landscapes, Famous and Not, as the Threats Increase*

Far beyond the "Instagram ready" cliff dwellings of Bears Ears, southeastern Utah holds cliff cultural landscapes of immense value for Native American tribes, scientific study, and heritage tourism. The sheer number of archaeological sites, combined with an incredible degree of preservation, makes this one of the most important archaeological areas on earth. At risk from over-visitation, energy development, looting and vandalism, irresponsible motorists, and other threats, these understudied and often unrecorded sites present a major challenge for conservationists and land managers. The "cowboys versus Indians" dynamic and political battles certainly don't help. This paper discusses what two non-profit organizations - Archaeology Southwest and Friends of Cedar Mesa - are learning as they work to protect cultural resources, advocate with land managers, educate the public, and engage the scientific community.

[323] *Discerning Paleoindian Mobility in the Eastern Great Basin: A Geochemical Analysis of Lithic Artifacts from Bonneville Estates Rockshelter and Smith Creek Cave*

Lithic technological organization studies and geochemical analyses provide a useful way for archaeologists to examine prehistoric forager mobility. In the Great Basin, these methods, when applied to assemblages from multi-component sites, have revealed diachronic changes in lithic raw material procurement patterns between the Paleoindian and Early Archaic periods; less often, however, has there been an opportunity to explore variation in raw material procurement in coeval Paleoindian assemblages from buried and dated contexts in the same region. In the current study, new and existing geochemical data are compiled from the lithic artifacts from the Paleoindian components of two sites in eastern Nevada, Bonneville Estates Rockshelter and Smith Creek Cave. Both of these assemblages contain Western Stemmed bifacial points and associated debitage, and both are associated with hearth features dating in excess of 12,000 calendar years ago. The results provide important information regarding variability in Paleoindian mobility in the eastern Great Basin - not just the differential conveyance of the various kinds of lithic materials transported to the shelters, but also the duration of occupation at the shelters and the organization of Paleoindian technology.

[316] *Translucent but Opaque: Obsidian in the American Southwest and the Mesoamerican (dis)Connection*

The movement of people, objects, and ideas between the American Southwest/Northwest Mexico (SW/NW) and Mesoamerica is one of the most enduring and debated research topics in American archaeology. Pueblo and Mesoamerican groups prominently used obsidian for hunting, warfare, and ceremony, but is there Mesoamerican obsidian in the SW/NW and in what contexts? Steve Shackley has geochemically characterized thousands of obsidian artifacts using XRF spectrometry to connect people to places to things, but interestingly, groups in the SW/NW did not use obsidian from Mesoamerica or West Mexico. If leaders in Chaco Canyon, Hohokam, Mimbres, and Casas Grandes needed macaws, cacao, copper, and Mesoamerican-like iconography and architecture, why did they not need obsidian prismatic blades and anthropomorphic eccentrics? To thank and to honor Steve for his extensive and prolific career, I present new data, showing Pachuca obsidian was used in northern New Mexico, but during the sixteenth century by the Spanish. I discuss why Mesoamerican obsidian was not used or needed in the prehispanic SW/NW. I address why the absence is significant for evaluating models of interaction and circulation of goods between two of the most studied regions in obsidian studies.

[252] *Prehistoric Pointillism: Rock Art Near 'Amlah, Oman*

Rock art is one of the most ubiquitous archaeological features in southeastern Arabia, yet it remains one of the most poorly understood aspects of the region's prehistory. Re-occurring motifs of people, weapons, camels, horses, and other animal figures appear in similar forms across the UAE and Oman, and many were produced utilizing similar methods. Though they offer a unique gateway into the symbolic worlds of Arabia's ancient inhabitants, the study of Arabian rock art is complicated by issues of dating and documentation.

This paper explores the discovery of over two-hundred petroglyphs in the Omani interior near the UNESCO World Heritage Site of Bat. Documented during a winter 2017 survey, these examples of ancient art are spread over five limestone boulders located near the modern settlement of 'Amlah, Oman. The various images were impressed on limestone with percussion, in a fashion resembling a prehistoric form of pointillism. Although interpreting these complex and temporally-dynamic features remains difficult, the proximity of these petroglyphs to a nearby Iron Age cemetery offers new insight into their meaning and connections to other rock art sites in the region. The paper concludes by examining new outreach-based strategies for preserving this open-air site.

[415] *Why Pursue Fish in Small Quantities? The Case of Ancestral Puebloan Fishing in the PIV Middle Rio Grande*

In prehispanic central New Mexico, small numbers of disarticulated fish remains—such as catfish, sucker, and gar—are frequently recovered from Pueblo IV (AD 1350–1600) sites in the Middle Rio Grande basin, but they are rare during earlier agricultural time periods. Increased aquatic habitat quality brought on by the end of the Medieval Warm period could have impacted the foraging goals of energy maximization and risk minimization for Ancestral Puebloans in the region. The energy obtained by Ancestral Puebloan fishers could have been maximized because fishes provided more calories due to increased fish body size. In addition, fishes could have been more successfully harvested per fishing episode, making fishing less risky, because the stability of fish communities was greater than it was previously. However, the intersection of risk minimization and energy maximization foraging strategies regarding Pueblo IV fishing is speculative and should be tested. Here, I estimate the body size of Middle Rio Grande fishes and analyze the stable carbon and nitrogen isotopes of fish bones recovered from archaeological sites in the region to begin to tackle this problem.

Domeischel, Jenna (Eastern New Mexico University)

[297] *Deaccessioning for Education: It's Not a Four Letter Word*

Archaeological curators struggle with the growing number of collections in our repositories, a phenomenon commonly referred to as the 'curation crisis.' Yet 'crisis' is an acute term, when the problem is instead chronic. The discipline of archaeology marches on, and so must repositories, even as the quantities of collections increase every year. We must find increasingly effective ways to make collections work for us, rather than against us as drains on space, time, finances, or manpower. At Blackwater Draw, deaccessioning is viewed as revitalization, not inherent loss. Collections are re-imagined as ambassadors of knowledge, bringing the stories of past peoples out of the repositories and into the present day. Through selective deaccessioning we redistribute collections more appropriately for their size, item quantity, or classification, while simultaneously reinvigorating community programming, STEAM education, or specialized university curricula. Through education initiatives at Blackwater Draw and elsewhere around the nation we hope to see a growing understanding of the benefits of deaccessioning change to a willingness to incorporate it into our archaeological toolkit.

[243] *Colors and Chants of the Flower World: The Use of Organic Colors in Pre-Hispanic Mesoamerican Codex Painting Traditions*

The performance of non-destructive chemical analyses on Mesoamerican codices has provided an unprecedented understanding of the technological diversity of pre-Hispanic codex-painting traditions, as well as of their patterns of change in early colonial times. One of the most striking results has been the recognition that pre-colonial Central Mexican and Mixtec codex painting practices – in contrast with genres such as mural painting – clearly privileged the use of organic colors, mostly extracted from flowers.

This paper argues that this preference – which also required the development of complex techniques for the production of lakes and hybrids – depended on a deep-rooted, culturally established link among color, brilliance, flowers, and speech. Indeed, organic colors infused the manuscripts' pages with a brilliance that was arguably seen as the manifestation of the creative power of speech, a power that Mesoamericans used to express through the flowery visual and linguistic metaphors of sprouting, bursting, or emitting fragrance and dew. The conjoining of the results of scientific analyses with visual and textual sources illuminates the link between color materiality and Mesoamerican esthetics, and shows how painting practices and technologies were conceived as meaningful ways to express the generative power of the Flower World.

[181] *Combustion as a Process of Reconfiguration of the Historical Space: The Potrero Mendieta Context in Southwestern Ecuador (~3000 BCE)*

In this presentation, the historical processes of the Formative Period in the Ecuadorian Andes are evaluated through the material renderings of fire from the site Potrero Mendieta. In this context, they are associated with a swift restructuring in the use of the circular architectural structures identified at the site and immediately precede the interment of the structures and the possible abandonment of complex during the 9th century BCE. The site may have been occupied as early as 3,500 BCE and this shift, associated with a well-used hearth, occurred at the end of the culture-history placement of the Initial Period. This event coincides with the rapid reconfigurations in settlement patterns seen in the region. Moreover, burning and interment events would have reconfigured the experience of time and place for the inhabitants, who had connections that spanned the central Jubones River Basin (Ecuador) and extended to the Amazonian cloud forest to the east and to the Pacific coast to the west. The event associated with this hearth would have altered their social interaction processes and their shared experience of the historical landscape.

Menard-Hodges (3AR4), also known as the Quapaw village of Osotouy, is a Mississippian site along the Arkansas River in southeastern Arkansas. Professional excavations have yielded French trade goods and various diagnostic artifacts that supports a predominantly Mississippian-to-protohistoric origin. The site also includes several mounds, the largest of which, Mound A, is conical and ~10 m high. It adjoins a ~4 m high platform, Mound B. Questions about chronology, construction, and taphonomy of the mounds remained unanswered until 2016 when we initiated geoarchaeological investigations. Using solid-earth cores and electric resistivity profiles, we provided details about when and how the mounds were built. Resistivity profiles between Mounds A and B indicates that their apparent conjoining may have resulted from erosion of Mound A, and is not necessarily purposeful. Radiocarbon ages from cores around the mound bases indicate the mounds were built and used from AD 1400-1550 and apparently stable until the 20th century. After ~AD 1930-1950, large trees, particularly on the sides of Mound A, caused gravity slumps. This project has scientific and methodical value, and provides information to formulate effective management, stabilization, and mitigation plans for the mounds. It also offers details to the Quapaw descendant community about their ancestral village.

[416] *Assemblages of Stone Artifacts in the Region of Shuiyang River, South China: LCTs and Model 2*

Most scholars supported that there were only choppers or chopping tools in East Asia among Paleolithic time, while in the west side of the old continent the innovation of technology is obvious. In China, archaeologists have already found some important regions which are characterized with large cutting tools such as handaxes, cleavers, picks, and knives during recent years, including Bose Basin, Luonan Basin, Danjiangkou Reservoir Region, and Dingcun Site. In the region of Shuiyang River, we have surveyed and excavated several sites which buried on the second or third terrace, such as Chenshan Site, Maozhushan Site, Guanshan Site, Wulipeng Locality and so on. We successfully separate a small amount of large cutting tools from the whole assemblages of stone artifacts buried in vermicular red earth. In this paper, we will analyze these lithics discovered in this region. We will also try to explain why such large cutting tools appeared in this region in Middle Pleistocene.

Dongoske, Kurt E. (Zuni Cultural Resource Enterprise)

[75] *Making Mitigation Meaningful to Descendant Communities: Examples from the Pueblo of Zuni*

Mitigation of adverse impacts to an archaeological resource within cultural resource management is commonly achieved by implementing a data recovery plan. The principal focus of the plan is to recover scientific information that would otherwise be lost. Under this venue, the primary significance of the site is its evaluation under criterion d – information potential. Rarely is commensurate consideration given to the emotional, psychological, perspectival, and spiritual values that descendent Native American communities attribute to these places by considering their importance under criteria a & b. Balanced design of mitigation measures is seriously lacking from putative CRM practice resulting in descendent Native American communities being disenfranchised through the silencing of their voice in the management of their own heritage. This presentation examines past and on-going positive and negative conversations between federal agencies and the Pueblo of Zuni to design mitigative strategies that are meaningful to the Zuni people. Examples are discussed where successful mitigation of an adverse effect to a Zuni traditional cultural property is impossible and in those instances the quantified direct, indirect and cumulative impacts, both emotionally and psychologically, to the Zuni people are left unconsidered.

[323] *A First Look at Western Stemmed Tradition Lithic Reduction and Procurement Strategies at Connley Cave 4, Oregon*

Western Stemmed Tradition lithic assemblages are typically small at buried, Younger-Dryas aged sites throughout the Great Basin. Recent work at the Connley Caves, in the Fort Rock Basin of south-central Oregon, has uncovered

a rich cultural assemblage containing projectile points, scrapers, flake tools, cores, abraders, graters, and thousands of lithic detritus. This poster presents a debitage analysis of the Western Stemmed Tradition component at Connley Cave 4. Technological strategies are placed within the context of source provenance analysis of both tools and debitage to illuminate broader patterns of lithic reduction, procurement, and landscape use.

[412] *Just a Matter of Time: Preliminary Ceramic Chronology Building in Central Nicaragua*

The archaeology of central Nicaragua offers a challenging arena for the deconstruction of traditional ceramic chronology discourses in Southern Central America. The 'anthropology of techniques' approach and ethnoarchaeological research have determined that the most stable steps in ceramic manufacture are connected to socially learnt bodily gestures materialized in the shaping of vessels. In contrast, other stages of the production process are more susceptible to synchronic and diachronic changes. Hence, the temporal and societal implications of ceramic decoration variability as the proxy for chronology building requires re-evaluation. In this paper, I present the results of my doctoral research at Leiden University. The project included a systematic surface survey and stratigraphic excavations in the Mayales river subbasin. Ceramic analysis was outlined through a technological approach to manufacturing practices, comprising of macro-fabric, macro-traces, compositional analysis, and formal examinations. Using this methodology, alternative choices in the operational sequence of ceramic production were identified in their specific spatial and temporal context. These choices are interpreted as representing the intersection and interweaving of various processes that may interrelate to other practices, such as foodways and dwelling, with differential temporal rhythms that operated in dissimilar times spans and with different frequencies and amplitude in variability.

[211] *Bridal Veil Lumbering Company: A Glimpse into an Intact Early Logging System in the Columbia River Gorge*

Logging was an economic and cultural pillar of the Pacific Northwest. The Bridal Veil Lumbering Company, a logging company operating in the Columbia River Gorge in Oregon State, was the longest continuously operating early lumber mill west of the Mississippi. The company spanned a timeframe that encompassed a wide range of technologies, immigration trends, and safety regulations. Until recently it was thought that the Bridal veil system was not intact—broken up by roads, previous development, and looting. USFS Archaeologists working in the vicinity during the Eagle Creek Fire in 2017 documented previously unknown portions of the system. Later research revealed that LiDAR technology could be used in targeting further documentation. In 2018 a Passport in Time project was coordinated to identify and document more of the system and assess it for integrity. The project is expected to continue for several more field seasons. This poster documents the preliminary results of the project.

[265] *Changes along a Native Transportation Corridor in Western Massachusetts: The Fife Brook Sites and the Deerfield River*

A cluster of Native American sites was first identified in the early 1970s at the junction of Fife Brook and the Deerfield River in western Massachusetts, and was further examined 15 years ago. Recent additional work has expanded knowledge of site distribution on this portion of the Deerfield and added to the inventory of material culture from sites near Fife Brook. The sites in this cluster range from the Late Archaic to the Woodland Period, and include intact features, fire-cracked rock, lithic tools, and pottery. This paper presents the new data gathered in 2018 in comparison to other known sites along the Deerfield, including the nearby cluster of sites at the junction of the Deerfield with the Cold River. The Fife Brook sites were located along a major transportation corridor between both New York State and southern Vermont and the Connecticut River, which was used for many millennia following glacial retreat. The Fife Brook sites and those along the wider Deerfield River are examined to look at how Native material culture has changed over the past thousands of years.

[265] *Always Changed But Never Gone: A Century of Farming in Southeastern Massachusetts.*

The Anthony Farmstead historic site (SOM.HA.4) in Somerset, Bristol County, Massachusetts, was excavated through the data recovery level in anticipation of the construction of an electrical substation on the property. The site included remnants of an eighteenth- and nineteenth-century farmstead, including a cellar hole, well, outbuildings, field system, and burial ground. As a part of the data recovery efforts, extensive documentary research was conducted into the property's ownership and residential history, as well as the family histories of the people who once inhabited the land. This paper will compare evidence of changes in the productive and domestic use of the property to the documentary results, particularly related to how these observable changes correlate with property transfers. The economic and productive histories of the various owners and tenants will be examined through the analysis of recovered cultural materials, and through the lens of Massachusetts' history of pre-Revolutionary European colonization and later waves of immigration connected to the Industrial period, as well as the general trend across the region of a shift from subsistence to commercial farming.

Activism through ethical community engagement is now a requirement, rather than an elective, of all scholars. Archaeologists have a responsibility to mobilize our understanding of the past, especially to achieve mutual goals we have with modern community partners with whom we work. As an example, we present a case study that focuses on the cultural heritage of mining communities in southwest Transylvania (Romania). These mining communities are currently in a showdown with a transnational mining company that seeks to strip mine and use cyanide to extract gold from this region, which is home to the largest gold deposits in Europe. The mining project threatens the environment, cultural heritage, and challenges how people create communal identities. Prehistoric mining, prior to the emergence of institutionalized inequality and world systems that marginalized mining communities, may hold a key to understanding how an alternative, more sustainable approach to mining might be organized. We argue that it is necessary for policy makers to consider insights from archaeological research when developing new public policy on sustainable mining.

Dortch, Joseph (University of Western Australia), Tom Whitley (Sonoma State University) and Peter Veth (University of Western Australia)**[305]** *Shellfishing Transitions with Sea Level Rise across the Dampier Archipelago*

This paper takes a zooarchaeological approach to the investigation of social and demographic changes that may have influenced Holocene rock art production in the Dampier Archipelago, northwestern Australia. Rising sea levels transformed the former Dampier Ranges into peninsulas by 8 ka, and then mega-islands by 6 ka. In the peninsular phase, Aboriginal people exploited the intertidal gastropod *Terebralia*, leaving compact, dense shell middens on landmasses that are now the outermost islands of the Dampier Archipelago. From 6-4 ka, with continuing sea level rise, Enderby and Rosemary Islands became smaller and the sea crossings between them and the mainland more challenging. Late Holocene Aboriginal use of these outer islands appears to have changed to logistical camps supporting seasonal, targeted hunting of large marine vertebrates. At this time, on the more accessible inner islands and Murujuga (the present-day Burrup Peninsula), Aboriginal people exploited the intertidal bivalve *Anadara*, creating large middens. The early Holocene peninsula and mega-island phases appear to represent dense residential populations – but were they comparable to the Late Holocene populations on Murujuga? Taking into account taphonomic and environmental variables, shellfish species abundances and age profiles in dated midden deposits suggest that zooarchaeological transitions reflect structural changes in regional populations.

Dove, David**[398]** *Feasting and Shrine Formation at Mitchell Springs and Champagne Spring*

Although most archaeologists agree that large-scale feasting occurred in the prehistoric Southwest, excavations have produced little direct evidence for it. Villages where feasting has been asserted had large populations, public architecture (monumental buildings, shrines, plazas, etc.), and often deep antiquity. Recent excavations at two such sites in southwest Colorado have revealed some of the clearest direct evidence for feasting. At the Mitchell Springs and Champagne Spring site complexes, large-scale feasts appear to have been hosted by powerful households in plaza-associated buildings where special facilities were used to prepare, cook, and hold large quantities of food at a warm temperature. Over time, some feast venues acquired layers of social memory and ritual associations that reaffirmed links between residents and ancestors and the spaces they both lived upon. Many of the plaza-associated buildings where these feasts were hosted were decommissioned in impressive ritualized events that involved packing structures with important items and burning them, ritually offering meaningful property, sealing important features and structures, and/or sacrificing animals. Some of these buildings became shrines that served as venues for feasting and appear to have acted to venerate space and ancestors who lived on that space.

Between A.D. 900 and 1250 major forces of change were operative among the Phoenix Basin Hohokam. These changes include a shift from ball courts to platform mounds as major public architectural features. What is the meaning of these mounds? A diachronic approach is used to investigate the origins and development of platforms as a new architectural feature type and as a new approach to social signaling. Examples of early platforms like those excavated at Snaketown and Gatlin are analyzed to address construction dynamics, as even these small early platforms, which existed at villages in both the Gila and Salt River valleys, exhibit complex architectural patterns. Context is explored to adduce what this Mesoamerican-inspired architectural feature might have represented in terms of belief systems, ideology, social organization, and other factors. The possibility is investigated that among

other functions early Hohokam platforms may have been associated with ancestor veneration as public spectacle within the context of population growth. The more massive platforms of the later Classic period in the Phoenix Basin have remnants of these earlier platforms within their footprints. Did social signals associated with platform mounds remain stable or did they change through time?

[63] *Multiproxy and LiDAR Evidence for Intensive Maya Wetland Agriculture along the Rio Bravo River*

We present preliminary results from a newly discovered Maya wetland canal and raised field system found along the Rio Bravo River in Northwest Belize using airborne LiDAR. The LiDAR data reveals canals and raised fields in a very rectilinear pattern that suggest planning and organization for many kilometers down the floodplain near the site of Wari Camp. In fact, these fields may be the most rectilinear and extensive known the region. In the summer of 2018, we surveyed the canals on the ground and conducted 3 excavations in the raised fields and canals, an excavation of a platform terrace on a hill in the floodplain, and took soil cores from a main feeder canal that still had water. We found a well-developed paleosol about 1.2m below the surface of the raised field, similar to other systems in the region. High gypsum in the soils likely precipitates from the sulfate rich groundwater, posing a challenge for agriculture without proper management in addition to seasonal variation in water levels. Carbon dates and geochemical evidence constrains the timing of creation and abandonment of the canals in the archaeological context, and possible environmental challenges this ecosystem engineering could overcome for intensive agriculture.

[204] *Indigenous Grape Wine and Black Drink Production in Pre-Hispanic Texas*

This paper presents the result of microfossil and organic residue analysis from 54 Leon Plain sherds from six Terminal Late pre-Hispanic (Toyah Phase) sites in the American Southern Plain. Small (3-5 cm square), undecorated body sherds were chosen from six Toyah sites with large ceramic collections in central and south Texas. This study combined methods for microfossil (starch and pollen) recovery as well as absorbed organic residue analysis with liquid chromatography coupled mass spectroscopy (LC-MS/MS). Microfossil recovery was successful, but too sparse to accurately reflect use. Absorbed residues were successfully extracted; biomarkers associated with Black Drink (Yaupon Holly tea) and grape wine were identified in several sherds. This study is the first to find evidence chemical residue evidence of Black Drink production in Texas and the first to find evidence for indigenous grape wine production in the Americas.

[30] *Exploring Trends in Mortuary Behavior among the Ancient Maya of Northwestern Belize*

Studies of ancient Maya mortuary patterns have asserted that Maya burials do not adhere to a singular mortuary pattern (Ashmore and Geller 2005, Fitzsimmons 2009, Geller 2004, Ruz Lhuillier 1965, Welsh 1988). However, many of these same studies also suggest that a review of data specific to certain contexts (inter-site, time period, region, and/or social class) may yield new trends that have not yet been identified. Through ongoing excavations and reviews of past-recorded Maya burials, regional, small-scale data sets of mortuary behaviors are available to test these assertions. This presentation explores burial data recovered from 25-years' worth of excavations in northwestern Belize. A total of 123 individuals represent 2000 years of Maya mortuary behavior across 12 archaeological sites of varying sizes and types. Observed patterns are presented with the aim of exploring mortuary variability and commonality, and to spur future investigations into regional interaction and fluidity through time among these geographically and temporally complex culture groups.

[195] *Forensic Methods for the 3D Reconstruction of an Infant Burial in Arma Veirana Cave, Liguria, Italy*

Spatio-temporal models can function as detailed digital surrogates of archaeological sites, providing the context and content needed to enable analytical reasoning by means of interactive visualization. The starting point is often surveying techniques based on light detection and ranging as well as photogrammetry, which have been readily adopted into the digital archaeology toolbox, creating a means to construct a site and artifact specific 3D/4D data scaffold. The data at the source of digital surrogate creation has to be verifiable, accurate and trusted, and the Arma Veirana cave in Liguria, Italy has served as a catalyst for the synthesis of multiple site documentation and analytics techniques, creating a comprehensive cave model and coordinate system, and a catalog for the tracking of all artifacts. For this study, an infant burial was documented using calibrated and spatially referenced camera systems, allowing for camera correction, geometry extraction and alignment as part of the model synthesis workflow. Photogrammetric models of both specific artifacts and broad overviews containing common georeferenced markers are joined to create such a baseline model. The resulting digital surrogate allows for the analysis of the complex arrangement of burial goods, erosional displacement, and the documentation of delicate remains before removal.

[264] *Navajos, Traders, & Tourists: Cultural Patterns in the Architecture of Trading Posts*

Spatial organization and architectural form derive (at least in part) from a template that is unique to a given society or culture. This might include ideals of building form, materials, and layout, as well as the direction of movement and behavior into and through a space. Trading posts in Navajo country present an opportunity to explore this question. Initially built by Anglo traders to meet the needs of Navajo customers, posts were later adapted to accommodate a burgeoning tourist trade. A mixed heritage and shifts in function and emphasis should select for traits that reflect Navajo and Anglo building traditions and that changed over time as the tourist trade became more important. This study, drawing from a photographic survey of 30 posts, considers elements of architecture, interior space, and patterns of movement across that space.

Dubois, Jonathan (Cal State San Bernardino)**[339]** *One of Many Centers: Evidence for Precolumbian Cosmopolitanisms in the Rock Art of Huánuco, Peru*

How might we better understand interactions between contemporary peoples of the past from different geographic regions with distinct cultural practices? I propose to address this question from the perspective of Precolumbian cosmopolitanisms: a theoretical framework that allows the investigator to examine the interregional interactions evident in material cultural remains, while simultaneously considering how peoples' distinct, autochthonous beliefs and practices distinguish them. Precolumbian cosmopolitanisms offer a lens that enables the viewer to preserve attention to rooted local practices while seeking to investigate the routes of extralocal interactions. I briefly review some of the data that demonstrates that a cosmopolitanism existed prior to the Early Horizon (~800-200 BCE) in Peru that made the spread of Chavin-related materials possible. Recent evidence in the rock art of Huánuco and Satipo, Peru, examined in light of simultaneous discoveries in the Ceja de Selva by Valdez and others, demonstrates that interactions between peoples of the Amazon and the Andes was far more intensive than was previously understood and had a profound influence on Andean cultural development. I explore how local peoples were affected by and affected extralocal ideas and beliefs in the Andes and Western Amazonia with increasing intensity leading into the Early Horizon.

(Lincoln Memorial University)**[131]** *Lipidomic Analysis of Arch Street Project Brain Tissue*

The Arch Street Project provided desiccated brain tissue recovered from a cemetery uncovered in Philadelphia, PA to the DeBusk College of Osteopathic Medicine Metabolomics Unit. As the Arch Street cemetery burials predate chemical fixation funerary practices, analysis of biological soft tissue samples was possible.

This study examines the potential of lipid analysis of soft tissue remnants in buried remains, and archaeological excavations by presenting evidence of long-term lipid preservation in unfixed brain tissue 200 years postmortem. With further analysis, the identification of signaling lipids and/or disease biomarkers provides broad implications for epidemiological studies of past and present populations.

High-resolution mass spectrometry was used to explore and identify the presence of different lipid molecules present in the brain tissue, which can indicate molecular activity and provide information regarding cellular signaling cascades active during life. Forty separate lipids were observed in significant quantities. Two known phospholipids found in large quantities within cell membranes were identified and validated via MS2 after bombarding each molecule with high energy electrons. With analysis of more brain tissue that predates chemical fixation, lipid degradation patterns may shed light on post-mortem interval estimation techniques as well as provide insight to the pathologies present in these remains.

Duenas-Garcia, Manuel (PhD Student), Miriam Campos (University of California, Merced PhD Student) and Nicola Lercari (University of California, Merced Assistant Profess)**[221]** *Cerro de En medio, a Hidden Epiclassic Site in the Northern Frontier of Mesoamerica*

This paper presents the analysis of the role of violence underlying the settlement pattern at Cerro de En medio, Aguascalientes, Mexico, located in the northern frontier of Mesoamerica. Violence is one of the social forces that shape the decision making involved in selecting a place to settle. This paper focuses on understanding the role of defensibility as a reaction to potential violence using spatial analysis in GIS combined with aerial 3D mapping. This study aims to quantify location-based factors such as visibility, elevation advantage, and accessibility to understand conflict and warfare in this ancient civilization. The site entirely occupies a 34-acre plateau in the middle of a canyon near the modern Plutarco Elias Calles Reservoir in the municipality of San Jose de Gracia. The name Cerro de En medio itself derives from the site's geographical setting. Due to location, its defensiveness seems to be a key factor in shaping the settlement pattern. Additionally, occupation at Cerro de En medio can be traced back to the Epiclassic (600 – 900 A.D), a period defined in Mesoamerica as a time of intense competition between local elites due to the restructuring of power relationships following the fall of Teotihuacan state.

Duff, Andrew (Washington State University), Judith Habicht-Mauche (University of California, Santa Cruz) and Rob Franks (University of California, Santa Cruz) and Andrew Duff**[188]** *Glaze-Paint Pigmenting Strategies in the Upper Little Colorado and Western Zuni Regions*

We report on research that uses LA-ICP-MS to examine glaze-paint pigmenting strategies and lead isotopes to investigate lead sources used during the Pueblo IV period in the Upper Little Colorado and Western Zuni Regions of the American Southwest. Pigment data suggest that glaze-paint recipes were shared across several adjacent regions, attesting to cross-cutting technological communities of practice and the circulation of ideas, production techniques, and (probably) potters during the Pueblo IV period. Additionally, potters in these regions used raw materials that derive from two main sources, Cerrillos and Hansonburg. Many western region potters appear to have regularly mixed materials from both sources in their glaze paints, a contrast from Rio Grande potters who typically utilize a single source. Similarity in glaze recipes applied to both Zuni Glaze Ware and White Mountain Red Ware suggest shared practices at the village, intraregional and interregional scales. These results contribute to the increasingly macroregional exploration of glaze-paint technology and we conclude by situating these data in this larger analytical frame.

[298] *Pots with Purpose: Examining Mortuary Craft Specialization on the Late Woodland Gulf Coast*

Extant models of craft specialization often assume that craft production served to instantiate or reify existing social relationships. By this line of reasoning, pots must have played only a passive role at communal gatherings and mortuary rituals. If pots were merely the accoutrements of specialists, the symbols of lineages, or status markers, pots in and of themselves could not have generated social change. However, archaeologists might reach different conclusions about these relationships by viewing pottery production and exchange as part of a broader suite of efficacious technologies (sensu Warnier 2009), which had enduring effects in people's lives. Pots do much more than signify inclusion or membership into lineages and social units; they can also facilitate new types of social interaction in the context of specific events and ceremonies, such as mortuary rituals. Pots themselves then potentially place humans within novel circumstances. We support this position by presenting technological, petrographic, and chemical (NAA) data of mortuary pottery from Late Woodland (AD 600-1000) sites across the Florida Gulf Coast. We use these data to suggest that the types of relationships which emerged between specific activities, pots, and people during this timeframe prompted labor reorganization and craft specialization in the region.

[249] *Haskett and Its Clovis Parallels*

Haskett represents an initiating point style in some parts of western North America. Radiocarbon dates suggest the earliest Haskett occupations were within the Clovis era, and Haskett shares several technological and geographic attributes that are more in kind with Clovis than with later stemmed styles. Here we emphasize these similarities—such as high craftsmanship, widespread toolstone conveyance, large spear-knife functionality, and accompanying hunting-based tool forms—to clarify the dialogue about how Haskett fits into the story of North America's interior colonization.

Duke, Guy (The University of Texas Rio Grande Valley)

[232] *Making a Meal at the Late Moche (AD 600-850) Site of Wasi Huachuma, Peru*

Creating a meal at the Late Moche (AD 600-850) site of Wasi Huachuma was not simply a matter of visiting the pantry and cooking the ingredients. It required the knowledge of whom to acquire ingredients from, when the ingredients were available, and how to process them. The culinary materials recovered from Wasi Huachuma indicate that knowledge of agricultural products such as maize (*Zea mays*), squash (*Cucurbita* sp.), chilli pepper (*Capsicum* sp.), and potato (*Solanum tuberosum*) was combined with that of terrestrial and marine protein sources including camelids (*Lama* sp.), guinea pigs (*Cavia porcellus*), and a variety of fish (*Mugil cephalus*, *Galeichthys peruvianus*, and *Cynoscion* sp.), mollusks (*Donax obesulus*, *Polinices* sp.), and arthropods (*Platyxanthus orbigny*). The occupants of Wasi Huachuma not only used their knowledge of the cycles of availability of these materials in order to feed themselves, but also knew what tools and utensils were necessary to process them for consumption and the culturally appropriate ways to consume them. This paper discusses how the people of Wasi Huachuma acquired, processed, and consumed their meals through their application of cultural knowledge of the relationships between the physical environment and the various groups of people collecting and producing food in the region.

[127] *Shaping Hominin Cognition: A Comparative Three-dimensional Shape Analysis of LCTs and Cores from the Early Acheulean at Kokiselei 4, West Turkana, Kenya*

The development of 'shaping' abilities in hominin lithic technology involved increases in higher-order cognition including forward planning, working memory, and spatial reasoning. Longstanding assumptions engrained in lithic typologies claimed that "Long Core Tools" (LCTs), such as "handaxes", were the earliest shaped lithics. LCTs first appear in eastern African contexts after 1.8 Ma alongside *Homo erectus* fossils, the first hominin species with significant increases in areas of the brain important for higher order cognition. Many studies about change in LCT shapes (both 2D and 3D) include cross-regional and diachronic comparisons, both in terms of assemblage-wide variation and typologically-meaningful forms. Few studies compare LCTs with contemporaneous cores to understand how their morphologies differ. This study applies two complementary 3D analyses of interior volume distribution (Riddle and Chazan 2014) and exterior surface (Fox 2016) to the world's earliest known LCTs (1.76 Ma) and cores from Kokiselei 4 in West Turkana, Kenya. Results demonstrate meaningfully distinct artefact clustering. When paired, these analyses challenge long-held assumptions about best practices in lithic shape analysis and the typological classification of artefacts. These results will impact the way archaeologists use morphological variables to interpret variation in lithic assemblages and the evolution of hominin cognition during the Acheulean.

[246] *Mounds, Mounding, and Polychrome Pottery in the Late Prehispanic Tonto Basin*

Both platform mounds and Roosevelt Red Ware (or Salado Polychrome) pottery have been interpreted as tied to religious practice in the late prehispanic southern Southwest, although the relationship between the two traditions is still debated. In the mid-14th-century (Gila phase) Tonto Basin, settlement included not only platform mounds with layouts that show clear connections to earlier platform mounds in the region but also included “syncretic mounds,” in which “mounding” was used within what is essentially room-block space. These otherwise diverse sites are united by the use of Roosevelt Red Ware. The ware dominates painted ceramic assemblages at late excavated sites and many whole vessels were recovered from room floors. This paper will explore the role played by the production and use of Roosevelt Red Ware in the diverse social and religious landscape of the Gila phase Tonto Basin through ceramic sourcing, design analysis, and the analysis of intrasite provenience.

[288] *Analysis of Cuchimilcos from Coastal Peru*

Cuchimilcos are small painted clay figurines and are one of the most recognized artifacts from ancient coastal Peru. They are associated frequently with the Chancay culture (1100-1400 AD) but are found throughout the central and north coast. Although most museums have one, little is certain about their purpose in society. To address the questions of function and meaning, we recorded attributes of figurines from online museum databases to determine if there is any pattern in decoration, sex of figurines, construction techniques, etc. that may aid in interpretation. We classified the figurines into groups based on these features and then compared them to additional information from burials, textiles, and other ceramics. Our analyses determined that the figurines are predominantly female and are not focused on sexual acts or childbirth; this runs counter to regular assumptions that they represent fertility or classic Andean duality. This study also contributes to our understanding of ancient craftsmanship and distribution.

[296] *Casas Grandes Fauna*

The prehistoric inhabitants of the Casas Grandes region of northwest Chihuahua, Mexico, exploited a wide range of local and non-local fauna. This paper explores the value of different animal species throughout the prehistory of this region and how various animals were utilized for daily subsistence and utilitarian purposes, as items for trade with other cultural groups, as inspiration for artistic expression, and as objects of significant ceremonial and religious importance. By examining the diverse uses of animal resources from the Paleoindian through the Late Prehistoric periods, we develop a holistic understanding of human-animal interactions throughout time within the Casas Grandes region and explore how these interactions affected and shaped the lives and worldviews of the inhabitants of this cultural area.

[15] *Constructing Identity in the Swabian Aurignacian*

The human body plays a significant role in constructing identity. According to Bourdieu (1974, 1976), the habitus, displays the social status and the role of the individual within a society. Group membership manifests itself with symbols like personal ornaments, the choice of emblematic objects, and their compositions. The ornamented body also displays stages in the life circle of individuals. One of the oldest, well-documented assemblages proving such kind of behavior may be the Aurignacian in the Swabian Jura. Personal ornaments are a wide-spread phenomenon in this region from 43.000 to 32.000 cal BP. Typical bead-forms, like the double-perforated bead, show the cultural unity throughout the whole Aurignacian sequence. Other forms prove diversity and change in time. In addition to these, several figurative depictions of humans provide us with a deeper insight into gender- and status-related differences of body adornment. Two female depictions from Hohle Fels bear markings. Here, different zones and probably purposes of the decorations are present. The therianthropes, like the two Lionmen from Hohlenstein-Stadel and Hohle Fels, are very likely male depictions, combined with animal-like features. Their decorative elements might be linked to a special role of these individuals.

[264] *Distribution of Artifacts at the Historical Campsite of Paraje San Diego*

The site of Paraje San Diego in south-central New Mexico was used for over three centuries as stopping point on El Camino Real de Tierra Adentro National Historic Trail. While multiple historical sources identify this site as a "paraje" or campsite, we know surprisingly little about what travelers did at the site and where these activities took place. In 1994, the New Mexico State University (NMSU) archaeological field school conducted metal detector survey, surface collection, and test excavation at Paraje San Diego. Students and other researchers analyzed the artifacts collected in this project, but lacked the resources and time to consider the distribution of artifacts across the site. In 2018, I began digitizing maps and artifact inventories produced by the 1994 project in order to explore these data with the more powerful analytical tools available in ArcGIS. In this paper, I examine the spatial distribution of artifacts at Paraje San Diego in an effort to identify and locate specific activities that took place at this historical campsite.

Duwe, Samuel (University of Oklahoma) and Kurt F. Anschuetz (Rio del Oso Anthropological Services, LLC)

[84] *Through Tewa Eyes? Exploring the Diversity and Universality of Pueblo Sacred Landscapes*

Pueblo worlds are remarkably similar, yet completely distinct. This paradox has challenged Southwestern anthropologists: how do Pueblo people, from Hopi to Taos, share similar worldviews and beliefs, but maintain unique histories of their paths of becoming? Elsie Clews Parsons and Edward Dozier characterized Pueblo ceremonialism as essentially identical among communities, but it is the emphasis of the elements of belief that distinguish the Pueblos from one another. We argue that this view extends to Pueblo sacred geography through the ways that the people define, remember, and live in their traditional homelands. Pueblo shrines, a major component of these landscapes, have similar morphology across space and time. Nonetheless, it is the context and placement of these places that distinguish and define individual Pueblo worlds. Archaeologists have begun to identify Pueblo shrines in earnest. Investigators have used select ethnography, especially broadly accessible accounts of Tewa landscapes, as guides to interpret past worlds. We laud these efforts, but we caution against overgeneralizing ethnographic accounts. We grapple with the questions that Parsons and Dozier raised: how can we identify crucial elements of Pueblo worlds while accounting for unique historical and cultural difference? We highlight ancestral Tewa and Keres landscapes in our argument.

[358] *Animal Masters, Guardian Animals, and Masters of Animals in Eastern North American*

In this presentation I discuss beliefs that focus on “supernatural” animals and associated charter myths, regalia, and ceramic effigies. Three forms of transcendental animals are evident in eastern North America: animal masters, guardian animals, and masters of animals. Animal masters control the availability and behavior of their animal “subjects.” They are materialized as animal effigy vessels, which are employed as venerated figurines/statuary and as ritual containers for preparing and transforming purifying “medicines.” Guardian animals, as the object of human supplications for power, bestow health and protection, and are often visualized as artistic motifs and ritual regalia. Masters of animals may be either tricksters or culture heroes. As protagonists, masters of animals free captive animals for the benefit and welfare of humankind. As antagonists, masters of animals hoard animals, and are often depicted as “other than human persons” in a variety of artistic media, but most commonly as ceramic effigies. These otherworldly agents typically grant health, power, and success to those who establish proper procedures and protocols by performing specific rituals and by adhering to various prescribed practices of supplication and veneration.

[29] *Event, Process, and Occurrence: A Bayesian View*

Steve Athens’ substantive and interpretive contributions provide a firm Bayesian grounding for Hawaiian chronology. This paper offers operational definitions for archaeological events, processes, and occurrences and describes how they can each be investigated in a Bayesian framework with the R software ArchaeoPhases package authored by Anne Philippe and Marie-Anne Vibet at the University of Nantes.

Dyer, Jennifer (Six Rivers National Forest)

[257] *Integrating Traditional Ecological Knowledge into Archaeological Practice*

As Heritage Program Manager for Six Rivers National Forest in Northern California, I have worked closely with the Karuk Tribe and other partners on the Western Klamath Restoration Partnership (WKRP). WKRP is an initiative designed to utilize traditional ecological knowledge (TEK) to restore cultural burning on a landscape at the center of Karuk aboriginal territory. Archaeological surveys for WKRP were conducted by an integrated crew of Karuk tribal practitioners and Forest Service archaeologists. The crew took a holistic approach of recording more than just artifacts and features, to include cultural vegetation characteristics and evidence for how the land was used and managed in the past with a view toward revitalizing those practices in their traditional places. Collecting TEK and archaeological data allowed for an enhanced understanding of the values and resources that make up this cultural landscape. As the surveys took shape it was clear that standard archaeological site recordation forms would not be sufficient. A TEK form was collaboratively developed to identify natural resources showing signs of past or contemporary use/management, associations with the broader landscape (known villages, trails, hunting grounds, old campsites, springs, ridgetops, viewsheds, ceremonial areas), and management recommendations to enhance plant quality for cultural uses.

[260] *Zooarchaeological Remains and Their Impact on Land Management Decisions: An Example from Kirtland Air Force Base, New Mexico*

In 2008, during geoarchaeological survey of a portion of Tijeras Arroyo located on Kirtland Air Force Base, researchers located remains of bison in four new locations. This includes a *Bison occidentalis* skull which was found in soils that were dated to 5600 to 5700 BP. Using techniques from zooarchaeology these remains are aiding archaeologists and natural resources staff at Kirtland Air Force Base better understand what the natural environment looked like. This in turn is helping Kirtland Air Force base staff better preserve the natural environment of Kirtland Air Force Base as required by the Sikes Act.

Earle, Julia and Jhon Percy Cruz Quiñones (Pontificia Universidad Católica del Perú)

[98] *Pre-hispanic Building Stone Quarrying and Selection Near Mt. Coropuna, Perú*

Studies of Inka quarries have largely been restricted to the Cusco heartland, such that only a handful of quarries have generally served to describe Inka stoneworking technology, labor organization, and material selection as a whole. This bias has resulted in a dearth of understanding as to how Inka stoneworking varied over time and between geographical contexts. The study of quarrying in Inka provincial contexts stands to add nuance to our understanding of how Inka stoneworking technology developed in the heartland and the extent to which local knowledge might have influenced the construction process elsewhere. In 2017 we conducted an oriented survey within a 30-kilometer radius of Maucallacta, an Inka administrative center of the southern Cuntisuyo province, registering a total of 10 pre-Hispanic quarries. The technological repertoires present at these quarries overlap, but do not completely match, with those that have been described in the Inka heartland. These quarries do attest to a preference for dark-colored andesite that has likewise been noted in the heartland; in some cases this stone was transported over several kilometers to construction sites. In addition, we present our methodological approach to studying building stone quarries in the Andes in the hopes of advancing this sub-field further.

Earley, Caitlin (University of Nevada, Reno)**[303]** *New Monumental Sculpture from Quen Santo, Guatemala*

Recent archaeological work at the western Guatemalan site of Quen Santo by the Proyecto Arqueológico de la Región de Chaculá (PARCHA) has investigated the chronology of the site and resulted in the discovery of new monuments. In this paper, I present the results of recent study of these monuments. After reviewing the art historical investigation completed in summer 2018, I will introduce three new sculptures from Quen Santo and explore how they add to current archaeological and art historical understanding of the site. These sculptures, I argue, both adhere to and depart from themes in the artistic program of Quen Santo. In addition to presenting new information about the art of a poorly understood site, this presentation provides a new perspective on broader issues in Mesoamerican art history, including rulership, ritual, and the role of sculpture in highland Maya centers.

Ebel, Erika (University of California, Davis), Christyann Darwent (University of California, Davis), Genevieve LeMoine (Peary MacMillan Arctic Museum and Arctic Studies) and John Darwent (University of California, Davis)**[10]** *1000 Years of Small Bird Capture in NW Greenland*

Excavations in 2012 and 2016 at Iita, located along the North Water Polynya in NW Greenland, revealed unmixed stratified deposits extending from Late Dorset habitation over 1000 years ago through Thule-Inughuit occupation and Inughuit contact with Arctic explorers ca. 1850–1917. Iita is unique in that a large dovekie colony breeds in this area annually, thus the faunal assemblage provides a unique opportunity to study the history of bird use. Given rapid climate change in the Arctic, this will likely be the last opportunity to investigate the archaeological record at Iita.

Ebert, Claire (Northern Arizona University) and Emily Zavodny (University of Central Florida)**[248]** *Societal Cycling Influenced by Climatic Variability Among Early Agricultural Communities: Comparative Perspectives from Belize and Croatia*

Archaeological studies continue to highlight the extreme variability in sociopolitical responses to prehistoric fluctuations in climate, from the emergence to complete breakdown of hierarchical societies. These processes were likely more volatile among early farming communities with high degrees of environmental dependency. Using new high-precision AMS 14C dates and regional paleoclimate proxy datasets, we compare the developmental trajectories of early agricultural groups from two disparate world regions: Belize and Croatia. Results suggest that changes in climate regimes correspond to alternating cycles of sociopolitical integration and fragmentation in both regions. Our research provides a framework for understanding the complex relationships between society and environment the promoted resilience or induced vulnerability in response to dramatic climate shifts.

Eberwein, Ann (University of Wisconsin - Milwaukee)**[404]** *Bread, Apples, and Cereal Grains: Analyzing a Collection of Carbonized Food from Robenhausen, Switzerland*

This paper presents the results of research on a collection of food from Robenhausen, a lake-dwelling site southeast of Zurich. These specimens are part of a larger collection that was recovered in the late 19th century and is housed at the Milwaukee Public Museum. The material includes thirteen bread fragments, seventy-five apple pieces, and thousands of cereal grains. This research focuses on the identification of the grains and the processing methods used at lake dwellings to create a temporal framework based on species present and the way they were manipulated. In addition, many of the bread fragments include visible cereal grains, which may indicate grain preference in bread making, while the convex shape of these pieces indicates the shape of the surface on which they were baked. The size of the apple pieces indicates that they are crab apples, which were harvested and divided longitudinally, then left to dry prior to carbonization. The purpose of this research is to document this material and demonstrate its utility despite the orphaned state of the collection. In addition, this information will contribute to data from modern excavations at circum-Alpine sites and more broadly, to an understanding of food processing in Neolithic Europe.

Eble, Benjamin and Zachary Hruby

[255] *A Review of Indirect Percussion Techniques in the Americas and Their Possible Applications in the Manufacture of Ceremonial Bifaces and Mesoamerican Eccentrics*

Almost a century of bias in favor of direct percussion in the archaeological modeling of biface manufacture in the New World has obscured the central role of indirect percussion in this process. We examine ethnohistorical and archaeological evidence of indirect percussion in certain stages of biface manufacture, and posit their possible applications in the production of Mesoamerican ceremonial lithic items. A special focus is placed on replication experiments that utilize tools actually found in the ethnohistorical and archaeological record rather than those created by archaeologists and avocational knappers.

Eche Vega, J. Eduardo (Universidad Nacional de Trujillo) and Jose L. Peña (University of South Florida)

[236] *Estudio de la Arquitectura Monumental Casma en el sitio El Campanario, valle de Huarmey-Perú*

Las construcciones monumentales públicas cobraron un rol importante dentro de la vida social, política, económica e ideológica de las sociedades complejas andinas. Estas sociedades complejas edificaron grandes estructuras de piedra y adobe destinadas a eventos de carácter público. Las recientes excavaciones arqueológicas llevadas a cabo la plataforma 1 en el sitio El Campanario (Valle de Huarmey) han revelado que esta fue construida, ocupada y ampliada desde el Horizonte Medio hasta el periodo Intermedio Tardío. En esta estructura pública de adobe y piedra se han registrado y recuperado fragmentos de cerámica del estilo Casma Moldeado y fragmentos de cerámica policroma asociada al Horizonte Medio. La cerámica Casma moldeada es de acabado fino, y está formando en su mayoría por vasos, cuencos con base y jarras; mientras que los fragmentos de cerámica policroma son parte de un pequeño cuenco y vasos. Ambos estilos alfareros fueron recuperados sobre la base de los muros junto a restos botánicos (corontas de maíz) y malacológicos. Es posible que las diferentes formas y estilos cerámicos hayan sido usados como parte de eventos públicos destinados a reforzar lazos sociales entre los habitantes de El Campanario o para establecer relaciones sociales con otros grupos étnicos.

[298] *From Technological Style to Communities of Practice: Defining Yavi-Chicha Sociotechnical Systems in the Río Grande de San Juan Basin (Border of Bolivia and Argentina) during the Period of Regional Developments (ca. AD 900-1450)*

Despite the Yavi-Chicha phenomenon being widely discussed in the Southern Andes, there is a lack of systematic research around the socioeconomic and political implications of production and circulation of the pottery of the Río Grande de San Juan Basin (Chicha Region). From the study of ceramic production and circulation, this paper seeks to contribute to the knowledge of the social dynamics, and, particularly, of the political economy in the Chicha Region during the Period of Regional Developments. We use the concept of technological style, as the main analytical axis, which is defined through the analyses of ceramic operational chains. This study uses a combined approach of macroscopic analyses with petrographic and elemental analysis by INAA and SEM. For this purpose, we have analyzed ceramic assemblages from two representative sites from the Chicha Region. Results suggest that, (1) the site of Chipihuayco was a ceramic production town, supplying ceramics to the town of Finispatria; (2) potters from Chipihuayco organized under one community of practice; (3) people from both sites participated in one or more regional networks; and (4) decentralized polities organized ceramic production and circulation practices.

Eck, Christopher and E. Christian Wells (University of South Florida)

[160] *A New Tool for Forensic Geoarchaeology: Sediment Fingerprinting with Geochemistry for Homicide Investigations*

Sediment fingerprinting by elemental analysis has been an important analytical tool in the environmental sciences to help explain sediment movement and deposition in water bodies and other catchments. Related techniques have also been used in many archaeological investigations to aid in ancient activity area analysis. However, this technique has only been rarely applied in forensic archaeology. This paper discusses methods and two case studies from Florida that use sediment fingerprinting in homicide investigations. In both cases, sediments from the crime scene and the suspect's vehicle were compared. For the comparison, sediments were digested with strong acids and analyzed with ICP-MS for a range of minor and rare earth elements. The results were analyzed with discriminant function analysis, which provided probabilities for group membership compared to off-site/control samples. This presentation introduces the methods and advocates for the further development and use of this technique in forensic science.

Eckerstrom, Kyle (Pima Community College) and Emiliano Walker (Pima Community College)**[125]** *The Point of the Project: Analysis of Projectile Point Data in the Burro Creek/Pine Creek Wilderness*

During a 15-year-long survey conducted by Pima Community College of the Burro Creek/Pine Creek area, between Bagdad, Arizona and Prescott, Arizona, many different types of diagnostic projectile points were recorded and/or recovered. Based on an analysis of these projectile points, the area was occupied from the Paleoindian Era to the more recent and less known era of the Prescott Culture, which dates as late as AD 1300. This poster presents an in-depth analysis of the projectile point distribution across the landscape including typology, as well as a GIS-based examination of overall trends across more than 100 sites on BLM and private lands. The results seek to clarify chronology of occupation in the area and to refine our understanding of artifact typology within the Prescott Culture.

Eckert, Suzanne [25] see Habicht-Mauche, Judith

Eckert, Suzanne (Arizona State Museum, RPA) and Deborah Huntley (Tetra Tech)**[298]** *The Struggle within: Effects of Spanish Colonization on Pueblo Pottery Technology Revealed through Petrographic Analysis*

There is no doubt that Spanish contact and colonization, dramatically changed certain aspects of Pueblo life, among the Ancestral Piro of south central New Mexico. In the context of Pueblo history, examining ceramic technology provides a means of recognizing cultural continuity and transformation on the social landscape and of acknowledging the role indigenous agency played in determining the topography of that landscape both prior to and after Spanish contact. In this study, we examine both decorated and undecorated wares for evidence of adopting expedient ceramic technology over time among potters living in the Rio Abajo region. We rely on previous research among pottery producing foragers, as well as on studies of historic expediency, to identify the variables most likely to inform on whether or not expedient ceramic technology was used at some point during the Colonial period. We couch our interpretations within a framework of agency and practice to discuss the active role of material culture in potters' daily attempts to negotiate their place within a changing cultural landscape.

Edgar, Heather [189] see Price, Karen

Edgar, Heather (University of New Mexico)**[192]** *What the Spanish Brought with Them: Phenetic Complexity of the Spanish Population at Contact*

Colonial contact in Mexico brought together populations from diverse regions of the world – Europe (especially Spain), Mexico, Africa, and eventually, Asia. While much attention has been focused on the contributions of these groups to the admixed population that resulted, this attention has primarily been about quantifying broad patterns of continental ancestry, and so may have missed much by ignoring the diversity that existed within each region. We begin to address this shortfall using evidence from dental morphology, which provides phenetic evidence of population genetic admixture. Data from 10 European countries, 13 African countries, and Mexico (n=3552) from the 9th century to the present were analyzed using Structure, a program that estimates ancestry proportions at the individual level. Results reflect the genetic complexity of the Spanish colonizers. Medieval Spanish samples are more similar to those from Morocco and Tunisia than from other European countries. Historic Mestizos cluster with Europeans, including Spain and Morocco. However, contemporary Mestizo samples cluster together, separated from their European, African, and Native American ancestors. Our results show that including North African samples provides a better understanding of the Old World Origins of admixed populations in North America.

[178] *Discussant***Edwards, Alexandra (University of Georgia), Doug Dvoracek (Center for Applied Isotope Studies), Anna Semon (American Museum of Natural History), David Hurst Thomas (American Museum of Natural History) and Robert Speakman (Center for Applied Isotope Studies)****[380]** *Lead Isotopes and XRF Analyses of Spanish Colonial Bronze Bells from Galisteo Basin, New Mexico*

Few elemental and isotopic studies have been conducted on bronze bells recovered from 16th – 17th century Spanish Colonial missions. Mission bells shaped daily life as they not only provided a call to prayer and daily tasks, but also served to reinforce the power dynamics of colonialism. We recently completed a study of 85+ bronze bell fragments from Pueblo San Lazaro, Pueblo San Marcos, Pueblo San Cristóbal, and other sites in the Galisteo Basin of New Mexico. Surface sampling of lead from these bells, followed by isotopic analyses via multiple collector inductively coupled plasma mass spectrometry (MC-ICP-MS) allowed us to determine the geologic origin of lead used in the production of these bells (e.g., local, Mexico, or Europe). Elemental analysis using X-ray fluorescence (XRF) facilitated identification of different recipes used to cast bronze bells during this era. Unique differences in silver, antimony, and arsenic concentrations in conjunction with isotopic data aided in linking individual bell fragments to the “parent” bell from which they originated. Ultimately, this allows for estimates of the minimum number of individuals (MNI) present within our bell fragment sample. Our results further show that these missions were provisioned with bells produced in North America and Europe.

[116] *Food and Cooking at Dust Cave: An Experimental and Microarchaeological Approach*

The potential of features to elucidate our understanding of past cultures is often understudied. When they do receive attention, it is often on the macroarchaeological scale, looking at visible morphology and artifacts. Microartifact analysis (MAA), however, has demonstrated the potential to add more information to our understanding of a site than macroartifacts alone. This project will examine microartifacts from features at the archaeological site of Dust Cave, a Late Paleoindian through Middle Archaic site in the Middle Tennessee Valley. Previous research has investigated features using a variety of methods, including micromorphology and geochemistry in addition to morphological analysis of feature shape and size. Such an integrated approach has yielded a more complex understanding of site activity, but recent analysis of microartifacts from feature fill has demonstrated the potential for MAA to further clarify hearth use at Dust Cave and provide a more nuanced understanding of prehistoric cooking technologies and diet. This project will involve experiments designed to test hypotheses generated from the MAA regarding prehistoric cooking, diet, and processing methods at Dust Cave.

Edwards, Emily (East Carolina University) and Megan Perry (East Carolina University)

[391] *Cultural Factors of Metabolic Disease in Infants and Young Children from Late Ottoman-Era Jordan*

The site of Tell Hisban in Jordan was seasonally occupied by nomadic agropastoral tribes for over a thousand years. In the latter half of the 1800s, the Ottoman Empire instituted the Tanzimat, a series of reforms intended to solidify control over the region, including a new system of private land ownership. This new land law conflicted with traditional tribal-based land rights and resulted in intensification of agricultural production and diminished pastoralism in the regional economy. During this period of economic change, at least 62 individuals were interred in ruins on Tell Hisban, of which 55% were non-adults. Many long bones and cranial elements of non-adults within these commingled remains display evidence of vitamin C (scurvy) and D (rickets) deficiencies at a greater frequency than pre-Tanzimat or earlier regional cemeteries. Increased sedentism at Hisban resulting in a shift in child-care practices could have resulted in the surprising presence of rickets in this high-ambient UV radiation environment. Additionally, increased agricultural production may have impacted seasonal availability of traditional foods high in ascorbic acid that prevented scurvy in past groups. Together, these biocultural changes contributed to increased frailty in the form of metabolic disease for infants and young children within this population.

[10] *Croxton Site Faunal Assemblage: Pre- and Post-deposition Disturbance Analysis*

The pre- and post-depositional processes that impacted the faunal assemblage associated with the Ipiutak component at the Croxton site, Alaska, have not been adequately studied/documentated (see Gerlach 1989). This study focuses not only on the pre- and post-depositional disturbances that may have occurred, but also on how the burial environment may have played a role in the preservation of the bones. The underlying causes of the staining present on the bones, the differential levels of weathering, and the presence of warping were analyzed. The potential effects of freeze/thaw processes and the characteristics of the sediment and its associated pH level were tested as well. The results indicate that the previous interpretations of the soil and its effects on the faunal assemblage are well supported, and that the high level of preservation and the presence of warping were most likely caused by characteristics of the surrounding soil. However, the cause behind the staining remains unresolved and requires further testing.

Eeckhout, Peter and Kusi Colonna-Prete (Independent Investigator)

[39] *Archaeometric Analysis of Mural Paintings at Pachacamac, Peru*

From 2014 to 2018, we excavated Building B15, a small temple decorated with mural paintings at the archaeological site of Pachacamac. These are the first paintings discovered on the site since 1938. On the walls, as on many fallen adobe bricks, polychrome motifs painted in several layers can be seen on mud plaster or directly on the adobe walls. The archaeological context, absolute dates and iconography suggest a date around the beginning of the sixteenth century, i.e. the end of the Pre-Hispanic Period.

The exceptional value of these paintings led us to carry out an in-depth study of the stratigraphy of the pictorial layers and laboratory analyses: optical microscopy, SEM-EDX, FT-IR and μ -Raman. Preliminary results corroborate studies carried out on other mural paintings of the central coast of Peru but also reveal new data about pigments. In addition to the murals, tools used for the mural decoration were discovered in the same building: a collection of

paintbrushes, bowls, rough pigments, and a grinding stone. We were able to identify the brush bristles with light microscopy.

[48] *When the Volcano Erupts: Lessons from the Archaeological Record on Human Adaptation to Catastrophic Environments*

How do repeated disasters shape and strengthen communities? The Tilarán-Arenal region of Costa Rica is one of the most volcanically active regions in the world, but despite the risk, from the advent of sedentary villages during the Tronodora phase (2000-500 BC) until the arrival of Spanish in the 16th century, people demonstrated remarkable resilience. Using this region as a case study, this research uses archaeology, tephrochronology, and geographic information system to explore the innovative ways pre-Hispanic people adapted to the hazardous nature of their environment.

Egbers, Vera (Free University Berlin / ANAMED Koç University Istanbul)

[421] *Lived Space of Displaced People: A Comparative Approach to Contested Spaces in Iron Age Northern Mesopotamia and Modern Europe*

Archaeology grapples with the materiality of past subjects' perception and organization of space, as drawn from objects, landscapes, architecture, and pictorial or textual representations. Generally what emerges from these data is a dominant or normative conceptualization of space. However, space is not merely the result of planned ideas from powerful individuals, but also the lived experience of the marginalized or foreign. Marxist philosopher Henri Lefebvre's *La production de l'espace* (1974) asserts that "space" is not a given, but a product. Every society produces its own (social) space that subjectivizes its members. In this paper I use a comparative approach to address the question of hidden forms of lived space. I compare the materiality and possible perception of deportees in the Urartian and Neo-Assyrian empire in Iron Age Northern Mesopotamia with the narratives and experiences of present-day refugees in Europe. Ethnographic data is presented based on experiences teaching German in Berlin in 2017-18 to people mainly from Syria, Iraq, Iran and Afghanistan. I seek to both enhance the study of lived spaces in archaeological contexts and better understand the political impact of this concept on modern cities.

[390] *Neotaphonomy of a "Common Amenity" on the Grasslands of the Ngorongoro Conservation Area, Tanzania*

Identifying the variables that influence the deposition, preservation, and spatial distribution of faunal material across landscapes remains a key goal of taphonomic research. Here, we report on the results of pedestrian surveys for faunal material around a seasonal waterhole surrounded by woodland within the Ngorongoro Conservation Area (NCA). All visible faunal material within a 100 x 100 m area was plotted with a laser total station and collected. Focused analysis of a subassemblage collected under the canopy of a tree reveals a significant co-occurrence of modern human and carnivore taphonomic signatures. We discuss these findings within the context of Glynn Isaac's "common amenity" model for the formation of many early Pleistocene archaeological sites.

[154] *Investigating Fatty Acid Profiles in Sediments. Household and Activity Areas in Western Mongolia Winter Campsites*

The study of ephemeral traces of mobile pastoralist campsites has its beginning at a local scale. Mongolian basic household units are the spaces where people and animals interact in a very intensive way: from milking and processing dairy products to butchering, consuming and finally disposing of dead animals. All these activities structure campsites, and particularly leave a molecular biosignature that can help archaeologists to identify spatial arrangements and animal exploitation within the domestic space. In order to help lipid profile recognition in archaeological contexts, here we present fatty acid carbon isotope ratios of modern-day adipose fats of terrestrial animals and vegetable oils that are contained in sediments recovered from winter campsites in Züünkhangaï, Western Mongolia.

[125] *Land Use in the Burro Creek-Pine Creek Survey Area based on Ceramic Analysis*

One hundred and seventy sites were identified during the Burro Creek-Pine Creek (BCPC) Survey conducted by Pima Community College between 2003 and 2018. The BCPC project area is located on BLM land within Yavapai County, Arizona, north and east of the Burro Creek wilderness, in an area now known to have been occupied by the Prescott Culture (AD 300 to 1300). Before Pima College's long-ranging project, the Burro Creek-Pine Creek region was largely unstudied, with no major prehistoric sites - other than the few remaining standing structures - believed to be present in the area. Surface collections conducted during the BCPC project yielded a more complete understanding of the occupational history of the area through time. Ceramic collections, in particular, produced a range of types and densities, including Prescott Gray, Prescott Red, Prescott Black-on-Gray, Tizon Brown Ware and Tusayan White Ware. This poster analyzes the distribution of sites containing ceramics across the BCPC survey area to better understand their spatial distribution and potential prehistoric land use patterns. This study also seeks to compare the density of various ceramic types within the BCPC survey area to sites throughout the greater region to determine if there are any significant spatial patterns.

Ehrich, Richard (UCLA Cotsen Institute of Archaeology)**[214]** *Chair***Eichner, Katrina (University of Idaho)****[179]** *Misidentification on the American Frontier: Queer Perspectives on Identity Classification in Historical Archaeology*

As archaeologists we link patterns of performance and daily practice to identity categories. These classifications depend on normalized understandings of idealized behaviors. However, the groupings we use to discuss past actors rarely fully encompass the extent of behaviors in which they engaged. An extremist queer argument challenges that by looking for the patterning of human behaviors as a means of discussing identity groupings, we actually miss the markers of moments of mis/dis-identification in the material record. While we must consider how identity models are unintentionally used to homogenize past experiences, it is also important that archaeologists don't "throw out the baby with the bath water" by concurrently recognizing that identity ideals still shape the large majority of peoples' behaviors. Using a case study focused on the 19th c. American military in the western frontier, this presentation problematizes the complexity of daily behavior and identity construction from a queer perspective.

Eifling, Kurt (Larner College of Medicine at University of Vermont)**[140]** *Moderator***Einarsson, Arni (University of Iceland)****[35]** *Old Fences and Archeology*

Fences form distinct patterns and are a prominent feature of most cultural landscapes. Such patterns contain information about people and their relationship with the land. Archeological mapping of extensive Viking Age fences in Iceland highlights the need for a theory of fence construction. How are fences expected to align with topography, soil, and other ecological factors? How are they shaped by purpose, land use, and social interaction? As fences in pastoral settings tend to run along farm boundaries, the collective fence pattern reveals the configuration of farms. The fences in Iceland were built shortly after the colonisation of the island and probably reflect the original land division by the settlers. A settlement process is dynamic, depending on resource level, resource predictability, density of earlier settlers, and topography. Settlement density and property boundaries are determined by costs and benefits leading to strategic behaviours of settlers and produces a settlement pattern which is geometric, equalised, and predictable. Fences also serve seasonal on-farm grazing management, where slope and distance from living quarters are important. The close ties of farm boundaries with population, resource characteristics, and landscape mean that archeological fence patterns hold high potential as a source of information about ancient communities.

Ek, Jerald (Western Washington University)**[28]** *In the Path of the Snake: Connecting Myth and Material Culture in the Late Prehistory of Champotón, Campeche*

The personage and deity of Kukulcan/Quetzalcoatl plays a central role in indigenous historical accounts regarding the prehispanic city of Chakanputun (Champotón). However, extensive disturbances resulting from continuous occupation of Champotón from the Preclassic period into modern times has had a major impact on the public precincts of the ancient city. This situation creates unique challenges in connecting ethnohistoric and archaeological evidence, particularly pertaining to the era of major societal upheaval and emergence of pan-Mesoamerican political, social, and economic links during the Terminal Classic/Epiclassic period. The goal of this paper is to create linkages between archaeological (settlement pattern, ceramic, and lithic evidence) and ethnohistoric evidence to understand diachronic processes along the Gulf Coast periphery of the Maya Area. Synthesis of these diverse sets of data provide a unique view of major changes that swept across Mesoamerica starting at the close of the Classic Period and extending to the eve of Spanish Contact.

Eklund, Elizabeth (University of Arizona - School of Anthropology)**[104]** *Archaeology in the Plaza: Public Display of the Past in Banamichi, Sonora*

Just off the main highway, the Ruta del Río Sonora, in Banámichi, Mexico, is the Plaza de la Piedra Histórica (Plaza of the Historic Rock). Raised upon the shoulders of Ópata / Teguïma inspired stone figures is a petroglyph originally found in the floodplain below. The imagery on the rock was interpreted by archaeologist William Doolittle in 1984 as “the first map,” which he argued depicted the pre-Hispanic canal systems and fields in the floodplain below. The statue is a monument to the heritage of the area, a silent testament of the past clearly visible in the present. The purpose of this project is not to question whether Doolittle was correct in his interpretation of the petroglyph, but rather to look at the links and memory carried in the land and its canals to present day water users. Ethnohistoric reports attest to the agricultural productivity of the river valley. This project draws from published archaeological reports and theory to look at the intersection of public displays and narratives about cultural heritage and the living practices contemporary irrigators. The research provides insights into concepts of “tradition” and the role material manifestations of past cultures play in social memory.

El Safadi, Crystal (University of Southampton) and Fraser Sturt (University of Southampton)**[378]** *Navigating the Neolithic of the North Western Approaches*

The dynamics behind the development of the Neolithic in Britain and Ireland has been a topic of debate for over one hundred years. At its heart lie a series of different conceptions as to the nature of connectivity across the seaways of North West Europe. Neolithic practices in Britain are evidenced c. 1000 years later than their arrival in north-west France. This delay has at times been explained by seeing the surrounding seaways as a barrier to movement. The material record, however, proves otherwise, with multiple lines of evidence indicating maritime mobility taking place over this period. This paper explores maritime mobility from 5000 – 3500 BC in the north-western seaways of Europe. It takes an ensemble approach, integrating results from agent based, sea-level and palaeotidal modelling to generate new perspectives on old problems. We argue that by adopting an open approach, and not expecting a definitive result, it is possible to be surprised and challenged by the modelling process, forcing a more considered approach to the record as a whole.

Eldridge, Stuart (POWER Engineers)**[265]** *The More Things Change, the More They Change: Persistence and Evolution in the Gulf of Maine Archaic Tradition*

The Gulf of Maine Archaic Tradition has been defined as a persistent technological pattern that spans the Early to Middle Archaic Periods ca. 9,500-6,000 B.P. in the northeast, although sites containing this component have remained poorly documented. It is possible that human population density in New England was low throughout the early Holocene, and subsequently such sites are expected to be relatively rare. Alternatively, it is probable that Gulf of Maine Archaic Tradition sites have been missed or wrongly interpreted during archaeological surveys in the past because many regional archaeologists committed to a limited number of “diagnostic” bifacially flaked artifact forms for site identification and remain unfamiliar with a techno-complex devoid of recognizable projectile forms. Site ME 7.65 on the lower Saco River in southwestern Maine produced associated lithic and faunal material dating to the late Middle Archaic/early Late Archaic transition. This site provides an opportunity to examine both the pervasiveness and the evolution of the long-standing Gulf of Maine Archaic Tradition and a potential starting point to understand early Holocene interrelations between humans, technology, and resources in a changing landscape.

[265] *Chair***Elezi, Gazmend (PhD Candidate)****[275]** *Manufacture of Late Neolithic Pottery from the Southern Balkans: An Integrative Approach*

Throughout their life, from manufacture to final discard, ceramic vessels participated in different human activities within Neolithic communities throughout the Balkans. As a result, vessels, potters, and users are involved in a relational interaction leading to a continuous negotiation of various aspects of the Neolithic world. The outcome of this relation is also reflected in the technological variation of Late Neolithic ceramics. The study of the manufacture

of ceramic vessels, which is the subject of this presentation, should be set within its context to understand how and why different technological options were chosen. In order to investigate the whole range of the operation sequences, I have used various methods, including typological classification, ceramic petrography, X-ray fluorescence analysis, X-ray analysis, and residue analysis. The first results of these analyses show that although there are significant similarities between different sites as to how the vessels were manufactured and elaborated, there are also technological differences that characterize the ceramic assemblage of each settlement. The variety of technological choices is also evident within each site as the potters have used different clay sources or recipes for making the vessels, while a number of different techniques were used for finishing their surfaces.

[14] *Public Education about Archaeological Practice with... Spaceships?: An Archaeologist Writing a Science Fiction Novel*

Archaeologists have always found popular culture a bit lacking in terms of realistic and ethical representations of their realm of study, from process to ethics to the actual subjects of the archaeological research. Even as modern archaeology progresses through improved technology and increased diversity among archaeologists, a question emerges: how to better represent archaeologists and archaeology to a public, the pop-culture consuming audience. This presentation centers on my experience as an archaeologist and novelist writing a science-fiction story involving archaeology. In my novel I attempt to represent archaeological process and practice realistically and accessibly while maintaining loyalty to the genre, and while also being mindful of the marketability of the novel. In order to do this, I have considered the feedback of my non-archaeologist peers, the existing limited realm of archaeology-based novels and popular culture, and the potential of archaeological technology and abilities in the future. The ultimate goal is to create a vision of archaeology that takes advantage of the already existing adventurous and captivating public view of archaeology, while embracing the exciting future of archaeology, and still maintaining an accessible, accurate, and realistic presentation of archaeological practice, research, and ethics to a non-archaeological audience.

[81] *Exploring the Role of Fire in Tarascan Ritual Contexts of the Zacapu Basin, Michoacan, Mexico*

Studies of ritual activities often focus on paraphernalia, architectural structures, and other aspects of performance. While these are all important features, other more subtle elements that are nevertheless crucial to these activities are often not considered in detail. Today we present an overview of our ongoing study of the role of fire and flames in Postclassic Tarascan ritual. Although ethnohistoric sources provide many interesting clues regarding these practices, they have still not been well characterized by archaeologists. Fire was omnipresent in Tarascan society, appearing in domestic and public contexts, and served a variety of needs ranging from the quotidian to more specialized practices. Through a study of charcoal remains, hearths, and other loci of combustion in a variety of contexts at the site of Malpais Prieto, in the Zacapu Basin of northern Michoacán, we demonstrate that a wide range of fire-related activities existed, most (if not all) of which can be linked to ritual practice or beliefs. Our findings indicate that the boundary between ritual and ordinary activities was often quite blurred, and that the sacred qualities of fire permeated Tarascan life, from intricately structured, state-sponsored ceremonies, to basic tasks in daily domestic life.

[174] *Amino Acid d13C Analysis of Ancient Marine Consumers Quantifies Environmental Change in a Nearshore Ecosystem through the Late Holocene*

Kelp forests are some of the most biodiverse and ubiquitous temperate marine ecosystems. Here, we employ d13C analysis of individual essential amino acids (EAA) from ancient top consumers to evaluate the dynamics of southern California kelp forests across a period of rapid cultural change and accelerating human impacts (~3500 ybp – present). We analyzed sea otter (*Enhydra lutris*) and sheephead (*Semicossyphus pulcher*) bone collagen sourced from late Holocene archaeological sites on two southern California islands. We also characterized d13CEAA profiles for modern marine producer groups as baseline values for comparison: kelps, green algae, red algae, and offshore particulate organic matter. We used linear discriminant analysis (LDA) and Bayesian isotope mixing models (MixSIAR) to classify consumers according to their reliance on different producers. Results showed that over 75% of ancient sea otters and sheephead EAA were derived from kelp, indicating that these consumers were feeding in ecosystems driven by kelp production. In combination with bulk tissue analysis and ongoing d13CEAA analysis of modern samples, these findings suggest that, at these sites, kelp forests were more extensive in the late Holocene than they are today. Our study demonstrates the application of d13CEAA analysis in integrating historical ecological information and modern conservation biology.

[393] *Anthropogenic Landscapes of Amazonia: A Spatial Analysis of Landscape Modification and Settlement Organization at Macurany, Brazil*

I analyze anthropogenic landscape modification at Macurany, a pre-colonial terra preta site on the Middle Amazon River in Parintins, Brazil, in order to gain insight into settlement formation and organization. Settlement patterns and artificial landscapes are the result of human action, technological innovation and ingenuity. Understanding anthropogenic landscape features can illuminate the relationship among domestic and common areas, leading to a more nuanced understanding of terra preta formation, natural resource management, and routes of movement and communication. This research addresses what processes contributed to the formation of these modified landscapes at Macurany, which feature terra preta, sculpted soils, and anthropogenic ports. Can the spatial patterning of these landscape features reflect social organization? Topographic and soil probe data collected at Macurany in July 2017 were used to detect correlations between surface and subsurface features. Preliminary results suggest site organization at Macurany was decentralized given the frequency and proximity of the ports in relation to the variable depth and distribution of terra preta. This analysis contributes toward an understanding of precolonial landscape modification and settlement organization in Amazonia and, more broadly, of the formation of terras pretas and anthropogenic ports.

[82] *Cobbling Material Memory: Kings, Gods, and Shrines in an Old Kingdom with Active Roots – Kanazi Palace, NW Tanzania*

Over the last decade, heritage research in Kagera Region of NW Tanzania has responded to community-driven initiatives focused on preservation, tourism, and museum development. This attention to heritage-related programs has fostered several projects that continue to enhance our understanding of appropriate methods for preserving local and regional histories in African contexts, including the challenge of working in settings where projects expand and contract as trust between researchers and informants develop. Recent work at Kanazi Palace — an edifice built by the German colonial government in 1905 for local kings (bakama) of Kihanja kingdom — illustrates how trust, coupled with generational change, can transform an ongoing project. A multi-functional site, Kanazi Palace currently functions as a residence, active shrine complex, and historic museum dedicated to archaeological research conducted on the site in 2011 and 2012. This paper summarizes recent developments at the palace while outlining future plans aimed towards linking its heritage component to the kingdom's spiritual center in Kaibanja, approximately 20 kilometers east near Lake Ikimba.

Ellyson, Laura (Washington State University)

[57] *Inequality among Ancestral Pueblo Households and Its Impact on Animal Subsistence*

Recent studies of household inequality in the central Mesa Verde region (CMV) and Chaco Canyon indicate that the degree of wealth inequality among ancestral Pueblo households remained relatively low in the CMV, even as it increased dramatically in Chaco from the mid-800s through the early 1000s, based on Gini coefficients calculated on household floor area as a proxy for wealth. Beginning in the late A.D. 1000s, however, Gini coefficients increased among CMV households as well, reaching values as high as those for Chaco Canyon, and above the median for a recently compiled worldwide sample of prehistoric agriculturalists. This study explores the distribution of faunal remains associated with households from CMV sites to understand how the development of inequality (as reflected by Ginis) impacted subsistence strategies and access to faunal resources.

[72] *Old Site, New Data: Challenges and Success in the Re-analysis of the North Shore Site, Providence Covelands Archaeological District*

The multi-component North Shore site has been frequently cited as a point of comparison in regional subsistence, settlement, and ceramics studies in part because 1980s-era archaeological investigations included marine shell thin section and tooth cementum analyses, and a large number of radiocarbon dates used to address chronological patterning, settlement changes and seasonality. The Public Archaeology Laboratory, Inc. recently undertook a massive effort to re-catalog, re-organize, and re-analyze the North Shore Site assemblage as part of an alternative mitigation project. Several challenges arose including an incomplete artifact inventory during the original cataloging efforts and new information indicating the radiocarbon dates were unreliable. We undertook new analyses including ceramic residues, XRF analysis of lithic materials, re-organization of seasonal data, and a new suite of radiocarbon dates. The resulting data have provided new insights into interpretations of the site. Our re-analysis indicates the site was likely a seasonal village-like settlement most intensively occupied during the terminal Late Woodland to Early Contact Period. Site inhabitants engaged in regional trade and consumed maize, a previously unrecognized material in the assemblage.

Elson, Mark (University of Arizona)

[246] *Platform Mounds and Ethnographic Analogy Revisited: Defining the Functional Universe*

Archaeological data from Southwest U.S. platform mound sites will likely not satisfactorily resolve the question of platform mound function and social organization. This is due to the ambiguities inherent in our data base and in our limited opportunities to excavate these features. Because of this, explanations given for prehistoric mound function vary tremendously, although almost all researchers agree that mounds were constructed by socially complex groups with defined leadership and subsistence surplus. Twenty-three years ago I used ethnographic and ethnohistoric records to characterize extant platform mound-using groups for my dissertation and then applied these findings to a prehistoric mound system in the eastern Tonto Basin of central Arizona. This paper continues this research using new information based on the assumption that human's use platform mounds in a finite set of ways. The range of variation in ethnographic/ethnohistoric platform mound-using groups is investigated and the universe of known behavior defined. New observations are applied to prehistoric mound groups of the Southwest to better understand mound function and the social organization of mound-building groups.

[348] *Late Precolumbian Subsistence Change, Socio-political Transformation, and Ethnogenesis in the Upper Illinois River Valley*

Post-AD 1000 was a time of tremendous change in the Upper Illinois River valley. The Terminal Late Woodland groups in the region were bordered on the south by emergent Mississippian petty chiefdoms of the Central Illinois River valley, on the north by Oneota and Mississippian societies, and on the east by Fort Ancient groups. Coinciding with this cultural mix was the recent adoption of maize agriculture. First evident isotopically at ca. AD 900, maize became a substantial constituent of Upper Mississippian diet by AD 1100. Archaeologists have proposed that

pressure from surrounding groups, including increased violence and intermittent raiding, may have propelled changes in the lifestyle of Terminal Late Woodland people. By AD 1100, these highly mobile family-sized horticultural bands had transformed into settled villagers who practiced full-time maize agriculture, and buried their dead in large communal mounded cemeteries. The period between the 11th and the 15th century is a time of considerable climatic fluctuation in this area, that likely contributed to social and subsistence stressors facing these Upper Mississippian societies. In this paper we examine the interrelationships of changes in settlement patterns, diet, and culture, within the context of known climate changes.

[183] *Moving On Up: The Promise of Multiple Data Sources in Reconstructing Early Population History of High Altitude Sites in Nepal*

Archaeological research in the high elevation regions of Upper Mustang, Nepal, offer insights into population history in this region through multiple data sources including material culture, genomic, isotopic, and bioarchaeological data. Together, these data have enabled us to address questions of migration, patterns of exchange, quality of life, and burial treatments in several valley systems. Here we compare research at two communal mortuary sites each with a rich assemblage of material culture and human burials: Mebrak (400-50 BCE) with a minimum of 42 individuals and Samdzong (400-650 CE) with a minimum of 105 individuals. Bioarchaeological profiles with regard to trauma, stress, and interpersonal violence are broadly similar between the sites, as is genomic similarity. Yet material culture in the form of metal, glass beads, stylistic motifs on metal objects, and fabrics/dyes, as well as mortuary pattern suggests differences in patterns of interaction with surrounding regions. Specifically, Mebrak appears to have had a more "lowland/south facing" cultural orientation, compared to Samdzong, which shows expanded connections that face to the Tibetan Plateau and Central Asia. The use of multiple lines of evidence thus offers significantly greater opportunities for developing insights into continuity and change in these high elevation environments.

[307] *Genomics and Archaeological Survey: Elucidating Ancient Mesoamerican Human-Plant Interactions*

Archaeogenetics, a term coined by Colin Renfrew in 2000, is a relatively new line of inquiry into the archaeological past. Archaeogenetic techniques use ancient DNA and genomic sequencing to reveal population-level data that may be used to elucidate processes central to archaeological research, such as group migrations and domestication events, among others. This paper explores the potential for genomic data and regional archaeological survey to complement each other. Building on recent collaborative research, it examines interactions between humans and plants—specifically cycads (cycadales) and maize—throughout Mesoamerican history. Genomic evidence, based on genotype covariance of transcriptome-derived microsatellites, reveals patterns in cycad evolutionary dynamics that suggest human-induced dispersal of these plants. When compared with archaeological survey data ranging from Tamaulipas to the Tehuacán valley, several correlations between cycad evolution—particularly *Dioon* spp.—and cultural processes are evident. Dispersal and population split events parallel the spread of certain shared linguistic terms, episodes of demographic migration, the development of specific cultural practices (e.g., nixtamalization), and possibly the domestication of maize. The paper concludes with a discussion of how genomic data may productively inform archaeological survey, in terms of identifying areas or regions in which crucial evidence for specific human activities may be encountered.

[26] *Changes and Reactions: Hunting and Gathering by Agriculturalists in the Woodland Period*

In the midcontinent of North America, the transition from the Archaic to the Woodland Period is generally signaled in the archaeological record by the presence of ceramics and the adoption of agriculture, particularly of low yield indigenous plants including barley grass, goosefoot, sunflower, and squash during the Early and Middle Woodland. In contrast, stable isotope analyses from Late Woodland sites indicates a major increase in proportion of maize in the diet. New strains of maize were introduced with much greater productivity, changing the dependence on agriculture from a minor role at 15 to 20% to a major role at 50 to 75% of the calories in the diet. This enormous increase in the agricultural productivity resulted in an explosion of population and a substantial expansion of the number of sites, particularly with increases in smaller secondary river valleys and uplands. Part of the increase is sites includes greater use of rockshelters. Analyses of ceramic, lithic, faunal and spatial data from Woodpecker Cave will investigate the role of seasonal hunting sites within the context of greater agricultural dependence.

Ensor, Bradley (Eastern Michigan University)

[405] *The Late Classic Islas de los Cerros Landscape: A Tapestry of Kinship, Identities, Histories, and Ancestries*

Archaeological studies on cultural landscapes are promising avenues for interpreting the embodiment of meaning to ancient peoples. Within Mesoamerica, most are restricted to elite contexts and centers with monumental architecture. In contrast, this presentation considers residential landscapes across social classes using settlement data and house mound construction sequences from Islas de los Cerros, Tabasco, Mexico to infer the intersection of settlement history, kinship practices, and successor relations to ancestral spaces. Whereas patrilineal elite groups maintained nucleated residential areas at ancestral locations across generations, and adding new lower-ranked subgroup residences at those locations, one class of commoners practicing neolocality expanded and cast bilateral networks across the islands whereby only one descendent (and spouse) of each generation remained residentially affiliated with their ancestral locations. Viewed in this way, the tapestry of space, identities, histories, ancestries, and statuses can be read into Islas de los Cerros' kin-embodied landscape. The case study illustrates the utility of residential features and class differentiation in the interpretation of ancient Mesoamerican cultural landscapes.

[410] *City of the Centipede, Part 2: Urban Development and Construction Chronologies at El Perú-Waka', Petén Guatemala*

Part II of II. The Waka' Archaeological Project (PAW) has conducted over a decade of archaeological investigations documenting the modification, layout, use, and chronology of monumental and residential landscapes of the Classic lowland city of El Perú-Waka'. These papers will evaluate current theoretical and methodological perspectives of ancient Classic Maya urbanism based on fifteen years of excavation and survey at El Perú-Waka'. Part II presents the occupational sequences and architectural history as reconstructed through artifactual, ceramic analysis, constructing a model of shifting urban development in this lowland capital. While El Perú-Waka' was a "typical" Classic Maya city in many ways, the PAW and LiDAR settlement and archaeological data reveal a distinctly "local" pattern of urbanization, landscape modification, and political history.

[359] *Elite Stronghold or Communal Defense? Investigating a Late Bronze-Early Iron Age Cyclopean Fortress in Kvemo Kartli, Southern Georgia*

Emerging after a Middle Bronze Age, which is defined by massive kurgan burials and a lack of permanent settlements, cyclopean fortresses of the South Caucasus represent the product of a significant amount of coordinated labor. However, much is unclear about the social order of these fortresses and the communities that built them. Excavations at the site of Dmanisi Gora in Kvemo Kartli have begun to explore the formation, organization, and transformation of one of these fortresses during the Late Bronze and Early Iron Age (LBA-EIA). The site consists of two large fortification walls enclosing an area with low mounds and linear stone structures. Excavations within the fortress uncovered two well-preserved phases of occupation tentatively dated to the LBA-EIA. These two phases have broadly similar pottery but significant differences in the character and orientation of their architecture. Excavation of the inner fortification wall—now shown to be more than 4 m thick and at least 2.5 m high—show that its initial construction dated to the earlier phase of the site's occupation. Evidence of craft production and mortuary activities highlight the potential of the site for investigating the societies living within these cyclopean fortresses.

[67] *On the Practical Use of Knives Manufactured from Human Feces and Saliva: An Experiment*

In 1996, the anthropologist and ethnobotanist Wade Davis recounted in his book "Shadows in the Sun" the tale of an Inuit man who manufactured a knife out of his own feces and saliva as these raw materials froze during the arctic night. With these items he then butchered a dog. Since that time, this story has been told, and retold, on websites, radio interviews, and other media. In this paper, we present an ethnoarchaeological experiment testing the practical use of knives manufactured from frozen human feces and saliva. After acquiring the necessary raw materials, we produce these knives, and then use them in controlled cutting tasks of hide, muscle, and tendons/ligaments. Prehistoric and indigenous people regularly produced ingenious and expedient technologies, and in so doing could survive, and even thrive, in desperate situations and dangerous contexts. However, modern perceptions of prehistoric and indigenous people and their abilities can also be exaggerated or false. Our results have implications for these sorts of perceptions.

[388] *The Production and Use of Chipped Stone Tools during the Metal Ages in the Southern Levant – Evidence from Abu Snesleh*

The Middle Bronze Age (MBA, c. 2000–1500 BCE) in the southern Levant (modern day Jordan, Israel, Palestine, and southern Syria) is characterized by a re-urbanization, and extended use and specialized production of metal objects which obviated the use of chipped stone tools, of which production has long been considered to have significantly declined after the Chalcolithic period (c. 4800–3600 BCE). Challenging this assumption, this analysis of the chipped stone tool industry paints a fascinating picture of technological knowledge used by the inhabitants of Abu Snesleh in Jordan. The site represents a vibrant local industry of chipped stone tool technology during the MBA, with elements long considered extinct such as burins and tabular scrapers. Based on this evidence we argue that MBA people at the site actively made and used stone tools, and possibly re-used and maybe copied earlier Chalcolithic pieces they found on site. While chipped stone industries after the Chalcolithic period typically receive little attention, the results from Abu Snesleh join a small but important group of post Chalcolithic sites with undisputed evidence for chipped stone technology, teaching, and use.

[306] *Don Lathrap, Precocious Civilization, and the Highland-Lowland Link in Andean Archaeology*

The dynamic interaction between culture areas has been and continues to be important. Traditionally, the boundaries or frontiers between culture areas were considered fixed. Many scholars now recognize that these spaces were fluid and their inhabitants played roles in the development of cultures throughout the world. Based on his own and previous archaeological research in the Andes and Amazonia, Donald Lathrap proposed that advanced societies in the Upper Amazon and Northern Andes heavily influenced early civilization in the Andean region. This included early appearance of pottery and other important technological innovations, tropical lowland resources, village life, temple architecture, crops, iconography, standardized styles, and worldview. He proposed a range of processes including migration, diffusion, trade, competition, and proselytization to account for the diverse evidence. His ideas about the origins of Andean civilization were accepted by some scholars and rejected by others. Lathrap later focused on the formation of unique precolumbian cultures that developed in the intermediate zone (montaña) as an important cultural phenomenon. We evaluate Lathrap's diverse ideas using contemporary archaeological research in the Andes and Amazonia and argue that Lathrap's deep tradition approach and continent-wide perspective on the past continues to have relevance.

Erickson, Katrina (National Park Service) and William Reitze (University of Arizona)

[3] *A Backcountry Learning Laboratory: Archeology and Internships at Petrified Forest National Park*

Beginning in 2012 Petrified Forest National Park developed an archeological internship program designed to bring young professionals into the park for training, education, and outreach with the public. Since then the park has had 31 student interns. The internship program involves students working directly with interdisciplinary teams of park staff and outside researchers to document the current conditions of archaeological sites. This field training is coupled with independent research to help interns apply their skillsets to a specific research question. Research partners have included Northern Arizona University, the University of Arizona, the Museum of Northern Arizona, the Laboratory for Traditional Technology, the UA Geoarchaeology Laboratory, and the Laboratory for Tree Ring Research. There are numerous direct benefits of this program to the park. Interns allow the park to increase the capacity of our limited cultural resources staff allowing us to work more with the general public. Cultural resource

staff and interns can then provide more education and interpretive opportunities for the public. The PEFO internship program has been very successful in promoting the careers of these interns. The bulk of these interns have gone on to further graduate work, careers in Federal land management, or jobs in cultural resource management.

Erickson, René (Independent Researcher)

[168] *Exploring Perforated Earspools of the Arkansas River Valley*

Earspools dating from the Mississippi Period are found throughout the Southeast region of North America. Some of these artifacts were recovered from sites in the Arkansas and Red River Valley regions, and share similarities with those from other Mississippian sites in form, material type, size, and decorative motifs. The variability suggests that not all earspools were intended to be identical. The degree of diversity and lack of standardization with regard to the decorative features in the sample of earspools suggest that some of these items of adornment may have been created for specific individuals or for a specific purpose. One of the different types of stylistic attributes present on the artifacts in the assemblage is a perforation. This poster presents results from the analysis of earspools to determine if there is a relationship between the diameters of the perforations and the earspool types in order to further identify diversity in the artifacts and its implication in personal identity.

Erlandson, Jon (University of Oregon)

[249] *Western Stemmed Technology on California's Channel Islands*

Paleocoastal sites on California's Northern Channel Islands have produced hundreds of stemmed points, crescents, foliate points or knives, and other bifaces dated between ~12,250 and 8200 years ago. Although uniquely maritime in nature, these island Paleocoastal assemblages are clearly related to the broader Western Stemmed Technology (WST) of American Far West. The Arlington Man remains from Santa Rosa Island, dated to ~13,000 years ago, show that the islands were settled by humans by Clovis times, but no diagnostic Clovis-like artifacts have been found on them and Clovis-like points are relatively rare in California. In this presentation, I will explore the potential origins and implications of early Paleocoastal WST assemblages on California's Channel Islands.

Erlick, Mary (Utah State University)

[116] *Obsidian Sourcing and the Origins of the Black Mountain Redoubt Site, Wyoming*

Projectile points are one of the few artifacts present on the surface of archaeological sites that may also serve as a diagnostic of the site's relative age. A shift in the archaeological record can be seen through changes in projectile point technologies between the Late Archaic and the Historic periods in northwest Wyoming. The exact causes of these changes are unknown. This time period also saw a decrease in the diversity of obsidian found at local sites. The Black Mountain Redoubt site, located in the Washakie Range at 8200 feet, contains diagnostic projectile points including Late Archaic, Rose Springs, and Desert Side Notch indicating the site is multi-component. However, projectile point types like Rose Spring and Desert Side Notch have wide chronological ranges, making it difficult to date archaeological sites where only these types are present. Through experimental archaeological comparison of the obsidian assemblage from the Black Mountain Redoubt site, I answer questions about technology, mobility, exchange, and migration in the Central Rocky Mountains. This poster explores the preliminary data collected using X-ray fluorescence (XRF) to examine similarities and differences between the debitage versus the projectile points via analysis of geochemical composition.

Ermigiotti, Paul, Mark Varien (Crow Canyon Archaeological Center), Leigh Kuwanwisiwma (Hopi Cultural Preservation Office) and Grant Coffey (Crow Canyon Archaeological Center)

[122] *The Pueblo Farming Project: A Hopi-Crow Canyon Archaeological Center Collaboration*

The Pueblo Farming Project, or PFP, is a collaboration between the Hopi tribe and the Crow Canyon Archaeological Center. The Primary goal of the PFP is to investigate traditional Pueblo farming techniques and assess how they could help us understand ancient farming in The Mesa Verde region. The PFP established 5 experimental garden plots. Traditional Hopi farmers helped select field locations, provided seed stock, and supervised plantings and harvesting from 2008 to the present. Crow Canyon staff collected data on maize growth and yields as well as temperature, precipitation and soil moisture. The PFP conducts research, develops educational programs and pursues Hopi interests in preserving traditional farming practices.

Ernst, Marlieke and Brendan J. M. Weaver (Stanford University)

[170] *Towards a Comparative Analysis of African-Influenced Ceramic Motifs in the Spanish Americas: Hispaniola and Peru*

In this poster we present a ceramic phenomenon occurring at two Spanish colonial sites of differing spatial and temporal provenience in the Spanish Americas. The appearance of various African influenced comb-dragged and wavy line motifs in Cotuí and Concepción de la Vega (early colonial Caribbean, 1495-1562) as well as at the haciendas of San Francisco Xavier de la Nasca and San Joseph de la Nasca (middle-to-late colonial Peru, 1619-1767) have raised many questions about the people making these ceramics. Here we present an initial comparative study of the decorative elements, ceramic technologies, and site context of previously undocumented phenomena

related to innovation and cultural confluence in ceramic production. By comparing the material from two disparate Spanish colonial contexts these ceramics offer us indications of how enslaved African actors maintained social memory and expressed social agency.

Escalante, Kirsty (Tulane University)

[116] *Multifunctional Obsidian Blades: Exploring Use-Wear of Maya Blades from the Quiché Basin, Guatemala*

Use-wear analysis is a valuable method for understanding the various functions of stone tools, a central concern in lithic analysis. This poster focuses on the results of a use-wear study of 50 Late Postclassic (AD 1250-1525) prismatic obsidian blades from two Maya sites in the Utatlan/Q'umarkaj region of the Quiché Basin in highland Guatemala: Ismachi and Pakaman. A preliminary analysis of a random sample of ten blades revealed signs of intensive use on all blades as well as microscopic hair or fiber attached to the edge of 40% of the sample. The present study aims to elucidate these initial results by examining a larger sample size at magnifications over 10x. The use-wear patterns from this study will be compared to previous analyses of archaeological use-wear, as well as experimental studies linking certain tool functions to specific obsidian wear patterns. Preliminary conclusions suggest that the Maya employed obsidian blades for a variety of functions, including animal meat and hide processing. By comparing the wear patterns from this previously uninvestigated sample to archaeological and experimental studies of obsidian use-wear, this project will contribute to comparative analyses of wear and tool function in the Maya area.

Eschbach, Krista (Arizona State University)

[198] *Beyond First Encounters: Mechanisms of Social Transformation at the Colonial Port of Veracruz*

The Port of Veracruz was significant not only as the landing site of Hernán Cortés, but also as a central gateway for European colonists and African slaves entering New Spain. First encounters between immigrants and natives had significant long-term consequences, but initial interactions were only a starting point for centuries of sociocultural change. Historians have identified at least three macroscale shifts in the social structure of colonial Mesoamerica. Colonists initially borrowed Iberian ideals for organizing colonial society. Varied historical settings, local interactions, and reciprocal responses by officials and institutions led to the development of the casta system by the seventeenth century. The casta system, in turn, began to decline a century later. Drawing on the work of sociologists and political scientists, I take a "mechanistic" approach for explaining local changes in social relations and the development of durable social categories as seen at the Port of Veracruz. My focus is on relational mechanisms that modified reoccurring patterns of interaction and concatenated into processes of categorical change. I identify mechanisms that were at work in pluralistic neighborhoods at the port through analyses of census data, use of urban space, and the production and consumption of material culture from archaeological contexts.

[129] *A Tale of Two Bombers: Forensic Recovery of WWII-era Aircraft Crash Sites in the Jungles of Papua New Guinea*

The successful recovery of human remains from aircraft crash sites is significantly impacted by the circumstances of loss, to include how the crash occurred, the size of the aircraft, and taphonomic factors. Two WWII aircraft crashes in the East Sepik and Madang Provinces of Papua New Guinea highlight these variables, and how the archaeological recovery strategies utilized were impacted by the resulting wreckage fields and remains distribution. The first case study involves the loss of twelve U.S. service members aboard a B-24D Liberator, which partially broke up in the air after being struck by anti-aircraft fire, resulting in a crash site spread out over more than a 500-x-500 m area and distribution of remains over more than one loci. In contrast, the second case study focuses on the loss of an A-20G Havoc, a light bomber with two service members on board that failed to return from a bombing run near Wewak, resulting in an extremely compact crash site in which both individuals were recovered primarily within a 2-x-2 m impact area. This poster will review the circumstances that led to these contrasting site types, the impacts to forensic excavation strategies utilized, and the resulting recovery and identification of the service members involved.

Casal (University of Texas at Austin)**[309]** *Soil and Water Chemistry: Aguada Fenix, Tabasco and Northern Belize*

Most of the Yucatan has no vestige of rivers; humans and ecosystems rely on rainwater catchment and soil and ground water. Along the southern margins of the Peninsula, however, lie rivers in Belize and Quintana Roo to the southeast and Tabasco and Campeche to the southwest. This paper considers the soil and water chemistry of the Middle Preclassic site of Aguada Fenix, Tabasco based on samples collected in 2018 and ongoing laboratory analysis for elements and minerals, carbon isotopes, and organics. Second, we compare these and other soil and water analyses to water control and wetland fields and canal systems in these regions of river convergence in Tabasco and northern Belize. Alfred Siemens and coauthors studied these wetland systems since the late 1960s across this whole zone from Veracruz to Belize. This oeuvre led to more wetland field studies, some of which presented evidence for early wetland field evolution in the Archaic and Preclassic and others for much later timing in the Late to Postclassic. Here, we provide new imagery from lidar and drones and soil and water evidence for wetland field evolution over Maya history.

Social-cultural changes and the growth of digital media have led to new broadcasting methods in archaeology and public archaeology, using computer games, gamification and virtual reality, as these encourage the user to solve problems and construct social relations that enable personal development and reflections on the past. The purpose of this paper is to examine how these tools can be best applied in educational and public environments to increase understanding and visualization of archaeological contexts.

Ethridge, Robbie (University of Mississippi)**[162]** *Chicasa and Soto: Toward a Continuum of Disentanglement*

The concept of "entanglement," when applied to the Native American colonial experience, usually assumes both an inevitability and magnitude that comes with historical hindsight. Such an assumption easily masks the fact that historical players did not act with this in mind and that encounters between Natives and newcomers were intrinsically variable and historically contingent. We argue that disentanglements are likewise variable and contingent and also shaped by the kind of entanglements from which they derive. Scholars often analyze the entrada of conquistadors such as Hernando de Soto as a single event, a single "entanglement," that resulted in a single kind of impact across the American South. We use archaeological and ethnohistorical evidence to examine and compare a first, short-lived event of contact between Hernando de Soto and the Indians of the Southeastern Mississippian polity known as Chicasa with other of Soto's encounters in order to highlight the variations of encounters during the expedition and to gauge the degrees and variations of entanglements and disentanglements between Soto's army and the people they encountered.

[162] *Chair*

Eubanks, Paul (Middle Tennessee State University)**[242]** *Economic, Political, and Religious Motivations for Visiting Salt and Mineral Springs in the Late Prehistoric Southeastern United States*

Over the past forty years or so, there has been a marked increase in the number of studies dealing with the archaeology of salt and mineral springs in the southeastern United States. Many of the Southeast's springs contain an abundance of salt production debris, and as a result, much of this recent scholarship has focused on the material and economic facets of the salt-making process. This topic is a worthy anthropological pursuit; however, the ceremonial and spiritual realms of salt's production and use in the Southeast are frequently overlooked. In an effort to shed some light on both the material and non-material aspects of salt, this paper reconsiders the economic and political implications of salt making and offers new insights into the potential ritual importance of salt in the late prehistoric Southeast.

Evans, Amanda (Coastal Environments, Inc.), Richard Weinstein (Coastal Environments, Inc.), August Costa (Moore Archeological Consulting, Inc.), Louise Tizzard (Wessex Archaeology, Ltd) and Ramie Gougeon (University of West Florida)**[108]** *Submerged Prehistoric Archaeology: Tackling the Issues of Scale and Context on the Gulf of Mexico Outer Continental Shelf*

The northwestern Gulf of Mexico outer continental shelf (OCS) includes approximately 38,660,700 acres of submerged land under federal permitting authority, which are in turn subject to Section 106-compliant archaeological survey. Both historic and prehistoric resources must be identified. While historic shipwrecks can occur in any water depth, sea-level curve data correlating with periods of known human occupation in North America suggest that only those portions of the OCS out to the 60m depth contour could have been exposed as dry land and available for human exploitation. Combined with predictive modeling developed over the last 40 years, archaeologists use geophysical data to identify high probability areas for the occurrence and preservation of archaeological sites, however this has not yet resulted in the indisputable identification of a prehistoric site. At issue is the attempt to identify discrete sites from a largely unexplored area; to date, only 0.827 m² (8.901 ft²) of the northwestern OCS has been physically sampled for prehistoric archaeology. The authors will discuss a newly-funded study that will develop baseline characterizations within a 234 square miles area anchored by two identified paleolandscapes at depths of 17m BSL, and associated with the probable shoreline stand at approximately 8,000 BP.

Evans, Susan Toby (Penn State University)**[24]** *Night Falls on Tenochtitlan*

Cortes escaped from Tenochtitlan on "La Noche Triste" in the summer of 1520, but many in his entourage did not – a Mexican woman awake in the night saw them heading across the causeway to the mainland and roused the city to pursue them. The intruders had been under siege by the Tenochca, whose daytime prowess as street fighters was not matched by a vigilant presence at night. There are several important reasons why. One was exhaustion after long days of fighting in the weeks since the Toxcatl massacre of Aztec lords in late spring. Furthermore, even under normal circumstances, the Aztecs believed that the night transformed their world into a dangerous place, where the dreaded tzitzimilit spirits of the dead imperiled the living who would venture out. However, palaces and temples represented sanctuaries where fires were kept burning all night, maintained by stewards and novices. And throughout the year festivals involved dancing and feasting that went on all night. This study of how the Aztecs conceptualized the night shows that, as was true of so many cognitive constructs, dualism structured their attitudes and permitted them occasional riotous enjoyment in a nocturnal world that they typically avoided.

Evans, Tomos (The College of William and Mary)**[82]** *Archaeology and the End of Empire in Nigeria: Learning from the History of Late Colonial Archaeology at Ile-Ife*

At the city of Ile-Ife (Nigeria) in 1953, three foreign archaeologists (Bernard Fagg, AJH Goodwin, and William Fagg), with the permission of the Oni of Ife, conducted several months of fieldwork in the old city. With the aim of uncovering evidence relating to Ile-Ife's early industries (including exquisite brass and terracotta artworks), they excavated several sacred shrines devoted to specific Orisha across a city that was considered the religious and spiritual centre of the Yoruba people. As a result, the excavations inflamed tensions in the city and exposed the complexities of the relationships between the colonial state, Western archaeologists, traditional authorities and priests, Nigerian fieldworkers and local people. Using archival data from the University of Cape Town and the University of Glasgow including the field diaries of Bernard Fagg and AJH Goodwin, this talk will tell the tumultuous story of the 1953 field season at Ile-Ife, explore the nature of late colonial archaeology in Nigeria at a time when Nigerian independence was looming, and ponder what may be learned from the mistakes of Western archaeologists during this period when approaching discussions relating to the decolonisation of archaeology as a discipline.

Evans, Victoria [44] see Montoya, Joaquin

Evans, Victoria (New Mexico Highlands University) and Linda Gregonis (Ceramic Analyst)**[258]** *Connecting Hohokam Art and Iconography*

All cultures use symbols to convey ideas. In archaeological contexts those symbols have become ways to define and differentiate archaeological cultures. But what did the symbols mean to the artisans who created them? The art

that Hohokam craftspeople produced embodied the world (seen and unseen) as they understood it. They were influenced by weather, animals they encountered, plants they grew and used, pilgrimages they made, other people they met, their ancestors. They translated their experiences into art, creating iconic motifs that were shared across a wide region. We explore how these images were shared through time in various media—pottery, shell, carved stone, and rock art—and what these symbols may have meant in the context of Hohokam identity.

Everhart, Jennifer (Washington University St. Louis)

[402] *Hunted Deer and Buried Foxes: Fauna from the Middle Epipaleolithic Site of 'Uyun al-Hammam*

The Levantine Epipaleolithic (ca. 23,000—11,500 cal BP) saw an explosion of behavioral innovation and diversification in hunter-gatherer groups. One of these new behaviors was the development and spread of repetitively used and reused burial grounds or cemeteries. The Middle Epipaleolithic site of 'Uyun al-Hammam in the Wadi Ziq'ab area of Northern Jordan preserves the earliest known evidence for the construction and use of cemeteries. Human mortuary behaviors develop within the broader contexts of subsistence strategies, social networks, and the economy. Here, I focus on the development of cemeteries in the Late Pleistocene Levant in the context of Epipaleolithic subsistence economies as well as hunting modalities. We uncovered an unexpected hunting pattern at the site dominated by local cervid taxa. Interestingly, the faunal remains from mortuary contexts closely mirror those found within habitation areas. Yet, an interred fox alongside humans suggests that Middle Epipaleolithic ritual activities involved modifications as well as echoes of familiar behaviors.

Everhart, Timothy (University of Michigan Museum of Anthropological Archaeology)

[176] *A Study of Woodland Ditches*

The Woodland societies of the Central Scioto River Valley in Ohio, most notably the Hopewell, have garnered much archaeological distinction from two elements of their ceremonialism: the construction of large, sometimes geometric ditch and embankment enclosures and the production of ornate art, often of exotic materials, utilized in funerary practices. It has been long held, dating back to the many 19th century maps from the region, that Woodland monumentality involved the erection of monuments of various geometric and non-geometric designs. Yet, the variability in composition and architectural complexity has only recently been detailed through modern excavation. The majority of this research has focused upon the extant remnants of embankment walls, while associated ditches have received relatively less study. Given how readily detectable ditches are with geophysical survey and their relatively better preservation, they form useful datasets to explain Woodland monument life histories and to more fully understand these monumental landscapes as a whole. This paper reports the excavation of 5 ditches in comparison to previously excavated ditches, demonstrating the archaeological richness of these features and lending insight into the organization and diversity of Woodland practices of monumentality.

Fadem, Cynthia (Earlham College) and Shanna Diederichs (Crow Canyon Archaeological Center)

[86] *Geoarchaeology of the Basketmaker Communities Project: Informing Past and Present Agricultural Sustainability*

Sustainable land-use is critical to the past, present, and future of human occupation of the desert Southwest. Our work on the Basketmaker Communities Project (BCP) and Pueblo Farming Project (PFP) demonstrates that pedogenic mineral accumulation and water stress are likely the limiting factors for agriculture in this region. Overall we find no pattern of nutrient depletion at BCP sites or in PFP gardens. With mineral accumulation limiting crop yield, its impacts on Basketmaker and Pueblo farmers would have been substantial. Settlement strategy and farming technology would have evolved in response to induration, which opens new avenues of archaeological and agricultural inquiry. Though climate conditions do not change substantially at PFP and BCP spatial scales, soil tilth does, giving things like fine-scale geomorphic modeling, check dam surveying, and site-specific paleoenvironmental reconstruction the potential to open new avenues of research for the Southwest Neolithic. The identification of soil and climate refugia, especially if these areas co-locate with check dams or specific geomorphic contexts, would provide greater insight into the productivity, patchiness, and scale of agricultural land-use in times of water stress.

[359] *Everything Old Is New Again: Considerations for Re-examining the Previously Excavated Material of Hellenistic- and Roman-Period Armenia*

Throughout the twentieth century, archaeological investigations into the Hellenistic and Roman periods in Armenia sought to understand the ancient kingdom's place in the broader Mediterranean sphere. The projects often worked to identify cultures and cultural influences in the material record, disentangling evidence of external influences from the material culture that expressed the identity of the local people. Through examinations of large sites like the ancient capitals of Artashat and Vagharshapat or the settlement and fortress of Garni, scholars debated the degree to which the material data reflected Greco-Roman or Near Eastern influences, and argued about the persistence of

Armenian culture. In the twenty-first century, the question of Armenia's place in the Mediterranean remains an intriguing puzzle, while the further development of archaeology as a discipline allows us to explore the puzzle from different perspectives. This paper will discuss what happens when we ask new questions of previously-excavated material, and how those questions can help place Armenia in the Mediterranean sphere using the lens of the political relationship between Armenia and the Roman Empire.

[371] *Excavations of a Secondary Burial at Group L of the Medicinal Trail Hinterland Community, Northwestern Belize*

During the 2018 field season, a burial was exposed and recovered during exploratory test-pitting of Group L, a small residential complex within the Medicinal Trail Community located in northwestern Belize. Designated Burial L-1, the burial is secondary in nature as evidenced by the disarticulated remains placed directly on top of bedrock and below a single-phase construction strata near the center of the courtyard. The burial consists of diagnostic long bones fragments and small unidentifiable bone fragments. Additionally, there are sherds from at least two ceramic vessels. This poster will review literature of similar burials in the Maya Lowlands and use these data to inform our findings and interpretations of these remains at Group L.

Fairley, Helen (US Geological Survey)

[99] *Understanding Dam Effects on Downstream Archaeological Resources: Lessons Learned from Three Decades of Research Downstream from Glen Canyon Dam, Arizona*

The destructive effects of large dams on upstream archaeological sites has been recognized for many decades, resulting in passage of federal legislation and numerous large-scale archaeological salvage projects in the 1940s through 1970s. Considerably less attention has been paid to the effects of large dams on downstream archaeological resources. For the past three decades, U.S. Geological Survey scientists have studied effects of Glen Canyon Dam on the downstream Colorado River corridor in lower Glen Canyon and Grand Canyon, including effects to archaeological site condition. Lessons learned from this research may be applicable to other regulated rivers where the emplacement of large dams results in an unnatural sediment deficit downstream; however, caution must be exercised when attempting to extrapolate findings from the Glen Canyon Dam research program to other river systems because downstream dam effects can vary widely, depending on numerous local environmental factors including topography, pre- and post-dam hydrology, sediment supply, seasonal flow patterns, and a host of other variables. This presentation provides an overview of learning from the Glen Canyon Dam research program, plus examples from several other regulated rivers in the American West, to illustrate the various ways in which dams can and do affect downstream archaeological sites.

[365] *Coverage-Based Rarefaction in Zooarchaeology: Potential and Pitfalls*

Zooarchaeologists routinely measure the taxonomic richness of faunal assemblages in order to explore questions related to human subsistence behavior or paleoenvironmental change. A common solution to the well-known sampling issues that attend such analysis is rarefaction, whereby sample size is standardized by rarefying larger assemblages down to a sample size equivalent to that of the smallest assemblage under consideration. A drawback of this approach is that the difference in rarefied richness between any two assemblages varies as a function of the sample size that is used, obscuring ecologically or behaviorally meaningful signals. As demonstrated in the ecological and paleobiological literature, this can be overcome by rarefying assemblages down to an equivalent coverage (a measure of sample completeness) rather than to equivalent sample size. In this presentation, we explore the potential and pitfalls of coverage-based rarefaction (CBR) in zooarchaeology. A key challenge in the implementation of CBR in zooarchaeology is that the units used to quantify taxonomic abundances (NISP versus MNI) can have a considerable influence on the outcome, particularly in poorly sampled assemblages. We explore why this is so, and suggest protocol for implementing CBR in zooarchaeology.

[11] *A Comparison: Two Methods for Timing Linear Enamel Hypoplasia among a 19th Century African American Population from Newburgh, New York*

Linear enamel hypoplasia, also known as LEH, becomes apparent in dental enamel as horizontal indents from thinner layers of enamel being produced. This defect forms as the dental enamel responds to physiological disturbances from systematic stress attributable to biological, cultural, and environmental factors. LEH has allowed researchers to time the defect formation on human remains and can recover information about a population that was previously unknown. Two commonly used estimation methods are the Goodman (1990) and the Reid and Dean

(2006) methods. With these two methods, we compared and contrast the results of a nineteenth century African American subpopulation (n=31) from Newburgh, New York. The results showed a significant difference in the peak ages for LEH formation between the two methods. Through this comparison, we will attempt to reconstruct the roots of why some of the Newburgh population was subjected to early childhood stress producing hypoplastic developments, give insight on the dental health of the subpopulation based off of the prevalence of LEH, consider the history of racism and inequality that took place in the New-York-Newburgh region during the nineteenth century among those of African descent as well as those of poverty, and offer new proposals for future research.

Farah, Kirby (University of Southern California)

[24] *Bright Light in the Big City: The Aztec New Fire Ceremony and the Drama of Darkness*

Populated by as many as 200,000 people, the Aztec capital of Tenochtitlan—like most cities—was buzzing with activity through the night. Given the dynamism of the city, and especially weighed against our modern understanding of the sounds and lights that keep cities alive during the night, it is significant that one of the most important Aztec ceremonies took place in total darkness. The New Fire Ceremony, a rare but potent ritual, took place every 52 years and required that all the fires across the empire be extinguished. Night became dark in a way that many urban central Mexicans may never have experienced. While archaeological research has helped provide evidence for the range of household and community activities that surrounded the ritual, some of the most compelling information comes from ethnohistorical documents which convey the emotions bound up in the ritual. This paper explores how the total darkness that fell over the city in the days leading up to the ceremony contributed to the anticipation and impact of the event. The New Fire Ceremony reflected some of the core values that helped sustain the empire, and certainly the drama of this ritual helped to create a lasting impression.

Farahani, Alan (University of Nevada, Las Vegas)

[365] *Challenges and Prospects of Richness and Diversity Measures in Paleoethnobotany*

The measurement of the richness and diversity of archaeological plant remains recovered from sites is an essential, if not always explicitly recognized, aspect of paleoethnobotanical practice and interpretation. The range of different recovered plant taxa can be indicative of routes of taphonomic entry, diet breadth, local responses to social or environmental disturbance, and other aspects of human lifeways. This paper will identify the prospects and challenges of the utilization of existing richness and diversity measures developed in the biological/ecological sciences for paleoethnobotanical inquiry. Discussion is focused on re-sampling methods such as sample- and individual-based rarefaction. The theoretical challenges of identifying the relationship of the measured assemblage to the actual plants that were used or consumed is outlined. The strengths and weaknesses of existing implementations in the open-source statistical programming platform R are discussed. The paper advocates for a more rigorous incorporation of statistical methods developed in the biological/ecological sciences into standard paleoethnobotanical practice, but with consideration of the aspects that are unique to these data and their collection.

[238] *El Malinche and Tlaxcallan: A Field Guide to Taking Down Democracy*

Contact between the Conquistadores and the native peoples of Mexico 500 years ago was a watershed moment in human history. At its heart was the relationship between El Malinche (Hernán Cortés) and the Tlaxcalteca. Although much has been made of the role the resulting alliance played in the Conquest, the impact of incorporation on social and political organization within Tlaxcallan has received comparatively less attention. This is due in part to a near total reliance on Contact and Colonial Period documents. While these documents are important, they reflect a medieval worldview and, consequently, provide limited information on cultural processes prior to the conquest. Therefore, I draw on multiple seasons of systematic mapping and excavation to examine the pre-Hispanic – Colonial Transition in Tlaxcallan. Together with historic documents, these data allow us to shed light on how the Spanish Colonial government took down one of the most highly collective states in human history.

Farmer, Reid, Jon Kent (Metropolitan State University Denver) and Allan Koch (Cherokee Ranch Science Institute)

[147] *Current Research at Cherokee Mountain Rock Shelter, Douglas County, Colorado*

In 1971, excavations were conducted by avocational archaeologists at Cherokee Mountain Rock Shelter (5DA1001) in Douglas County Colorado. A 1973 published report showed an assemblage indicating three Late Prehistoric components. The middle component contained what was interpreted as Shoshonean ceramics likely from outside of the region. The collection was given for storage to the landowner, until their rediscovery in 2014. The authors are reanalyzing the 1971 collection and doing new research on the terrace south of the shelter. The rock shelter and terrace are the result of erosion of the upper Eocene Castle Rock Conglomerate. Radiocarbon assays on charcoal from the 1971 excavations confirm a Protohistoric occupation, no earlier than ca. AD 1700. Ceramics are reinterpreted as Ute. From 2014–2017 shovel tests, test units and auger tests were conducted on the terrace, showing cultural deposits to a minimum of 1.2m and an unusual mollic A horizon, 1.2 – 2.0m thick with a buried A horizon at 2.5-3.5m. The organic-rich A horizons are probably the result of stratigraphically- focused ground water

flow to the terrace surface over thousands of years. An assay on charcoal from this paleosol returned a date of 9890 +/- 25 RCYBP or 11350-11230 cal BP.

Farnsworth, Paul (Temple University)

[295] *Test Excavations at the African Village of Wallblake Estate, Anguilla*

In 2017, archaeological survey and excavations began at the Wallblake Estate on Anguilla, B.W.I., to examine the plantation landscape and the major activity areas of the estate. The research project is focused on understanding the development of African-Anguillan culture from its origins in the boom and bust plantation economies of the seventeenth and eighteenth centuries, through the nineteenth and twentieth centuries. The research in 2017 identified the location of the African village and excavated a small sample of materials from it to compare to samples excavated at both the extant main house and kitchen. In summer 2018, the project continued the archaeological test excavations. The primary goal of the fieldwork was to identify the locations of houses occupied by enslaved African or African-descended people working at the plantation and the associated trash and other archaeological deposits they left behind. A grid of shovel tests were excavated over the village area which identified six artifact concentrations, three of which have been tested so far with 1x1 meter excavation units. Analysis of the recovered artifacts along with their spatial distributions yielded insights on the ways of life of the enslaved African or African-descended population of the plantation.

[35] *Human-Environment Interactions: The Role of Foragers in the Development of Mobile Pastoralism in Mongolia's Desert-Steppe*

This paper presents a research design to investigate the role of foragers in the evolution of pastoralism in Mongolia's desert-steppe. Past efforts to understand the origins of herding have been stymied by the "steppe and sown" dichotomy that perpetuates long held stereotypes of farmers and herders, and posits agriculture as a precondition for pastoralism. Recent perspectives, however, have revealed more complex evolutionary processes, helping to dismantle outdated views and expand our understanding the role of non-agricultural traditions (e.g., foraging). While studies have generated insights about foraging life in Mongolia, we still have scant information about how foragers contributed to the development of herding. Using archaeological and environmental data from on-going work at the Ikh Nart Nature Reserve in the Dornogovi Province, the study will focus on land use and mobility patterns across the economic and social transition (ca. 4500 BP) as a way to understand the nature of change and implications for the development of Eurasian pastoralism. Working within the framework of evolutionary ecology and concepts of habitat suitability, the study will compare how foragers and herders distributed themselves within habitats, detecting differences in how, when, and why people moved, illuminating how people make decisions about existing environmental conditions.

Farrell, Sean (Texas State University)

[218] *Geoarchaeological Investigations at Bone Bed 1, Bonfire Shelter: Implications for Evidence of Early Paleoindian Site Use*

In the summer of 2018, Texas State University returned to Bone Bed 1 at Bonfire Shelter, a stratified rockshelter in the Lower Pecos Canyonlands of Val Verde County, Texas. Excavations in 2017 and 2018 confirmed the presence of Pleistocene fauna in the potentially earlier than Clovis deposits of Bone Bed 1. However, evidence of cultural activity was limited to the bone breakage patterns observed in the 1960s and 1980s. Previous investigators speculated that geological processes may have impacted the integrity of Bonfire's archaeological deposits, scouring away cultural material or artificially introducing faunal remains. This paper explores the taphonomic processes associated with Bone Bed 1, reporting the results of intensive geoarchaeological analysis and microartifact sampling conducted during 2017/2018. The results of the 2017 loss on ignition, particle size, and magnetic susceptibility assays have been supplemented with X-ray diffraction, total organic carbon, and stable carbon/nitrogen isotope analyses to deconstruct the depositional environment of Bone Bed 1. Over 80 sediment samples specifically targeting residual lithic debitage associated with large animal butchery and stone tool resharpening were analyzed. This paper contextualizes the presence of faunal remains within Bone Bed 1 and broadly explores the role of rockshelters within Early Paleoindian subsistence strategies.

[349] *The Sets of Figurines in Western Mesoamerica: Contexts and Possible Interpretations During the Formative*

In Western Mexico, as in Mesoamerica generally, anthropomorphic and zoomorphic figurines are rather often found in groups, either in caches or in funerary context. These particular contexts allow substantial advances in our understanding of their uses and possible meanings, in particular when the data concerning the arrangement of every element inside the group is known. In this presentation, we shall examine the case of the Chupicuaro's tradition figurines, a formative culture of Northwestern Mexico, between 600 and 100 BC. Several scenes can be reconstructed from sets found in context, mainly in children's graves. These examples will be then placed in the vaster frame of Western Mesoamerica where numerous discoveries took place recently in funerary contexts. According to the age of the deceased, the eventual presence of containers, the arrangement of the artifacts and the protagonists identified, these groups can be interpreted either as a set of objects referring to a function or an activity exercised by the deceased during his life or as scenes intended to accompany him in the afterlife.

[51] *Some Thoughts on "Clovis": Where Were They From, Where Did They Go, Where Do They Fit in the Peopling of the Western Hemisphere*

This talk will present some opinions I have about Clovis - woven with facts to convince the skeptical. I will define what I mean by "Clovis", show what some others mean by "Clovis", and add some additional ways to think about "Clovis" in both synchronic and diachronic directions. I will present what I think about its origins and about where we might be finding "proto-Clovis" already. This Clovis school of knapping (and the assumed bio-linguistic groups within which it was embedded) was parent to several subsequent archaeological culture groups that evolved into the Holocene in multiple places. How do we know this? How do we trace archaeological culture groups into the Holocene? And let's not forget that Clovis was on landscapes with "others", that is contemporaneous groups such as, Denali/Nenana; Western Stemmed Point/PaleoCoastal; and groups in South America too, where Magellan/Fishtail was "other" to Abriense, Umbu, Itaparica, etc. Where do we see these different groups interacting archaeologically, and what were the outcomes?

[197] *Cuisine Choices in Mundane and Ceremonial Contexts at a Late Classic Palace Compound in the Valley of Oaxaca, Mexico*

In the Late Classic (CE 500 – 900), elite families in the Oaxaca Valley maintained and reinforced their elevated status through calendrical rites, where they acted as intermediaries between the community and supernatural entities associated with the agricultural cycle. These rituals served as the key components of broader festivals that likely involved well-orchestrated feasts, including special meals served to important participants. In our recent excavations of a palace and adjacent ceremonial complex, we have identified differential patterns of consumption between the residential-private space and ceremonial-public space within the compound. In this paper, we employ spatial analysis of faunal remains and other markers to examine social and political implications behind the cuisine choices made within the household.

[270] *Art, Archaeology, and Chronology Building: Recent Investigations at Fracción Mujular*

Located on the Pacific Coast of Chiapas, Mexico, the site of Fracción Mujular is best known for its corpus of carved stone monuments. First investigated by Carlos Navarrete in the 1960's, the site is characterized by multiple stelae and carved altars. Several of Fracción Mujular's stelae contain circular glyphs which seem to associate the site with the nearby Early Classic center of Los Horcones, as well as with artistic traditions from Central Mexico. Additionally, two of the site's stelae display glyphs that have been interpreted as sixth century dates. Recent archaeological investigations at the site, however, have uncovered a much longer history, ranging from the Early through Postclassic periods. Using high-resolution digital models of Fracción Mujular's stelae, this paper will connect the story told by the site's stelae with that revealed by recent excavations. I will discuss the site's long history of connection with distant places, as well as the importance of photogrammetry as a tool for the preservation of poorly preserved monuments.

The Wakulla Springs site is a well-known paleoindian site in Florida, which contains abundant Pleistocene megafauna and artifacts including early projectile points. Previous optically stimulated luminescence (OSL) dating at the Wakulla Springs Lodge site (8WA329) suggested occupation older than 11.6 ka but younger than 22.5 ka (W.J. Rink et al. Florida Anthropologist 2012) and raised the possibility of a pre-Clovis presence. This work measured luminescence on small aliquots of quartz. This paper extends this work by measuring luminescence on single grains of quartz on several samples from the same site. Bioturbation is an issue, and single grains provide the best resolution for addressing mixing. Methods for interpreting single-grain age distributions are discussed.

Fecher, Franziska [103] see Otto Mejía, Raquel

Feder, Kenneth[215] *No Shit Sherlock: Sir Arthur Conan Doyle's Use of Archaeological Landscapes*

There are a number of fascinating instances in the Sherlock Holmes canon of four novels and fifty-six published short stories in which Sir Arthur Conan Doyle hints at the presence of malevolent forces embedded in archaeological landscapes. Doyle uses these seemingly eerie, inevitably mist-enshrouded places as a backdrop for stories involving spectral hounds from hell, evil spirits, blood sucking vampires, and inexplicable and ineffable descents into madness. For Doyle, archaeological sites do not just provide an interesting context in the canon; they serve, in a sense, as characters in the stories. Ancient sites are used by Doyle to represent what archaeologist Jeb Card characterizes as a "mythic past," a distant time period quite alien to our modern world, one that is "spooky," and decidedly goosebumpy. The connection between antiquity and the apparently paranormal evil manifested in a some of the Holmes stories is explicit even if the precise nature of the connection is opaque. Fortunately, while this may be how Doyle uses archaeological landscapes, Sherlock Holmes is having none of it and explicitly says so, though he's not above collecting arrowheads with his dear friend Dr. Watson.

Fedick, Scott (Anthropology, University of California, Riverside)[370] *When Do We Eat? The Life Cycle of Indigenous Maya Food-Plants and Temporal Implications for Residential Stability*

For Maya agriculture, both ancient and modern, it is known that a wide range of time is needed between planting and harvesting of various plant species. While annual crops require less than a year to reach full productivity, perennial crops, particularly tree-crops, might require many years to begin production, and even longer to reach full productivity. Documents from the Colonial period of the Maya Lowlands describe the significance of orchards and other perennial food plants cultivated in and around Maya villages, and the great distress caused by the destruction of these resources. Annual crops allow for rapid food production under conditions of residential instability such as forced relocation or flight. Perennial crops imply residential stability or long-term tenure over land or rights to harvest specific plants. Working with an inventory of 497 indigenous food-plants of the Maya Lowlands, this presentation will quantify and discuss the social, economic and political implications of time investment and locational stability required by the known range of food-plants available to the Maya.

Fedoroff, Michael (USACE TNTCX)[6] *Discussant***Feeley, Frank (CUNY Graduate Center)**[31] *Rescue Excavations at a Medieval Fishing Station in Western Iceland*

In 2008 an eroding midden along Iceland's western coast was discovered to be part of a large 15th century commercial fishing station - the first of its kind to be found in Iceland. The site was clearly endangered by coastal erosion and with support from the National Science Foundation rescue excavations were carried out over the course of the next few summers. While post excavation analysis is still ongoing it's clear that this site is a window in a tumultuous time in Iceland's history. It captures an Iceland that was challenging existing ideologies of isolation as it rebuilt after a catastrophic brush with bubonic plague, and laid the foundation for the modern commercial fishing industry so integral to Iceland's modern economy.

Feely, Cassandra**[217]** *Game On: Investigations of Ballcourts 1 and 2 at Xunantunich, Belize*

This paper presents the results of recent investigations of the two ballcourts at Xunantunich, Belize. Located on the Mopan branch of the Belize River, Xunantunich is primarily a Late to Terminal Classic regional center. The site's rapid rise to power in the late 8th to 9th centuries is attributed to its political affiliation with the larger site of Naranjo, Guatemala to the west. Investigations of the two ballcourts at Xunantunich identified differences in both architecture and caching traditions. The architecture of Ballcourt 1 is more closely in line with northern (Yucatecan) traditions, while the architecture of Ballcourt 2 demonstrates a more local Belize Valley tradition. In addition, while Ballcourt 2 demonstrates an extensive caching tradition, no caches were found in Ballcourt 1. These differences will be analyzed in light of the political affiliations of the site as well as the cultural changes that were occurring during the Late to Terminal Classic period in the Belize River Valley.

The genomic revolution opened up new dimensions for paleogenomic research, inconceivable only a decade ago. However, with a primary focus on big-picture population genetics like large-scale migration events, paleogenetics also became somewhat removed from problem-based archaeological research questions with a regional focus, addressing issues such as kinship, genealogy, and political organization. With new methods on hand, and sufficient population genomic data frameworks established, it is now possible to re-focus big picture data, and foster fruitful collaboration with archaeologists who are equally interested in smaller-scale population dynamics. As an example we present our study on social and political dynamics of the Moche Culture along the Peruvian North Coast, one of the earliest (ca. 300—850 C.E.) complex societies in South America. We obtained genome wide data from the iconic Señora de Cao, and 15 other high status Moche burials from the Huaca de Cao to examine marriage patterns and family relations. The genome wide data, contextualized with the rich archaeological record, along with new isotopic data, allow us to not only address the reconstruction of genetic genealogies of past Moche royal families, but to understand the population history of the Moche, and the evolution of political systems in ancient Peru.

Feinman, Gary**[225]** *Discussant***Feliciano-Centeno, Sofia****[418]** *From Prison to Tourism: Historical Evolution and Population of Presidio de la Princesa*

Presidio de la Princesa is one of the oldest prisons in the city of San Juan, Puerto Rico, currently housing the headquarters of the Puerto Rico Tourism Board. This paper presents an analysis of blueprints and historical documents to chronologically delineate changes to the spatial distribution and activity areas while it served as a prison. In addition, I am looking at data collected in the population census of 1910 and 1920 to trace the demographics of prisoners and staff. Drawing from frameworks proposed in archaeology of confinement studies, looking at existing archaeological data from the surrounding areas and incorporating documentary sources it will be possible to propose new research projects.

Feltz, William, Patrick Mullins (University of Pittsburgh, Department of Anthropol.) and Brian Billman (The University of North Carolina at Chapel Hill)**[120]** *Ciudad de Dios: An Analysis of Destruction Using Drone Technology*

In July of 2018, the archaeological site of Ciudad de Dios, located in the Moche Valley of the north coast of Peru, was surveyed using a drone. The digital map was then used to not only analyze the settlement's organization, but also the natural and unnatural destruction that has affected the preservation of the site. Excavated by MOCHE Inc. in 1998, Ciudad de Dios was drone mapped in 2016 before the El Niño Costero of March 2017; the delayed El Niño resulted in amplified rainfall, bringing floods of liquid mud and large boulders that devastated the country. One year after this event, the resulting drone map, in conjunction with the previous 2016 map, allows for the analysis of the effects left by not only the El Niño, but also site destruction caused by modern settlement expansion. The map data from both 2016 and 2018 can assist in understanding the destruction to global archaeological complexes in environments where such risks are present.

Cuba (AmaTerra Environmental, Inc.)**[187]** *Paleo-lake Otero, Playas, and Paleoindian Land-Use in the Tularosa Basin, New Mexico*

Perennial lakes and wetlands occupied many intermontane basins of the western United States during the last glacial period. Spatio-temporal trends in Paleoindian land-use and subsistence inferred from the distribution of sites relative to paleo-lakes remain speculative for many basins in the Southwest in the absence of well-constrained paleo-lake-level chronologies, limited paleoenvironmental reconstructions, and few systematic attempts to identify and determine the distribution of Paleoindian sites. We present the results of geoarchaeological investigations focused on understanding the distribution of predominately Folsom and later Paleoindian sites in relation to the evolving surficial paleohydrology of the northern Tularosa Basin, south-central New Mexico. Previous work indicates that Paleoindian sites are disproportionately associated with small playa basins and are sparse proximal to paleo-lake Otero. Our radiocarbon assays indicate that paludal deposits accumulated in playas contemporaneous with the initial human occupation of the basin. We speculate that the hypersalinity of paleo-lake Otero rendered water unsuitable for human consumption and, consequently, hypothesize that the distribution of Paleoindian sites in the northern Tularosa Basin reflects the availability of potable freshwater in playa wetlands. Our results contribute to increased understanding of the regional environmental response to hydroclimate changes during the last deglaciation and inform basin-scale models of Paleoindian land-use.

Fenn, Thomas (Department of Anthropology)**[82]** *The Appearance, Use, and Production of Glass in Ancient Sub-Saharan West Africa*

One of the commodities heading south across the Saharan Desert over the past 2000+ years was glass. The typical form was as beads, but vessel glass and other forms also have been recorded. Glass not only was imported but at some point in the past also was produced by indigenous populations for local and regional consumption. Advances in recent analytical methods have led to an increased body of compositional and isotopic data on ancient and historic glass in Sub-Saharan West Africa. As a result, these data provide archaeologists and historians a much richer and more robust basis for interpreting the role glass played in trade and exchange networks, and the socio-political, ideological and economic aspects of glass in past cultures. The following paper will review some of the evidence we have for ancient glass in West Africa, present some new and recent results, and synthesis these into a bigger-picture interpretation of the role of glass amongst ancient West African societies.

Ferguson, Haylie (Horrocks Engineers, Inc.) and Scott Ure (Brigham Young University)**[420]** *Low Altitude Aerial Photography in Montezuma Canyon*

Photogrammetric imagery, spatial modeling, and resulting high-resolution orthomosaics can be used to identify potential excavation areas, previously unrecorded architecture and other archaeological features, and to verify and update existing mapdata and site information. This paper discusses the methods and results from Unmanned Aerial System (UAS) mapping at three Ancestral Puebloan sites Montezuma Canyon. Our use of a UAS in conjunction with Global Positioning Systems (GPS), a high-resolution digital camera, a thermal imaging camera, and computer processing software resulted in the collection of thousands of georeferenced aerial photographs of archaeological sites, structures, and landscapes with centimeter-precision resolution and accuracy. Twenty-seven flights were conducted at two sites in Montezuma Canyon and one site on the adjacent plateau. These sites included Montezuma Village, Coalbed Village, and Site 13. The collected data was processed to produce high-resolution orthomosaics, topographic maps, and 3-Dimensional models of each site. Digital elevation models were created for each site which will allow for further GIS analyses. The sites and their varied landscapes each posed unique challenges, allowing us to refine our general and site-specific UAS reconnaissance methods. The data provide a baseline for future research including additional geospatial analyses, survey, and excavation in Montezuma Canyon.

[33] *Central Place Foraging Models and Early Holocene Coastal Adaptations in the Western Mediterranean*

In this paper we use a Central Place Foraging Model to evaluate the impact of environmental changes on subsistence and mobility strategies in the Mesolithic period in the Western Mediterranean. We focus on the analysis of the El Collado site because of its position in the interface between a foothill and the Mediterranean coastal plains. Recent geomorphological studies have allowed us to reconstruct the Early Holocene sea shore position and its impact on coastal ecosystems, showing a progressive contraction of lagoon biotopes. In this changing scenario, we use the rich bioarchaeological record of the El Collado site (faunal, mollusk and fish bone assemblages) to test predictions of the Central Place Foraging model. On one hand, we produce prey abundance estimates within the site catchment at three different Mesolithic phases. On the other hand, we compare these estimations with bioarchaeological empirical data. Our results suggest differences in human foraging strategies (in terms of prey rank, acquisition and processing costs of both prey and mollusks) from the Early to the Late Mesolithic. These transformations may be driven by a dramatic drop in environmental carrying capacity, likely forcing a change in the function of the site within the regional settlement system.

Fernandez, Rachel (Center for Digital Antiquity)

[134] *Digital Curation of Photogrammetric Data*

Back in 2003, archaeologists were warned of what Sullivan and Childs coined as the "Curation Crisis." They explained that a set of historical circumstances, "...has contributed to a crisis in curation of archaeological collections." Primarily focused on the curation of physical documents and objects, they argued that the need for long-term curation efforts be emphasized in all stages of archaeological research. A similar alarm was raised in 2015, when Mary Clarke wrote on the issue of digital data curation in what she called the "Digital Dilemma." This call to action still rings true in the present where we see an ever increasing proliferation of digital data stemming from archaeological contexts and projects. While this deluge of information is gladly accepted in advancing the field, the level of curation and preservation is still deficient. Focusing on photogrammetric practices, in this paper I will offer standardization methods that are useful in all stages of the archaeological process in order to ensure proper curation.

Fernandez-Gotz, Manuel (University of Edinburgh)

[23] *Narratives of Rise and Collapse: Fragile Urbanism in Early Iron Age Europe*

While traditional research on early urbanism has focused predominantly on 'successful cities', i.e. urban settlements that show long settlement histories, recently scholarship has also started to pay increasing attention to cases of short-lived agglomerations which only lasted for some decades or generations. In this paper, I will present a case study from Early Iron Age Central Europe: the so-called Fürstensitze ('princely seats') that developed between the late 7th and the late 5th centuries BC. These sites were complex central places with evidence for significant political, economic and sometimes also religious functions. They were part of a wide network of exchanges that connected them with other areas of temperate Europe and also the Mediterranean civilizations. However, their development was a fragile phenomenon, and after some generations all of them were abandoned or experienced a marked decline. How should we interpret their rapid rise, but also rather abrupt end? Are we dealing with a societal collapse, with a resistance to centralized power formations, or with an adaptation to changing exterior circumstances? And what can we infer more generally about non-linear cycles of transformation, and about fragile urbanization processes?

Fernández-Llamazares, Álvaro (University of Helsinki) and Victoria Reyes-García (Autonomous University of

Barcelona & Institució Ca)**[358]** *Supernatural Gamekeepers among the Tsimane' Hunter-Gatherers of Bolivian Amazonia*

We examine the traditional beliefs on supernatural gamekeepers by the Tsimane' hunter-gatherers of Bolivian Amazonia. As other Amazonian Indigenous groups, the Tsimane' believe in the existence of supernatural spirits (known as a'mo in Tsimane' language) who own much of the natural world, including wildlife and animal breeding grounds. The Tsimane' traditionally had a number of rules and rituals to regulate their behaviour in relation to wildlife, and particularly hunting and fishing. Some of these rules were in the hands of the shamans (cocojsi'), who acted as managers of wildlife stocks in the Tsimane' society. Shamanic rituals provided them with an opportunity to communicate with the supernatural gamekeepers and get first-hand information on all the rules that should be respected. Amongst the many rituals used to show reverence to the spirits are the shamanic songs, locally known as ferentyé, a type of songs exclusively performed by shamans to ask supernatural gamekeepers to supply wildlife for the community. In this talk, we draw on a unique pool of 12 ritual songs of the Tsimane' (compiled by J. Riester in the 1970s) to illustrate the powerful bonds of kinship and reciprocity that this society maintained with supernatural gamekeepers to ensure wildlife availability.

Fernandini, Francesca (Pontificia Universidad Católica del Perú) and Stefanie Bautista (University of Rochester)**[315]** *Reassessing Models of Pre-Incaic Federations and Empires on the Peruvian South Coast*

John Rick's research at the site of Chavin de Huantar reassessed the chronology for the Late Formative and Early Horizon periods in Peru. This example inspired other scholars to reexamine previously accepted chronologies and models of prehispanic Andean cultures. The first half of this presentation will discuss how the archaeological site of Cerro de Oro, located in the Cañete Valley, is just one example of how regional independent settlements, with local political structures that incorporate iconographic elements inspired in the Wari hegemonic style, have been used to construct the idea of an expansionist society that established colonies throughout the Andes, in many ways mimicking models proposed for the later Inca empire. This brief presentation will contextualize Wari-inspired material culture within its local contexts at Cerro de Oro in order to counter-argue its association with the highland Wari state. The second half of this presentation will reassess the models of settlement hierarchy that scholars have proposed for the Early Horizon archaeological culture of Paracas. To this end, the second half of the presentation argues that Paracas was not one archaeological culture but a diverse socio-political society that had an established settlement hierarchy evidenced through the production and spread of pottery.

Fernstrom, Katharine (Towson University)**[190]** *Can We See Travelers in Rock Art?*

Polly Schaafsma's extraordinary body of rock art publications allows us to return repeatedly to the images to ask different questions as our knowledge expands. Rock art informs my studies of pre-European Native American murals and 3-dimensional human figures because murals are compositions on surfaces that validate culturally defined places. Rock art presents diverse anthropomorphic figures that overlap and broaden the range of visual presentations in other media for example shell, copper, earth, and ceramic. Portable objects can travel hand to hand with minimal human travel. Rock art murals are fixed on the landscape and require that people travel to them; and we know that pre-European people traveled. The Hopi and Aztec migration stories are classics; the Nebraska Osage self-identify as descendants of Ohio Hopewell; and Siouan speakers are in the Southeast and Great Plains. However, we rarely discuss travel evidence in the archaeological record. I propose that it is worthwhile to hypothesize that images in rock art include associations with travelers, and may therefore also relate to conceptual uses of the landscape associated with exploration and shared knowledge of "place".

Ferrales, Esmeralda (New Mexico State University), Kalib Sorenson (New Mexico State University), Shannon Cowell (New Mexico State University) and Kelly Jenks (New Mexico State University)**[122]** *Collaborative Research at the 19th-Century Settlement of La Parida, Socorro County, New Mexico*

In March of 2018, New Mexico State University (NMSU) students enrolled in the cultural resource management class re-visited and recorded La Parida, a 19-century Hispanic settlement located on El Camino Real de Tierra Adentro National Historic Trail. The Bureau of Land Management (BLM) funded this project as part of a collaborative agreement with NMSU to support research on the Camino Real. The purpose of this project was to 1) relocate and record habitation and midden features associated with the settlement, and 2) evaluate the potential of the site for future research and public interpretation. Students identified six distinct loci at the site, only two of which showed clear evidence of structural remains. Of these, only one was located on land managed by the BLM. While water erosion, vehicle traffic, and modern development have clearly damaged portions of this site, it has considerable historical significance and some potential for future research. NMSU recommends that surviving portions of the settlement be explored through public archaeology, oral history, and collaboration with private landowners.

Ferriman, Colin**[393]** *Surface Sites and Surface Pipes Results of the Dead Horse Lateral Pipeline Data Recovery Grand County, Utah*

Environmental studies associated with the Dead Horse Lateral Pipeline project of Grand County Utah afforded archaeologists from Cultural Resource Analysts Inc. an opportunity to intensively study the cultural resources within

and around the pipeline corridor. This multifaceted research examined both micro analyses associated with individual sites, artifacts, and natural resources as well as macro analyses that focused on the use of the landscape by prehistoric peoples. The results of the data recovery from 12 archaeological sites and an encompassing environmental attribute based model are summarized as well as the findings associated with multiple inventories associated with the 24 mile long pipeline project.

[328] *Come Together Over Olcott: Recent Collaborative Investigations*

The Olcott Site, 45SN14, was first recorded nearly 60 years ago by Butler, and was fundamental in defining the Old Cordilleran Culture. Situated upstream from two named Stillaguamish villages, the Olcott site was a heavily utilized hunting area for thousands of years. Although the site has been disturbed through the years from farming and domestic use of the land, it remains remarkably intact. Due to recent disturbance, the Stillaguamish Tribe of Indians collaborated with Cardno, DAHP, and the landowner to examine the site more closely. Working together with the landowner, tribal and canoe family members, agencies, college professors, and consultants, a portion of the site was excavated to characterize the site profile and approximately 13 cubic meters of back-dirt were screened to recover cultural materials. Such support exemplifies the collaborative nature of archaeology, and our research furthers understanding of the period and the connection the site has with current generations.

Festa, Marcella (Ca' Foscari University of Venice)

[416] *Understanding Early Societies and Investigating Early Interactions: Origin, Significance and Transmission of the Bronze Plaques from the Tianshan Beilu Cemetery, Eastern Xinjiang*

The Tianshan Beilu cemetery – the largest and earliest Bronze Age funerary context in Eastern Xinjiang, including 705 graves dating to ca. 2000-1300 BCE – has been widely recognized as a key-point in the early interactions system throughout Eurasia – the 'Prehistoric Silk Road'. However, due to the failure to publish the excavation report, research has been mostly limited to a small group of painted pottery and bronze weapon-tools, while decorative and ritual objects remain virtually unknown. This paper aims to fill this gap by examining a body of decorated bronze plaques from Tianshan Beilu hosted at the Hami Museum. Evidence is investigated through a multi-disciplinary approach, combining archaeology, ethnography and environmental studies. Specifically, by analysing bronze plaques in light of the unpublished material from the Tianshan Beilu site's excavator - Prof. Chang Xi'en -, and looking at them from a comparative ethnographic perspective, this study examines their features, archaeological context and function, in order to enhance the knowledge on the community's cultural developments. Moreover, the analysis of the spatial distribution of these objects over a wider area - including Central and Eastern Asia - allows to explore prehistoric cross-regional interactions, with a special focus on rituals transmission.

Fetterman, Liv (USDA Forest Service)

[135] *How Can Archaeologists Better Engage the Public, Tribes, Land Managers, Law Enforcement Officers and Prosecutors Regarding the Importance and Relevance of Heritage Protection?*

Planning for active engagement with land managers, law enforcement, tribes and the public during federal archaeological project development can lead to a more comprehensive, reciprocal appreciation of heritage and its protection. To include public engagement and interpretation into project work, especially NHPA Section 110, partnerships and collaboration with interested tribes, publics, and agencies are critical. Archaeologists often appreciate the scientific, objective data archaeology affords; tribes and non-archaeologists (land managers, law enforcement, prosecutors, publics) prefer histories rooted in identifiable cultural values and emotions. Archaeologists benefit from subjective, value based assistance in partnerships and public forums to develop and plan for interpretation and outreach. The Forest Service, Dakota Prairie Grasslands, has one case study currently being implemented through partnerships with Montana State University, a local historical museum, and members of local tribal and ranching communities. This project includes professional historians interviewing local tribal and ranching communities, holding public meetings and publishing notices in social and conventional media outlets. One desired result is publishing a comprehensive story incorporating oral histories and interview research gathered in conjunction with data from NHPA Section 106 projects. The second desired result is creating a long-term interpretative strategy engaging diverse publics through dynamic, subjective, value based, multimedia approaches.

[408] *Push and Pull, Part II: Modeling the Inland Exploration and Settlement of Fiji*

Previous GIS-based analyses (2017) by the authors have identified the ranges of several classes of terrestrial fauna that would inhabit the island of Viti Levu in prehistory. The ranges and habits of reptiles (giant tortoises, iguanas, and snakes), flightless birds (megapodes and giant pigeons), and bat and seabird colonies intersect in two major areas of Viti Levu: the Rewa River Valley, the Navua River Valley, and several upland portions of the mountains of the west and north of the island. This presentation evaluates additional modeling of foraging in immediate post-colonization Fiji, with examination of terrain, density of prey, and distances incorporated into potential foraging forays.

Field, Sean (University of Notre Dame)

[84] *Timber Pilgrimage: Timber Importation as Pilgrimage to Chaco Canyon*

Beginning with Neil Judd's early speculations about timber importation, the Chaco road network has been the basis of diverse and often contrasting archaeological interpretations about the use of such unique landscape features. While a wide-array of interpretations have been suggested, recent least cost analyses reiterate Judd's earliest interpretations—that certain roads may have been the most efficient pathways for the movement of construction timbers across the San Juan Basin. Although such utilitarian ideas are enticing on their own, more accurate conceptualizations of Chaco roads may aim to integrate ideas of ecology, optimality, and religion. Here I emphasize a holistic interpretation of Chaco roads and suggest that some roads were simultaneously routes for efficient movement and paths of ceremonial pilgrimage. Doing so requires that these roads and the routes they represent be interpreted on a landscape scale, with an equal emphasis on the places, the path between, and the objects being carried.

Figuroa, Alejandro (Southern Methodist University) and Whitney Goodwin (Southern Methodist University)

[256] *WWPAED?*

Pat Urban and Ed Schortman instilled in us the inability to think small. Their big picture, long-term approach to research, teaching, and mentoring is the greatest of all the many gifts they have shared with us. In research, it means we dig in. We have chosen our research sites carefully, with the understanding that addressing the kinds of questions that Pat and Ed do, means first putting in the time and labor. It means embedding yourself within the community, not to gain points, but to gain the insight and the support of people who will literally move (small, artificial) mountains to help you. When it comes to teaching and mentoring, it means taking a student-centered approach from the beginning. Knowing full well that fostering future academics or archaeologists is only a small part of the goal. It means sharing time, knowledge, and resources without regard to that goal and rejoicing in all of the different kinds of personal and professional growth that results. In these areas, and in most everything that we do, we often ask ourselves: "What Would Pat and Ed Do?"

[352] *Understanding the Interplay between Domesticated Choice and the Environment: The Case of the Humble Australian Sheep*

Domestication could be described as a drawn out, nuanced dance between humans and animals – a dance that shapes not just the animal actors – but the physical, cultural and economic environment of all the players. Recent examples of this effect abound in areas colonized by Europeans, particularly those with drastically different physical environments from the motherland. This paper explores some thoughts on the intricate relationship between people and sheep that shaped Australia's character. In particular, we examine the way in which the behavioral ecology of sheep have altered the physical landscape of Australia. We highlight the need to explore our oft taken for granted relationship with this key animal as an integral step toward understanding the transformative relationship between people, non-native animal domesticates and the environment in early Colonial areas.

[39] *Microscopic and Spectrometric Techniques Applied to Identify Luxury Materials in a Fifteenth-Century Aztec Shield*

In the collections of the world, only six Aztec feathered objects exist: three shields and a headdress in Europe, and two shields in Mexico. Mexico's National Museum of History conserves one shield, made of mammal hide, feathers, plant fiber cords, and a structure of matting. Various Optical Microscopy (OM) and Scanning Electron Microscopy (SEM) techniques were used to analyze the cuticle and medulla scales of various hairs from the shield, as well as the fibers, and the rod elements providing its structure. This enabled the precise identification of the animal and plant species chosen by the fifteenth-century Mexica artisans. Non-invasive spectroscopic techniques, yielded surprising and unexpected results. Fiber Optics Reflectance Spectroscopy (FORS) analysis identified the use of cochineal (*Dactylopius coccus*) to dye the animal hair that adorned the surface and also delineated the sections of hide trimmed by the Mexica artisans. X-Ray Fluorescence (XRF), in turn, revealed that the shield originally was decorated with gold elements that were removed within the last five hundred years of the history of this object. In this work we discuss the archaeometric results of the material findings and their implications concerning the manufacturing technique and original appearance of this unique pre-Hispanic piece.

[231] *The Use of Ancient DNA to Investigate Change in Vole Populations during the Past 7,000 years: Implications for Past Land Management Practices*

The integration of genetic research on contemporary and ancient organisms into archaeological studies represents a novel approach in the analysis of long-term landscape management practices by small-scale societies. Our project employs methods in genetics (aDNA, phylogeographic research on contemporary populations) that are underutilized in archaeological studies. We analyzed vole aDNA (*Microtus californicus*) from four archaeological sites that date from the mid-Holocene to the contact period. Through the analysis of vole aDNA, we investigate potential shifts in open coast prairie to closed chaparral and forest environments associated with changes in land use practices that began with European colonization. We expect that the change from indigenous to European land use would have caused large effects on rodent population shifts, with closed country species gaining ascendancy over grassland species. By integrating these archaeological aDNA samples into existing large-scale contemporary sampling of voles across their range, we hope to pinpoint population movement and estimate demographics at a high degree of precision. Data produced through this component of the project will improve our understanding of the long-term responses of voles to changes in climate, human use, and landscape disturbance regimes.

[248] *The Socio-ecological Dynamics of the Uinta Fremont Agricultural Transition*

Northeastern Utah's Uinta Basin marks the northernmost extent of maize agriculture diffused from the American Southwest, with as many as a dozen distinct Fremont pithouse communities forming between AD 300-1350. Recent work in the Cub Creek locality of Dinosaur National Monument demonstrates that Fremont societies maintained relatively high mobility and low-level agricultural production within a context of multi-decadal precipitation variability; a semi-sedentary pithouse village emerged during a 300-year period of reduced precipitation variability from AD 750-1050 that increased maize yields. While a summed probability distribution of ~600 radiocarbon ages demonstrates peak regional population levels coincident with the same 300-year window, site-specific radiocarbon age models have not been created to evaluate the tempo and timing of pithouse village formation. Here we test the hypothesis that fluorescence of Uinta Fremont pithouse village formation occurred during the narrow 300-year window of reduced environmental variability, increased agricultural returns, and overall economic intensification. We suggest this event set the stage for the emergence of aggrandizing leaders, inter-community competition, and conflict noted in the regional rock art record. The Uinta Fremont stand as important example of the socio-ecological pathways through the agricultural transition that are critical for understanding variability in this global process.

[76] *Following the Fiber: Agave Tools from Cropping to Crafting*

Hohokam farmers of southern Arizona grew agave for food, fiber, and probable alcoholic beverages in distinctive

and widely preserved fields on dry slopes that were dedicated to this major succulent crop. Specialized tools from Hohokam agricultural and residential contexts allow us to track agave fiber production, processing, and craft manufacture, often in terms of quantified parameters. Thin, flat “knives” of tabular-fracturing stone with sharp, uneven edges and steep-edged core tools dominate field assemblages. Farmers used them for severing tough, fibrous leaves during harvest and preparing the plant bases for communal roasting in field-side pits. Tools recovered from excavated structures in nearby villages emphasize another category of tabular-stone knives with smoothed edges that would not tear leaf fibers when scraping away pulp to expose them. Some smooth-edged knives had regular indentations resembling the teeth of a comb that would have served to untangle and separate the fibers. Modalities in knife blade widths appear to indicate agave species with different leaf sizes. Distributions of smooth-edged knives and appropriate spindle whorl types among structures help identify locations of manufacturing activities. Our interpretations of Hohokam agave tools are enhanced by comparison with ethnographic and archaeological counterparts from the western United States and Mesoamerica.

[194] *Dimensions of Platform Mound Variability: A Tucson Basin Perspective*

Tucson area platform mounds are not architecturally uniform but conform to the broader pattern of rectangular configurations as mound distributions expanded across the Hohokam domain. We believe mound forms incorporate a degree of Hohokam awareness and selectivity with regard to West Mexican modes of the time. We focus on platform mounds in two Tucson central settlements, providing new structural, chronological, and organizational information. Construction and active use of the Marana platform mound terminated prior to Late Classic polychromes. It provides a useful chronological contrast with University Indian Ruin, where construction of a large and a small mound likewise began in the Early Classic period but continued through latest Classic times. Each of the three platform mounds in these two centers are distinctive in some aspects while sharing attributes with other mounds in the Tucson, Phoenix, and Tonto Basins. In considering differences and similarities, no singular interpretational framework appears to account for the full range of architectural variability, nor dictates a singular expression of religious, civic, residential, or bureaucratic activities. Rather, we ask how residents of different Hohokam Classic communities may have differentially conceived and constructed their public architecture to materialize a range of social and communal agendas.

Fish, Theresa (University of Cincinnati)

[9] *Investigating the Archaeology of Shifting Community Values at Chrisholm Farmstead*

Throughout the 19th century, Amish and Mennonite settlers fleeing persecution settled in the United States. In this study, I focus on families who settled in what is now Butler County, Ohio. For these settlers, there is a robust historic record telling a story of the community shifting from conservative Amish to more liberal Mennonites. I investigate to what extent the archaeological remains recovered from the Augspurger family's farmstead, Chrisholm, align with that story. Are the found possessions indicative of changes in identity in the same way that the documents are? I hypothesize that as religious tendencies of these families shifted, so did their personal everyday possessions, which should be seen in the archaeological record through change over time in artifact type. I expect to find positive correlations between my two data sources, archaeological data previously collected by the Cincinnati Museum Center in a preliminary survey of the Chrisholm site and written historical documents from this community. The results can help to understand if, for this group of people, possessions used for daily practices can be linked with known values of intentional communities, or if there are tensions between these data types that need to be considered.

[58] *Celebrity Chefs and the Long View of Sustainable Agriculture in Yaxunah, Yucatán*

The ejido (collective agricultural landholding) of Yaxunah, Yucatán, Mexico is known among archaeologists for its pre-Hispanic archaeological sites. But among a growing contingent of food aficionados, Yaxunah is known for its cooking. Having attracted the interest of celebrity chefs like René Redzepi (Noma, Copenhagen), David Chang (Momofuku, New York), and Rick Bayless (Frontera Grill, Chicago), Yaxunah has emerged as an epicenter of Yucatec Maya cuisine. Yet as the town's culinary reputation expands, the accompanying demand for organic, sustainable, and so-called authentic food is changing the way Yaxuneros relate to their local environment. To understand these changes and what they mean for long-term sustainability, we can look to how Maya farmers have interacted with the Yaxunah landscape over the past 2000 years. I draw on archaeological data from the sites of Tzacauil and Yaxuná, as well as historical data from the 16th-20th centuries, to situate Yaxunah's current incarnation as a culinary tourism destination into a larger historical narrative of human-environment interaction. I explore the potential of celebrity chefs and "foodie" culture for advancing the goals of agricultural sustainability among the public, both in Yucatán and on an international level – and consider the role archaeology might play in this process.

[386] *Space and Activity on an Upland Neolithic Landscape*

Investigations of Neolithic cultural landscapes in Southern Germany raise questions about relationships between clusters of settlements, low-density artifact scatters, and empty space, and call for analysis of individual settlements in the context of broader cultural landscapes. This poster presents results of test excavations on an upland LBK settlement in the context of a regional survey project focused on the Swabian Alb plateau, a significant source of stone raw material. The regional project combines geomagnetic survey, systematic fieldwalking, and analysis of private collections to explore Neolithic activities on the plateau. The Schlaghau LBK site was investigated as a part of this project, with targeted test excavations of settlement features located through geomagnetic survey of an area with dense surface finds. At 670 meters above sea level, Schlaghau is among the highest-elevation LBK settlements known. Excavated assemblages from Schlaghau are examined in the context of regional patterns in surface artifact density, raw material availability, suitability for agriculture, settlement features, and chronological and functional variation in lithic assemblages. Comparisons of raw material attributes, core technology, and chipped stone tools point to intensive use of diverse locally available cherts at the upland margin of a LBK settlement cluster in the upper Danube valley.

Fisher, Philip (Washington State University)

[112] *Topographic Morphometrics: Utilizing 3D Scans of Lithic Projectile Points to Look for Similarities and Differences in Flake Scar Patterning*

The conceptual basis of this study is that flintknapping knowledge and technique in small, hunter-gatherer groups is passed from generation to generation through a small number of flintknappers. This should result in similar flake scar patterning on projectile points that can be identified using topographic morphometric analysis. Topographic morphometrics is a new digital methodology that utilizes high-resolution three-dimensional imagery to measure variation in flake scar patterns on both faces of a projectile point. The cross-sectioning of projectile points at given heights (much like contour lines on a topographic map) records the morphology and patterning of flake scars that result from the flintknapping knowledge and technique that goes into their manufacture. If the production of discrete archaeological projectile point types is representative of different flintknapping techniques and knowledge, then this methodology has the potential to identify the information required to associate different point types in the archaeological record that share the same flintknapping methods. Using projectile point assemblages from three Late Paleoindian non-fluted point types from the Great Plains and a single Middle Archaic non-fluted point type from Missouri, this study concludes that topographic morphometrics can identify similarities and difference in the flake scar patterning of these four projectile point types.

[87] *Recompiling the Archaeology of East Africa: The Swahili GIS Project, and What Comes Next*

The East African coast is famous for the stonetowns of the 'maritime trading' culture of the Swahili, but the scale of this region, fractured history of research, and scattered publication of work have until recently prevented macro-scale investigations of settlement patterns and coastal interactions. Furthermore, disparities between the availability of specialist software and training, and access to archives, pay-walled journals and digital resources has hampered both research and international collaborations. The Swahili GIS Project is a recent collaboration between the University of York (UK) and University Dar es Salaam (Tanzania) to digitise the published record of the Swahili Coast in a new GIS database and digital hub at UDSM, with the hope that this becomes a centre for digital archaeological research and education in East Africa. To this end each phase between initial digitisation and final installation has involved training workshops for the benefit of staff, researchers, and students beyond the limits of the project. In this paper we discuss the aims and achievements of the project, lessons learned in the process, and plans for the future of the hub to support its continued expansion as a digital, archaeological, and educational resource for East Africa.

Fitts, Mary (NC Office of State Archaeology)

[94] *Adaptive Approaches to the Thingness of Institutional Datasets: A View from North Carolina*

The North Carolina Office of State Archaeology has been building a database of standardized information about archaeological sites since 1977. Like most datasets that bridge the analog to digital transition, the North Carolina site file has experienced several distinctive phases of accretional development. Designed for the purposes of predictive modeling, the database initially included many environmental variables but few artifact-specific fields. With the increasing accessibility of Geographic Information Systems and geospatial data, many of the environmental variables are now at best redundant, and it is the artifact data that are of interest for examining large-scale patterns in landscape use through time. In this paper we examine the thingness of the North Carolina Site File database: how does this mass of information resist our efforts to study it, and what potential does it hold? We then discuss our strategies for overcoming some of the challenges associated with institutionally managed archaeological data and the results of our attempts to learn from the four decades of work condensed in the North Carolina site file through a spatial analysis of Archaic Period stone tools.

[290] *The Zooarchaeology of Households at Las Peñas, a Late Intermediate Period Site in the Upper Torata Valley, Peru*

The Late Intermediate Period (LIP; ca. 1000CE-1450CE) site of Las Peñas is located in the sierra of the upper Torata valley in southern Peru. Laboratory analyses of faunal remains recovered during the 2016 excavation of households at Las Peñas provide insight into domestic life during the LIP, as well as environmental and subsistence strategies that may have mitigated risk during a turbulent period of Andean prehistory. Differences in skeletal element frequencies and taxonomic breadth suggest intra-site status differences between individual households, as well as household clusters. Taphonomic data provide information about domestic site formation processes and the depositional patterns of daily life at Las Peñas during the LIP. The presence of both oceanic marine and highland taxa attest to spatially extensive relationships of vertical exchange. Life history analysis of camelid remains suggest the possibility of local camelid herding, and may provide evidence for the seasonality of feasting and dietary practices at Las Peñas. Collectively, the results from these initial analyses challenge certain long-held assumptions about subsistence and domestic life during the Late Intermediate Period in the southern Andes.

Fitzgerald-Bernal, Carlos (Universidad Santa Maria La Antigua), Alvaro Brizuela-Casimir (Anthropo Studio Inc) and Freddy Rodriguez-Saza (ARGE Colombia)**[330]** *New Phylogenetic Information from Ancient DNA for Central Panamá*

New interpretations of Precolumbian Panamanian archaeological sequences and regions are provided. Results from ancient DNA (aDNA) analyses of remains from the site of Panamá Viejo, Panamá, are compared with a multiple burial found in the vicinity of La Pintada in Coclé, Panamá. The Panamá Viejo materials are classified as haplogroup A2 and include sub-haplogroups A2af and A2ad that link them to other “Chibchan” groups in Central (Greater Coclé) and Western (Greater Chiriquí) Panamá. The La Pintada samples date from the AD 750-950, the Conte Style Late Ceramic Period, and are the first genetic assessments for Greater Coclé whereas the Panamá Viejo samples are somewhat later (AD 1300-1500). This allows us to compare the supposed break in the sequence after AD 1000 that has been proposed to account for the less “Central” character of the ceramics of Panamá Viejo and vicinity with what appears to be a genetic continuity. Finally, I present a discussion of the phylogeny of Buglé, Ngábe and Guna in the context of the aDNA markers found both in the Panamá Viejo and La Pintada samples.

Fitzhugh, Ben (University of Washington), Catherine F. West (Boston University) and Sven Haakanson (University of Washington)**[31]** *Anna and the Sea: Reflections on Anna Kerttula's Influence on a Generation of North Pacific Archaeology*

Archaeological research in Alaska and the broader North Pacific Rim has revealed a long and complex history of human occupation, dynamic human-environmental interactions, and – above all - underscores the relevance of archaeology to people living across the region today. These developments span the nearly two decades of Dr. Kerttula's tenure at the helm of NSF's Arctic Social Sciences Program and reflect how she has engaged us and our colleagues and students in integrative, interdisciplinary, and community-based scholarship. In this paper, and from our unique perspectives, we seek to show how Dr. Kerttula's tenure in NSF's Office of Polar Programs has stimulated us to new scholarship and scientific discovery, paved the way for a new generation of scholars, and promoted Native Science, socially responsible research, and a comparative and collaborative approach to knowledge. Highlights of this narrative include community archaeology in the Kodiak Archipelago, Bering Sea social science planning, and comparative human ecodynamics across and between the subarctic North Pacific and Atlantic.

Fitzhugh, Ben [33] see West, Catherine F.

Fitzpatrick, Leslie (Mercyhurst University)**[160]** *The Intersection of Bioarchaeology and Forensic Archaeology Methodologies and Theories: A Practical Application*

Although often viewed as disparate fields of practice, bioarchaeology and forensic archaeology share a number of commonalities in their approaches to human remains recovery techniques. To address the theoretical and methodological intersection and divergence of these two fields, a case study involving the recovery of remains from a historic cemetery that were displaced via bioturbation processes will be explored. A detailed examination of these methodological commonalities and differences reveals a need for increased communication and coordinated education efforts amongst practitioners from both fields of study. Possible avenues for collaboration will be offered.

Fitzpatrick, Scott (University of Oregon)**[157]** *Discussant***Fitzpatrick, Tony (University of Wyoming)****[329]** *Chemical Analyses at Hell Gap: Preliminary Results from Blood Residue and Stable Isotopes*

Cross-over immunoelectrophoresis (CIEP) analyses from chipped stone artifacts have been completed to provide additional information on faunal procurement and use at Hell Gap. Results include positive reactions to dog and bovine antisera, with canid and bison bones represented in the faunal assemblage at the site. In addition to blood residue, samples from bison bone have been collected for stable carbon isotope analysis. Bison collagen $\delta^{13}C$ values are expected to be within the range reported by other researchers of around -19‰ to -16‰. Higher values may be indicative of increased C4 grasses during periods of increased temperature and aridity.

Fitzsimons, Chandler (The College of William & Mary) and Danny Sosa Aguilar (University of California, Berkeley)**[381]** *“How far is that in Bernie Miles?” Landscape and Identity in Abiquiu, New Mexico*

Current community-based, diachronic archaeological research in Abiquiu, New Mexico seeks to undertake specific projects that answer stakeholder questions about the past and bring these narratives about the past into conversations about the present. Balancing the diverse requirements and entailments of this kind of partnership and project necessitates thinking with the way that landscape, identity, and the community-based nature of the project are entangled. It also requires recognition of the fact that findings about the past have lives in the present. In

Abiquiú, landscape is a point of both continuity and flux, the site of community livelihoods, identities, aspirations, and anxieties. Furthermore, the positionality of academic archaeologists—in identity, space, and time—has a direct and integral role to play in the way that research is conceptualized, performed, and articulated. Landscape-based archaeological and ethnographic approaches must not only take an emic perspective but also acknowledge the positionality of the archaeologist. Integrating the messiness inherent in these dynamics provides more nuanced and fuller view of not only the archaeological and historical record but the practice of fieldwork itself.

Flad, Rowan (Harvard University)

[242] *Brine Processing Pits at Zhongba, China*

Excavations at the site of Zhongba in the Three Gorges region of Chongqing China from 1997-2002 recovered salt-production debris spanning many millennia of specialized manufacture at the site. The big picture of this development has been discussed extensively in previous publications, but the forthcoming publication of the full monograph of the excavations allows for more detailed analysis of the artifacts and features from different sub-phases of the evolution of this technology. This paper explores one of the enigmatic features characteristic of the earliest phase of salt production at Zhongba - clay-lined pits, often with stones at their base. The paper considers the degree of standardization of shape and size in these features and speculates about their function within this phase of the Zhongba salt production sequence.

[259] *Gendered Identities and Room Conversions at Homol'ovi*

In the Pueblo Southwest, architectural spaces often take on the identities of the groups who own and use them. Gender, in particular, plays an important role in differentiating structures within a site. In this poster, I examine the strength of gendered identities in room use through an examination of the conversion of spaces at the Homol'ovi Settlement Cluster, a group of Ancestral Hopi villages in northeastern Arizona. Room conversion, or when a space is demonstrably changed from one use to another through architectural alterations, occurred in about 10% of the excavated structures at Homol'ovi. Analyses reveal that changes to use rarely involved a switch in the gender associated with a given space. Further investigation of the few cases that do cross this line reveal intermediary stages that served to neutralize potential conflicts prior to the final conversion from male to female or female to male. Continuity in the gender associated with structures speaks to the importance of this identity as an organizing principle at Homol'ovi and suggests further investigation of differences in the treatment of structures associated with each gender in the Pueblo world is warranted.

[419] *Evaluating Turkey Wellness and Treatment in the Maya World*

As the primary domesticated animal in prehistoric Mesoamerica, the turkey occupied a prominent and multivalent role in society, as a food source, a feather provider, and a subject of ritual sacrifice. The preponderance of turkey remains across the archaeological record of the Maya region references the myriad ways the turkey was utilized, and the various ways its life could play out. This paper presents a health profile of domesticated turkeys based on skeletal remains gathered from various Maya sites, in order to assess and compare differences in turkey treatment and use. The analysis utilizes data on pathology and morphometrics acquired by means of computer tomography (CT) scanning, supplemented by additional data derived from aDNA and isotopic research, to establish general parameters of age, diet, and management, and evaluate the presence and possible causes of illness or trauma and signs of human intervention. The combination of several lines of evidence is beneficial in reconstructing the life histories of Maya turkeys, which may help clarify the different conditions and depositional contexts in which their remains are encountered.

[414] *Saint Croix Oneota and 14th Century Migration into the Saint Croix Valley of Minnesota and Wisconsin*

The Sheffield site is the only known Late Precontact Oneota village along the Saint Croix River of Minnesota and Wisconsin. Additionally, a small collection of Oneota ceramics from a nearby rock shelter site and isolated Oneota sherds point to a slightly more widespread presence in the valley. Still, the general geographic isolation of the Sheffield site and these other finds raises questions of the timing of the spread of Oneota into the valley and the relationships of the site's occupants to other Oneota complexes in the Upper Midwest. This paper summarizes what is known of Oneota in the Saint Croix Valley and reports on the Science Museum of Minnesota's investigations at the Sheffield site between 2013 and 2018. The Sheffield site has long been tied to Blue Earth Oneota of south-central Minnesota, based on excavations from the 1950s. But, more recent studies of Oneota complexes in the Midwest point to more regional identities, challenging that broad assessment. Geophysical survey and renewed excavation, along with examination of unstudied collections has led to new interpretation of the nature of the site and our understanding of the movement of the Oneota tradition into the Saint Croix Valley during the 14th century AD.

[23] *Seasonal, Dispersed and Ephemeral*

By convention urban settlements have been described as densely inhabited, permanently sedentary, and usually protected by barriers. While the latter might be conceded the other two were, until early in the 21st century, assumed to be definitive and fundamental to the functions of urbanism. The definition was a pillar of stage theory. In reality, none of these categories is either necessary or sufficient and indeed a settlement can wholly lack these features and still unambiguously possess the operational functions associated with other conventionally recognised cities. Places like the moving capitals of the Ethiopian Empire in the 16th and the 19th century and the great imperial Mongol ordu of the 12th century operated seasonally on an unambiguous urban scale as imperial capitals with substantial military and mercantile associations. Recognition of these settlements further dissipates the urban category and removes the conventional material, urban classificatory pillar from Stage Theory – which as yet has not been replaced by a viable theoretical alternative. Without a new frame of reference the meaning of urbanism has diffused so far that its ephemeral shadow engulfs the fundamental topic which we urgently need to understand.

[421] *Artificial Lines in Saltwater and Sand: Boundaries, Borders, and Beaches in Oceania and Australia*

Islands have long appeared to Western eyes as naturally bounded entities. It has been proposed that they represent 'natural laboratories' for understanding natural and cultural evolution. At the same time, islands are recognised as contact zones, for example historian Greg Denning has outlined the significance of 'the beach' for cross-cultural encounters. Pacific Islanders, for their part, see the ocean not as a boundary but as a medium for voyaging, exchange, and communication, Epeli Hau'ofa's famous 'sea of islands'. In this paper, I explore some of the ways that arbitrary boundaries, usually drawn by Europeans, have shaped Oceanic histories, from early encounters with Pacific Islanders, to the territorialisation of Tasmania, to contemporary Australian border policies. These usually immaterial lines have profound material outcomes that resonate across time and space.

Flint, Richard (Latin American and Iberian Inst., Univ. of NM)

[257] *Not the World as We Know It*

The Coronado expedition to Tierra Nueva of 1539-1542 was an enterprise of reconnaissance and conquest, traveled from home locales to one exotic target locale. But before anyone who eventually made the trip had ever heard the name Cibola, the future expeditionaries were already certain where and what that place was. They were heirs to a geography of expectation. With the hindsight of more than five hundred years we might imagine that in the years after Columbus' voyages, navigators and geographers quickly corrected his geographical errors, bringing to the world maps of Earth that broadly resembled our modern vision of the planet from space. But that was not the case. At the time of the Coronado expedition, though, European conceptions of the Earth were still Medieval allowing for only three continents: Europe, Africa, and Asia. So since Cibola was not in Europe or Africa, it had to be in Asia. Indications and presumed facts, learned from various independent sources, suggested this was so. The Tierra Nueva of Cibola would be home to camels and elephants; great herds of yaks; producers of exquisite silks and luminous porcelains; and wholesalers of exotic spices and dyes. That much, future expeditionaries were sure of.

[233] *The Cusco Valley Road System*

The Inca road system in the Cusco Valley has been remarkably understudied and undertheorized despite lying at the heart of the largest empire in the Americas and being the origin point for a road system designated as a World Heritage Site by UNESCO. Far from the simplistic vision of four primary roads emanating to the four corners of Tawantinsuyu, this paper presents the Cusco Valley road system as a complex and multifunctional network that worked to enact and perform elements of Inca state power and perception. The paper also analyzes the form and function of viewing platforms found in close association with road remains near the valley horizon, suggesting a consideration of forced perspective and structured experience relating to the act of entering and exiting the Cusco Valley. Analyzing data collected during an extensive field survey conducted over two years between 2012-2013, this paper considers implications for our understanding of how intervisibility relates to and constructs Inca ideas of authority, relatedness, and identity.

[205] *Star Bridge: A Late Mississippian Village in the Central Illinois River Valley*

The late pre-Columbian period in the central Illinois River valley (CIRV) is demarcated by the development of large, oftentimes fortified Mississippian towns, farming hamlets, extensive trade networks, and shifting political alliances between AD 1050 and 1400. The fission and fusion of local polities ceased with abrupt abandonment of the CIRV by AD 1450 as part of the larger Vacant Quarter phenomenon. Located on a hypothesized boundary between Mississippian and Oneota zones of socio-political influence during the 14th century, Star Bridge (11BR17) was a Mississippian village previously believed to have been incinerated during an assault. Through the analysis of an avocational surface collection, a 1992 excavation assemblage, and recent geophysical investigations, our research reexamines Star Bridge and also assesses the site's integrity after decades of agricultural modification. Our geophysical data and the material culture from excavations suggest Star Bridge never burned, but was abandoned after one or two generations of occupation shortly before regional abandonment. Meanwhile, our analyses also revealed a dearth of Oneota-derived symbols and material culture, indicating minimal interaction between Star Bridge's inhabitants and their neighbors upstream.

[419] *Were Turkeys Domesticated by Prehistoric Farmers in Oklahoma?*

Turkeys (*Meleagris gallopavo*) were domesticated by Basketmaker peoples in the American Southwest and independently by prehispanic Mesoamerican groups, yet relatively little is known about the nature and origin of ancient Oklahoma turkeys. In this project, we analyze the genetic and stable isotope composition of ancient Oklahoma turkey specimens to determine whether they were domestic or wild. The first stage of the investigation uses mitochondrial DNA sequencing to determine which genetic lineages of the turkeys were once in Oklahoma, comparing archaeological samples to reference subspecies – *M. g. intermedia* (Rio Grande turkey), *M. g. merriami* (Merriam's turkey), and *M. g. silvestris* (Eastern turkey). We expect that domestic populations will show reduced genetic variability relative to wild populations, as farmers selectively breed only a few birds for desired traits. The next step is measuring the ratios of stable carbon ($^{13}\text{C}/^{12}\text{C}$) and nitrogen ($^{15}\text{N}/^{14}\text{N}$) isotopes, which are indicative of diet. We will use this analysis to reveal if the turkeys were foraging or being fed maize by farmers. Following previous studies, ours should reveal if native groups in Oklahoma exploited turkeys like other ancient North American societies did.

[253] *Identification of Mitochondrial Haplogroups in Native Mexican and Mestizo Populations*

Currently in Mexico there are around 68 ethnic groups, grouped into 11 linguistic families, representing 15% of the Mexican population. The mitogenome (mtDNA) has allowed us to make inferences about the history of and relationships between these populations. However, the evaluation of the mitochondrial genetic structure in the Mexican population has been restricted to a small proportion of the underlying ethnic diversity among these populations. The complete sequencing of the mitogenome has generated specific information of the populations and has increased our understanding of the population events that have shaped the population structure of today. The present study focused on the characterization of the variants and haplogroups that represent the Mexican population across the country, taking samples from each state. We identified the four previously reported Native American haplogroups A2 (55%), B2 (23%), C1 (18%), and D1 (4%), and 73 subhaplogroups, most of them not previously reported in the Mexican population. Some haplogroups suggest association with metabolic diseases. It is concluded that within the indigenous populations there is great genetic diversity, providing clues about the history of the

population, including its origin, divergence, and migrations, thus contributing to the knowledge and understanding of the settlement of the Americas.

[240] *Nearshore Paleoceanographic Conditions and Human Adaptation on the Coast of the Atacama Desert (Chile, 25°S) During the Early and Middle Holocene*

The transition period between the Early and Middle Holocene is associated with important changes in climate and human dynamics around the world. The coast of the Atacama Desert (Chile, 25°S) is not an exception. Early Holocene archaeological sites show evidence of a generalized coastal economy that towards the Middle Holocene changed to a consolidated marine subsistence with a marked increase in fish remains and specialized fishing tools. Changes in local nearshore sea surface temperatures (SST) are also recorded from cooler to warmer conditions. SST plays an important role in modulating natural conditions of nearshore habitats. At the same time, subsistence strategies of fishing communities are strongly linked to the natural dynamics of these habitats. Data on past SST, archaeological marine fauna and fishing technology from the coast of the Atacama Desert (Chile, 25°S), will be presented to discuss the relationship between the development of specialized fishing communities and nearshore habitats along the Pacific Coast of South America.

[151] *Puebloan Subsistence Patterns on the Shivwits Plateau, North Rim of the Grand Canyon*

Based on fieldwork from the South Rim, Alan Sullivan has argued that ancient Puebloans in the Grand Canyon region practiced little or no corn agriculture. Instead, he proposes they relied on the gathering and processing of wild plants such as pinyon nuts, amaranth, and goosefoot. Here, we evaluate the applicability of this model to the southern portion of the Shivwits Plateau, located on the Grand Canyon's North Rim. Like Sullivan's study area, the latter area is located on the Colorado Plateau in a pinyon-juniper woodland setting. However, unlike along the South Rim, archaeological research on the Shivwits Plateau has yielded ample evidence of maize agriculture. In this paper, we examine why these differences in subsistence patterns might have occurred.

[111] *Isotopic Analysis and Social Identities from Classic Period (ca. 300-900 CE) Burials at the Maya Site of Ucanal, Petén, Guatemala*

Ucanal, is an archeological site situated in the Petén area of the southern Maya Lowlands. Close to the modern-day border between Guatemala and Belize, it is situated on the Mopan River which seems to have facilitated the trade of objects between different neighboring sites. While we know that this site was a nexus for the movement of goods from afar, less is known about the movement of people. With the analysis of strontium and oxygen isotopes sampled from human burials excavated between 2016 and 2018, and the identification of an isotopic baseline in the region, this study explores the social identities and migration of individuals from Classic period (ca. 300-900) Ucanal burials.

Fogle, Kevin (University of South Carolina) and Diane Wallman (University of South Florida)

[295] *Free to Choose? Emancipation, Foodways and Belonging on Witherspoon Island*

After emancipation, formerly enslaved people in the American Southeast encountered significant challenges while transitioning to free life. Despite many obstacles, individuals and communities chose diverse paths towards establishing new lives as free men and women. Here, we examine post-emancipation foodways through historical archaeology on Witherspoon Island, an upland cotton plantation in South Carolina, to explore how newly freed people and families formulated social, economic and ecological networks. After the Civil War, tenant farming developed at Witherspoon Island, with African American residents falling into two groups: former slaves from neighboring plantations; and former Witherspoon slaves who chose to return to their old homes after being forcibly relocated in 1862. By synthesizing the archaeological and ethnohistorical record, we explore the multi-scalar socioecological and economic networks created by the tenant farming community at Witherspoon. The research suggests that through animal husbandry, fishing, hunting, trade and exchange, the freed men and women at Witherspoon maintained connections to the land and community developed under slavery, while also establishing novel social, economic and foodways practices.

Foguth, Adesbah

[118] *A Case Study in the Use of Photogrammetry for Management, Public Outreach, and Research Potential*

Photogrammetry has become increasingly relevant in the field of archaeology as digital software becomes more accessible, with the increased ease in which archaeological sites can be recorded three-dimensionally, and with the ease in which it can be added to regular field work with minimal monetary costs or time. Despite current interest in 3D technology, the practicality of this method is debated and often underutilized. Presented is a case study on the ways in which Cultural Resource Management firms, tribal governments, and federal and state agencies can leverage 3D documentation technologies to record, preserve, and remotely share cultural heritage with the public.

Photogrammetry as a method of management, research, and public outreach is examined through a Mimbres site in Cliff, New Mexico. This site is remote and inaccessible to the public. As such, this case study demonstrates the suitability and applications of 3D technology in remote locations. A presentation of resulting models produced in the photogrammetry program Agisoft Photoscan demonstrate the versatility, importance, and ease with which photogrammetry can be used by archaeologists.

[76] *A New Gauge: More on Formative Period Textiles and Technologies*

While considerable research has been conducted on the importance of textiles in Classic and Postclassic Mesoamerica, little study has been done on textiles among Early or Middle Formative period cultures, mainly due to scanty preservation. As noted in previous research, however, depictions of textiles are evident in sculpture, and evidence of textile-making can be found through re-examination of small stone Formative period artifacts. Close analysis and replication studies have revealed that objects previously identified as “bloodletters” most likely served as functional weaving picks and awls; perforated iron ore cubes were likely net weights; certain types of figural celts and clamshell pectorals may have served as net gauges; and the objects known as tailed “spoons” were likely small weaving battens. Further research has revealed that other small stone objects previously deemed as purely ornamental also may have been used as net gauges or battens, and this research is supported by objects found in an exciting new cache of jades recovered at the Middle Formative period Maya site of Paso del Macho, Yucatan. All together, these data reveal much about the making and use of ancient textiles and highlight the considerable importance that textiles held for these Formative Period cultures.

Forde, Jamie

[162] *Untangling Shifting Social Agendas at Colonial Achiutla, Oaxaca, Mexico*

In this paper, I draw on both archaeological and documentary evidence from the site of San Miguel Achiutla, in the Mixtec region of Oaxaca, Mexico, to examine the complex relationships that residents of this indigenous community had with colonial Spanish rule. At certain points, members of the community harassed resident Dominican friars and threatened their lives, while at others helped them translate the Christian doctrine into the Mixtec language. Indigenous families actively acquired certain European goods and participated in the newly imposed economic system, while they simultaneously rejected other European technologies in favor of prehispanic ones. Native officials cooperated with Spanish viceregal and religious authorities on certain matters, while in other instances they assaulted and imprisoned these same officials for interfering in community matters.

Taken together, the evidence suggests that indigenous community members did not see the Spanish colonial project as something monolithic, to be simply accepted or resisted on the whole. Instead, engagement or disengagement with the viceregal system and Spanish authorities shifted from situation to situation, from moment to moment, depending upon a complex suite of political, economic, and spiritual agendas.

Forest, Marion (Brigham Young University)

[307] *From the Sky and from the Ground: Using Multiple Survey Strategies to Map El Palacio, Northern Michoacán*

In this paper, I present the recent results of the archaeological surveys conducted at El Palacio, an important pre-Tarascan site located in the Zacapu Basin, Northern Michoacán. The settlement was occupied from the Epiclassic through the Colonial era, with an important episode of urbanization occurring ca. 1250 A.D. If the modern agricultural activity has altered significantly several areas at the site, other areas present an excellent state of preservation, coupled with a general erosion and low post-abandonment soil deposit. Prehispanic architecture remains overall, clearly visible. In order to create the first map of the site and understand its spatial structure, I combined various tools and techniques to survey this highly contrasted topography and preservation of archaeological remains at the site. The use of remote-sensing techniques (LiDAR) was coupled with a pedestrian survey to obtain a reconstructed multi-layer map of the site that allows advanced spatial analyses, and consistent excavation sampling strategies. Finally, the observations made shed the light on the progressive destruction of the archaeological zone.

[286] *The Population Genetics of Machu Picchu*

Since its discovery a century ago, Machu Picchu has become an iconic archaeological site, inspiring researchers and visitors alike. Its history and function, however, are unclear and hypotheses have been advanced ranging from Machu Picchu as a royal estate, sacred shrine, or city. Here we present the preliminary results of our genomic study of human burials found at Machu Picchu. Genome-wide and mitochondrial data were obtained from 34 individuals buried in Machu Picchu and 40 from a variety of contemporaneous archaeological sites in the Sacred Valley and Cuzco. Combined with previously published isotopic and archaeological work, these data allow us to define the diversity of the Machu Picchu burial population and sheds light on the resident population's origin, kinship, and the integration of migrants from different parts of the empire. This in turn provides a broader context for understanding the population genetics of the Inca empire as a whole.

[180] *A Great House in the Petrified Forest: Iconography of a Possible Chacoan Outlier*

The Chaco Phenomenon remains a contentious and ever evolving paradigm of Southwest Archaeology. Key to understanding the nature of Chaco is the extent and purpose of the many outlying great house communities scattered across the northern Southwest. One of the farthest flung of these possible outliers is the Mac-Stod great house of the Petrified Forest National Park expansion lands. This structure is diminutive in scale compared with canyon great houses, but retains multiple features associated with Chacoan architecture. Its relationship to the greater Chaco world is unclear, but such structures did not exist in isolation and must be regarded as part of a larger cultural landscape. One often-overlooked aspect of Chacoan landscapes is the presence of rock art. Surveys around Mac-Stod found large concentrations of petroglyphs depicting a range of motifs, placed in a variety of settings on the landscape. By comparing the depicted elements to panels found throughout the rest of the park and the greater Southwest, this study seeks to understand regional influences represented in the iconography. With this study we gauge whether the Mac Stod site was ingrained within locally rooted systems of interaction or may represent an extension of Chacoan influence into the Petrified Forest.

Fowler, Thomas [20] see Ameen, Carly

Fowler, Tom (University of Nottingham), Carly Ameen (University of Exeter) and Naomi Sykes (University of Exeter)**[153]** *Exploring Hare Introductions and Management*

Archaeological studies of animal management have traditionally focused on domestic livestock, such as cattle, sheep/goat and horses. Within farming societies, less attention has been paid to wild animals - particularly smaller taxa, such as lagomorphs. Evidence suggests that the brown hare (*Lepus europaeus Pallas*, 1778) is a non-native species in Britain, so this is a major oversight, the introduction of new fauna being closely related to new animal and landscape management practices, as well as changing cultural phenomena.

This paper will explore the introduction of the brown hare to Britain. It will present the results of new osteometric data, which allow us to differentiate between bones of brown hares and Britain's native lagomorph, the mountain hare (*Lepus timidus Linnaeus*, 1758). Combined with new (zoo)archaeological research, they illuminate the chronology of this introduction, and reveal how hares have been managed in the past. Case studies of hares found at key Iron Age settlements, and high-status Roman sites, will show how they transitioned from specially deposited "exotica" to managed wild fauna. Size change and age profiles from prehistory to the medieval period will show how human relationships with hares in Britain are reflected in their interactions with them.

Fowler, Tom [352] see Alves, Joel

Fowler, William (Vanderbilt University) and Payson Sheets (University of Colorado)**[191]** *Arqueología sin Fronteras: Reflections on the Career of Frederick W. Lange*

For the past five decades, Frederick W. Lange has tirelessly bridged geographical barriers and political boundaries to promote and help to create an archaeology of interaction of Mesoamerica with Central America and northern South America. As one of only two leaders in the field, he brought about fundamental changes in the practice of archaeology in Costa Rica, training the first generation of national archaeologists and professionalizing the discipline. On an interpretive level, he has focused largely on pre-Columbian networks of interaction, trade and exchange, and political integration, and he has encouraged others to address these issues from a wide variety of theoretical perspectives and methodological interests. Deploying his gregarious nature and infectious enthusiasm, Fred has for decades brought together scholars of several generations and of many nationalities in conferences and published volumes that represent milestones in the literature of Central American archaeology and ethnohistory without regard for national borders.

[196] *Diffusion, Migration, and "Culture" in the Eurasian Bronze Age*

The past 25 years has led to a completely new understanding of Eurasian Prehistory. Archaeometric analysis, landscape archaeology, and aDNA have allowed longstanding debates to be silenced, and fundamental principles underpinning key concepts such as social interaction, participation, migration, and more, have been lofted to new heights of enquiry in Eurasian Archaeology. This paper traces some of this progress in regards to the Bronze Age in light of primary data and new discoveries, and sets out new directions for the decades to come.

Frahm, Ellery (Yale University)

[316] *Beyond the Technical Revolution: Epistemological Shifts in Archaeological XRF (or: "The World of XRF Will Never Be the Same Again")*

In 1983, an advertisement for a Tracor X-ray spectrometer proclaimed that "the world of XRF will never be the same again" thanks to an integrated microcomputer that "takes the confusion out of instrumental analysis." It was an exaggeration that this model offered "mistake-proof" XRF, but the point is that this instrument was more automated than those in previous decades. Such an instrument might have been unrecognizable to Edward "Teddy" Hall, who, as the first Director of Oxford's Research Laboratory for Archaeology and the History of Art, pioneered the use of XRF in archaeological science during the 1950s. As Shackley noted in 2011, XRF has become "easy to use" because "tasks that once required the constant attention of a trained analyst can now be handled by skilled students and are fully automated." Critics of pXRF, however, suggest that this technology has become too easy for archaeologists without "hard science" backgrounds to use. One could instead view it as an advantage for our field, specifically how analytical knowledge is generated and who is able to do so. This process began in contexts such as UC-Berkeley, where, for two decades, undergraduate and graduate students in archaeological classes learned to use XRF from Shackley.

[369] *The Lasting Legacy of Larry Loendorf at Legend Rock*

For over 30 years, Larry Loendorf has spurred rock art research throughout Wyoming and Montana. Nowhere have his contributions been more important and deeply felt than at the Legend Rock State Petroglyphs site (48HO4) in Wyoming. Through encouraging the use of standard archaeological methodology at rock art site, development of standardized classification systems, exploration of new dating techniques, use of new technology for documentation, incorporating the use of ethnography to aid in interpretation, and strong advocacy for conservation and protection, Larry has helped ensure the preservation and long term management for both research and public education of this key rock art site in Wyoming. He has done this through mentorship of other researchers and cajoling and prodding of site managers and state officials. This paper reviews some of his many contributions which have resulted in a lasting legacy for this site.

[364] *Luis Borrero's Model of Peopling of Patagonia: Some Examples of his Application in Lithic and Mobility Studies*

Borrero's work has greatly influenced Patagonian archaeology. Through his papers and classes, he strongly influenced new generations of archaeologists. In the case of lithic studies, his model of the peopling of Patagonia was integrated with ethnoarchaeological information within an organization of technology framework in order to generate expectations to be tested with the archaeological record of the Upper Santa Cruz River basin. Results obtained, which took into account the availability and quality of lithic resources, allowed researchers to identify the main changes in the way this space was utilized, which were in turn related to environmental changes. In addition, the application of this model, allowed researchers to identify not only an exploration phase of human peopling of this environment at the beginning of the Holocene, but also a new exploration at ca. 500 BP which, according to genetic results recently obtained, corresponds to the introduction of a new human population. In the case of the Southern Deseado Massif, the application of the same model was useful to understand the role of different resources in the human ranking of habitats, as well as the technological and mobility strategies used during initial human dispersal into this environment.

[66] *Home Is Where the Plants Are: Spatial Analysis of Land Use during the Archaic Occupation of Coronado National Memorial*

Coronado National Memorial in the Huachuca Mountains is best known as a possible entry point into the American Southwest by Spanish conquistador Francisco Vázquez de Coronado. While Coronado's historic presence remains a mystery, this small park on the border of Mexico has a rich prehispanic archaeological heritage ranging from Early to Late Archaic period. Forty-three archaic sites recorded on only 178 acres; however, there is no indication of any Ceramic Period occupations. For Archaic hunter-gatherers, availability of natural resources and the maximization of return for output of energy were likely important factors for the selection of short-term camp locations. Using spatial analysis, this paper explores the question "why was this area repeatedly visited during the Archaic?" When making site location decisions hunter-gatherers likely took many factors into account, I explore six: water, soil, site vegetation, elevation, slope, and aspect –on a landscape level to establish possible land use patterns. These data are then compared to the environmental background of the park to determine whether the Archaic land use in Coronado National Memorial was representative of randomly selected campsites in the Huachuca Mountains or areas chosen specifically for the availability of discrete natural resources.

[120] *Identification of Altars at Angamuco in Michoacán, Mexico Using Geospatial Analysis of LiDAR Data*

The site of Angamuco was discovered during a survey of the Lake Pátzcuaro Basin in 2007. Angamuco is located in western Mexico, within the modern Mexican state of Michoacán. This site has been identified as part of the Purépecha Empire. Angamuco has primarily been examined using spatial data from LiDAR flights. Previous researchers have used the spatial data to understand how the residents of Angamuco organized their buildings and social space, to classify and analyze the function of circular architectural features, and to understand the political and spatial organization of Purépecha cities. I will use the geospatial data to identify, classify, and analyze altars across the entire site of Angamuco. Using ArcGIS, I will locate the altars on the site. After the altars have been identified, they will be differentiated by where they are in relation to the architectural features around them. I expect to find altars that are used for residential, community, and district-wide religious activities. The proposed research project will provide more information about the Purépecha Empire by defining previously unresearched architectural features on the site. It will also provide future scholars with more details on the religious activities in this state-level society.

[129] *"Inconceivable!": Innovation and Improvisation on a WWII-Era Aircraft Crash Site in the Swamps of Papua New Guinea*

Archaeological recovery of an aircraft crash site differs significantly from traditional archaeology in that the former often takes place in locations unsuitable for human habitation, in geographic and environmental settings beyond the scope of standard excavation strategies, tools, and methods. These circumstances require considerable flexibility, innovation, and resourcefulness on the part of the archaeologist, to adjust methods and develop tools, often "on the fly," in order to meet the demands of the site. Our recent excavation of a WWII-era aircraft in Papua New Guinea's sago swamps showcases this adaptability and creativity in approaching a site in a neither wholly terrestrial nor wholly underwater context. Among the archaeological problems confronting the archaeologists were 1) maintaining horizontal and vertical provenience in an excavation area lacking typical sedimentary deposits and with no discernable stratigraphy; 2) conducting systematic excavation to depths of approximately 1.5 m in conditions of extremely limited underwater visibility; 3) ensuring fullest possible recovery of incident-related materials while essentially excavating "blind;" and 4) ensuring team safety while operating in an area contaminated with aircraft fuel, unstable and hazardous aircraft wreckage, and dangerous wildlife. This poster will demonstrate the novel techniques and purpose-built, improvised tools employed to successfully excavate this unusual site.

[223] *Employing Disruptive Technologies Teaching Archaeology in Field and Classroom Settings*

Recent studies in pedagogy indicate that knowledge acquisition and retention among millennials is facilitated when phased assessment criteria are used. Our multidisciplinary team (Archaeology and Geography) has employed a variety assignments around disruptive technologies (cellular telephones) in order to move students from elementary knowledge milestones (foundational knowledge) to sophisticated milestones (application or integration of knowledge) in a travel study setting. The methods employed allow both rapid delivery and assessment of student work and allow students to build on skills using alternative technologies. These methods, involve non-traditional narrative delivery, preparing students for a global workforce in which alternative forms of knowledge acquisition and delivery are commonplace. We also teach foundation skills in delivering factual information, building on prior knowledge. Similar techniques were employed in three semester offerings of a general education course on archaeology, the last of which utilized word association as a way of measuring the success of knowledge acquisition and transformation. Both efforts have integrated learner-centered approaches with top-down traditional lecture formats. The former approach is guided by group exercises, democratic dialogue, and competition, which helps students learn valuable skills in collaboration, leadership, and communication while at the same time teaching them the value of multi-vocality in archaeological interpretation.

Freire, Shannon (University of Wisconsin-Milwaukee)**[121]** *Exploring Targeted Postmortem Investigative Practices at the Milwaukee County Poor Farm Cemetery*

The Milwaukee County Poor Farm Cemetery is an umbrella term used to describe the four cemeteries that were used by Milwaukee County, WI from 1878 through 1974 for the burial of the indigent, unclaimed, institutionalized, and anatomized. The focus of this research is the twice-excavated Cemetery II, in use between 1882 and 1925. Approximately one-quarter of Cemetery II interments did not meet expectations for standard, institutionalized pauper burials and have been associated with the local medical establishment. Outstanding questions related to the practices that resulted in these two general categories of burials, here identified as Categories A and B, persist. This project utilized strontium isotope analysis to address whether specific immigrant groups were targeted for the postmortem investigative practices that frequently resulted in Category B burials. Permanent molars of 30 individuals from each category were sampled for enamel apatite to determine whether there was a relationship between strontium isotope values and type of burial. This research demonstrates that there was no targeted selection of a specific immigrant population for dissection on the part of Milwaukee's early medical colleges and institutions. Rather, the factors that led to an individual being interred in a Category B burial may have been more opportunity-based.

Freiwald, Carolyn (University of Mississippi)**[199]** *Crossing Borders: What Isotope Geochemistry Reveals about Migration among the Maya*

Present day conversations about migration focus on borders and limiting population movement with the presence of police, harsh regulations, and walls. This paper examines the concept of migration in the Maya region and what the past decade of isotope geochemistry research tells us about population movement and ancient boundaries. Was mobility bounded by physical places, such as rivers and mountains, or did it relate to political borders between regions with distinct ceramic and architectural styles? On a more basic level, how do patterns of population movement reveal aspects of societal organization and how it changed over space and time? This paper presents isotopic case studies from the Formative through Colonial periods to characterize mobility in Mesoamerica. I then focus on the Maya region, specifically the central lowlands, to interpret where people moved and what that tells us about boundaries, both social and political.

In 1961, archaeologist William T. Sanders traveled to México's Teotihuacan Valley to film a documentary based on his 1957 Harvard dissertation. The film, *Land and Water: An Ecological Study of the Teotihuacan Valley of México*, provides an invaluable snapshot of agricultural and land-use practices in the area just prior to the urban explosion of México City. Sanders documented peasant farmers using masonry dams, canals, and splash irrigation; women and children washing clothes at a nearby spring; and the many uses of the native maguey plant. Cultural conservation was not the intention of the original film, but it is a sobering reminder of how quickly traditional landscapes and cultural adaptations vanish when sustainability is ignored. The Land and Water Revisited Project consists of 1) a look at what the original film captured; 2) a comparison of the old footage with the valley today; and 3) how researchers are currently studying the effects of urbanism in the Teotihuacan Valley. In the end, the film will be a modern and tangible view of the effects of unchecked and unregulated growth. Here we present the results of our 2018/2019 field seasons.

Freund, Kyle (Indian River State College)**[316]** *Obsidian Characterization as a Means to an End: A Survey of the Scholarship of Professor Steven Shackley*

Obsidian sourcing is a well-established facet of archaeological practice and has the capacity to address a wide range of relevant archaeological questions. For decades, Professor Steven Shackley has been on the forefront of methodological and theoretical developments in obsidian characterization studies, and his contribution to our understanding of past human societies is immeasurable. This presentation focuses on the specific archaeological questions and issues that Professor Shackley has addressed over his long career, in turn highlighting how his scholarship has influenced the way archaeologists contextualize obsidian provenance data and how his work has impacted an entire generation of researchers around the world.

Friberg, Christina (University of California, Santa Barbara)**[205]** *Tradition in Transition: New Data and New Insights on Mississippianization from the Audrey-North Site*

The Mississippianization of the Midwest unfolded during the late 11th and early 12th centuries as interactions with Cahokia influenced aspects of local community organization, ceremonialism, material culture, and access to exotic

raw materials. For local peoples in the northern hinterland regions, these encounters and affiliations also facilitated interactions between Mississippian groups beyond Cahokia. New data from the early Mississippian (AD 1100–1150) Audrey-North site (11GE20) in the Lower Illinois River Valley illustrate the localization of Cahokian practices in a village uniquely positioned within a vast network of long-distance exchange and sociopolitical interaction. An interregional comparative analysis using published ceramic and lithic datasets from the Apple River and Central Illinois River valleys adds to the growing narrative of local innovation and interregional interaction in the Mississippian Midwest. This paper further seeks to demonstrate the complexity of cross-cultural encounters in the forging of new traditions.

[370] *Paleoethnobotanical Remains from an Early Classic Maya Tomb at Buenavista del Cayo, Belize*

In the tropics, paleoethnobotanists often face challenging preservation environments, making most of the macrobotanical specimens that we analyze those that are preserved through processes of carbonization. This preservation issue is often framed as limiting the questions we can ask and the interpretations we can make about ancient Maya relationships with the environment. Occasionally, unusual preservation contexts reveal new and exciting possibilities for understanding ancient human-plant relationships. In 2018, the excavation of an Early Classic Maya tomb at Buenavista del Cayo, Belize, recovered a variety of uniquely preserved, uncarbonized macrobotanical remains, including hundreds of maize kernels that were likely originally part of whole ears buried with the individual. The paleoethnobotanical analysis of the remarkably preserved contents of this tomb allow us to contribute new ideas about the use of plant materials in Maya royal burials. Additionally, the plant remains found with this individual have the potential to shed new light on ancient landraces as well as trade and migration throughout Mesoamerica.

[410] *Distributed Site Cores and Low-Density Urban Settlement at the Site of Zibal, Belize*

The sites of Zibal and Kich'pan Uitz in western Belize, recorded as minor Maya centers by the Aguacate Regional Archaeology Project, have recently been investigated via remote sensing, survey and test excavation. As a result, we see that these two clusters of monumental structures, along with their secondary nodes, are located in a continuous fabric of settlement that covers the surrounding area. The two monumental groups, separated by 1.5 km, can thus be understood as distributed central locations of the same site. This low-density urban settlement pattern is consistent with recent findings across the southern Maya lowlands. Testing at the Zibal site indicates that the monumental core was established in the Preclassic and went through multiple configurations and phases of construction. The establishment of low-density urbanism settlement patterns in close proximity to minor site cores located in remote areas may be taken as an indicator that low-density urbanism is an early and pervasive feature of Maya settlement, rather than a later development.

[126] *Burning Up and Breaking Up: Understanding Heat-Induced Bone Modifications in a Hungarian Bronze Age Cemetery*

In an attempt to better understand how social inequality manifests itself in Middle Bronze Age Hungary, the Bronze Age Körös Off-Tell Archaeology (BAKOTA) project has been researching a cemetery in the Körös region of Eastern Hungary. The individuals in the cemetery appear to have been buried in a consistent manner, mostly cremated and placed in urns regardless of age. Prior research shows that cremated remains have various fracture patterns that may relate to how the body was prepared pre-burning. This poster focuses on comparing the presence of certain types of heat-induced bone modifications (i.e., longitudinal, curvilinear, and transverse fractures, patina, and warping) between adult and subadult burials to determine whether they were cremated using different practices. Based on a sample size of 14 human burials, results suggest that adults and subadults were not burned differently, as they exhibited no statistically significant differences in fracture patterns. This may suggest that bodies would have been positioned in a similar manner on a funeral pyre regardless of age, causing similar fracture presence when burned. These tentative conclusions contribute to the discussion surrounding the usefulness of the analysis of heat-induced bone modifications in determining social practices.

[406] *From Collective Government to Communal Inebriation in Ancient Teotihuacan, Central Mexico*

A simulation model of Teotihuacan's hypothetical collective government has shown that a highly distributed network of leaders could have been effective at ensuring social coordination in the city by means of consensus formation. The model makes a strong prediction: it indicates that this collective mode of government would have been most effective in combination with large-scale communal rituals, especially rituals involving strong alterations of normal mental functioning. These communal rituals could have allowed the sociopolitical network as a whole to escape from the suboptimal behavioral configurations that otherwise tend to result from the interactions between self-interested individuals. In line with this prediction, recently there has been a growing recognition of the existence of communal rituals involving inebriation, even to the point of vomiting and loss of motor control. The current consensus holds that these rituals are based on a mildly alcoholic beverage made from maguey, today known as pulque. However, in accordance with the model's strong prediction and based on iconographic and ethnographic evidence, I propose that in some cases the beverage was made more potent with the addition of powerful mind-altering substances, in particular delirium-inducing plants from the genus *Datura*, today known as toloache.

[390] *Post-depositional Processes and Their Impact of Inferences of Behavior at FxJj 34 (Koobi Fora Formation, Northern Kenya)*

It is often argued that surface assemblages provide insight into human behaviors at a regional scale. Measures of artifact use life and reduction intensity at this broad scale are often used to characterize the structure of stone tool use across space. However, once re-exposed, artifacts are subject to a variety of processes that potentially bias the behavioural signatures evident in lithic assemblages. Size sorting is a particularly common effect. Here, we study both the surface and excavated assemblages at the site FxJj34 (Okote Member, Koobi Fora Formation, northern Kenya) to characterize the impact of modern erosional process on lithic assemblages as well as the potential biases they introduce into behavioral patterns evinced by stone tool reduction. In addition to measures of stone tool reduction, we also apply resampling methods. This documents distinctions between surface and excavated assemblage and also investigates the statistical significance between these assemblages. Our results indicate that despite the logical chain linking artifact winnowing as a source of bias in measures of stone artifact reduction, inferences of behavior based on reduction proxies in surface and in situ artifact assemblages are identical at FxJj34.

[398] *What's It Alder About? Paleobotanical and Zooarchaeological Analysis of Feasting Remains from the DgRv-006 Village, Galiano Island, SW British Columbia*

The study of feasting activity in precontact societies can illuminate hierarchical social structures that existed within a community, because of the labor and wealth investments required to produce a successful feast. It can also highlight the integrative aspects of feasts, since they often involved widespread participation. We present results of paleobotanical and zooarchaeological analysis of bulk soil samples from a Late Period plankhouse at DgRv-006. A large, centrally located hearth feature in the plankhouse has yielded fuel wood and faunal remains from a single feasting event that are significantly different from remains collected from contexts representing daily consumption and wood fuel use. Fuel woods utilized in the feasting feature are unique to the feature, and not represented anywhere else in the house. Additionally, a massive volume of sea urchin from the feature suggests that this feasting event was produced for more than just the occupants of the house. Based on the differences in feasting consumption and daily subsistence exhibited at this site, we suggest that the feasting remains represent both a prestige and solidarity enhancing feasting event, but which also needs to be contextualized in the broader context of Coast Salish social practices.

Fullen, Brittany (Binghamton University)**[250]** *The End Is in Sight: Preliminary Findings for Terminal Middle Horizon Occupation at Huari*

Continuing excavations at the domestic sector of Huari in 2018 (re)opened several structures whose occupation spanned the end of the Middle Horizon. The collapse of the Wari empire is not well understood, and the perspective these quotidian examples provide will help us continue to untangle what happened to the Wari. This presentation explores the similarities and differences found not only with the Patipampa sector occupation, but with other sectors of Huari, and more broadly with other sites within the Wari realm at the beginnings of a pivotal moment of change. The preliminary analysis will focus on room closure/abandonment, mortuary remains, depositional practices, and ceramic chronology to elucidate indicators of Wari decline, and its effects upon inhabitants both within the capital city, as well as those throughout the heartland and hinterland.

Fuller, Dorian**[352]** *Pathways to Plant Domestication: Categories of Cultivation Practice and Convergent Evolution*

Taking inspiration from Zeder's notion of pathways to animal domestication (commensal, prey, directed), this presentation will outline equivalent pathways of plant domestication types, and suggest a range of species that can be grouped by these pathways. These pathways are united by issues of habit (annual, perennial), ecological constraints (early successional or late successional) and the nature of selection during the domestication process, which can be illustrated by a range of archaeological examples from both the Old World and the New World. These pathways include the well-documented grain annual pathway shared by primary cereals and pulses, but also secondary vegetal pathway, of later weedy cereals, a camp-following ruderal pathway, of numerous vegetables and some of the earliest domesticates; a tuber pathway of short cycle perennials, woody perennial pathway, shared across most tree fruits and vines, and ecosystem engineering pathway that applies to management of long-lived trees within quasi-natural woodlands.

Fuqua, Julie (Director of Conservation The Walters Art Museum) and Glenn Gates (The Walters Art Museum)**[39]** *Influence and Exchange: A Technical Study of Colonial Period Ivories from the Philippines*

This paper focuses on the early phases of a technical study of the polychrome and gilding on colonial period ivory sculptures produced in the Philippines and transported into Mexico via an annual trade network known as the Manila Galleons. These ships moved goods to and from colonial ports in Asia, to the Americas, and on to the port of Seville, Spain. It exploited the riches, gold and silver, of the Americas and brought in silks, porcelains from Asia, and a new type of sculpture produced under catholic missionary rule. The Catholic sculptures—usually depictions of Christ, the holy family, and archangels like St. Michael—were all carved in ivory and decorated with gilding and paint. Technical studies of these ivories are rare and questions about where the ivories were decorated have been posed. Were they carved in the Philippines and then painted in Mexico as some scholars have proposed? Minimally and non-invasive techniques of analysis including, XRF, FORS, FITR and Pyrolysis-Gas Chromatography Mass Spectrometry were used to characterize materials. This paper will summarize early results of a coordinated effort to study the materials and techniques of the polychrome and gilding materials in order to help identify and support places of production

[328] *Geochemical Analysis of Crystalline Volcanic Rock Artifacts from Three Olcott Sites along the Elwha River, Clallam County, Washington*

Raw material sourcing of crystalline volcanic rock (CVR) artifacts through geochemical analysis has a decades long history in Olympic Peninsula archaeological research and is an important aspect of site interpretation. Recent archaeological investigations at three Olcott sites by Archaeological and Historical Services, EWU as a part of Washington Department of Transportation's US 101 Elwha River Bridge Replacement Project yielded a relatively abundant lithic assemblage composed almost entirely of CVR raw material. Whole rock geochemistry and trace element analysis of CVR artifacts from the three sites along the Elwha River (sites 45CA727, 45CA774, and 45CA775) were analyzed using non-destructive portable X-Ray Fluorescence Spectrometry. The resulting geochemical data provides critical lines of evidence to assess potential raw material sources and CVR procurement strategies used at the three sites. The site-scale results are then placed into broader regional patterns of CVR toolstone procurement strategies.

[125] *Twentynine Wash Excavations and Collaboration AZ BB: 5:127 (ASM)*

The Pima Community College archaeology program has conducted field work at AZ BB: 5:127 (ASM), the Twentynine Wash site, intermittently since 1997. The Twentynine Wash site is a large Hohokam habitation site that lies in the western foothills of the Santa Catalina Mountains north of Tucson, Arizona. Due to its proximity to nearby communities and encroachment from washes, the site was in danger from both erosion and looting. This prompted the Pima Archaeology Centre to obtain permissions to conduct fieldwork at the site. Thirty-two surface and subsurface features have been identified at Twentynine Wash including middens, pits and pithouses while many more features remain buried and not yet discovered. Twenty-three of the identified features have been fully or partially excavated and students and faculty have recovered, cleaned, sorted, and stored over 100,000 artifacts, some of which have been further analyzed by students. This productive collaboration between Pima Community College and the Arizona State Land Department has led to extensive field training and research opportunities for students and to the preservation of information that was being lost to erosion and vandalism. This poster discusses the history of archaeological investigations at the site, and summarizes the research done to date.

Gabe, Caroline (University of New Mexico)

[208] *San Gabriel del Yunque: As Seen through a Museum Assemblage*

In 1598, the first Spanish colonists in the southwestern United States established a capitol at Yunque Owingeh, later known as San Gabriel del Yunque, New Mexico. They concentrated in a series of converted Puebloan roomblocks until the capitol was moved to Santa Fe in 1610. For over 300 years, the location of this first capitol was the stuff of legends and oral traditions. In 1944, Marjorie Tichy Lambert conducted salvage archaeological tests at one possible location, which was further examined in the late 1950s and early 1960s by Florence Hawley Ellis and University of New Mexico field schools. Based on these excavations, Ellis argued that the Spanish Area of Yunque was modified into 13 apartments, a kitchen, a blacksmith area, and a possible convent. This poster presents a reanalysis of the artifacts excavated by Ellis from the Spanish Area and evaluates the assemblage composition and spatial distribution to reexamine Ellis's initial interpretations. Initial results show variations in the distribution of artifacts within the reused roomblocks, but that specific use areas within the structure are not always supported. Instead, new interpretations are proposed.

Gadsby, David

[385] *Negotiating Complexity in the Management of Sensitive Digital Data*

Appropriate stewardship of sensitive archeological data necessarily involves overlapping and intertwined authorities, systems, and institutions. The authorities, in turn have different limits and requirements, while various entities have divergent purposes, needs, and protocols. Archeologists, librarians, data managers, planners, and resource managers who work with sensitive data require a thorough understanding of the nature of both the physical and digital resources and the contexts in which they are embedded. Healthy institutional relationships and the effective communication that comes with those relationships are as critical to ensuring appropriate access to data as they are to protecting them from unwanted disclosure. Legacy data present a particular challenge, especially when methods for their appropriate disposition are ambiguous. I describe some of the complexities of managing these data, and examine practices and procedures for the stewardship of older data and examine some consequences of inappropriate disclosure.

[42] *Regional Archaeology in the Peja and Istog Districts of Kosova (RAPID-Kosova): Results of the 2018 Field Season*

This paper reports the results of an initial season of regional archaeological survey in western Kosova, in the districts of Peja and Istog. RAPID-Kosova is the first intensive, systematic survey ever conducted in Kosova, and aims to document settlement and settlement change through time. During June of 2018, we ran three survey teams in three zones covering 15.4 square kilometers in 1510 tracts. Fifteen new sites were identified and 3521 pieces of pottery were collected and analyzed, indicating significant occupations in the region in all periods of the past. Perhaps the most important discovery was a large Bronze Age settlement, called Pepaj, located on the foot slopes below the Gradina hill fort near the village of Lubozhdë. Such “flat” Bronze Age sites are rare in the Balkans, e.g. in Albania. Most late prehistoric sites are located on eroded hill tops with little remaining stratigraphy. Pepaj thus presents the opportunity to investigate an intact late prehistoric village of the type that must certainly have been in contact with villages in northern Albania. Ultimately, we hope to gauge the importance of such contacts to the formation of complex societies in Kosova, including as a result of trade with Greece and, later, Rome.

[145] *Evolving Narratives of Mother Washington*

Ideal gender roles feature prominently in biographies written about George Washington. Once his father passed away, a young Washington was raised by his single mother, Mary Ball Washington. The narratives of Washington's life, and his mother's influence upon him, are dynamic, reflecting prevailing gender ideologies of the times in which they were written. Influenced by the cult of domesticity, Mother Washington was venerated in early nineteenth century. Transformative social movements, which questioned traditional gender roles or that promoted civil rights for women, often inspired critical appraisals of her. Despite negative portrayals, the modern communities that surround Mary Washington's historical homes celebrate her with museums, street names, a monument, and eponymous institutions. One of these homes, Washington's boyhood home in Stafford County, Virginia, was managed by Mary for over three decades. Archaeological investigations there underscore the dissonance between the material culture of his youth and popular stories about his upbringing. Social media has intensified social movements relating to women, bringing renewed interest to Mary's depiction in Washington biographies.

Gallaga, Emiliano (EAHNM)

[336] *The Presidio San Carlos Archaeological Project: Preliminary Results*

The Camino Real was a cultural, political, and economical link between the Viceroy of Mexico and the northern communities of the New Spain, mostly mining centers. But these new territories were not only harsh geographically but dangerous by the constant raids by the local communities of American Indians, and pressure from foreign nations like England, France and Russia. Because of that the Spanish empire establishes a military line of presidios from California to Florida not only to protect the empire frontier. These structures were simple constructions made of local material. Several of these presidios were short lived; others become major cities today, such as Chihuahua. The conformation of the frontier in colonial times is well known historically, but poorly known archaeologically specially in Mexico. The Presidio San Carlos is located near the community of Manuel Benavidez, Chihuahua, near the Texan border. It's relative isolation contribute to its well preservation and present a good archaeological opportunity to explore and know more about the “presidiales” life and its relation with the landscape and local communities. Here we will present the result from the recent archaeological survey project conducted at the Presidio San Carlos this summer of 2018.

[63] *The Role of Burials in Place Making at Chan Chich, a Royal Court in Northwestern Belize*

Research on ancient Maya cities is generally focused on large paramount sites that had written records of the rulers' activities. However, these large cities are the exception, rather than the norm, since the majority of the urban sites consist of smaller settlements. Research at the archaeological site of Chan Chich recovered evidence of the development of a non-paramount ancient city. Excavations at the Upper Plaza, the site's main royal precinct, suggest large construction projects, including a large northern platform, nicknamed “Blanca”, two smaller platforms at the northeast and northwest, likely topped by perishable super-structures whose use spanned the Late Preclassic and Early Classic periods. In addition to the expansion of monumental construction, the Upper Plaza was a focus of mortuary ritual for the Chan Chich elite during this time. Excavations in 1997 recovered a Terminal Preclassic royal tomb in the center of the plaza and our 2016-2018 excavations uncovered six interments containing eight individuals intrusive into Late Preclassic architecture, including another possible royal interment. In this paper, we examine the local urban tradition at the site of Chan Chich and how the construction of monumental architecture in the Upper Plaza articulates with the mortuary record.

Gallivan, Martin (William & Mary)**[239]** *Algonquian Landscapes and Multispecies Archaeology in the Chesapeake*

Archaeological and ethnohistorical studies have begun to trace the ritualized practices of Native groups as they returned to places with deep histories throughout the Southeast during the colonial era. In the seventeenth-century Chesapeake, Algonquian groups traveled across contested territories to bury ancestors, animals, and objects in places with long, precolonial occupations but no resident colonial-era population. This paper compares these colonial-era practices with the precolonial history of a site located near the James River that also lacked a yearlong residential population. Periodic visitation at the Hatch site produced a 400-year long record of human interments, dog burials, and feasting debris. Borrowing ideas from multispecies ethnography, this comparison considers the complicated and shifting entanglements between human lives and dogs, highlighting intersections between landscape, political economy, and cultural representations in the Algonquian Chesapeake.

Galm, Jerry, Stan Gough (Eastern Washington University) and Julia Furlong (Eastern Washington University)**[326]** *Site Organization and Abandonment Processes: A Late Paleoindian Case Study*

Abandonment processes at the Sentinel Gap site highlight a high degree of formalism, ritual behavior, and sophistication in this Late Paleoindian site record. The structured distribution of recovered remains from the site includes an abandonment overlay of "killed" artifacts, the redistribution of broken objects across the occupation surface, and the burning of two probable domestic structures. Although the combined elements of this abandonment signature imply a planned departure, the available evidence likewise indicates no clear intent of returning to this locale. From a regional perspective, site organization and abandonment records support the presence of different cultural groups in the Columbia Plateau during the Late Paleoindian era.

Gambim Junior, Avelino**[185]** *Materiality of Amerindian Human Bodies in the Mouth of the Amazon River: Life and Death at the Curiaú Mirim I Site, Around the Second Millennium AD*

This paper aims to show an osteobiographical approach to read human bodies like a special kind of material culture which was inspired by the concepts of Amerindian ideas of construction of bodies and persons in the interpretation of the data analyzed. The Curiaú Mirim site is formed by funerary burials, ceremonial structures, which was dated by the 10th to 16th centuries AD associated to Mazagão, Marajoara, Koriabo and Caviana cultural complexes. In order to understand and characterize the funerary practices in that site, this study privileged human skeletal analysis to know how the persons was buried there and how funerary treatment was dispensed to them by the living mourners in the Ancient Amazon. It was possible to observe different kind of gestures in funerary/ceremonial depositions, as well as some osteobiographical inferences in the ways of life and burial practices interpreted in the light of ethnographical and ethnohistorical data concerning some Amerindian world views that allowed possible explanations of the cultural rules and cultural choices. There were seems to have been a continuity in the way of use of specific places that was spatially marked to bury the dead that indicates ancestor

worship.

Gamble, Lynn (University of California, Santa Barbara)

[308] *Secret Societies, Power, and Ritual among Hunter-Gatherers in California*

Secret societies are groups of individuals that possess esoteric knowledge that is not available to non-members, and therefore are by definition exclusive. Many such societies are associated with administering ritual ceremonies. The Chumash Indians of southern California had a secret society known as the 'antap, a political and religious organization whose primary purpose was to access and manage supernatural powers necessary for the maintenance of balance in the universe. High-ranked individuals were members of the 'antap society, and included chiefs, their family members, and religious specialists who performed dances and rituals at public ceremonies. Members were baptized into the 'antap as children, with relatively large quantities of shell-bead money paid by their parents as a type of membership fee. All chiefs and their immediate family members were required to be initiated into this prestigious group. Members learned sacred dances and songs, and communicated with one another through an esoteric language. Ethnographic data indicate that only members of the 'antap society possessed and used large deer-tibia whistles, which appear in the archaeological record about a thousand years ago. Certain members of the 'antap society used coercion and intimidation to maintain their power and concentrate wealth.

Gao, Bo, Xiangyu Zhang (Xi'an institute of cultural relics protection) and Chenggang Duan (Xi'an institute of cultural relics protection)

[78] *A New Discovery of a Tang Dynasty Cemetery in the Eastern Suburb of Xi'an*

Between August 2017 and December 2018, more than one thousand Tang dynasty tombs had been found in the eastern suburb of Xi'an by Xi'an Institute of cultural relics protection and archaeology. Abundant important antiquities were uncovered, including Persian style silverwares, silver sachets, bronze mirrors, stone incense burners, and stone epitaphs of princesses, eunuchs, and ministers. Most of the tombs were outside the eastern wall of the capital of the Tang dynasty, and those tombs' owners were likely common civilians of the Tang dynasty who were living in ancient Chang'an city. Research about tombs of the Tang dynasty is meaningful in representing ordinary life quite vividly for that time, showing the relationship between city and cemetery, and indicating cultural exchange between the east and the west.

[404] *The History of Archaeobotanical Research on the Island of Puerto Rico and Its Relationship with Notions of Poor Preservation of Macro-botanical Remains on Archaeological Contexts*

Archaeobotanical research of macro-botanical remains in the Caribbean is scarce due to notions of poor preservation in tropical landscapes. This shifted archaeobotanical research towards the analysis of micro-botanical remains because these types of analysis have been reported as more successful for recovering data of subsistence practices in the Neotropics. However, there has not been a study that questions the preservation issues of macro-botanical remains in the Caribbean. Even though, the presence of macro-botanical remains has been reported on various Caribbean islands on pre-Columbian and historical contexts, there have been limited attempts at systematic assessment of the presence and utility of macro-remains. Based on a historical overview of archaeobotany in Puerto Rico, several inconsistencies in recovery strategy are noted. I then report results from my own recovery by flotation from 6 sites where charred seeds, parenchyma, wood charcoal, and possible cooked food remains have been recovered. These results highlight the potential for more archaeobotanical work on Puerto Rico on a wide range of plant remains.

Garbellano, John Michael

[324] *Shell Middens: Foodways at Dogan Point and Other Hudson River Sites*

This research focuses on reanalyzing the Dogan Point site and other Archaic shell midden sites along the lower Hudson River. The Dogan Point site has a shell component with calibrated dates ranging from 7919 B.P. and 2343 B.P., and a non-shell component with calibrated dates ranging from 3261 B.P. and 473 B.P. Dogan Point was originally investigated by Louis A. Brennan in the 1960s and 1970s, and reinvestigated by Dr. Cheryl Claassen in the 1980's and 1990s; however, there are still several important site-specific research questions surrounding Dogan Point that remain unanswered or incompletely resolved. The role of shell middens in the lower Hudson River has been looked into closely, but at Dogan Point and other shell midden sites it has been years since anyone has done systematic investigations. This research will focus on defining the foodways of the occupants of Dogan Point and other shell midden sites along the lower Hudson. The results will provide new insights on the Dogan Point site, and more generally on riverine adaptations of Holocene Native Americans in the Lower Hudson.

[154] *Archaeology of High-Mountain Pastoral Campsites in the High-Pyrenees*

European high-mountain landscapes are nowadays characterized by the presence of pastures and grasslands. Archaeological and palaeoenvironmental research conducted during the last decades are picturing these environments as long-term cultural productions, resulting from complex environment-society interactions. Since prehistory, herding appears as one of the main factors in the ecology of high-mountain landscapes. The Landscape Archaeology Research Group from the Catalan Institute of Classical Archaeology has conducted different multidisciplinary projects in the Eastern Pyrenees since 2004. The archaeological work included the excavation of 100 structures related to the temporary accommodation of both shepherds and animals and the micromorphological study of the soils. This contribution will present different case studies of excavated structures, with chronologies from the Neolithic to the Modern period. In this paper we will analyze (1) the internal articulation of the sites, (2) relation to landscape transformations and (3) the integration of high-mountain activities in complex supra-regional socio-economic dynamics of the different periods.

[270] *Caminos a Los Horcones, Chiapas: A Least Cost Path Analysis of Early Classic Trade Routes*

During the Early Classic Period (250-600 CE), the site of Los Horcones rose to become an important gateway community sitting strategically on the flanks of Cerro Bernal where it controlled the terrestrial trade route along Pacific Coast into the Soconusco region. Archaeological research of this important regional center has revealed a complex history of interactions with many regions and centers, including with the Central Mexican metropolis of Teotihuacan. Using GIS we applied Tobler's Hiking Function to explore some of the most important least-cost paths from Los Horcones to and from regions with whom we have documented contacts. This particular function is particularly useful for looking at Mesoamerican trade as all transport of goods was done without the benefit of wheeled carts and draft animals. We then take these paths and discuss the possible networks used for the movement of goods.

[125] *Prehistoric Land Use in the Upper San Simon Valley and Chiricahua Mountains: A View from the Finley and Sally Richards Projectile Point Collection*

The Finley and Sally Richards collection represents the largest and most complete collection of projectile points documented from the remote corners of southeastern Arizona and southwestern New Mexico. The collection, donated to the Arizona Archaeological and Historical Society in 2013, offers a rare overview of the prehistoric cultural history of the upper San Simon Valley and Chiricahua Mountains. Study of the collection, which spans the Holocene epoch, was made possible through a healthy partnership between not just archaeologists and a local ranching family, but the entire community of Portal, Arizona, who collectively invited us to generate the information provided here. Our analysis documents the attributes and variables of the projectile point collection, and summarizes the sequence of typological designs that are distinctive to the southern Plains, the Chihuahuan Desert, and the Sonoran Desert. Raw materials used to create the tools, including obsidian, demonstrate a fluid territory between what is today described as the U.S.-Mexico borderlands. The process of observing, measuring, describing, and interpreting such a group of textbook artifacts provides an ideal opportunity for student learning, while contributing to our understanding of the regional archaeological record.

[202] *Shell Jewelry Exchange and Social Status in Central Sonora*

The archaeological site of El Cementerio, dated between the Middle and Late Sonoran Ceramic Period (circa AD 1000-1521) and located in central Sonora along the Yaqui River, displays several characteristics suggestive of closer links to West Mexican coastal settlements including the presence of shell jewelry and intentional cranial and dental modification among the mortuary sample. All other artifacts consist of locally manufactured materials and traditions, whereas the shell jewelry was clearly manufactured at the coast and traded into the site. Less than half (36.9%) of the mortuary sample were buried with jewelry (pectorals, pendants, bracelets, earrings, and beads), and most were juveniles (56.1% of total with objects). This pattern contrasts the rich burial assemblages found among contemporaneous communities along the coast, and the probable source of the jewelry. We suggest that individuals buried with jewelry reflect direct connections with coastal communities and were afforded higher social status. The higher proportion of juveniles buried with jewelry likely reflects their inherited status and perceived future importance within the community.

[285] *Modeling the Spread of Smallpox during Spanish Colonial Rule in the Chicama Valley, Peru*

Myriad reasons for the native depopulation of the Americas have been cited, chief amongst them is the spread of Old World diseases like smallpox (*Variola major*) with the arrival of Europeans. Ethnohistorical documents are limited in understanding the direct effects of infectious diseases at the community level, especially in small indigenous towns where documents are limited. Coupled with this, many diseases, including smallpox, are skeletally

invisible, making interpretation difficult. Here we use ethnohistorical documents and the epidemiological characteristics of smallpox, in order to investigate the effects of this epidemic disease at the reducción of Magdalena de Cao Viejo (1578 ~ 1750) in the Chicama Valley, Peru. We present a computer model for the spread of smallpox from the large colonial city of Trujillo to this small 'backwater' town. This model was made to illustrate the speed and scale of such an epidemic and to illuminate how communities may have coped with their spread. While it is impossible to account for the countless variables influencing disease proliferation in such a complex system as Colonial Peru, this model provides a foundation for future study and, in complement with the archaeological record, can inform our understanding of life under colonial rule.

Gardiner, Caroline

[3] *Archeology as a Teaching Tool*

This project, conducted between summer and fall of 2018, was part of a larger NPS initiative to use archaeology as an educational tool. The project's main objective was to use this interdisciplinary field to teach concepts stemming from various academic subjects, ranging from history to chemistry. To achieve this goal, lesson plans were created for the National Park educational website that highlighted these concepts. This project is a useful example for further NPS public education endeavors. It demonstrates existing issues, specifically the need for technological accessibility and website consolidation. It also speaks to project adaptability, communication with park staff, and the challenge of creating material that addresses both educator need and wider NPS objectives.

[397] *Variability in the Cultural Assemblage During the Formative Period in the Upper Colorado River Drainage Basin*

The Formative period in the upper Colorado Drainage has been variously defined but broadly extends from 2000 B.P. to 400 B.P. Recent investigations indicate there was a high degree of variability in the cultural assemblage during this period. Specifically, habitation structures, maize storage facilities, and maize types show a great deal of variability. In this presentation, we will briefly look at this variability in terms of spatial distribution and the chronology of the Formative in the Upper Colorado River Basin.

Gardner, William (Yale University)

[154] *New Insights on Mobile Pastoralist's Household Ritual Activity: Early Observations from the Excavation of a Mongol Period Ephemeral Dwelling in Northern Mongolia*

Conversations on ritual practice along the Mongolian steppe are often dominated by discussions of monumental architecture that is typified by large stone mounds referred to as "khirigsuurs" or "Deer Stone" steles. Conversely, the idea that ritual space and practice can be considered at the small-scale household has been mostly dismissed. This is in large part due to prior misconceptions about the inability of the archaeologist to identify the ephemeral dwelling spaces of mobile peoples. However, recent discoveries of ephemeral habitations in northern Mongolia has shown that these once-invisible spaces are in fact preserved and identifiable in the archaeological record. The discovery of such dwellings now gives us access to aspects of the mobile pastoralist's life that have been previously unexamined. Considering the ethnographic work of Rebecca Empson on household ritual space in modern pastoralist's dwellings in Mongolia, this presentation will explore the idea of ritual practice at the household level while reporting the initial findings of the excavation of a Mongol period housepit in the Tarvagatai Valley of northern Mongolia.

[345] *Transportation or Transformation?: Road Depictions in Relaciones Geográficas of 16th-Century New Spain*

The 16th century was a time of extraordinary cultural exchange in Central Mexico. The heterogeneous indigenous populations interacted with recently arrived Spanish and the Creole populations. In this paper, I examine one manifestation of these peoples' concepts of place, space, and movement as visually represented in maps. Focusing on the sixty-nine maps created in response to a questionnaire sent by the official cartographer of Spain's King Philip II allows for a close examination of how different scribes from different cultural backgrounds treat the same prompt. These hybrid maps hold a record of cross-cultural interactions and how these groups viewed place and space differently. I focus on the use of footprints by indigenous scribes to show their different perception of roads from that of the Spanish. I contend that the ways scribes reflected their sense of place and space through depictions of roads, the movement from place to place, and in particular the use of footprints is intimately connected to indigenous creation myths, migration narratives and ultimately their quotidian experience of roads.

Garraty, Christopher (Logan Simpson), Travis Cureton (Logan Simpson), Erik Steinbach (Logan Simpson) and Paula Scott (Logan Simpson)**[194]** *Exploring the Pre-Classic Roots of Hohokam Platform Mounds: New Evidence from La Plaza*

Recent archaeological and historical investigations at the Hohokam site of La Plaza revealed robust evidence that a platform mound once stood in the north part of Arizona State University's Tempe campus. Recently obtained archaeological evidence suggests that the mound was built during the middle-late Sedentary period (ca. A.D. 1020–1125/1150) using Sedentary period canons of mound form and composition, as evidenced by its oval or subrectangular shape in plan, small size, and absence of adobe walls and interior rubble fill. Analyses of the fill contents and arrangement of multiple puddling pits and a large borrow pit associated with the mound provide insights into labor effort associated with the mound's construction and maintenance. Notable also is the presence of Classic period (post- A.D. 1125/1150) features beneath the outer edges of the inferred mound footprint, which implies that the mound was expanded during the Classic period but that Sedentary period canons of mound form and construction were maintained. In this presentation, we discuss the broader implications of our findings concerning the organization of public space in La Plaza and, more broadly, the mobilization of labor for communal construction projects in Hohokam society.

Garrett, Zenobie [196] see Campana, Douglas

Garrett, Zenobie (University of Oklahoma)**[266]** *A Site with a View? A 3D Reconstruction of the Structures at Dun Ailinne*

The site of Dún Ailinne (Knockaulin) in County Kildare is one of four major ceremonial sites of the Irish Iron Age. The site sits on a large, isolated hill in an otherwise flat landscape on which a large earthen bank and ditch encloses approximately 13 ha of land at the top. Excavations in the 1960s-1970s, as well as ongoing excavations today have defined several timber structures and phases of construction at the site. The stunning vistas that the hilltop affords today have inspired archaeologists, including myself, to consider the importance of vision in the experience of ceremony at the site. While archaeologists have postulated that gaps in the timber structures would have controlled not just access but also views, these studies have largely focused on the location of the structures, without taking into account the visibility of the building themselves. This paper builds upon this work by presenting the results of a 3D reconstruction built for the site and exploring the structures visibility and invisibility both within the site itself and in the larger landscape. In so doing, this paper seeks to understand the impact these structures would have had on local performance and activity.

[266] *Chair***Garrido, Francisco (Museo Nacional De Historia Natural)****[355]** *Reconsidering the Imperial Subjects of the Southern Collasuyu: Commensality and Agency in Northern Chile*

As in other parts of the empire, Inca pottery in the southern provinces portrays a mix of Cuzco and local designs. Inca aryballos, plates, and jars incorporated local styles, just as local pots incorporated Inca styles. However, does the presence of Inca style always indicate imperial control? How did locals manage to express their closeness or distance to the Inca state?

Through contextualizing the use of pottery in the case of Copiapó valley, northern Chile, I explore how these pots were used in ritual activities and daily life, including state sponsored commensality, and domestic and funerary use. The distribution and diversity of styles and practices associated with pottery suggests that in this region, Incas established their domain in a selective way, leaving room for local groups to express their autonomy and aspirations, during times of higher social complexity and broader regional interconnection.

[79] *Stephen Houston's Impact on Maya Archaeology: Celebrating His Completion of 3 K'atuns*

Stephen Douglas Houston was drawn to archaeology and ancient scripts from a young age, fascinated by the rune stones of his mother's native Sweden. While he is most widely seen as an epigrapher to outsiders, Mayanists recognize that he is, in fact, a world class field archaeologist that knows where to dig to answer anthropological questions, and is not afraid to get his own hands dirty. Houston's intellect possesses an insatiable curiosity, which means that he has given his informed opinion on a number of important debates in archaeology, shaping and advancing academic discourse. Even with such lofty credentials, he has always made the mentoring of young scholars a priority, which also keeps him on top of the most current theories, debates, and methods that are emerging in Maya archaeology. In this paper, I will reflect on my ten years working with Steve at El Zotz. In that time, he has dramatically influenced my existing views on remote sensing, GIS, and digital technologies in general. In our most recent work using lidar data, Steve has pushed me beyond settlement pattern analysis and has helped me see how this technology is changing our understanding of the ancient Maya at many levels.

[127] *Simulation and the Identification of Archaeologically-Relevant Units of Analysis in the Study of Prehistoric Cultural Transmission*

Reconciling the archaeological record's coarse grain with the person-to-person information exchanges central to cultural transmission (CT) models will allow us to better tap this powerful body of theory. Previous efforts at reconciliation demonstrated that within- and between-assemblage coefficients of variation (CV) are archaeologically relevant units of analysis in CT models (e.g., patterns of artifact attribute variation indicate particular learning biases and their relative strengths). Still lacking was a means of interpreting intermediate CVs—ones poorly aligned with independent standards for very high and very low CVs. Simulation can generate “artifacts” with well-specified production histories, and these simulated data can be used to interpret archaeological CVs. Here, I use simulations informed by rich contextual data to generate archaeologically-appropriate CT predictions for interpreting intermediate CVs observed in a collection of late prehistoric projectile points from the U.S. Southwest. Specifically, I simulated point attribute data under four learning scenarios: model-based biased transmission and within-household learning at three levels of transmission fidelity. The archaeological CVs are most consistent with extremely high-fidelity, within-household copying, which may reflect a strong group-affiliative norm or heightened incentive to “advertise” group membership given the social context in which the points were produced.

[198] *Material Culture and Technological Innovation in Colonial Soconusco, Chiapas, Mexico*

The Soconusco region of Chiapas, Mexico, quickly attracted the attention of the Spanish invaders in the Early Colonial period because of the valuable cacao produced in the area. Intensive trade brought long-distance merchants to Soconusco bringing trade goods to exchange for cacao, as had been the case in the Late Postclassic period. As a result, indigenous Soconusqueños acquired new materials such as glazed ceramics, metal tools, and glass objects, in greater quantities than was the case in areas that did not produce goods in demand on the larger Mesoamerican or international markets. New plants and animals also were introduced and became integral parts of local lifeways, and a range of new social institutions—religious, political, and economic—were imposed by the colonial regime. In this paper I focus principally on patterns of consumption and production of these new materials, and I consider how they may reflect sociocultural continuity and change. Additionally, I explore the lasting legacy of these patterns for postcolonial and contemporary Soconusco residents.

Gaskell, Sandra (Tribal Archaeologist Southern Sierra Miwuk Nation)

[400] *Indigenous Archaeological Involvement in Front of Suppression Reduces Mitigation*

During early suppression efforts of two wildland fires, indigenous firefighters reduced damage by sharing unrecorded cultural site polygons created from oral tradition aligned to dozer lines ahead of the fire's predictive path. During the Detwiler Fire (2017), and the Ferguson Fire (2018), the Tribal Archaeologists from two tribes, and the Cultural Officers from the Seven Affiliated Tribes of Yosemite participated at Incident Command during suppression efforts by guiding fire lines that would avoid unrecorded roundhouse depressions, milling features, and burial locations. Confidentiality of the information was protected through the use of controlled distribution of data to only the field READ and REAF for the sites being protected on that day in advance of the dozer crews. Tribal Archaeologists compare resource maps (historic, prehistoric, flora and fauna) to see which resources overlap tribal sacred sites not

yet discovered. When the repair process begins, tribal monitors and archaeologists participate in the mitigation measures revealing less damage to sites than in previous fires. GIS collector applications used by field archaeologists can hold an abstract polygon for the areas of interest, which the tribes request to remain unrecorded by a site survey record form.

[116] *Heating Stones: An Experimental and Ethnographic Analysis of Fire Cracked Rock at Two Monongahela Sites in Southwestern PA*

The use of heated stones in both cookery and social rituals is an important technology in the repertoire of human food and lifeways. Archaeological assemblages often contain high percentages of these heated stones, or fire cracked rock (FCR). Yet despite its relative frequency in archaeological collections, the full diagnostic potential of FCR for determining feature or site function is little explored, specifically regarding its use among the Monongahela. This research experimentally created FCR through stone boiling, dry-roasting, and steaming to assess the morphological characteristics of the resulting heated stones. The experimental methodology was informed through consultation with Native American community members and through ethnohistoric research concerning traditional cooking methods. Experimentally created FCR was then compared to archaeologically recovered FCR from two Late Woodland period Monongahela sites located in southwestern Pennsylvania: the Johnston and Squirrel Hill sites. This study seeks to improve our interpretation of FCR recovered during archaeological investigations and to aid in differentiating between either cooking and non-cooking behavior, or between specific types of cooking techniques.

[172] *Ceramic Variation between Two Caribbean Islands*

The Exploring Globalization and Colonization Through Archaeology and Bioarchaeology National Science Foundation (NSF) Research Experiences for Undergraduates (REU) provided ten undergraduates the opportunity to conduct research on the Dutch Caribbean island of Sint Eustatius (Statia). This research poster's goal is to compare ceramic sherds Fort Amsterdam on Statia and Brimstone Hill Fortress on Saint Kitts. The research examines how globalization impacted Statia. Fort Amsterdam was used by military personnel and was in close proximity to numerous trading warehouses. Brimstone Hill was a British fort and we use ceramics from an area occupied by the Royal British Engineers, who would have had enough income to possess ceramics from around the world. Unlike the free port of Statia, Saint Kitts was under strict British trading restrictions; therefore, limited ceramic variety was predicted for the Brimstone Hill assemblage. Ceramic comparison methods involved using a standardized analytical methodology used by St. Eustatius Center for Archaeology Research (SECAR). Ceramics were grouped by ware and decorative types to determine the ceramics' country of origin. Concluding our research, this project found that ceramic variety was greater at Fort Amsterdam than Brimstone Hill.

Gauthier, Nicolas [9] see Wissler, Amanda

Gauthier, Nicolas (Arizona State University)**[127]** *Generalized Additive Mixed Models for Archaeological Networks*

Distance is a fundamental constraint on human social interaction. This basic principle motivates the use of spatial interaction models for estimating flows of people, information, and resources on spatial and social networks. These models have both valid dynamical and statistical interpretations, a key strength well supported by theory and data from geography, economics, ecology, and genetics. To date, archaeologists have primarily relied on the dynamical approach because the idiosyncrasies of archaeological data make the wholesale adoption of statistical approaches from other fields impractical. Here, I argue for the use of generalized additive mixed models (GAMMs) for statistical inference on interaction networks in archaeology. GAMMs are a flexible form of regression model well-matched to the complexities of the archaeological record, including non-normal distributions in the form of counts or proportions, non-independent observations with correlated errors, and non-linear functional relationships. Using two case studies, an ethnographic marriage network and an archaeological assemblage similarity network, I illustrate how this approach can lead to unbiased parameter estimates and more robust comparisons of competing hypotheses. I conclude by outlining how future empirical efforts can help to refine our thinking about past network dynamics and reveal cross-cultural regularities of human social interaction in the present day.

Gaylord, Donald (Washington and Lee University) and Alison Bell (Washington and Lee University)**[11]** *A Comparative Analysis of Ceramic Assemblages from Slave Plantation Sites in the Valley and Piedmont of Virginia*

The excavation and analysis of slave plantation sites from the Valley of Virginia, and especially their comparison to the well-documented sites of eastern Virginia, is becoming an important new source of information regarding variability in the conditions of enslavement across the Atlantic World. This poster compares ceramic assemblages from slave plantation sites near Lexington, Virginia with similar ones in the Piedmont by building on recent quantitative analysis of free and enslaved sites at Monticello (Gaylord and Bell, forthcoming). Ceramic cost and decorative diversity will be analyzed in relation to other variables such as distance to market, plantation size/population, and distance between slave plantations. Data collected by Washington and Lee Archaeology from early 19th-century sites during the 1970s through the 1990s will be compared with those curated by the Digital Archaeological Archive of Comparative Slavery (DAACS).

Gayó, Eugenia (Center for Climate and Resilience Research (CR)²) and Jose M. Capriles (Department of Anthropology, Pennsylvania State University)**[248]** *Climatic and Demographic Changes in the South Central Andean Highlands during the Late Holocene*

The south central Andean highlands have a rich and complex socio-environmental history. Although generally seen as a single cultural area with fluid sociocultural interaction, its geographic heterogeneity is mirrored by its cultural diversity. To explain the varying effects of climate in the late Holocene history of the south central Andean highlands, we constructed four paleodemographic records of radiocarbon dates following a precipitation gradient: Lake Titicaca, Central Altiplano, Southern Altiplano, and Precordillera. Using regional proxies of paleoenvironmental change, we evaluate the timing, intensity, and resilience of each of these regions to significant events of environmental change. Our results suggest that climate had an observable effect on demographic trends including accelerating or slowing population growth and possibly causing migratory movements between neighboring regions. This outcome suggests that the south central Andean highlands emerged as an integrated cultural area as a consequence of long-term processes of climatic change as to processes of sociopolitical integration driven by emergent complexity. Ge, Yun (Harvard-Yenching Institute)**[361]** *The Origin of Metallurgy in China: Retrospect and Prospect*

Early metallurgy is considered one of the most essential factors to the development of Chinese civilization, and the controversy concerning its origin has been going on for decades. With increasing number of early bronzes found in the past decades, scholars keep renewing their views on this topic, and as a result, the controversy has been updated with time. One of these views, which states that early metallurgy was introduced into China, became popular in the 21st century, and recently, the latest technologies and new approaches add even more evidence. We are now able to learn more from samples, and thus there is no better time for us to make clear how can we conduct our research and take it further. Especially the latest finds in Shaanxi province will change our understanding to the origin of metallurgy in China.

Gearty, Erin (Flagstaff Area National Monuments), Laurie Webster (University of Arizona), Chuck LaRue and Louie Garcia (Language arts specialist and Piro/Tiwa weaver)**[76]** *Weaving and Spinning Technologies from the Northern Southwest: Recent Research by the Cedar Mesa Perishables Project*

Perishable materials that provide information about precontact weaving traditions rarely preserve in the archaeological record. One region where they have survived is the Four Corners region of the North American Southwest, where the arid environment and intensive use of dry caves allow for the extensive preservation of textiles and production implements related to cotton processing and weaving. These fabrics and tools demonstrate a robust tradition of cotton textile production and provide a rare glimpse into its underlying material culture. Recent research by the Cedar Mesa Perishables Project has resulted in the documentation and analysis of numerous wooden cotton

beaters, spindle sticks, awls, temples, battens, and finishing needles, as well as wood, gourd, and bighorn sheep horn spindle whorls, from sites in southeastern Utah and northeastern Arizona. This work has identified cultural preferences in the selection of raw materials and documented the construction techniques used to make various implements. These precontact weaving and spinning traditions also provide a direct connection to contemporary Pueblo Indian tribes, with Pueblo weavers using many of the same weaving technologies today.

Geller, Pamela (University of Miami)

[317] *Bioarchaeology and Bioethos*

The future of bioarchaeology requires a robust sub-disciplinary bioethos. The concept refers to consolidation of a habit that gives rise to moral, normative practices related to exhumation, documentation, analysis, and posthumous treatment of dead bodies. Conversations in bioethics—about consent, anonymity, vulnerable populations, legislation of policy, etc.—are germane, but require expansion so as to be useful for the particulars of studying archaeologically contextualized dead bodies. I cite the contemporary case of HeLa/Henrietta Lacks as instructive for building a bioethos applicable to the remains of ancient (or historic) decedents. Illustrative are Kennewick Man/Ancient One and Ata the “Alien” Mummy from Chile. More than cautionary or idiosyncratic tales, these cases, the latter of which continues to unfold in interesting and unforeseen ways, have involved normative, disciplinary practices in need of deeper deliberation. I focus on naming, facial reconstruction, and genetic testing. These techniques are useful for personalizing individuals, thereby making academic analyses more interesting to non-specialists. But, they also raise epistemological and ethical concerns related to stakeholders’ ontological security (or its destabilization) and dissemination of narratives in mediascapes, among other issues. By way of conclusion, I suggest that bioarchaeologists begin research by posing certain key queries.

[74] *From the Earthly to the Celestial: Material Culture and Funerary Practice at Fujinoki Kofun*

In 1985, archaeologists excavating Fujinoki Kofun opened for the first time the tomb’s sealed burial chamber. They were surprised to discover that not only had the site been undisturbed by tomb robbers, but that it contained one of the most lavish collections of grave-goods to have been recovered from Japan’s Late Kofun period (500-600 CE). Bridging the fields of archaeology and visual culture studies, this paper considers the formal design and positional relationships of the Fujinoki artifacts as a means of analyzing the mortuary rituals conducted at the site. This study represents a departure from the dominant scholarly discourse on kofun, which approach tumuli primarily as monuments symbolizing regional authority, often overlooking the soteriological beliefs that precipitated the creation of tombs. The argument highlights the need to move beyond studies relegating Japan to a passive role in a core-periphery relationship with the mainland, classifying protohistoric objects as either “native” Japanese or “foreign” imports. This paper posits that the design of the Fujinoki grave-goods embody an intersection of cultural traditions, reflecting the fluid exchange of people and ideas across the Japan Sea, and displaying the integration of mainland derived materials into a funerary system specific to the sixth century Nara Basin.

Gentil, Bianca (The Pennsylvania State University)

[374] *Mapping Obsidian Exchange Networks in Central Mexico from the Late Postclassic Periods (900-1519CE)*

This study examines the differentiation of obsidian exploitation between large centers and domestic settlements in the region of Puebla-Tlaxcala. The results of pXRF analysis of obsidian artifacts from the surface and excavated materials from three single occupation sites are compared to pXRF studies of the larger centers of Tepeticpac and Cholula. This study engages in the discussion of the effect that the Triple Alliance blockade on the Tlaxcala region, with the hypothesis that smaller sites were less affected (if at all) by such a strict trade imposition. Domestic contexts of small, rural settlements have rarely been thoroughly investigated. This study sheds light on center-hinterland relationships.

[153] *Archaeogenomic Evidence from the American Southwest Points to a Pre-Hispanic Scarlet Macaw Breeding Colony North of the Endemic Neotropical Range in Mexico between 900 And 1200 CE*

Hundreds of scarlet macaw skeletons have been recovered from archaeological sites across the American Southwest and northwestern Mexico. The location of these skeletons more than 1,000 km outside their Neotropical endemic range has suggested a far-reaching pre-Hispanic acquisition network. Although evidence for scarlet macaw breeding within this network is only known from the settlement of Paquimé in northwestern Mexico dating between 1250 and 1450 CE, researchers have speculated on the existence of earlier breeding centers within the region. In this study, we analyzed 14 ancient scarlet macaws mitogenomes dating between 900 and 1200 CE from archaeological sites in Chaco Canyon and the contemporaneous Mimbres area of New Mexico. We observed remarkably low genetic diversity consistent with the breeding of a small founder population translocated outside their natural range. Phylogeographic comparisons with mitochondrial sequences from historic macaws collected from their endemic Neotropical range identified genetic affinity between the ancient macaws and a single rare haplogroup (Haplo6) only observed among wild macaws in Mexico and northern Guatemala. Our results suggest that people at an undiscovered pre-Hispanic settlement dating between 900 and 1200 CE managed a macaw breeding colony outside the endemic range and distributed these symbolically important birds through the American Southwest.

[210] *Testing the Efficacy of Methodologies for the Estimation of Body Size of California Mussel Based on Shell Fragments*

Over the past decades, archaeologists have developed regression formulae to estimate animal body size based on shell fragments. In this study, we tested the efficacy of five different methods by measuring over 1200 mussel (*Mytilus californianus*) shells excavated from an archaeological site (CA-VEN-395) in the Santa Monica Mountains, located about 9 km from the coast. These formulae are based on a variety of umbo measurements to infer total length and include 1) umbo height; 2) umbo width; 3) umbo length; 4) umbo thickness; and 5) umbo length to inner hinge teeth. The umbo is the thickest and hardest element of the mussel shell and typically remains intact in most archaeological contexts. Our results suggest that each method has its own set of limitations because of differential growth rates among mussels or allometry, habitat specific conditions like overcrowding, broad oceanographic events, and other ecological and climatic variables. Of these methods, umbo length, and umbo thickness produced the best results, whereas umbo height was the most limited in its application. Methods for the estimation of total shell length needs further research to establish reliable and effective regression formulae.

[399] *Long-Term Climate Change: A Case Study on Climate Records from the Middle East in Relation to the Neo-Assyrian Empire Agriculture*

The Neo-Assyrian Empire as one of the major empires in the Ancient Near East emerged soon after late Bronze Age collapses. It ruled Mesopotamia from the eastern Mediterranean Sea to western parts of Iran and to Persian Gulf during the first millennium B.C. in a cold period in the Holocene Epoch. For my thesis, I am focusing on their plant cultivation, agriculture and plant based products in the Peshdar Plain region in Iraqi Kurdistan. It is essential to understand environmental and climatic conditions during that time to understand their influences on these plants and plant choices of farmers and elites. In this paper, I will focus on the paleoclimate records from lakes including Van, Zeribar, Mirabad, caves including Soreq and Dim, and the Neo-Assyrian archival records and cuneiforms. Different scientists documented climatic changes during this period using multiproxy records and various methods. I hypothesize that dry periods should produce a shift to more aridity resilient plants such as barley. This is confirmed by phytolith analyses, climate records and archival records cohesively.

[208] *18th to 20th Century Architectural Changes of Embudo's Torreón*

This poster will analyze the architectural changes of an 18th-century defensive tower called a Torreón, located in

Dixon, New Mexico—previously known as the buffer community Embudo. Acting as community protection against Plains Indians during Hispanic settlement in Northern New Mexico, the Torreón's initial use as a defensive structure may be identified through written documentation: a 1975 analysis by Larry S. Lopez of a will written by the Torreón's original owner. Documentation of the Torreón after this period does not occur until the 1960s in the form of two pictures. However, excavations performed by Barnard College's field program, led by Severin Fowles, have helped uncover archaeological evidence of spatial repurposing in the Torreón—specifically, changing adobe structures, materials, and methods of storage. Using evidence from the excavations as well as historical context of the area, this poster will provide a cohesive, relative timeline of the Torreón's architectural changes from the period in which it was constructed to the 1960s: heretofore a 200-year gap in its history. Therefore, this poster identifies how the utilization of the Torreón adds to Embudo's brief, irregularly recorded history, providing evidence for how buffer communities in Northern New Mexico reformed after Plains attacks ceased.

[126] *Bronze Age Burials from the Carpathian Basin: New Isotope Results*

Material culture, burial customs, and isotopic data have been used to suggest that the Bronze Age in the Carpathian Basin was characterized by high levels of human mobility; however, the extent to which people in this region migrated and travelled, and its relevance to questions regarding culture change, remain unresolved. In this study, we present new isotopic results collected from cemeteries of the Bell Beaker, Kisapostag, Vátya, Füzesabony and Tumulus cultures; assemblages that span the first one thousand year of the Bronze Age (2500–1500/1400 BC) in Hungary. Multiple isotopes ($Sr87/Sr86$, $\delta18O$, and $\delta13C$) were analyzed from tooth apatite samples from inhumation burials ($n=95$) and archaeological fauna ($n=53$). Results are compared to regional isotopic estimations for eastern and western Hungary, as well as previously published data for earlier time periods.

[224] *Down and Out at Dysert O'Dea*

Díseart Molanín castle was constructed by a leading lineage of the O'Dea clan in the late 15th century in north central Co. Clare, Ireland. The clan occupied a territory within a composite chiefdom that had been dismembered and incorporated into a primitive state in the 12th century AD, led by the O'Briens. The O'Deas hung on to their lands as aristocratic clients of the O'Brien leaders, and in the specific case of Díseart Molanín on account of the status of the O'Deas of as high-ranking clergy and coarbs of an ecclesiastical territory. Though the O'Deas and their successors the Neylons weathered the political turmoil of the 16th and 17th centuries, they fell prey to the negative consequences of downward genealogical emplacement and the monetization of the political economy. The archaeological survey of fields in the castle's vicinity clarified the organization of the local political economy as expressed by the organization of land enclosure. What the survey highlighted was the continuity of this economy from the Early Medieval Period. The excavation carried out on the grounds of the castle revealed the physical impact of Oliver Cromwell's 1649 invasion of Ireland.

[149] *Representation Matters: Disabled Professorship and a Move Toward a Higher Standard of Accessibility in the Office and the Field*

While workplace affecting disabilities are covered by the ADA (Americans with Disabilities Act), oftentimes universities struggle with how to accommodate faculty with disabilities. When conversations between faculty and chairpersons occur, they may cover only the bare minimum that must be acknowledged to maintain ADA compliance, yet true accessibility should go beyond merely being able to access one's own office. Additionally, professional and academic archaeologists with disabilities have further complications when attempting to work in field situations which are not accessible due to distance, the physicality of the location, or the weather. This narrows the opportunities for a disabled archaeology faculty member, and truncates the contributions they would otherwise be completely capable of making to the discipline. This presentation will focus on two aspects of the current struggle for representation of disability within full time archaeology faculty: normalizing language surrounding accommodations, including addressing disability as a measure of inclusiveness and diversity in hiring practices, and what aspects of accessibility are practical to address in arranging, funding, and stocking fieldwork expeditions on local and national excavations.

Gidding, Aaron (University of California, Santa Barbara) and Alicia Boswell (University of California, Santa Barbara)

[200] *Frontiers and Borderlands Phenomena, What Would Bradley Say?: Comparative Case Studies from the Levant and Andes*

In this paper we seek to emulate two different aspects of Bradley J. Parker's career: his transition from the Near East to the Andes and his interest in the theoretical underpinnings of frontier communities. We are inspired by his work on frontiers and borderlands in our own work in these regions and use his theoretical writings on frontiers and borderland processes to enable greater interdisciplinary dialogue and comparative studies. We build on Parker's work on defining the "continuum of boundary dynamics" (2002, 2006) by adding the dimension of time to discuss what we call "dynamic frontiers" in two case studies from the Levant and the Andes. The Levantine example focuses on the frontier processes described by Parker at the site Khirbat Hamra lfdan in southern Jordan to highlight the value of studying frontiers over the longue durée. The Andean example from Collambay in the Moche valley introduces what we call an "enclosed" frontier which is only recognizable through diachronic study.

[288] *Pre-Colombian Metallurgy at the Middle Horizon (600–1000 CE) Site of Castillo de Huarmey, Huarmey Valley, Peru*

The site of Castillo de Huarmey, located on the north coast of Peru and dated to the Middle Horizon period (650–1050 CE), is widely known for an important discovery of the first undisturbed Wari royal mausoleum. With multiple burials, rich ceremonial offerings, and a wealth of grave goods, the assemblage embraces a diversity of artistic, iconographic, and technological craft traditions which represent a plethora of Central Andean cultural backgrounds. In 2018 a new primary burial context was discovered which contained the preserved remains of a young male individual with an intriguing set of copper and bronze objects, an argentiferous lead ingot, and metallurgical byproducts such as slag and speiss. The following poster presents an archaeometric and archaeological comparison of the metallurgical materials discovered in both this newly discovered tomb and the royal mausoleum at Castillo de Huarmey. The results indicate that associated craft artisans employed a variety of technological strategies to produce an eclectic mix of copper, arsenic bronze, silver, and gold objects with differing chemical compositions and material properties. These results shed further light on early Middle Horizon metallurgical technologies within the Central Andes, including early arsenic bronze technologies on the North Coast of Peru.

[231] *The Role of Faunal Evidence in Pyrodiversity Studies: Cases from California*

Ascertaining the past existence of fire-based landscape management practices requires the use of multiple lines of geological, arboreal fire scar, pollen and charcoal, archaeobotanical, and faunal evidence. In our initial project in a now-woody valley near the Central California coast, these and other lines of evidence converged toward indicating maintenance of an open local environment with high-ranked nut trees, through repeated use of fire. The rodent fauna was the strongest faunal evidence for local habitat, dominated by voles (*Microtus*) and field mice (*Peromyscus*), as opposed to closed country species (e.g. *Neotoma*, *Sciurus*). Recent sampling of coastal sites has provided further lessons in the importance of site selection for retrieving adequate records of habitat management.

[248] *Human-Environment System Change and Stability in the Farming/Hunter-Gatherer Transition*

Central Western Argentina shows during historical times a surprising mosaic of human strategies, ranging from populations with domestic plants and animals in one extreme, to populations focused on wild resources in the other. In general, this variation was associated with more sedentary and dense populations opposed to more mobile and scattered populations. Using radiocarbon SPD as a demographic proxy, we explore differences in demographic trajectories in different areas of the region and how variable they were during the last 3000 years. The results show that the incorporation and spread of domesticates was associated with a peak in human demography and that the hunter gatherer archaeological record suggests changes in its organization.

[213] *Exploring Cultural Differences in Irrigation Canal Systems through Time at the Creekside Village Site, New Mexico*

Irrigation systems provided the foundation of many prehistoric and historic communities in the Southwest. Creekside Village near Tularosa, New Mexico, is a Jornada Mogollon site occupied from AD 400-1150 containing evidence of both prehistoric and historic irrigation systems. Geoarchaeological investigations of stratigraphic sequence and site formation processes are used to reveal possible morphological differences in the two systems, which may be used to distinguish the canal systems culturally and chronologically. This comparative phenomenological and geoarchaeological approach to Creekside Village's irrigation systems is an investigation into the potential of sediment characteristics, canal morphology, and placement to inform our understanding of past cultural landscapes. Methods include participatory excavation/trenching and survey to aid site understanding as well as stratigraphy, particle grain size distribution, soil texture, organic and calcium-carbonate content, and GIS modeling. A focal goal of the project is to contribute to our diachronic understanding of past cultures' perspective and mitigation of water scarcity in the Southwest.

Gilchrist, Anthony

[118] *The Impact of Humans on Shipwrecks in Lake Winnepesaukee, New Hampshire*

Shipwrecks are adversely affected by human activities. Some of the most common activities conducted by humans, include recreational SCUBA diving and fishing, have the potential to destroy the data and cultural integrity of these sites. Human interaction with shipwrecks requires additional research in order to find the best way to limit human impact on shipwrecks. This project's primary goal was to measure the level of human impact on newly discovered shipwrecks one year after their locations were made publicly accessible. To achieve this goal six shipwrecks whose locations were previously unreleased until 2017 in Lake Winnepesaukee, New Hampshire were examined during the summer of 2018. The primary method was the comparison of previously collected video data with video data collected in 2018 to determine if there are any noticeable changes in the conditions of the shipwrecks including evidence of looting since their locations have been published.

[176] *Kindling "New Fires" in Ohio Hopewell Ceremonial Regimes*

Our paper investigates the relationship between Ohio Hopewell ceremonial hearths and the caches interred within/adjacent to them in submound buildings at Hopewell and Mound City. While large Ohio Hopewell mega-caches have captured the attention of archaeologists, discussions of the ceremonial hearths associated with them have typically focused on their use. Yet these interpretations have often missed how the use of Ohio Hopewell fired clay basins and charnel houses was intertwined, since new hearths and buildings were sometimes constructed over older dismantled/razed structures. We argue that the razing and renewal of these spaces could be akin to ethnohistorically documented "new fire" ceremonies in which ceramic vessels, buildings, effigies and other objects were often destroyed in a ritual that served to purify the community. This raises the possibility that long-term continuities exist in the ceremonial linkage of fire in the Eastern Woodlands to 1) the sun, 2) communal health and purification, 3) the treatment of the dead, 4) world renewal and 5) rites of riddance. We conclude by considering how these associations might alter interpretations of Middle Woodland ceremonial regimes, especially the significance/importance of Ohio Hopewell caches.

[388] *Rocks through the Ages: A 360° Geometric Morphometric Approach to Middle Pleistocene Bifacial Technological Variability in Central Armenia*

This study applies a three-dimensional landmark-based geometric morphometric (GM) technique to evaluate chronological variation in Acheulian bifacial technology during the Middle Pleistocene of Armenia. This analysis utilizes 360° documentation of biface shape to supplement more commonly used single-surface and outline GM approaches. Furthermore, traditional metric classification schemes are used to contextualize the source of variation documented by GM. Structured light 3D-scanning is employed in this research to obtain highly-accurate models of bifaces from three Armenian Middle Pleistocene assemblages for use in GM analysis. Bifaces from Hatis I (>MIS 11), Nor Geghi I-South (~MIS 11), and Nor Geghi I-North (MIS 9e) reveal a sequential pattern of expansion and retraction in biface variability. Principal component analysis and metric classifications suggest that this variation is consistent with a chronological trend from elongated pointed forms to discoidal forms. Additionally, this trend reveals a shift from maintenance of rounded proximal ends to reduction strategies that produce flatter proximal areas. Similar trajectories in Western Europe are rationalized as a product of the linear evolution of form, differences in resharpening behaviors, or raw material dissimilarities. These explanations as well as considerations of reduction strategies, social learning, and the relationship between core and biface shape trajectories are investigated.

[412] *Preliminary Results of Archaeological Survey in the Zapatera Archipelago, Granada, Nicaragua*

Although archaeology within the Zapatera Archipelago was initially documented in the 19th century due to the islands' exceptional stone statuary and petroglyph panels, little scientific archaeology or environmental work has taken place there. This paper presents the results from the first season of the Proyecto Arqueológico de Zapatera, which consisted of opportunistic survey drawing on local, community-based knowledge of Zapatera Island and the surrounding smaller isletas. Additionally, it illustrates the considerable potential of digital survey methodologies in a region where such techniques are underutilized. Previous research suggests that despite Zapatera's proximity to the western coast of the lake, the architectural and ceramic styles more closely resemble those of the Chontales region, on the eastern side of the lake. Therefore, this archipelago is uniquely situated to provide a perspective on networks of interaction across Lake Cocibolca, as well as how those interconnectivities were influenced by microenvironmental variations, exploitation of lacustrine resources and perceptions of landscape. This survey documented human activity areas, evidenced by mounded architecture, petroglyphs and artifact scatters, as well as geomorphological features, to discern relationships between settlement locations, non-occupational activity areas, and prominent constituents within the landscape, which include rivers, rock shelters and volcano peaks.

Gillam, J. Christopher (Winthrop University)

[416] *Upper Paleolithic Cultural Landscapes of the Selenge Tributaries, Northern Mongolia*

The distribution of Upper Paleolithic sites in northern Mongolia indicate that maintaining social networks, subsistence and shelter were all significant factors in the cultural landscapes of these ancient hunter-gatherers. In 2018, 12 new Upper Paleolithic sites were documented in the Naryn Tolberiin Gol (Narrow Tolbor River, n=21) valley of the greater Selenge River Basin that feeds Lake Baikal farther north, bringing the total number for the Tolbor locality to 95 sites (including 74 sites from the neighboring Ikh Tolberiin (Big Tolbor/Tolbor), n=45, Kharganyin, n=17, and Altatyn, n=12, rivers). Site distributions indicate a settlement preference for south- and east-facing slopes, warmth from solar exposure and shelter from cold northern winds, with prominent viewsheds of surrounding terrain for game monitoring, and locations near either mountain passes or confluences with the Selenge River or secondary drainages, for maintaining social networks between valley systems.

[371] *Understanding the Ritual of Peri-abandonment Deposit Behavior Evidenced by Late Classic Maya Figurines at the Site of Baking Pot, Cayo District, Belize*

The Belize Valley Archaeological Reconnaissance Project is an archaeological field school operating in the Cayo District of Western Belize and has excavated at multiple sites in Belize annually since 1988. In the past five years, the project has focused on excavation of peri-abandonment deposits, or deposits of artifacts built up during and after the abandonment of city centers during the Late Classic period of Maya history (approximately 750 – 900 AD). This poster will present data on two specific artifact types, ceramic figurines and musical instruments, that were recovered from peri-abandonment deposits at the site of Baking Pot, Cayo District, Belize. In looking at these figurines and instruments, this poster will first detail the iconography of the Baking Pot collection, which includes 234 items. Next, a brief discussion of the composition of the collection will be outlined, showing categorical differentiation of the items into groups of figurines versus instruments, hand-made versus mold-made items, and anthropomorphic, zoomorphic, and unknown representations (with unknown representations being undiagnostic fragments of these items). Finally, the poster will discuss hypotheses of ritual behavior, and conclude why these items were included in these specific peri-abandonment deposits made by the Maya of Baking Pot during the Late Classic.

Gillespie, Jeanne (Jeanne Gillespie)**[304]** *Skirts and Scorpions: Female Power and Poisonous Creatures*

In the *Tratado de supersticiones* (1626) Hernando Ruíz de Alarcón documented invocations and prayers to pre-Hispanic divinities to assure a good catch/hunt or to protect against poisonous/painful bites/stings. This confirmed that these divinities remained important to the local consciousness even 100 years after the arrival of Europeans. Ruíz de Alarcón included an intriguing account about the creation of the scorpion in this collection. In this legend three female Aztec divinities Citlalicue (Star-her-skirt), Chalchihuitlicue (Jade-her-skirt) and Xochiquetzal (Flower-quetzal) interacted with a warrior-priest, Yappan, who was serving penance to improve his military prowess. As a result of contact with the divinities, Yappan was transformed into a deadly scorpion; however, one of the divinities interceded to lessen the power of the poison. Ruíz de Alarcón documented that the common practice for curing scorpion stings was to tie off the afflicted body part, to cover the victim with a huipil, and to invoke the divinities for healing. This study will examine the associations between these three divinities and images of scorpions and other poisonous creatures from Post-Classic and colonial sources.

Gilliam, David [69] see Roquemore, Katie

Gillot, Celine (University of Montreal, Canada) and Christina Halperin (University of Montréal, Canada)**[161]** *Knowledge Networks and Entanglements in the Crafting of Pre-Columbian Maya Ceramics and Architecture*

One of the underlying precepts of materiality is that, whereas people make objects, objects simultaneously and recursively make people. Objects also make objects, however, in so far as seemingly separate crafting traditions were intimately entangled with each other, stimulating and reinforcing similar procedures, practices, and aesthetics. In this paper, we argue that Pre-Columbian Maya decorated ceramic vessels and plastered masonry buildings were linked through the knowledge networks of different craftspeople producing seemingly very different things. We document the similarity in production techniques of ceramics and mortars and discuss the social and technological implications of knowledge networks between different craftspeople and objects in antiquity.

Gillreath-Brown, Andrew [86] see Bocinsky, Kyle

Gillreath-Brown, Andrew (Washington State University), Kyle Bocinsky (Crow Canyon Archaeological Center) and Tim Kohler (Washington State University)**[248]** *The Impact of Temperature on the Transition to Maize Agriculture in the Northern Upland United States Southwest*

While the Neolithic Demographic Transition (NDT) spread rapidly across most of Europe (~600 years) after the first introduction of domesticated plants, the NDT is much more gradual in the southwestern United States (1600–2600 years) following the first appearance of maize (ca. 2260–1990 BC). Climate had a major impact on the boom-and-bust cycles in the Southwest and likely had an impact on the adoption and intensity of maize farming, which did not move directly south to north but exhibited more of a “leapfrog” pattern. Maize dependence increases substantially in southeastern Utah during Basketmaker II (500 BC – AD 500); however, maize farming does not expand across southwestern Colorado until around AD 600. Cooler temperatures in the northern Southwest from 100 BC to about AD 600 could have contributed to the absence of maize farming. Here we use pollen data from the Neotoma Paleocology Database to produce low-frequency temperature reconstructions using the Modern Analog Technique—implemented as part of the Synthesizing Knowledge Of Past Environments (SKOPE) project—to cover the period of the introduction of maize to heavy dependence. Reconstructing past temperatures allows for an understanding of how climate might have affected the transition to maize farming in the northern Upland United States Southwest.

Gilman, Patricia (University of Oklahoma), Jakob Sedig (Harvard University) and Darrell Creel (University of Texas, Austin)**[263]** *Contextualizing the Differences Between Upper Gila and Mimbres River Valley Ceramic Design Elements*

This poster updates our previous research that examined similarities and differences between upper Gila Valley and Mimbres Valley painted ceramic designs. That work focused on the identification and quantification of stylistic elements and demonstrated that there are some significant differences between the painted designs in the two river valleys. We begin this phase of our research by assessing when design element differentiation between the river valleys first emerged. In particular, we examine the hypothesis that the “Gila” elements we identified in our previous research appeared on bowls from Gila sites or with Gila NAA sources earlier than “Mimbres” elements on bowls from Mimbres valley sites or with Mimbres valley NAA sources. We use “strong cases”—bowls from burials or contexts that have been directly dated—to test this hypothesis. We then situate our data within broader Mimbres contexts, to explore how sociocultural transformations might help explain the patterns in design element distribution and timing we have identified. We focus especially on whether differences in pottery design elements might be associated with the apparent ritual/religious changes that occurred in the Mimbres Valley between the Late Pithouse and Classic periods.

[49] *Paleoenvironment, Population, and the Origins of Resource Intensification on the Eastern Edge of the Colorado Plateau*

Site 5ME13127, a Formative-Era camp at the eastern edge of the Colorado Plateau, was excavated in 2018. Macrofloral and faunal analyses indicate small seeds and lagomorphs dominated subsistence by AD320-420, and the bow was adopted by AD560-650. Sediment cores from Kannah Creek fen on Grand Mesa (27km southeast) provide paleoenvironmental context for interpretations of the site. Fluctuations in relative humification and organic content of peat provide proxies for effective moisture and temperature, respectively. The summed probability distribution curve for archaeological radiocarbon dates in the Northern Colorado River Basin provides a population proxy. The Formative was characterized by steadily increasing population beginning 400BC. From 200BC-AD400, generally warm and dry conditions were punctuated by two episodes of significant drought, the latter occurring during the initial occupation of the site at AD300-400. Severe drought coincident with increasing population may have compelled resource intensification, which once established, continued during a long period of more mesic conditions and rapid population growth from AD400-1000. Many of the technological and economic innovations that define the beginning of the Formative reflect reliance on less nutritionally dense resources and increased efficiency in resource procurement. These technological innovations acquired during drought-related resource shortages were retained even when conditions ameliorated.

[152] *Pottery, Practice and Provenance. Interpreting Ceramic Data from the Middle Preclassic Site of Holtun, Guatemala*

Formal studies of archaeological pottery have moved far beyond traditional typological approaches through applications of complementary instrumental analyses, borrowed mainly from the Natural Sciences. No contemporary study of archaeological pottery is complete without some form of compositional examination, be they chemical or mineralogical, resulting in some plausible identification of material origins – provenance. With a dearth of primary production evidence, interpretations of compositional data rely heavily on a combination of comparative geological information and theoretical bridging arguments to determine if an object can be subjectively characterized as “local”. But what is local? What do these compositional signals actually represent? In this paper we consider that manufactured objects, such as pottery, are the results of human behavior influenced through cultural, environmental and material constraints. Through reconstructing culturally informed technological systems of production in pottery assemblages at the site of Holtun, Guatemala, we are able to identify, characterize and compare discrete practices associated with specific production units in Middle Preclassic lowlands.

[324] *Quantifying Intra-site Spatial Patterns at Early Paleoindian Sites*

Understanding intra-site spatial patterning has long been a focus in archaeology. This poster focuses on patterns observed through a detailed analysis of an Early Paleoindian site. The models developed from these analyses provide testable hypothesis to compare to other mobile hunter-gatherer sites. In total, over 18,000 artifacts with exact spatial coordinates were examined from the Shawnee-Minisink Clovis site in Pennsylvania, USA. The patterns and models presented come from observations that include lithic analysis, lithic refitting, and use-wear. As few sites have this level of detail in terms of completed analyses and the precise mapping of small and large artifacts (i.e., many pieces <1 cm), this poster offers both behavioral and methodological considerations for interpreting hunter-gatherer campsites.

Giomi, Evan (University of Arizona) and Nicole Mathwich (University of Arizona)

[421] *Colonial Ideology and the Organization of Spanish Missions in Nuevo México and the Pimería Alta*

Archaeologists working from a post-colonial framework are increasingly examining how the politics of Indigenous societies in North America structured European colonialism on the continent. In these colonial encounters, conflict and the social transformation that followed often resulted from the dissonance between the imagined, colonial subject and the reality of Indigenous social organization. Understanding the organization of Indigenous societies is therefore not enough; the ideological basis of colonial attempts to organize and control social space is a necessary counterpoint in the dialectic of colonial encounters. We present two case studies to address this issue. We compare the imagined colonial organization of early 17th century Spanish missionization among the Pueblos of New Mexico with 18th century missionization in the Pimería Alta of Arizona and Sonora. Network analysis is applied to documentary evidence to evaluate the idealized structure of Spanish missions systems in both regions. Through this analysis, we highlight areas of dissonance and conflict in the social organization of space through time, as local realities altered colonial expectations. The Spanish attempted to structure mission communities around their own organizational ideals, and these imagined spaces intersected with Indigenous societies to produce the topology of

colonial conflict and social transformation.

[159] *What Is Good to Eat Is Good to Translocate: The Intangible Dimension of Non-Native Animal Introduction and Consumption in the Pre-Columbian Caribbean*

Despite occupying the Caribbean since ca. 6500-6000 BP, Amerindians did not introduce continental animals to the islands until approximately 2000 years ago. In most cases, non-native taxa, while consumed, did not rival local marine resources in dietary importance; yet there is limited evidence to support an alternative, ritual-based explanation for their introduction. Why were these animals transported over water into the Antilles, and what do these actions signify? Focusing on a suite of a half-dozen mammals, I examine the possible material, social, and ideological drivers of animal introduction, including risk management, logistics, identity and status mediated consumption, and animal agency, among other possibilities. I also consider the likely reasons for the apparent late dispersal of these fauna into the islands, while critically assessing the authenticity of this patterning. Antillean translocation studies are at a critical juncture, requiring new lines of inquiry and data to move forward. Existing evidence suggests, however, the intangible dimensions of ethno-phoresy are a necessary component to explaining this phenomenon and identifying its archaeological correlates in the pre-Columbian Caribbean.

[149] *Images of Aphrodite, Sexual Desire, and the 'Chilly Climate' of Classical Archaeology*

Since 1792, nine catalogues of surviving ancient Roman replicas of the Knidian Aphrodite—the first monumental image of an unclothed woman in Western art—have been compiled. During this time, the number of known ancient replicas has increased by two orders of magnitude, yet analyses of this corpus have not changed. Overwhelmingly, elite, cis-gendered, heterosexual men of central or northern European origins have employed connoisseurial methodologies to analyze these images, advancing formalist arguments that consistently elevate the same few images above hundreds of others. Such analyses inspect the bodies that these images show, rank these images by their bodies' perceived sexual desirability, and preferentially analyze the subset of images that show more sexually desirable bodies. By contrast, this paper's author begins his analysis from a different standpoint—that of a cis-gendered, multi-ethnic, gay man—and reframes the study of this corpus through social archaeology and anthropological approaches to images. Two conclusions emerge. First, modern scholarly interpretations premised on the sexual desirability of these images' bodies are the products of a longstanding "chilly climate" in classical archaeology. Second, analyses from different standpoints can produce more nuanced and reflexive interpretations of the past and bring about disciplinary transformation in the present.

[175] *Modeling the Dynamics of Diversification*

Quantifying diversity is one of the most fundamental components of both a scientific and evolutionary approach to archaeology. While archaeologists have spent decades painstakingly describing diversity, we continue to lack a comprehensive understanding on broader evolutionary patterns of diversification. This work applies a novel Bayesian modeling approach, developed in quantitative paleontology, to estimate rates of technological innovation and extinction. This approach offers improvements over existing methodologies by providing a quantitative framework to estimate rates of diversification that does not rely on strong phylogenetic assumptions and only requires data on the occurrence (times of first and last appearance) of artifact lineages. Quantitative analysis of ceramic data from the Southwest Social Networks Database will be demonstrated using the program PyRate with visualization of results using tools from R. Results highlight a dynamic pattern of technological change with strong responses to social and environmental perturbations. Broadly, this work contributes to a growing set of computational methods that give greater flexibility for comparing and contrasting patterns of technological change.

[316] *Obsidian Artifacts from La Venta and Sources in Mesoamerica*

In the late 1960s, Heizer and colleagues at UC-Berkeley began to use X-ray fluorescence to measure chemical fingerprints for obsidian artifacts from a number of sites in Mesoamerica. In their study of obsidian artifacts from the Olmec site of La Venta, they found that 93% of the artifacts were explained by five distinct chemical types (A thru E). The remaining artifacts were from less frequent types. At that time, the source for only one of the major types at La Venta was known (Type A = Pachuca). Despite the fact that many more sources of obsidian have been located during the intervening years, it appears that no one has ever revisited Heizer's original La Venta article and explicitly identified the source names for the remaining chemical groups. In this paper, we review the progress made with respect to obsidian source and artifact studies in Mesoamerica from the 1970s to the present. Finally, we report on our re-analysis of the original La Venta artifacts to identify the obsidian types found at La Venta.

[109] *Geographic and Temporal Variation in Canid Dietary Patterns from Five Huron-Wendat Village Sites in Ontario, Canada*

Stable isotope analysis of bone collagen in 48 dogs (*Canis familiaris*) was conducted to investigate geographic and temporal variation in diet at five Huron-Wendat sites (A.D. 1250-1650) in southern Ontario, Canada. Carbon and nitrogen isotope data indicate intra- and inter-site variation in dietary protein for these dogs, as well as temporal variation in diet between the Middle Ontario Iroquoian (MOI) (A.D. 1250-1400) and Contact Period (CP) (A.D. 1600-1650). Published faunal data from the CP Kelly-Campbell site are used to characterize the local/regional food web. Intra-site analysis reveals that dogs recovered from middens had significantly lower $\delta^{15}\text{N}_{\text{col}}$ values than those recovered from house contexts. Variability in $\delta^{13}\text{C}_{\text{col}}$ values is greatest during the MOI and Contact periods, with the highest values in the Late Ontario Iroquoian (LOI) samples. The trend of increased isotopic values during the LOI is also observed in humans and has implications for using dogs as proxies in human dietary studies. Dogs from the Ball site had significantly lower $\delta^{13}\text{C}_{\text{col}}$ values than those from Ossossané. Nitrogen isotope ratios gradually increase through time with significant differences between the MOI and CP. These results are considered in relation to dog ecology and the variable roles of dogs in Huron-Wendat communities.

[141] *Jade and the Illusion of Jade: Gokok and Magatama in Korea and Japan from 250–700CE*

Ritual stone ornaments (gokok and magatama) found in elite burials in Korea and Japan were examined to determine raw material and manufacturing process as well as use life. The primary materials examined were hard jadeite and nephrite, though softer stones such as alabaster/gypsum, amblygonite and hydrogrossular were sometimes used. When new, these softer stones would have resembled jadeite/nephrite. Such colored stone beads made of precious materials, or what was perceived to be precious materials, were integral to the ritual and political life of elites in both regions. Both quantitative and qualitative documentation was undertaken, including bead shape, size, manufacturing indicators and use wear. Scanning Electron Microscope analysis of drill hole impressions was used to differentiate drilling techniques and the degree of string wear. Many of the beads showed heavy string wear and abrasion indicating long periods of use before final deposition. Drill shape analysis indicates two major workshop traditions, one associated with Japan and one with Korea, utilizing different shaped drills and abrasives as well as drilling chaîne opératoire. Decorative incised lines are sometimes found around the perforation hole of the beads; comparative analysis of their production and distribution will be presented.

[188] *Mesa Verde Centers and Regional Analyses: Good Stuff!*

Beginning with his dissertation, Kintigh's research in the Zuni/Cibola region has focused on the formation, organization, and distribution of large ancestral Pueblo villages. His methods and the Zuni historical models he developed have notably influenced how we have approached research on large sites (aka community centers) and regional-scale analyses in the Mesa Verde region (CE 600-1280). Recent comparative evaluation of VEP II output with the known archaeological data for each center has highlighted the need to further improve large site data and modify analytical algorithms to better account for biases introduced by surface remains when assessing multicomponent sites among other issues. These newly updated data and the output of estimated households per period from the refined algorithms are used to examine the spatial and temporal dimensions of continuity and change among large Mesa Verde villages. We explore intraregional variation in key dimensions such as the timing of construction, occupation and population history, and use of farmland, and are particularly interested in the period from CE 880-1180/1200 when social dynamics are affected by the ebb and flow of Chaco and Aztec influence in the

region.

[357] *Transcending Transects: Research Contexts for a Landscape View of Highway Corridor Archaeology in California.*

Archaeology within highway corridors is too easily hampered by an inability to adequately address bigger research issues due to the narrow slices of landscapes crossed, access restrictions, project-specific limitations on funding and focus of attention on isolated or smaller pieces of larger archaeological resources. Research contexts developed for the California Department of Transportation (CALTRANS) attempt to broaden the scope of research concerns addressed, provide methodological guidance and add value to the investigations undertaken here. District-scale geoarchaeological sensitivity models, a regionally focused research design for the San Francisco Bay Area, and a bedrock milling feature thematic context offer examples of ways to address resources that may be hidden, disturbed, or otherwise dismissed due to a lack of appropriate contextual scale. Highlights are presented with added emphasis on tribal cultural values and concerns not readily addressed by more narrowly focused compliance studies.

[126] *Channeling the Stylist Within: A Comparative Analysis of Bronze Age Ceramic Design Structure in Eastern Hungary*

The design structure—or position of individual design elements—has the potential to highlight social boundaries and the degree of interaction between potters in a comparative analysis of ceramics. This poster focuses on the design structure of ceramics from the Békés 103 site, a Middle Bronze Age (1600-1280 calBC) cemetery in eastern Hungary. We first try to determine whether elements such as channeling, bosses, and specific motifs such as spirals occur only on particular parts of the ceramic vessels at Békés 103. We then broaden the investigation of design structure by comparing the results from Békés 103 to a contemporaneous nearby cemetery, Csanytelek-Palé. We attempt to identify differences in the design structures of the two cemeteries that may result from social boundaries, despite the shared sets of individual design elements found between them.

[249] *Stemmed Points from Nevada Caves*

The lack of a comprehensive and sound geochronology of Paleoindian sites in the Great Basin has long been a stumbling block for explaining variability in Western Stemmed points and their relationship with Clovis. Open-air sites are often undatable or present conflicting radiocarbon dates, while stratified records from caves and rockshelters are often mixed from biogenic or anthropogenic post-depositional processes. In this paper we present new information on the geochronologies and/or stemmed-point assemblages from three important rockshelter sites: Bonneville Estates Rockshelter, Smith Creek Cave, and Handprint Cave. Bonneville Estates and Smith Creek Cave contain records of Haskett stemmed points that approach and even overlap the age of Clovis elsewhere in the western US, while the previously identified stemmed point from Handprint Cave is better labeled as a middle Holocene Humboldt point form. Details on raw-material procurement, technology, and function of the Haskett points from Bonneville Estates and Smith Creek Cave are presented, and these findings are placed in the broader context of Paleoindian variability in the intermountain west.

[83] *Backpack Biographies: Re-scaling Undocumented Migration in the US-Mexico Borderlands*

Federal agencies and news media often report undocumented migration across the US-Mexico border in gross terms of hundreds of thousands to millions of crossings and apprehensions—a scalar project that then plays into broader political discourse about national belonging. In this paper we draw on research by the Undocumented Migration Project to develop an alternative scalar project through a discussion of the backpacks carried and discarded by migrants crossing the Sonoran Desert of southern Arizona. On a microscale, the biographies of these objects, including acts of personalization, techniques for repair, and traces of suffering, offer material testaments to the ethnographic accounts of migrants themselves. On a macroscale, the contemporary archaeological contexts of these objects, including time and place of deposition, associated artifacts, and quantities measured as a minimum number of individuals (MNI), reveal how individual practices accumulate into an increasingly deadly process of migration shaped by US border policies over the last two decades. Ultimately, an archaeology of backpacks aims to critique popular narratives of the US-Mexico borderlands by mediating between these scales, and by valorizing the material traces of undocumented migration as an historical process.

[155] *The Magnetic View of a Princely Landscape*

The Hallstatt period hilltop settlement at Mont Lassois and its environs have been the focus of archaeological interest ever since the discovery of the famous princely grave of the “Dame de Vix” in 1953. Several excavations as well as aerial and geophysical prospections have since explored the sites on top and around the hill. Starting in 2013, the German Archaeological Institute in cooperation with the multinational Programme Collectif de Recherche “Vix et son environnement” has been conducting large-scale geomagnetic surveys, using a vehicle towed 16-channel magnetometer system. The interpretation of the resulting magnetograms is complemented by the numerous aerial images taken of the area, as well as LiDAR based elevation models. This survey project has now covered more than 700 ha, and the results so far have not only revealed numerous new sites dating to the neolithic to historic periods, but have also enhanced our understanding of the ancient landscape, showing clear patterns of distribution for both burial and settlement sites, embedded in a natural network of waterways and dominated by the prominent hill Mont Lassois.

[308] *Aztalan from the Perspective of Institutions of Social Relatedness*

The archaeological site of Aztalan is located between the modern cities of Milwaukee and Madison, Wisconsin, and is commonly identified as Mississippian, dating to about AD 1000. The site has been known since the 1800s, and many amateur and professional archaeologists have excavated there. Much of the Aztalan literature focuses on time and whether or not the site is predominantly Late Woodland or Middle Mississippian in nature. My own work has focused on the mortuary and spatial organization and layout of the site, and how it was used for display and communication by means of landscape alteration, placement, and use of color and textures. Using Aztalan data, combined with data from a few other outlying Mississippian sites, I investigate the nature and degree of social relatedness one might infer from Aztalan site organization and repetition of symbols and structures. The question of change and/or repetition over time will also be addressed.

[82] *Iron Age Agriculture at the Multi-Component Site of Kakapel Rockshelter, Western Kenya*

The domestication of African cereals and origins and spread of plant agriculture in eastern Africa remain poorly understood. Questions about the timing of farming, crop packages, and correlations with migration events, endure largely due to a lack of paleobotanical recovery and high-resolution dating on inland eastern African sites. In this paper we report on the initial findings of archaeological fieldwork at the Kakapel Rockshelter site, southwestern Kenya carried out in collaboration with the National Museums of Kenya. Situated north of Lake Victoria on the low-flanks of Mt. Elgon, Kakapel is a rock art site that preserves a sequence representing the Late-Holocene Kanysore fisher-foragers, Early Iron Age Urewe producing early-farmers, and the Late Iron Age Roulette period. Extensive flotation at the site revealed large quantities of domesticated sorghum, finger millet, and wild plants from different archaeological phases. We also report briefly on the rich faunal assemblage, excavations of burials at the site, and evidence of activity areas and related features. In combination, these lines of evidence provide critical new insights into the chronology of early farming, and lifeways of early farmers, in western Kenya. In addition, results from Kakapel Rockshelter highlight the importance of intensive flotation at eastern African sites.

[320] *Holocene Paleoenvironment and Demography of the New Guinea North Coast*

The Pacific islands are often used as model cases of human-environment systems and the development of biocultural diversity. In comparison to the smaller islands of the southwestern Pacific, the prehistory of the north coast of New Guinea remains poorly understood, particularly prior to ~2000 BP. We draw together a variety of archaeological evidence collected during fieldwork in the area around Aitape (Sandaun Province, Papua New Guinea) as well as paleoenvironmental data from coring (pollen, diatoms, charcoal) to examine the regional environmental sequence, land use intensity, and inferred paleo-demography. We find likely increases in population and land use intensity during the mid-Holocene, including a particularly rapid increase after ~3500 BP, a period that witnessed rapid movement of people out of Near Oceania. We argue that population growth from about 6000-3000 BP was a region-wide phenomenon driven largely by increasing environmental productivity on newly emergent coastlines after the Holocene Thermal Optimum and Marine Transgression. After 2000 BP, declining resource potential and unsettled climate may have contributed to population decline. These demographic and environmental trends have important implications for interpreting cultural and biological patterning in the region.

[82] *Quaternary Paleoenvironmental Changes in the Inhambane Bay (Southeastern Mozambique)*

Contrasting with other areas of the globe, there are few palaeoenvironmental studies in Africa and in particular in Mozambique. However, the knowledge about Quaternary palaeoenvironmental changes and their forcings (e.g. climate and sea level changes) is essential to understand the environmental context of human occupation of the Inhambane area. Thus, to shed light on this subject, we collected 4 cores in a mangrove east of the city of Inhambane. All cores were sedimentologically described and samples were collected every 10 cm for geochemical and diatom analysis (unicellular algae with a short-live cycle and largely sensible to environmental variables such as salinity, sediment texture, duration of the tidal inundation and nutrients). The analyzed record encompasses the last 4700 years, period during which Praia da Rocha and Praia do Tofo archaeological sites were occupied. Preliminary results showed that, during this time span, the environmental changes of the studied area were mainly related to the bay lateral progradation, after the mean sea level stabilization. Moreover, diatoms (which were moderately preserved and presented high diversities per sample) point to the occurrence of wetter conditions at ca. 4500-4700, 2500-3000, 1000-1500 years cal. BP.

Gómez, Juliana (Universidad de Caldas) and Henry Tantaleán (University of South Florida)**[182]** *Fardos Funerarios de los Antiguos Paracas en el Valle Medio de Chincha, Costa Sur del Peru*

Este trabajo presenta los resultados del análisis bioarqueológico realizado a ocho fardos funerarios del periodo Paracas Tardío (400-200 BCE) relacionados con el estilo cavernas que fueron recuperados en el Cerro del Gentil, valle de Chincha. Los fardos funerarios asociados a este periodo han sido poco conocidos en la costa sur, entre otras razones debido a su mala preservación. En este sitio también se recuperó cerámica, abundante material botánico, huesos, líticos, canastos, mates y diversos artefactos depositados como ofrendas durante consecutivas ceremonias rituales de abandono del sitio. Los resultados presentados aquí describen la estructura de cada fardo y la complejidad en la distribución de las ofrendas, según la edad y el sexo del individuo. La conformación de estos fardos revela el desarrollo de una tradición funeraria compleja, que posiblemente daría lugar a los reconocidos fardos Warikayán de la península de Paracas descubiertos por Julio C. Tello. Nuestros hallazgos indican que el valle de Chincha fue una región central para el desarrollo cultural de los Paracas y que los fardos constituyeron una de las ofrendas más importantes con fines políticos y rituales antes de la llegada de la tradición Topará.

Gómez Ambríz, Emmanuel (ENAH) and José Luis Punzo Díaz (INAH - Michoacán)**[192]** *Offerings in the Yacatas: The Funerary Objects from Tzintzuntzan Burials*

The most important city of The Tarascan Empire was Tzintzuntzan. The Yacatas, political and ceremonial center of this site, was explored in the first half of the 20th Century by Mexican scholars. Nevertheless, information about these excavations is not clear at all. For this reason, here we offer a revision of the burials located in the Yacatas and its features from data that were never published with the objective of understanding the importance of ornaments for the Tarascan culture during Postclasic era.

Gonciar, Andre [386] see Zejdlik, Katie

Gonlin, Nan (Bellevue College)**[24]** *City Nights: Archaeology of Night, Darkness, and Luminosity in Urban Environments*

In the modern world, we are constantly surrounded by natural and artificial light that blends day into night. As a result, the contrasts between day and night, and their associated activities, have been deadened in our contemporary urban environments. This blurring has also bled over into our examination of cities of the past. Both low-density and high-density urban environments were significantly and experientially different from our modern experience, even a hundred years ago. This evolving urban nightscape can be examined from many perspectives. A focus on the archaeology of night and darkness allows us to envision nocturnal cityscapes that inhabitants navigated to perform particular activities, as well as the objects associated with those activities. The study of ancient lighting (lychnology) brings to the fore how and how much early urbanites lit up their spaces to participate in nightlife, nightshifts, and other nightways. Lighting devices also provide insight into the cost of these implements and the social prestige that illumination provided. A consideration of how much planning was done to urban landscapes for nocturnal activities reorients our perspective from day to night. This orientation is enhanced by sensory archaeology when we consider how the senses engaged with the ancient urban night.

[197] *The Impact of Diet and Dental Health among the Mixtec Urban Societies from the Formative Period of Oaxaca, Mexico*

We present the results of a preliminary study that investigates the impact of increased social complexity on the dental health of two Mixteca Alta populations, one from the Middle Formative (850 – 400 BC.) component of the site of Etlatongo and the other from the Late to Terminal Formative (400 BC. – AD. 300) urban center of Cerro Jazmín. Our research sample includes over 70 burials from Etlatongo and Cerro Jazmín, both sites in the Nochixtlán Valley, Oaxaca. We assessed the presence of approximal, buccal, lingual, and root caries, antemortem dental loss (AMTL), and the degree of dental wear, and compared these factors between a site (Etlatongo) that develops early indicators of urbanism during the Yucuita phase (500-300 BC) and another that presents a later and fully urban (Cerro Jazmín) population. The results of this study provide a baseline to discuss how changes on diet and subsistence strategies impact in the transition of increasing social complexity from urban centers.

Gonzales, Moises

[193] *Genízaro Ethnogenesis and Futurism*

Genízaro Ethnogenesis, Emergence, and Futurism is an emerging story about the evolution of identity and cultural practices of the Genízaro people of New Mexico. The term Genízaro was the designation given to North American Indians of mixed tribal derivation living among the Hispanic population in Spanish fashion: that is, having Spanish surnames from their masters, Christian names through baptism, speaking a simple form of Spanish, and living together or sprinkled among the Hispanic towns and ranchos (Chavez, 1979). The permanence of Genízaro identity and cultural practice blurs the lines of distinction between Native and Hispanic frameworks of race, cultural affiliation, and identity. The continuance of contemporary indigenous cultural production through futurism generated by Genízaros in New Mexico is countering a dominant cultural hegemony of the Spanish American identity in New Mexico. This study attempts to provide insight to the origins of Genízaro identity, how it has evolved and adapted, and more importantly, how Genízaro identity is beginning to emerge in New Mexico as a counter hegemonic force challenging the historic notion of being Hispanic or Spanish American in New Mexico.

[90] *Engaging Local Pueblo Youth to Preserve Ancestral Pueblo Sites at Bandelier National Monument, New Mexico*

Bandelier National Monument lies on the Pajarito Plateau where the Tewa, Keres, and Zuni Puebloan ancestors chose to reside. These people modified, then utilized naturally eroded recesses in welded volcanic ash to create what archaeologists term *cavates*. Ancestral Puebloans also used the soft volcanic tuff to shape the building blocks for their homes. Today these archaeological sites are managed by diverse organizations and federal agencies that preserve and study these sites. In order to preserve Ancestral Puebloan sites, Bandelier National Monument partnered with Rocky Mountain Youth Corps to establish the Bandelier Preservation Corps (BPC) in 2015. The BPC consists of local Pueblo youth, as well as youth from surrounding communities, to help preserve these ancestral sites. The BPC allows for Pueblo youth to gain hands-on interaction with the architecture of their ancestors while being guided by experienced Pueblo community members who work for the National Park Service. The BPC works together to stabilize, repoint, and record data on standing architecture. This program has been very successful in its ability to maintain the archaeological sites of Bandelier National Monument and mobilize youth to engage in preservation.

Gonzalez, Albert (Cal State University - East Bay)

[193] *Chicanxperimental Archaeology: Inclusion and Inclusions in the Experimental Construction of Earthen Ovens*

This paper describes the pedagogical and scientific results of the construction and testing of several miniature scale Mexican-style adobe ovens (*hornos*) by faculty and students in Anthropology at California State University, East Bay (CSUEB). Findings are divided into three sections: Adobe as Teaching Technology, Adobe as Construction Technology, and Adobe and Thermal Mass. We explore the use of adobe as a valuable contemporary pedagogical technology in addressing the achievement gap in archaeological science courses between under-represented minority (URM) students, particularly those of Latinx and Chicanx backgrounds, and others and encouraging their retention and graduation. The paper also presents a blueprint for the construction of the same experimental ovens in order to encourage outside replication of CSUEB experiments, suggesting utilization of the template in college archaeology laboratories, in primary and secondary school lesson plans, and among descendant communities. Finally, the paper presents experimental results as to the relative thermal mass of those ovens in hopes of paving a path for development of a model archaeological signature for the colonial- and Mexican-era adobe ovens of the

American West. The paper draws the results of horn and pedagogical experiments together in order to improve historical-archaeological practice in the field, laboratory, and classroom.

[127] *A 3D Geometric Morphometric Comparison of Bone Surface Modifications on Proboscidean Assemblages from the Western Great Lakes*

Currently, an alarming number of plants and animals are on the brink of extinction due to habitat loss caused by human activities and climate change. Though numerically unprecedented, this may not be the first instance of a human-driven mass extinction. For decades, scholars have hypothesized that human predation led to the extinction of North American megafauna in the Pleistocene. However, trace evidence of proboscidean butchery by humans in the form of cut marks and other bone surface modifications (BSM) is contentious. For example, independent experts observing identical BSM on four Clovis and Pre-Clovis aged proboscidean assemblages from the Western Great Lakes region disagree on whether the agents responsible for the marks were human butchers. Here, we conduct a 3D geometric morphometric analysis of BSM from the Hebior, Fenske, Mud Lake, and Schaeffer proboscidean assemblages. We compare these marks to known human and natural BSM using Bayesian inference to assign probabilities that each agent caused the marks. This technique has shown enough statistical power to differentiate between cut marks resulting from different behaviors in the past. Results facilitate a methodology allowing researchers to better understand the origins of BSM and contribute to our knowledge of human-megafauna interactions in the Pleistocene.

[218] *Projectile Points Exhumed by Dune Migration, Implications for Human Presence and Mid-Holocene (?) Wetter Climate in the South Texas Sand Sheet*

The South Texas Sand Sheet (STSS) spans ~7,000 km², and consists largely of sand sheet deposits, mostly under three meters thick, stabilized by vegetation, but active SE-NW longitudinal dune ridges make up less than 5% of its area. Evidence of human presence in the STSS in prehispanic times is sparse. Limited archeological investigations have revealed a record characterized by low preservation of non-lithic remains, and overall very sparse cultural remains. Chronology of human occupation, subsistence strategies, and settlement patterns remain poorly known. A migrating dune at the center of the STSS, has exhumed projectile points and abundant debitage, suggesting the presence of seasonal camps occupied by large groups. Preliminary findings from an ongoing investigation at this unique site include: 1) evidence of human occupation, dating back to Paleoindian or Early Archaic times, suggested by Golondrinas and Abasolo points; 2) a well-developed soil, over one meter thick, on which the archaeological horizon sits is interpreted as a stabilized and vegetated dune indicative of a wetter climate; and 3) fastest rates of dune migration captured by aerial photography occurred in the late 1950s coinciding with severe drought conditions. Results of optically stimulated luminescence ages on this newly exposed surface are pending.

[396] *Primitive Dentistry from a Native American Burial in the Southern Chesapeake Region, Virginia*

Dovetail Cultural Resource Group conducted an emergency excavation of two Native American burials in the Southern Chesapeake Region of Virginia which were AMS dated to 620±20 and 540±20 RCYBP. The ensuing analysis of the human remains showed evidence for prehistoric dentistry in one of the individuals, a male who died between the ages of 40–45. A large circular carious lesion in the mandibular left second molar led to consultation with several dental and physical anthropology experts. The tooth was subsequently examined with optical focus-stacking microscopy, periapical radiography, cone beam computed tomography, and micro-CT scanning to image the carious lesion and compare it to a smaller carious lesion on another tooth. The imaging revealed compelling evidence for purposeful removal of decayed tissue. Scanning electron microscopy was also utilized to examine striations observed on the interior surface of the cavity to identify the tools and methods employed in the treatment of the tooth. In addition, there is evidence for extraction of the mandibular right third molar, suggesting that the individual sought treatment for dental ailments on at least two occasions. This paper will discuss the analyses and conclusions drawn from the studies as well as potential future research avenues.

Gonzalez, Laureano and Lilia Lizama Aranda (Manejo Cultural, AC.)

[71] *El Modelo Portuario de México como modelo de Administración Arqueológica en México*

En esta presentación realizamos la importancia que tienen los sitios arqueológicos de menor tamaño que yacen en ruinas, que por la falta del recurso y políticas del sector público representan un nicho de inversión para la iniciativa privada. De aquí que, la problemática de administrar sitios arqueológicos de menor tamaño, con suficiente fondo financiero como humano, representa la oportunidad de convertirlo en un sitio sustentable accesible al turismo-población y un parteaguas en la disciplina arqueológica. Para ello, en este trabajo se parte de la diferencia entre la administración de los puertos antes y después de los noventa. Resaltando, el paralelismo entre la administración de

los puertos y la de los sitios arqueológicos en México. Antes de los noventa, se trataba de una administración a distancia desde el centro de México situación similar a la actual administración del patrimonio arqueológico. Los resultados arrojan indicadores sobre la administración antes y después de la integración de la administradora privada en los puertos, así como el discurso de la iniciativa privada presenta un procedimiento sobre el sector cultural que mimetiza el modelo de los puertos. Ello implica la participación del sector académico para la formulación de un Plan Maestro de Desarrollo Arqueológico para dichos sitios.

[314] *Was There a Relationship between Michoacán and Ecuador? An Analysis of Copper Objects*

There are many studies on the interactions between the North Coast of South America and the Western part of Mesoamerica where many relationships have been seen in objects. In this paper we will present an analysis of similar metal archaeological materials produced from Michoacán and Ecuador, exploring their technological and form similarities, but also noticing the great differences that there are in many of these, which accounts for a shared history but with a particular development.

Gonzalez, Sara L. (University of Washington, Seattle) and Ora Marek Martinez (Northern Arizona University)

[136] *Good Medicine: Prescriptions for Indigenous Archaeological Practice*

While the history of North American archaeology points to a long engagement with tribal elders and scholars, these encounters largely consist of unequal, extractive relationships wherein indigenous collaborators and indigenous archaeologists have been treated more as objects of study and pity—what Bea Medicine refers to as “creatures”—rather than as equal research partners. As indigenous women, we reflect on the life journey and scholarship of Bea Medicine, whose work has provided generations of indigenous anthropologists with the means to participate in the discipline with their whole selves and, importantly, on their own terms. We argue that Medicine’s contributions—alongside indigenous archaeologies’ often overlooked grandmothers, mothers, and aunts—provide concrete strategies for continuing to decolonize the discipline and its broader relations and highlight continuing disparities in archaeological practice.

[38] *Paleoindians from the Basin of Mexico: How Do They Fit in the Early Peopling of the Americas?*

The Basin of Mexico is important in the debate on the early peopling of the Americas because several well preserved Paleoindian/Pre-ceramic individuals have been found in the lake sediments/volcanic deposits surrounding the Late Pleistocene Lake. They include: Peñon Woman III, Tlapacoya Man, Metro Man, Chimalhuacan Man, Tlahuac Woman, Tepexpan Man and San Vicente Chicoloapan. Here we characterise them, discussing their stratigraphy, dating of the skeletons and preservation status together with their skeletal morphology and paleodiet information. We then compare their craniometric information against other Paleoindian/Pre-ceramic human populations in Mexico (e.g. Pericues, Coahuiltecos) and elsewhere in the Americas (e.g. Arch Lake Woman, Kennewick Man, Prehistoric Chumash from Santa Cruz Island) to establish connections and migration pathways across the American Continent. Our data strongly support a Pacific Coast migration route passing through Mexico. As with other Paleoindian skeletons found in the Americas, in Central Mexico there is an older “Paleoindian skull morphology” with long and narrow skulls for the Late Pleistocene individuals. This morphology changes to the “Amerindian skull morphology” with rounder and shorter skulls at around 9,500 years ago. The implications of these different skulls morphologies differences will be discussed.

Gonzalez, Toni (University of California, Santa Barbara)

[383] *Alternative Interpretive Lenses for Landscape at Mulch'en Witz, La Milpa, Belize*

This paper discusses ongoing archaeological investigations at the Late Classic Period (CE 600-800) Maya site of Mulch'en Witz, La Milpa, Belize. Survey and excavation at the site have revealed an unconventional geographical density of man-made subterranean spaces (“chultuns”) in association with provocative architectural and geological features. While ‘utilitarian’ interpretive frameworks are available to make sense of this modified landscape, this paper recognizes that such an approach may be over-constrained. The possibility will be explored using an ahemegonic archaeological interpretation, which can present new perspectives on relationships between landscapes and cultural processes. By introducing artistic representations of landscape such as ‘Wasp Mountain’ in the Mixtec Codex Zouche-Nuttall, this presentation incorporates attested indigenous perspectives into the realm of archaeological interpretation. Not only do we begin exploring alternate relationships between ritual and utilitarian practices and activities, we also allow for different kinds of questions to emerge during archaeological excavation.

Gonzalez La Rosa, Luis Manuel

[356] *Architectural Contexts in Quilcapampa*

This paper will briefly discuss the architecture at Quilcapampa, with particular emphasis on possible patio groups at the site. We discuss these groups, the contexts found in the rooms, and the access patterns between spaces. The site appears to be arranged around a principal asymmetric plaza, with sections orientated differently related to that

plaza. The paper suggests that the construction of Quilcapampa La Antigua was part of an ongoing negotiation between Wari settlers, local groups, and visitors.

[243] *Templo Mayor and Representations of the Flower World: Agriculture, Fire, Sacrifice, Death, Rebirth, and Imperialistic Agendas*

One of our primary sources of descriptive information about the Flower World comes from Central Mexican colonial historical documents. While ethnohistorical accounts have portrayed this world with shared beliefs of the floral paradise, this paper provides a complementary scenario, by explaining nature and representation of the Flower World in the hearth of the capital through an analysis of the many material culture products from archaeological explorations in and around the Main Temple of Tenochtitlan. This paper seeks to explore the idea of the Flower World from the Mexica angle, by focusing on the one hand of articulation with the solar war cult, with militaristic ideology and with fire as a transformative element to access to this realm. On the other hand, this narrative is linked with agricultural behavior promoted by the Mexica state as part of an imperialistic agenda. This paper focuses on iconographic information and contextual analysis of 56 sculptures from the Main Temple area and historical sources to show to what degree and how the Flower World was interpreted and understood by the head of the Aztec empire, especially with a tendency towards state violence and exploitation using stone images as relevant media.

[70] *Bayesian Models for the Occupational History of Complex Hunter-Gatherer-Fisher Communities in the Interior Pacific Northwest*

The interior Pacific Northwest landscape contains a system of waterways that coalesce to form three major drainages with outlets in the Pacific Ocean. Substantial evidence has been provided that complex hunter-gatherer-fisher communities occupied sites in these river drainages during the late Holocene. Some chronological frameworks suggest there are similarities across the region while others indicate disparate timing of cultural developments spanning material culture, settlement patterns, and sociopolitical organizations. This paper presents Bayesian models for late Holocene sites the Middle Fraser and Upper Columbia River areas. Results suggest that while region-wide chronologies have been adopted, Bayesian models predict very different occupational histories for villages in the Mid-Fraser and Upper Columbia River areas. Intensive excavations from the sites Bridge River (EeRI-4) and Slocan Narrows (DkQi-1, 2, and 17) will be case studies for discussion.

Goodwin, Rebecca (University of Western Ontario)

[269] *Beyond Binaries: Queering the Archaeological Record of the Western Canadian Arctic*

Queer theory is often equated with sexuality research in archaeology (Blackmore 2011), but a queering of the archaeological record actually allows us to challenge all aspects of (hetero)normativity in archaeological practice (Croucher 2005; Blackmore 2011). Queer is “whatever is at odds with the normal, legitimate and the dominant” (Halperin 1995:62), and it allows us to replace binaries—including those related to gender—with a proliferation of differences. Instead of focusing on a generalized understanding of gender, created and perpetuated in the archaeological literature, a queering of the archaeological record asks us to focus on examples of objects, spaces, or individuals that deviate from these generalizations. In this paper we will provide an overview of the gendered landscape of arctic archaeological research, including a retrospective survey demonstrating the normative ways arctic archaeologists have commonly discussed gender in their research. Additionally, we will discuss examples of individuals or groups who deviate from normative, binary gender roles drawn from both the ethnographic record and from interviews conducted with Inuvialuit elders and knowledge holders. Finally, we will consider the archaeological implications of viewing gender outside of simple binaries and how to move forward in our examinations of the material record.

[332] *From Source to Site: Investigating Diachronic Toolstone Procurement and Land-Use in the Nenana Valley, Interior Alaska*

The archaeological record of Eastern Beringia is critical to understanding human dispersal into the Americas and the settling-in processes of the First Americans and their descendants. Investigating prehistoric landscape use and provisioning behaviors is significant in answering questions related to adaptive behaviors of prehistoric Beringians. We can begin exploring behavioral adaptation through the lens of toolstone procurement and use in the Nenana Valley, central Alaska, by characterizing the lithic landscape upon which prehistoric Alaskans provisioned themselves as well as by employing geochemical sourcing methods such as portable x-ray fluorescence (pXRF), a useful tool for characterizing non-obsidian volcanic materials (basalts, dacites, andesites and rhyolites). In an effort to define the lithic landscape and explore hunter-gatherer land-use and provisioning strategies, this paper presents results of raw material surveys conducted to map the distribution of knappable materials in the Nenana Valley, then compares results of geochemical (pXRF) analyses of artifacts from several Late Pleistocene and Holocene sites in the Nenana Valley with both primary (outcrop) and secondary (alluvium) sources within the valley to understand and explore how local (and extra-local) materials were utilized by prehistoric Alaskans in Eastern Beringia.

Gorenflo, Larry (Penn State University)

[38] *Twentieth Century Settlement Patterns in the Basin of Mexico: In Search of Pre-Columbian Roots for Regional Demography and Land Use*

Archaeological settlement pattern surveys in the Basin of Mexico during the 1960s and 70s capitalized on cultural behavior that seemed to share important connections with the Pre-Columbian past. The labor-intensive agricultural economy that dominated the region throughout much of the 20th century involved dozens of rural communities, many growing the same crops found prior to the Spanish Conquest, helping to justify use of modern material remains to interpret the archaeological record. This paper uses historic air photos, maps, and census data to document settlement in the Basin of Mexico during different parts of the 1900s. Results indicate some striking similarities between Pre-Columbian and historic 20th century settlement and land use that seem to support a link between the historic and prehistoric past. Urban sprawl and expansion of commercial agriculture, beginning in the 1970s in much of the basin, mark the emergence of important differences with the region's Pre-Columbian past. Late 20th century settlement and land use, continuing into the first decades of the 21st century, have yielded a very different landscape that, among other things, have important implications for many of the more than 3,900 sites discovered by settlement pattern surveys.

Goring-Morris, Nigel (Hebrew University) and Anna Belfer-Cohen (Hebrew University)

[366] *Neolithic Group Sizes – Further Thoughts*

The dominant paradigm concerning group size is frequently couched in terms of the “social brain hypothesis” (Dunbar 1998). On the other hand ethnographic evidence (Hill et al. 2014) posits much higher interaction rates amongst individuals than those based solely upon biological criteria (cognitive capacities, kin-based relationships, etc.). Such interactions, especially those with a ritual basis, may have major implications concerning the scale and scope of interactions relating to the shift from the mobile foraging bands to settled farming communities during the terminal Pleistocene and early Holocene in the Near East. We shall attempt to evaluate the implications of such observations concerning cultural dynamics in the region. One should bear in mind that during this period of significant changes in lifeways (both material and social/spiritual), the intensity and, especially, geographic scope of desired culture exchange networks (archaeologically most evident in the material remains) increased dramatically.

[387] *Sinis Archaeological Project: Preliminary Results of the First Season of Landscape Survey in West-Central Sardinia*

The Sinis Archaeological Project is a new regional survey in west-central Sardinia that explores the landscapes of the Sinis Peninsula and adjacent territories from multi-scalar, diachronic perspectives. The region is a diverse landscape of agricultural plains, coastal areas, and mountainous territory. In antiquity, it was inhabited by both local Nuragic people and foreign colonizers (Phoenicians, Carthaginians, and Romans) who exploited its rich resources, ranging from salt and other marine resources, to metals, to agricultural products. Our aim is to understand the diverse social and environmental factors impacting resource extraction, settlement patterns, and colonial interactions in this varied and dynamic landscape in the 1st millennium BCE through late antiquity, as well as the impacts of modern landscape use on the archaeological record. We focused our first season of work in June 2018 on the territory surrounding the site of S'Urachi, a major indigenous inland site of the 1st millennium BCE located in an agricultural plain. We incorporated traditional Mediterranean pedestrian survey alongside multi-scalar remote sensing techniques, including multispectral satellite and drone reconnaissance. This poster details the results of our first season and discusses the benefits of our multi-scalar methodology for understanding this and other varied ecological landscapes.

Gouge, Charlotte (University of Bristol)

[145] *Of Pirates and Pilots: The Impact of Climate on Illicit and Survival Behaviour on the Fringes of Global Society*

Relationships between people and landscapes can be used to inform upon social and behavioural variations. Hurricanes and shifting climatic dynamics around Ocracoke Island in the Outer Banks NC directly affected this relationship. Historically, Ocracoke provided vital trade and communication links from the West Indies to North America. Pilot Town, on Ocracoke island, was so-named for ships' pilots who guided ships safely through treacherous, moving inlets and sand-banks. Outer-Bankers based their survival on developing intimate knowledge/relationships of their environment and climate. Ocracoke provides an extreme example of developing isolation, making it a useful case study to examine reactions, relationships and developmental attitudes. This study combines island and hurricane mapping to examine social communication and isolation models to highlight acclimatisation within local environments, and test how changing climatic-environmental factors affected social structure hypothesising that the local landscapes, both static and shifting, affected human interactions and lifeways.

[157] *Archaeology and Contemporary Capitalism*

Hamilakis and Duke first considered the relationship between "Archaeology and Capitalism" in 2007. In the intervening decade, contemporary capitalism has changed vastly, relocating and concentrating wealth and economic power, constraining national sovereignty in globalized markets, disrupting industries through technology at an accelerating pace, and exacerbating demographic and social pressures. The neoliberal consensus among economists in the early 2000s has splintered, austerity-driven government policies have undermined official support for archaeological research and museums, philanthropy's turn toward "effective altruism" and "impact measurement" have called into question the value and even the ethics of supporting archaeology, and tentative steps have been taken toward engaging market forces and digital economies in support of archaeology. Such conditions call into question the ethics of engagement with capitalist forces, yet also underscore the necessity for archaeology to adapt to new realities if funding, and public and political support are not to wither. This paper will revisit the relationship between archaeology and contemporary capitalism, reassess the critical perspectives of a decade ago, and consider whether and, if so, in what fashion, capitalist motivations, market forces, and business technologies may be engaged to promote archaeology and offset the consequences of austerity, the new philanthropy, and changing public priorities.

[329] *A Possible New Paleoindian Area of the Hell Gap Site: The 2018 Shovel Test at Locality IV*

During the 2018 field season, a fluted preform was recovered during surface survey at Hell Gap Locality IV. A shovel test was dug at the location of the preform to investigate the stratigraphy, landform characteristics, and assess the possible age of the deposit. The test uncovered 675 very tightly vertically clustered artifacts, suggesting a Pleistocene age surface. Paleoindian artifacts such as fluted projectile points and paleo aged scrapers, along with C. Vance Haynes' analysis of paleo-sediments support the Pleistocene age living surface conclusion. As excavation of Locality I of the Hell Gap National Historic Landmark is coming to completion, the findings at the 2018 Locality IV shovel test offer the possibility of an additional Pleistocene age occupation area for future investigation.

Gowland, Rebecca (Durham University)**[317]** *Ruptured: Bodies, Boundaries and Reproductive Loss in Bioarchaeology*

The concept of the bounded body is powerfully resonant within the post-industrialised western world; it is performed and reinforced through cultural practices which observe the maintenance of bodily space and the delineation of individual bodies. Recent research on the developmental origins of health and disease hypothesis, epigenetics and microchimerism has increasingly exposed the fragility of this construct. As feminist scholars have stated, the pregnant body represents the ultimate boundary transgression: the body within a body. This presentation aims to provide a theoretical exploration of the maternal body, the interconnectedness of mothers and infants in relation to bodily boundaries, and the impact of reproductive loss (miscarriage/neonatal death). Approximately 15-25% of pregnancies end in miscarriage and infant mortality rates in the past are estimated at 25-30%. Reproductive loss brings violent rupture to a woman's sense of bodily boundaries, both literally in that she is unable to contain the fetus, but also because she is required to reconfigure her expected self. Up to 40% of mothers who miscarry suffer from PTSD three months afterwards. This rupture of the infant/mother nexus creates social anxieties concerning the boundedness of both infants and mothers that have hitherto unexplored repercussions for burial practice and bioarchaeological interpretations.

Graesch, Anthony (Connecticut College)**[157]** *Tossed Cigarettes, Illegal Dumps, and Soiled Cardboard: An Archaeology of Illicit, Invisible, and Seldom-Studied Discard Phenomena in the Twenty-First Century*

Archaeology has long sought to distance itself from the present, and despite a small corpus of novel and seminal research emerging over the last four decades, an archaeology that addresses the contemporary has remained only on the fringes of the discipline. Highlighting recent investigations in which the anthropological lens is refocused on discard and material culture in the twenty-first century, this paper explores the ways that an archaeology of and for the contemporary can excite a deeper, more impactful engagement with the methods and analytic contributions of anthropological archaeology both within and beyond the academy. In particular, I focus on how the archaeological study of seldom-examined and backstage garbage-related phenomena opens anthropologically potent lines of inquiry into attitudes and behaviors inextricably linked to acts of discard: ideologies of dissent; involuntary dispossession; socially performative identity; liminal possession; sanctification of consumption; object atomization; and environmental toxicity. In turn, I argue that a more resonant archaeology of the contemporary capitalizes on the discipline's unique strengths: assemblage-focused analyses; depositional context; spatial patterning; robust datasets; and systematic data recovery. Such resonance is realized in the fostering of positional reflexivity, the cultivation of empathy, and the connection of research products to present-day communities and challenges.

[280] *Using Landscape to Unbuild Binaries: Human-Environment Relationships at Aventura, Belize*

Dividing the landscape into the categories of natural and cultural clouds an understanding of the relationship between humans and their ecological environment. Humans are not separate from or above the landscape they inhabit, and landscape archaeology is well-situated to address arbitrary binaries that reinforce problematic notions about human-environment relationships. In this paper, I confront two binaries associated with urban landscapes: inside/outside and built/unbuilt. At the ancient Maya city of Aventura, the landscape is characterized by seasonally wet karstic depressions known as pocket bajos. Pocket bajos are both inside and outside of the city. Some are surrounded by temple complexes, directly abutting monumental architecture and households, while others stretch to areas with little or no settlement. Pocket bajos are also both built and unbuilt. In some areas pocket bajo edges were modified by humans, while in other locations, their form was determined by water and erosion. Using data from pedestrian survey and excavation, I demonstrate that the pocket bajos at Aventura offer a way to go beyond a division of natural and cultural landscapes. Doing so is not only important for understanding human-environment relationships in the past, but for reflecting on our inextricable connection to the ecological environment in the present.

[298] *Tracking 1,600 Years of Ceramic Technology at Prehispanic Jecosh (Ancash, Peru)*

How do ebbs and flows in regional trade relations affect village level practices of pottery production? We assess this question by tracking variability and continuity in ceramic technological traditions at the site of Jecosh, located in the Callejón de Huaylas of Ancash, Peru. Recent excavations of domestic and mortuary structures at Jecosh revealed a continual site occupation, beginning with the Huarás cultural tradition (~100BCE-200CE) and enduring through the Inka occupation of the valley (1450-1534CE). Jecosh's residents had access to a diverse ceramic assemblage throughout this time, including Recuay kaolin finewares, and later, coarse Aquilpo styles. Easily accessible clay sources and tempering materials near Jecosh, as well as possible ceramic production tools recovered from excavations, suggest that locals likely produced much of their pottery. Here we present the results of a sample of petrographic thin-sections (n=97) of 46 paste groups. We examine their technological differences, compare their composition with local geological samples, and situate findings within regional politico-economic trends. This preliminary study will yield insights into shifting potting traditions at Jecosh. Further, as the first petrographic study of Huarás and Recuay pottery, we will expand scholarly understandings of these iconic prehispanic styles and the people who produced and used them.

[195] *An In-Depth Study of the Arma Veirana Pierced Shells and Pendants used as Grave Goods*

During the 2017 excavation season at Arma Veirana, a cave site located in the Italian pre-Alps, a Final Epigravettian burial was discovered. Careful excavation of the feature has uncovered an important number of grave goods comprised of over 80 perforated marine shells. The majority of these ornaments were made from the shells of *Columbella rustica*, while four bigger pendants – the likes of which had never been encountered before in an Upper Paleolithic site – seem to have been made from larger bivalves. Here, we present the results of our research on these ornaments, which involves the use of experimental archaeology to reproduce the large pendants and better understand the importance of the interred individual. We will also place this new burial and its associated grave goods within the contemporary context of the region, as well as the larger mortuary context of the European Upper Paleolithic.

Graves, Michael W.**[257]** *Science in Archaeology: Ann Ramenofsky's Contributions*

Ann Ramenofsky has a record of scholarship in archaeology in which one can identify a consistent application of a science-based approach. This approach recognizes: the systematic nature of science; the distinction between conceptual and empirical domains; the role of unit formation in science, the complementary roles of theory and methodology, and how archaeological methods must be sufficiently rigorous to be tied to a set of expectations that can be demonstrated to be false. This approach is exemplified here in several of Ramenofsky's key publications on population collapse, using frequency seriation as a tool for creating intra-pueblo community chronological sequences, and how to reconstruct prehistoric to historic population histories in the American Southwest.

A decade of investigations of earth oven baking pits and their associated burned rock discard middens across southern New Mexico and west Texas have revealed new insights into the economic and social roles of these ubiquitous features. Investigations range from pedestrian and aerial surveys and 3-D image enhancement to the excavation of 80 earth oven facilities under a standard set of field and laboratory methods. Massive feasting pits were constructed during the Middle Archaic period, thousands of smaller baking pits were used during the Ceramic period, and during the Protohistoric and Historic periods large quantities of rock were transported to construct pits in distant locations in desert basins up to seven miles from the source of rock. These and other research findings challenge the conventional view that such features had relatively unimportant roles in past settlement and social organization. Systematic studies of large samples of earth ovens establishes that the features did not solely serve as a technology for food preparation, but instead functioned as active agents in social production related to labor organization, land tenure, feasting, and political economies. This paper explores the social dimensions of earth oven use in prehistoric and historic societies of the US Southwest.

Constructing the depositional history of an archaeological deposit requires identifying and describing the physical attributes of the sediment particles, including artifacts. Observable changes in the physical properties is the basis for distinguishing one archaeological deposit from another. The Ceremonial Center of Tibes, Puerto Rico provides the ideal case study to demonstrate the importance of differentiating deposits in archaeological contexts. Tibes was originally founded as a small village in A.D. 1. Between A.D. 600 and A.D. 900 changes occurred in the social, economic, and political systems that resulted in a significant transformation to the Tibes landscape. Multiple ball courts and plazas were constructed that reorganized the landscape and use of space. Current research has uncovered evidence of natural transformation processes that also played a role in the development of the cultural landscape at Tibes. Geoarchaeological, archaeological, and radiometric evidence suggest that a major flood event associated with a prehistoric hurricane occurred during late occupation at the site, sometime between A.D. 800 and A.D. 900. These results are compared to similar conclusions from other parts of Puerto Rico and the Caribbean.

Human behavioral ecology predicts that individuals alter reproductive strategies to maximize reproductive success in response to environmental and social conditions. We employ stable isotope measures ($\delta^{15}\text{N}$ and $\delta^{13}\text{C}$) of weaning age and early childhood diet from serial micro-samples of first molar dentin from 10 individuals as proxies for the reproductive strategies employed by individuals interred at the site of Uraca, in the Lower Majes Valley of Arequipa, Peru during the Early Intermediate Period (EIP) to Middle Horizon (ca. AD 200 – 750). This era in southern Peru is marked by regional shifts in trade relationships, settlement patterns, and subsistence practices that reflect the impact of intense flood-drought cycles during the EIP and the transition to Wari imperial rule during the Middle Horizon. Bioarchaeological evidence shows Uraca was a status-differentiated cemetery of locally-born people, plagued by high levels of interpersonal violence. Given that injured men from the elite sector consumed more C4-enriched diets as children, we hypothesize that the early lived experience of Uraca children, measured through weaning age and diet, will exhibit status and gender distinctions. These data on differential parental investment provide one avenue for understanding how the population responded to shifting environmental and social conditions.

Greenwald, David (Jornada Research Institute)**[86]** *Creekside Village: Early Village Organization and Subsistence Strategies in Tularosa Canyon, South-central New Mexico*

Investigations at Creekside Village are focused on exploring the cultural landscape within Tularosa Canyon. Creekside Village is one of the best preserved and most informative sites of the Mesilla phase in the Tularosa Basin. Investigations conducted indicate that it was occupied between AD 600 and 850, and its occupants established a permanent settlement that included numerous pit houses (ca. 200) and a great kiva. Residents built an irrigation system that diverted water from the Rio Tularosa for fields located on the floodplain. They also created an elaborate water collection and conservation system that included ditches, a reservoir, and agricultural terraces above the floodplain. Considerable effort was invested in constructing facilities to increase the carrying capacity of their surroundings in support of a sedentary lifestyle with a focus on corn agriculture through diverse farming methods and water conservation. Attempts are being undertaken to assess the level at which Tularosa Canyon was used as a travel corridor and the role of Creekside Village in regional trade and exchange. Additional contemporaneous villages in Tularosa Canyon are being evaluated. These efforts are demonstrating the need to reconsider the organization of and strategies employed by the Jornada Mogollon during the Mesilla phase.

Greer, Allan (McGill University)**[162]** *The Indigenous Colonization of New France*

While the French were settling their colony of Canada in the 17th century, Iroquois, Wendat, Abenaki and other indigenous people also established villages in their midst along the St Lawrence River. Historians have considered these native enclaves very much from a European perspective, as markers of the success or failure of efforts to Christianize and “frenchify” natives, all in the service of an integrative colonial project. This paper considers the same relocations in terms of indigenous purposes. Natives, it appears, sought access to northern hunting territories and they valued the diplomatic and commercial advantages that close association with the French could provide. Within strict limits, they were willing to adapt to the ways of their neighbors, but they insisted on maintaining their political autonomy and cultural identities. Both alliance and “disentanglement” are in evidence when we examine indigenous relations with the French colony. This paper focuses on marital practices, land tenure and criminal jurisdiction, areas where the indigenous villagers of the St Lawrence demonstrated their determination to stay aloof from the French.

Greer, John [190] see Greer, Mavis

Greer, Mavis (Greer Archeology) and John Greer**[190]** *Arriving at a Meaningful Rock Art Interpretation*

Knowing the past through rock art interpretation has been a hallmark of Polly Schaafsma's rock art studies. She has advocated and practiced her stance that the meaning of rock art is not a guessing game but is instead the result of data collection and analysis completed within a theoretical framework, and this may result in different scenarios relative to function based on the knowledge of the individual doing the study and the questions they ask of the data. Her use of ethnographic information is often tied to rock art's place within the greater landscape, and this approach can serve the study of rock art in any region around the world. On the edge of the Northwestern Plains of North America there are two caves whose interiors are completely painted red. These sites predate any historical records, and their complete painting leaves no figurative images that can be compared with others. However, their location within the landscape, their sizes, shapes, and associated nearby cultural items and ethnographic and historical information on tribal beliefs and rituals all provide data to create a meaningful interpretation of their function prior to European contact.

Greer, Taylor (Center for Big Bend Studies)**[259]** *Revisiting Spirit Eye: Ongoing Research from a Cave in West Texas*

This poster presents some of the preliminary results from two seasons of excavation work at Spirit Eye Cave, a prehistorically occupied site near Presidio, Texas. Despite being heavily impacted by decades of collecting, the Center for Big Bend Studies began excavations in the cave in 2017 and recovered thousands of artifacts discarded by collectors as well as intact deposits. More excavations were planned, preceded by efforts to preserve the deposits with 100-pound stock mats and mapping the cave with a terrestrial LIDAR scanner. In 2018, a SRSU/CBBS field school produced thousands more artifacts, many of them perishable items such as cordage, corn, and a sandal, and located intact features and deposits. Our field efforts have produced some unanticipated results, such as a Clovis-aged fiber bed and, at the moment, the oldest maize in Texas. Spirit Eye is an excellent case study that illustrates the useful, collaborative studies that can be done at previously looted sites with an unconventional research agenda.

Gregonis, Linda [258] see Evans, Victoria

Gregorio De Souza, Jonas**[248]** *Climate Change and Culture in Late Pre-Columbian Amazonia*

Climate change has been linked to the reorganisation of past societies in different parts of the globe. However, until recently, the lack of archaeological and palaeoclimate data for the Amazon had prevented an evaluation of the relationship between climate change and cultural change in the largest rainforest of the world. Thanks to advances in archaeological and palaeoclimate research, such assessment is now possible. Here, the most relevant cultural transformations seen in the archaeological record of six different regions of Greater Amazonia during late pre-Columbian times are reviewed. The chronology of those cultural transitions is compared with regional paleoclimate proxies, showing that, while some societies faced major reorganisation during periods of climate change, others were unaffected and even flourished. The results suggest that societies with intensive, specialised land-use systems were more vulnerable, whereas those combining forest enrichment, polyculture and the formation of fertile Amazonian Dark Earths were more resilient to climate change – reinforcing the role of those economic strategies for sustainable land use in tropical forests.

Fort Campbell has a robust dataset for cultural resources following decades of survey, testing, and monitoring projects. Recent surveys of thousands of acres have included the collection of digital data. Coupled with the complete survey coverage of large areas of the installation, this data was used for a landscape approach examining pre-contact and historic settlement systems and site preservation. Instead of looking at the number of sites of a given type or age, this approach looks at the proportion of each area that is within a delineated site boundary. Using Fort Campbell's extensive GIS database, these areas were compared to a set of variables for selected site types and temporal periods to identify patterns in settlement systems and in the preservation of these resources. The goal of this research was to provide predictive patterns for use in resource management by the Fort Campbell Cultural Resources Office.

Gregory, Teresa (Statistical Research, Inc.) and Shelby Manney (Arizona Army National Guard - Department of Emerge)**[75]** *Digital Curation Laws and Practice: Creative Measures for a Big Problem*

Excavating through all of the digital curation laws, practices, and procedures for proper handling and storage of archaeological data can be overwhelming and somewhat daunting. Have no fear! It is true that you must figure out how the laws related to one another (e.g., 36 CFR Part 79 and Part 1220.1-1220.20 in terms of Federal records) and how to follow them using the most creative and innovated data management solutions to ensure proper archiving of the digital record. Understanding these laws is crucial for Section 106 CRM projects and it is vitally important to follow set guidelines and archival standards, such as file naming conventions, when thinking about record curation. The development and implementation of a comprehensive and integrative CRM database is essential to aide in the handling and storing of all the digital data in perpetuity. Adhering to Federal and State laws and regulations also is key and quite necessary to achieve the most complete digitally archived record for cultural resources for us and future generations. Digital Curation is indeed a Big Problem, however there is a Creative and Innovated Solution at hand!

Greig, Karen (University of Otago) and Richard Walter (University of Otago)**[354]** *Core-Hinterland Dynamics in New Zealand Archaeology*

The concept of 'hinterland' encompasses ideas of distance, marginality and challenge and is often contrasted with 'core', which in turn implies centrality and resource richness. In this paper we address the applicability of both these concepts in New Zealand and examine their role in understanding long-term Maori history. We suggest that high mobility, low population density and extreme environmental and climatic diversity shaped circumstances where core-hinterland dichotomies were fluid and easily subverted. Working at different scales, we show how places transitioned across the core-hinterland continuum in response to socio-cultural, economic and environmental processes. Our case study shows that in New Zealand core-hinterland relationships were temporally dynamic and contingent rather than emerging from fixed principles of geographic resource distribution and accessibility.

Grenda, Donn (Statistical Research, Inc.)**[4]** *Discussant***Grier, Colin (Washington State University)****[188]** *Stability and Change in the Construction of Place: Juxtaposing Practices on the Pacific Northwest Coast with the US Southwest*

Southwestern precontact history appears written in migrations and dramatic shifts in settlement patterns and identity over the last two millennia. Recent data from the Northwest Coast of North America, in contrast, suggest people may have been situated in specific places and persisted in certain practices for as much as 10,000 years. Such differences have significant implications for the way in which people were connected to and constructed place. I examine this issue initially from a theoretical perspective, invoking approaches to place-making to contemplate the construction of social identities and histories over varying time scales. Second, I take a more operational view, considering the methodologies by which we might address currents of social change and stability in these two regions. Despite the differences of continuity versus fluidity, and of maritime abundance versus agricultural marginality, Southwestern and Northwest Coast communities appear to have negotiated tensions between social differences and collective identities in somewhat similar ways. Limitations of Northwest Coast data — in chronological resolution, in material survivorship, and in density of research — are daunting relative to the Southwest, but I argue that constructions of place provide a productive basis to juxtapose these otherwise disparate areas of precontact North America.

[297] *Maritime Archaeological Collections and Public Engagement in Florida: An Ocean of Opportunity*

With the second longest coastline in the United States, Florida has a maritime past that spans at least 14,000 years of human habitation. Archaeological collections from prehistoric middens, colonial-era shipwrecks, and industrial coastal communities, among a variety of other maritime and submerged sites, demonstrate this long history. As a leader in archaeological education and outreach in the state of Florida, the Florida Public Archaeology Network (FPAN) seeks to engage the public with maritime history and archaeology in thoughtful and energetic ways. While each public audience requires a unique approach, utilizing archaeological collections has been one of the most successful ways of bridging the disparity that many people feel between past and present, intangible and tangible. FPAN's citizen science programs, STEAM workshops, and educator seminars have thus all benefited from the use of maritime collections as "real" representations of the past. Program assessment has also shown that sensory connections created through access to artifacts can reinforce and reinvigorate interpretive themes and messages. This paper reflects on FPAN's most recent efforts to involve the public in archaeology with collections specifically from maritime and submerged sites, including thoughts on the uses of technology to enhance future engagement with collections across broader audiences.

[153] *Bodies Shaping Bodies: Using Butchery to Trace Human-Animal Relationships*

While our relationship encompasses far more than just the dinner menu, food is one of the key ways in which human and animals lives and bodies directly shape one another. Indeed, beyond just the act of eating, how human and animal bodies meet in the context of procurement and processing can produce tangible traces of how these long-extinguished lives intersected, not to mention highlighting the agency present on both sides of the human-animal equation.

This paper explores how butchery and other coupled taphonomic and zooarchaeological analyses can tease out such aspects of animal use. Examples from the southern African Iron Age—including two intensive, if not specialised, large wild mammal hunting sites—are used to track particular processing choices, their associated taphonomic patterns, and the socioeconomic and craft implications of those strategies.

Grooms, Seth, Grace Ward (Washington University in St. Louis) and Andrew Schroll (Tulane University)**[99]** *Jaketown Re-Revisited*

In the summer of 2018, we reopened two previously excavated units at the Jaketown site in Humphries County, Mississippi. We collected geoarchaeological and paleoethnobotanical data from basal Poverty Point contexts. These deposits, dating to the Late Archaic (ca. 4000-3000 cal B.P.), represent the earliest and most intensive occupation at Jaketown. Analyses of these two datasets will inform our understanding of how the Late Archaic people at Jaketown interacted with their landscape, specifically through earthen construction and plant management. We will subject soil samples to magnetic susceptibility testing, loss on ignition, laser diffraction particle-size analysis, and macrobotanical analysis. In this paper, we present our preliminary findings.

Grossman, Joel**[306]** *Seeing Underground: The Feasibility of Archaeological Remote Sensing in Coastal and Highland Peru*

This paper reports programmatic recommendations, an advanced seminar series in archaeology, and field tests in geophysics undertaken during a consultancy with the Peruvian Institute of Culture (INC) in October 1982. The invited international program focused on the investigation of eleven historic, Inca, and pre-Inca sites throughout the coast and highlands. Funding was provided by the OAS, UNESCO, and the Andres Bello fund. This is the first formal presentation of this effort. The Sendero Luminoso war prevented future investigations under this initiative. The collaborative international effort had three major components: 1) a three-week seminar series on applied technology in archaeology for the archaeological and preservation staff of the INC in Lima, Cuzco, and Ayacucho, 2) a visit to eleven INC project sites to recommend appropriate applied technology strategies in support of excavation and stabilization efforts, and 3) resistivity and soil chemistry tests at each site to establish the utility of a variety of site-specific remote sensing strategies (e.g. resistivity, magnetics, or ground penetrating radar) for the enhanced definition of archaeological boundaries and internal site structure.

Grouard, Sandrine (Muséum National d'Histoire Naturelle (Paris)) and Sophia Perdikaris (College of Arts and Sciences, Department of Anthro)**[159]** *From Frog to Bat: The Extraordinary Bestiary of the Pre-Columbians from the Caribbean*

Zooarchaeological studies bring information on the history of the vertebrate faunas during the last 30000 years and especially on their relationships with human activities since 5000 years in the Lesser Antilles.

In such an oceanic island environment, the Pre-Columbians have mainly exploited animals from the sea. However, in a society that consumes mainly fish, what is the place of other vertebrates in the food and the symbolism?

For example, the Racer snake (*Alsophis*) has been extinct in Barbuda during the historical time period and thus never previously described. This docile and non-venomous racer snake appears to have inhabited Barbuda and has been found in context dating to 400 AD. The presence of bones in cooking pits and articulations indicate that the snake was cut in sections and either burned or cooked for possible consumption.

In a second case, we will draw up a list of the animals of the ordinary and extraordinary bestiary of the Pre-Columbian of the Lesser Antilles, based on zooarchaeological analysis, chroniclers writings, engraved bones, and archaeological stylized representations on ceramics, lithics, and shells. We will discuss the symbolism of few animals: were the manatees, dogs, bats, frogs, lizards and snakes consumed or were they taboos?

Grouard, Sandrine [159] see Perdikaris, Sophia

Gruber, Anya (University of Texas, Austin)**[414]** *Palynological Investigations of 17th Century Spanish Colonialism and Ecological Change at LA 20,000, New Mexico*

This talk will use archaeological pollen data from LA 20,000, a Spanish rancho site located approximately 12 miles from Santa Fe, New Mexico, to investigate how Pueblo and Spanish environmental alteration made long-term, complex changes to the landscape. By identifying and quantifying pollen taxa, this research will demonstrate how plant population fluctuations near LA 20,000 indicate localized ecological shifts. These patterns are then understood within the context of cultural activities, particularly, agricultural and pastoral practices. This research also seeks to dispel myths of the Native American 'noble savage' living in harmony with a 'pristine Nature'; rather, signatures of a marshy and meadow-like pre-Hispanic environment show a Pueblo-modified environment prior to the arrival of the Spanish. Furthermore, though the Spanish instituted agro-pastoral practices that heavily modified the environment, it was a slow process that took place over time, rather than a rapid and immediate change. Spanish introduction of intensified wheat agriculture and animal grazing led to a drier, more heavily disturbed landscape with increased populations of ruderal weeds and fewer riparian trees and shrubs.

Grund, Brigid [329] see Pelton, Spencer

Grund, Brigid (University of Wyoming) and Stephen Williams (University of Wyoming)**[329]** *Can Soil Microbial Community Composition Distinguish Indoor and Outdoor Spaces?*

Various methods have been used to differentiate among activity areas at archaeological sites (e.g., element and lipid analysis), but additional work in this area is needed. To our knowledge, no previous studies have attempted to classify indoor and outdoor spaces by examining soil microbial community composition. Phospholipid fatty acid (PLFA) analysis is a technique widely employed by soil scientists to estimate microbial presence in soils. PLFA signatures may be used to identify the occurrence and prevalence of certain groups of soil microbiota, such as bacteria, fungi, and protozoa. Ethnoarchaeological soil samples collected from inside and outside nomadic Dukha house footprints in Northern Mongolia in 2013 produced significantly different PLFA signatures, indicating that this technique could potentially inform archaeological interpretation. In 2014, soil samples were collected from inside and outside stone circles at the Hell Gap Tipi Ring site (48GO556) in eastern Wyoming, just southwest of the well-known Hell Gap Locality 1 Paleoindian site (48GO305). In this poster, PLFA results from Mongolia and Hell Gap are compared to determine whether differences in PLFA signatures persist on a timescale that is archaeologically useful.

Gruner, Erina**[357]** *Recent Work at the Pueblo del Alamo: Ceramic Production and Exchange in the Lower Salt River Valley*

Since 2015, WestLand Resources has excavated sites along the proposed South Mountain Freeway, Loop 202 extension in Phoenix, Arizona, for the Arizona Department of Transportation. The freeway corridor lies in the western, lower Salt River Valley near the confluence with the Gila River, within what is traditionally defined as the Hohokam core. It includes a portion of Pueblo del Alamo, a major Hohokam settlement occupied from the Pioneer to the Classic periods (~A.D. 600-1450). I discuss two attributes of the ceramic assemblage identified during the initial analysis, and the implications of these findings regarding local exchange networks and demographics. First, the Colonial period assemblage contains red-on-brown variants of the Hohokam Middle Gila Buff Wares, that were likely produced in the lower Salt River Valley. These differ in composition, style, and distribution from the Middle Gila Buff Wares and should constitute a separate series. I also discuss increased diversity in utility wares during the Sedentary period, including unnamed types with technological qualities similar to the Patayan ceramic tradition. The appearance of these utility wares at Pueblo del Alamo and neighboring sites presents further evidence of interaction or co-residence between Hohokam villagers and nomadic Patayan populations during the Sedentary period.

Gruntorad, Kelsey, Katie K. Tappan, G. Tucker Austin and Chrissina Burke**[260]** *Rabbits, Pronghorn, Oh Deer! Oh My! Part II: A Complete Faunal Analysis of Utility Indices at Wupatki National Monument, Northern Arizona*

Wupatki National Monument, a Puebloan site located in the Sinagua region of Northern Arizona, yielded an assortment of wildlife available to past populations. Analyzing faunal remains from archaeological sites on the Colorado Plateau develops a holistic understanding of the prehistoric lifeways of Southwest communities. Through the determination of taxa present, minimum number of individuals, animal portions utilized, cultural modifications such as butchering and pot polish, and natural taphonomic signatures, our research provides a thorough investigation of animal use through time at the site. Further, we examine utility indices such as MGUI and FUI, and discuss the relative frequencies of Artiodactyls and Lagomorphs in the community's diet. Our research highlights the importance of understanding the role of animals in the Southwest diet, and provides discourse on animal resources in an arid environment.

Grunwald, Allison**[131]** *Ten Right-Sided Sheep Femora and Other Peculiarities: What To Make of the Arch Street Faunal Assemblage*

In 1860, a concerned party claimed that neighboring tenement dwellers used the cemetery of the First Baptist Church of Philadelphia as their personal dumping ground, leaving behind 'refuse of their domestic economy' in the form of material culture and food waste. In 2017, salvage archaeology operations at the cemetery recovered a small faunal assemblage of 214 identified specimens, and an additional 26 specimens likely from the same timeframe. Due to rushed recovery, the assemblage is both small and likely incomplete, potentially leading to peculiarities in species and element representation. But the assemblage nevertheless offers insight into the economy and habits of the tenement occupants who took advantage of the neglected church grounds.

Guadalupe De Jesús, Coralisse [418] see Torres Roldán, Isaac

Guadalupe De Jesús, Coralisse (University of Puerto Rico, Río Piedras Campus)**[418]** *Stitching Histories: Women in the Puerto Rican Clothing Industry between 1910-1930*

This case study focuses on the reconstruction of stories of women who worked in the clothing industry, specifically dressmakers and seamstresses in the Mercado neighborhood of San Juan, Puerto Rico, between 1910-1930. The aim of this research is to demonstrate the viability of using primary sources such as maps, population census and images to create a better understanding of this group. The information acquired was organized in a database that considers variables including the level of literacy, family composition, age groups, and generational characteristics. Also, the use of commercial registries permits the pinpointing of places where they most likely acquired tools and materials related to the aforementioned trades. The results of this study can be used as a point of reference for future investigations that will consider connecting this data to existing archaeological evidence, as well as promote

the reassessment of women's contribution to the local workforce.

[30] *And here's the NEWS from Xnoha! Understanding Maya Settlement and Early Anthropocene Landscape Modifications at a Small Maya Center*

Xnoha is a small Maya center in northwestern Belize that has seen two phases of investigation since it was recorded in 1990. While current research is largely focused on the Central Precinct or kawik, we have also invested much energy in the outlying groups of monumental architecture and settlement.

Xnoha is located in a heavily dissected zone east of the Alacranes Bajo and north of the Dumbbell Bajo. The Central Precinct and associated Elite Residential Groups are located on a broad hilltop with four other such areas surrounding it in each of the cardinal directions. Each of these, NEWS groups, are residential groups with approximately 100 residences in each. Each residence is bounded by low albarradas, which may have formed bases for larger "living walls". These functioned to define residential space and possibly land ownership. Each bounded area was also large enough to support household level agricultural production tying each household into larger market systems.

At the bases of these hilltop residential groups are ditched intensive agricultural systems that likely were controlled by the ruling elites of Xnoha and would have employed labor from the surrounding settlement zone.

[350] *Shared Spaces, Shared Stories: A Reflection on Archeology and Community from the Ecuadorian Rain Forest*

This presentation attempts to reflect on the dynamic relationship between archeology and communities, based on the 17 years of field experience of the Palmitopamba Archeological Project, in NW Pichincha Providence, Ecuador. The success and challenges of our experience demonstrate the need for a more reflective archeology that aspire to be participatory in its pedagogy, outreach and methodology. An archeology that feels comfortable implementing multivocality as a framework to produce work that "is inclusive and that tells multifaceted stories" (Joyce, 2002:1-11).

[350] *Chair*

Guebard, Matthew (National Park Service)

[85] *Architectural Documentation at the Montezuma Castle and Casa Grande Ruins National Monuments*

This presentation will discuss a partnership between the National Park Service and the University of New Mexico for in-depth documentation of ancient architecture at the Montezuma Castle cliff dwelling and Casa Grande great house. While the project was initially developed to produce a management plan, it also resulted in the discovery of decorative plaster washes. Colored washes are the primary form of decoration on interior walls and may provide clues to the visual symbolism associated with certain colors and visual effects found on interior walls at both sites. This presentation will highlight efforts to document, manage and interpret these washes.

Guengerich, Anna (Vanderbilt University)

[18] *Houses and the Puzzle of "Public Space" in Ceja de Selva Communities of Northeastern Peru*

Researchers seeking to systematically compare built environments across the late Andean highlands have frequently noted the absence of monumental corporate architecture at hilltop sites. A number of alternative candidates that fulfilled the function of public architecture have therefore been proposed, such as communal tombs and large perimeter walls. In this paper, I explore the question of how social communities were created in built environments that lacked architectural settings capable of accommodating community-wide gatherings. In the context of the ceja de selva of northeastern Peru, I propose that houses—rather than special-purpose structures—were the principal element that fulfilled this function for communities in this region. The large scale and elaborate exteriors of houses brought communities together during the events surrounding the initial construction process, but also as individuals continue to experience their façades as they moved through space on a daily basis. At the same time, the architectural similarities between houses and ceremonial structures reinforced the connection between household groups and spaces of shared value. In sum, these built environments provide a perspective not only on what "public space" meant in the LIP, but also how we conceptualize its relationship to domestic space more generally.

[34] *Beyond Counting Sheep: An Interdisciplinary Review of Faunal Assemblages in the British Pastoral Landscape*

One of the challenges in zooarchaeological research is to advance new methods of understanding animal husbandry within the past socio-ecological context. Intensification of wool production is typically evidenced in the archaeological record by the increase of sheep remains in species abundance and adult mortality; however, with increasingly complex data sets, classical quantitative methods of taxonomic abundance may not provide robust explanations of human activity based on herd structures alone. The application of computational archaeology to faunal analysis allows for the study of intra- and inter-site variation, as well as the investigation of regional trends with environmental, geographic, and temporal variables. To further explore the changes in sheep husbandry related to wool production in Medieval Britain, this project aims to provide reproducible analysis using computational archaeology to refine interpretations that reject generalizations and test the validity of patterns found in the archaeological record. Data sets from published assemblages are presented in case studies that move beyond regional descriptions of pastoral systems to assess faunal and environmental data with statistical analysis and models. The relevance of computational methods for zooarchaeology is critical for sharing complex data across disciplines, formalizing approaches in quantification, building new research questions, and informing perspectives on site variability.

[17] *Connecting Language, Places, Stories, and Archaeology for Landscape-Level Heritage Preservation: A Collaborative Archaeology Case Study of Eyak Lake, Alaska*

This paper explores a methodological process for documenting the intricate relationships between language, place names, stories, and cultural places for effective landscape heritage preservation. This multi-disciplinary program, led by the Eyak community, is focused on the analysis of place-based data and cultural knowledge systems, as the basis for protecting and mitigating the threats and impacts upon Eyak heritage and land; embedded within a broader program of language revitalization and community resilience. As a community initiative, it is the language learning process itself that directs the community-based research into the way place names and stories are organized and structured; it is the method of revealing aspects of underlying knowledge systems and cultural principles embedded in landscape. When integrated with archaeological methods and regional studies, the process also provides insights into patterns of traditional settlement and traditional management practices, and how they relate to these cultural systems and layers. This methodological process outlined here is applied in an assessment of Eyak Lake as a collaborative, strategic response to a range of direct and indirect threats to heritage places - including traditional burial grounds and salmon habitats - within this cultural landscape.

[169] *Hunting Varmints, or Tasty Morsels?: An Isotopic Survey of Iroquoian Garden Hunting*

We use stable carbon and nitrogen analyses of over 500 archaeological animal bones to explore the relationship between ancient farming practices and local wild fauna in the context of Iroquoian horticulture in Southern Ontario (AD 1000-1600). By creating openings in the forest and introducing non-local plants, Iroquoian farming served to increase habitat diversity and foraging opportunities for wild animals, potentially attracting a wide range of mammal and bird species that could then be hunted and incorporated into local subsistence. While such garden hunting has long been theorized for Iroquoian sites in the region, it has been difficult to securely identify garden-hunted specimens in the archaeological record. Because maize, a key plant grown in these gardens, has a distinctive isotopic signature, animals feeding within a garden-subsidized ecosystem for a significant portion of their lives should be isotopically distinctive. By comparing the relative importance of maize in the diets of different wild taxa, we identify which species were most effective at exploiting ancient human food systems and relate this to the widely theorized practice of garden hunting. These findings also shed new light on the role of indigenous farming practices in the ecological structure of ancient forest ecosystems.

Gullapalli, Praveena (Rhode Island College)**[161]** *Taking Things Apart: Reconfiguring Production Practices in South India*

In this paper I explore how taking apart the bundle of practices grouped together as 'metallurgy' might lead to a better understanding of not only that technology but also of ancient South Indian society. While cross-craft approaches to technologies allow archaeologists to explore potential relationships between production activities that otherwise might be investigated independently or in isolation, disaggregating the processes involved in any given craft can further their potential to illuminate past production practices. A focus on constituent practices—rather than on the bundle that constitutes each craft—draws our attention to how such practices might be present not only in varied crafts but also in other, non-craft, activities; to how such activities might reflect divergent, locally specific bundles of practices. This tracing of discrete components can be potentially useful in South India and especially regarding the development of local metallurgical productive activities. The archaeological landscape there presents evidence attesting to a range of production practices that do not easily fit those boundaries of craft production and technological development usually used by archaeologists. This mis-fit reveals a glimpse into a possible alternative crafting framework, perhaps one better suited to South India.

Gunchinsuren, Biambaa [416] see Gillam, J. Christopher

Guo, Meng (China Northwest University)**[214]** *A Primary Study of Ceramic Technology at the Shimao Site*

The Shimao site was a significant stone-walled settlement in Northern China dating to around 2000 BCE. In recent excavations, vast amounts of pottery sherds were unearthed from Huangchengtai, the stone-walled platform which was encircled by both the interior and exterior stone walls. Around 200 pottery sherds were examined by naked eye or hand magnifier, meanwhile samples were analyzed with petrography and X-radiography. We found that some pots were made by coiling or molding, but throwing was also a critical primary forming technique of certain shapes. Pots thrown on the wheel were usually trimmed on the wheel as well, while paddling was also a significant secondary forming technique for pots made by coiling. The dark gray color of most sherds suggested that they were cooled in a reducing atmosphere. The smudging technique was employed when a metallic black color was desired.

Gupta, Neha (University of New Brunswick), Susan Blair (University of New Brunswick) and Ramona Nicholas (University of New Brunswick)**[77]** *What We See, What We Don't See: Spatial Data Quality in Large Digital Archaeological Collections*

In an era of cyber-infrastructures, large digital archaeological collections have the potential to enable deep insights into human history. Yet the life of digital archaeological data post-field recovery is not well understood, and consequently, issues of spatial data quality in large digital archaeological collections have been under-examined. Archaeological practices impact the quality of spatial data and any subsequent analysis and interpretation of those data. We shed light on the quality of digital archaeological data from the perspective of post-colonial and Indigenous archaeology. We re-conceptualize maps in a representational model to examine the role of digital archaeological data and simple map visualization as a part of heritage management in New Brunswick, Canada. We argue that critical examination of maps and map-forms can open broader discussion on the interweaving of power, space and knowledge in archaeology, which in turn, can create opportunities for addressing the quality of digital archaeological data and deepening our understanding of the past.

Gurova, Maria [392] see Bonsall, Clive

Gustas, Robert (University of Victoria)**[378]** *Comparison of Circuit and Least Cost Path Modeling for Maritime Peopling of the Americas*

Despite much recent scholarship there is still much to learn about the exact method, route, and timing of the Peopling of the New World. Geographic Information System (GIS) based analytical methods provide opportunities to model where and when coastal peopling events could have taken place. I will compare the results of traditional Least Cost Path models to Circuit Theory models and discuss how these techniques can be used to inform site prospection efforts. While previous scholarship has examined and compared the application of Least Cost Path and Circuit Theory models to terrestrial movement events, substantially less work has been done to compare the use of these methods in large scale maritime migration events in the deep past. To this end, I analyze results produced by both these methods using reconstructed coastlines (accounting for sea level change) as they would have existed 15,000 years BP, from multiple locations on the coast of British Columbia; including Barkley Sound, Prince Rupert Harbour, and the Dundas Islands. The results of this analysis as well as the strengths and weakness of both approaches are discussed in the context of early movement events in the Americas.

[285] *New Surveys along the Middle Basin of the Quequén Grande River, Pampas Region (Argentina)*

During the last 30 years, archaeological research in the middle course of the Quequén Grande River, Pampas region (Argentina), has provided a wealth of data, both in the density of recorded archaeological sites, and in its chronological representation, which spans from the Late Pleistocene to Late Holocene (10,250--1500 14C years BP). This is true of the archaeological localities Paso Otero and Zanjón Seco. Given this background, new surveys carried out recently in areas near these localities assumed the finding of a significant number of sites with diverse chronologies. However, the recorded findings did not yield the results according to these expectations. In this paper we discuss the disparity in results found along different sectors of the river. The number of findings recorded on the surface is the result of lower archaeological visibility than those often recorded decades ago, produced by changes in the modern plowing methods (no-till farming). The lack of materials registered in stratigraphic position (sites located along the river banks) likely corresponds to a predominance, in some sectors of the stratigraphic sequences, of deeper sections of paleo-lakes, not feasible for human occupation, and with a low representation of stable buried soils.

[375] *A Possible Sculptural Tradition in Eastern Michoacán and Western State of México*

Scant attention has been paid to the past of the current border of the states of Michoacán and Estado de México, though there has been a proposed local archaeological traditions for the region in order to understand archaeological contexts. There are archaeological data about large carved stone sculptures which can lay the foundations to start a regional archaeological study. In the High Cutzamala River Basin region, there are around fifteen carved stone sculptures found between its northwest end (San Felipe Los Alzati, Michoacán) and its southeast end (San Lucas del Pulque, Estado de México). Some of them are in regional museums, community museums, and private collections. These impressive sculptures have been described since the mid-20th century, attributing them to its aesthetic similarity to "snake heads" or "rattle snakes" and their shapes have been compared to sculptures from distant regions. However, these studies have not placed these important monuments in a firm spatial and temporal archaeological context. In this study, I present a detailed typological study to develop a first categorization, identify them in time and space, and determine the technological and symbolic features they express.

[363] *Transferable Skills: Crafts and Knowledge Transmission in the Ancient Caribbean*

In this paper, we examine the development of craftsmanship and knowledge transmission in the pre-colonial and

early colonial Caribbean. By adopting a chaîne opératoire approach to different crafts, we aim to investigate processes of circulation of materials and knowledge between different social groups. We focus on multiple scales of interaction through time, as illustrated by 1) the exchange of exotic gemstone ornaments across the eastern Caribbean (ca. AD 0-400), 2) the production and circulation of ground stone celts on the northwest of the Dominican Republic (AD 1200-1500), and 3) the development of transcultural ceramics from one of the first large Spanish settlements of the New World (Dominican Republic, AD 1492-1562). Combined with ethnographic and ethnohistoric sources, this approach allows us to evaluate possible social mechanisms responsible for raw material, typotechnological, and skill variability in these artefact repertoires.

[409] *Preliminary Investigations of Archaeological Vicuña Drives on the Andean Altiplano*

Archaeological game drives are well documented in many parts of the world but are virtually unknown in the Andes Mountains despite millennia of large-game hunting. Using satellite imagery, we identify nearly 200 V-shaped, stone-wall structures that exhibit qualitative and quantitative properties of game drives. Furthermore the features coincide with the habitat of vicuña—a species of wild camelid that lives at high altitudes. Ground observations were made at ten of these remotely identified structures and excavations at two of them. Combined with ethnoarchaeological observations of modern Aymara vicuña drives, the archaeological results suggest that prehistoric communities of 30-100 individuals used the structures to capture up to 50 vicuña in a single event. We conclude with a discussion of the implications for Andean economics and the evolution of human cooperation.

[25] *The Western Connection: Using Comparative NAA Data to Source Glaze Wares from Tijeras Pueblo*

Non-local glaze-painted pottery types, such as Heshotautla and Kwakina polychromes, comprise more than 20% of the decorated ceramic assemblage at Tijeras Pueblo (LA581). Despite Tijeras Pueblo's location at the eastern edge of the Albuquerque basin in the central Rio Grande region, these pottery types exhibit strong stylistic and technological affinities to contemporaneous pottery produced across broad parts of the Western Pueblo area, including the Western Keres, greater Zuni, and Upper Little Colorado regions. Provenance studies, including NAA, suggest that this "Western-style" pottery at Tijeras is a mix of imported vessels and local copies. In this paper we compare the NAA chemical compositional data from Western-style Glaze Wares recovered from Tijeras Pueblo with recently compiled multi-regional NAA ceramic databases from across the Western Pueblo area of the American Southwest in order to better pinpoint the origin of the imported vessels. These results have the potential to significantly impact our understanding of the history of migration and processes of community formation at Tijeras and throughout the central Rio Grande during the 14th century.

Habu, Junko (University of California Berkeley)**[74]** *Long-Term Perspectives on the Resilience of Food and Socioeconomic Systems in Prehistoric Japan: Examples from the Early and Middle Jomon Periods*

This paper argues that the examination of rich archaeological data from the Jomon period of prehistoric Japan can contribute to the recent discussion of the resilience of food and socioeconomic systems. Theories of resilience which consider the importance of adaptive cycles and panarchical connections provide an ecological viewpoint from which we can pose the question of why diversification and decentralization, along with several other traits, are crucial for systems' resilience. Discussions of local and traditional ecological knowledge (LEK and TEK) have revealed the limitations of a "scientific" understanding of the efficiency of food production systems, and calls for an integrative understanding of food production in relation to the whole range of human-environmental interaction, including the role of material culture. In particular, physical and social landscapes are inextricably linked to LEK. TEK, and material culture that contain bundles of practices, meanings, attributes and values. Using examples from northeastern Japan, I argue that understanding continuity and change in landscape use from prehistoric times to the present may be key in developing proposals for alternative food production systems that are both resilient and sustainable.

Hackbarth, Mark [189] see Howard, Alex

Hackenberger, Steven (Central Washington University) and Jon Shellenberger (Yakama Nation)**[122]** *Cultural Landscape Studies: Central Washington Yakama Nation Partnerships*

This is our 15th year of formal collaboration between Central Washington University (CWU) Department of Anthropology and the Yakama Nation Cultural Resource programs (YNRP). CWU (Ellensburg) is located in the center of Ceded Lands of the YN and an hour from YN tribal headquarters (Toppenish). Contracts, learning agreements, lecture programs, internships, and field school sessions have involved three CWU academic programs and four YNRP. The majority of our partnerships involve: inventory, mapping, monitoring, damage assessment, supporting databases, and site assessment. Two initiatives are highlighted: 1) lidar and ground mapping of house settlements, and 2) ground penetrating radar studies of sites with cooking features and house features. Airborne Lidar coverage has grown and improved in resolution due to extensive wildlife and fisheries studies and habitat improvements. This coverage is aiding mapping and monitoring of house settlements that remain threatened by looting, grazing and fire management. Pilot projects using ground penetrating radar are proving useful for evaluating type and number of cooking/heating features outside and inside of small and large house features. While sources of funding and support are under threat, our working relationships stretch our capabilities, build resilience, and add educational and cultural outcomes for the communities we serve.

This paper will discuss the burials of infants and young children in the earliest Christian cemeteries in Anglo-Saxon England (10th and 11th centuries CE). While in earlier pagan periods the burials of the very youngest members of communities are conspicuous by their paucity, the earliest Christian cemeteries have a much more representative complement of child burials. Yet the burials of such individuals are still notably distinct, with many being interred in clusters close to the walls of churches, or around, or even within, prominent adult burials, often those of males. In this paper we explore the reasons for this patterning, incorporating stable isotope evidence that appears to reveal different health and weaning experiences for infants buried in distinctive locations, which may help to explain their funerary treatment. We also argue that the form of the burials of children may have played a part in ensuring their welfare in the afterlife, and also the welfare of the communities among which they had lived and died.

Hahn, Christina**[168]** *Rethinking Ceramic Attribute Technology during the Late Woodland Period in Southwest Ohio*

The focus of this research is the variability of ceramics from Late Woodland (A.D. 400-1000) sites in the Little Miami River Valley in Hamilton County, Ohio. Few Late Woodland features have been recovered and little is known about the ceramic technology in southwest Ohio, but these artifacts still play a major role in understanding prehistoric societies. The Hahn's Field (33Ha10) and Firehouse (33Ha419) sites were selected to show how changes in ceramic technology affected vessel attributes. Variability in temper, exterior-surface, interior-surface, weight, maximum thickness, burn patterns and thermal features were examined to determine differences between sites. Radiocarbon dating provided a Late Woodland context to the features and ceramic attributes, and x-ray diffraction

analysis provided a bases to develop inferences about resource selection through key mineral identifications. Considerable differences between Hahn's Field and Firehouse ceramic technology were determined in this study. Specifically, variability in temper, exterior-surfaces, burning, and thermal features of sherds indicates that change in ceramic attributes occurred on a shorter timescale than previous models suggest. Combining ceramic analyses with dating results revealed that Hahn's Field and Firehouse were contemporaneous (A.D. 392-564). Finally, mineral identifications supported the inference that local resources were used to produce these ceramics.

[189] *The Other Black on White: Aspen Carvings of the Flagstaff Region*

Once a widespread industry throughout the southwest, sheepherding has left its mark, albeit a delible and dwindling one, throughout the high elevation mountains of the American southwest. Aspen carvings made by sheepherders provide a window into the daily lives, ethnicity, politics, and personal sentiments of these men. In the 1990s through the 2000s archaeologists from the Coconino National Forest led volunteers into the aspen groves in the mountains surrounding of Flagstaff, Arizona to document hundreds of names, dates, and images carved into the aspens by Basque and Hispanic sheepherders during the early to mid-twentieth century. The work has continued through several contract archaeology projects on the forest. This paper reports the results of these efforts, provides a preliminary analysis of the spatial and temporal distribution of these dendroglyphs, and attempts to apply these glyphs towards understanding the people who cultivated the sheepherding industry of Flagstaff.

Haines, Julia (University of Virginia)

[347] *Mauritian Indenture in the Indian Ocean*

This paper presents a case study of an African/Indian Ocean plantation that focuses on daily lives of indentured laborers during the 19th century. Mauritius's Bras d'Eau National Park was a sugar estate that functioned from 1786 to 1868. During the 1830s, French colonial landowners shifted from a reliance on enslaved laborers primarily from Mozambique and Madagascar, to indentured laborers primarily from India. Four hundred and fifty thousand men, women and children traveled to Mauritius on five-year indenture contracts to live and work on sugar estates. Domestic artifacts from the plantation village, such as Indian smoking pipes, glass bangle fragments, buttons from second-hand British military uniforms, cowrie shell currencies, lotus bowls, and traces of a pulses-and-rice-based diet are broadly representative of long-standing Indian Ocean cultural networks. On the other hand, the organization of village housing reflects laborers' preferences not just for individual homes over communal barracks, but for houses adapted to the local environment and climate based on Indian health practices and the western concept of miasma. As such, the landscape and material culture of Bras d'Eau are expressions of indentured immigrant identities that are specific to Mauritius, but that also fit within Indian Ocean and European colonial sensibilities.

[134] *The Maya Cranial Photogrammetry Project: A Look at Ethics and Best Practices*

The Maya Cranial Photogrammetry Project consists of a database of digitized crania that can be used to investigate questions related to biological and cultural histories. The shape of human remains reflects a complex interplay between the environment and genetics, and thus can be used to reconstruct evolutionary processes. Typical methods rely on obtaining metric data directly from the physical remains, however, poor preservation and prolonged access have proven challenging. 3D modeling technologies have emerged and made it possible to preserve the remains and access collections remotely. Despite these victories, digital data has manifested its own challenges, such as; management, preservation, and of particular concern when discussing digitized human remains, security and access. Utilizing crania from Tipu, a Colonial mission site located in western Belize, 3D models were created using photogrammetry and craniometric data were produced digitally. This paper does not aim to address the biological and cultural transitions occurring in the contact period, but instead use the growing database as an opportunity to explore guidelines and best practices in the management of digitally produced and recorded data.

[47] *Honing an Integrated Approach to Geoarchaeological Research in Alluvial Environments of the Lower Ohio River Valley*

Identification and interpretation of buried cultural deposits in alluvial settings is improved by an integrated approach that considers the area at an appropriate scale in line with prehistoric land use; applies key underlying concepts; and utilizes multiple methodologies of subsurface investigation, laboratory analysis, and environmental modeling. Success at finer resolution depends on recognition that a "floodplain" represents a range of depositional environments that in the stratigraphic record have a varying potential to contain intact cultural deposits. Key concepts include identification and significance of alluvial veneers, facies analysis, and dynamic modeling of soil - evolution, -facies, -stratigraphy and -geomorphology. Integrated methods and techniques of the approach include the use of LiDAR-based digital elevation models; graphic sediment soil logs; and dark soil color distinctions that

reveal stacked and welded upper sola. Drawn from work in progress in the Knob Creek Bottom of the Ohio River Valley, example results show: 1. A previously unrecognized soil complex of three buried soils; 2. Subtle hill slope segment differences in the natural levee environment that have soil-stratigraphic and -morphologic consequences; and, among others, 3. A previously undifferentiated fine grain terrace sediment assemblage that is divisible into six lithofacies with prehistoric settlement, activity, discovery and other archaeological implications.

[317] *Ethical Issues of Bioarchaeology in Southeast Asia*

Since the 1990s, there has been an increase in bioarchaeological research in many parts of Southeast Asia conducted by both locals and non-locals. Southeast Asian countries are characterised by varied social, cultural, and political histories, but there are also some broad similarities in terms of poor economic development that limits much local research, strong nationalism, and rigid bureaucratic procedures for research. All have implications for the future of bioarchaeological research. Despite increasing growth in the field, the ethics of the practice of bioarchaeology in this region remain relatively underexplored. This paper presents some of the main ethical issues of research with human remains in the region focusing on the countries of Thailand, Myanmar, and Cambodia, from a non-local and local researcher viewpoint. We review a range of ethical issues, including the varied way different cultures respond to bioarchaeological work, local and non-local partnership in research, community archaeology, bioarchaeological methods including post-excavation management, and looting of archaeological sites. With the recent development of local expertise in bioarchaeology in the region, the repatriation of skeletal samples, the increase in local training, and partnerships between local and non-local bioarchaeologists, there is much promise for the further development of local research in the field.

[88] *Getting Out of the Box: New Horizons for Cultural Resources Data Management and Analyses*

Though making great strides over the past 50 years, Section 106, the primary driver of Cultural Resource Management (CRM), is still boxed in by rote inventory and unimaginative interpretation and implementation. This poster details a national initiative by the Bureau of Land Management to create cultural heritage resource data standards, which allow the application of more rigorous data management principles to landscape level planning and data modeling across the Western United States. Using a systematic attribution structure and ubiquitous domain values, the standard facilitates proactive versus reactive resource assessments, allows for advanced querying and geo-statistical analysis, and the enables development of appropriate treatments of cultural heritage values. This poster exhibits the BLM national CRM standard and associated modeling tools, showing ways we can break out of the box through standardized data management and applied analytical applications.

Hall, Amanda (University of Florida)

[362] *Rewriting Narratives by Challenging Old Ideas: The Potential in Applying Recent Innovations in Archaeology to Legacy Collections.*

In the 1970s and 1980s, the Army Corp of Engineers Mobile District funded excavations in Mississippi to salvage a number of Native American sites along the Tombigbee River from the construction of the Tennessee-Tombigbee River lock and dam complex. Three of these sites, Tibbee Creek (22Lo600), Kellogg (22Cl527), and Yarbrough (22Cl814) are multi-component farmstead collections that have been housed at the Cobb Curation Laboratory at Mississippi State University for decades. Aside from site reports, the collections have not received in-depth research inquiries. However, advancements in theoretical approaches and new concepts coupled by methodological and technological innovations offer ideal opportunities to pull these collections off the shelves and "re-excavate" to mine fresh research regarding cultural patterns and drivers of change in the area during the Late Woodland and Early Mississippian Periods. At the time excavations were conducted, migration was rejected by most as a means for explaining culture change because of its unpredictable nature and the difficulties it presented in the archaeological record. Using the assemblages from the three sites, this preliminary paper examines what new research questions and analyses could potentially reveal regarding the migration of Mississippian peoples into the area during the Early Mississippian Period (A.D. 1000-1100).

Hall, Sarah (Arizona State University)**[9]** *Bodies Apart: Dissection and Embodied Structural Violence in a Historic Skeletal Assemblage from San Francisco*

Historic-era skeletal samples from the United States routinely reflect marginalized and vulnerable populations, many of which were also subject to dissection, a partible practice widely considered a form of desecration in the nineteenth century. Using historic and osteological data from a skeletal assemblage (MNI=25) at Point San Jose in San Francisco, CA (AD 1863-1903), this work builds upon previous scholarship to discuss the marginalized social identities of the individuals within the assemblage. The commingled assemblage at Point San Jose comprised thousands of human bones, many with cut mark damage, suggesting they were used for anatomical dissection. Assessment of biological characteristics suggested that individuals of non-European ancestry were overrepresented based on late nineteenth-century census data from the Bay Area. This study explores the ways structural violence is embodied in these skeletal remains during life and after death using several lines of evidence, including isotopic analyses of diet and migration, burial context, and osteological evidence of dissection. The ensuing discussion of embodiment and postmortem agency is critically applied not only to historic postmortem examinations but also to the excavation and analytical methods used for this assemblage.

Halligan, Jessi (Florida State University)**[33]** *Coastal Paleoindians in the Southeastern US? Envisioning Early People on the Now-Drowned Continental Shelves*

Archaeological data have demonstrated that the Southeastern United States were occupied by at least 14,550 years ago, but evidence of these first people is limited to far inland and upland settings as more than half of Florida's peninsula was drowned between 18,000-5500 cal BP. Recent models suggest that at least some of the first Americans may have arrived by coast and may have colonized the continent from the margins inward. Human behavioral ecology in combination with recently-refined paleoenvironmental reconstructions of the Florida Gulf Coast and the known pre-9500 cal BP archaeological record can be used to discuss when and where coastal opportunities for the first Floridians would have been greatest and discuss potential early coastal lifeways on the now-submerged continental shelf.

Halling, Christine (Louisiana Department of Justice)**[160]** *A Case Study of Legal and Practical Pitfalls of Forensic Archaeology Recovery of Human Remains from a New Orleans Pauper Cemetery*

Many coroners' offices in the State of Louisiana have a contract for interring unclaimed or unidentified individuals, keeping their coolers clear for new bodies. Therefore, the public relies on interment to document the location of the body in the event that family members require disinterment in the future. When these contracts are with private companies, questions of ownership and access to the records may arise. Just such a situation has occurred in New Orleans, Louisiana, raising such issues as: Who has the right to access the interment information? In the event of a disinterment, what parties are responsible for assisting in the location and recovery of the remains? When there are incomplete or inaccurate records, or multiple interments in a single space, what precautions must be observed with regard to other interments? Do the dead have rights that must be respected? In this case study, an experience with a New Orleans pauper's cemetery and the successful excavation and disinterment of a specific individual is employed to address these questions and more.

Halperin, Christina (Université de Montréal)**[199]** *Convergence Zone Politics and Cultural Affiliations at the Archaeological Site of Ucanal, Peten, Guatemala*

The Maya archaeological site of Ucanal is located in Peten, Guatemala, close to the contemporary border with Belize. In Pre-Columbian times, the site also sat at the borders of some of the largest political centers, such as Caracol (Belize) and Naranjo (Peten, Guatemala). Entangled between these dominant centers and with ties to peoples in the Upper Belize Valley and the Petexbatun region in Guatemala, Ucanal was arguably a critical convergence zone of political and cultural interaction. This paper synthesizes three years of archaeological research at Ucanal to underscore the ways in which this small polity manoeuvred within and between different cultural affiliations and political networks. In considering monuments, prestige items, and common household items dating to the Late Classic and Terminal Classic periods, we find that the site's border status was more of a bridge than an edge.

[258] *Survivorship and Periosteal Lesion Activity at Pueblo Bonito and Hawikku: Examining the Biological Impact of Contact in the Ancestral Pueblo Southwest*

A consideration of periosteal lesion activity and its effect on the likelihood of survival can communicate a deeper understanding of major cultural-ecological transitions by elucidating the effect of heterogeneous frailty on the formation of a skeletal assemblage. This study tests the effects of Spanish contact on the association between survivorship and periosteal reactions in the Ancestral Pueblo Southwest by examining skeletal samples from Pueblo Bonito (AD 800-1200) and Hawikku (AD 1300-1680). The study hypothesizes that survivorship will differ based on lesion activity category – individuals with healed lesions will possess a survival advantage over those with active, mixed, or no lesions. Further, due to similarities in settlement environment and subsistence, the relationship between survivorship and periosteal lesions will not differ between the two sites. The results of the Kaplan-Meier survival analysis documented a significant difference between activity level and survivorship at both Pueblo Bonito and Hawikku. Individuals with healed lesions appear to possess a survival advantage over those with active, mixed, or no lesions. The results suggest that Spanish contact did not have an observable effect on the relationship between activity level and survivorship, potentially reflecting a broader trend between heterogeneous frailty and periosteal reactions in the archaeological record.

[83] *Food and Eating Practices as Affirmative Bio-politics on the Border*

In this paper, I will explore the role of provision, preparation, and consumption of food among undocumented border-crossers on the island of Lesbos in Greece. In the various migrant centres run by solidarity groups, cooking and eating become the embodied experiences that bind migrants and solidararians together. Relying on primary archaeological ethnography fieldwork, I will be tackling the following questions: (1) How do the materiality and corporeality of food provision, preparation, and consumption produce time and memory in the various border-crossing contexts?; (2) How do they define and redefine sociality and community, and shape understandings of the border and of the migrant experience?; and (3) What kind of bio-political effects do such material and corporeal phenomena produce, for migrants, solidarity groups, and local communities? Based on the insights gained from the anthropology and archaeology of food, sensoriality, and memory, and on the Deleuzian concept of the “assemblage” (redefined as “sensorial assemblage” – Hamilakis 2017), I will be claiming that food provision, preparation, and consumption on the border operate as affirmative bio-politics (cf. Esposito 2008): as a positive, affective and corporeal/multi-sensorial act of place-making and community-building, as well as an arena for trans-corporeal and trans-cultural flows, and political agency and emancipation.

[111] *Using Multiple Isotopic Analyses to Infer Population Mobility in Iron Age Britain*

This poster presents the ongoing results on isotopic research on Middle Iron Age (~400–200 cal BC) populations in Wessex and East Yorkshire. The multi-isotopic approach has been employed to infer population mobility for both the inhumed human population at a series of sites and the faunal assemblages from either the associated settlements or directly recovered from graves. A traditional ‘population’ approach allows us to investigate broad questions of human and animal movement, such as to what degree were livestock transported across the landscape? Additionally, a ‘differential’ approach (i.e. looking at the changes in the isotopic ratios in an individual through time) can help reconstruct the movements of individuals within the population and approach questions about individual mobility, social differentiation, and the treatment of the individual in death. The combination of these two approaches in a single research strategy, thus produces data at multiple scales that allow us to develop a robust narrative of the society.

Hamilton, Marcus (University of Texas at San Antonio)

[187] *The Paleoecology of the Mockingbird Gap Clovis site, New Mexico and Surrounding Region*

In this paper I discuss recent work at the Mockingbird Gap Clovis site, New Mexico, and the surrounding region. Our goal was to understand how Clovis hunter-gatherers utilized and adapted to the regional landscape and its available resources. Focusing on lithic raw material use, I show that the Clovis occupants of Mockingbird Gap had access to a wide diversity of high quality raw materials from a large area of the Southwest. Moreover, Clovis raw material network analysis across the continent suggests that Mockingbird Gap was an important link between the Southwest and Southern High Plains. This work shows that Clovis people in this region of the Southwest had an extensive and specific knowledge of the landscapes around them, and may well have had connections to other Clovis peoples in neighboring regions.

[48] *Fire and Foxes: Investigations into a Pre-historic Human Presence in the Falkland Islands*

The warrah (*Duscicyon australis*), also known as the Falkland Islands wolf, was the only terrestrial mammal native to the Falkland Islands when Europeans arrived in the seventeenth century. The lack of definitive evidence of a pre-European human presence, coupled with the expansive channel separating the islands from mainland South America, raises questions about how and when the extinct, endemic *D. australis* arrived in the islands. Two competing theories have been proposed to explain the presence of *D. australis* on the Falklands: 1) the warrah crossed a hypothetical ice bridge at the Last Glacial Maximum (21,000 B.P.) when sea level was lower than present, and 2) prehistoric humans traveling from southern South America brought the warrah to the Falklands via canoes. Through a combined paleoecological and archaeological approach we have begun investigating the potential pre-historic arrival of humans to the Falklands. At one remote island location the close association of numerous marine mammal and bird bone piles with an orders-of-magnitude increase in fire frequency and magnitude, coupled with the proximal presence of one locally sourced stone point, suggests that New Island may hold the earliest known evidence of pre-historic human arrival in the Falkland Islands.

[155] *Multisensor Geophysical Survey of Monte Albán's Main Plaza*

During the summer of 2017, we conducted a landscape-scale geophysical survey of the Main Plaza at Monte Albán, Oaxaca, Mexico. We obtained full coverage of the plaza with gradiometry, electrical resistance, and ground-penetrating radar and also generated a centimeter-level accuracy map using a drone and a robotic total station. The most prominent feature discovered was a buried building that we interpret as a probable temple. Survey results add to our archaeological understanding of Monte Albán, show the benefits of utilizing multiple technologies, and provide potential guidelines for heritage management.

Hampton, Ashley (University of Montana)

[308] *Social-Relatedness and Power: Determining Lineages and Multi-Clan Connections within a Singular Housepit (HP54)*

This paper focuses on understanding how lineage-based and clan-based connections structured labor patterns and access to prestige/power within a multi-generational housepit (HP54) over time. The Bridge River site (EeR14), located in the Mid-Fraser Canyon, British Columbia, Canada, was generally egalitarian, but shows variation and situated power-differentials in terms of wealth and influence of individuals or groups based on familial, lineage, and/or clan connections across several generations. These relationships were likely negotiated both within households and externally between houses as well. Due to the longevity of occupation of HP54 (roughly 346 years), this housepit may be representative of long-lived kin groups who were connected to the initial construction of the housepit, and/or to each sequential expansion of the space. Clan-based resource connections and spatially-defined traditions were potentially passed down through generations, a possibility reinforced by the presence of multi-floor/multi-generational site furniture (e.g. in situ grinding stones). Through an examination of changing patterns in subsistence resource management and the use of space across these occupational floors, we examine micro- and macro-scale shifts in lineage-based connections or alliances at this household level in order to illuminate how such connections interplay with the development of prestige-based social distinctions and subsequent access to power.

[35] *An Islandscape IFD: Predicting Archaeological Settlements from Grenada to St. Vincent, Eastern Caribbean*

Building on the Caribbean-wide models presented in Giovas and Fitzpatrick (2014) and predictive models recently synthesized for Grenada, this study focuses on a fine-grained analysis of environmental and cultural factors affecting settlement locations in the multi-island/archipelagic region from St. Vincent and the Grenadines south through Carriacou and Grenada. We compiled an inventory of all archaeological sites in the area, designating a sub-sample of settlements for analysis based on availability of accurate data (ceramic types, radiocarbon dates, confirmed locations). A multivariate analysis of environmental data was then conducted on each settlement, including soil attributes, proximity to freshwater/stream beds, structure and sizes of marine environments (grasslands, reefs), and net primary productivity layers. Common variables were analyzed to discern which areas would be the most suitable in an unsettled landscape, and the timing of settlement for each area was then predicted using an IFD model. The model was iteratively tested and refined using the remaining site inventory locations. Stronger predictions of settlement patterns were made when an island-centric approach was set aside for a larger islandscape perspective. Notably, the pattern of longevity seen at the earliest sites highlights potential Allee effect/conspecific density dependence factors that correlate to larger notions of cultural niche construction.

Hannigan, Elizabeth and Laura Heath-Stout (Boston University)

[149] *Affording Archaeology: How the Cost of Field School Keeps Archaeology Exclusive*

In response to the contemporary critiques about discrimination and inequality within the archaeological academic community, many individuals and advocacy groups have suggested field school scholarships as one tactic in promoting diversity in the field. In this paper, we will explore the costs of going to the field in various parts of the world, the strategies that archaeologists use to make fieldwork affordable, and the availability of scholarships. While creating these field school grants may provide the appearance of generating change, the reality is that there are an extremely limited number of these opportunities and that the financial allowance is inadequate to cover the cost of field schools. These scholarships allow academics to feel as though they are supporting diversity in archaeology while maintaining the white/cis/straight/upper-middle-class demographic of the field. These empty gestures hinder many potential archaeologists from gaining the experience necessary to finish their undergraduate degrees, conducting their own research, or finding employment in cultural resource management. The aim of this paper is to address one aspect of the institutionalized racism and discrimination exhibited by the archaeological community and to consider potential solutions to these problems.

[36] *Macrobotanical Perspectives on Earth Oven Use in the Lower Pecos Canyonlands, Texas*

The tradition of cooking foods in earth ovens goes back at least 10,000 years in the Lower Pecos Canyonlands of southwest Texas. Throughout millennia earth ovens were used to transform otherwise inedible plants into food, fiber, and possibly beverages. The region's arid climate favors preservation of perishable materials in abundant dry rockshelters, allowing insight into past plant use generally not accessible in open-air sites where preservation of uncarbonized organic material is rare. Excavated earth oven features in sheltered sites in the Lower Pecos contain not only the partially-carbonized remains of plant foods, fuelwood, and packing material used in these facilities, but also post-oven discard deposits of largely uncarbonized botanical materials associated with other activities (e.g., fiber production, tool manufacture). This outstanding preservation provides a unique opportunity to evaluate pre- and post-oven plant processing and track behavioral chains involved in rendering plants into food and fiber artifacts. Using plant identifications obtained incidental to several research projects, we attempt to address the challenges of modeling prehistoric processing of plants with multiple uses (e.g., lechuguilla [*Agave lechuguilla*] and sotol [*Dasylirion* spp.] for both food and fiber); factors governing selection of particular plants for food, fiber, and fuel; and aspects of past environments.

[31] *Clearing the Fog: Contributions to Central Aleutian Island Archaeology*

Archaeological survey and excavation on Adak Island, Aleutian archipelago, Alaska were funded by NSF through the American Recovery and Reinvestment Act of 2009. The chance NSF and Anna Kerttula took on a small project in a remote location with a small crew had an unexpected and significant effect on the understanding of pre-Russian occupation and on the crew. While some upland sites were previously recorded, the reports were not considered credible by many archaeologists. This research demonstrated that these sites were numerous and occupied between 4000 years and the protohistoric period. Populations were much higher during the Neoglacial than previously supposed. The excavated house is similar to Arctic Small Tool tradition houses in the Eastern Aleutian Islands leading to a new proposal to determine if ASTt extends into a strictly maritime environment. The undergraduates and graduate students contributed to the project through their MA theses and one initiated PhD studies on an Aleutian project.

[318] *Driving Us Nuts: Acorn Processing Experiments and the Impact of Mentorship and Yooper Wisdom*

Jim Skibo has undeniably had a profound impact in archaeological method and theory, but he has had an even greater role in teaching and student mentorship, providing his students with a robust foundation infused with Yooper wisdom. In an homage to the theoretical and methodological foundations provided by Jim, this paper reviews an experimental archaeology project spearheaded by Jim and carried out by a team of his graduate students. Inspired by the results of lipid residue analyses that demonstrated the presence of nut lipids in early pottery, we developed an experimental protocol to evaluate the performance characteristics of processing acorns in ceramic vessels. Our results indicate that acorn oil can be effectively rendered at simmering temperatures like those afforded by low-fired ceramic vessels. In contrast, no oil is rendered when acorns are subjected to boiling temperatures. This paper outlines the results of these experiments, highlighting the importance of Jim's methodological and theoretical training and unwavering support in shaping research and career trajectories, especially my own.

[94] *Morphometric Analysis and the Investigation of Communities of Stone Toolmakers*

This paper will explore the usefulness of morphometric analysis when investigating how communities of stone toolmakers are embedded in and help construct their social landscape. Utilizing the concept of communities of practice, I intend to examine the culturally and historically situated nature of stone toolmakers through the analysis of their products. Morphometric analysis has the ability to preserve the complex three-dimensional morphology of artifacts; and the measurement of whole artifact forms may provide insights into geographic and temporal learning patterns of stone toolmakers. Specifically, I will investigate hafted bifaces created by communities of stone toolmakers during the Archaic period in southeastern North America because of the existence of spatial and temporal morphological trends in this tool type. Data from a preliminary study of Early Archaic hafted bifaces from a lithic manufacturing site in Kentucky will be discussed. Intensively occupied during the Early and Middle Archaic periods, site 15TR1 has extensive lithic deposits that represent all stages of manufacture. Hafted bifaces typed as Kirk and Kirk-Like make up approximately 70% of the total hafted biface assemblage (n=455). This paper presents analysis results and discusses how such an approach is useful when exploring communities of practice.

[263] *The Sanchez Site: An Early Agricultural and Early Pithouse Period Cerro de Trincheras on the Upper Gila River, Arizona*

The Sanchez cerro de trincheras is situated on a 650-foot mountain above the Gila River in the eastern end of the Safford Valley, Arizona. The site contains about 130 rock rings clustered on and near the top of the ridge and has perimeter walls with an aggregate length of 1.5 km. Based on radiocarbon dating and the plain brown ware ceramics the site has both Early Agricultural period (800 B.C. – A.D. 50) and Early Pithouse period (A.D. 200-550) occupations. The Sanchez site has internal site organization, numerous features, and a constructed plaza and is relevant to questions regarding village formation, population aggregation, and the regional role of this cerro de trincheras.

[233] *The Inca Transformation of the Lucre Basin*

In the study of archaic states and empires, much can be gained from analyzing how imperialist regimes transform and modify the landscape and built environment in the pursuit of their political goals. The Inca Empire, which expanded out of the Cusco Valley in the south-central Peruvian Andes ca. 1400 CE, provides an ideal case study to understand this process. However, this type of interrogation has rarely been applied towards understanding how the Inca consolidated their heartland. That is, how did the Inca manipulate the built environment to integrate local ethnic groups closer to the imperial capital itself? I examine this question using material from the Lucre Basin, approximately 30 km southeast of Cusco. Within a century of its integration, the Lucre Basin had been radically transformed through a series of construction projects and landscape modifications. I argue that this was done in ways to not only enforce and expand material dimensions of Inca power (i.e., through productive infrastructure), but also specifically structured the daily lived experience of non-Inca ethnic groups in the basin. In other words, things like buildings, terraces, and canals worked to transform notions of local sovereignty into structured experiences of subjugation.

Hargrave, Michael and Carey Baxter (USACE Engineer Research and Development Center)

[112] *Experimental Use of 3-D Data to Predict the Risk of Slumping at Monks Mound, Cahokia*

Monks Mound is the largest prehistoric mound north of Mexico, and is arguably the Cahokia World Heritage Site's most dramatic monument. Major slumps that occurred in 2007 did significant damage to the mound. Repair of the slumped area revealed a complex stratigraphy, multiple features, and evidence for previous prehistoric and historic slumps. Mounds, like earthen levees, are more likely to slump when saturated. Expected changes in climate will likely place Monks Mound at an increased risk of additional slumps in the future. An experimental study is exploring the feasibility of predicting the risk of slumping using 3-D data. Our initial hypothesis is that seasonal variation in soil moisture causes subtle but measurable changes in the mound's micro-topography. One challenge is that the grass and brush that covers Monks Mound varies in height and density. We compare 3-D data from a Leica P40 terrestrial scanner with aerial LiDAR. The former yields very high density data but records a single return, precluding production of a bare earth model. The aerial LiDAR data is much lower density but its multiple returns allow the effects of vegetation to be removed. This poster reports on methodological issues and initial results.

[213] *Kill Holes in Context: A Study of Kill Holes in Prehispanic Southwest New Mexico*

Mimbres Classic Black-on-white is the hallmark of the Mimbres Classic period (A.D. 1000-1130) in prehispanic Southwest New Mexico. Bowls from this region are often marked by an interesting practice where holes, called kill holes, are punched out of the bottom. Kill holes are found across sites in the Mimbres archaeological region, however, little statistical research has been conducted on them. Many explanations for this practice have been proposed, mostly associating the hole with burial ritual. This study expands on recent research on the relationship between iconography on bowls and kill holes by adding the context in which bowls are found. A previously unanalyzed site, Treasure Hill, is added to data from Galaz, Mattocks, Swarts Ruin, NAN Ranch, and Cameron

Creek. Exploratory data analysis is used to see if bowls with kill holes are placed in burials at a significantly higher rate. Assuming the theory that kill holes are associated with burial ritual is correct, I expect to find a statistically significant association of kill holes with burial context. However, a lack of statistical correlation could indicate that kill holes hold different significance, and could pave the way for new theories as to their significance.

[183] *Ridges, Valleys, Mountains, and Plateaus: The Topographic Context of Late Mississippian Diversity in East Tennessee*

Topographical constraints played a role in shaping the social trajectory of the Southern Appalachian region. The Ridge and Valley physiographic province of East Tennessee includes the Tennessee River and is characterized by linear ridges and parallel valleys, with the Blue Ridge Mountains to the east and the Appalachian Plateau province to the west. The north to south elevation decrease in the Ridge and Valley has the result that floodplains of the Tennessee River and its tributaries are broader to the southwest. The configuration of the topography also was an obstacle to east-west travel. In this presentation, we focus on Late Mississippian communities in East Tennessee, referred to as the Dallas Phase (AD 1300 to 1600). Elsewhere we have argued that the term "Dallas Phase," while reflecting broad similarities, actually obscures a great deal of internal variation. Through mortuary, bioarchaeological, and material cultural analysis, we explore the ways in which this variation relates to the topographic diversity among Ridge and Valley Dallas Phase towns and how this diversity had both biological and social consequences.

Harman, Jon (DStretch)

[369] *DStretch Contributions to Sacred Sites Projects in Montana and Wyoming*

In 2014 – 16 I participated in Sacred Sites Research rock art documentation projects in Montana and Wyoming, led by Larry Lowendorf. My contribution was my expertise with the DStretch program, which I created. DStretch proved to be an important resource in aiding the documentation of sites and recognizing tobacco related imagery in the rock art. I present images from several sites where DStretch was particularly impressive. They include Medicine Lodge Creek State Park and Ten Sleep Alcove in Wyoming and Frozen Leg Cave, Valley of the Shields, and Comanche Creek in Montana.

[251] *Climate Change, Capacity-Building and Local Engagement: Report on the 2018 Arctic Viking Field School, Vatnahverfi, South Greenland*

The Eastern Arctic is currently observed to be undergoing significant environmental change as a direct consequence of global warming. For archaeologists working in Greenland, this means the rapid and complete loss of cultural remains due to changing soil conditions. As annual temperatures increase, many middens in Greenland are in an active state of 'composting' their once well-preserved artifacts and ecofacts. The Norse Eastern Settlement in Southwest Greenland (>500 sites) possess a substantial number of prehistoric and colonial era archaeological sites and is now over the critical threshold—with hundreds of these sites now rapidly degrading. Greenland faces an urgent threat because these unique scientific and cultural resources may soon be lost forever. This paper discusses the recent initiatives by the Greenland National Museum to combine a robust international field school training program combined with public engagement to addresses the loss of archaeological resources in Southwest Greenland, where climate change is observed to be having immediate impacts on heritage.

Harris, Andrew (University of Toronto)

[333] *What Was Angkorian Theravada? New Analyses and Findings from "Buddhist Terraces" and Other Monastic Structures at Angkor Thom, Cambodia*

The Khmer Empire (c. 802-1431 CE) is believed to have undergone a dramatic religious transition during the 14th century from syncretic Brahmano-Buddhist worship to what is defined currently as "Theravada Buddhism". While demarcated in previous scholarship by a cessation of monumental temple-building central to previous traditions, the establishment and practice of "Theravada" in Cambodia has only recently been analyzed beyond a framework of culture-history and art-historical iconography. Recent fieldwork undertaken within and immediately surrounding the Khmer capital of Angkor Thom has revealed a vast Theravada Buddhist urban landscape consisting of the remains of more than seventy monastic substructures known in early scholarship "Buddhist Terraces". Through their survey, mapping, clearance, and photogrammetric imaging, unique structural typologies, patterns of placement, and the reuse of pre-existing ritual space and urban infrastructure at Angkor Thom have emerged. Architectural morphologies and visible renovations, too, reveal that "place-making" at Angkor appears to have transcended religious affiliation, which helps to explain the uniqueness of the Theravada remains at Angkor compared to other Southeast Asian contexts. This study thus applies an anthropological framework to understanding how religious practitioners and builders viewed, augmented, and appropriated the ritual spaces of their ancestors, stressing the imperfect nature of localized religious practice.

Harris, Edwin (Colorado State University)

[221] *Defining the Urbanism of the Ancient Purépecha Site of Angamuco*

The ancient Purépecha site of Angamuco located in the Lake Patzcuaro Basin of Michoacán, Mexico provides an unrivaled opportunity to study the urban tradition of the Purépecha prior to the formation of the empire in the late postclassic (1350 – 1520 CE). Previously, the understanding of Purépecha urbanism relied upon analysis of the imperial capital Tzintzuntzan, now covered by the modern town of the same name. Angamuco occupies a densely vegetated malpais, ancient volcanic lava flow, which has preserved the site's architectural features to include pyramids, mounds, raised roadways, water control features, and ballcourts. Utilizing LiDAR data, ArcGIS, and additional open source GIS software applications, a methodology is presented which allows for the extraction of above ground architectural features from the surrounding complex topography. This methodology allows for easier analysis of the pre-empire Purépecha urban tradition and provides an avenue to understanding the transition from multiple chiefdoms to an empire within the Lake Patzcuaro Basin.

[128] *Archaeological Applications of Optimal Foraging Theory: Employing Bayesian Probability Modeling to Estimate Profitability Parameters for Rare and Extinct Prey*

Reconstructing the subsistence strategies of past hominin populations remains one of the most important endeavors of archaeological studies. However, the presence and relative frequency of species alone, recovered as faunal material in archaeological contexts, is insufficient to reconstruct the complex foraging decisions made by hominins. Optimal foraging theory (OFT) refers to a family of formal foraging models that are designed to predict the foraging decisions of a particular organism given a suite of parameters. A key parameter is a robust estimate of profitability associated with pursued prey. However, in the case of rare and extinct prey species, measured profitability estimates do not exist. Here we describe a novel solution to this dilemma using Bayesian inference applied to modern observations of hunting behavior. We use a Bayesian probability model, populated with ecological and behavioral data collected from modern prey species collected from field research with Hadza hunter-gatherers in Tanzania, to build a predictive model of prey profitability, thus producing robust estimates of prey profitability to be used in archeological contexts.

[128] *Estimating the Effect of Endogenous Spatial Dependency with a Hierarchical Bayesian CAR Model on Archaeological Site Location Data*

This research presents a method to test the endogenous spatial correlation effect when modeling the landscape sensitivity for archaeological sites. The effects of endogenous spatial correlation are inferred using a Hierarchical Bayesian model with an Conditional Auto-Regressive (CAR) component to better understand the importance of modeling spatial cultural process. In current practice, effects of endogenous spatial autocorrelation are rarely explicitly incorporated into quantitative archaeological predictive models. This is due in part to the difficulties of measuring how cultural process relate across space and time, as well as accepting the assumption that geographically near sites are implicitly more related than distant sites. Typically these difficulties are side-stepped by including aspects of cultural processes as features and ignoring endogenous spatial correlation by assuming sites are spatially independent phenomena. While there are benefits to this approach, aside from convenience, the validity of either of these assumptions has not previously been tested. The approach developed here leads to better understanding the penalty for assuming spatial independence and the development of methods to model spatial cultural process

Harris, Megan

[396] *Bury Me with Beads*

Ground stone disk beads represented a tangible signal of wealth within the Salish Sea archaeological record; they appeared continuously from 7,000 – 500 BP across the region in scattered frequencies to massive caches. The massive caches were often observed in a burial context, despite non-burial contexts being more frequent and widespread. The differences in both their deposition (burial vs. non-burial) and frequency (scattered vs. caches) demonstrated that beads had a specific conceptual niche within Coast Salish society, communicating wealth in a particular way. This paper intends to look at beads recovered from burial contexts. Examining beads from a burial context acknowledges a relationship between the living and the dead with a focus on how the living represented the dead. Investigating beads recovered from a burial context, with an emphasis on biological sex and age of the individual, contextualizes how an individual was perceived at the time of their death.

[110] *Archaeobotany of Food & Craft near Bono Manso, Ghana, during the Transition from Trans-Saharan to Atlantic Trade*

Kranka Dada is a village site on the periphery of Bono Manso, a complex polity occupied between the 14th – 17th centuries AD, at the height of the trans-Saharan trade and the shift to early Atlantic trade. Questions remain about the degree and nature of the involvement of sites like Kranka Dada in these different trade networks. In this paper, we offer preliminary results on archaeobotanical analysis of flotation samples from Kranka Dada. The archaeobotanical assemblage is dominated by indigenous pearl millet, with little to no botanical evidence for introduced crops like maize. This is in contrast to the pottery assemblage, which includes maize cob impressed pottery and tobacco pipes in 16th-17th century contexts. One of the most interesting botanical finds from Kranka Dada is probable indigo, which suggests the presence of a local cloth-dyeing industry. We consider the implications of these archaeobotanical results for understanding the dynamics of craft and trade in the region.

[251] *Saving the Story of Medieval Icelandic Fishery Development: Siglunes as a Case Study*

The combination of deep sea fishing and dried fish production, and its distribution to inland consumers, is a distinctive and largely Nordic contribution to European diet and economy of eventual global impact in the 14th -17th centuries. One of the main questions is how and when this Viking Age pattern of marine resource use became integrated into the growing stockfish trade of the Medieval Period. Threatened by modern coastal erosion, the site of Siglunes, North Iceland offers a most unusual opportunity to consider the development of commercial fisheries in its local environmental and cultural context. Erosion reveals a well-stratified archaeofaunal record that provides insights into the Atlantic marine ecosystem before Early Modern commercial whaling and through the major climatic shifts of the MCA LIA. Siglunes has excellent organic preservation conditions, resulting in the recovery of significant amounts of well-preserved marine and terrestrial mammal, fish, and bird bone. The Siglunes deposits, dated by AMS radiocarbon, volcanic tephra, artifacts, and documentary sources, span the 9th to early 20th centuries AD. They thus represent a major archive for zooarchaeology, cultural and environmental history, and for fisheries biology and marine mammal conservation science.

Harrison-Buck, Eleanor (University of New Hampshire) and Timothy Pugh (Queens College-CUNY)

[199] *Breaking with Tradition? Terminal Classic and Postclassic Developments across the Guatemala – Belize Border*

Following the Classic Maya “collapse” a clustering of traits appear at sites in the Peten – Belize area of the Southern Maya Lowlands. These include new architectural forms, such as circular and colonnaded buildings and the introduction of distinctive portable goods such as molded-carved ceramics, as well as phallic and turtle effigies, among other material forms. These “new” assemblages embody “old” Classic Maya narratives concerning captive-taking, penis bloodletting, ancestor conjuring and replacement, and the sacrifice and rebirth of the Maize Lord. We examine these elements in the context of new alliances and conflicts that arose in this area during the Terminal Classic and Postclassic periods (ca. AD 830-1525). We conclude that an emphasis on masculinity is undergirded by a concurrent focus on the maternal line as an important element of elite legitimation in the Southern Maya Lowlands, echoing concerns expressed at the distant Maya capitals in northern Yucatán during this time.

[142] *Often the Victims, Occasionally the Aggressors: The Role of Women in Warfare and Raiding in the Ancestral Pueblo World*

Discussions about warfare in the pre-contact Southwest tend to focus on lethal interactions between male combatants or the capture of women during raids; much of our own research has focused on the latter. What is overlooked most of the time, however, is the roles that women played in hostile encounters in the region, especially in supporting, engaging in, and socially sanctioning acts of violence. Archaeological and bioarchaeological data collected in the Colorado Plateau dating to between AD 800-1300, informed by ethnographic accounts, provides a means of assessing the ways women engaged in warfare and raiding among the Ancestral Pueblo. Mortuary context and human skeletal remains were analyzed in the Colorado Plateau from sites that include: Aztec Ruins and Black Mesa, and multiple pueblos in Chaco Canyon, Mesa Verde, and throughout southern Utah. Taking a temporal and regional approach, this research considers the agency of women in times of conflict. The intent is to identify how women were more than just victims of violence, but also occasionally aggressors, defenders, or even supporters of warfare and raiding.

Harry, Karen (University of Nevada-Las Vegas) and William Willis (University of Nevada Las Vegas)

[151] *Puebloan Occupation of the Shivwits Plateau, North Rim of the Grand Canyon*

In this paper we examine the archaeology of the southwestern portion of the Grand Canyon-Parashant National Monument. Drawing on an extensive survey database of more than 600 site records, we trace the Puebloan occupation of the area from the initial settlement at around A.D. 900/1000 to abandonment at about A.D. 1250. In particular, we examine what the data suggest regarding the area's population density and the settlement and subsistence strategies used by the prehistoric inhabitants. These patterns are then compared to those found in other areas occupied by Ancestral Puebloan populations, and reasons for apparent differences and similarities are explored.

Hart, Ashlee (University at Buffalo, SUNY)

[106] *Archaeometric Analysis of Ceramics from Iron Age Thrace, Bulgaria*

In American archaeology the use of archaeometric testing such as neutron activation analysis and inductively coupled plasma-mass spectrometry have become increasingly utilized since the 1960s. These techniques, adopted from parallel disciplines including geology, continue to be relatively underrepresented approaches out of Western European and American archaeology. This presentation shows the results of two popular forms of ceramic testing - X-ray fluorescence spectrometry and thin section petrography - conducted in Bulgaria on ceramic materials from the Bulgarian Iron Age (1,200-200 B.C.E.). Through this process new relationships were forged between Bulgarian archaeologists and geological scientists aimed at testing different methodologies, using equipment previously underutilized, and incorporating computer programs for statistical analysis and spatial analysis through geographic information systems. These efforts address the importance of interdisciplinary collaboration, the development of a user-friendly international database, as well as a combined approach in archaeology that includes traditional practices with new methods and theory.

[85] *Pluvia Ex Machina: Testing Rainfall Variability on Adobe Structures*

In recent years, National Park Service and Vanishing Treasures cultural resource managers have noted archeological site damage caused by seasonal rain events. Standing earthen architecture, like adobe, appears to be most vulnerable to weather-related damage, particularly extreme rainfall events. Efforts to efficiently document and assess storm damage, however, currently rely on anecdotal and qualitative descriptions of material loss. These accounts suggest that changing rainfall patterns cause damage to fragile earthen architecture at increasing levels; however, no previous study has been conducted to clarify this cause-and-effect relationship. This study sought to fill that gap, as well as test the potential of terrestrial laser scanning (TLS) as an accurate and precise method for quantitative measurement of material loss. In heritage preservation TLS is commonly used to document, map, visualize, and measure cultural resources. While TLS is also employed in Building Information Modeling, manufacturing and parts inspection, and industrial deformation studies, the equipment is expensive and the knowledge to interpret results is limited to specialists. In addition to forecasting the effects of rainfall damage on earthen architecture, this project helped document a financially feasible workflow for accurately assessing physical impacts to adobe cultural resources.

Hart, Siobhan (Skidmore College)**[414]** *The Invisible Whiteness at New England's Native Heritage Sites*

While many of New England's memorials contribute to the false narrative of Native American disappearance, a growing number of heritage sites create and promote public memories that counter these myths. In some instances, Native American communities and heritage professionals work collaboratively to use objects and landscapes to challenge erasures and re-shape popular memory. In this paper I discuss the results of a study of four Native New England heritage-scapes (Deerfield, Aquinnah, and Plimoth, Massachusetts, and Mashantucket, Connecticut) that attempt to replace disappearance narratives with stories of survivance. In these places objects, landscapes, and bodies are used to challenge and create alternatives to existing narratives of social extinction that deny modern Indianness. Offered in public settings and aimed at largely (but not exclusively) non-Native audiences, they serve as interventions in popular recountings of Native histories, identities, and modernities, and interruptions in non-Native ideas about cultural distinctiveness, land and property rights, and race. I conclude that the memory work engaged in these places demands much from Indigenous curators, interpreters and collaborators, but little from non-Native visitors except "an open mind." This common trope reinforces white privilege and obfuscates the normalization of whiteness that persists as a legacy of colonialism.

Hart, Thomas (Franklin and Marshall College), Debora Trein (National Geographic Society) and Fred Valdez (University of Texas at Austin)**[30]** *Maya Paleoethnobotany and La Milpa: Evidences from Northwest Belize*

Widespread terrace construction in the Lowland Maya region is often viewed as a response to increasing demands for food during the Late Classic. Such was the demand that terraces became integrated into the architectural arrangements of large urban entities, going so far as to be built right up to the edge of a settlement center. Despite their ubiquity, very little is known about what was grown on these terraces and how they relate to the adjacent ceremonial core. This paper discusses the paleoethnobotanical contents of terraces that abut the ceremonial core of the third largest Maya urban center in Belize, La Milpa. An analysis of the terrace sediments collected from the 2017 excavation season of the Programme for Belize Archaeological Project revealed macrobotanical and phytolith indicators of mulching and fertilization activities. This presentation examines some of the preliminary results from these analyses, and provides a discussion on the role of terraces in both Maya ceremonial activities as well as Late Classic agricultural intensification and extensification practices.

Hartley, James**[259]** *Date Precision and Faunal Distribution from Pleistocene Sites (Archaeological vs. Paleontological) in the American Southwest*

Precise dates are helpful in tracking changes in paleoenvironment and faunal distribution through the Pleistocene. The ages of Paleoindian archaeological sites in the American Southwest with faunal remains are often precise. They have a specific date with a margin of error. This precision allows for the distinction between warm and cold periods. However, paleontological sites, while more abundant in the Southwest, are not as precise. They are often somewhere within a land mammal age (often Irvingtonian or Rancholabrean, each spanning hundreds of thousands of years) without a specific date. It is thus more difficult to assess changes in distribution through time of animal taxa. It is also more difficult to assess whether or not said changes align with known cold and warm periods.

Hartman, Gideon**[102]** *Post-Charring Bacterial Degradation of Archaeological Lentils by Bacterial Degradation*

According to common knowledge, the preservation of stable isotope values in archaeological seeds requires that they be charred at low temperatures, because charring reorganizes sugar and protein polypeptides into stable Maillard reaction products. Charred seeds are understood to be resistant to diagenetic alteration, and therefore lab processing is limited to the removal of secondary deposited contaminants. In this study we compared charred modern and archaeological lentils from the Iron Age site of Tel Dor, Israel. Through a combination of structural, genetic, and isotopic analyses we show that the charred archaeological lentils were subjected to post burial diagenetic alterations that significantly impacted bulk carbon and nitrogen isotope values. Shotgun DNA extraction and sequencing of bacterial 16S rRNA from modern and archaeological lentils revealed that bacteria genera capable of degrading lentils into Maillard reaction products were present in the archaeological lentils.

Harvey, Allison [187] see Fenerty, Brendan

Harvey, David (University of Nevada, Reno)**[35]** *Despotism in the Southern Sierra Nevada: Linking Habitat Distribution and Tubatulabal Territorial Behavior*

Fifty years after their introduction, ideal distribution models have recently contributed to our understanding of numerous behavioral processes. In this paper, I argue these models hold the potential to increase our understanding of a broader suite of behaviors including, but not limited to, territoriality. Territorial and competitive behaviors are fundamental components of the ideal despotic distribution and have often been overlooked in discussions of such spatial patterns. Here, I present an ideal distribution model for the Tubatulabal of the far southern Sierra Nevada, California in an effort to link habitat distribution and territorial behavior among low population density foragers. Though such behaviors are often viewed as an active process, passive territorial and competitive behaviors should

be reflected in the distribution and land-use patterns of a population, which can elucidate the processes behind territorial formation and maintenance through time. Tubatulabal territory provides a unique opportunity to assess these hypotheses as they are the long-term occupants of the far southern Sierra Nevada and maintained their territory through contact despite dramatic demographic shifts and the emplacement of larger population density groups with more complex sociopolitical organization in adjacent territories throughout the late Holocene.

Harvey, William (Oxford University), Sandra Nogué (University of Southampton), Nathan Stansell (Northern Illinois University) and Kathy Willis (Oxford University)

[412] *The Apparent Resilience of the Dry Tropical Forests of the Nicaraguan Region of the Central American Dry Corridor to Extreme Variations in Climate over the Last c.1200 Years*

The Central American dry corridor is currently and has historically been the most densely populated area of the Central American Isthmus and is subject to the greatest covariance in precipitation between seasons. The vegetation of this region was typically composed of dry tropical forests, which are suggested to be highly susceptible to variations in climate and anthropogenic activities. This study examines the vulnerability of past dry tropical forests surrounding the Asese Peninsula, Nicaragua to climatic and anthropogenic disturbances over the past c.1200 years. Past vegetation, climate, burning, and animal abundance were reconstructed using proxy analysis of fossil pollen, diatoms, macroscopic charcoal, and dung fungal spores (*Sporormiella*). Dry tropical forests reduce during wetter conditions associated with increased fire and expand during relatively drier conditions associated with reduced fire. Heightened seasonality (1030-1180 and 1450-1600 CE) coincides with dry tropical forest community reorganization as well as the abandonment of the pre-Columbian settlement of El Rayo (1100-1150 CE). There is no palynological evidence for traditional agriculture during this time, therefore pre-Columbian hunter-gatherer subsistence is suggested to have persisted up until European contact. Results from this research also suggest that dry tropical forests have been highly resilient to past climatic and anthropogenic perturbations.

Harvkey, Jesse

[14] *Dungeons, Dragons, and Conquest: Using Fantasy to Address Topics of Colonialism, Archaeology, and the Destruction of Indigenous Culture*

In this research experiment, I use the tabletop role-playing game Dungeons & Dragons to examine topics of colonialism, archaeology, and destruction of indigenous culture. Basing aspects of my fictional fantasy game on these real-world historical and modern-day issues, I plan to place my players into situations which will allow them to both learn the importance of cultural preservation and see the effect of colonialism on indigenous lands and peoples in a fictional world. The story and game will last until May of 2019, with the plot section relating to these topics ending in late March. During this time, I will examine and record my players' actions and reactions when given an interactive storyline of imperial conquest of native lands. They will be exposed to rich indigenous cultures and given opportunities to place themselves into the narrative, to learn of cultural preservation and archaeology, and to test their own western belief systems. I hope to open my players' eyes to these difficult topics and place them into the midst of this intense storyline, giving them the opportunity to take action and make conscientious decisions based on the knowledge and emotions I hope to bring to the table.

Hasenstab, Robert

[176] *The Sugartown Earthwork: A Late Prehistoric Hilltop Site in the Upper Allegheny River Drainage*

The Sugartown Earthwork, situated in Cattaraugus County, NY, is one of a series of late prehistoric hilltop earthen enclosures in the upper Allegheny River valley of southwestern New York and northwestern Pennsylvania. It was the subject of a previous SUNY Buffalo Archaeological Field School and is revisited here. Limited testing revealed evidence of habitation, maize horticulture, and shell-tempered ceramics. The earthen embankment revealed a wicker-style palisade enclosure. Radiocarbon dates obtained cluster around A.D. 1520, uncalibrated. This site, along with its related counterparts in the surrounding region, remain poorly understood in terms of their cultural affiliation, site function, and reason for their remote settings.

[80] *Visualizing Mountain Shoshone Occupations in the Washakie Wilderness of Northwestern Wyoming*

Interpreting past uses of mountainous regions of the American West is hampered by difficult access, excessive ground vegetation, and wilderness restrictions. Recently however researchers working in the Greater Yellowstone Area have recorded hundreds of sites exposed by forest fires, and our knowledge of campsite structure, resource use, and movement patterns has increased dramatically. Remote campsites often contain tens of thousands of artifacts that represent a greater commitment to mountain resources and places than previously considered. In this paper, we focus on the seventeenth-century Caldwell Creek site (48FR7091) in the Shoshone National Forest as a case study. At more than 30,000 square meters in area, Caldwell is a massive campsite with over 70,000 recorded artifacts including diagnostic lithics, sourced obsidian, carved pipestone, and the largest quantity of ceramics found in western Wyoming. We discuss challenges in data recording, our evolving methodologies, and ways to combine disparate data sets, photographs, and field maps. In order to better visualize the campsite, we present the results of three-dimensional models and photogrammetry. Using emerging technologies increases our ability to participate in wider discussions of cultural heritage and preservation.

Haws, Jonathan (University of Louisville)

[144] *Late Pleistocene Refugia and Neanderthal Extinction in Southern Iberia*

The Iberian Peninsula has long been regarded as a glacial refugium for humans, as well as temperate, Eurosiberian flora and fauna. The well-documented Cantabrian region served as an "active" and densely populated refugium during the LGM and Late Pleniglacial. In southern Iberia, the Mediterranean-type biota found refugia in small-scale pockets along the coastal strip and sheltered valleys in the interior. The bioclimatic zones generally shifted in elevation and latitude. Humans adapted to these environmental changes, maintaining populations through long-distance social networks. In contrast, models for late Neanderthal survival and the persistence of the Middle Paleolithic technology in southern Iberia imply a more "passive" refugium where species on the road to extinction may be found in low densities as the last remaining populations holdout in adjacent areas. In this scenario, southern Iberia may have been a suitable Neanderthal refugium, but abrupt climate shifts further reduced the conditions favorable to their survival. This paper uses new data from Lapa do Picareiro on the western edge of Iberia to evaluate the impact of abrupt climate change on different human socio-ecological systems.

[302] *Roots and Tubers in Late Pleistocene to Early Holocene China: Experimental Paleoethnobotany and Preliminary Case Studies*

Recent advances in paleoethnobotanical research reveal that plants have been critical to the human diet for longer and in more diverse ways than previously assumed. This paper addresses the relative dearth of paleoethnobotanical information on the early uses of vegetatively propagated plants in China, despite their significant representation in modern crops. We developed a systematic criterion for diagnosing taxa of roots and tubers, also known as vegetative storage organs (VSOs), from macrobotanical remains in the archeological record. We characterized commonly consumed and historically significant VSOs in China, by studying experimentally charred modern samples under the scanning electron microscope (SEM). We then compared the characteristics of these modern VSO samples against systematically floated plant remains from archaeological sites in China. VSO taxa can be differentiated by using multiple lines of evidence, including the texture and arrangement of parenchymous cells, as well as the shape and arrangements of various organs. Though identification is difficult when fragile cell structures have collapsed or deteriorated, more robust features are often preserved for diagnosis. Our results suggest that the potential for studying the role of vegetatively propagated plants in early human-environmental interactions is overlooked, and can be expanded significantly with further investment in their systematic identification.

[315] *Water, Waka's, and Empire in the High-Altitude Atacama*

Through his teaching and research, John Rick has reshaped our thinking on how people in the past related to the land, each other, and supernatural beings and the ways in which politics altered these relationships. Student

participants on his field projects at the Panaulauca rockshelter site in the Junín puna, Zuni, and Chavín learned these lessons first hand, and many have continued to apply them in their own research. After briefly revisiting the Panaulauca field school, we discuss Inka incorporation of the Rios Loa and Salado region located in the high-altitude Atacama in northern Chile, which was accompanied by investment in state infrastructure, a marked increase in copper mineral mining, and the expansion of irrigation agriculture. We argue that an explanation for these changes requires acknowledging, as the Inka and local communities did, the role played by powerful non-human beings (wak'as) in local life and imperial politics, and how Inka claims to water, land, and labor were reinforced and legitimated through their control and use of copper minerals, a substance essential for offerings to mountain wak'as, the source of water and hence of life in this hyperarid environment.

[368] *Can Mammoth Killing Be Distinguished from Mammoth Scavenging by Humans and Carnivores?*

The characteristics of human-killed and human-scavenged elephant carcasses differ in important ways. The bones of an elephant butchered immediately after humans killed it are identifiably distinct from bones taken from a "ripened" carcasses that was scavenged by humans. With newly killed carcasses, the butchering may be light to full, resulting in variable modifications such as cuts made during meat-stripping or scraping marks made during removal of periosteum to prepare bones for breaking. The locations and intensity of carnivore gnaw damage also diagnostically vary when carnivores feed on elephant prey, versus when they scavenge human-killed elephants. Not all these differences may be equally relevant in analysis of fossil proboscidean assemblages, but some diagnostic patterns appear to be applicable for interpreting mammoth sites.

[190] *Mural Ecology: Walls That Bring People Together*

Our daily news brings much shouting about building giant walls to divide neighbor from neighbor. We optimistically turn our attention to walls that brought people together—Puebloan painted walls. In the 1960s, the painted kiva walls of Pottery Mound, near Albuquerque, brought artist Polly Schaafsma together with a motley crew of archaeologists. In the decades since, she has continued to bridge art and archaeology, rock art and mural painting. Analyses of the kiva murals themselves reveal past encounters between locals and migrants from the south, and between eastern and western pueblos. Contemporary mural artists today weave past and present through art in public places where all can gather instead of the traditional smaller and restrictive kiva space.

[410] *A Royal Portrait at Chichen Itza? Central Mexican Emblems of Authority in the Northern Maya Region*

The city of Chichen Itza has defied attempts to identify individuals who ruled the city and its basic political organization. Scholars once argued for a shared governance system called multepal, basing this assertion on glyphic references to a series of people who apparently jointly held power. Subsequent scholarship challenged this assertion, as revised hieroglyphic decipherments revealed that many of these "people" were in fact deities; thus, a

textual list of royal names was not substantiated. Nevertheless, glyphic evidence still supports the existence of an individual named K'ak'upacal, indicating that at least one historic leader was celebrated. This paper uses the visual record, arguing that a portrait of an ancestral ruler may exist among the Temple of the Chac Mool's relief columns. The image contains royal elements that are distinctly Maya, but the majority of his emblems of authority participate in a pan-Mesoamerican tradition with roots in the ancient city of Teotihuacan. Not only will iconographic analysis reinforce this assertion, but also the Early Postclassic date of the image offers additional support. Furthermore, this identification bolsters arguments for foreign intrusions into Chichen during the Early Postclassic and helps elucidate the nature of political reorganization at the city during this period.

Healan, Dan (Tulane University)

[38] *Interaction between the Basin of Mexico and West Mexico In the Prehispanic Era*

Nearly fifty years ago Paul Tolstoy and David Grove argued that a major component of the so-called Tlatilco complex was West Mexican in origin, raising awareness of substantial interaction between the Basin of Mexico and an area then considered largely peripheral to Mesoamerica. Since that time investigations in both the Basin and various parts of West Mexico have uncovered evidence of systematic interaction between the two areas throughout prehistory. Such interaction appears to have been highly variable in terms of its nature and the specific areas of West Mexico that were involved. This paper reviews the evidence from a diachronic perspective and offers explanatory models for some of the mechanisms of interaction that may have been involved.

Healy, Alissa (North Wind Resource Consulting) and Jana Comstock (Santa Fe National Forest)

[213] *Understanding Gallina Pitstructures*

The Gallina culture is one with a fascinating history of violence, defensive environments, unique artifacts, and most importantly—the sustained habitation of pitstructures for the duration of their 200 year occupation (AD 1100—1300). This behavior is dissimilar to the surrounding pueblo period cultures. Several cultural resource management firms have conducted intensive pedestrian surveys of approximately 10,000 acres of the Gallina region in which numerous pitstructures have been identified and recorded. This paper assesses the variation in the physical and environmental contexts of a sample of pitstructures recorded during recent cultural surveys. It is expected that certain relationships among the structures may be identified, including the density of artifacts and the placement of structural materials and masonry structures associated with each feature. This study will examine the types of artifacts, the locations of external unit houses/bin features, and the directions in which they were constructed to better understand social constructs of the Gallina culture.

Heath-Stout, Laura (Boston University Archaeology Program)

[69] *The Invisibly Disabled Archaeologist*

At an SAA conference, one is not likely to see wheelchair users, American Sign Language interpreters, copies of the program rendered in Braille, or attendees accompanied by personal care assistants. One might think that all archaeologists are nondisabled; after all, we prize fieldwork and physical exertion. Yet, archaeologists with non-apparent disabilities are all around us. I have interviewed 72 archaeologists about their experiences of race, gender, and sexuality, and stories of disability have emerged along the way. Some disabled archaeologists told me about the difficulties of asking for accommodations in an ableist profession. As one graduate student with a mental illness put it, "To come to a panel of people who have your future literally in their hands and say, 'These are all the ways that I'm incapable,' is a very humbling experience, and it is one that's hard to recover from in terms of professional ability." Others told of finding ways to shape a career that fit their particular strengths, or of the complexity of passing as nondisabled. First, I consider what these stories tell us about how our discipline privileges some bodies and minds over others. Then, I offer suggestions for building a truly inclusive and accessible archaeology.

[96] *Born This Way, Becoming That Way: Difference, Disability and Sickness in Inka Society*

The Inkas' social constructions of physical difference recognized 'disability' as a permanent state of being, one that Guaman Poma de Ayala suggested was considered a specific calle or passage of life. Unlike much of the contemporary Late Middle Ages of Christian Europe, such individuals were not socially induced into aspiring for miraculous divine healing to achieve some physical state of perceived 'normalcy'—they were valued as an integral part of Inka society for their lived difference. Oppositely, illnesses were recognized as momentary transformations of health that could result in death and could only be counteracted through an act of healing. Many healers within Inka society were people who survived an illness themselves, being reflective of actual lived experiences they could guide others through. The vast majority of what is known about Inka notions of medical care and social welfare networks is derived from ethnohistory; however, bioarchaeological research has increasingly contributed to this. Primarily through a review of ethnohistoric sources, I will elaborate on Inka systems of medical care, perceptions of mental health, and social constructions of physical difference.

[307] *Full-Coverage Survey in the Lower Río Verde Valley, Oaxaca, Mexico: Broad-Scale Insights on Human-Environment Relations*

Regional survey in the lower Río Verde Valley, Oaxaca, Mexico has been ongoing since 1994. Our full-coverage approach resulted in extensive spatial coverage (224 km²) spanning the valley's major physiographic zones (e.g., floodplain, piedmont, etc.). The coarse-grained data produced via this methodology is ideal for broad-scale research questions. We focus on the recursive relationship of settlement choice with: 1) political shifts, and 2) the development of highly productive resource areas (c.a. 1800-150 BCE). To be fully understood, these settlement shifts must be placed in a macroregional context. Land use choices are made in relation to a network of agents operating at both local and broader spatial scales. Interdisciplinary evidence indicates that urban settlement in the Mixtec highlands had far-reaching effects, including the transport of eroded settlements from the highlands to the lower Verde coast. Ultimately, this led to the expansion of the floodplain and the enclosure of estuaries. After discussing the history of survey on the lower Verde coast, this paper details the results of a geospatial study on long-term human-environment relations.

[348] *Temporal Patterns in Diet and Population Movement within Greater Cahokia*

At its peak, Greater Cahokia had a population of over 30,000 people, and engaged in social, political, and religious interactions that covered the midcontinent. The factors that influenced the rise and dissolution of Greater Cahokia between ca A.D. 1000 and 1300 remain a focus of inquiry. Archaeobotanical and isotopic research indicates maize first became a significant food resource for American Bottom populations at about A.D. 900 and quickly increased in importance. Strontium (⁸⁷Sr/⁸⁶Sr) analysis provides evidence that immigrants from a variety of regions contributed significantly to population growth at Greater Cahokia. For some immigrants, a move to the American Bottom correlates with a dramatic change from a diet low in maize to one heavily maize dependent. New data from the well-contextualized East St. Louis excavations, an expanded isotopic dataset for the American Bottom, and a better understanding of midcontinental strontium signatures, allows us to explore temporal and regional patterns of diet and the movement of people within Greater Cahokia. We will consider these patterns of subsistence change and population movement in light of regional climatic conditions.

[189] *The Ideal Site (LA 8671): A Mexican Territorial Residential Site Near Placitas, New Mexico*

The Mexican Territorial period (1821-1846) is perhaps the least-studied historical period within New Mexico. However, one site that is almost always mentioned in culture history overviews is the Ideal Site, LA 8671, excavated by the UNM field school and Dr. J. J. Brody in 1963-1964. However, there was only one publication reporting on this small residential site: a 1966 *El Palacio* article that summarized the pottery and imported materials found at the site and described a small three room house with an outdoor kitchen and an animal pen. Recently, this collection was revisited with detailed technological analysis of the imported materials and New Mexican ceramics at the site, including petrographic analysis. Results indicate that this small, relatively isolated settlement actually possessed ceramics from a fairly wide variety of sources from both local and Tewa Pueblos. Residents also consumed a surprisingly high proportion of imported materials. Contrary to expectations, it appears that residents at the Ideal Site adapted to their lack of close neighbors by cultivating a wider regional network to help meet their material needs. These results suggest that some of our ideas about trade and social relationships on the Mexican frontier need to be revisited as well.

[31] *The Human Experience of Social Transformations in the North Atlantic and US Southwest*

Archaeologists and other scholars have long studied the causes of collapse and other major social transformations and debated how they can be understood. This paper instead focuses on the human experience of living through those transformations, analyzing 18 transformation cases from the North Atlantic and the US Southwest. The transformations, including changes in human securities, were coded based on expert knowledge and data analyzed using Qualitative Comparative Analysis techniques. Results point to the following conclusions: Major transformations, including collapses, generally have a strong and negative impact on human security; flexible strategies that facilitate smaller scale changes may ameliorate those difficulties. Community security is strongly implicated in these changes; strong community security may minimize other negative changes. The relationships among the variables are complex and multi-causal; while social transformation may lead to declines in human

securities, declining conditions of life can also push people to transform their societies. Finally, the considerable variability indicates that some societies are better able to deal with difficulties than others. These kinds of cases, in the past as well as today's world, are worthy of much more attention.

[354] *Nā Wahine o nā Āina Kuleana: Assessing the Impact of Colonization on Gender Experience in North Kohala, Hawai'i Island*

While pre-contact gender in Hawai'i has primarily been interpreted in terms of the kapu and its regulation on food, close analysis of multiple ethnographic sources reveal that gender was more complicated than originally realized. Therefore, examination of gender experience in Hawai'i needs to be location specific. My research highlights the value of consulting historical documents and Hawaiian tradition, especially those written in 'ōlelo Hawai'i, as resources for understanding Hawaiian history. I analyze 'ōlelo no'eau, mele, oli, place names, ka'ao, and mo'olelo specific to selected ahupua'a within North Kohala to interpret how gender was conceived within each ahupua'a. Using this interpretation as a foundation for understanding gender experience in these locations pre-contact, I then use it as a means to interpret how the conception of gender changed in Hawai'i, post-contact during the period following the Great Māhele. My research examines the mo'okū'auhau (genealogies) of Land Claim Award recipients in these locations to figure out if foreign conceptions of gender influenced how Land Claim Awards were distributed and later passed down. Through this analysis, I will assess to what degree colonization impacted Hawaiian gender norms, specifically the status of wahine.

Heisinger, Bryan (Texas State University)

[94] *Skiles Shelter (41VV165): A Closer Look at a Long-Term Earth Oven Facility*

Skiles Shelter (41VV165) is located at the mouth of Eagle Nest Canyon, roughly 250 meters northwest from the Rio Grande in the Lower Pecos Canyonlands of southwest Texas. Skiles Shelter is characterized by a fading panel of Pecos River Style rock art, numerous bedrock milling features, and a massive burned rock midden (BRM) accumulation of fire cracked rock (FCR) and cultural refuse. In 2013 and 2014, archaeologists with the Ancient Southwest Texas Project (ASWT) of Texas State University carried out extensive excavations in Skiles Shelter to better understand the rockshelter and how its archaeological deposits formed. Based on the initial excavation results, it was hypothesized that Skiles Shelter was used primarily used as an earth oven facility for the baking and processing of plant and animal foods. This paper further explores the results from the archaeological investigations at the site and takes a closer look at its use as an earth oven facility.

[308] *House Society Models in Anthropological and Archaeological Theory: Chaco Canyon and the Prehispanic American Southwest*

In recent years, a growing number of archaeologists have explored the potential of expanding Lévi-Strauss's concept of "house societies" to better understand local as well as regional development sequences. In this paper, I draw on the work of cultural anthropologists as well as archaeologists to create a revised theoretical framework for archaeological application. Taking a broad view of the extant theoretical and ethnographic literature on house societies, the primary goal of this paper is to identify how, cross-culturally, social inequalities are constituted in such societies. The manuscript proceeds in three stages: First, I discuss the history and evolution of house theory over the last 35 years and its development within archaeology; second, I present a revised definition of a house society model; and third, I use ethnographic and ethnohistoric data from Western Pueblo groups (specifically Zuni Pueblo and Hopi) to demonstrate the utility of resuscitating Indigenous house concepts to advance our understanding of Chaco Canyon and the Prehispanic American Southwest.

Heller, Eric (University of California Riverside) and Benjamin Bellorado (University of Arizona)**[313]** *Photogrammetry and Virtual Reality Visualization of Cultural Landscapes in Southeastern Utah*

Recent technological advances, including photogrammetric capture and virtual reality visualization, offer exciting new means to document, analyze, and reconceptualize archaeological landscapes. Minimally invasive, cost effective, and extremely precise, these methods and technologies provide powerful datasets and investigative tools when applied to the cultural resources of Southeastern Utah. Through photogrammetric capture of features, sites, and entire viewsheds, we extend this technology into the scale of the cultural landscape. By so doing, we situate detailed three-dimensional models of archaeological resources into their social and environmental contexts. In addition, translating photogrammetry products into virtual reality environments allows the intuitive viewing and interaction with archaeological data. This advancement provides innovative pathways toward addressing longstanding and emergent research questions, facilitating collaboration, and enhancing land management practices. Finally, we explore the potential of educational virtual reality experiences to minimize the impacts of site visitation while simultaneously increasing and enhancing public engagement with the archaeology and cultural landscapes of Southeastern Utah.

Helmer, Emily (Washington State University)**[66]** *Placemaking in Southwestern Oregon*

This study takes a Geographic Information Systems approach to understanding the role of place in determining settlement patterns in southwestern Oregon. Persistent use of settlement locations transforms these spaces to places, or locations where memory and identity become embedded. In order to test how this phenomena influences settlement location, a site suitability model for prehistoric settlement was designed and tested against actual site locations. Rather than relying solely on environmental variables to build this model, site location data was also integrated in order to investigate whether or not proximity to previous settlement locations would increase the likelihood of settling there.

Helmer, Matthew (US Forest Service)**[12]** *Planning for the Future: Integrated Resource Management and Ecosystem Services*

Resource managers, researchers, and policymakers are increasingly considering ways to integrate across silos for more effective land management in the 21st century. In 2005, the UN Millennium Ecosystem Assessment articulated an international strategy of ecosystem services which aims to holistically measure the cultural and biophysical benefits that landscapes and ecosystems provide to the public. The goals of ecosystem services management include the valuation of resource benefits, the identification of beneficiaries, trade-offs among various land use changes, and others. The 2012 Planning Rule for the Forest Service requires that all national forests now consider ecosystem services in their management planning. While biophysical ecosystem services, such as measurements of soil quality and carbon sequestration are relatively straightforward to value, cultural ecosystem services are often much more difficult to define and measure. As such, management of cultural ecosystem services is less developed. Heritage can play a key role in forging the future of ecosystem services and integrated resource management. This poster provides background information on ecosystem services and how the approach can help heritage managers to improve preservation and to include management of cultural heritage benefits in the broader fulfillment of the National Historic Preservation Act.

Hemmings, C. (Aucilla Research Institute)**[332]** *Late Pleistocene Faunal Utilization: Some Current Thoughts on Paleoindian Diet and Tool Source Selection*

Accumulated evidence regarding the range of prey utilization and tools made from animal remains is rapidly growing and overdue for a summary consideration of Clovis and Pre-Clovis sites in North America. This discussion is heavily weighted with data from Florida sites along the Wakulla and Aucilla Rivers, and the Old Vero Site. Recent proboscidean data from utilized mastodon, mammoth, and gomphothere remains are complemented with new information from a tapir kill site and numerous burned freshwater aquatic and marine species found 25 miles inland from the ice age shore.

Hemsley, Samuel (Northern Arizona University)**[120]** *Down By the River Side: A LiDAR-Based Settlement Survey in the Belize River Valley*

This paper focuses on the use of lidar technology, in combination with traditional pedestrian ground survey methods, to compare ancient settlement patterns and activity areas in contrasting environmental zones, alluvial floodplains and karstic hills, in the upper Belize River Valley. The paper also describes the capabilities and accuracy of LiDAR

technology for use in settlement survey in tropical environments. Landscape archaeology is used as the primary theoretical approach in this study, allowing for an examination of human-environment interactions. Lithic and ceramic analysis from assemblages that were surface collected during the survey are also incorporated in our chronologic and activity centric conclusions for the surveyed settlements in the area of study. LiDAR accuracy rates are examined to evaluate the technologies potential for future research in the area. The collected geospatial data obtained throughout this research contributes to a growing body of GIS-sourced data in the Belize Valley Region and has the potential to inform future research and heritage management in similar geographic areas.

Henderson, Gwynn [419] see Manzano, Bruce

Henderson, Helen

[256] *Field Schools and Gender in Archaeology*

This paper reflects on the singular importance of field school experiences, such as the semester abroad program of Kenyon College, for supporting students as they come to understand the social context of professional life in Latin American Archaeology and their ability to positively contribute to an eclectic discipline such as archaeology. The formative experiences of living and studying in a foreign country provide opportunities to develop different kinds of cultural competencies that help young investigators develop the confidence and skills to not only handle challenges that arise during field work but also can help navigate academic professional contexts where issues of plurality, diversity, and/or gender differences may not be openly addressed. I want to highlight the importance of teaching and supporting young investigators in field schools as a means to increase our ability to reflect on ethical dilemmas and disciplinary biases, such as androcentrism, and actively work towards a more diverse and inclusive academic discipline.

Henderson, Jon (University of Nottingham UK)

[20] *The Legacy of the Oceans: Past Marine Exploitation and the Sustainable Development Agenda*

SDG14 Life Below Water recognises the economic and social benefits that sustainable use of marine resources can provide including enhanced food security, sustainable energy generation, and poverty eradication through marine orientated livelihood opportunities. While environmental sciences and ecological approaches have had a major role in the development of solutions, the potential role of marine cultural heritage as a usable resource is not widely appreciated. Providing deep-time data over millennia, the marine archaeological resource has more to offer than solutions based on tourism. For example, coastal management strategies and conservation projects rely on short-term baseline data that, at best, cover little more than a century. As a result, projects and strategies put into place are limited, and do not fully reflect ecosystem dynamics or the relative resilience of different species to the effects of both human activities and changes driven by long term climatic and other environmental factors. This paper will argue that a marine cultural heritage outlook (prioritising human interaction with the sea in all its diversity) could provide the conceptual framework that unites, stimulates and informs interdisciplinary responses to the challenges set out in SDG 14.

Hendricks, L. Renee

[410] *Bundles and Bloodletting: An Analysis of Women's Ceremonial Roles in Classic Maya Art*

This paper addresses the inclusion of women within Classic Maya works of art, consisting of, for this purpose, private-consumption ceramic vessels and large scale public monuments. Through the use of Feminist and Gender Theory, Performance Theory, and Iconographic Theory, the roles of women in iconographically depicted ceremonial performance is assessed. A Microsoft Access database was constructed in order to look at various aspects of female depiction, including but not limited to, bodily action, costume, and paraphernalia. The context, individual actions, and associated paraphernalia of women performing numerous roles were analyzed, in which women were found to participate in many of the same roles as men, although there are some roles from which either men or women are excluded, and certain paraphernalia items with which women are not associated.

Henebry-DeLeon, Lourdes (Central Washington University)

[326] *Born on the Columbia Plateau: Cultural Affiliation for the Ancient One*

NAGPRA's preponderance of evidence standard is utilized to demonstrate a relationship of shared group identity between the Ancient One (Kennewick Man) and the Colville, Nez Perce, Umatilla, Wanapum, and Yakama tribes. Data is presented within the evidentiary standard applicable to cultural affiliation determinations under Section 3 of NAGPRA. Scientific certainty is not required but rather evidence demonstrating that the existence of a cultural affiliation is more probable than its nonexistence. Biological data offered the most direct line of evidence in identifying the earlier group. All available, population specific data for the Columbia Plateau within the immediate (7-mile radius) and nearby (55-mile radius) areas of the Ancient One site, shows the Ancient One falls within the variability exhibited on the Plateau at the same time period and throughout time. He was not outside of the norm for the population existing during the Early Cascade period when he was alive and for the populations that followed for which he has a shared group identity. Additional archaeological and geographic data demonstrates the Ancient One was intentionally buried at a location on the Southern Columbia Plateau during the Early Cascade Period.

[300] *Between Angkor and Champa: Political Economy of the Buffer Zone*

Highland Southeast Asia was historically the domain of ethnic swiddeners, in contrast with the wet rice farmers of lowland states. Recent scholarship has re-envisioned these upland groups as active agents who resisted lowland state domination, rather than viewing them as isolated tribal groups. Highlands located east of the Mekong River in southeastern Laos, eastern Cambodia, and west-central Vietnam form a buffer zone that separated Angkor from Champa, and documentary records suggest complex dynamics between neighbors. The 10th-13th century CE rise of Angkorian power involved a series of battles between Angkor, Champa, their internal rebels, and occasionally, the highlanders. Archaeologists have yet to contribute to this discussion. This paper uses archaeological, historical, and art historical data to explore political economic relationships between Angkor, Champa, and upland groups in the buffer zone. In this model, the buffer zone was neither passive nor remote: it played an important role in the sociopolitical and economic development of both Angkor and Champa. The distribution of Khmer and Cham style temples and inscriptions in the highland during the 7th-14th century CE, and the 16th-19th CE records of politics and economic interactions suggest an interdependent economic system between the highland and lowland communities.

[290] *Phytochemical Characterization of Chicha de Molle Production at Cerro Baúl*

Converging evidence from archaeological excavations and ethnographic research in the Peruvian Andes has demonstrated that the indigenous alcoholic beverage chicha de molle has a time depth of at least the Middle Horizon (600 CE – 1000 CE). The most impressive example of large-scale, pre-Hispanic production of chicha de molle hails from an exhumed brewery discovered atop Cerro Baúl, part of a Wari emissarial outpost abutting Tiwanaku settlements in the Moquegua Valley, and the finding has suggested this beverage's importance to Wari elites. Ripe drupaceous fruits of *Schinus molle* L. (Anacardiaceae) are still to this day harvested to produce a sweet, aromatic chicha and are added to maize beer (especially chicha de jora) to improve the flavor and increase the alcohol content. Direct analysis in real time mass spectrometry (DART-MS) was employed to characterize potsherd residues and spent molle drupes recovered from the Cerro Baúl brewery, which were compared to experimental archaeology controls i.e. ethnographically produced modern chichas, including chicha de molle brewed both with and without maize as well as chicha de jora. Monoterpenoid and triterpenoid biomarkers identified, plus the presence of sesquiterpenoids, the phenylpropanoid safrole, and the aliphatic aldehyde decanal, strongly corroborate chicha de molle production at Cerro Baúl.

[47] *Using Avifaunal Trends to Evaluate Environmental Shifts on the Eurasian Forest-Steppe with the Expansion of Agropastoralism*

Expansion of agricultural communities during the Eneolithic in Europe likely had an impact on the environment due to a need for land, wood for building houses, and agricultural practices (e.g., slash-and-burn). We focus on the Trypillians (an Eneolithic, forest-steppe group) from Southeastern Europe, and how their agropastoral lifestyles impacted their environment. Bird remains associated with human activity can provide key insights into past environments. Reports on avifaunal remains from archaeological sites were collected to examine changes in bird species availability over three environmental zones (forest, forest-steppe, and steppe) from the Neolithic to the Middle Ages. Data suggests that at sites in forested environments, there are relative decreases in woodland species (19% / 198 MNI in the Neolithic to 6% / 47 MNI of the Iron Age), with small relative increases in steppe species (10% / 198 MNI in the Neolithic to 11% / 47 MNI of the Iron Age). At forest-steppe sites, there are relative increases in domestic and synanthropic species with no marked changes in forest or steppe dwelling species. Our results suggest that groups living in forested environments had more of an impact on their local environment than the Trypillians living in the forest-steppe.

Hepp, Guy (California State University, San Bernardino)

[314] *Landfalls, Sunbursts, and the Capacha Problem: The Case for a Pacific Coastal Interaction Community in Early Formative Mesoamerica*

In the 1960s, Ford argued that the first Pacific coastal Mexican pottery should more closely resemble that of northern South America than of early highland Mexican wares of the Tehuacán tradition. In the 1970s and 1980s, Kelly argued that Colima's Capacha phase represented one of several "landfalls" of technological and stylistic influence emanating from its southern front among Valdivia, Machalilla, or Puerto Hormiga potters. Revisiting of Ford's arguments in the 1990s suggested independent development of ceramics in various parts of the Americas, and determined that interregional similarities are too scant to signify diffusion from South America. Locona pottery from the Soconusco, markedly dissimilar from South American wares, further muddied the waters by suggesting Central American influences to some. Recently, archaeologists applying Appadurai's concept of "disjuncture" have argued for interaction models emphasizing both similarity and difference to better reflect complex interactions fraught with opportunity and tension. In this paper, I consider early Pacific coastal pottery from Colima, Oaxaca, and Ecuador. I find that indicators of interaction exist and suggest at least two major sources of technological influence in Early Formative Mesoamerica. Understanding local implications of these interactions, and thus the actual advent of pottery in several regions, will require more evidence.

[307] *Sculpting the Landscape: Analyzing the Formative-Classic Period Built Environment at Los Guachimontones, Jalisco*

Los Guachimontones is the quintessential and largest archaeological site of the Teuchitlán tradition or culture. Despite this, until recently our understanding of the site has been hampered in part by an overemphasis on excavations in the largest, most monumental guachimontón (or circular architectural groups). However, recent intensive survey and mapping of the site is now providing a more nuanced understanding of this large and complex settlement. In this paper, I report on the results of multiple spatial analyses at the scale of the entire site during the Formative to Classic periods. The results suggest a highly accessible built environment. Specifically, the inhabitants of Los Guachimontones created discrete and socially meaningful spaces (e.g., neighborhoods), where a variety of economic and ritual activities took place. The centers of these neighborhoods were focused on a guachimontón, which served to organize social use of space and their limits were expressed in the form of empty or sparsely occupied zones. The highly repetitive and planned character of the urban landscape sheds light on the internal organization of the site, which provides important insights into its political and economic organization.

[280] *Warfare, Fortifications, and Archaeological Formation Processes: The Case of Mensabak, Chiapas, Mexico*

This paper musters archaeological, ethnohistoric, and ethnographic data to highlight that a greater focus on formation processes and sampling bias is necessary in the archaeology of warfare and study of martial architecture. Fortifications are some of the most important archaeological indicators of past warfare. For example, the myth of a peaceful Maya civilization was shattered through multiple studies that established the presence of martial architecture prior to the Postclassic period (AD 900-1521). Yet, when compared to the amount of Maya sites, a proportionally low number are fortified. Additionally, many known fortifications contain gaps or do not encircle entire sites. The breaks in martial architecture shed doubt on their defensive function. By examining formation processes associated with martial architecture, we suggest that contemporary methodologies lead to an underrepresentation of Maya fortifications. Thus, the study of Maya warfare should bring the issue of sampling bias to the forefront. To build our case, we examine masonry fortifications from two sites in the Mensabak region of Chiapas, Mexico. Our analysis suggests the presence of Maya fortifications is strongly affected by the physio-chemical properties of construction materials (wood and plaster) and bioturbation.

[198] *Landscape with Bees: Apiculture in Yucatán after the Spanish Invasion*

In this paper we examine how European colonization and the shift to industrial capitalism altered beekeeping in Yucatán from AD1600 to the present. Honey and wax produced from stingless bees were circulated throughout the Mesoamerican world system during the Postclassic period. In the wake of the European colonization, honey and wax were in high demand as tribute and repartimiento goods, which shaped new ecologies and communities of practice involving both native (*Melipona beecheii*) and introduced (*Apis mellifera*) bee species. Although traditional apiculture with stingless bees has persisted to the present day, we don't know when European bees were introduced or how apiculture of mixed bee species altered ecologies, vegetative communities, and practices under demands for intensified production of honey, wax, and derivative alcoholic beverages (balche, mead, and distilled spirits like Xtabentun). We examine archaeological, material, ethnobotanical, and soil chemical evidence from the remains of an apiary, likely for *Apis mellifera*, at Hacienda San Pedro Cholul, a henequen plantation situated on the outskirts of Mérida. The importance of this research is underscored by the disappearance of traditional beekeeping and possible extinction of *Melipona beecheii* in the wake of neoliberal globalization today.

Hernandez, Jorge (National Park Service) and Susan Snow (National Park Service)**[3]** *Using STEM to Educate the Public about Cultural Diversity in the San Antonio Missions*

Twice a year Western National Parks Association has a Mexican Art Exhibit featuring pottery from Mata Ortiz at the San Antonio Missions National Historical Park Visitor Center. The pottery from Mata Ortiz follows the centuries-old ceramic tradition of Casas Grandes culture of the Chihuahuan desert. Park interpretive staff wanted to develop a program to link the park's material culture history to the art exhibit in a more tangible way. Using new research on utilitarian pottery from the missions and its ties to prehistoric pottery styles and group ethnicity that has been conducted by Dr. Steve Tomka, a new program was developed. During the three day event, visitors had the opportunity to experience through hands on learning and experimental archeology the similarities and differences between prehistoric and colonial indigenous pottery making techniques, and the traditional pottery techniques of Mata Ortiz. This paper will discuss the development of this program and also the importance of ensuring that new park initiatives designed to appeal to different groups are linked to the park's enabling legislation.

Dr. Wendy Teeter, Stevy Hernandez, and Xochitl Aguinaga from the Fowler Museum at UCLA were part of an implementation committee initiating the California Curatorial Survey which was distributed to professionals from a variety of institutions. The 2018 Society of California Archaeology Curation Committee led the creation and dissemination of this survey to understand who curates archaeological collections and what the needs and standards are of these locations. To ensure survey results adequately represented the reality of curation, those who were asked to participate were affiliated with numerous facility types including state/federal, tribal, CRM, museum, and repository. The responses collected corroborated the existence of a widespread curation crisis. In March of 2018, a round table discussion with the SCA committee members was held. Those in attendance reviewed the survey responses, offered insights, and provided suggestions based on their personal experiences as they related to the presented data. Based upon this discussion and the survey itself, the implementation committee concluded that a follow-up survey was necessary. This new survey tailored questions to facility type, providing a better overview of curation needs. Additionally, to encompass the full scope of California curation, a broader range of regional facilities were invited to participate.

In this study we present the preliminary results from a micromorphological and biomarker analysis of one of the structures.

Hernández, Laura (University of Puerto Rico, Río Piedras Campus)**[418]** *Commercial Activity, Trades and Professions in Barrio Ballajá, 1910 - 1940*

A deeper analysis of the neighborhoods (barrios) of San Juan, the capital of Puerto Rico, during the early 1900's provides a clearer scope of the complexities of population density and work related activities. For instance, Barrio Ballajá, the smallest neighborhood located to the northwest of the walled city, had a population of approximately a thousand people distributed within six urban blocks. This study concentrates on identifying the types of trades and professions of the people who resided in Ballajá, as well as the types of businesses that existed in the area. The information is gathered from population census for 1910 and 1940, commercial directories and registries from the first half of the 20th century. As a result, this study developed a wider picture on the neighborhood's types of jobs and commercial activities. The retrieved data will aid on new interpretations of the material culture and features recovered from archaeological excavations.

Hernandez Espinoza, Patricia Olga (Centro INAH Sonora)**[379]** *Children of Privilege: Infant Mortuary Practices at Late Postclassical Tamtoc Society*

Funerary practices identified in the Architectural Funerary Complex of La Noria in Tamtoc, SLP, have been interpreted as belonging to a space used to symbolize the social and possibly political importance of the individuals who were buried there during the Late Postclassical period (1350-1521 a. P.). Most of the burials correspond to adults, but there are also burials of children and juveniles, whose mortuary treatment was part of the symbols to

identify their place in the social strata of Tamtoc. In this paper, we presented bioarchaeological evidence we found to interpret that these children were part of a privilege sector of the ancient city of Tamtoc.

[179] *The Witching Hour: Demonization of Female Bodies and the (mis)Construction of Gender during the Spanish Evangelization of Huarochirí (Lima, Peru)*

In 1660, Francisca Melchora, widow of the lord of the Huarochirí people in the Viceroyalty of Peru, became immersed in a witchcraft criminal case. However, she was not accused of being a witch herself, but instead of hiding accused women and resisting a Spanish lieutenant sent to arrest her. What follows in the written account of this case were testimonies in which women and men incriminated each other by identifying rituals, sacred places, and associations between alleged witches as community leaders. What is compelling about the case is that the women, though simplified as witches by the Spanish authorities, were recognized as counselors to the deceased local lord, and were considered powerful enough to be renowned beyond the boundaries of their small towns. In this presentation, I examine colonial written records and archaeological data to investigate the ritual paraphernalia, places, and activities that identified the so-called witches. I propose that while female bodies were demonized as dangerous, lustful and sinful by the Spanish Catholic clergy, the accounts from Huarochirí demonstrate that gender was not considered in such limited terms by Andean ritual practices, and that women were powerful political actors that held similar status to their male counterparts.

[373] *Building Community Ties Using Archaeology in Tlajinga, Teotihuacan*

Teotihuacan is an ancient city located in Mexico that was designated a UNESCO World Heritage Site in 1987. It was the largest city in the Americas during its peak between 100-550 CE and its significance as an early, cosmopolitan center has been demonstrated over decades of continuous study. The Proyecto Arqueológico Tlajinga Teotihuacan (PATT) began in 2012 and has focused primarily on better understanding household and neighborhood organization in a southern district of the city. Two excavation seasons plus four seasons of remote sensing have been completed, along with ongoing artifact analysis. An important facet of the project involves working closely with members of the contemporary community of San Pedro Tlajinga, as contemporary constructions impact this southern sector of the ancient city. Through an initiative of community-based archaeology, we seek to broadly disseminate results of the project and highlight the significance of local archaeological remains while strengthening ties with community members. In this poster, we outline ongoing efforts at promoting awareness of the archaeological value of the area and mitigating concerns of local stakeholders through community-engaged research and evaluation of conservation and dissemination strategies.

[43] *Are the Tohono O'odham Descendent from the Hohokam and Their Predecessors? A Rock Art Test of Occupation Continuity in Southern Arizona*

This paper reports data supporting continuity of Hohokam and O'odham occupation and use at the Cocoraque Butte Rock Art Complex by the Archaic, Hohokam, and O'odham people. Data analyzed are from a comprehensive recording of over 11,000 rock art elements completed in March 2018. Surface artifacts indicate the site was in use from 4000 to 5000 years before present through the early to mid-1900s. The 1007 petroglyphs of anthropomorphs located on one intensely-used hillside at this site appear to represent much of the time frame. The images were separated into three patination and intensity-of-execution levels consistent with the occupations of the Archaic, Hohokam, and O'odham people, and then classed into 9 stylistic types resulting in continuity of style across the time frame. Some archaeologists previously proposed that during the A.D. 1200 to 1500 migrations from Northern Arizona and New Mexico, the Hohokam and O'odham in Southern Arizona were joined by Puebloan immigrants. These data were also compared to anthropomorph style types from Pueblo II, III, and IV.

Herrera, Israel [71] see Lizama Aranda, Lilia

Herrera, Roberto (Medgar Evers College CUNY)**[65]** *Making the Invisible Visible or How Culture History Can Have An Impact*

This paper treats Archaeology as an exercise in revitalizing social memory. In it we detail the current development of the Anthropology degree program at Medgar Evers College CUNY. Emphasizing anthropology and archaeology as a means to promote the underrepresented narratives of marginal groups in the Americas, the program also provides the knowledge required to work within contexts that deal with historically charged cultural dynamics and tensions. Focusing on global citizenship and social justice, Medgar Evers Anthropology engages with its student body to promote a critical evaluation of culture historical phenomena, focusing on heritage, preservation, and the integration of research with sustainable practices in urban and rural settings. We present outcomes from the recent implementation of introductory level classes, special presentations on Latinx and Afro-Latinx identity and the introduction of archaeology classes designed to reach students that may not explicitly pursue archaeology as a profession, but use it to promote productive public discourse. Basic knowledge of the cultural history of New York City and beyond has had significant impact on the perception of shared memory and spaces. This counters the often pejorative view of culture history which overlooks its usefulness as a means to recapture and reintegrate obscured identity and memory.

Herrera Valencia, Karen (University of Puerto Rico, Río Piedras Campus)**[418]** *Narratives of the Recent Past: La Playa Slum as a Case Study*

The slum of "La Playa" in the municipality of Arecibo, northern coast of Puerto Rico, existed from the late 19th century to the mid-20th century. This study presents the results of researching this type of site using documentary sources that include maps, plans, photographs, population data and newspaper articles. The objectives of this case study are to establish the site delimitation, and identify the approximate number of houses, families and people per household in two selected areas. This information can be used in future archaeological research projects, and to delineate investigations that will center around the people who inhabited these spaces. It will also contribute in creating awareness within the community about their recent past.

Herrera-Herrera, Antonio V. (Archaeological Micromorphology and Biomarkers Lab, ULL, Tenerife, Spain), Caterina R. de Vera (Archaeological Micromorphology and Biomarkers Lab,) and Carolina Mallo (Archaeological Micromorphology and Biomarkers Lab,)**[417]** *Development of a Quick, Easy, Cheap, Effective, Rugged, and Safe (QuEChERS) Method for the Analysis of Lipid Biomarkers in Archaeological Sedimentary Deposits*

The analysis of lipid biomarkers plays an important role in sedimentological studies because these compounds are representative of particular sources (plants, macrophytes, algae, bacteria, and animals) and are likely to persist after burial. Frequently, their analysis involves methodologies, such as ultrasound assisted extraction, accelerated solvent extraction, Bligh and Dyer method, Folch method, etc., with high consumption of contaminant solvents, time and reagents. Following the principles of Green Analytical Chemistry, agrifood and environmental researchers have developed a particularly important methodology with positive results for analysis of different kinds of contaminants (i.e. pesticides, antibiotics, endocrine disruptors, mycotoxins, etc.): the so-called QuEChERS method (Quick, Easy, Cheap, Effective, Rugged, and Safe). Despite the inherent advantages of the mentioned protocol, it has not been applied to lipid biomarkers in sedimentary contexts. In this work, we investigated the applicability of QuEChERS in this field, optimizing the parameters affecting the extraction efficiency (type, acidity and volume of extraction solvent, amount of salts added, type and amount of sorbents, and humidity of sample) and validating the methodology in terms of linearity, detection limits and recoveries. Then, the methodology was applied to archaeological sedimentary samples and lipids were determined by gas chromatography coupled to mass spectrometer detector.

Herrera-Malatesta, Eduardo (Leiden University)**[421]** *Contested Landscapes in the Caribbean: Revisiting Colonial Representations of Indigenous Political Hierarchy, Borders and Movement*

What we know today of the Indigenous inhabitants of the Caribbean is the result of a process of cultural interpretation and representation originating from the colonial enterprise. For the island of Haytí, later renamed as Hispaniola by Columbus, the first Spanish chroniclers identified a set of indigenous territories that represented diverse indigenous political hierarchies and cultures. This identification has been repeated through the years, reified in textbooks and histories until it represented the "truth" about the indigenous past for the general public in the Dominican Republic, Haiti, and even worldwide. Using regional surveys and extensive excavations throughout the northern Dominican Republic, the Nexus 1492 project has compiled a database of archaeological information that, provides enough data to critically reflect on the colonial representation of indigenous political hierarchies and to quantitatively explore how the archaeological record may contest or support this narrative. In this paper, we will confront these colonial representations with archaeological data and provide a new image of indigenous landscapes at the time of European invasion of the Caribbean. Most importantly, we will discuss how these results are being used to craft a dialogue with modern descendants of groups whose entire histories were selected, erased, and modified by colonizers.

[277] *Reconstructing the Amanzi Springs Acheulian Site, South Africa, 50 Years after Hilary Deacon*

The Amanzi Springs Acheulian site in South Africa was first excavated by Ray Inskip and then Hilary Deacon for his Masters project in the 1960s. Deacon excavated two spring he designated Areas 1 and 2 and this work suggested that Amanzi Springs preserved stratified Acheulian bearing deposits, something rare in the South African archaeological record. The Amanzi Springs Archaeology Project (ASAP) began in 2015 nearly 50 years after Deacon, to clarify the stratigraphy of the two spring eyes, as well as open test excavations in a number of other springs at the site. To date, this work has established the presence of Middle Stone Age materials and that all archaeological deposits are associated with wood and organic remains. Furthermore, ASAP has used photogrammetry to digitize Deacon's original excavations and incorporated co-ordinate data associated with artefacts he collected nearly 50 years earlier, which has produced a comprehensive GIS model for relating Deacon's finds with stratigraphic sections. Lastly, preliminary excavations in Areas 1 and 2 have begun to clarify the stratified nature of Acheulian materials at the site and a comprehensive dating program of the spring eyes will produce ages for the Acheulian and Middle Stone Age occupations at Amanzi Springs.

Herrmann, Edward (Indiana University Department of Earth and Atmospheric Sciences)

[49] *Assessing Continuity and Change in Paleoindian Landscape Use through Time in Indiana: Implications for Site Predictive Modeling*

The recent completion of the Indiana State Historic Preservation Office's SHAARD database provides researchers with a comprehensive site archive that includes site locations, projectile point typologies, raw material types, and a marginal record of site details. We use Geographic Information Systems (GIS) to analyze the distribution of over six hundred Early, Middle, and Late Paleoindian sites that have been previously recorded in Indiana. We map site distributions relative to regional chert sources and potential travel corridors using least cost paths to highlight likely mobility patterns. These data, combined with local site and projectile point types, support an argument for multiple macrobands in the state and show the process of settling in, particularly during the Late Paleoindian Period. Site distributions along highly productive resource areas, overland travel corridors, and high rates of local chert use suggest that even Early Paleoindians were well aware of local resources.

[387] *Demography, Health, and Diet of the Hellenistic to Early Christian Burial Samples from Ayioi Omoloyites Neighborhood in Lefkosia, Cyprus*

The primary goal of the Ayioi Omoloyites Bioarchaeological Project is to document and interpret the commingled human remains recovered from three Hellenistic to Early Christian rock-cut tombs located south-southwest of the old city walls of Lefkosia, Cyprus. Laboratory research over the past four years has focused on the inventory, assessment, and contextualization of the remains. In 2017 and 2018, the osteological inventories of two of the three tombs (Tomb 47 and 48) were completed and nearly three-quarters of Tomb 49 was documented. Altogether, 7277 skeletal elements have been examined from the three tombs. Minimum Number of Individuals (MNI) estimates based on zonal scores and demographic parameters both suggest varied uses of the tombs. Radiocarbon dates, in combination with stable isotope assays from select elements, provide evidence of the later use of Tomb 49 as an early Christian ossuary and suggest a diverse diet and a potentially a varied residential history of these early Lefkosians. Issues of health, diet, injury, infection, and social interaction are explored in relation to the demographic, isotopic, palaeopathological, and archaeological record of early Lefkosia. These results are also contextualized within the broader Cypriot Hellenistic to Early Christian experience.

Herron, Molly (University of Wyoming)

[322] *Camping with Mammoths? Identification of Ivory Fragments at the La Prele Mammoth Site Using Microscopy*

While it is well known that Clovis people hunted mammoths (*Mammuthus columbi*), there are few cases in the Paleoindian record where campsites associated with mammoth remains have been found. The La Prele Mammoth site, located near Douglas, Wyoming, is an approximately 13,000-year-old mammoth kill site with an associated camp. While mammoth remains have been found on site, they have not been identified within the camp area. This may be due to the fragmentary nature of the faunal assemblage, which limits traditional means of morphological identification of taxa. However, based on a preliminary analysis, some of these small fragments may be proboscidean ivory. Here I discuss the identification of material type using microscopy. Under magnification, ivory can be identified by its unique characteristics such as Schreger lines and annual rings. The identification of mammoth remains from the campsite area would support the association of cultural deposits contemporaneous with

the mammoth remains at the site. This method could also offer an alternative means to identifying ivory in other sites with fragmentary faunal remains.

Herzog, Nicole (Boise State University), Liz Dolinar (University of Montana) and Anna Prentiss (University of Montana)

[327] *Using Micro and Macrobotanical Analyses to Assess Socio-economic Strategies at 48PA551, the McKean Occupation in the Sunlight Basin, Wyoming*

Located in the Absaroka Mountains of northwest Wyoming site 48PA51 is unique for its pithouse, rock pile surrounded by deer skull caps with antlers, abundant hearths and pit features, large number of dart points and groundstone, and substantial faunal assemblage. These features and the artifact assemblages associated suggest a winter-sedentism pattern with increasing social complexity. In order to test hypotheses about Middle-Archaic adaptations, specifically related to plant gathering, processing, and food storage, we examined paleoethnobotanical assemblages recovered during the 2018 excavations from multiple features. We report findings from micro- (starch) and macrobotanical analyses in addition to efforts to identify plant foods used in the past via ethnographic inquiry. These data provide a context within which to evaluate alternative hypotheses about Northwestern Plains socio-economic strategies.

Hess, Erin

[241] *U.S. Army Corps of Engineers: Emergency Response Adaptive Management*

The mission of the U.S. Army Corps of Engineers' (Corps) Regulatory Program is to protect the Nation's aquatic resources while allowing reasonable development through fair and balanced permit decisions. The Corps works with consulting parties to develop appropriate mitigation measures when adverse effects to historic properties cannot be avoided. In emergency situations, there may not be sufficient time to fully develop a mitigation plan. In these situations, it is critical for stakeholders to work together to develop and implement an emergency response plan, which may require adaptive management during implementation. In 2017, the Corps was notified of an emergency project at a state park which would adversely affect a Native American occupation site. The Corps worked with the consulting parties to develop an emergency response and recovery strategy to address adverse effects. The strategy included continuous involvement of archaeologists, tribal representatives, and volunteers to screen and sort through 6500 cubic yards of material in under three months to recover artifacts from the material. This presentation discusses the initial mitigation strategy, adaptive management undertaken during the project, the effectiveness of various artifact recovery techniques attempted and utilized, and the continuous cooperation and collaboration between stakeholders through the course of the project.

[237] *Planning for Post-1990 Inadvertent Discoveries in the Alaska Region, USDA Forest Service*

Post-1990 inadvertent discoveries are not uncommon but visiting a reported discovery is costly, typically requiring personnel to boat or fly to remote locations to verify land ownership as well as age and affiliation of the remains. An additional challenge is the common knowledge that some individuals were buried in boxes and left undisturbed in rock shelters, caves, crevices and other out of the way places. Curious recreationists, as well as vandals and looters, regularly investigate areas that are difficult to monitor. Once State protocols have been followed and the discovery is confirmed to be archaeological in nature, timing of consultation becomes the next challenge. Determining whether remains are Alaska Native may require analysis, but approval of analysis requires consultation. Add to that our internal challenge of inadequate administrative procedures for extending institutional knowledge to the next generation of staff. To improve our processes the Alaska Region is developing a Comprehensive Agreement per 43 CFR 10.5(f) with Alaska Native Tribes and Alaska Native Corporations that includes protocols for and treatment of discoveries as well as confidentiality protocols and access restrictions.

Hicks, Megan (City University of New York)

[31] *Expanding Archaeological Research in Mývatnssveit: Conservation, Politics, and Modernity*

Archaeological research in the Mývatn region of northern Iceland contributed the first regional-scale interdisciplinary archaeological program to Icelandic archaeology (e.g. Lucas 2009, McGovern et al. 2007). Until recently the regional project focused chiefly on the settlement period (beginning in the late 9th century) through approximately the 1300s. This paper details how excavations, surveys, and research since 2008 have broadened the understandings of this key region through the expansion of chronological scope, methodological improvements, and the assessment and sampling of additional archaeological sites. The long-term regional research program has created new opportunities for understanding Iceland's shifting rural economies, histories of resource conservation, and socio-political changes after the middle ages when the island became increasingly enmeshed in long distance political and economic networks.

[183] *Zapotec Funerary Tradition: A Perspective between Bioarchaeology and Landscape Archaeology*

The state of Oaxaca, southern Mexico has a very diverse topography, from highlands to floodplains, where mortuary and funerary patterns have been practiced by the prehispanic indigenous Zapotec for at least 3000 years. From simple graves to very complex and elaborate tombs, the Zapotecs used and reused their mortuary space within the household or specific buildings, like temples. Therefore, in this paper we discuss the relationship between the Zapotec beliefs in the afterlife and how this ideology was stronger than any political barriers and beyond any political loyalties across time.

Our study includes a spatial analysis of 20 Zapotec archaeological sites from the Valley of Oaxaca, Sierra Norte and Isthmus of Tehuantepec, from Early Formative (circa 1600 BC) to the Late Postclassic (circa AD 1521). Focusing on the differences and similarities of architecture, location and grave goods, from mortuary context located across all topographic variation from the plains, the mountains, and the coast, this paper contributes to the dialogue between landscape archaeology and bioarchaeology by exploring compared mortuary analysis and beliefs systems.

[17] *Returning the Gift: Scientific Research and Heritage Preservation*

In 1974-76 I conducted ethnoarchaeological research among the Tahltan Indians of northwestern British Columbia. Like many native groups, from the early 1800's into the 1940's, the Tahltan were repeatedly decimated by epidemics. These killed disproportionately- with many old and very young dying. The loss of the elder women (the "Grandmothers") meant the concurrent loss of much of the Tahltan culture. The Grandmothers were the repositories of traditional wisdom. Persons would come to them for guidance in proper conduct and appropriate actions when there were internal controversies.

My research was problem driven, focused on concepts of space, and did not address Tahltan heritage. However, recently the Tahltan have become concerned with loss of their unique culture. They have begun examining their heritage so as to regain some aspects and preserve all of it that they can. As part of this, my primary research documents have been used as a source of information. This paper examines the collection of data useful in the future to local indigenous people. This approach is contrasted with the problem driven scientific approach, the current hallmark of the anthropological professions. The paper concludes with a discussion of the issues involved in such heritage driven data collection.

Higueras, Alvaro**[359]** *Research and Heritage Management in the Southern Caucasus: Future Perspectives in Post-Soviet Scenarios*

The inheritance of Soviet-molded approaches to cultural heritage has seen slow changes in the last three decades in the ex-Soviet South Caucasian countries of Georgia, Armenia and Azerbaijan. The creation of new models of research and management has been heterogeneous in the region. I continue here the trend presented at Vancouver's meeting, where I discerned two specific innovative but unsuccessful endeavors: private management of an archaeological site and documentation in a disputed territory. The heritage scenario is still not ready for drastic innovations: these new trends require a good deal of foresight, as in modeling the future scenarios by which heritage will thrive in the new modern "westernized" societies. So the question is: What is it ready for? What is it doing that contrasts with Soviet patterns? The arrival of the market economy, the rise of nationalism, and the revival of the role of the church (again, heterogeneously among the three countries) have marked the societal steps towards a post-Soviet world or an atmosphere of reneging on any Soviet inheritance. I discuss the heritage issues in light of the work the researchers in the region are achieving and the narratives they are proposing for understanding South Caucasian history.

Conventional methods for collection of ground penetrating radar (GPR), magnetic gradiometry, and other archaeo-geophysical data generally require precise grid layout ahead of surveys and significant labor to set up and move survey ropes, slowing data collection and creating a hurdle to larger, landscape-scale investigations. Although some commercial systems now employ Real Time Kinematic (RTK) GNSS for precise positioning of instruments during data collection, consistent and high-resolution coverage over large areas remains difficult without preliminary grid surveys, while the cost of such RTK systems is prohibitive to many archaeologists. In an effort to expand the possibilities of RTK-enabled geophysical survey, we built the "Archaeo-Rover": an autonomous vehicle designed to carry a GPR antenna while towing additional geophysical instruments, incorporating a new generation of low cost RTK GNSS tools. The Archaeo-Rover is capable of autonomously surveying areas many times larger than what is possible using traditional techniques, providing consistent, high-resolution geophysical data at a fraction of the cost of commercially available towed systems. This poster presents our ongoing experiments with the Archaeo-Rover as well as results of field testing at archaeological sites in New Hampshire and Illinois.

Hill, Brett (Hendrix College)**[246]** *A Path Forward: Casa Grande as Metaphor*

Two of the most iconic cultural symbols in the American Southwest are the O'odham Man in the Maze and Casa Grande Ruins National Monument. In this paper I illustrate a possible connection between them that might resolve some of their enduring mystery. From the merging of these symbols, a new perspective on the relationship between heritage and archaeology is outlined. Throughout the recorded history of O'odham heritage and archaeological interest in the Southwest, Native perspectives were routinely dismissed as an inferior kind of knowledge. The disappearance of the Hohokam, and other claims of collapse, are metaphors for failure and are supposed to offer lessons, but mostly inspire debate among scholars. In contrast, Native heritage programs approach the past with an emphasis on success and life in an ongoing generational movement. The implications of this approach are taking hold in archaeology as Native insights and premises are integrated into scientific thought. Integration was once suspected of undermining basic principles of knowledge, but rather they suggest a deeper and more accurate sense of the connection between living and ancient people. Looking at the past in different ways illuminates the nature of past societies and our relationships to them.

Hill, Brittany (R. Christopher Goodwin & Associates)**[334]** *Expanding the Role of Animals in Romano-British Burials*

This work considers the implications of human-animal relationships as they are found in the mortuary record of Verulamium- modern town of St. Albans, England. Once considered to be a major center, the mortuary rites given to its people suggest high variability in the role specific animal species played within the living and death culture of the city. While 480 human individuals were examined, only a small percentage was found to have been afforded the rite of a human-animal co-burial. Of major concern are the treatment of remains, the point at which animals enter into the funerary rituals and the impact this had on the surviving members of the society. Investigations were primarily carried out using zooarchaeological and human osteological techniques, but also refer to literary sources and other data. Analysis is situated in a broader theoretical approach on human-animal relationships adopting a non-anthropocentric view point. It is concluded that within the Romano-British city, there is a mutual participation of certain faunal species (namely cattle, sheep, pig and chickens) in rites that extended beyond the typical agricultural needs. Thus recognizing that different animal individuals within the same species could fulfill roles beyond that of the ultimate purpose of 'food item'.

Hill, David (ASET Siftung), Jan Petřík (Department of Geological Sciences, Faculty of Scie), Karel Nováček (Archaeology Section Department of History Palacky) and Ali Ismail Al-Juboury (Petrology and Mineralogy of Sedimentary Rocks Geol)**[298]** *Examining Sources of Glazed Ceramics In Mesopotamia in Late Antiquity*

Estimation of provenance in fine ceramics is a challenging task. Documenting the trade in glazed Sassanian and Islamic ceramics into southeast Asia and China has driven an interest in identifying the sources of these ceramics. We have defined three hypothetical provenance groups 1) Greater and Lesser Zab catchment (Arbil area), 2) Tigris, 3) Middle and lower course (Baghdad and/or Basra). Based on comparison of ceramic fabrics with regional geology, reference soil samples, LA-ICP-MS, INAA, and petrography of Mesopotamian glaze-decorated ceramics These provenance groups express possible areas where glazed-decorated ceramics were produced. Compositional difference in the ceramic pastes provide evidence for localized production of glazed ceramics and their circulation across Mesopotamia.

Hill, Erica (University of Alaska Southeast)**[91]** *Human Interment and Making Memory in Viking Age Iceland*

Over 300 Viking Age (AD 871–1000) human interments are known from Iceland, many with accompanying dogs and horses. Though these interments are similar to those of elites in Scandinavia, inhumation burial in Iceland apparently served a different purpose — to demarcate boundaries in a landscape devoid of hoards, mounds, and other markers of ancestral habitation. Without an existing sacred geography or the possibility of large-scale cremation or ship burial, early colonists adapted Scandinavian funerary rituals to the socio-political and environmental landscapes of Iceland, inscribing land claims and creating memory in spaces devoid of a mythic past.

Hills, Kendall (University of Illinois at Chicago)**[300]** *A Morphological Analysis of Sandstone Temples in the Provinces of the Angkorian Khmer Empire*

Archaeological research in Cambodia was traditionally relatively narrow in scope. Our knowledge of the Khmer Empire (9th to 15th century CE) has been primarily informed via two lines of evidence: epigraphic sources, especially in the form of temple inscriptions, and art historical analysis of monumental architecture. Due to the large corpus of monumentality found within the Khmer capital of Angkor, research was also heavily geographically focused on the imperial core. Although a large collection of temples has been documented beyond the capital, scholars generally have not engaged critically with this massive architectural dataset. This paper explores how this architectural data can be leveraged to discuss issues of imperial integration and control, and intermediate elite power in the provinces of the Khmer Empire. Emphasis is placed on a morphological analysis of the sandstone temples to investigate how rigorously the imperial architectural template was applied in the provinces. Through studying temples as artifacts, this paper analyzes the formal and organizational traits of temple models to identify regional variability in temple construction. This analytical approach to temples moves away from the traditional art historical focus of core temples and provides an avenue to test degrees of imperial control.

Hilo, Regina (SHPD Hawaii)**[244]** *Challenges, Opportunities, and Kuleana: Historic Preservation in Hawaii*

Working and consulting with the community is built into Hawaii's historic preservation laws and statutes. I work for the History and Culture branch of the State Historic Preservation Division, and my main role is mitigating effects to human skeletal remains, iwi kupuna, from burial sites over 50 years old. As a division, the SHPD has many challenges and opportunities, and a kuleana, a responsibility, to protect iwi kupuna to the best of our abilities. This paper will briefly survey a few of our challenges and opportunities at the SHPD, and provide an outlook for our future.

Hinkelman, Sarah (Ohio State University) and Robert Cook (Ohio State University)**[168]** *From Formal to Efficient: Variation in Projectile Point Manufacture and Morphology from the Late Woodland to Fort Ancient Period in the Middle Ohio River Valley*

Cultural groups in the Middle Ohio River Valley experienced significant changes in mobility, subsistence, and social organization from the Late Woodland (AD 700 – 1000) to the Early Fort Ancient period (AD 1000 – 1300). Technology changed as well, particularly the production and morphology of projectile points. It is possible that constraints related to changes in subsistence and mobility prompted a shift in raw material use and manufacture, from free-hand reduction to bipolar reduction. Shifts in the learning processes that facilitated cultural transmission appear to have occurred accompanying changes in settlement and mobility, from a guided variation learning strategy to one of indirect bias. The research presented investigates the variability in lithic assemblages between the Late Woodland and Early Fort Ancient periods using two sites from the Middle Ohio River Valley, Clark (33WA124), a late Late Woodland site, and Guard (12D29), an Early Fort Ancient site. The analytical methods used identified the differential presence of high quality raw materials and bipolar reduction and variability in projectile point morphology between the late Woodland and Fort Ancient periods. This study displays how social and cultural changes can be interpreted through technology and reinterprets the trajectory of technological innovation; newer is not always better.

Hiriart, Juan (University of Salford)**[14]** *Teaching History with Digital Historical Games*

Digital games and simulations based on historical themes or settings have been used in school classrooms for more than 50 years, however, still key questions concerning their representational appropriateness, educational effectiveness, and practical implementation remain largely unanswered. In this paper I would like to give an overview of a research project set to analyse the potential of digital games for historical education. Following an action-research approach, a series of game prototypes based on Anglo-Saxon history were iteratively designed and tested within a primary school. While playing the game, children spontaneously engaged in dramatic exercises of re-

enactment, which revealed as much about their personal identities, lives and world views in the present as about their conceptions of an imagined past. In many cases, their assumptions and naive theories became interrogated and in some instances challenged by their experiences within the game, resulting in dissonances that lead to powerful “teachable moments”. Drawing from these experiences, I would like to open the debate on the role of digital games in education, focusing on their potential to create affective interactive spaces, capable of involving players/learners emotionally and empathetically with the past.

[403] *Using Cryptotephra in Archaeology: Precise Correlations and Improved Age Estimates*

Establishing robust and reliable chronologies at archaeological sites is essential for understanding the sequence and timing of past events. At the Middle-to-Upper Paleolithic site Arma Veirana (AV, Liguria, Italy), robust chronologies are especially important for answering questions regarding the Middle-to-Upper Paleolithic transition in Europe. Because the radiocarbon method has a limit of 50,000 years, this period has not been reliably dated. AV contains deposits with cultural industries attributed to Neanderthals and anatomically modern humans (AMH). Cryptotephra, also known as microscopic volcanic ash, were recently identified at AV in a stratigraphic unit known as the Black Mousterian (BM). AMS radiocarbon dates of charcoal samples collected in the BM were reported as infinite ages. Because these dates are close to the measurement limit of radiocarbon, the presence of cryptotephra provides a way to test these existing dates as well as establish a precise isochron to correlate with other sites. Both major and trace chemistries show unique geochemical signatures and are rare for volcanoes in the central Mediterranean region. With potentially two different populations present, this provides the perfect opportunity to establish unprecedented temporal correlations between other key sites throughout this region, significantly reducing temporal uncertainty within inter-site comparisons.

[26] *Domestic Crop Production among the Ju/'hoansi San of Nyae Nyae, Namibia: Ethnoarchaeological and Ethnographic Perspectives*

This paper examines the oscillations between foraging and farming among the Ju/'hoansi San of Nyae Nyae, Namibia from both ethnoarchaeological and ethnographic perspectives. In addition to a certain amount of foraging, some of the important economic activities of the Ju/'hoansi San Nyae Nyae region are agriculture and pastoralism. Some 27 of the 36 contemporary Nyae Nyae communities had gardens where they raised domestic crops in 2018. These gardens are small, generally less than half an acre, and they are cultivated using hand tools including hoes, digging sticks, and pitch forks. These rain-fed gardens are also irrigated by water facilities provided by the Nyae Nyae Development Foundation of Namibia (NNDNF), the Traditions and Transition Fund, and the Namibian government. A variety of domestic crops are grown in the gardens which in 2018 numbered 18 species. Challenges to the agricultural production systems in Nyae Nyae include spatial and temporal variability in rainfall, periodic drought and floods, limited soil fertility, breakdowns in the water systems, destruction of water points and gardens by wild animals including elephants, and predation of livestock by lions, leopards, and other animals. There are also problems in gardening work due to conflicts among individuals in the communities.

[248] *A Critical Review of Radiocarbon Dates Clarifies the Human Settlement of Madagascar*

The timing and subsequent environmental impacts of the human settlement of Madagascar remain key topics of debate in archaeology. Located approximately 250 miles off the East African coast, Madagascar, the fourth largest island in the world, appears to have been one of the world's last large landmasses to be settled by people. Radiocarbon dating of archaeological sites and remains of butchered animals on Madagascar provide important evidence of when the island was first settled and how subsequent settlement progressed. The reliability of existing archaeological radiocarbon dates on Madagascar, however, requires critical evaluation. Here we apply principles of chronometric hygiene to assess existing radiocarbon dates and clarify the island's human settlement.

Hodgskiss, Tammy (Origins Centre, GAES, Wits University)**[15]** *The Many Meanings of Red: Ochre Use through Time in Southern Africa*

From c.100 000 years ago, ochre pieces were habitually collected and used at Middle Stone Age sites in southern Africa. This earthy iron-rich rock has been continually used since then and still has many applications today, such as pigment, sunscreen or body paint for ritual purposes. Although a range of colors were collected in the past, bright red, and often sparkly, varieties were preferentially used to create colored powder, paint and also on which to engrave designs. But why red? The Middle Stone Age is a period of significant behavioral developments for Homo sapiens, with important cognitive inferences. The appearance of items such as perforated shells, engraved ostrich eggshell and the use of red pigments are perceived as potential symbolic, social and cultural identity indicators. Did red symbolize blood, power or love, as it does today? When considered within the context of the significant technological advances in the Middle Stone Age, social dynamics and interactions of these early modern humans may be explored. By looking at the use and applications of ochre through time in southern Africa, links are drawn between ochre use strategies, color symbolism and social identity indicators.

Hodgson, Wendy and Andrew Salywon (Desert Botanical Garden)**[302]** *Pre-Columbian Agaves in the Southwestern United States: Discovering Lost Crops among the Hohokam and other Arizona Cultures*

The importance of agaves to Mesoamerica and its cultures has long been recognized, providing food, fiber and beverage. However, their significance to these cultures has overshadowed and distorted the plants' role for indigenous peoples north of the U.S. - Mexico border. Pre-Columbian farmers grew no less than six and possibly as many as eight or more domesticated agaves in Arizona dating to at least A.D. 600. Because of their longevity and primarily asexual reproduction, relict agave clones have persisted in the landscape to the present, providing an opportunity to study pre-Columbian nutrition, trade, migration and agricultural practices. Additionally, these remnant clones present a rare opportunity to examine domesticates virtually unchanged since they were last cultivated within a prehistoric cultural context. DNA sequence data, in addition to plant morphology, suggests that at least three may have originated in Arizona, suggesting this state as a secondary center of domestication. These discoveries underscore the necessity of viewing landscapes and some plant species from a cultural, rather than "natural," perspective that may help discern potential cryptic species veiled by more traditional taxonomic treatments. Understanding these plants and their ecological/cultural roles requires interdisciplinary collaboration between botanists and archaeologists.

Hofman, Courtney (University of Oklahoma), Torben Rick (Smithsonian Institution) and Jesus Maldonado (Smithsonian Conservation Biology Institute)**[368]** *California Channel Islands Micromammals: A Story of Invasion and Extinction.*

Humans have unintentionally and intentionally introduced rodents to islands around the world, sometimes causing local extirpation and extinction of endemic fauna. On the northern California Channel Islands, island deer mice

(*Peromyscus maniculatus*), may have arrived as stowaways on Native American canoes at least 10,000 years ago. Following this introduction, the native deer mouse, *Peromyscus nesodytes*, persisted for several thousand before going extinct. Questions remain about the relationship between humans and the extinct deer mouse, especially the cause of their extinction. Here, we investigate the evolutionary relationship between the extinct and extant island deer mice species, the impact of the introduction of a non-native rodent on *P. nesodytes* and explore the role humans may have played in the extinction of an island endemic. Archaeological, paleontological and genetic data highlight the importance of understanding the impact of ancient invasions on the extinction of island species following the arrival of humans. Since *P. maniculatus* is considered an island endemic today, we also explore the often blurry relationship between past human-environmental interactions and the structure and function of modern day ecosystems.

Hofman, Jack (University of Kansas) and Lawrence Todd (Colorado State University)

[80] *Paleoindian Activity in the Washakie Wilderness, Absaroka Range, Wyoming*

More than 15 years of systematic surveys in the Washakie Wilderness area by the GRSLE archaeology project in the Shoshone National Forest, northwest Wyoming, has yielded a sample of over 30 Paleoindian projectile points at a mean elevation of 2885m. These specimens provide clues about early prehistoric activity at high elevations in the region. Here we summarize the occurrence of Paleoindian points as to location, inferred activity, and lithic material use in the Washakie Wilderness and compare this with evidence from Paleoindian components in the Big Horn Basin and high elevation sites in adjacent areas. Plains and Mountain-Foothills technologies are represented, including Clovis, Cody, Allen, and Pryor/Lovell types.

[390] *Stone Tool Debitage Fails to Reliably Identify a Toolmaker's Handedness*

The classification of stone tool debitage features as right- or left-oriented has become an increasingly common method for assessing knapper handedness in experimental and archaeological lithic assemblages. Replication attempts using these published methodologies, however, have been unsuccessful. We tested the validity of eight flake feature categories, from Bargallo et al. (2017) and Dominguez-Ballestros & Arrizabalaga (2015), assessing their predictive accuracy with an inter-rater reliability analysis on an experimental assemblage of Oldowan flakes produced by 18 knappers (9 left-handed). Three experienced raters independently made blind predictions of knapper handedness using directional skew for each of the eight features, on 344 complete flakes from 43 isolated knapping events. Inter-rater reliability measures (Fleiss' Kappa) showed fair agreement for only two flake features (erraillure scar and impact point locations), with moderate (hackles, ripples, parabolic crack) to poor (ridge, extraction axis, platform inclination) agreement for all other features. All three raters failed to perform significantly better than chance for predicting handedness. These results suggest not only that these flake features are unreliable predictors of a knapper's handedness, but also, that some of these features do not represent objective categories. We therefore urge caution in applying this method to archaeological assemblages pending further independent replication.

[353] *Exploring Cooperation and Hierarchy among Napoleonic Soldiers by Reconstructing Dietary Variation Using Stable Isotope Analysis*

Historical evidence indicates that two strategies characterized diet provisioning in Napoleon's Grand Army: rationing and cooperative foraging. Drawing on practice theory, we examine which strategy dominated Napoleonic soldier diet during military service. Although the amounts distributed varied by rank and corps, rations canalized military diet. Conversely, cooperative foraging of local resources during distant campaigns contributed to dietary variation. Military and long-term diets were reconstructed through stable carbon and nitrogen isotope ratio analysis of Napoleonic soldier rib and femoral bone collagen (n=19) from the mass gravesite of Šiaurės miestelis, Vilnius, Lithuania associated with Russian Campaign retreat of 1812. These diets were compared to determine whether previously discovered long-term diet variation was maintained during military service through cooperative foraging or whether diet became canalized through army rationing. Mean femoral and rib $\delta^{13}C$ ratios were $-17.64\text{‰} \pm 0.87\text{‰}$ and $-19.54\text{‰} \pm 0.45\text{‰}$ and mean femoral and rib $\delta^{15}N$ ratios were $10.65\text{‰} \pm 1.86\text{‰}$ and $11.15\text{‰} \pm 1.51\text{‰}$. Levene's F-test indicated statistically significant differences in $\delta^{13}C$ ratios (F-statistic=3.74, df=18, p=0.008), but not $\delta^{15}N$ ratios (F-statistic=1.52, df=18, p=0.38). These results indicate that diets later in life were canalized around C3 plants

but animal protein consumption varied, suggesting that cooperative foraging was the dominant provisioning strategy.

Holen, Kathleen (Center for American Paleolithic Research) and Steven Holen (Center for American Paleolithic Research)

[115] *Human-Induced Percussion Technology: A Synthesis of Bone Modification as Archaeological Evidence*

Prey animal bone modification by humans has long been part of the archaeological record; however, debate continues as to whether this evidence alone is sufficient to justify interpretation of technological activity. This is especially true if such evidence is used in support of archaeological sites older than 16 kya in the Americas. This poster synthesizes data that represent over a decade of research including experimental bone breakage and archaeological excavations of proboscidean assemblages. Replicable features of percussion and use wear patterns on bone elements are described along with interpretive methods which demonstrate analogous, concurrent and anomalous patterns that represent human behavior. Geological contexts that rule out alternative causes of percussion breakage are described. We conclude that features of bone modification by percussion can be strong evidence of human behavior when interpreted in the light of experimental reference samples, analogous archaeological sites and geological context. The age and geographic location of a site does not invalidate this evidence.

[116] *Evaluating Material-Specific Responses to Heat Treatment in the Santa Barbara Channel Region*

We evaluate the process by which archaeologists have interpreted heat treatment of lithic raw materials in the Santa Barbara Channel region and present comparative examples of materials to work toward refinement of our understanding of production processes. Relatively little systematic work has been done, even though regional lithic materials are well-suited to improvement via heat-treatment. Current regional approaches to evaluating the use of heat to prepare raw materials for tool production rely on visual identification of heat damage and untested assumptions about the response of various material types to high temperatures. We selected a representative sample of non-archaeological raw materials from sources throughout the region often recovered in archaeological assemblages, from relatively high-quality cherts to silica-rich shales. We subjected the samples to both slow and fast heating to campfire temperatures to assess the local material factors that may have impacted heat treatment techniques. After treatment we evaluated each sample's appearance by eye test, low-power, and high-power microscopy. On this basis we review the accuracy of field identifications and provide a comparison for understanding how archaeological examples of these materials do or do not reflect the production processes to which they were subjected.

Hollenbach, Kandace (University of Tennessee) and Jillian Galle (Thomas Jefferson Foundation)

[295] *Use of Plants by Enslaved Laborers at Andrew Jackson's Hermitage Plantation*

From 1804 until 1865, The Hermitage was home to Andrew Jackson, his descendants, and over 130 enslaved men, women, and children, often invisible in the historical record, who labored in the fields of Jackson's cotton plantation near Nashville, Tennessee. After emancipation, freed households continued to live in the former domestic quarters. For three decades archaeologists excavated hundreds of thousands of artifacts from twelve domestic sites scattered across three settlement clusters: the Mansion Backyard, the Field Quarter, and the First Hermitage. A collaboration between the University of Tennessee Department of Anthropology and The Digital Archaeological Archive of Comparative Slavery, this paper presents the results of the plant analysis from over 35 contexts from the First Hermitage, the area of the property that was home to the Jackson family and a small group of enslaved laborers between 1804 and 1821. After 1821, the First Hermitage was populated entirely by Jackson's growing slave labor force. Remains of cotton seeds, corn cobs, and sweet potatoes, among other plant remains, provide insights into the ways that the enslaved used plants in their daily activities to supplement rations and to cope with the struggles of life on the plantation.

Hollenback, Kacy (Southern Methodist University)

[291] *Behavioral Cosmology and Fictive Kin: James M. Skibo (The Behavioral Golden Child)*

In the 1970s, the "founding fathers" of Behavioral Archaeology (BA), Schiffer, Rathje, and Reid expanded the bounds of traditional archaeology to fully integrate ethnoarchaeology, experimental archaeology, and modern material culture studies. Building on the foundations of processual archaeology, BA emphasized rigorous testing of mundane and not-so-mundane aspects of technology and human behaviors. In the quest for stronger inference, experimental archaeology and ethnoarchaeology became key tools in the Behavioral toolkit. Cultivating a familial intellectual environment full of parental favorites, sibling rivalries, and lifelong bonds, the "founding fathers" shaped an intellectual network of behavioral archaeologists that spanned generations. In this (fictive) kinship network, James M. Skibo is central. His methodological work in experimental and ethnoarchaeology has influenced the work of all behavioral archaeologists and many others, as has his theoretical work on technologies. Among his "kin," Jim has been the "golden child," jocular older brother, and goofy uncle. This paper reflects on these origins, as well as Skibo's work, and his lasting influence.

Holley-Kline, Sam**[405]** *The Beginnings of Archaeological Administration and Labor at El Tajin, Veracruz, 1900-1938*

In the history and ethnography of archaeology, only recently has archaeological labor – both administrative and physical – become an area of interest. In the Mexican context, recent historical research has dated the emergence of institutional archaeology to the dictatorship of Porfirio Díaz (1876-1911). However, there are few site-scale studies that explore the emergence of a heritage management bureaucracy and the labor involved therein. In this paper, I draw upon rarely-consulted institutional archives to discuss the beginnings of administration and labor at the Epiclassic urban center of El Tajin, Veracruz. I argue, first, that the key concerns of conservation and development through tourism date from this period, and are not a result of archaeological research alone. Second, I posit that the mundane exchange of materials, reports, and funds do not just reflect but instantiate the government's interest in the management of the pre-Hispanic past. Third, I discuss the labor of site guards as critical intermediaries between Mexico City and other users of the site. I conclude by arguing for the importance of labor and management in historical terms as a necessary compliment to histories of excavation and interpretation.

Holliday, Vance [187] see Fenerty, Brendan

Holliday, Vance (University of Arizona), Jeffrey Saunders (University of Arizona), Jesse Ballenger (EcoPlan Assoc/University of Arizona), David Bustos (National Park Service, White Sands National Monument) and Aimee Weber**[368]** *Late Pleistocene Megafauna in the Archaeological Record of the Greater Southwest*

The record of extinct fauna from Terminal Pleistocene archaeological sites in the Southwest is stereotypically characterized as mammoth kill sites. Mammoth kills certainly are well known from the region, including the highest concentration of such sites anywhere in the Americas, but the remains of other extinct megafauna with evidence for human association also are documented. Most of the sites are in Arizona and most associated with Clovis occupations. Six Clovis kill sites with mammoth (*Mammuthus columbi*) are known from southeast Arizona. One site also includes a *Bison antiquus* kill and another yielded burned bone of black bear (*Ursus americanus*) from a hearth. A post-Clovis kill site with extinct bison is also known. The only other clear in situ evidence for a bison kill is in central New Mexico, although both Folsom and Allen artifact assemblages from surface contexts in the same region produced fragments of bison enamel. Several human/extinct fauna associations in the Southwest are the first for North America. In northern Sonora, Mexico, Clovis artifacts were found in association with Gomphothere (*Cuvieronius*), and in New Mexico at White Sands National Monument, human tracks are documented in association with trackways produced by sloths (either *Nothrotheriops* or *Paramylodon*).

Hollimon, Sandra (Santa Rosa Junior College)**[239]** *Silenced Undertakers*

Chumash undertakers were third gender persons and postmenopausal women. The Spanish Mission system significantly disrupted traditional practices, especially through sexual violence as a silencing tool. I examine the impacts of the Spanish colonial effort on Chumash mortuary rituals, with regard to the concept of gendercide.

Hollinger, Eric (Smithsonian Institution)**[177]** *Discussant***Hollingshead, Analise (Florida State University)****[99]** *Investigations at Half Mile Rise Sink (8TA98): A Submerged Paleoindian Site in Northwest Florida*

Half Mile Rise Sink (8TA98) is located within the Half Mile Rise portion of the Aucilla River in Northwest Florida. This site offers vital clues on Paleoindian lifeways of peoples occupying the Big Bend region of Florida. Here, Paleoindian projectile points and other lithics, faunal remains, and bone tools were recovered during previous investigations from a sandy deposit on the edge of an inundated sinkhole. The projectile points encompass the entire known Paleoindian period in Florida, including Page-Ladson, waisted Suwannee, and Greenbriar types. Formal analysis of these points in comparison with diagnostics from other nearby sites offers further information on these types. In addition, I present information on the geoarchaeological context of Half Mile Rise Sink, examining the site formation processes at this site via core analysis, isotopic analysis, and new excavations. Previous studies of nearby submerged sites in the Aucilla River have proven to offer vital clues on First American studies, and Half Mile Rise Sink has the potential to do the same.

[10] *The Struggle Was Real: The End of the Archaic and the Onset of the Intermediate Indian Period in Eastern Subarctic North America*

The transition between the end of the Archaic and the Intermediate Indian Period in the Eastern Subarctic of North America was marked by significant changes in just about all dimensions of Amerindian life—technology, raw material use, exchange networks, social organization, architecture, burial customs, settlement patterns, and subsistence strategies. These changes, coinciding with an apparent reduction of site numbers and site distribution, suggest that this transition was less of a strategic reorganization and more of what we may call a cultural and demographic collapse.

[202] *Creolization and the Zapotec Diaspora: A Classic Period Zapotec-Teotihuacano Settlement in Southern Hidalgo, Mexico*

This paper will present the results of a multi-faceted research endeavor at the site of El Tesoro, Hidalgo, Mexico. Previous and recent research have shown that the Classic-period settlement at El Tesoro exhibited affiliations to both Teotihuacan and the Zapotec homeland in the Valley of Oaxaca and was likely related to the Oaxaca Barrio of Teotihuacan. Recent mineralogical (XRD) and chemical (NAA) compositional analyses of pottery from the El Tesoro strengthen the findings of previous research, which indicate that the Classic-period occupation exhibited fluid identities typical of a creolized group. These findings will be contextualized within the broader phenomenon of the Zapotec Diaspora, which is comprised of several sites in central Mexico, including at least two others located in the same region as El Tesoro.

Holtkamp, David (Los Alamos National Laboratory), Karla Sartor (Los Alamos National Laboratory) and Maria Musgrave (Los Alamos National Laboratory)

[90] *Identifying Cumulative Impacts from Wildfire and Wildfire Mitigations at Los Alamos National Laboratory*

The impacts of wildfire on cultural and natural resources have been discussed and analyzed for many years. Impacts include loss of irreplaceable artifacts, features, habitats, and landscapes due to increased wildfire regimes, as well as climate change. While these analyses provide land managers and resource specialists with information that is important for protecting resources from fire, much of the existing literature does not systematically address the impacts of wildfire mitigations in the same manner. In accordance with the National Environmental Policy Act (NEPA), cumulative impacts analyses are a requirement of federal agencies to take into consideration the potential impacts of a proposed project that has potential impacts similar to other actions in an identified surrounding area. Using the area of the Pajarito Plateau where Los Alamos National Laboratory resides, this poster identifies potential areas of improvement for cumulative impact analyses of both wildfire impacts and impacts from wildfire mitigation

strategies on cultural and natural resources. Potential information for this preliminary analysis will come from the Santa Fe National Forest, the National Park Service at Bandelier National Monument, and Los Alamos National Laboratory operated for the Department of Energy/National Nuclear Security Administration.

Hommon, Robert

[354] *Hinterlands and Mobile Courts of the Hawai'i Island State*

The eighteenth century Hawai'i Island state included more than 400 local communities divided among six districts, each with a resident elite. The king's mobile court of as many as a thousand people frequently moved from one highly productive district core to another. The "capital" was wherever the king resided. Varying in time and space, hinterlands were anywhere the court was not, with the potential for disputes tending to vary with geographical or political distance. Hinterland residents included both commoners who provided nearly all the kingdom's productive work and low-ranked government officials with whom they negotiated the payment of tax in kind, corvée labor on public works, military service, and ritual participation. Commoners negotiated double title to their lands in the form of both inheritance from parents and grants by resident officials. Commoner revolts against greedy kings and insurrections led by factions of district chiefs appear to represent negotiation by other means and may in part evince the emergence of the Hawaiian primary state during which the people's gifts traditionally donated to be redistributed by generous high chiefs became tax revenues collected to fund the governing apparatus of politically powerful kings.

[237] *Archaeology and NAGPRA in Alaska: Examples of Intentional Excavation*

Intentional excavation of human remains and associated items subject to NAGPRA occurs rarely. Such excavations are only permitted under particular circumstances and only with approval of lineal descendants (as appropriate) and affiliated tribes. In Alaska, National Park Service staff have facilitated consultation and developed Memorandums of Agreement with Plans of Action for excavating and analyzing human remains, with parties to the MOA including the National Park Service, affiliated tribes, lineal descendants, researchers, and the National Science Foundation. This presentation focuses on two projects on NPS lands in Alaska, where affiliated tribes approved of excavation of human remains for the purpose of research, including non-destructive and destructive analyses of human remains and associated funerary items. In these projects at Bering Land Bridge National Preserve and Kobuk Valley National Park, tribal members also participated in archaeological investigations.

Hookway, Esme (Staffordshire University)

[379] *An Exploration of the Demographics of Non-adults in Medieval Hospital Cemeteries in England (AD 1050-1600)*

During the medieval period (AD 1050-1600) in England, hospitals were associated with the Church and most were governed by Church rule. Distinct types of hospitals were founded: leper hospitals, general infirmaries, and alms houses. These sites provided care, shelter, and spiritual nourishment for those in need. Many hospitals had admission policies, although the extent to which they were followed is debatable. Hospital foundation charters document the refusal of admission to pregnant women, whilst some hospitals were given funds specifically for the creation of wards for the care of pregnant women and children. Little is known of hospital inhabitants however archaeological excavations of medieval hospital cemetery sites and subsequent osteological analysis, is creating a

rich source of information. The cemetery demographics revealed at some hospital sites suggest that high proportions of infants, or alternatively, juveniles and adolescents, were present at particular types of hospital. This presentation aims to highlight current research exploring the demographics of medieval hospital cemeteries, using osteology reports, archaeological finds, and historical documentation. It is hoped that this will enhance our understanding of the different types of hospitals in the medieval period and the people who used them.

Hoopes, John (University of Kansas)

[191] *Evaluating La Guinea/La Ceiba, a Sapoa' Period Settlement (AD 800-1300) in the Tempisque River Valley, Guanacaste, Costa Rica*

La Guinea was one of several stratified sites excavated by Claude Baudez when he first undertook the construction of a ceramic chronology for Greater Nicoya in the 1960s. Forty years ago, under the direction of Fred Lange in 1979, it was the location of rescue excavations in the wake of local flooding which recovered portions of the clay floor of a simple structure, human burials, and associated offerings. Subsequent excavations at the contiguous site of La Ceiba revealed additional burials and food preparation areas associated with mortuary rituals. This paper presents new data and interpretations from research on collections from La Guinea/La Ceiba in the context of current knowledge and discusses how additional research in the Tempisque Valley will fill gaps in understanding of the archaeology Greater Nicoya.

[169] *Beneath the Surface: A Ground-Penetrating Radar Study at the Mary Rinn Site (36IN29)*

Little is known about the Mary Rinn Site's cultural affiliation. The site is surrounded by better defined cultural groups such as the Monongahela and the Fishbasket complex. Limited excavations and research revealed evidence of possible housing structures and the trace of a stockade line. Surface collected materials from the Boyer Collection, and field school excavations from IUP have provided a preliminary understanding of the cultural materials at Mary Rinn. This research will improve the temporal and spatial understanding of the Mary Rinn Site (36IN29), located along Crooked Creek in Indiana County, Pennsylvania, by means of Ground Penetrating Radar (GPR) and excavation units. This survey seeks to determine the presence or absence of stratification between two large intersecting circular anomalies discovered by a previous GPR survey. These anomalies raise a question about the timeline of site occupation. To further investigate these anomalies, GPR data collection at tighter transect intervals will target where these large anomalies intersect. The results of the GPR data collection will identify the location of excavation units to determine the presence or absence of stratification at Mary Rinn. Understanding the spatial relationships within the Mary Rinn Site will contribute to the understanding of prehistory in Western Pennsylvania.

[403] *Testing the Danube-Corridor-Hypothesis—New Results from Chronometric Modelling of the Middle-Upper Palaeolithic Biocultural Shift*

The Middle to Upper Palaeolithic biocultural shift is an important turning point for Human Evolution. As Anatomically Modern Humans (AMH) enter Europe, Neanderthals disappear, eventually leaving AMH as the only representative of their species. To understand the trajectory of AMH dispersal, and the processes underlying this biocultural shift, a robust chronology of the period is essential. This doctoral research presents extensive and novel radiocarbon dating and modelling approaches from the Danube corridor – an area that has previously not benefited from recent developments in radiometric dating and analysis, despite its importance in theories of AMH dispersal. The chronology is based on 160 new radiocarbon measurements (anthropogenically modified fauna & osseous points) and 440 published dates. The results demonstrate the validity of the Danube corridor as a conduit for AMH expansion into central Europe, and date the dispersal as early as 50–47k cal BP. Against previous assumptions, this migration did not introduce the Aurignacian technocomplex to Europe. Instead, the biocultural diversity of central Europe appears to have been essential to the emergence of the Early Aurignacian technocomplex at 43–41k cal BP. This chronological framework will have significant implications for the study of cultural 'modernity' and the rise of Upper Palaeolithic industries.

Hoppa, Kristin (Channel Islands National Park)

[240] *Human Adaptations to Environmental Change on the California Channel Islands*

This paper provides an overview of human adaptations to environmental change during 13,000 years of human occupation on the California Channel Islands. In particular, I consider how the range of economically important species shifted with changing environmental conditions and how different foraging strategies for marine and terrestrial resources correlated to fluctuations in sea surface temperature and rates of precipitation. A case study of Middle Holocene (approximately 6500-3500 BP) sites on Santa Cruz Island includes data from faunal and floral (both macrobotanical and starch grain) assemblages alongside stable oxygen isotope data measuring sea surface temperature. This paper also discusses how environmental change will likely impact cultural resources on the Channel Islands in the future, using data on sea cliff retreat and rising sea levels. Finally, I include hazard maps with concentrations of cultural resources at greatest risk for erosion and inundation, alongside a discussion of management strategies.

Hopwood, David (Vancouver Island University)**[200]** *Living with the Dead: Burial Practice at Kenan Tepe, Turkey, During the Ubaid Period*

Due to the generosity of Dr. Bradley Parker I had the opportunity to analyse the Ubaid Period burials from Kenan Tepe, Turkey. These burials provide a glimpse into the social dynamics and ritual practice of Kenan Tepe's Ubaid Period community. The burials are divided into two groups: infants buried in courtyards adjacent to building structures and foundation burials interred between phases of construction of domestic structures. Aside from the foundation burials, adult burials--in fact any burial of an individual above the age of two--are absent from the site. This practice indicates that the residents of Kenan Tepe conducted age-based burial practices and that infants were viewed in a separate manner than the other members of the Kenan Tepe community. The practice of foundation burial observed at Kenan Tepe is rarely seen anywhere else during the Ubaid Period in Mesopotamia. In those few cases where it has been suggested the burials were of infants and not adult individuals. The lack of any comparable burials in Mesopotamia during this time makes the foundation burials at Kenan Tepe a unique burial practice and reflect that in some way the dead still had power in the world of the living.

Hopwood, Marie [115] see Ayling, Melissa

Hopwood, Marie (Vancouver Island University)**[200]** *Feeding the Household and the Spirit During the Ubaid Period at Kenan Tepe, Turkey*

During the Ubaid Period, a small village overlooked the Tigris River at the site we now call Kenan Tepe. Here, household members carried out activities both inside and around their houses, as well as utilizing roof-top spaces. During its habitation one of the structures burned and collapsed, preserving evidence of daily household activities in a manner only possible through disastrous events of the living. Inspired by work with Dr. Bradley Parker, I use evidence of household activities to craft an ancient taste of place for Kenan Tepe through analyses of food preparation assemblages, with special attention paid to ground stone tools. Cook pots and grinding stones are anything but simple and cannot be interpreted as serving solely practical functions. The imminently durable basalt favored by Kenan Tepe residents shows that one block of stone was used for generations, transformed from one tool to the next as use shaped both its functionality and meaning. Of use for both the living and the dead, ground stone tools of Ubaid Period Kenan Tepe exhibit extreme repurposing over the course of their multiple use lives.

Horn, Amy (Museum of Northern Arizona)**[5]** *Discussant***Horn, Jessica (The Public Archaeology Laboratory, Inc.) and Dianna Doucette (The Public Archaeology Laboratory, Inc.)****[46]** *Walking the Line: Settlement Patterning in Interior Southern New England as Identified by Utility Corridor Survey*

Although restricted to confined, linear study corridors, archaeological surveys of new and existing utility easements provide an opportunity to take a closer look at Pre-Contact settlement patterning across the interior regions of Southern New England. Cultural Resource Management (CRM) identification surveys and site evaluations within these linear project areas often fall short of clearly defining horizontal site boundaries due to the constraints of the work space. However, by taking a broader and more regional approach to these multi-town and occasionally multi-state corridor projects, we begin to identify patterns associated with landscape, resource, and temporal affiliation. Spatial analyses of data from several linear projects conducted by The Public Archaeology Laboratory, Inc. (PAL) can be applied to predictive modeling and a greater understanding of Native American landscape utilization choices.

Horn, Sherman (Grand Valley State University)**[152]** *Taking the Thumb Off the Scale: Identifying Local Production in the Middle Preclassic Maya Lowlands*

The Middle Preclassic (1000 – 400 B.C.) Maya Lowlands were peppered with autonomous communities connected by webs of socioeconomic interactions at the local and regional scales. Increasingly complex social relationships were forged in Middle Preclassic centers and later developed into the institutionalized hierarchies of Classic Maya society. Archaeologists have investigated the roles economic relationships played in Maya sociopolitical development, but studies have tended to focus on trade in clearly non-local commodities, such as obsidian or green stone. The production and exchange of goods created from locally available materials has received less attention, and identification of locally produced goods presents several problems. Recent provenance studies of Middle Preclassic pottery illustrate methodological and interpretive issues in defining local economies and their relation to social complexity. The geographic extent of areas defined as “local” by chemical data is large enough to include several independent polities, thus subsuming important interactions between emerging political centers. Microscopic analysis further indicates that presumed “local” pottery comprises a range of material variability, likely reflecting differences in both provenance and practice. The local vs. import dichotomy implied by chemical studies of Middle Preclassic pottery, and its implications for understanding social complexity, must be reassessed.

Southwestern Iberia is often considered a refuge for what are considered the last Neanderthals. Neanderthals in this region displayed unique behaviors compared to other European and Iberian regions. Among these are particular technological traditions and a high variability in resource exploitation, including marine resources. For this presentation, we aim to highlight important questions such as resource selection, exploitation, and technological and

settlement patterns in this region based on new data from the recently discovered Companheira Cave. The site is a small cave site located in Portimão city (near the Southwestern peak of Iberia), some 50 meters away from the Boina River, an important affluent of the Arade River.

Two one square meter test pits were excavated, revealing several Mousterian lithic artifacts in association with both terrestrial and marine fauna. A preliminary technological analysis, indicating a Levallois technology, revealed distinct patterns from the ones typically found in the region. Despite a lack of absolute dates, the proximity of the site to the river and the exploitation of marine fauna suggest a possible ecological refuge for late Neanderthals in this region.

Horton, Elizabeth (National Park Service)

[9] *Vacationing in Wonderland: Archaeology of Tourism in Yellowstone National Park*

There is a wealth of historical archaeological resources in Yellowstone, and the development of the park is directly connected to larger socioeconomic changes occurring across America. Recent investigations of refuse dumps associated with late-19th to mid-20th century tourism in Yellowstone National Park provided insight into the various beverages, foods and medicines people were consuming, as well as their participation in local and regional economies. These sites grant us a unique view of leisure and tourism development in a remote park environment over the past 140 years, a viewpoint that is unavailable in most other places in North America.

Horton, Shannon (University of Nevada, Las Vegas)

[209] *An Archaeological Study of the Anomalous Sites along Southern Nevada's California Wash*

This poster aims to provide a comparative study using the ceramics at three prehistoric sites along southern Nevada's California Wash. Several surveys, test excavations, and some full excavations were undertaken ahead of the proposed Navajo-McCullough Transmission Line Right-of-Way located in Clark County, Nevada. Typically archaeological sites in southern Nevada are clustered around perennial springs, playas, or rivers. The California Wash, however, has none of these. Thus, the presence of prehistoric sites over what appears to be long occupations and different cultural groups including the Virgin Branch of the Ancestral Puebloans, Patayan, and Southern Paiute was unexpected. The intent of this study is to answer questions of site density and site function in order to better understand why and how prehistoric peoples inhabited the area.

Houk, Brett A. (Texas Tech University)**[199]** *The San Pedro Maya and the Western Frontier of British Honduras*

Having fled the violence of the Caste War in Mexico, the San Pedro Maya occupied nearly two dozen small villages in the forests of western British Honduras and northeastern Petén from the 1850s to the 1930s. Archaeological and archival information attest to the fact that the western "border" of British Honduras was a colonial concept of little concern to the San Pedro Maya. Because the colonial administration had no ability to police this frontier zone, the San Pedro Maya moved freely between Mexico, Guatemala, and British Honduras. Ultimately, however, the colonial concern for the frontier and the San Pedro Maya's disregard for it, among other factors, led to the forceful eviction of the Maya from their villages. In this paper, we present archival and archaeological data related to Kaxil Uinic and other San Pedro Maya settlements to explore how the Maya interacted with the border between Guatemala and British Honduras.

Housse, Romuald (Université Paris 1 - Panthéon Sorbonne)**[143]** *Conquer the South: From the First Contacts to the 'Integration'. Study of the Defensive Settlement Patterns' Evolutions and Modifications between the Late Intermediate Period and the Late Horizon in the Tacna Region*

In the south Central Andes, in the upper basin of the Sama River, the fortresses built during the Late Intermediate Period to deal with the endemic conflicts that affected the Andes between the 14th and 15th centuries appeared to have undergone many modifications and to have been re-used when the Incas arrived in the region. As in other regions of the Andes, the first contacts with the Incas are still poorly understood, but the excavations have shown that some fortified sites were abandoned very early when, on the contrary, others seem to have experienced an important Inca occupation. The region of Tacna seems to have been a true strategic crossroads between the regions of Moquegua, the altiplano and northern Chile but it also appears to have been little marked by its integration into the empire. This paper will try to understand the strategies put in place by the pre-Hispanic populations during this transition period.

Howard, Alex (Logan Simpson) and Mark Hackbarth (Logan Simpson)**[189]** *Late Nineteenth and Early Twentieth Century Hispanic Communities in the Salt River Valley*

Comparison of archival and archaeological data from contract investigations of Hispanic residences and commercial loci provides an opportunity to investigate multiple strategies for economic survival in the Phoenix Basin. Late nineteenth century agricultural and urban settings are examined from Tempe and Phoenix to identify similarities and differences between the residents of several additions.

Howard, Steven**[176]** *Ancestral Ohiyo Haudenosaunee Ceramic Styles and Technology*

Ongoing investigations at the Bockmier One Site in southwestern New York State are providing new insights into the lives of the Ancestral Ohiyo Haudenosaunee, who lived in the upper Allegheny Valley from around AD 800 to around AD 1350. This paper will focus on ceramics thus far recovered from the site, which indicate at least two temporally distinct settlements, possibly about 200 years apart. Comparative analysis reveals similarities with known sites described through salvage operations in the 1960s and 1970s at sites downstream along the Allegheny, and may hint at the movement of individual potters and their families. The pottery at Bockmier One and other sites offers us a better understanding of the range of ceramics produced in the valley, the production techniques, and the methods of maintenance and upkeep.

Howe, David**[281]** *Moderator***Howe, Mark (US State Department - USIBWC)****[264]** *Smelertown: A Community Lost to Time along the U.S – Mexico Border*

In the late 1880s in El Paso, Texas, the establishment of a copper and lead smelter on the Rio Grande later brought about the rise of a community called Smelertown. This community of workers, families and Mexican nationals from across the border established a thriving community. Located at the intersection of both land and water borders of the U.S. – Mexico international border positioned to the west and south down the Rio Grande. Its location on the Rio Grande at this convergence of Texas, New Mexico and the Country of Mexico makes this a nexus of history as a demarcation of Mexican and U.S. History. In 2017, re-construction to the American Canal on the western edge of Smelertown unearthed features, artifacts and foundations. This presentation will show how Smelertown was a thriving community, until leveled in 1972 due to lead contamination in Smelertown and environs. This will examine the artifacts that comprise culture from both sides of the border and predicts what will be found, as Smelertown is still there – buried, even if the people are not.

Howell, Eleanor (The College of Wooster) and Paul Nick Kardulias (The College of Wooster)**[386]** *Stylistic Inconsistency and Artistic Intent in Viking Age Oval Brooches*

This study examines stylistic and thematic variation as seen in a sample of P51 type Viking Age (approx. AD 700-1100) oval brooches excavated mostly from burial contexts in central Sweden. As examples of applied art heavily reproduced through casting and imitation, paired oval brooches have the potential to reveal a great deal about how artisans perceived their products and how these perceptions developed and spread within the trade. In particular, replicated works may reveal which aspects of the applied art held symbolic significance, and which were simply aesthetic features expected by patrons. I examine both general stylistic variation and the development of a persistent “sea monster” motif that separates itself from otherwise stylistically consistent metalwork. I investigate the processes and phenomena that drive variation in heavily reproduced applied art as well as those that could affect the persistence of certain motifs despite changing styles and geographic distance. I outline a series of those which apply to the sample and which may be used to analyze similar stylistic elements in future studies.

Howell, Wayne and Eric Force**[420]** *The Late Holocene Geomorphic History of Montezuma Canyon and the Puebloan Agricultural Landscape*

Our study identified four depositional packages in our Montezuma Canyon study area, the older two of which formed the Ancestral Puebloan canyon bottom agricultural landscape. The older unit began accreting during the mid-Holocene and was formed by a meandering channel that periodically overflowed its banks, filling the canyon from wall-to-wall with multiple interbedded flood deposits. This was the environment encountered by the first Ancestral Puebloans to settle the canyon. A dramatic erosional event opened a deeply incised arroyo in this floodplain sometime during the late A.D. 800s to the early A.D. 900s, and a new floodplain began forming within the arroyo. Puebloans adapted by placing their settlements at localities favorable for agriculture, either along the arroyo edges where the narrower floodplain was accreting nearby or at side canyons where tributary alluvial fans grew out onto the floodplain. This formed the Puebloan agricultural landscape from the mid-A.D. 900s until abandonment in the

late A.D. 1200s.

[239] *Great Lakes Enclosures and Un-silencing the Midewiwin Ceremonial Complex*

The Midewiwin is a ceremonial complex whose importance among the Algonquin-speaking peoples of the Great Lakes Region was noted frequently throughout the historical era. Various scholars have interpreted this ceremonial complex as an exclusively post-contact phenomenon, as a medicine society that evolved in relation to European-introduced diseases. This interpretation relies on a Euro-centric understanding of the indigenous concept of "medicine" resulting, then, in the silencing of the socio-spatial breadth and temporal depth of this indigenous ritual system. Various lines of archaeological evidence indicate a precontact origin to the Midewiwin. One such line of evidence comes from the circular enclosures indigenous communities built across the Great Lakes during Late Precontact. I have argued these enclosures embed deep and complicated social and religious histories, histories that were implaced in them. Here, I explore connections among enclosures at a large geographic scale in order to contribute to an un-silencing of the foundational, deep-time, and potentially, pan-regional significance of Midewiwin in the centuries prior to colonialism.

[152] *Seeing the Forest for the Trees: Some Observations on Petrographic Indicators of Residential Mobility Patterns in Canadian Great Lakes and Arctic Regions*

The manufacture and consumption of material goods by households and communities is shaped significantly by residential mobility patterns, and the reasons why people moved around the landscape in the past are as varied, as they are today. A variety of kinds of mobility have been recognized in the archaeological record, ranging from household relocations to the seasonal or cyclical movements of hunter-gather and herder groups over long and/or short distances, to large scale population migrations. These movements of people, objects and ideas shaped daily life and practice. A nuanced understanding of the material manifestations of different kinds of mobility is required to unravel how they did. Petrographic studies and pottery assemblages offer a means of recognizing and tracing the movement of objects and people, through the identification of raw material source locations on the geologic landscape. This paper compares the petrographic evidence of different kinds of mobility, drawing on examples from the Great Lakes and Arctic regions of Canada. It illustrates the kinds of insight that can be gained into resource use and the timing and seasonality of pottery production and people's movement, and discusses how mobility patterns affect the conceptualization and interpretation of local production.

[134] *Digital Deforestation: DTM Generation with Agisoft Photoscan*

Applying digital photogrammetry to archaeological sites is a well-known approach. Also fairly common is photogrammetry's combination with low-altitude aerial photography (LAAP) in order to generate three-dimensional data and produce GIS outputs such as orthophotographs and digital elevation models (DEMs). DEMs are widely useful for a number of spatial analyses and a LAAP-photogrammetry workflow is one of the easiest ways to produce these datasets. However, DEMs produced by these methods often include vegetation, as photogrammetric systems are not able to distinguish between true ground surfaces and the tops of trees. This paper describes a processing technique using point cloud classification that allows users to remove some types of vegetation and architecture in photogrammetric models from consideration when generating a DEM. By doing so, researchers can generate digital terrain models (DTMs), a subset of DEM which factors in only the Earth's surface and eliminates vegetation and architecture from elevation measurements. These DTMs are better basis for contour generation and various spatial

analyses including slope and water flow calculations.

[255] *A Comparison of Lithic Caches from Ucanal and Xunantunich: Is It Possible to Identify Eccentric Traditions as Communities of Practice at the Regional Level?*

Two recently discovered ritual deposits from the eastern Maya Lowlands seem to reveal similarities in the kinds of eccentrics used in Late Classic Maya caches from different political centers. Upon closer examination, however, they do not replicate all of the interred forms. This paper examines these two caches in terms of style, technology, and morphology, and also attempts to identify broader spheres of eccentric flint and obsidian traditions in the Maya world. If these objects can be found to constitute an "eccentric sphere," then it brings up the possibility of identifying communities of practice that supersede political boundaries as may be seen in ceramic types, or art and architecture styles.

[82] *Of Fire and Stone: Cremation and Secondary Burial Practices at Noomparrua Nkosesia, a Pastoral Neolithic Site in Southwest Kenya*

The spread of food production in East Africa c. 5000-1000 BP involved peoples with diverse subsistence patterns, material culture repertoires and identities. Pastoral Neolithic burial traditions include monumental pillar sites in northern Kenya, cremations in rockshelters in the southern highlands of Kenya and northern Tanzania, and widespread cairns. Little is known about the social landscapes and the diversity of mortuary practices of Neolithic-era peoples of the southern highlands. In 2016, members of a Maasai community near the Tanzanian border in Kenya discovered and exhumed a unique Neolithic mortuary site named Noomparrua Nkosesia (GxJg2). This 3.5 x 3.5 m rock crevice chamber held the remains of five cremated individuals in a matrix of soil, ash and powdered red ochre, associated with approximately 90 ground stone bowls and 44 obsidian artifacts. However, unlike all other known cremation sites, grindstones, ornaments and pottery were absent. We report on the chronology, stratigraphy and formation processes of this site. Geoarchaeological analyses show a distinct lack of ash or burned sediment despite the presence of burned bones, artifacts and cobbles. Noomparrua is the first cemetery containing only secondary burial of cremated remains in East Africa and increases the diversity of known Pastoral Neolithic

mortuary practices.

[356] *Estilo Cerámicos del Horizonte Medio en Quilcapampa*

Excavaciones arqueológicas en el sitio de Quilcapampa. Arequipa, dieron como resultado el hallazgo de fragmentos cerámicos del Horizonte Medio cuya iconografía y estilos tienen estrecha relación con la cultura Wari, el hallazgo incluye a formas de vasijas y diseños de la época 1B y 2A (estilos Chakipampa, Robles Moqo, Viñaque y estilos locales) que al parecer llegaron desde espacios culturales próximos a la costa sur. La variedad iconográfica y tecnológica de estos hallazgos en Quilcapampa pueden ser comparados con aquellas registradas en la costa sur por Dorothy Menzel, y la sierra sur por Justin Jennings y Willy Yépez. Este estudio cerámico también ha permitido observar áreas de actividad, reocupaciones y posibles ofrendas semejantes a las registradas en el sitio arqueológico de Conchopata y Wari en Ayacucho.

Huang, Cindy Hsin-yee (Arizona State University)

[112] *From the Lab to the Cave and Back: 3D Modeling Finger Flutings*

Finger flutings are lines and markings drawn with the human hand in soft sediments in caves and rock shelters throughout southern Australia, New Guinea, and southwestern Europe that date back to the Late Pleistocene. Over the last two decades, Kevin Sharpe and Leslie Van Gelder developed a method to determine characteristics of the creators, such as age, sex and group size. However, research on finger flutings is still constrained by physical challenges and limitations of the cave environment. 3D scans of the fluting panels would allow researchers to conduct measurements and other analysis in the lab. In order to determine the most appropriate method of 3D documentation, I conducted an experimental project in which I created and scanned replica panels using three different 3D scanners. I compared the process and results of each digitization method based on how well each accommodated for the challenges posed by the flutings and the cave environment.

Huang, Jennifer (Bureau of Reclamation)

[190] *Out From the Center: Rock-Art of the Chaco World*

Chaco Canyon contains multitudes of petroglyphs and pictographs, yet rock art has not been a prevalent line of evidence in the archaeological study of that pre-contact culture. More than 15,000 Ancestral Puebloan elements attest to the importance of the role of iconography within the canyon. And the Chaco World extended far beyond what today is called Chaco Culture National Historical Park. Certain Chacoan architectural components found in more than 230 habitation sites outside the canyon - including great houses, great kivas, roads, and earthworks - are used to identify those sites as related to the Chaco Center. Rock art has not been identified as a Chacoan trait. But data for more than sixty known outlier communities indicate that 23 contain rock art imagery. As no single trait is found at every outlier, and trait frequencies generally don't exceed one third of all sites, the presence of rock art imagery at 10% of great house communities containing other Chacoan traits could indicate iconographic relationships and trends both temporally and regionally. Polly Schaafsma's great gift to rock art research includes her ability to recognize the big pictures of the past. This paper touts rock art imagery as a viable line of evidence in the study of Chaco on a Polly-esque scale.

Huang, Tsuimei (Professor at Tainan National University of the Arts, Taiwan)

[141] *Jade Ear Ornaments with Human-Animal Motif from Prehistoric Taiwan — Design, Technology and Symbolism*

Jade ear ornaments with human-animal motif, dating to 2800-2300 BP, have been the most distinctive jewelry from prehistoric Taiwan. Since the first ear ornament of this kind became known in 1982, a total of 41 pieces of such items have been unearthed from 9 archaeological sites. These objects are comparable in composition, i.e. an animal image of a boar or a deer on top of the heads of a group of two frontal human figures placed side by side. These two groups of ear ornaments, those consisting of a boar image and of a deer image, can be differentiated according to

the size relationship between the human image and associated animal figures in the composition, carving techniques, and geographic distribution that also suggest the evolution of these artifacts in time and space. It is believed that these human-animal images were representations of the triumphant return of brave tribal hunters with their prey; these objects not only are faithful records of a long-standing hunting tradition but also serve as the visual evidence for studying the production, circulation and symbolism of jade ear ornaments in prehistoric Taiwan.

[173] *Avances y perspectivas de la conservación de edificios monumentales en Uxmal*

Sin lugar a duda Uxmal fue el sitio más importante de la región Puuc desde el siglo VIII hasta el X. Cuenta con un área amurallada de 2.6 km², en los que se distribuyen 11 grupos de arquitectura monumental. A principios del siglo XX la lógica de conservación fue intervenir los edificios que tenían en pie hermosas fachadas de mosaicos de piedra. Más adelante, influyó el interés de los presidentes Lázaro Cárdenas y Miguel Alemán, estos criterios dieron como resultado que a los ojos del visitante Uxmal se percibiera como una serie de edificios inconexos. A partir de 1992, se planteó una estrategia para recuperar Uxmal, entendiéndola como una ciudad con espacios dedicados a diferentes actividades y diseñada para captar el agua de lluvia y dirigirla hacia los reservorios localizados al poniente del asentamiento. En esta presentación hablaremos de los procesos de restauración que nos han permitido hacer una intervención integral de los monumentos y recuperar los espacios que los rodean. Haciendo énfasis en las técnicas de exploración, la recuperación de saberes antiguos sobre el uso de la cal y la aplicación de nuevas tecnologías en el registro del estado de conservación de cada monumento.

Huckell, Bruce (University of New Mexico)

[316] *Clovis Use of Obsidian in the Southwest*

The role of obsidian in Clovis technological organization in the US Southwest and northwestern Mexico is investigated. The distribution and typology of obsidian artifacts from excavated sites as well as surface contexts is reviewed. Projectile points appear to be the principal, and nearly only, tool for which obsidian was used, in contrast to chert and other siliceous materials that served for the manufacture of multiple tool types. Compositional studies by Steve Shackley indicate that, Clovis groups exploited several different primary obsidian sources within the region, which offer piece sizes ranging from large nodules to small marekanites. Secondary sources—nodules available in Quaternary alluvial deposits—along major drainages were also likely exploited. Use of marekanites and small nodules from secondary contexts is particularly interesting because small piece sizes restrict the sizes of projectile points that can be made. Small obsidian points are common at Clovis sites in southeast Arizona and south-central New Mexico, and analysis of their dimensions and those of Clovis points of other materials are presented. Reasons for the organizational decisions to select, transport, and use these small pieces of obsidian are explored.

Huckell, Lisa (UNM)

[25] *New Life for Old Samples: Investigating the Paleoethnobotanical Record from Tijeras Canyon*

University of New Mexico field school excavations carried out at Tijeras Pueblo in the Sandia Mountains by Jim Judge and Linda Cordell from 1971 to 1976 left a legacy of more than 2,000 botanical samples, consisting of maize, flotation samples, wood samples, and macrobotanical specimens. Apart from a single preliminary paper produced by a field school staff member, the potential of this archive has remained untapped for more than 40 years. The use of Tijeras flotation samples for student projects for a UNM class in paleoethnobotany has provided the opportunity to initiate a new phase of investigation that has expanded on the limited contexts sampled for the earlier study to include all room blocks and both major occupation periods defined by Cordell. This paper presents the results of the current semester's analyses in combination with previous data to offer new insights into the subsistence economy created by the Tijeras Pueblo residents.

Huckleberry, Gary [8] see Steinbach, Erik

Huckleberry, Gary (Geoarchaeological Consultant)**[312]** *The Importance of Sediment: A Selection of Julie Stein's Contributions to Geoarchaeology*

Of Julie Stein's many contributions to geoarchaeology, her publications regarding sedimentology and stratigraphy with respect to site formation have been particularly influential. By employing earth science methods to elucidate the history of archaeological sediments in a diversity of environments and cultural settings, her work has helped archaeologists better interpret the context of material culture and thus better understand past human behavior. In honor of Julie's scientific contributions to the profession, I will review three geoarchaeological case studies from the North American Southwest (Arizona) and Northwest (Washington) where strategies borrowed from her published work were used to elucidate the history of sediments from cultural contexts and address archaeological questions. Julie's research demonstrates the importance of the sedimentary matrix in the archaeological record and is a reminder of the value of interdisciplinary scientific collaboration.

Huddart, David [38] see Gonzalez, Silvia

Hudgell, Gemma-Jayne, Ellen Cowie (Northeast Archaeology Research Center, Inc.) and Robert Bartone (Northeast Archaeology Research Center, Inc.)**[400]** *A Well-Travelled Route: 7,500 Years of Occupation along the Missisquoi River, Northwestern Vermont—The Vermont Agency of Transportation Route 78 Project*

Vermont Route 78 follows the Missisquoi River into its floodplain and out to Lake Champlain, and in doing so crosses a rich archaeological landscape. Since 1999, archaeological excavations have been undertaken in advance of safety upgrades to this major east-west route, and although necessarily a narrow slice along the road corridor, the results document continuity in Native American occupation over approximately 7,500 years. This paper focuses on the Headquarters and Porcupine sites, which underwent phase III data recovery in 2013. The integrity of these sites is exceptional, with cultural features, living surfaces, and artifacts preserved in a sealed, layered alluvial setting. These extensive, stratified sites contain intact components dating to the Middle and Late Archaic, the entire span of the Woodland period, and the early Contact and early historic Euroamerican settlement periods. Archaeological evidence includes virtually the entire range of Vermont Native ceramics (over 300 separate vessels), remnants of a Native American longhouse dating to ca. A.D. 1200, and products of horticulture including maize, beans, squash, tobacco, and sunflower, suggesting the presence of a village of considerable size. The project also provided an ideal setting for a substantial Public Education and Outreach program given project accessibility and visibility.

Huerta, Danielle (University of California, Santa Cruz)**[204]** *Analysis of Late Rio Grande Glaze Wares from a Post-Revolt Jemez Pueblo*

For 400 years Rio Grande Glaze Ware played an important role in Pueblo life, from feasting and ritual acts to everyday life as serving vessels. What is interesting though, is that regardless of its said importance and the specialized nature of technical knowledge required to produce glaze ware, it appears that Pueblo potters stopped making glaze ware sometime after the Pueblo Revolt of 1680 for reasons that Southwestern scholars have speculated on. This paper presents petrographic, chemical characterization, and isotopic data from the analysis of Rio Grande Glaze Ware Glaze E & F ceramic sherds from the post-Revolt Jemez Pueblo of Patokwa (LA 96). Jemez oral traditions and ceramic evidence suggest that Patokwa was the place the Jemez settled following their departure from Walatowa after the Revolt and when the Spaniards returned to New Mexico in 1692, this is where they found the Jemez living (Liebmann 2012). These analyses were carried out to investigate the procurement, production, and movement of late glaze wares and their raw material constituents in hopes of revealing some broader information about how Pueblo people reorganized and remade their lives after the Spanish were driven out of New Mexico.

[252] *The Smell of Power: The Apishapa Pilgrimage Trail*

Abstract rock art formed part of a pilgrimage trail that led from the lower Apishapa Canyon to the Spanish Peaks near Trinidad, Colorado. Hunter/gatherer ethnography from the Great Basin makes sense of abstract engravings in the canyon at sites such as Cramer, Canterbury, and Snake Blakeslee. The Apishapa Canyon leads from these and other sites up to the volcanic-like Spanish Peaks, an igneous stock well-known for its unusual series of radial dykes. According to Great Basin ethnography, shamans should lead pilgrims along sacred trails to such volcanic intrusions because they were sources of supernatural power, or puha. In the Great Basin, pilgrims should stop along the way at igneous intrusions so that neophytes could gain spirit helpers. Between the canyon and peaks, the trail leads past a dyke with small artificial platforms, as well as flake scars and random peck marks on tumbled boulders not suitable for tool production. Moreover, experimental bashing did not produce loud sounds or echoes, but it did produce a sulfurous odor. Since hot springs in the region also emit sulfur, and since hot springs are another source of puha, neophytes may well have bashed the boulders in order to acquire supernatural power in another form.

Huftalen, Cameron (Bates College) and Colleen O'Loughlin (Bates College)

[123] *Identification and Classification of the Environmental Microbiome of the Temyiq Tuyuryaq*

This pilot study aims to culture and monitor bacterial species from a specific range of archaeological samples from Temyiq Tuyuryaq, a multigenerational village in northern Bristol Bay, Alaska. Goals of this study are to test our ability to identify variability and consistency of the microbial species present in conditions of food storage areas, cooking features and household floor contexts. Bacteria, like any life form, compete for resources. Although the numbers of microbial competitors are vast in any given environment, favorable conditions are heavily influenced by existing nutritional sources. Relying on the resource ration competition model, the predominance of different taxa are heavily influenced by availability, individual demand, and rate of consumption of nutrients. Bacteria, like humans, display a range of relationships with each other; from competition, coexistence, and cooperation. The ability to explore bacteria colonies from samples collected at Temyiq Tuyuryaq creates opportunities in support of less invasive field methods (e.g. core extraction vs. excavation). This research contributes to a growing interest in Indigenous archaeology; one that prioritizes the interests and ideas of descendants. Less invasive methods allow for opportunities to bridge the divide between traditional archaeological interests and community interests facilitating respectful and equitable collaborative relationships.

Huggett, Jeremy (University of Glasgow)

[77] *Is Digital Data Different?*

Archaeological data is notoriously tricky: while we appreciate it is always incomplete, frequently unreliable, often replete with unknown unknowns, we nevertheless make the best of what we have and use it to build our theories and extrapolations about past events. Are data in a digital environment any different? Is there any reason to think that digital data alter this complicated relationship with archaeological data? If it does, how, and what are the implications for our use of such data? And if not, why does the shift to an infinitely more flexible, fluid digital medium not change the character of our data? As we are increasingly subject to algorithmic agency, this paper seeks to unpick the nature of digital data, a prerequisite to rational and appropriate digital data analysis.

Hughes, Elaine (Museum of Northern Arizona)

[21] *Archaeological Collecting at the Museum of Northern Arizona: Then and Now*

The Museum of Northern Arizona (MNA) is a private institution, yet 89% of its archaeological holdings are from federal, tribal, and state lands. The story of how MNA acquired these collections is rooted in its founding in 1928 by a group of local citizens under the leadership of Dr. Harold S. and Mary-Russell Ferrell Colton. The idea for the museum grew out of Dr. Colton's correspondence with an amateur archaeologist and custodian of Wupatki National Monument. They both felt that cultural and natural science resources from Arizona should be preserved in Arizona rather than in large Eastern museums. Dr. Colton encouraged local collectors to donate their prehistoric collections to MNA for greater accessibility to the public, while he continued a systematic archaeological survey begun in 1916 to document sites in northern Arizona. There have been many changes since these early days with the passage of

laws that affirm federal ownership and tribal claims to archaeological resources from their lands. In line with this, MNA has developed and will discuss its current policy and protocol for accepting archaeological materials from private entities as well as partnerships with local tribes for re-homing artifacts.

[86] *No Stone Unturned: Rock Technology from the Basketmaker Communities Project*

The stone artifacts recovered from the Basketmaker Communities Project study area in southwestern Colorado resemble broader technological and social trends documented in the San Juan region during the Basketmaker III time period on the Colorado Plateau. Do the residents of the BCP study area represent a convergence of Western and Eastern Basketmaker II populations? In this paper, we examine the variation in chipped and ground stone technologies from the BCP and use these data to attempt some clarity on the origins of the residents of the study area. Lithic materials recovered from the Dillard community center and smaller Basketmaker sites represent not only adaptation to local resources but suggest interactions and social connections with the greater Southwest. Stone technologies represented at these sites suggest some continuity with Basketmaker II populations in the area and the beginnings of Pueblo social and material culture.

Hughes, Richard (Geochemical Research Laboratory)

[257] *Critical Dimensions in Obsidian Provenance Analysis*

Geochemistry, geology, and archaeology all conjoin contemporary provenance studies. Geochemistry provides the chemical signatures of parent geological materials and the requisite data to support attributions of archaeological artifacts to "source" (chemical type), geology provides the overarching context for understanding the formation of the geological parent materials, while archaeology informs on the human time-space-function dimensions of material use. Recent "big picture" synthesis of regional obsidian use in archaeology have drawn on artifact-to-source assignments from a variety of literature with minimal attempt to evaluate the accuracy of the source assignments themselves. This paper will address epistemological challenges arising from this narrow view of obsidian provenance designations, suggesting that confidence in synthetic results will require a common reporting "language", adherence to rigorous analytical standards, sensitivity to geological issues, and in-depth knowledge of the advantages and disadvantages of different instrumental and data manipulation methods.

Hughes, Tyson (Crow Canyon Archaeological Center), Kate Hughes (Crow Canyon Archaeological Center) and Bruce Bradley

[261] *Curated Lithic Tools from the Lakeview Group*

Current excavations at the Lakeview group in southwestern Colorado have sparked interest in a fresh look at the Ida Jean site and Wallace Ruin collections. The Ida Jean and Wallace sites, part of the Lakeview group, are two Chaco-style great houses that were occupied during the Pueblo II and III time periods (AD 900-1300). However, both sites have many projectile points, bifaces, and knives that appear to have much older origins. We take a look at the technology, lithic materials, and provenience of these older tools in an attempt to understand this connection through time and space.

[110] *Stable Isotope Analysis of Humans, Pine Nuts, and Acorns from the Central Sierra Nevada, CA*

In stable isotope analysis of human remains, $\delta^{13}\text{C}$ enrichment is often interpreted as a marine or C4 contribution to the diet. There are instances when neither of these interpretations is supported by the archaeological evidence, such as in the central Sierra Nevada of California. Archaeological evidence for this region suggests that pine nuts and acorns provided the bulk of the plant-based diet, while deer constituted most of the meat. Here we present $\delta^{13}\text{C}$ and $\delta^{15}\text{N}$ values of bone collagen from ancient human inhabitants of this region. We compare $\delta^{13}\text{C}$ values of archaeological pine nuts (*Pinus sabiniana*, *Pinus lambertiana*) and acorns (*Quercus* spp.) from within the same region to help elucidate $\delta^{13}\text{C}$ differences among these two important dietary genera. Our research suggests that fundamental differences between these two genera of trees may account for $\delta^{13}\text{C}$ enrichment observed in some individuals.

Hull, Kathleen (University of California, Merced)

[19] *Recognizing Post-Columbian Indigenous Sites in California's Colonial Hinterlands*

Land-use patterns of seasonally mobile hunter-gatherers present a particular set of challenges to archaeological recognition of post-1492 indigenous residential sites in the colonial hinterlands of California. The relatively short duration of site use, frequent re-use of sites episodically occupied in the more distant past, and fine temporal scale often required for archaeological study of cultural practices in the wake of colonialism necessitate a multifaceted approach. This research strategy entails: (1) creative and exhaustive use of diverse data sources, including documents, images, and material evidence; (2) innovative approaches to inferring site formation, chronology, and organization; and (3) a formal iterative method that feeds data back into the identification process and builds on often subtle differences between components dating before and after 1492. This paper illustrates this research strategy via examples from studies in Yosemite National Park that also have relevance to archaeological identification of post-1492 indigenous sites elsewhere in North America, including areas where very different land-use practices were pursued.

[115] *Oops, I Touched It Again: Debunking Myths and Misconceptions of Radiocarbon Dating Sample Collection*

Established field sample collection procedures have fostered misconceptions of the vulnerable nature of organic materials destined for radiocarbon dating. To address common contamination concerns and debunk these misconceptions, wood samples of known age were intentionally exposed to a variety of substances found in the field and the lab, including coffee, human hands, cleaning solvent, aluminum foil and low-density polyethylene film. Experimental samples were then subjected to a standard acid-base-acid (ABA) pretreatment protocol with the aim of examining the effectiveness of removing exogenous carbon. Results indicate that the standard procedure for the pretreatment of organic materials effectively removes common exogenous carbon contamination, and thus reduces handling and curation concerns after excavation.

[81] *Uncovering a Globalized Past with the Connections Project: Highlighting Challenges Associated with Exploring Long-Distance Interaction between the Southwest US and Mexico*

The Connections Project is a long-term research venture focused on documenting material indicators of interregional interactions amongst people that inhabited an area ranging from the US Southwest and Mexican Northwest (SW/NW) to Central America from 800-1540 CE. Data relating to distantly traded goods and materials indicative of relations across space were collected and collated from archaeological reports, publications, and cultural resource management records. The long-term goal of this project is to create an open access research and reference database for storing evidence of material and iconographical interactions amongst peoples who inhabited the SW/NW and Mesoamerica. However, there remain a substantial number of obstacles to data curation and analysis. In this Knowledge Development Framework (KDF) paper, we address three things. First, we delve into what the Connections Project is and what data we use. Second, we highlight an example of an obstacle to data analysis that was overcome through collaboration. Third, we discuss an issue that we are actively working to overcome—namely the challenges associated with digitally curating archaeological data. By discussing these obstacles, we hope to create a dialogue regarding the challenges of collecting, curating, and using archival data for large scale analysis.

[143] *Periodizing Andean Colonialism: A Comparison of Archaeological and Historical Data From Markaqocha, Cusco, Peru*

This paper assesses the problem of materially distinguishing between the Andean Late Horizon Inka Empire (ca. 1450-1532 CE) and ensuing Spanish Colonial Period (1532-1824 CE) in contexts that lack overtly colonial artefacts. The arrival of Spanish conquistadors in the Andes, and subsequent conquest and colonization of the region, is frequently framed as a cataclysmic rupture, a singular historical event, or a rapid transition. This paper uses data from the Cusco area site of Markaqocha to examine such characterizations. A comparison of archaeological, historical, and paleo-environmental data from Markaqocha demonstrates that while the population living at the site

participated in drastic cultural change under colonialism, these changes were not always materialized in ways that align with the historical events that dominate periodization, and were accompanied by notable continuities in practice. This suggests that for Markaqocha's residents, the "rupture" of the colonial transition was experienced by fits and starts for centuries after the arrival of colonizers. These data emphasize the importance of considering the variability of historical transitions at local scales, accentuating that what constitutes chronological rupture, historical event, or material transition is highly dependent on daily lived experience.

Hunter-Anderson, Rosalind (University of New Mexico)

[29] *Paleo-sediment Coring Studies in Micronesia: A Review and Critique*

Paleo-sediment coring studies by archaeologists, pioneered in Micronesia by Steve Athens and colleagues, including myself, in the 1980s, are reviewed and assessed for their contributions to archaeological science in the western Pacific within a CRM context. It is suggested that while data generated by these studies comprise a major advance over the narrow perspective of culture history long dominant in Pacific archaeology, using a priori narratives and ad hoc statements about past human behavior to guide and to interpret the research findings is a serious methodological error leading to embarrassing revisions and reversals, as also happens to culture historians when contradictory observations come to light. An alternative approach is illustrated.

Huntington, Yumi (Framingham State University) and John Warner (University of Southern Florida)

[64] *Monumental Structure, Sacred Landscape, and Cosmology: The Late Formative Period Peruvian Site of Jequetepeque-Jatanca*

How does architectural construction relate to the surrounding landscape and a broader cosmological framework? This paper discusses the relationships among architecture, geography, and cosmology at the site of Jatanca in the Jequetepeque Valley on the northern coast of Peru. This site was occupied mainly during the Late Formative Period (approximately 500 BCE to 100 CE) by local coastal populations, resulting in the construction of six monumental architectural compounds located on a relatively undifferentiated flat plain. Only one partially elevated structure exists at the site, a unique Acropolis that radiocarbon tests and excavations indicate was the very first building constructed there. This Acropolis seems to form a focal point for the local architecture and its relationships to the surrounding sacred mountains and even celestial bodies. We argue that the Acropolis exhibits a specific cosmological relationship with the nearby mountain Cerro Cañoncillo, creating an almanac based on alignments of solstices and equinoxes that connected the site's inhabitants to a larger cosmic framework. This paper will discuss the rationale behind Jatanca's geophysical location and spatial considerations for its ritual practices, including analysis of its surrounding environment and irrigation canal system.

Huntley, Ashley

[400] *Assessing Our Impact: An Examination of the Role of Historic Preservation in the Gentrification of Urban Centers in the Midwestern United States*

Over the past few decades urban centers, especially in the Midwestern United States, have experienced "revitalizations" that have completely altered the socio-political and ethnic make-ups of these cities. While historic preservation does not always play a role in the gentrification of cities—especially in urban locations where the emphasis has been placed on modern builds—preservation efforts have contributed to the pattern of displacement that is often seen during the gentrification process. This can be partly attributed to the selective emphasis on a neighborhood's history that sometimes occurs. This paper will examine how historic preservation has traditionally caused displacement and what can be done to shift the focus to not only preserving historic structures, but also preserving established communities in historic neighborhoods.

[188] *Unroofed Great Kivas, Post-Chacoan Great Houses, and Aggregation: Kintigh's Legacy as Viewed from the Lion Mountain Community*

As graduate students, Keith Kintigh shaped each of our careers in significant ways. Keith introduced us to the archaeology of the Cibola region, a place that remains dear to us. He also inspired an enthusiasm for the use of statistics, particularly for ceramic typological seriation and chemical provenance studies. And his interest in the spatial organization of Ancestral Pueblo communities and the role of public architecture in those communities are themes we continue to explore. Our current archaeological work in the Lion Mountain area on the Cibola National Forest near Magdalena, New Mexico, allows us to combine these tools and interests. Over the past two summers we have documented over 50 sites in an area covering about 2 square miles -- sites that include ceramic types indicating a largely late Pueblo II-Pueblo III occupation with close ties to the Acoma and Zuni regions, grid gardens, public architecture that we are calling post-Chacoan great houses and an unroofed great kiva, and a possible Chacoan outlier. This paper presents preliminary results of our ongoing research and discusses how we have adapted Kintigh's model of aggregated post-Chacoan great house communities to an area much farther afield than originally included in his research.

Hurcombe, Linda and Theresa Emmerich Kamper (University of Exeter)

[20] *The Materiality of Human-Animal Relationships: Animals as Hides, Furs, Fibres, Sinew, and Tools*

Human relationships with animals include materials not just food. Animal products provide strong resistant materials for tools, and flexible ones for clothing and containers. Humans can wrap themselves and sleep warmer because they have turned animals into clothing, bedding and shelters. The tools made from them can enable hunting, food processing, and the preparation of other craft materials. We present a broad perspective looking at the way both wild and domesticated animals have been used by humans. Based on our practical knowledge of many kinds of animal materials and products, we outline the ways in which the finished artefacts can have smells and textures that are a combination of the original animal and the way humans have chosen to process it. Inherent knowledge of species-specific characteristics influences animal selection and therefore hunting and herding practices. Differences between species and within one species (sex, age, condition) can cause humans to exploit one animal over another to align to a specific purpose. Awareness of the effect of exploitation patterns can manipulate the availability and suitability of animals into the future. In all these ways animal-based material culture is a tangible expression of human-animal relationships.

Hurst, Heather (Skidmore College)

[39] *Chemical Indices as a Key to Context: The Use of pXRF to Reassemble Maya Mural Fragments from San Bartolo, Guatemala*

The dissemination of wall paintings from the Late Preclassic period Maya site of San Bartolo, Guatemala, have focused on the in situ north and west walls of the buried chamber named Sub-1A. In contrast to their excellent preservation, the east and south walls of the temple were intentionally broken and buried by the Maya as part of its ritual termination in the 1st century. It took several years to recover over 3000 mural fragments during archaeological excavations of the Sub-1A chamber, and then slowly piece sections back together based on iconographic and stylistic characteristics. However, the relationship among reassembled scenes remained unclear. Compositional analysis characterizing the finishing plaster of the reassembled scenes provides an innovative technique with which to assess their spatial distribution and aid further reassembly. Building on an integrated study of wall substrates, painting techniques, and artistic practice of the in situ walls, this new analysis uses pXRF to identify specific finish plaster compositional groups of the fragments. Plaster compositional groups provide non-visual data informing spatial reconstruction of the original east and south wall narrative sequence. This paper uses chemical indices of mural manufacture to aid contextual analysis of new images from the San Bartolo paintings.

[400] *Constructing Heritage along the Eastern Escarpment of the Southern High Plains Northwest Texas*

The removal of the Comanche from northwest Texas in the early 1870s opened the Southern High Plains eastern escarpment region to new pastores (Spanish shepherders from New Mexico) and Anglo-Americans, who created order out of the landscape through construction of built cultural heritage. An Unmanned Aerial Vehicle (UAV) was used to document the built cultural heritage of pastores, buffalo hunters, cattle ranchers, and early homesteaders occupation of the region from ~1877-1914. Images from the UAV were used to create 3D models using photogrammetry for analysis. Results indicate that the pastores relied upon unmodified caliche boulders and cobbles in the construction of corrals. In contrast, Anglo-Americans used sandstone that was easily modified for dressed and coursed walls in constructing corrals and buildings. A variety of different rock types from local cobble deposits were incorporated as decorations into the exterior walls of a homesteader's rock house. The variation in the types of rock used in construction demonstrates changing perceptions of the surrounding landscape as Spanish and Anglo-Americans moved into northwest Texas.

Hurst, Winston (Bohunk Inc.)

[313] *Ruminations on Puebloan Ethnic Diversity and Ceramic Specialization in the Ancient Western San Juan*

Though traditionally perceived as representing two distinct Puebloan subcultures, San Juan Red Ware and Tsegi Orange Ware are best understood as representing a single ceramic tradition whose production geography shifted several times between the eighth and fourteenth centuries, independently of associated gray ware and white ware ceramic traditions. That history suggests that red ware production was restricted to a well-defined, persistent group of production specialists who occasionally moved as a group between cultural territories. The late-11th century shift in red ware production from San Juan Red Ware in the Mesa Verdean northern San Juan to Tsegi Orange Ware in an empty quarter of the Kayentan territory to the southwest, coincides with a proliferation of great houses and associated Chaco-connected features and institutions in the north and may reflect a "voting with the feet" response of red ware producers to the expanding great house system. This presentation presents the hypothesis that ancient red ware production was tied to a branch of ancestral Keres-speaking Pueblo people, citing circumstantial archaeological, linguistic and ethnohistoric evidence.

Hurt, John Duncan (University of Texas at Austin)

[114] *GIS-Based Approaches to the Study of Castro Architecture*

The term "Castro Culture" refers to a set of evidential trends encountered in the archaeological record of Galicia and northern Portugal from roughly 900 BCE – 200 CE. Conventional definitions of the Castro Culture rely heavily on the architectural characteristics of the castros, a type of hillfort which is thought to represent the primary form of settlement in the imagined "culture." The essence of the Castro Culture is therefore defined in part by the idea that castro communities held certain architectural practices in common, seen for example in their preference for circular forms and extensive stonework. Yet studies of castro architecture are few and far between, and many dimensions of the evidence remain unexplored. Here I apply GIS to the visible remains of a few castro sites in northwestern Portugal, providing new insight on the organization of space within these settlements. I explore the implications of my findings for discussions of concepts such as urbanism, "Romanization," and political power in the context of the Castro Culture. Ultimately this is an exercise in critical inquiry as well as in spatial analysis: What can we conclude from the form of these settlements, and how does it challenge conceptualizations of the Castro Culture?

Hurtubise, Jenna (University of Alabama)

[236] *Casma Occupation at Pan de Azúcar de Nepeña: Findings from the 2017 and 2018 PIAPAN Field Seasons*

In 1968 and 1973, Donald Proulx conducted surface surveys of the Nepeña Valley, registering sites spanning different time periods and cultural occupations. One of these sites, registered as PV31-29, is Pan de Azúcar de Nepeña, a Casma site consisting of a fortified hill topped by an adobe stepped platform surrounded by 13 mounds and three cemeteries. Since 2014, research by the author has focused on understanding the Casma occupation at this site based on preliminary surface surveys, photogrammetry, and excavation. Aside from the evident Casma

occupation, evidence suggests a Chimú presence based on a multiplicity of findings including commingled Chimú-Casma material culture as well as prevalent amounts of isolated elite Chimú material. Based on our findings we suggest that Casma-Chimú interactions existed at Pan de Azúcar de Nepeña, before, during, and after the time of Chimú conquest around A.D. 1350. This paper centers on findings from the 2017 and 2018 field seasons and explores Casma occupation at Pan de Azúcar de Nepeña in examining architecture, ceramics, and burial practices as well as providing preliminary interpretations for the extent and degree of Casma-Chimú interactions in the western end of the Nepeña Valley.

Hussey, R. Scott (University of Florida)

[295] *Dungeons, Altars, and Slaves: The Subterranean Material Culture of Christian Slaves in Early Modern Morocco*

The treatment of European Christians held in servitude in Early Modern North Africa continues to be the subject of contention. Robert Davis argues that, out of the million or so Christians brought to North Africa between 1530 and 1780, most were never ransomed and died as slaves. Nabil Matar questions Davis' claims, in part, because of an absence of corroborating material evidence. Structural evidence is rare, likely destroyed by time and urban expansion. One of the few sites to remain is a subterranean dungeon for European Christians in Northern Morocco: the Mazmorras of Tetouan. In this presentation, I examine the material culture of enslaved Christians in the Mazmorras through its sacred spaces, ceramics, and its carceral function. My research considers the dungeon interior and its relation to the city above together as an object of incarceration. The mechanisms of incarceration is a consistent theme with primary source accounts, including an emphasis on the iron barrier demarking the transition between free and unfree space. Additional themes in the historical accounts are the presence of sacred spaces and the use of ceramics. My research provides support for these historical accounts through architectural evidence and the identification of ceramics within the Mazmorras.

Huster, Angela (Arizona State University) and Christopher Morehart (Arizona State University)

[374] *The Burial Artifacts of Epiclassic Los Mogotes, Basin of Mexico*

The hilltop, Epiclassic period (ca. 600-900 CE) site of Los Mogotes (ZU-ET-12) sits on the boundary between the northern Basin of Mexico and the southern Mezquital valley. Hence, it is well-placed to understand local and regional transformations between the fall of Teotihuacan (ca. 650 CE) and the rise of Tula (ca. 900 CE). In this paper, we examine burial goods from several excavations by the Northern Basin of Mexico Historical Ecology Project associated with four residential structures and one monumental structure at the site. Burial goods are compared to their respective household assemblages and to data on regional patterns of offerings from burials and other ceremonial contexts. Compared to local household assemblages, burial ceramics include unique vessel forms and higher percentages of stylistically non-local types. This pattern is also reinforced in the iconography on several burial vessels as well as other offerings, which exhibit symbolic depictions of coastal environments. The ritual use of non-local items for burial offerings is common during the Epiclassic period in central Mexico, which sheds light on the complex nature of social and cultural transformation.

Huston, Ann and Kristina Whitney (National Park Service)

[124] *Interpreting a Temporary Buffalo Soldier Camp in Chiricahua National Monument*

Interpretive park rangers share the stories of Chiricahua National Monument, but sometimes some stories can slip through the cracks. That happened at Faraway Ranch, where one of the chimneys is composed of stones hand carved by Buffalo Soldiers stationed in Bonita Canyon during the "Indian Wars" in the 1880s. While the history of the chimney has been shared on tours, it wasn't until recently that rangers began to delve into the stories of the soldiers themselves, and share these stories with visitors. Since 2017, rangers have added programs, web pages, and visitor center displays focused on the Buffalo Soldiers, their role in the complicated Indian Wars, and what the men did before and after their time in Bonita Canyon. During African American History Month, a ranger-led walk explored the archaeology site, and incorporated photographs of Buffalo Soldier artifacts found in Bonita Canyon. With the help of the park archaeologist, curators at the Western Archaeological and Conservation Center (WACC) and the Arizona Historical Society and Museum, and the Interpretive Division, the stories of Buffalo Soldiers in southern Arizona

have gained a much wider audience.

[100] *Partialities of Power at Uci, Yucatan, Mexico*

Beginning in 2008, the Uci/Cansahcab Regional Integration Project has investigated the causes and consequences of the construction of an 18km long causeway that connected four ancient Maya sites with monumental architecture in the Late Preclassic period. This paper presents the results of recent excavations at Uci, the largest site along the causeway and the likely capital of a micro-polity. Our excavations suggest that Uci benefitted from its position at the top of the site hierarchy and created lasting links with its smaller neighbors, but did not exert major influence. Though Uci thrived across millennia, its history was uneven. Social memories span disjunctions. By the time of the Spanish Conquest, the capital had shifted 3km southward to Motul, seat of the Cehpech province and current municipal center, though Uci was never fully abandoned.

Hyde, David (Western State Colorado University) and Lauri Martin (Center for Tropical and Archaeological Studies)

[345] *Veneration and Pilgrimage at a Hinterland Shrine: Evidence from the Medicinal Trail Community, Northwestern Belize*

Data recovered from excavation of the residential Tapir Group at the Maya hinterland site of Medicinal Trail provides evidence for ancestor veneration and pilgrimage. For veneration, the Maya incorporated ancestors into their built environment through the ritual practice of physically including them in the architecture as burials within or beneath the structures. Pilgrimage is defined as a social process or an act of visiting a sacred place for practical and/or spiritual purposes. Postclassic pilgrimages are of particular interest in light of the Classic Period Collapse of the southern and central lowlands beginning around AD 900. The abandonment left the ancestors in large ceremonial site centers as well as hinterland communities. Pilgrimage theories have proposed that these journeys were perhaps multipurpose, and that they were combined with veneration. This paper will demonstrate that the eastern structure at the Tapir Group functioned as an ancestral shrine and that a pilgrimage occurred at the shrine.

Hyde, David G. (UC Berkeley)

[107] *Culture Contact and Change in the Industrial American West: Examples from the 19th Century Samuel Adams Lime Kiln Complex, Santa Cruz, California*

Archaeological investigations of historic industrial sites in the American West have long been dominated by questions surrounding power, resistance, and the emergence of class structures and ideologies. While these questions are still relevant, these sites offer the potential for a much wider range of anthropologically situated research that extends beyond this relatively narrow scope of research foci. In this paper, I position early western industrial sites as dynamic pluralistic communities. From this perspective, work at these sites offers great potential to contribute to conversations surrounding culture contact, change, and hybridity. As an example of this potential, I will present findings from archaeological investigations at the Samuel Adams Lime Kiln complex, a 19th century company town located outside Santa Cruz, California. Situated at the social and geographic nexus of dramatic technological and demographic change, findings suggest this industrial operation was the site of emergent practices that continually contested and transformed notions of labor and community, with lasting social implications. It is hoped that this conversation both compliments and contributes to more traditional investigations of power, resistance, and class, highlighting the tremendous potential for historic industrial sites to serve as ideal test areas for a wide range of anthropologically situated archaeological investigations.

Hyde, David M. [30] see Dodge, Robyn

Hylkema, Mark (California State Parks)**[231]** *Middle Holocene Projectile Points from the Santa Cruz County Coast of Northern Monterey Bay, California*

A group of Middle Holocene aged archaeological sites along the Santa Cruz County Coast have produced a large number of chert and obsidian projectile points. Sites SCR-3, SCR-7, SCR-10 and SCR-40 have the same range of point types and materials, and are all within 10 miles radius of each other. The diversity of types and materials indicate that ancestral Native Americans of the region were highly mobile hunters who also opportunistically harvested marine mollusks, fish and sea birds while hunting on the coastal terraces. Ranging between the southern San Francisco Bay, over the Santa Cruz Mountains and onto the open Pacific Coast, these mobile hunters eventually became territorially circumscribed and with the advent of the Late Holocene the emphasis was on managing resources within a narrower territorial range.

Iannone, Gyles (Trent University)**[300]** *Towards an Integrated Socio-ecological History for Residential Patterning, Agricultural Practices, and Water Management at the Classical Burmese (Bama) Capital of Bagan, Myanmar (11th to 14th Centuries CE)*

The IRAW@Bagan project is striving to generate an integrated socio-ecological history for residential patterning, agricultural practices, and water management at the Classical Burmese (Bama) capital of Bagan, Myanmar (11th to 14th centuries CE) across a range of significant ecological, climatic, economic, socio-political, and religious changes. This objective is being achieved through a settlement archaeology study within the peri-urban (mixed urban-rural) settlement zone immediately surrounding Bagan's regal-ritual epicenter, which is still clearly defined by remnants of its original walls and moat. The significance of this ongoing program of survey, excavations, and geo-spatial inquiry is grounded in addressing the continuing bias toward upper echelons of Bagan society, namely high-ranking nobles and religious institutions. This program of settlement archaeology will ultimately: 1) generate a more nuanced understanding of Bagan as a dynamic capital city; 2) provide insights into the unique characteristics of early urbanism in the tropics; and, 3) contribute to considerations of resilience and vulnerability in contemporary tropical metropolises.

[68] *Thread Production in Ocotelulco, Tlaxcallan, Mexico*

Archaeological excavations undertaken by the Tlaxcallan Archaeological Project have recovered an important sample of spindle whorls from Late Postclassic – Early Colonial (1420 -1540 A.D.) domestic contexts in Ocotelulco, a subsection of the urban site of Tlaxcallan, Mexico. In this paper, we present the results of the analysis of identified whorl types and group proportions to better understand local thread production. These results are then compared with a sample from Tepeticpac, another subsection of Tlaxcallan. In this latter sample, we previously recorded a high proportion of whorls associated with processing fine and short fibers, such as cotton. We discuss the socioeconomic and technological implications of these results, as well as provide a wider panorama for textile production in Tlaxcallan.

Ibarra Asencios, Bebel

[396] *Ancestor Veneration or Funeral Practices? An Examination of Recuay Mortuary Variability in the Basin of Puccha (Ancash) between AD 200-900*

Mortuary studies have followed different perspectives, such as ancestor veneration mostly based on intrasite analysis. This paper examines the regional distribution of Recuay's funeral practices and its implications for ancestor worship studies. Radiocarbon dates available for the valley show an occupation between AD 200-900, and it correlates with the presence of kaolin ceramics, associated with Recuay style. Excavations in funeral and ceremonial contexts from three sites reveal the existence of different types of tombs, such as subterranean chambers, chullpas or above ground tombs, and cists. The variation of tomb architecture is very substantial but changes in civil/public architecture and ceramics are minimal. Particularly, I will present the results of excavations in Huamparán a patio group complex that had important modifications to its architecture, such as incorporation of cist tombs ca AD 500, that can be understood as the inclusion of ancestors in political life. The building and use of several types of tombs suggest the existence of diverse funerary practices, not all of which relate to ancestor veneration.

Ibarrola, Mary (University of Florida)

[414] *Purposeful Unpatterning: Investigating Maroon Site Distribution In Colonial Florida*

During the colonial era, Spanish Florida built a reputation as a refuge for self-liberated people escaping from slavery in the Carolinas and Georgia. However, following the Treaty of Paris in 1763, Florida was passed from one government to another and the Maroons' freedom was under constant threat. Florida Maroons were constantly on the move and their communities were ultimately disrupted and displaced by the U.S. government. Consequently, a low density of materials, deficiency of known sites, and lack of contemporary Maroon presence plagues Maroon archaeology in Florida, and Maroons have been largely relegated to a supporting role in Florida history. However, I argue that by turning our attention away from the sites themselves, and placing Maroon sites within a comparative framework, we will be able to identify significant spatial relationships between known Maroon sites and Euro-American and Native American sites, as well as recognize patterns in Maroon movement through the region; ultimately creating an opportunity to reinterpret the role played by self-liberated Africans and African descendent peoples in Florida's history.

Ichikawa, Akira

[330] *Double-Headed Serpent in the Southeastern Maya Frontier: Late Classic Deposit Unearthed from San Andres, El Salvador*

This paper aims to report a new ritual deposit dated to the Late Classic (A.D. 600-900), unearthed at San Andres, El Salvador. The items in the ritual deposit include vessels, *Spondylus* shells, and two pieces of jade artifacts, one of which was decorated with a double-headed serpent. In this paper, I present new data obtained from our recent excavation and tentative iconographic interpretations in comparison with the 1940s excavation data from the site. According to the excavation and iconographic interpretation, these artifacts were carefully buried in the central axis of the monumental architecture known as La Campana, and were possibly an offering dedicated to one of the construction phases of La Campana. These data will provide a better understanding about the symbolism of the regional political center in the Southeastern Maya Frontier, which remains poorly understood.

Iglesias, Christina (California State University, Los Angeles) and Michael Prout (California State University, Los Angeles)

[360] *Reinterpreting a Sacrificial Ossuary at Chichen Itza*

During the widening of the air strip at Chichen Itza in 1967, a small subterranean chamber, located some 300 m north of the Cenote of Sacrifice, was discovered. The feature, variably called a cave or a chultun, contained two small chambers, the larger of which was only 4 x 5 m. These chambers contained human skeletal material, a portion of which was removed and the collection divided between Chichen Itza and Merida. The collection was finally reunited by the creation of the Physical Anthropology Laboratory at the Centro Regional del Sureste and analyzed by Lourdes Marquez after 1980. Despite the small size of the feature, Marquez identified 109 individuals, 97 of whom were subadults. During the 2018 season, the Gran Acuífero Maya project interviewed the discoverer of the chamber in order to obtain additional details on the archaeological context of the material. Additionally, investigations of similar features allows us to clarify the context of the find.

Iizuka, Fumie (University of California, Merced), Pamela Vandiver (University of Arizona), Kazuki Morisaki (Agency for Cultural Affairs), Masami Izuho (Tokyo Metropolitan University) and Mark Aldenderfer (University of California Merced)

[416] *Ceramic, Lithic, and Settlement Variability of the Incipient Jomon Sites on Tanegashima Island, Japan*

Although conventional thinking has associated the advent of pottery with farming, sedentism, and groundstones, more recent research suggests that emergence contexts vary. Case studies on intra-regional variability are required to better understand the timing and behavioral context of the adoption of pottery. In this study, we provide the case of the first pottery on Tanegashima Island of southern Kyushu, Japan dated to ca. 14,000/13,500 Cal BP, during the Incipient Jomon period. We visually analyzed ceramics from the Incipient Jomon of the Onigano and Okunonita sites on Tanegashima to infer technological and behavioral variability. We also obtained data on chipped and ground stone technology and archaeological features for comparison. Results suggest that whereas Onigano contains non-local ceramics, Okunonita pottery does not have a signature of non-local production. The manufacturing technique is similar, a slab technique, but Onigano tends to have thicker and larger slabs. The degree of sedentism inferred from stone tools are similar although Onigano has chipped stone tools that are non-local. We suggest that the local production of pottery and stone tools occurred at both sites but Okunonita had more access to non-local products.

Iizuka, Yoshiyuki (Academia Sinica)

[141] *Nephrite Jade Mapping in Southeast Asian Prehistory: Petrological and Mineralogical Study of Stone Artifacts*

On-site and laboratory geochemical analyses have been carried out on jade and jade-like artifacts including unfinished pieces in the mainland of Southeast Asia by p-XRF and SEM-EDS respectively. In Vietnam, the results from more than 100 analyses show that the lingling-Os and double animal-headed pendants from central Vietnam are made of various colors of nephrite. So far only two lingling-Os show geochemical fingerprints of Taiwan's green nephrite. On the other hand, slit rings and a lot of worked disks are made of tremolitic white nephrite from northern Vietnam. Up to now, in Myanmar, 15 worked disks and bangles are made of actinolitic (green) nephrite from stone workshop and settlement sites in the central plain area. In Thailand, actinolitic nephrite artifacts were recognized from the Malay Peninsula area. A series of geochemical analysis indicates that there were at least two major nephrite sources that existed in prehistoric Vietnam, excluding Taiwan's green nephrite. And at least a potential nephrite source is expected from the metamorphic geological region in northern Myanmar. Some results may suggest long-distance and multiple cultural interactions were occurring in mainland Southeast Asian Prehistory.

Ikawa-Smith, Fumiko (McGill University)

[74] *Changing Perspectives for the Palaeolithic Research of the Japanese Archipelago*

Apart from sporadic finds of human bones and artifacts, systematic research on the Palaeolithic began in Japan with the Iwajuku excavation in 1949. In spite of the relatively short history of 70 years, and the negative impact of the "Fujimura Scandal" of 2000, which resulted in nullification of nearly 200 "Early" and "Middle" Palaeolithic sites, the

Palaeolithic Period is represented by over 15,000 assemblages, and Palaeolithic research is thriving in Japan. It is, however, taking a new direction in recent years. The earlier emphasis on artifact typology and the search for Japanese ancestors is being replaced by an endeavor to elucidate hominid behaviour during the Quaternary Epoch through a variety of inter-disciplinary approaches. The Palaeolithic assemblages of Japan are being placed in the context of the circum-Japan–Sea interaction sphere, and in the broader global perspectives of out-of-Africa dispersal of the behaviorally modern humans.

Ikehara-Quebral, Rona (Int'l Archaeological Research Institute, Inc.), Judith McNeill (Int'l Archaeological Research Institute, Inc.), Michele Toomay Douglas (Int'l Archaeological Research Institute, Inc.) and Michael Pietruszewsky (Dept. of Anthropology, University of Hawai'i-Manoa)

[29] *Apotguan Revisited: A Bioarchaeological Analysis of Latte Period Burials from Guam*

Cultural Resources Management studies in the Mariana Islands have consistently expanded opportunities for in-depth bioarchaeological research. Burial assemblages originating from historic preservation compliance obligations generally derive from one of three contexts: displaced fragmentary remains; isolated burials; or cemeteries. For example, the ancient inhabitants of Apotguan Village, Guam, unearthed during construction of the Agaña Beach Condos in 1990, represent a relatively large cemetery-derived sample. Over 150 Latte Period individuals were recovered by International Archaeological Research Institute, Inc. Since then, research related to this site has generated technical reports, conference papers, journal articles, and book chapters, expanding understanding of the ancient Chamorros and their culture. The original bioarchaeological study, completed in 1992, analyzed the Apotguan burial assemblage as a single statistical sample. Recent archaeological research has identified burial subgroups, which motivated a re-examination of the burial assemblage. By integrating the newly designated Apotguan subgroups with the osteological record, this paper focuses on discerning familial ties and spatial variability in health and biocultural practices.

[65] *Is Digital Always Better? Metrics for Evaluating and Understanding Digital Methods*

“Paperless archaeology” is becoming increasingly normal. Professionals in both academic and corporate spheres have turned to digital methodology as a means to organize and manage their projects and collect data. Normal field equipment now includes tablets and laptops using customized databases, apps for creating spatial data on site, digital cameras, and a host of pre-loaded digital reference materials for field use. But how do we measure the success of implementing a digital methodology? How do we know that the digital way of doing things is a better way? In this presentation, we will look at the digital methods we've implemented at New South Associates and discuss the metrics we are developing to quantify their effectiveness. While we are just beginning to track these metrics, we believe understanding and measuring our digital initiative is key to both meeting our business objectives as a CRM company and ensuring that we manage the archaeological resources to the best of our ability.

Ingalls, Victoria (The University of Texas at San Antonio)

[345] *Community Formation through Movement: Focal Nodes and Community Landscapes of the Mopan River Valley, Belize*

Movement is often implicitly assumed when exploring the ancient makeup of communities. We conceptualize movement at different scales of interaction – at the hyperlocal through households, as well as between and across communities, polities, and landscapes. Here, I will explore how movement to/from focal nodes on a landscape may

shape community identity through the creation of space/place. Public spaces are focal nodes for local community- and regional polity-making processes, embedding social hierarchies, ideologies, and social memories into the physical landscape. However, relatively little attention has been given to public spaces within rural communities. Using the ancient community of San Lorenzo, Belize, this paper focuses on movement to expand our understanding of how access to and through specific places changed over time. The dynamics of how focal nodes form within a landscape is examined by analyzing the potential for movement and interaction across the built and natural environments of the San Lorenzo community and the surrounding Mopan River Valley.

[212] *Pre-Contact Hawaiian Animal Burials: Interspecies Interactions and Embodied Experiences*

Zooarchaeological analyses of pre-contact Hawaiian midden deposits have yielded significant information on subsistence practices and, to a lesser extent, associated foodways practices. Archaeologists have also occasionally excavated burials of non-human domesticated animals, including dog, pig, and chicken. These ritual deposits provide unparalleled opportunities to reveal osteobiographical information about animal husbandry practices and taphonomic information about cause of death and mortuary treatment. At the time of European contact, humans and non-human domesticated animals in the Hawaiian Islands led imbricated lives and shared household living spaces, as well as food resources. This multi-species ontological similarity may have contributed to the maintenance of Hawaiian epistemologies, which blur distinctions between humans and non-human animals. Thus, analyses of non-human domesticated animal burials may also potentially provide important proxy information about the lived experiences of humans. Macroscopic analyses of a sample of pre-contact non-human domesticated animal burials are presented in osteobiographical format, and contextualized with ethnohistorical information, to shed light on interspecies social interactions and embodied experiences.

[188] *A Comparative Synthesis of Depopulation in the North American Southwest, 1100 to 1450*

Given the urgency of local to global sustainability problems, archaeologists must make progress toward understanding and interpreting for the public and policymakers the dramatic population declines that occurred in the North American Southwest during the 12th through 15th centuries. Southwestern-scale syntheses that seek insights beyond the particularities of our sub-regional interests and expertise are rare but have the potential to generate insights beyond the Southwestern past for the future. This presentation offers the first results of a systematic cross-case comparative study of the initial conditions of demographic decline (collapse) throughout the Southwest. Initial conditions investigated include the extent of conflict, resource depletion, demography, immigration, inequality and other variables that are often considered causal factors of depopulation. The aim of the presentation is to demonstrate the potential of Southwest-scale comparative studies, to generate hypotheses for more specific testing, and to provide one example of synthetic analyses Keith Kintigh and others have recently advocated "to advance science and benefit society."

[309] *Overview of Archaeological Investigations in the Middle Usumacinta Region*

The Middle Usumacinta Archaeological Project started investigations in the Department of Tabasco, Mexico, in 2017. Its main objectives are to examine the relationship between the residents of the Maya lowlands and those of the Olmec region and to trace social change during the Preclassic period. The research began with the analysis of

LiDAR data obtained by the Mexican governmental institution of INEGI for the entire study area of roughly 3000 km². An area of 110 km² was selected for a higher-resolution LiDAR survey. We identified the site of Aguada Fénix, which contained a large platform and other formal ceremonial complexes of the Middle Preclassic period, which we called the Middle Formative Usumacinta pattern. In the 2017 and 2018 season, we conducted excavations at Aguada Fénix and La Carmelita. These data show that the Middle Usumacinta region participated in active inter-regional interaction during the Middle Preclassic period.

[278] *Molecular Starch Degradation and Their Fingerprints: Insights from Modern African Taxa*

Ancient starch analysis is a controversial technique, as the polymer's chemical survivability over long periods of time is not understood. Our objectives are to establish the molecular composition of starch granules from sub-Saharan taxa of ethnobotanical relevance subjected to diagenetic processes, and to determine if these byproducts have diagnostic potential. Starch was placed into solution with an amino acid and reacted under heat and pressure in order to mimic diagenesis. The end stage of this process created melanoidins, stable high molecular weight compounds resistant to degradation. Fourier Transform Ion Cyclotron Resonance Mass Spectrometry (FTICR-MS) was utilized to analyze the molecular composition of the products of this reaction. Laboratory degradation resulted in a range of compounds. Discrete chemicals are exhibited, varying in functional groups and cyclic structure. As the reaction progressed, more breakdown products and smaller compounds formed. These are more stable than their precursors, and it is expected that they might have increased survivability in archaeological time scales. The structure of melanoidins and other breakdown products have the potential to become fingerprints to identify the presence of starch in ancient contexts.

[247] *Revisiting the Evolutionary Significance of Stone Tools*

Because lithics preserve better than almost any other trace of human existence in the deep past, they receive the lion's share of attention from Pleistocene archaeologists. In this paper we explore the theoretical and practical limitations of using lithics as subjects of evolutionary analyses. We base our discussion on rejecting the notion that lithic aggregates as found (or defined) in the course of archaeological work can be interpreted as reflecting intentionality or even 'average behaviors'. This is because the co-occurrence of artifacts (recovered as and defined traditionally as an 'assemblage' from an excavation) is the result of fragmented multiple actions by often unrelated and chrono-spatially distinct agents (including the researcher who undertakes the analysis). We then revisit key concepts such as 'adaptation', 'cultural transmission', and 'behavioral complexity' in the absence of detectable intentionality and 'cultural norms'. For this exercise, we distinguish between two scales of analysis: the artifact as 'extended phenotype' (Dawkins 1982) and the aggregate as record of human behavior and discuss the way selection, fitness, adaptation, cultural contact and acculturation, and others apply differently at these two scales.

Irvine, Benjamin (BIAA (British Institute at Ankara))

[359] *Howdy Neighbour – Transgressing Borders and Peering over the Fence to Examine the Application of Isotopic Analyses to Bioarchaeology in Anatolia*

Stable isotope analyses contributing to archaeological research in Anatolia was a relatively late bloomer, beginning in the early 2000s and only gathering pace in the last 5-10 years. Currently research into dietary habits, subsistence

practices, and mobility has focused on early proto-sedentary and sedentary agricultural populations in Anatolia and in later historical periods. This has resulted in ca. 5-6000 years of prehistory being relatively untouched by such quantitative scientific techniques. Instead, research in these intervening periods has focused primarily on material culture, where artefacts are studied individually, largely detached from their surrounding environment and social, cultural, technological, and economic contexts. This is starting to change now in conjunction with the realisation of the importance of bioarchaeology as an encompassing field, providing a holistic approach to examining prehistoric populations.

This talk will discuss the importance and valuable contribution of stable isotope analyses in better understanding dietary and subsistence practices, and mobility. Furthermore, how when applied in conjunction with human osteological, archaeozoological, and archaeobotanical analyses we can begin to greater understand human interactions on an inter-population level and pan-regionally, as well as on a more local and intra-population level in these pivotal periods of societal development in Anatolia, and further afield.

[250] *Investigating Huari Urban Residences: An Overview of the 2017-18 Excavations*

Excavations in an ancient non-elite area of Patipampa, Huari reveal remarkable new information about vernacular environments of the early city. Architectural remains consist of a limited range of very distinctive buildings, where life was probably ground-oriented, and experience of the city emphasized dark and enclosed spaces communicated via labyrinthine routes. However, residents ate well, probably feasting frequently in elaborate social and religious rituals. Quotidian life may have been organized around mortuary rooms where local ancestors were interred, although none of these tombs have been found intact. Huari residential buildings experienced complex histories of multiple occupation, abandonment, and re-purposing that resulted in deep stratigraphy, complex sequences of floors and multiple occupation surfaces. Water was apparently a problem in the city, and carefully constructed canals are found below numerous floors. What was probably "common space" in patios shows multiple remodelings, suggesting dynamic processes governing some kinds of space, through time. These new characterizations provide a basis for comparing Huari residential buildings at other Wari and non-Wari architecture.

[22] *Five Decades of Public Archaeology at Cahokia Mounds*

During nearly five decades of working in public archaeology at Cahokia Mounds State Historic Site, I have witnessed and experienced the importance of public awareness of archaeology and American Indian cultures and found the need to overcome stereotypes the public has about both. This has been accomplished at Cahokia through exhibits, public field schools, on- and off-site presentations, special events, lecture series, publications, social media, and events with Native American participation. I will review the philosophy and planning behind these various approaches and how they have evolved over the years.

[392] *Temporal Changes in Obsidian Procurement Strategy during the Upper Paleolithic on Hokkaido*

Reconstruction of obsidian procurement strategies based on systematic obsidian sourcing analysis in the Upper Paleolithic on Hokkaido will provides an important basis for examining several key issues of human evolutionary history, including how modern humans adapted to the cold, harsh environment of the north, and how these adaptations allowed for the possible migration to the Americas. Here we discuss temporal changes in obsidian procurement patterns between the early Upper Paleolithic and the middle Upper Paleolithic on Hokkaido. We examine these temporal changes by comparing site-based reconstructions of procurement patterns from two different regions, the Ishikari lowland and the Tokachi plain, where lithic raw material environments are quite different.

[99] *Of Marsh and Mangal: Political/Historical Ecology in Tampa Bay's Coastal Wetlands*

Today, dense mangrove forests dominate the intertidal wetlands of the Tampa Bay Estuary System in west-central Florida. Following the publication of seminal ecology studies in the 1960's, sub-tropical mangrove forests became a major focus of coastal environmental protection and restoration initiatives in Florida. Recent GIS-based historical research by the U.S. Geological Survey suggests that Tampa Bay's coastal wetlands converted en masse from salt marsh to mangrove forest since the late-19th century. In this study, I explore the historical and political ecologies of this wetland conversion by ground-truthing historic survey mapping through geoarchaeological analyses of sediment cores, and by reconstructing how the americanization of the region has interacted with climate change and sea-level rise to produce an industrial seascape that is often mistaken and marketed as 'natural'.

Jackson, Sarah (University of Cincinnati)

[161] *Crafting Human/Hieroglyph Relationships in Classic Maya Contexts*

The study of Classic Maya hieroglyphic writing (ca. AD 250-900, Mexico and Central America) has yielded rich understandings of texts in recent years through increasingly nuanced ways of reading, contextualizing, and interpreting hieroglyphs. Beyond examining hieroglyphic texts as culturally contextualized documentary sources, however, they also must be understood as "made" materials, crafted and created, and subsequently related to. This sense of texts as crafted requires not only connecting to their materiality and their involvement with the objects on which they appeared, but also understanding processes of writing (and reading) as culturally-moored productive acts (that is, ways of making), with attached beliefs and practices. In visual representations on painted ceramic vessels, we see examples of hieroglyphs leaving the boundaries of "text" and crossing over to enter human territory, indicating that we need to understand hieroglyphs as materialized and real in a human world. This paper looks closely at how Maya texts were understood to inhabit human spaces and how humans (textual writers and readers)

saw themselves as related to or positioned in social relationships with writing. These discussions impact our modern methodological stance by shifting understandings of key ideas related to written evidence such as authorship, production, literacy, and textual control.

[413] *Implications of Socio-economic Organization Based on Architectural Associations and Modified Sherds from Ricochet Village, White Sands Missile Range, New Mexico*

Archaeological investigations of the western portion of Ricochet Village (LA 76465), a late Mesilla to Dona Ana phase site at White Sands Missile Range, encountered clusters of structures and pit features and recovered a sizable assemblage of modified sherds, comprising 3.2 percent of the assemblage. Patterns within structure and storage pit spatial arrangements indicate that residents organized themselves within finite areas defined by feature layout, or household clusters. Modifications of ceramics represented specific tools and functional forms. Production methods included rough flaking, minimal-to-extensive edge grinding/smoothing, perforations (uni- and bi-directional), and incising to produce forms such as scoops/dippers, plates, "paint palettes," pottery scrapers, "spoons," awls, discs, whorls, gaming pieces and objects of unknown function. De facto refuse on house floors included several large vessel fragments that may have served as plates or trays, or were used for parching/food preparation. This paper examines socio-economic implications of the architecture and the modified sherd assemblage, making comparisons with assemblages from other regional sites.

[246] *Portals to the Past: Public Architecture and Storytelling Traditions in Hohokam Society*

Culture is adaptive, and defined as a group's learned, shared set of beliefs and behavior patterns that are transmitted across generations. Research at Hohokam sites indicates the presence of long-term well-established residential groups who tend to reside next to public spaces, the location of platform mounds in the Classic Period. This spatial circumstance creates the ideal situation for storytelling traditions and their ritual performances that integrate and maintain the community. The architecture, spatial design, and associated features of platform mounds demonstrates the creation of special places where ritual performances can be performed for the community.

[207] *Mobility in the Big Horns: GIS Analysis of Upper and Lower Canyon Creek and the Implications for Prehistoric Movement*

Least cost pathway research focuses on creating a baseline model of human movement constructed on defined variables. The stark landscape of the Bighorn mountains, from a Plains or Basin perspective, can be incredibly steep and difficult to navigate, without high cost or risk. The study uses GIS to identify least cost pathways as possible routes of migration through Upper and Lower Canyon Creek, between plains and alpine ecological zones on the western flank of the Bighorn mountains in Wyoming. This research is conducted using an archaeological landscape consisting of over 100 previously identified sites ranging from Paleoindian to Protohistoric temporal periods, across

80,000 acres, and tests the least cost pathway and the veracity of this analysis to model human movement. The assessment of how prehistoric peoples exploited and settled the landscape was aided by using a comprehensive analysis of site assemblages, site locations, and GIS models.

[65] *The Intention of Actions—A Cross-Cultural Study on Ancient Backfilling Processes*

During the last few decades, the study of ancient entombment processes at prehistoric sites has aroused research interest: besides the architectural features, the surrounding layer structure came into focus. A fundamental distinction is made between natural layers and deliberately deposited material. In contrast to geological erosion or debris layers, the fill consisting of very uniform and presumably carefully laid out material, is assumed to be the result of intentional human action.

In this paper, this phenomenon, also known as e.g. "Temple Entombment", will be discussed based on ritual sites of the Central Andes as well as case studies from other cultural areas of prehistoric times. While on all those sites conscious entombment processes and the active preservation of architectural structures seem to be a common feature, I will be focusing on the similarities and differences in the "intentional" process of entombment of monumental structures. Specifically, the question of tracing intentionality will be addressed. How can concepts of conscious and deliberate actions be identified in archaeological contexts? Are different levels of intentional actions visible? This paper seeks to offer the formulation of some possible motives and interpretations of this practice.

[149] *"The Chilly Climate Is Not Warming as the Old Guys Leave": Identity-Based Discrimination in Archaeology, an Example from Canada*

Research that considers the ways current socio-political issues affect our understanding of the past and our interactions with each other in the present are not new to the field of archaeology. However, a renewed focus on 'turning our gaze inward' has revived the dialogue regarding equity-based issues in the archaeological workplace, and importantly, is providing a significant opportunity to expand and build upon this area of inquiry in more intersectional ways. This includes examining how traditional modes of archaeological education and practice, as well as our interactions with fellow practitioners, might be operating at multiple levels to marginalize and exclude a variety of underrepresented, equity-seeking groups. With this in mind, this paper will present results from my Ph.D. research that broadly focuses on areas where participants felt they were impacted by identity-related discriminatory attitudes/practices and the ways in which these interactions affected their experiences in archaeology. Conducted through a mixed-methods research design that collected both survey and interview data, I will present results that illuminate the current status and demographic composition of archaeologists in Canada before further contextualizing these data through individual, narrative responses.

[417] *Molecular and Compound-Specific Stable Isotope Analysis of FAMES on Charred Plant Tissues: A Comparative Approach of Experimental and Archaeological Evidence*

GC-C-IRMS analysis of FAMES has been used successfully to distinguish among different animal fat groups. However, plant oils from different tissues (with the exception of seeds) have not been widely investigated even

though organic residues from leaf, root, and wood tissues are preserved at archaeological sites (e.g. sediments from combustion structures). By applying molecular and compound-specific stable isotope analysis to different anatomical parts of modern and fresh plants, to charred plant tissues in controlled laboratory heating sequences, and to sediment from experimental fires, we infer aspects related to the temperature of combustion and biomass burning. This information is compared with charred organic residues from combustion structures from two Middle Palaeolithic sites: El Salt (Spain) and Crvena Stijena (Montenegro), providing valuable information related to combustion substrates and combustion residues.

James, Steven (California State University at Fullerton)

[319] *Zooarchaeological Research at Pueblo Grande: Preclassic and Classic Period Hohokam Hunting and Fishing Patterns*

In the late 1930s, a Works Progress Administration (WPA) crew under the direction of Albert H. Schroeder excavated Trash Mound No. 1, a Preclassic Colonial period deposit (A.D. 775-950) at the extensive Hohokam site of Pueblo Grande along the Salt River in Phoenix, Arizona. This material remained largely unanalyzed at the Pueblo Grande Museum and results of the analysis are presented here. Comparisons are then made with a large Classic period (A.D. 1150-1400) zooarchaeological assemblage (26,000 specimens) recovered elsewhere at Pueblo Grande and analyzed by the author in another study. Although there are contrasts between the two assemblages that are the result of different recovery methods, other differences appear to be related to habitat degradation and overexploitation of animals in the vicinity of Pueblo Grande. Due to these considerations, the Hohokam inhabitants made changes in their subsistence strategies with regard to animal protein acquisition during the Classic period. The WPA excavations in Trash Mound No. 1 also recovered intrusive domestic chicken bones from the very late prehistoric or early historic period. Based on modern AMS radiocarbon results, this may be one of the earliest chickens reported from the American Southwest.

[390] *The Influence of Raw Material Availability on Lithic Assemblage Variability in the Koobi Fora Fm. (Kenya)*

A defining feature of human tool use compared to our closest living relatives is the transport of tools. This distinction is most evident in the Early Stone Age where transport is a feature of even the earliest industries. Spatial variability in raw material proportions has often been assumed to reflect transport patterns; however, these measures must be considered with respect to other factors that influence raw material accessibility. Raw material availability is usually characterized by estimating the distance between primary raw material sources and archaeological sites. This measure is accurate for localities limited to primary sources. However, secondary sources (e.g. rivers) change their location and carrying capacity over time. Thus, more nuanced methods for characterizing availability are needed. Here we estimate landscape-scale raw material availability in the Koobi Fora Formation of Kenya. We use a systematic survey to characterize raw material abundance across relatively synchronous land surfaces. We use inverse distance weighting interpolation to estimate the availability of stone at known archaeological localities. These availability estimates were then compared to measures of reduction intensity at different localities. Measures of stone tool utilization often track raw material availability; however, there appear to be significant deviations that need further inquiry.

Jamieson, Alexandra (University of Oxford) and Greger Larson (University of Oxford)

[20] *Adventures of the Mountain Hare: An Ancient DNA Study*

Mountain hares today can be found from Scandinavia to Eastern Russia with isolated populations in Ireland, Scotland and the Alps. While their modern distribution is well understood, the extent of their past range and interactions with humans remains unknown. The primary aim of my research is to assess the natural and human-aided distribution of mountain hares across their circumpolar region. I am employing an ancient DNA approach to assess the geographic and temporal shifts in mitochondrial haplotypes. The study initially focuses upon the westernmost edge of their range, the Western Isles of Scotland. Mountain hares are thought to be a non-native species to the islands and their place of origin is unknown. They first appeared in archaeological deposits of the Mesolithic period. I will present here initial results showing where these mountain hares may have originated and how they came to be on the fringe of Europe. This not only informs us more about the species itself. It may even give us insights into the Mesolithic people's trade routes or possibly even the origins of the people themselves. This is only a start to my investigation into the movements of mountain hares and their interactions with past people.

Janes, Stephen and Michael Cloud

[220] *Ground Survey Evidence for a Regional East to West Chacoan Road Passing through the Southern San Juan Basin New Mexico and across the Chuska Mountains into Arizona*

Ongoing large scale archaeological ground surveys are being conducted primarily in the southern San Juan Basin of New Mexico to determine if regional Chacoan Roads connect various great house outliers there. These surveys identified a series of linear sherd scatters following an east to west trend between the Standing Rock Great House Community and the Peach Springs Great House Community. Following this discovery, a series of north to south survey transects were conducted and confirmed that linear sherd scatters define a Chacoan Road crossing the southern basin and extending into the Chuska Mountains. Additional surveys conducted in Arizona indicate that this road crosses the Chuska Mountains and extends into Arizona at least as far west as the Second Mesa in the Hopi Nation.

Janetski, Joel (Brigham Young University) and Charmaine Thompson (US Forest Service)

[420] *Puebloan Patterns in Montezuma Canyon: Insights from the Nancy Patterson Ruin*

The Nancy Patterson Ruin is one of several large, multi-component pueblos, positioned at the mouths of side canyons draining into Montezuma Creek. Although occupations at Nancy Patterson span at least Basketmaker III through late Pueblo III, the most visible occupations are late Pueblo I and mid-Pueblo III. Unique features include a 16 m diameter, benched Pueblo I plaza in the upper ruin, a probable multi-storied Pueblo II great house on the northwest corner of the lower ruin, and an unusual Pueblo III kiva on the southeast corner of the upper ruin. Modest excavations over four seasons focused on comparing household units from the late Pueblo I and late Pueblo III periods and found stark contrasts in architecture, treatment of space, and subsistence. The architectural patterns combined with subsistence data suggest shifts in regional interaction and dietary stress resulting in site abandonment by AD 1275 or so.

Janik, Liliana (University of Cambridge)

[74] *New Approaches to Jomon Dogu: Case Studies from Eastern and Western Japan*

This paper presents a study of the clays used in the manufacture of ceramic figurines, or dogu, from the Jomon period of Japanese archaeology. Analyses of clays in dogu from sites in Niigata (eastern Honshu) and Okayama (western Honshu) using a handheld XRF machine will be discussed in the context of current approaches to the circulation of commodities in Jomon Japan. The great majority of the over 20,000 known dogu are from eastern Japan, with a much smaller number known from the west. Recent and current work in western Japan, however, including the development of a Western Jomon Database at Ritsumeikan University in Kyoto, is casting new light on our understanding of the Western Japanese Jomon. Comparisons will be made to studies of Palaeolithic figurines from Siberia, where specific materials were selected to represent particular forms of figurine.

[186] *Give Me Shelter: Reverse Engineering a Paleolithic Home*

Humans today are ubiquitous shelter makers but despite this, relatively little is known about the construction of the earliest shelters built by palaeolithic humans. While there is possible evidence for earlier shelters, archaeological evidence in Europe and Asia indicate shelter construction had become habitual by the Upper and Epi-Palaeolithic,

coinciding with the extreme climate of the Last Glacial Maximum. Most of these data result in 2-Dimensional footprints of fire hearths, activity locations, post holes, and possible thatching material. This provides a rough shape and indicates what materials were used but leaves the method of construction of these shelters to be largely hypothetical in nature. Looking to understand the interwoven nature of shelter, subsistence and thermoregulation at the end of the Last Glacial Maximum, the authors set out to construct a shelter that would match the archaeology of Upper Palaeolithic sites. Setting as conditions a shelter which would require a minimal time investment, retain heat effectively, repel moisture, and be constructed using stone age tools and materials, the authors used ethnographically derived examples of shelters constructed in colder climates. The process, methodology, and implications of effective shelter building for human evolution are discussed in this presentation.

Janusek, John (Vanderbilt University)

[24] *Living Landscapes of Night in Tiwanaku, Bolivia*

Most treatments of Andean urbanism and urban life emphasize the acts and rhythms of daily life. Ethnohistoric documentation of life in Cuzco, nevertheless, details a rich corpus of ritual sequences and domestic activities that ideally took place under cover of night. In Tiwanaku today, night is an ontological domain in which dangerous nonhuman beings and powerful, ancient carved monoliths may awaken. Recent research on Pre-Columbian centers in the Lake Titicaca basin has demonstrated the importance of nightly observations of the sky and the central role of celestial movements and rhythms in ordering monumental landscapes. In this paper, I draw on these rhythms but redirect attention back to the urban landscape of Tiwanaku itself. I muster evidence from spatial arrangements, routes of human flow, the placement of carved monoliths, and common objects, such as ceramic burners, in an attempt to specifically address nighttime ritual practices and domestic activities. I suggest, among other things, that night was critical for the animacy of carved monoliths that occupied some of Tiwanaku's most important monumental spaces.

Janz, Lisa (Trent University)

[415] *Why Choose Small Packages When There Are So Many Big Packages Around?*

The trajectory of diet change in Northeast Asia, is distinct from that in the Near East, whose archaeological record has shaped our most enduring models for changes in human diet. Traditional optimality models, as applied to the archaeological record, predict that small game will only significantly contribute to diet when the availability of large game declines. This is typically taken to mean that an increased focus on small prey is related to resource depression – either through overhunting due to increased population density or due to environmental degradation. Neither case seems to hold true for the intensified use of small game and seeds across Northeast Asia, which rather correspond to a continued abundance of large game, relatively low population density, and climatic amelioration. Here, I reconsider the idea of optimality and investigate how changes in the distribution rather than quantity of resources may increase demand for small packages when there are still plenty of big packages around.

Janzen, Anneke (Max Planck Institute for the Science of Human History), Mary Prendergast (Saint Louis University) and Katherine Grillo (University of Florida)

[82] *Early Herding Practices in Tanzania Revealed through Strontium Isotope Analysis*

East African pastoralists today rely on extensive social networks through which livestock are exchanged to maintain herds. The role of such animal exchange networks among ancient pastoralist communities can be revealed through stable isotope analysis. Pastoral Neolithic sites are broadly distributed across southern Kenya and northern Tanzania. Luxmanda is the largest and southernmost known Pastoral Neolithic site, and its early date signals a rapid expansion of PN herding groups across the region. Here we present the first strontium isotope data from livestock from Tanzania, which clarify how the earliest herders in Tanzania used the landscape, as well as their participation in livestock exchange networks with herders elsewhere. Strontium isotope ratios from sequentially sampled livestock teeth are generally high and extremely variable, reflecting the region's diverse geology. However, one cattle specimen exhibits highly distinct $87\text{Sr}/86\text{Sr}$ ratios compared to other livestock at the site, suggesting this non-local individual arrived through exchange. The individual closely matches those from some Kenyan PN sites which were herded on much younger geologies, and it may be possible that cattle were a medium of exchange used to maintain connections with herders elsewhere. However, we caution that additional research is needed, especially in northern

Tanzania.

[290] *Differential Diagnosis of Tuberculosis in a LIP and Late Horizon Skeletal Sample of Southern Peru*

The Moquegua Valley of southern Peru is known for multiple studies regarding the presence, origin, and evolution of tuberculosis in the pre-contact Americas. These studies have primarily focused on tuberculosis in Middle Horizon and Late Intermediate Period contexts and the continued presence and evolution of the disease during the end of the Late Intermediate Period and Late Horizon has yet to be examined. Initial differential diagnoses of vertebral lesions identified during analysis of a skeletal collection excavated as a rescue project during the construction of a new bus station in Moquegua, Peru is presented here. Tombs at this site contain decorated ceramic styles consistent with the later part of the Late Intermediate Period and the Inka defined Late Horizon. A skeletal sample containing 250 individuals was analysed during 2018, with ten individuals exhibiting vertebral lesions possibly consistent with tuberculosis. Here we present differential diagnoses of these individuals, four of whom possess lesions most resembling tuberculosis. Since this sample from the Terminal Terrestre dates largely to the latter half of the LIP and Late Horizon, the presence of TB in this sample shows that this disease continued to be present in the Moquegua valley during these time periods.

[189] *Analysis and Interpretation of the Bandelier Landfill Site: Determining the Information Potential of a Multicomponent Historic Trash Site*

The Bandelier National Monument landfill site represents a historic period artifact scatter containing many diagnostic artifacts. In the 1930s, workmen belonging to the Civilian Conservation Corps (CCC) camped at this site while tuff stone was quarried from mesa top outcrops for use in the construction Frijoles Canyon Historic District. Evidence of this includes spoils piles of tuff refuse as well as charcoal from campfires, but no diagnostic artifacts from this era have been documented at the site. Surface artifacts seem largely to belong to the 1940s-1960s time frame, during which Mrs. Evelyn Frey operated the Frijoles Canyon Lodge, feeding and housing overnight visitors to Bandelier National Monument. Refuse from the lodge includes dishware that she designed and special ordered herself as well as glass receptacles for foods she cooked and served. Although the parcel of land within which the landfill is located belonged to the Atomic Energy Commission between 1942 and 1961, no artifacts which are evidence of the Department of Energy activity at this location have been observed. The present study aims to determine the information potential of this site and to contribute to what is known about the park and its visitors during the historic period.

[35] *Applications of the IFD and IDD to Complex Societies*

The Ideal Free and Ideal Despotic Distribution (IFD/IDD) models have become increasingly popular in the archaeological and anthropological literature because of their flexibility to be applied at a variety of geographic scales. With some exceptions, however, most of the applications of the models have been to hunter-gatherer or horticultural populations, with less attention given to more complex urban and agricultural populations. This paper demonstrates the breadth of IFD/IDD by expanding their applications. We provide examples of settlement in Bronze Age (ca. 3100-1050 BCE) Greece over rising complex palatial society and northwest Morocco before and after its annexation by the Roman Empire (ca. 200 BCE – 500 CE). In these regions, settlement patterns are consistent with the predictions of the IFD/IDD. We also discuss changes in settlement consistent with a transition from the IFD to an IDD among these populations and complex hunter-gatherer-fishers in California. This study demonstrates the flexibility of the IFD/IDD models not only at different geographic scales, but for different population sizes and

degrees of social stratification. These applications are promising for future avenues of ecological research and the use of Human Behavioral Ecology models, especially in the case of complex societies like those around the Mediterranean basin.

[249] *Dating the Western Stemmed Tradition in the Northern Great Basin*

Recent University of Oregon investigations at the Paisley and Connley Caves have resulted in 300+ radiocarbon ages including coprolites with human DNA. Earliest human occupations have been established at the Paisley Caves by stone tool cut marks on bone dated to $12,380 \pm 70$ 14C yr B.P. Western Stemmed Tradition (WST) points are present in deposits dated between $12,760 \pm 35$ 14C yr B.P. and $10,200 \pm 35$ 14C yr B.P. Obsidian hydration dating of WST points supports the radiometric assessment that they are likely 14,000 years old at the site. New radiocarbon dates associated with WST points at the Connley Caves range from $11,104 \pm 45$ 14C yr B.P. to 9171 ± 40 14C yr B.P. WST points are the only types found in the oldest deposits at both the Paisley and Connley Caves.

[208] *Tracking Broken Pots across Paraje San Diego, New Mexico*

Paraje San Diego is a historic campsite situated on El Camino Real de Tierra Adentro National Historic Trail in Doña Ana County, New Mexico. Documents from the Spanish colonial, Mexican, and American periods indicate that travelers regularly stopped at this site to collect water and rest before continuing their journey. Archaeological survey, evaluative testing, and surface collection projects conducted at this site in 1991, 1994, and 2017 produced collections of ceramic artifacts discarded by early travelers. This poster combines ceramic and spatial data from all three projects in order to identify and interpret patterns of ceramic use and discard at this site.

Jennings, Justin (Royal Ontario Museum)

[356] *Understanding Quilcapampa*

As the papers in this session have demonstrated, the site of Quilcapampa La Antigua in a previously isolated region of southern Peru is notable for its long-distance connections, strong Wari influence, and brief occupation during the tenth century AD. In this closing paper on our excavations, I want to summarize some of the project's key findings and attempt to answer a deceptively simple question: what was "Wari" in this particular context? Outside of Moquegua, Quilcapampa boasts the strongest evidence for being founded by Wari-affiliated settlers. What, though, was the relationship of these settlers to the Wari state? To the greater Nazca region that they likely came from? To

the local population in the Sihuas Valley who likely help build the site? Although definitive answers to these and other questions cannot yet be given, we suggest that the Quilcapampa data point to more dynamic, often fraught, relationships linking settlers, distant homelands, and contacted people--all attempting to navigate life amidst the tumult of a new cultural horizon.

[251] *We Can't Save Them All: Thoughts on Prioritization*

Archaeological sites are important sources of data on past human behavior and as valuable resources for paleoenvironmental reconstruction. They can also inform attempts to adapt to environmental change in a sustainable way. Equally importantly, they are part of the tangible cultural heritage of descendant communities, and of humanity writ large. Just as new methods increase our ability to access information from these sites, accelerating environmental change poses a dire threat. The scale and urgency of the threat requires new models for funding, education and recruitment of staff, engagement with the public and long-term curation of rescued samples. One critical issue is how to prioritize salvage of sites, since we cannot save them all, or even come close. A variety of approaches will be highlighted, in hopes of fueling subsequent discussion.

Jerbic, Katarina (Flinders University, Adelaide, SA, Australia)

[240] *Connecting Survey and Fieldwork: Archaeology of the Core*

Based on a PhD research case study in the Croatian Adriatic, the paper demonstrates a step further into investigating coastal and submerged archaeology. Seabed mapping methods adopted from marine geology, such as side-scan and multi-beam sonar surveys and shallow water sub-bottom profiling are now considered the standard in maritime investigations. Whether on the basis of economics, politics, culture, or other reasonable grounds and unfortunately for continental shelf archaeology, this is often the moment when most fieldwork research stops. In the rare cases when the research is continued further, it involves diving and excavation. These investigations represent a stressful risk for both the archaeologists and the investors, not only because it involves diving and underwater excavations, but also because of the high likelihood of a negative archaeological result, regardless of the promising preliminary surveys. The paper proposes a research-based and tested interdisciplinary method: a combination of geological, environmental and archaeological fieldwork and laboratory techniques, under the colloquial term "Archaeology of the Core." Seabed coring provides an insight into the submerged environment, and of the cultural layers of a mapped site. Therefore, the risk of "empty" trenches is minimized, and the sediment contents represent a wholesome connection between archaeological survey and fieldwork.

Jeremiah, Kristen (Public Archaeology Laboratory, Inc. [PAL])

[169] *Written in Stone: Lithic Analysis at the Acushnet LNG Site*

The Acushnet LNG Site is a multicomponent Native American campsite located on the Brayton Point peninsula in southeastern Massachusetts. Brayton Point extends into Mount Hope Bay and is at the confluence of the Lee and Taunton rivers, an area with numerous documented Native American sites. The Public Archaeology Laboratory, Inc. (PAL) identified the Acushnet LNG site and determined it to be a minimum of 71,000 square meters in size. Diagnostic artifacts and the results of radiocarbon dating indicate that the site was occupied from the Early Archaic through Middle Woodland Periods. The recovered artifact assemblage consists of lithic tools and debitage, fauna and flora remains, fire-cracked rock, and raw materials manuports. Recovered chipped stone tools were predominately bifaces with lesser amounts of projectile points, utilized flakes, scrapers, an adz, drill, knife, and preform. In addition, nearly 7,000 pieces of lithic debitage and non-chipped stone tools, including a plummet, abrader, nutting stones, a grinding stone, and groundstone fragments, were recovered during the investigations. The

Acushnet LNG site is a significant Native American campsite during the pre-contact period, and a valuable resource with the potential to provide new information about Native American settlement patterns along the Mount Hope Bay.

Jerrems, William and Richard Rosencrance (University of Nevada, Reno)

[274] *Paleoindian Osseous Barbed Weaponry in the Intermountain West: Distribution, Chronology, and Function*

Some have suggested that osseous projectile weaponry preceded that of stone-that bone, antler and even ivory barbed points and sagaie (osseous rods) might have been the hunting and fishing weapons of choice for the earliest peoples. Early technology using meticulously fashioned barbed osseous materials for weaponry takes us back to Katanda, Zaire 95 kya, is prevalent in the Upper Paleolithic of Europe and the terminal Pleistocene/early Holocene in North America, and was used into the Holocene on several continents. Unfortunately, however, there are only rare occasions that this organic material survives in the archaeological record. In this presentation we examine the distribution of these osseous weapons in the Intermountain region of North America, focusing on the northern and western Great Basin where the majority of osseous barbed points and rods have been recovered. The few radiocarbon dates associated with barbed technology in the region suggest primary use during the Younger Dryas, while distribution suggests use as hafted fishing/hunting projectiles. In sum, we believe that this industry is quite old in the New World and played an important part in hunting and fishing at the end of the Pleistocene and possibly earlier.

Jeu, Michael (Eastern New Mexico University) and Heather Smith (Eastern New Mexico University)

[117] *A Spatial Analysis of a Knapper's Replication of Debitage Debris from Hunter-Gatherer Camp and Hunting Sites*

As hunter-gatherer groups manufacture and rejuvenate stone tools at hunting and residential sites, they left behind traces of these behaviors in the form of spatial patterns of discarded lithic debris. GIS modelling of the spatial organization of debitage provides a useful tool for comparing lithic reduction episodes from various hunter-gatherer site types. This poster presents an experimental analysis testing models of lithic-discard behaviors that occurred at hunting versus habitation sites. Stone cores were reduced at "sites" recreated to mock prehistoric arrangements of site furniture and settings. Morphology and provenience data was recorded for the lithic debris and spatially modeled using ArcGIS. Results were compared to previous models of artifact spatial distribution and reports documenting lithic spatial data recorded at a variety of sites to test the utility of these experimental models for interpreting site-specific past human lithic reduction behaviors.

[361] *The Study of Early Neolithic Tombs in Korea*

Analysis was conducted on 88 tombs on the southern coast of the Korean. Human remains in these tombs have traces of malnutrition and repetitive work. The burials have a small numbers of burial goods but show differences in the number of grave artifacts. I grouped the number of burial artifacts and tomb construction behavior into groups and examined their correlation. Based on this, tombs were grouped in order by giving scores based on the number of burial artifacts, the degree of burial behavior, the variety of burial goods. These groups examined the layout of tombs, age, sex, aspects of infant graves, and position of behave and position of birth. Burial goods were concentrated in tombs of adults in their 20s and 30s. Burial goods in infant graves were more than those in burials of old age individuals. Concerning gender, there was a clear tendency for men to be buried with higher numbers of different tools. I also explore the burial treatment of infants and burial ornaments, which have different characteristics depending on material type, damage status and burial methods. I argue that Neolithic society of the Korean is not simply egalitarian but complex society with an early phase of inequality.

[130] *Recent Research on the Settlement Sites of the Dian Culture of Yunnan: Excavations at Xueshan and Shangxihe Sites*

The Dian culture of Yunnan is known for production and use of bronze artifacts exhibiting remarkable artistic and technical features. However, for most of the 20th century our understanding of Dian culture was based mainly on materials from burials around Lake Dian. Meanwhile, little was known about the settlement areas relevant to these mortuary materials. The lack of Bronze Age settlement data in the Dian basin and in other areas in Yunnan have impeded progress of archeological research on this culture until recent decades. At the end of the 20th century, the Institute of Cultural Relics and Archaeology of Yunnan province began to investigate issues on the habitation sites of the culture; research projects have been established on topics regarding the origin of the culture. Following the discovery of settlement sites at Citongguan (Yuxi district) in 1990 and Tianzimiao (Xishan district, Kunming city) in 2005, recent excavation of the Xueshan site (Chengjiang county) and Shangxihe site (Jinning county) have now added a new chapter to Dian culture settlement studies. This work will present the results of recent research on these two new sites.

[350] *Arqueología y Comunidad en la provincia de Manabi, dos casos de estudio*

Tabuga, pequeña comunidad agrícola del norte de Manabi corresponde a un importante sitio arqueológico de la cultura Jama-Coaque (500 ac - 1650 dc). Ante años de expolio por huaqueros, del bloqueo del acceso al mar por el narcotráfico y de la falta de interés por la autoridades locales, la comunidad de Tabuga ha decidido enfrentar estos obstáculos con la recuperación de su memoria ancestral. La activación turística basada en el atractivo arqueológico del sitio se muestra como una salida viable para su desarrollo sostenible. Liguiqui, comunidad ancestral de pescadores y campesinos, situada en el litoral central de la provincia de Manabi, próximo a la ciudad portuaria de Manta, enfrenta actualmente un abandono demográfico alarmante. El poblado actual se sitúa sobre un antiguo y complejo sitio arqueológico relativo principalmente a la cultura Manteña (700-1532 dc.) La comunidad de Liguiqui, ante los desafíos que presentan la modernización y el éxodo rural, se ha movilizó para recuperar su memoria ancestral y ser participe de un turismo arqueología y comunitario como vía durable para el desarrollo.

[399] *Timely Attributes: Rethinking Medieval Ceramics from South India*

This paper offers a preliminary attribute analysis of archaeological ceramics excavated at Maski (northern Karnataka) to enable an understanding of the routine and embodied practices that were productive of temporal scale in medieval (ca. AD 500-1600) south India. Ceramics have often fallen through the cracks of a disciplinary division of labour between archaeologists and historians of the long medieval period in the region. Ubiquitous elements of the archaeological record, ceramics labelled 'medieval' are known for their plainness and mark a perceived continuity through time. These sherds have long functioned as indexical of a poorly understood chronological period, a heuristic device that obscures the temporalities that potentially coalesce in acts of making and using ceramics. At an empirical level, the findings presented here build from an analysis of the first excavated assemblage of medieval ceramics in south India. In calling attention to relations between ceramics and time beyond the diagnostic act of identification, this paper engages with a growing attention to questions of memory and historical consciousness in scholarship on precolonial India. It seeks to demonstrate how a critical analysis of archaeological materials productively problematizes narratives about periodization, temporality and historicity.

Johnson, Adam (Southern Methodist University), Mark McCoy (Southern Methodist University), Jesse Casana (Dartmouth), Austin Hill (Dartmouth) and Thegn Ladefoged (University of Auckland)**[408]** *Expanding Our Remote Sensing Toolkit: The First Application of UAV Aerial Thermography in the Hawaiian Islands*

Geospatial technology has allowed for significant advances in archaeological practice in Hawaii and Oceania as the equipment, software, and datasets have become more affordable and widely available. Remotely sensed data, notably aerial LiDAR and terrestrial laser scanning, are used in research and applied archaeology for site prospection and mapping throughout the region. Recent research has focused on developing methods for the automated identification and extraction of archaeological objects from LiDAR data. Remote sensing techniques not yet widely used in Oceania include visible light photogrammetry and aerial thermography from unmanned aerial vehicle (UAV) platforms. The potential of these is discussed using the results of a visible light photogrammetry and aerial thermography survey of portions of Lapakahai State Historical Park on the island of Hawaii. In particular, we explore machine learned identification and extraction of features from these datasets.

Johnson, Amber (Truman State University), Tanigha McNellis (Truman State University) and Anthony Scimeca (Truman State University)**[26]** *Differentiating Ecological Contexts of Plant Cultivation and Animal Herding: Implications for Culture Process*

Over the last few decades archaeologists around the globe have documented a much more variable pattern of prehistoric foraging and food production than was previously imagined. We have also made great progress understanding the macroecology related to variation in hunting-gathering subsistence and social organization. Data recorded from archaeological literature on locations with evidence for the earliest emergence of plant cultivation, plant or animal domestication, or animal herding are used to identify ecological parameters of settings of earliest food production. These data are then used to test logical propositions deduced from patterns in data on ethnographically recorded hunter-gatherers. This allows us to make some broad generalizations about conditions under which foragers become food producers, anticipate locations which are more likely to have food production focused on plants versus animals, and raise questions for future research.

Johnson, Eileen [147] see Litwinionek, Luc

Johnson, Eileen (Museum of Texas Tech University)**[368]** *Prey and Predators on the Late Pleistocene Llano Estacado*

Humans are among the major predators on the Llano Estacado (Southern High Plains, USA) during the late Pleistocene in competition with a diverse carnivore guild that included the now-extinct giant short-faced bear, saber-tooth cat, American lion, and dire wolf. Direct evidence on bone in the form of cut marks and bone fracture patterns are used in identifying human prey animals and the procurement strategies. Among the now-extinct large game

animals utilized by people are the typical four – Columbian mammoth, western camel, horses, and ancient bison and the atypical short-faced bear. Bone data indicate fresh carcass processing (probably hunting) and stiffened carcass processing (found carcass; scavenging). The large carnivores are focused on specific taxa within the large herbivore guild that enabled them to minimize competition among themselves. The typical four animals for humans also are prey for the large carnivores, bringing humans into direct competition that most likely affected the procurement strategy employed at any one time, but also may have encouraged a diverse rather than a focused diet breadth. Along with technological advantages (stone weapons, fire), food security and personal/group safety had to be contributing factors in addressing competition with the large carnivores and minimizing danger.

Johnson, Eric (Harvard University)

[204] *Consumer Agency beyond Identity: Indigenous Demand and Euro-American Wampum Production between New Jersey and the Plains*

The popular “object-biography” approach to commodities generally focuses on hegemonic material culture in the hands of unintended consumers, such as the analysis of “European” goods found in “Native” contexts. What this fails to capture, however, is a kind of consumer agency that extends beyond the politics of identity. In other words, what are the structural effects of colonial consumption on trajectories of capitalist production? This study compares assemblages from two Euro-American shell bead production sites in northern New Jersey: Stoltz Farm (1750-1830), a small-scale, Dutch household, and the Campbell Wampum Factory (1850-1900), famous for its mass production facilitated by “wampum drilling machines.” Shell bead styles produced at these sites—including wampum, hair pipes, and gorgets—were traded with indigenous consumers from the Great Lakes to the northern and southern Plains. Both sites were excavated in the early 20th century, but have not yet been analyzed archaeologically. This project reconstructs sequences of production, estimates efficiencies, tracks the number and quality of bead styles, and measures degrees of standardization between sites. Preliminary conclusions suggest that the demands of distant indigenous actors structured the local trajectory of capitalism in northern New Jersey in ways that complicate the traditional hallmarks of an “industrial heartland.”

Johnson, Erlend (Tulane)

[256] *Ixtepeque Obsidian and the Polity: a Network and Boundary Approach in Southeastern Mesoamerica*

Edward Schortman and Patricia Urban (2012) borrow theoretical approaches from Bruno Latour (1996), Giddens (1984), and Bourdieu (1977) to highlight networks of shared inter-elite interaction in southeastern Mesoamerica that interpenetrate ethnic and political boundaries. The following paper builds upon Schortman and Urban’s work by considering the role of boundaries in addition to networks (Campbell et al. 2009) for reconstructing interaction networks in Southeastern Mesoamerica. Specifically, the paper examines the results of pXRF sourcing studies of obsidian in the Cucuyagua and Sensenti valleys of southeastern Honduras consider what role, if any, the polity of Copan played in distributing Ixtepeque obsidian. Previous obsidian sourcing studies have claimed that the Copan polity directly controlled Ixtepeque distribution and limited its spread to regions under its suzerainty (Aoyama 1999). A critical analysis of past work combined with sourcing studies from the Cucuyagua and Sensenti valleys cast doubt on the idea that the Copan polity directly controlled the Ixtepeque source and failed to find significant drop-off in Ixtepeque obsidian when crossing the Copan polity’s boundaries. Rather, Ixtepeque obsidian may have been transported along networks of individuals that existed parallel to and cross-cut political identities and boundaries.

Johnson, James (University of Wyoming)

[196] *Assessing Connections between the Spoked Wheel and Bronze Age Elite Social Identities*

The wheel may be the greatest, and most enduring, technological innovation in human history. Certainly, the wheel transformed the potential and efficacy of transportation technologies, trade and exchange systems, not to mention human mobility. The innovation of the wheel produced previously unknown socio-economic possibilities, including traveling more and farther, increased speed and cargo load weight, as well as additional opportunities for culture contact and cultural transmission. What is dramatically under-studied are the long-term representational, or symbolic, connections between innovations in wheeled technologies and those in social structure and organization. This paper assesses the improved technological performance with the introduction of the spoked wheel and its association with changes to elite social identities and their place in regional cosmological orders. I seek to improve current qualitative and quantitative knowledge of how, when, and where spoked-wheel technology and its representations were integrated into various regional complex elite social systems. To do this, I assess changes to the materiality of the chariot and spoked wheel as these technologies moved from the southern Urals regions of the

Eurasian steppe, c. 2100-1100 BC, to other regions such as the Mediterranean and the Near East.

Johnson, John (Santa Barbara Museum of Natural History)

[358] *"Shadow of the Whale:" West Coast Rituals Associated with Luring Whales*

Native peoples along the Pacific Coast of North America exploited stranded whales that washed ashore, providing abundant meat and oil for consumption. Many rock art sites along the coast between Alaska and Acapulco contain images of whales and other cetaceans, and portable effigies also depict these marine mammals. According to ethnographic information from the Chumash and Northwest Coast tribes, the whale effigies were used by shamans in rituals designed to summon the whales to beach themselves in one's territory. At least some whale depictions in rock art may have been created in similar rituals.

Johnson, Keith

[222] *Sandals and the Basketmaker Occupation at Antelope Cave, Northwestern Arizona*

Antelope Cave is a large limestone cavern sunk beneath the undulation hills of the Uinkaret Plateau in Northwestern Arizona. Native Americans lived in the cave intermittently for 4000 years during the Archaic and Puebloan periods. This paper focuses on the Basketmaker materials, particularly the sandals, recovered by UCLA archaeologists at Antelope Cave in the 1950s. The sandals will be described followed by a discussion of several related issues. These include radiocarbon dating, age demographics, storage facilities (or lack thereof), and the BMII-BMIII transition.

Johnson, Kyra (University of Minnesota-Twin Cities), Emily Sponsel (University of Minnesota-Twin Cities) and Gilliane Monnier (University of Minnesota-Twin Cities)

[115] *A Comparison of the Surface Variation of Burned and Weathered Bone*

Burned and weathered bones play an important role in understanding the taphonomy and possible behavior of an archaeological site. The processes can sometimes be difficult to distinguish from one another due to the similarities in the overall degradation of the bone. This study attempts to further develop methods of quantifying surface texture variation in burned and weathered bones to understand how the processes compare to each other by using the average roughness parameter Ra. To do so, seven cow ribs were burned at 100 °C increments from 100 °C to 700 °C for three hours and compared to 10 weathered bones selected from the University of Minnesota collections. Images of the bone surfaces were taken at 80x magnification using the Leica stereomicroscope at three points along the surface and 2.5mm long profiles were extracted from the images using the Mountains software. The resulting data were analyzed using univariate statistics such as ANOVA in order to assess differences in surface roughness across the specimens. These analyses reveal patterns of outer cortical surface degradation and overall depth averages. If expanded upon, this pilot study has the potential to be a useful supplementary tool in the identification of which process an archaeological skeletal element has undergone.

Johnson, Matthew

[180] *Temporal Continuity in the Petrified Forest Expansion Lands*

Petrified Forest National Park contains one of the most diverse assemblages of prehistoric pottery on the Southern Colorado Plateau. For decades archaeologists have relied on characteristics of ceramics in order to assist in dating many sites throughout the southwest where the availability of absolute dates for prehistoric sites is rare. Using data from the 2013-2015 Expansion Lands Survey this paper provides an overview of the kinds of wares and types of ceramics present at sites identified within the expansion lands. Using the temporal designations for each site, the ceramic assemblage from several sites is then compared in order to investigate the validity of ceramic cross-dating within Petrified Forest.

Johnson, Matthew (Northwestern University)**[310]** *Bodiam Castle: Lived Experience and Political Ecology*

This paper discussed the results of buildings and landscape survey at Bodiam Castle, SE England, 2010-2015. Bodiam is a much discussed site, a classic case study in the 'defense versus status' debate in castle studies. Our project moved beyond this false and misleading binary framing of a tired 'controversy' to engage with more meaningful anthropological issues. It focused on understanding the lived experience and political ecology of Bodiam. We sought to place Bodiam in its landscape context, and understand its importance as a place over the very long term, from prehistory to the present. We worked at a series of scales, for example: building survey and digital reconstruction of the appearance, details and furnishings of the interior; tracing the landscape of work and daily routines that surrounded the castle through topographical and geophysical survey; to identifying flows of goods, animals and humans around the regional and maritime context of SE England and beyond. The theoretical framing of the project thus linked the immediacy of lived experience on the one hand to the long-term political ecology of the site in its landscape context on the other.

Johnson, Melyssa (Petrified Forest National Park)**[180]** *Dots on the Landscape: Analysis of Site Distribution at Petrified Forest National Park*

Situated in a variety of environmental settings, over 1300 archaeological sites dot the Petrified Forest National Park Landscape. Though the position of many of the sites within the park appears to be almost random, human behavior dictates that there must be an advantageous reason for the placement of a particular site in one location or another. Using tools in ArcGIS, this paper analyzes the distribution of sites throughout Petrified Forest in order to determine if any patterns emerge. In particular, it will investigate how sites relate to one another, and how they relate to the landscape.

Johnson, Nadia (Penn State)**[373]** *Erosion and Agricultural Resilience in the Formative Teotihuacan Valley*

During the Formative Period, the Teotihuacan Valley's population was dispersed in small farming settlements in the piedmont slopes surrounding the valley bottom. The end of this period witnessed a dramatic population shift, with the Valley's inhabitants clustering near perennial streams on the valley floor, along with thousands of new migrants. Erosion is suspected to have been a major pressure leading to the piedmont's Classic Period abandonment, but little is known about the agricultural strategies employed by Formative farmers or their erosive potential. This study uses the EPIC model, a modern agronomic model developed by Texas A&M's Agrilife Institute to simulate a variety of likely Formative Period cultivation strategies and model their ecological effects in terms of erosion and soil depletion. The intent is to determine the true erosive potential of Formative agriculture and to better understand the ecological constraints placed on early Central Mexican farmers.

Johnson, Phyllis (Vanderbilt University)**[392]** *Potential Applications for Agent-Based Models in Obsidian Studies*

Archaeologists have been using agent-based modelling (ABM) to re-create prehistoric social, economic, and political processes, along with prehistoric environments since the first publication of the model commonly known as "Artificial Anasazi." Very few archaeologists have attempted to model prehistoric lithic technology, however, and the handful of existing models have examined only raw material procurement and the formation of lithic assemblages. While not every aspect of lithic technology may be appropriate to model, the present paper describes the potential for ABM to further our understanding of many aspects of obsidian technology and the post-depositional movement of stone tools and debitage.

Johnson, Precious (Bates College) and April Hill (Bates College)**[123]** *Cultural Identity, Subsistence, and the Potential for Epigenetic Research in Togiak, Alaska*

The contemporary village of Togiak, and the old village site, Temyiq Tuyuryaq (Old Togiak), together represent a multigenerational Yup'ik village in northern Bristol Bay, Alaska (K. Barnett 2018). Cultural identity has been, and continues to be, heavily influenced by subsistence. Throughout the past 1300 years the region has experienced ecological variation and the encroachment of colonial marketplace, along with other colonial impacts, that have impacted subsistence and dietary practice. The emerging field of epigenetics is providing new avenues for exploring the effects of generational effects of colonialism, environmental factors, and their resulting modification to DNA. Temyiq Tuyuryaq provides a unique opportunity to explore these question in an archaeological context. The outcomes of this research seeks to identify relevant intersects between Indigenous archaeology and epigenetics that can make considerable contributions to current village concerns and long term community goals that address issues of health and well-being, education, and subsistence practices.

Johnson, Rachel (Tulane University) and Jason Nesbitt (Tulane University)**[288]** *An Analysis of Ceramic Compositions from Canchas Uckro, Ancash, Peru: Implications for Trade in the Formative Andes*

Canchas Uckro (ca. 1100-850 BC) is a large monumental platform situated above the Puccha River approximately 25 km north of Chavín de Huántar. Recent excavations have revealed monumental features that suggest the Canchas Uckro played an important role within the political landscape. Ceramic analysis has likewise linked the site to broader economic spheres of interaction and the Amazonian ceramic styles known from other eastern highland sites, such as Kotosh. This study further assesses the potential economic relationships between Canchas Uckro and its eastern neighbors through the study of ceramic pastes and a consideration of those sherds with more Amazonian traits. 327 sherds were selected from the total assemblage for the descriptive paste analysis, which details the mineral non-plastic inclusions, clay characteristics, and superficial decorative elements. 83 sherds were further analyzed and photographed using a handheld Dino-Lite microscope. The majority of the sherds notably share a similar composition, with varying pastes comprised of principally of quartz, muscovite, feldspars and hornblende, while other ceramics feature non-local schist inclusions, indicative of distant economic ties. We tentatively argue that Canchas Uckro's ceramic pastes further support initial hypotheses of eastern trade relationships during the Formative Period.

Johnson, Robyn**[46]** *Landscape and Elements: A Comparison of Four Rock Art Sites in the Bennett Hills, Idaho*

A number of sizable rock art sites occur along the ephemeral drainages of the Bennett Hills located in the Snake River Plain of south central Idaho. The Bennett Hills are a range of tangled ridges, canyons and drainages that trend east-west for over 60 miles. This poster session will highlight four of those rock art sites (Thorn Creek, Grasshopper Cave, Hidden Sheep Watering Hole, and the Bathtub Site) recorded as part of a Bureau of Land Management (BLM) Challenge Cost Share Program (CCS). I will focus on the similarities of both the physical aspects of the landscape and specific rock art imagery. Illustrative photographs will highlight these landscapes (i.e., ephemeral springs with watering holes lined by basalt outcroppings and large boulders) and some of the similar rock art elements that occur at all of the designated sites. In addition, an Optically Stimulated Luminescence (OSL) date was procured from a hunting blind feature at the Hidden Sheep Watering Hole site that provided a general age for the site's occupancy.

Johnston, Susan (George Washington University)**[266]** *Dun Ailinne and Its Meaning in the Context of Irish Identities*

The notion that, historically, Ireland was a homogeneous society situated on the edge of Europe and passively receiving cultural influences has long been implicit in the larger context of European archaeology. And yet Irish society and culture were neither passive nor homogeneous at any point in the island's history. This is evident through both material culture, which shows active choice in terms of incorporating foreign elements, and through documentary sources, which indicate some of the internal variation among contemporary communities in Ireland. In

this paper, these issues are explored in the context of recent research at the archaeological site of Dún Ailinne, a ceremonial site in Co. Kildare. In the Iron Age, Dún Ailinne was an important place in terms of both local identity and island-wide expressions of power, and this continued into the subsequent early medieval period but in significantly altered ways. Dún Ailinne thus provides an interesting case study to explore the interaction of similarity and difference in the context of island society and culture in the past.

[112] *Archaeology in 3D: Exploring Differences in Photogrammetric Models Created with Popular Structure-from-Motion (SfM) Archaeological Software from both Drone and Terrestrial Photography*

In this study, Structure-from-Motion(SfM) photogrammetric 3D models were created of mid- 19th century historic house ruins. Tyler house (Mound, TX) and Eyrie house (Holyoke, MA) have similar stone construction but dramatically different environmental contexts. The aim of this study was to compare point-cloud differences in, and the benefits and drawbacks of, popular SfM archaeological software. Specifically, comparisons were done through both metric and interpretive output, also addressing the difference in rendered models by acquisition method: drone and terrestrial photography. AgiSoft's PhotoScan (v. 1.4) and Autodesk ReCap Photo (v. 19) were employed and CloudCompare (v. 2.9.1) was used to compare cloud-cloud distances. The average distance between points and standard deviation were calculated between model pairs, and a Gaussian distribution was fit to each comparison to examine the distribution of points. For the paired models, clouds were accurate to within 0.03 cm, but had varying degrees of standard deviation. This is likely due to differences in methodology, such as degree of overlap in photos between acquisition methods, and slight differences in the rendering parameters of each program. These results may help the archaeological community in selecting software, increasing awareness of point-cloud and user-induced variations, and acquisition method when recording archaeological sites.

[257] *Measuring Change in the New Mexican Early Spanish Colonial Period: A View from the Isleta Pueblo Mission Convento Fauna*

The Spanish colonization of New Mexico unquestionably transformed indigenous populations, New Mexican environments, and the Spanish settlers themselves. The details of how and when these changes unfolded, however, have remained elusive, particularly in the Early Spanish Colonial Period (AD 1598 – 1680). Many of the challenges to identifying change in this time and place are rooted in problems related to units of analysis. In this paper, we use

the 17th century faunal assemblage from the Isleta Pueblo Mission Complex (Bernalillo County, New Mexico) to present a snapshot of foodways in a mission environment in the Early Spanish Colonial period. In doing so, we both illustrate and propose solutions to the challenges of identifying change associated with Spanish colonization.

[176] *Monumentality and Time at the Golden Eagle Site (11C120)*

The Golden Eagle site (11C120), Calhoun County, IL, is located on the edge of the Deer Plain Terrace, 8 km upstream of the confluence of the Mississippi and Illinois Rivers. First documented by William McAdams in the late nineteenth century, Golden Eagle is the only Illinois River Valley mound site to include a ditch-and-embankment enclosure. The site is traditionally thought to date to the valley's Middle Woodland (Hopewell) period based on its architectural features, particularly the enclosure and mounds; however, artifacts recovered from the site can be dated from the Archaic to Mississippian periods. Since 2013, archaeologists at the Center for American Archeology have conducted fieldwork at the Golden Eagle site in order to better understand construction sequences and to place the site within its proper temporal context. In 2018, students in CAA field schools excavated 16 1x2 m units to test for the presence of embankment fill north of Mound 1. Evidence from these units indicate that this portion of the enclosure was constructed during the Late Woodland period. In this paper, we present these results and those from previous seasons and discuss their implications for construction and use of Golden Eagle.

[153] *Spatiotemporal Analysis of Regional and Sub-regional Dog Size Data in Pre-Columbian North America*

Recent genetic research (Letholhair et al. 2018) showed that dogs were introduced into North America over as many as four migration events. The first two were by Native Americans and the third and fourth by Europeans. In light of these findings, our research seeks to describe and explain the regional and sub-regional patterning in the sizes of domesticated dogs in Pre-Columbian North America. To do this, we use a dataset of dog skeletal data from archaeological sites across the continent. Initial coarse-grained spatial analysis has shown significant variation in dog body size between regions where dogs were used as a source of labor (e.g., the Intermountain West and Plains) and those where they were not (the Great Basin and Southeast). Our work builds upon this research, and examines variation in dog size on multiple geographic scales and through time to describe trends in animal management. We offer explanations for these patterns using a combination of the recent genetic data, archaeological data, and ethnohistoric information.

[11] *A Preliminary Exploration of a Modest Massachusetts Homestead*

Massachusetts has long been at the center of historic archaeology in the United States, but there is a clear focus on the land and lives of upper class families. Through my research at MacLeish Field Station, an over 200-acre plot of land in Whately, Massachusetts owned by Smith College, I seek to provide a look at the daily lives history has ignored. During the summer and fall of 2018, I am conducting an archaeological assessment of a modest homestead, dating to the late 18th – early 19th century, located within MacLeish. This homestead has been overgrown by new forests since its abandonment in the early 20th century. By using archival material from the Whately Historical Society and the Hampshire County Archives as well as digital methods (such as LiDAR, GIS, photogrammetry, and potentially GPR), my research will shed light on this nearly forgotten homestead. This poster presents the results of this preliminary archaeological investigation - exploring archival materials, a timeline of land

ownership, and mapping of the site both manually and digitally.

[47] *Climate and Migration: Using Radiocarbon Date Frequencies to Identify Population Movement in the Bighorn Basin of Wyoming*

By analyzing radiocarbon date frequencies, it is possible to look at the prehistoric archaeological record on a wider plain, assessing how people dealt with large-scale changes in climate. While radiocarbon date frequencies have often been used to pinpoint time periods of population growth and decline, relatively little is known about how or why these changes occurred. Climate can affect population size, the collapse of civilizations, and/or site abandonment. Five significant population increases and subsequent declines spanning the Holocene have been identified within the Bighorn Basin of Wyoming through previous work by Kelly and associates in 2013. These periods of population change closely follow drought cycles; with the largest declines in population occurring during times of extreme aridity and increased temperatures. This research examines whether declines in population indicate migration events. This is achieved by looking at the frequency of radiocarbon dates through time in adjacent regions using non-parametric statistical analysis. These results are then compared to paleoclimate models for the region in order to determine at what point climatic extremes cause people to leave their familiar landscape.

[82] *Delayed-Return Hunter-Gatherers in the Horn of Africa? Faunal and Radiometric Data from the Guli Waabayo Rock Shelter in Southern Somalia*

Environmental changes during the African Humid Period (~11,000-5,000 BP) are associated with the emergence of new social and economic strategies among some hunter-gatherers in northern and eastern Africa. In response to Early Holocene climatic amelioration, foragers in southwestern Libya and the Lake Victoria Basin decreased their mobility and adopted delayed-return subsistence practices focused on certain wild, local resources. The range and extent of this move toward sedentism and resource localization among African hunter-gatherers, however, is unclear. Preliminary faunal evidence from Guli Waabayo, a Terminal Pleistocene/Early Holocene rock shelter site in southern Somalia, suggests foragers increasingly focused on net hunting and trapping small, territorial mammals such as dik-dik and hyrax throughout the site's occupation. This paper presents detailed faunal data, artifact densities and new radiocarbon dates to investigate whether a trend toward small game hunting corresponds with decreased mobility and elevated rainfall levels observed regionally in the Early Holocene. Findings from this study will contribute to broader discussions about the range and prevalence of increasingly delayed-return hunter-gatherer strategies in northern and eastern Africa and their relationship to environmental transformations during the African Humid Period.

[323] *Land Use in the High Desert of Northwestern Nevada: Analyzing Settlement Patterns of the Bare Allotment*

Mobility has long been seen as a key strategy for foragers in marginal environments, where movement around the landscape sought to take advantage of natural resources that often have narrow windows of availability. While mobility has often focused solely on obsidian conveyance in the Great Basin, ethnographic accounts suggest that food resources were more scarce and more influential to migration routes and timing. This study explores the land use strategies employed by prehistoric populations within the Bare Allotment, a BLM managed land located between Surprise Valley and Black Rock Canyon in northwestern Nevada. Our dataset includes a combination of over 100 records of existing and newly documented sites with chronological diagnostic markers spanning from the Paleoarchaic to the Late Prehistoric Periods. We explore the relationship between site locations and natural resources to develop a fine-grained analysis of land use and how it changed over time. The results of this study have the potential to contribute to our understanding of land use mobility patterns within this area, but also to the region as a whole.

[147] *Huff Village Revisited: A New Radiocarbon Chronology for a Pivotal Time*

The large, heavily-fortified Huff village site in North Dakota is a quintessential Late Prehistoric plains village within the Middle Missouri region of the Northern Plains. Since the 1940s, attempts to establish Huff's occupational history and absolute placement in time achieved only coarse-grained or inconclusive results, suggesting village occupations between AD 1300-1500. A new analysis including Bayesian modeling of 20 previous and 17 new radiocarbon assays established a high-resolution site chronology that constrains the occupation to only one or two generations during the mid-1400s. Based primarily on architectural and ceramic data, previous investigators suggest Huff marks the beginning of large-scale sociopolitical transitions in the region. These changes are characterized by regional population aggregations into heavily-fortified villages and intervillage competition underwritten by long-distance exchange and warfare. Some investigators also posit simultaneous shifts in social configurations eventually developed into the historic Mandan and Hidatsa clan structures observed by Catlin, Lowie, and Bowers in the 19th and 20th centuries. However, without an absolute site-level chronology, the exact tempo and timing of these society-wide transitions remained tentative. The new Huff village chronology suggests these processes began abruptly in the mid-1400s and evolved quickly.

[152] *Practice and Place: Ceramic Technology and Social Boundaries in the Late to Terminal Classic Belize River Valley*

Ceramic provenance studies often focus on resource acquisition to address the question "what is local?", overlooking the role that practice plays in vessel manufacture. Potters must learn to create viable ceramic vessels, engaging with learning networks that extend beyond conventionally cited political, social, and economic boundaries. This paper explores shared practice among potters using macroscopic analyses, thin section petrography, and Scanning Electron Microscopy (SEM) on unslipped jars recovered from house mounds at Baking Pot. The data indicate that potters living in the Belize River Valley (c. AD 700-900) were not part of individual communities that produced ceramic vessels that are distinguishable from another based on a set of discrete technological and morphological characteristics. Rather, shared practice existed at the level of the region and potters in different locations engaged in regular interaction and shared information on resource acquisition, raw materials processing, and vessel form. A narrowly defined approach to provenance does not adequately capture the importance of both place and practice in understanding locally pottery. Extending the concept of local to include practice acknowledges the importance of interaction in pottery production thereby more accurately representing what it means to be local to a specific place.

Jordan, Keith (California State University, Fresno)

[304] *Pumas and Vultures and Wolves, Oh My! The Appropriation and Alteration of Teotihuacan Processing Predators at Tula*

This paper examines the predatory animals on the relief friezes of Pyramid B at Tula, clearly based on Teotihuacan models originally expressed in different media and contexts--murals in interior spaces--and the possible reasons for both Tula's borrowing of this imagery and its redeployment in sculpture in the public space of a monument dedicated to the legitimization of rulership. Recent evidence from Teotihuacan in the form of fragmentary reliefs of jaguars eating hearts on the adosada added to the Pyramid of the Sun around 300-400 CE, suggests that part of this shift may have already started at Teotihuacan, but the context of the animal iconography remains quite different from its use at Tula. I interpret the transfer of imagery formerly used mostly in domestic spaces at Teotihuacan to more public buildings at Tula as reflecting a strategy of equating the monumental spaces of Tula Grande with domestic spaces linked to ancestry. The Pyramid B carnivores probably represent lineages of claimed Teotihuacan descent as well as warrior sodalities of Teotihuacan origin, ruling in coalition with the figures depicted on the Pyramid B pillar reliefs.

Jordan, Kurt (Cornell University)**[19]** *Small Sites as Evidence for Seneca and Cayuga Settlement Expansion, circa 1640-1690*

Sites in Haudenosaunee (Iroquois) territory that yield small numbers of artifacts diagnostic of Postcolumbian indigenous occupations typically are treated as ephemeral occurrences: travel stop-overs, resource-procurement stations, and the like. Concentration on obvious diagnostic artifacts such as glass beads or Christian-themed items neglects other less-flashy, temporally ambiguous materials (such as lithic debitage, faunal remains, or iron tools) that could demonstrate more substantial Postcolumbian occupation. Moreover, many of these small sites cluster in time to the mid-to-late 1600s. This paper uses examples from Seneca (Onōndowa'ga:) and Cayuga (Gayogohó:no') territory to argue that seventeenth-century Haudenosaunee nations expanded occupation with small-scale settlements and agricultural endeavors in a way that archaeologists have not previously recognized. This expansion likely was related to a peak period in Haudenosaunee political-economic power and prosperity. Small-scale settlements appear largely to have been abandoned when a series of French invasions swept through Haudenosaunee territory in 1684-1696. Subsequent Haudenosaunee territorial expansion in the eighteenth century had a very different spatial footprint.

Jorgeson, Ian (Southern Methodist University), Ryan Breslawski (Southern Methodist University) and Abigail Fisher (Southern Methodist University)**[127]** *Evaluating Chronological Hypotheses by Simulating Radiocarbon Datasets*

Evaluating chronological hypotheses using complex radiocarbon datasets is challenging. Sources of variability, including measurement error, interlab variability, uncertainty associated with the radiocarbon calibration curve, the inherent randomness of the physical processes of radiocarbon formation and decay, and potential mismatches between the dated event and the desired event (old wood effects, redeposition, etc.), all can compound in ways that are difficult to predict or account for. To overcome this challenge, we generate expected calendar ages for a given hypothesis, simulate radiocarbon measurements of those expected ages, and then compare the distributions of the simulated datasets with the distributions of observed radiocarbon datasets. These simulated datasets incorporate the known sources of variability in the observed datasets, providing insight into the expected dispersion and structure of a radiocarbon dataset. We demonstrate simulations for three chronologies: (1) a synchronous event, the Laacher See volcanic eruption in Germany approximately 12.9ka; (2) a hypothesized synchronous event at 12.8ka, the Younger Dryas boundary; and (3) an "old wood" effect on Valdez Phase (A.D. 1050 to A.D. 1225) dates in Northern New Mexico. Results demonstrate that simulation is a valuable method to evaluate whether a given radiocarbon dataset was produced by a hypothesized chronology.

Joseph, J. (New South Associates)**[22]** *Science, Circumstance, Dollars and Cents: Perspectives on the Public Benefit of Archaeology*

Opening with an introduction to a fictional (as of this writing) federal agency seeking to mine the public value of our nation's archaeological legacy, this presentation pivots to a consideration of the origins of precontact versus historical archaeology and our subfield's interactions with the public. I then present three contexts for the public benefit of archaeology; 1) fostering identity and authority for disenfranchised communities, 2) serving as a vehicle and platform for STEM education, and 3) serving as mode for job training and societal reintegration. I suggest that an activist approach using archaeology as a mechanism for public benefit can enhance our public value and expand

on the ways in which archaeology is in the public interest.

Joseph, Wilky (Bates College) and Sofie Sogaard (Bates College)

[123] *E-Week: Youth Collaboration within an Indigenous Framework*

Community driven approaches to archaeological research have provided the discipline with new and creative opportunities for engagement and dialogue. This poster explores the benefits of community engagement in the context of the k-12 classroom as part of a the NSF funded research, Temyiq Tuyuryaq; a collaborative archaeology the Yup'it way (Barnett 2018), a collaboration between the village of Togiak, AK and Bates College. This poster explores knowledge not only as co-produced, but also co-learned. Based on outcomes from experiential learning week (E-week) at the Togiak school in 2017 and 2018, we moved beyond a "flipped classroom" to "flipped archaeology". This project prioritizes active participation in its design, empowering youth, elders, and community members to engage in a meaningful way that archaeology often struggles to facilitate, linking together community goals with project outcomes. This poster highlights the role of Togiak youth participation, addressing both its challenges and benefits.

Joy, Brandy

[295] *"Where's the Beef?" and Other Meat-Related Questions: Pre- and Post-Emancipation Foodways on James Island, South Carolina*

Archaeological evidence, historical documentation, and oral histories are used to compare the diet of individuals enslaved on Stono Plantation with those of the tenant-era population of James Island. Pre-emancipation data indicate a high level of livestock consumption supplemented primarily by fishing, but also by some degree of trapping and/or hunting. Poultry consumption seems relatively low prior to emancipation, but may have increased through time. Preliminary evidence for the tenant-era suggest a diet based on produce along with home-raised poultry, locally caught seafood, and minimal livestock consumption.

Joy, Jody (University of Cambridge)

[50] *A Miniature Brooch and Gaming Pieces: The Story of the Smaller Objects from the Late Iron Age Elite Burials of Southern England*

Two iron firedogs, a tripod for a cauldron, a small amphora of Graeco Italian type, a bronze jug, glass vessels and Samian dishes. These are the objects selected for a catalogue record and for inclusion in the historic museum display of the 30 or so objects discovered in a Late Iron Age burial at Stanfordsbury, Bedfordshire in southern England. But what about the five stone gaming pieces or the miniature bronze annular brooch also from the grave? It is contended in this paper that the dominant narrative of this type of burial – that they are the graves of a local elite with elite status expressed in graves by presenting the deceased as the host of a feast – has acted to obscure the importance of smaller, more personal objects also included in these graves. I will explore these issues by examining the grave goods from Stanfordsbury, and several other burials from southern England, as collections in order to give objects of all sizes equal status in mortuary analysis. The dead do not bury themselves and the objects selected for burials like Stanfordsbury have their own individual biographies which will be pieced together through careful interrogation of the evidence.

Joyce, Rosemary (University California Berkeley)**[316]** *The Active Materiality of Obsidian*

When Steve Shackley informed me that over 90% of obsidian samples from Puerto Escondido, Honduras, that he had analyzed came from an unidentified source, presumably nearby, he started a process of re-education that led me to a place where he may not be comfortable, but that I deeply appreciate. This involves a reconsideration of the way that obsidian manifests today to us, as archaeologists, and the degree to which it may have presented itself differently to the people in the past whose lives we study. Drawing on theoretical work broadly called “new materialism”, I examine how volcanic glass is distributed across the landscape of northern Honduras, what the way material use by people in Honduras before 900 BCE might suggest about how they perceived obsidian glass as bounded and located, as mobile and circulating. I argue that the combination of chemical compositional analyses valued for their accuracy and not organized in falsely precise ways with social theories that ask us not to take the essential nature of something like obsidian for granted is consequential in understanding political, economic, and social relations in Honduras, in ways faithful to the example Steve provided in his own work in the US Southwest.

[161] *Discussant***Juarez, Santiago (Colgate University)****[146]** *The Late Preclassic Households of Noh K'uh, Chiapas Mexico*

The Late Preclassic (400 B.C. – A.D. 200) site of Noh K'uh is located in the Mensábäk basin, over 30 kilometers west of the Usumacinta. Within this understudied region, the site of Noh K'uh was an important ceremonial center during the Late Preclassic, and was composed of several hilltop aggregates that clustered around a moderate monumental core. The site's location on the western edge of the Maya lowlands placed residents of Noh K'uh near contemporaneous civilizations in the Isthmian sphere. Preliminary data from archaeological excavations and survey demonstrate both a material culture heavily influenced by cosmological symbolism and ritual practices that may have been shaped by outside influences. Ongoing research reveals how the households of Noh K'uh integrated cosmological rituals into their daily practices.

Juengst, Sara L. [286] see Bythell, Abigail

Juengst, Sara L. (UNC Charlotte)**[353]** *Bodies of Power: The Bioarchaeology of Cooperation*

Power differences and status are most commonly associated with hierarchy; however, heterarchy, or horizontal power differentiation, is another common way of organizing complex communities. Rather than the vertical ranking commonly associated with hierarchy, heterarchy may include differential or shared access to power at various times based on labor, gender, or age, among other possibilities and may contain hierarchies within these categories. Cooperation and consensus are often crucial to heterarchical systems, as people invest in cooperative (rather than competitive) relationships to achieve common goals. Political and social relationships are inscribed on our bodies through our daily activities, access to resources, and social interactions. In particular, risk and experience of stress and disease, access to food, and trauma experiences are closely linked with power relationships. Bioarchaeology is thus well situated as a discipline to investigate the diversity of cooperative and competitive relationships in the past, although researchers have often not recognized this interpretive potential. This paper provides a theoretical platform about how hierarchy and heterarchy affect human bodies and investigates how archaeology and bioarchaeology have engaged with this topic to date. Providing an introduction to the rest of the session, the paper will also suggest new avenues for exploration.

[353] *Chair*

Jurado, Alexander and Tatsuya Murakami (Tulane University)**[406]** *Social Status and Ritual Practice at a Middle Formative Residential Complex at Tlalancaleca, Puebla*

Fieldwork recently undertaken at Tlalancaleca, Puebla, explored a residential complex dating to the Texoloc phase (650 – 500 BC) of the Middle Formative period. Horizontal excavations exposed a residential platform and several wattle and daub rooms flanking a central patio. This paper presents interpretations regarding: (1) the status of inhabitants; and (2) domestic rituals and quotidian practices carried out within the complex. Interpretations are based on multiple lines of evidence, which include analyses of construction debris, personal adornments, and figurines. The assemblage, practices, and occupational history of this residential complex are compared with those of a contemporaneous, higher status residence at Tlalancaleca to elucidate the nature of social differences at this early urban center.

[316] *WDXRF Analyses and Understanding Variability in Time and Space: Trade in the Complex Society Island Chiefdoms*

Our WDXRF sourcing program of geological and archaeological specimens (n=177) from the Society Islands, outlines the dynamics of inter- and intra-archipelago exchange over an 800 year period. Adzes from 21 sources were identified. Those traded in from the Marquesas Islands, an over 1,400 km voyage, are found with low frequency (3%), augmenting known extra-archipelago imports by sixfold and illustrating inter-archipelago trade post-dating the 15th century. Four Moorean sources have “broad” island-wide reach; two represent quarries and two represent probable working floors. Nearly half of the analyzed artifacts are from non-local sources demonstrating widespread intra-island exchange in the pre-contact period and the development of a local prestige goods economy. Adzes from Tahiti Island quarries have the broadest reach, found on all three islands studied (Maupiti, Rai’atea, and Mo’orea), while adzes from Maupiti were also traded into Mo’orea. Evidence suggests two main mechanisms for adze exchange from the mid-15th century onwards. Trade and exchange of raw material and adze preforms and blanks amongst high status tahua, or adze specialists, likely accounts for non-local imports recovered at adze quarries and working floors. Trade and exchange amongst high status priests and secondary elites likely accounts for non-local imports recovered at elite ceremonial sites.

[317] *Theorizing an Anti-colonial Bioarchaeology*

Since the 1970’s bioarchaeology has become both a valid specialization within archaeology as well as a standalone discipline with its own analytical and institutional traditions. Archaeology, though, enjoys a much more robust mosaic of competing theoretical frameworks than does bioarchaeology. From the processual to the postprocessual—to the feminist, radical and postcolonial—contemporary archaeologists have plenty of theoretical locales to inhabit. In bioarchaeology we have certainly weathered the “bioarchaeology of behavior” vs. “contextualized bioarchaeology” divide, tried hard to both become biocultural and understand “the body as material culture,” and started to use social theory more frequently in our interpretations of past lives. Bioarchaeologists, though, typically need not articulate theoretical commitments in their work, although some certainly do. This paper contends that in order for bioarchaeology to innovate within archaeology in the next decades, our theory should be generative, not just interpretive; that is, we must ground ourselves in theory rather than simply use theory. I first explain why bioarchaeology, historically, has lagged behind archaeology theoretically. I then propose a decolonization of bioarchaeology, one situated within established anti-colonial theoretical traditions. Can bioarchaeology try to shed its settler-colonial past and perhaps even reach for a transformation of its intellectual project?

Kakos, Peter

[403] *Explaining the “Venus Figurines” of the Upper Paleolithic: Macronutrients and the Effects of Endocrine Responses*

For over a century the so-called “Venus Figurines” have inspired a plethora of scientific discourse and speculation regarding their meaning and function in the Upper-Paleolithic. This paper examines a more down-to-earth explanation regarding their forms and features that most likely reflects the food resources utilized by Upper Paleolithic cultures rather than the more popular assertion that they represent fertility figures and/or associated fertility cults per se. There seems to be a continuing and erroneous assumption about prehistoric diet, which is not supported by more recent physiological studies of nutrition, hormonal responses to specific macronutrients and female body fat. This paper proposes that the “Venus Figurines” represent a female body type caused by specific nutrient consumption and not merely an abstract concept of female fertility or art form. The climatic conditions of the Upper Paleolithic, site location, available resources, and the effects of macronutrients on the endocrine system on female body fat will be examined.

[122] *Ralph S. and Rose L. Solecki Papers and Artifacts Project: A Case for Collaboration between Archival and Artifact Collections*

In 2017, the Smithsonian Institution's National Museum of Natural History's Department of Anthropology began a two-year collaborative project through the Smithsonian's Collections Care and Preservation Fund aiming to connect the archival and artifact collections of paleo-archaeologists Drs. Ralph S. and Rose L. Solecki, known for their work at Shanidar Cave in northern Iraq from 1951-1960 and other sites throughout the Near East. Through the integration of these collections, the project aims to set a precedent by assuring that the association between archaeological collections and metadata is preserved in a way that increases their value to future researchers and the public at repositories collecting and preserving the collections of archaeologists. The poster will highlight the Ralph S. and Rose L. Solecki Papers and Artifacts Project's goals, methodologies, and challenges and encourage discussion about the preservation, physical and intellectual accessibility, and legacy of archaeological artifacts and records.

Kamp-Whittaker, April (Arizona State University)

[83] *Communal Spaces and Ideas of Belonging in a WWII Japanese Incarceration Center*

The World War II incarceration of Japanese Americans was based on a questioning of national allegiance and the role of minority groups within this nation. This paper looks at the development of communal spaces at the Amache Incarceration Center in southeastern Colorado and explores the ways these areas express ideas of national and cultural identity. Communal facilities created by internees demonstrate the dual cultural heritage of the population at Amache by incorporating Japanese and western elements. Constructed at both a neighborhood and site-wide level these community spaces may have helped mitigate some of the negative impacts of detention by helping create new social ties and a sense of belonging. The communal experience of unjust incarceration has had a continuing impact on how these sites are interpreted and their role in our national narrative surrounding Japanese American Incarceration.

[173] *La excavación monumental en Yaxchilán e Iglesia Vieja, Chiapas, México*

La liberación por el medio de excavación y consolidación de los monumentos prehispánicos tiene una larga historia en la arqueología mexicana. Los métodos de las excavaciones de los conjuntos arquitectónicos de los sitios arqueológicos a cual definimos como la excavación monumental. Presentamos los procesos de excavación monumental de la Acrópolis Oeste de Yaxchilán (1989-1991) y los grupos B y C de Iglesia Vieja (2003-2018) en el estado de Chiapas, México. La excavación monumental no solo significa la dimensión grande o espacio amplio del área de excavación que proporciona los datos e informaciones más completas para la interpretación arqueológica, sino también que los edificios restaurados se convierten a las zonas arqueológicas abiertas al público que sirviera al desarrollo socio-económico de la región, asimismo los monumentos prehispánicos se conservan eternamente hacia el futuro como los patrimonios culturales en la historia de la humanidad.

Kaner, Simon (Sainsbury Institute and University of East Anglia)

[74] *Stories from the Riverside: Metastability in the Shinano-Chikuma River System, Central Japan*

This paper discusses the significance of the archaeology of the Shinano and Chikuma River system, the longest drainage in Japan, an area of very high environmental activity, situated on the Fossa Magna. The paper focuses on

the Jomon period, when the region had the highest density of early ceramic sites (Incipient Jomon, c. 12,000 BP) and produced some of the most elaborate ceramics of the whole Jomon tradition (Flame pots c. 5000 BP). These are highlighted in the current Japan Heritage (Nihon Isan) initiative, designed to situate specific heritage assets in longer-term regional narratives appealing to the general public. Additionally, a number of Jomon objects from the region have in recent decades been designated as National Treasures, and Jomon obsidian mines are involved in the world's first international 'twinning' of archaeological sites. Short-term and longer-term archaeological sequences are interpreted in terms of metastability, providing a framework for understanding the continuity of tradition in the context of ever-changing landscapes.

Kang, Bong (Gyeongju University)

[267] *Reconsideration of the Relationship between Complex Societies and Dolmen in Northern Part of Korea and Manchuria*

Dolmen is one of the principal mortuary programs in the Korean Bronze Age (ca. between 1000 and 300 B. C.). A number of dolmens have been discovered almost everywhere in the Korean peninsula as well as Manchuria, China. A great amount of research has been conducted by Korean and Japanese archaeologists concerning this style of burial. Some scholars became interested in a social reconstruction and they have asserted that Korean dolmen society reached chiefdom in association with both mortuary offerings like mandolin-shaped (also known as Liaoning type) bronze daggers and especially energy expenditure. This issue has been one of the hottest research topics in Korea for a long time. Many researchers have taken it for granted that Korean dolmen society witnessed a centralized political organization. This interpretation has been printed in Korean National History Textbook. Consequently, there is no way for the majority of Korean students to think otherwise. This paper, based on the analyses of spatial distribution of dolmen and artifacts recovered from the burials located in northern part of Korea and Manchuria, will argue that the dolmen society in the study region did not reach complex society (e. g., Old Joseon) but remained egalitarian.

[388] *Understanding Stylistic and Technical Variation in Middle Chalcolithic Painted Pottery Decoration—A Test from Tel Tsaf*

This research explores the social interaction between Tel Tsaf and northern Mesopotamia through pottery decoration similarities. This ongoing research questions another possible connection between northern Mesopotamia and Tel Tsaf in the central Jordan Valley, representing one of the most southern sites discovered. The Middle Chalcolithic (5600-4500 BC) site of Tel Tsaf is located in the central Jordan Valley near Beth Shean, Israel. The site is believed to have influences from the Ubaid in northern Mesopotamia during the Chalcolithic period. This assertion is fundamentally based on the recovery of distinctive pottery sherds, Tel Tsaf ware, after decades of excavations (Gophna 1970s; Garfinkel 2004-2007; Rosenberg 2013-Present). To reconstruct the context, analysis of the pottery decorations will be mainly used to broaden the interpretation of the site through a consideration of all relevant Tel Tsaf pottery. X-ray Fluorescence (XRF) studies will be conducted on the pottery colorant in order to provide a better understanding of provenance of colorant components. Through examining the stylistic and technical variations of the Tel Tsaf ware as well as XRF analysis of the Ubaid-like pottery decoration, this study compares to Tel Tsaf with the sites in northern Mesopotamia, Ubaid interaction zone.

[251] *Smoke on the Water: Addressing the Burning Issue of Threats Climate Change Poses for Submerged Historical Sites in Florida*

Underwater archaeological sites are often omitted from sea level rise and resiliency discussions, but these resources, which attract tourists and provide critical information about the past, are at risk. Lack of personnel,

difficulty with routinely accessing sites coupled with the “out of sight, out of mind” mentality make submerged historical sites vulnerable. Increasing ocean temperatures result in increased storm activity, while ocean acidification impacts the delicate equilibrium of a submerged site. Documenting these changes and related impacts can help archaeologists understand how these factors impact site integrity over the long term. The Florida Public Archaeology Network (FPAN) partnered with the Florida Keys National Marine Sanctuary (FKNMS) to create a submerged historical resource monitoring program as part of the successful Heritage Monitoring Scouts (HMS) Florida initiative, launched by FPAN in 2016. Heritage Monitoring Scouts encourage the community, dive shops, and visitors to embrace submerged historical resources and learn how they can effectively identify changes and threats while routinely monitoring sites. Discussion includes the launch of the Submerged HMS Florida program, shipwreck trails, potential for HMS and similar programs addressing climate change and submerged resources to provide valuable data before it goes up in smoke.

[87] *Data Literacy and Public Engagement in Archaeology*

This paper will explore the need to cultivate deeper and broader data literacy in archaeology. Data and algorithms shape the actions of virtually every institution in modern society. In archaeology, data involve significant conceptual, modeling, and ethical challenges (including cross-cultural intellectual property issues). For data to be meaningfully preserved and used in intellectually rigorous ways, they need to be integrated fully into all aspects of professional practice, including ethics, teaching, and publishing. To succeed over the long term, we need to strengthen the human and community capacity to use data effectively and appropriately. To broaden and deepen our capacity to make better use of data, we need to strengthen instructional and public outreach programs that merge humanistic traditions of critique and wider cultural and historical perspectives with technical competencies. To put these ideas in practice, we propose combining elements of reproducible research, that make data and analytic steps clear and open for review and reuse, with engaging narratives so that data and analyses become more broadly accessible and meaningful to broader audiences.

[81] *Landscape Meaning and Materiality among the Indigenous Wixárika (Huichol) People of Jalisco, Mexico*

Landscapes are more than just where people subsist: landscapes are inherently social entities. People create landscapes in their interactions with the environment and with each other; they conceptualize landscapes in various ways; they mediate their relationships with one another through the landscape. It is the social nature of landscapes that makes them an essential component of anthropological inquiry. Ethnographic study of landscapes reveals their role in subsistence, ritual, social organization, and identity, and may also provide insights for evaluating ancient landscapes. In this paper, I present results of an ethnographic study of landscape among the present-day Wixárika, carried out under the supervision of Ben Nelson. I describe the meanings and content of a Wixárika landscape and also suggest how they may aid our approach to the past. In short, the Wixárika landscape is imbued with a prevailing concept of dwelling which entails key practices and a materiality that is archaeologically informative.

[170] *Preliminary Investigations on a Coastal Caribbean Island: A Multi-proxy Environmental Study at the Sabazan Amerindian Site, Carriacou, Grenada*

The Amerindian, enslaved African, and European peoples who successively settled the Caribbean island of Carriacou beginning AD 400 encountered a distinctive environment marked by recurrent drought, few terrestrial fauna, and the largest reef system in the region. Evidence suggests Carriacou's ecology was altered dramatically by humans, reflecting efforts to adapt to and transform the island's environment. While not fully understood, deforestation, erosion, species introductions, and extinction are among the known legacy effects. To better understand human-environment interaction and landscape history through time, the Carriacou Ecodynamics Archaeology Project (CEAP) is pursuing long-term, high-resolution records for habitat modification and biotic change at the Sabazan archaeological site using zooarchaeology, geoarchaeology, and geophysical survey. Sabazan is the location of an Amerindian village (AD 400 – 1400) and historic sugar plantation (1772 – late 19th century) that retains well-preserved, artifact-rich pre-Columbian deposits, the remnants of stone plantation buildings, a 19th century cemetery, and historic well. Here we report on the results of the 2018 pilot field season, including mapping, ground penetrating radar, and magnetometry applications. These show numerous anomalies indicative of past human occupation, including pits and hearths, and depth of the shell midden deposits which assist in understanding Sabazan's site formation history.

[39] *The Technical Study of Two 16th Century Mexican Pictographic Documents in the NMAI Collection*

Two mid-16th century Mexican pictographic documents in the collection of the National Museum of the American Indian, a codex on amate paper from the Valley of Mexico and a lienzo on a large cotton textile from Puebla, have been well studied by historians and archaeologists yet have never been the subjects of a technical study. This paper presents the preliminary analytical results of a study that aims to holistically understand the object's biographies, from manufacture and use through accession and conservation. In addition to technical analysis, this project looks to re-contextualize the codex and lienzo by strengthening our understanding of their relationships to historic and contemporary indigenous documentary traditions in Mexico.

[8] *The Ethnoarchaeology of Stone Craft Production in Athienou, Cyprus*

The town of Athienou in Cyprus lies at the southern edge of the fertile Mesaoria Plain. In addition to its agricultural focus, the region has been home to many traditional crafts, such as the making of lace and cheese. In addition, artisans have fashioned a variety of objects from the local limestone called "the stone of Athienou". Ancient sculptors made extensive use of this material to fashion statues, many of which formed the foundational assemblage of the fledgling Metropolitan Museum in New York. Excavation of a rural sanctuary at Malloura by the Athienou Archaeological Project (AAP) has recovered over a thousand sculptural pieces made of the local material. Use of these stone quarries has persisted to the present. This study focuses on the nature of work at the local quarries as documented through interviews with current stone workers. These individuals extract the stone and shape several types of vessels (bowls and basins), millstones, and construction materials. The AAP survey revealed the sources of bedded limestone and gypsum. The interviews provide details about quarrying procedures and the structure of the labor force. These investigations offer insights into an important local industry that thrived from antiquity to the recent past.

[168] *Exploring the Unexpected Early Woodland Occupation at Smith Creek, Wilkinson County, Mississippi*

Smith Creek (22Wk526) is a multi-component Native American mound site in the Natchez Bluffs region of the Lower Mississippi Valley. Surface collections and excavations from 2013–2016 clearly demonstrated a dense Mississippian (AD 1200–1500) occupation at the site and suggested a Late Woodland (AD 750–1200) date for the construction of the mounds. However, excavations during Summer 2018 revealed an unexpected Early Woodland (500 BC–AD 1) component underlying these later deposits. We examine the distribution of Early Woodland artifacts and features across the Smith Creek landscape before focusing our attention on a large circular structure in the northeast sector of the site. We compare this structure, and the artifacts recovered from it, to those from the small number of excavated Early Woodland sites in the Lower Mississippi Valley. In addition, we discuss the implications our excavations have for understanding the pace of soil development in the Natchez Bluffs and how this may affect the visibility of Early Woodland and Archaic components on later sites.

[111] *A Preliminary Study of Epiclassic Human Mobility at La Mesa in Tula, Mexico Using Stable and Radiometric Isotope Analyses and Radiocarbon Dating*

In this poster, we present preliminary mobility data for individuals recovered from La Mesa, an Epiclassic hilltop settlement in Tula, Mexico. For decades it has been hypothesized that the Tula area may have experienced an influx of immigrants from northwestern Mexico during the Epiclassic period, and that these newcomers played an important role in the rise Tula Grande. Results presented here provide an important step forward towards testing the long-held migration hypothesis. Analyses of modern and archaeological faunal remains were conducted to establish local baselines for oxygen ($\delta^{18}\text{O}$) and radiometric strontium ($^{87}\text{Sr}/^{86}\text{Sr}$) and lead ($^{20}\text{nPb}/^{204}\text{Pb}$) ratios for the Tula Grande region. These baseline values were then compared to human $\delta^{18}\text{O}$, $^{87}\text{Sr}/^{86}\text{Sr}$, and $^{20}\text{nPb}/^{204}\text{Pb}$ values, derived from the analysis of tooth enamel, to identify individuals who may have migrated to the Tula Valley during the Epiclassic. For all individuals included in this study, bioarchaeological, mortuary, AMS radiocarbon dating and stable carbon ($\delta^{13}\text{C}$) and nitrogen ($\delta^{15}\text{N}$) data are also assayed to contextualize the migration data. These new mobility data, in conjunction with other bioarchaeological results, will provide further insight into the population patterns of the pre-Toltec Tula Valley, especially when compared with data from other Epiclassic sites.

[270] *The Sound of Music: Performing Archaeomusicological Research in Museums*

This paper will discuss the methodology used to study archaeomusicology in a museum setting, which involves 3D scanning and modeling artifacts, playing and recording them (if permitted), and various other data collection techniques. To demonstrate the methodology used, I will discuss typologies of precolumbian ocarinas documented

at various institutions throughout Mesoamerica and the United States. The typologies created are based on technological, stylistic, and tonal attributes. I will also discuss how ancient music can be used as an effective topic for outreach classes in a museum setting, creating multisensory and engaging experiences for museum guests.

Katz, Monica (Hispanic Society of America)

[39] *Local Color: The Visual Analysis of a South American Colonial Lacquered Gourd from the Collection of the Hispanic Society Museum & Library*

The Hispanic Society has a small but very fine collection of colonial Spanish American lacquered objects, which are decorated with one of the more widely known indigenous lacquer techniques, barniz de Pasto. The Hispanic Society's objects date from the 2nd quarter of the 17th century to 1800 and were made using native materials and techniques for a European aesthetic which mimicked Asian lacquer and demonstrate the extraordinary craftsmanship of these anonymous artisans whose techniques are still in use today in Colombia.

Using only inexpensive and readily available lenses for a smart phone, this study of a mid-17th century barniz de Pasto gourd in the collection analyzes the decorative elements and hopes to identify their sources to show that artisans regularly substituted local flora and fauna in place of the stylized motifs in Asian lacquer as well as incorporating designs from European sources into these ornate objects. Relying on original sources as well as analyses conducted on similar pieces, the study will also identify pigments used to create the lustrous effects.

[327] *The McKean Complex Occupation in the Sunlight Basin, Northwest Wyoming: An Updated Assessment of Cultural and Geological Stratigraphy at Site 48PA551*

Site 48PA551 is a widely recognized winter camp originally dated to Middle Archaic (McKean Complex) period. Original investigators described the McKean occupation as a singular unit within a 30-90 cm thick sedimentary stratum beginning at the ground surface. Original radiocarbon dating placed the occupation range at ca. 3800-4400 radiocarbon years B.P. In this poster, we discuss results of new research at the site designed to clarify our understanding of the McKean Complex occupations. We offer new data to suggest that there are actually two periods of occupation consistently represented across the site. We also provide preliminary consideration of spatial variability in occupation materials that includes evidence for two new pithouses, cooking and storage features, and possibly dump areas for faunal remains.

Kay, David (University of Cambridge)

[82] *"The Land is now OK": Three Centuries of Marakwet Settlement on the Elgeyo Escarpment, Northwest Kenya*

Situated within the Great Rift Complex of northwest Kenya, the Elgeyo Escarpment and surrounding region has been home to Marakwet communities for the last three hundred years. Many of these communities inhabit settlements which span diverse ecosystems, from semi-arid bush to highland forests. In tandem with changes in local lifeways and social/ecological relationships, the location of these settlements has shifted across the landscape since their original foundation. Drawing on archaeological and ethnographic research conducted over the past three years, this paper will explore these changes in settlement form and location, alongside the cultural and environmental variations that are interwoven with such trajectories. Combining survey, geoarchaeological and interview data, it will argue that such settlements should not be interpreted as discrete 'villages', but rather as inhabited zones within broader parcels of landscape in which a variety of human activities and relationships have played out over time. These parcels roughly correspond to 'clan territories', but are cross-cut by inter-clan land-use agreements, marriages, trading relations, irrigation networks and modern infrastructure. Taken as a whole, these networks highlight the intrinsically historical-cum-ecological nature of Marakwet settlement, and serve as a potential guide for archaeological investigations of more ancient contexts throughout eastern Africa and beyond.

Kay, Evan and Alexander Kurota (Office of Contract Archeology, UNM)

[413] *Favorite Things: An Overview of Ornaments Used by the Jornada Mogollon in the Tularosa Basin, New Mexico*

Recent UNM Office of Contract Archeology evaluations and surveys at numerous sites on White Sands Missile Range (WSMR) and White Sands National Monument (WSNM) offer new insight into the use, manufacture and trading of diverse objects of adornment by the Jornada Mogollon during the Doña Ana and El Paso phases. A wide variety of artifacts made from turquoise, shell, travertine, serpentine and argillite is presented. This paper also discusses two rare ornaments: a tubular bead made from the shell of a *Vermetidae* species (a marine invertebrate commonly called a 'worm snail') and lacustrine shell beads made from locally available snails. A size-specific typology of disc beads is also presented.

[27] *Centralized Power/Decentralized Production? Angkorian Stoneware and the Southern Production Complex of Cheung Ek, Cambodia*

Historically, international archaeological research in mainland Southeast Asia (MSEA) has been typically site-focused and 'origins' oriented (e.g., agriculture, metalworking). Theoretical framing has been inductive, frequently emphasizing the role of migration in culture change. More recently, interest in the dynamics of MSEA economies has introduced regional-scale investigations and different theoretical emphases. This paper highlights the potential of large-scale approaches for understanding regional economic development in the Angkorian Empire (c. 9th-15th c CE). A central feature of the Angkorian economy was the relatively rapid development of sophisticated craft industries. Of the multiple crafts servicing this empire, stoneware production stands out for two reasons: distribution (consumption) of Angkorian stoneware appears to map directly onto the empire's geopolitical extent; and transport networks closely articulate with the location of stoneware production complexes best known east of Angkor. New data from Cheung Ek, a southern kiln complex near Phnom Penh, expand the number and range of large-scale ceramic production complexes beyond the Angkorian core (and Buriram). In addition, the identification of Cheung Ek stonewares at consumption sites reveals extensive exchange networks (e.g., Thala Borivat). These preliminary results reveal a more integrated Angkorian network of production and exchange than previously supposed.

[86] *Basketmaker III on the Chuska Slope, Northwest New Mexico*

The centuries-long Ancestral Pueblo Basketmaker period occupation of the Chuska Slope in northwest New Mexico was marked by intervals of relative stability punctuated by long and short distance residential moves. Basketmaker settlement and material culture data are examined relative to key aspects of the occupation including 1) the origin of Basketmaker III communities along the Chuska Slope, 2) relationships with more distant Basketmaker III communities, and 3) changes that mark the end of the Basketmaker III interval in the study area. Although Basketmaker settlement of the entire Chuska Slope is addressed, the emphasis is on Tohatchi Flats and the southern portion of the Chuska Slope, areas where most of the research has been conducted.

Keegan, Deanna

[279] *Adaptive Pastoralism and Climate Change in the Irish Chalcolithic – Early Bronze Age: Adding Evidence from Termon, Co. Clare*

The Burren, a karstic region located in Western Ireland, has seen intensive farming practices since the Neolithic. Local proxies throughout the west coast of Ireland have indicated periods where the environment shifted to colder and wetter conditions in two key phases during the late 3rd and early 2nd millennia BC. A comparison of the archaeological record at Burren site Roughan Hill to proxy signals has shown probable evidence that the prehistoric occupants of the Burren were impacted by climate change. This paper seeks to explore and compare evidence of climate change and adaptive pastoralism at the Chalcolithic – Bronze Age site of Termon, located at the center of the Burren. The archaeological record of Termon will be explored in relation to local proxy signals in effort to understand how its occupants were responding to the shifting environment. Further, a comparison to the archaeological evidence at Roughan Hill will be given in relation to Termon in effort to support the notion of social adaptation over collapse during the Bronze Age.
