Abstract. Investigation results of effective population of states of 5d-configuration of Ce³⁺ ions by energy transfer from Pr³⁺ ions in LiY_{0.3}Lu_{0.7}F₄ (LYLF) crystals are discussed. The real concentrations of Pr³⁺ and Ce³⁺ ions in LYLF crystals are determined. Such parameters as excited 4f-5d state photoionization cross-section of Pr³⁺ ions, ground state cross-section of Ce³⁺ ions at 266 nm wavelengths and energy transfer coefficients of energy transfer from Pr³⁺ to Ce³⁺ ions were estimated. The results of pump-probe experiments on 5d-4f transitions of Ce³⁺ ions in LYLF crystals are presented. The optimal parameters for getting maximal gain on 5d-4f transitions of Ce³⁺ ions were determined by mathematical modeling.

Currently tunable solid-state optical quantum generators of UV range are most easily implemented on interconfigurational 4fⁿ⁻¹5d - 4fⁿ transitions of rare-earth ions in wide-bandgap dielectric crystals. In this case the pumping of the laser is usually carried out by UV harmonics of visible and infrared radiation generated by of commercially available lasers, or powerful UV radiation of excimer lasers. However, UV pumping radiation induces in solid-state active elements various photodynamic processes (PDP), which cause degradation of the optical properties of active media. One of the ways to avoid or significantly reduce harmful manifestations of PDP is to use up-conversion pumping [1].

Here we investigate an opportunity of effective population of states of 5d-configuration of Ce³⁺ ions in LiY_{0.3}Lu_{0.7}F₄ (LYLF) crystals by stepwise ³H₄-4f5d up-conversion excitation of states of 4f5d-configuration of Pr³⁺ ions, followed by the transfer of excitation energy from Pr³⁺ to Ce³⁺ ions.

We determine the real concentrations of Pr³⁺ and Ce³⁺ ions in LYLF crystals. Such parameters as excited 4f5d state photoionization cross-section of Pr³⁺ ions, ground state cross-section of Ce³⁺ ions at 266 nm wavelengths and energy transfer coefficients of energy transfer from Pr³⁺ to Ce³⁺ ions were estimated. Obtained results of pump-probe experiments and results of mathematical modeling demonstrate good prospects of using crystal LiY_{0.3}Lu_{0.7}F₄:Ce³⁺, Pr³⁺ as an active medium of solid-state laser with up-conversion pumping. This work was funded by the subsidy of the Russian Government (agreement # 02.A03.21.0002) to support the Program of Competitive Growth of KFU among World's Leading Academic Centers, the subsidy allocated to KFU for the state assignment in the sphere of scientific activities and RFBR grant 15-02-05309
