Interaction of 3-(diphenylphosphonio)propionic acid with unsaturated derivatives of cinnamic acids leads to formation of stable dicarboxylate phosphobetaines **1** (a-d).

Novel synthesized dicarboxylated phosphobetaines **1** (a-d) are not soluble in water and in most organic solvents which makes it difficult to perform NMR studies. In order to establish the structure of synthesized compounds dicarboxylated phosphobetaines were included in reaction with 0.1 M solution of the hydrochloric acid. As a result phosphonium salts were isolated and characterized **2**(a-d). The structure of compounds was proved by IR, ¹H NMR, ¹³C NMR and ³¹P NMR spectral studies. Results of X-ray diffraction analysis were received for phosphonium salt **2c** (Fig.1).

Figure 1. Molecular structure of (2-carboxy-1-(3-nitrophenyl)ethyl)(2-carboxyethyl)diphenylphosphonium chloride **2c**
