

## SYMPOSIA

### Table of Contents

#### Sunday 8 July

- 11 Carcinogenesis
- 12 Structural bioinformatics for drug design and biotechnology
- 14 Emerging roles of noncoding RNAs
- 15 Host-pathogen interactions I – plants
- 17 Protein complexes and networks
- 18 Chromosome structure and segregation
- 20 Xenobiochemistry and drug metabolism
- 21 Host-pathogen interaction II – pathogen and parasite
- 23 Epitranscriptome
- 24 Computational biology
- 26 Bioluminescence: chemistry, enzymatics, applications

#### Monday 9 July

- 27 Omics technologies
- 28 Biochemical processes at cellular membranes
- 26 RNA synthesis and processing/mRNA homeostasis
- 31 Host-pathogen III – molecular virology and viral vectors
- 33 Dysregulation of metal homeostasis and neurodegeneration
- 35 Biochemistry and tailored therapy of cardiometabolic diseases
- 36 Structural biology I
- 38 Nucleic acids, nucleotides and the DNA world
- 40 Systems biology
- 41 Targeting brain plasticity in CNS diseases

#### Tuesday 10 July

- 41 Biotechnology
- 43 Proteases in cancer pathogenesis and immunity
- 44 Structural biology II
- 46 Glycans in health and diseases I
- 48 Synthetic biology
- 49 Nanoworld
- 51 Biological effects of gaseous molecules
- 53 Photosynthesis
- 54 Glycans in health and diseases II

#### Wednesday 11 July

- 56 Integrated structural biology for translational research
- 57 Redox biochemistry and signaling
- 59 Stem cell epigenetics
- 60 Combinatorial approaches in chemistry and biology
- 61 Plant signalling and behavior
- 63 Genome dynamics and stability I
- 64 Extracellular matrix
- 65 3D Genome
- 67 Plant biochemistry and molecular biology

#### Thursday 12 July

- 68 Scientific (mis)conduct: how to detect (and avoid) bad science
- 69 Natural biologically active compounds in environment and foods
- 71 Genome dynamics and stability II
- 72 Protein N-terminal modifications: from proteome to therapy
- 74 Lipidomics

Abstracts submitted to the 43rd FEBS Congress, taking place in Prague, Czech Republic from 7th to 12th July 2018, and accepted by the Congress Organizing Committee are published in this Supplement of *FEBS Open Bio*. Late-breaking abstracts are not included in this issue.

### About these abstracts

Abstracts submitted to the Congress are **not peer-reviewed**. In addition, abstracts are published as submitted and are **not copyedited** prior to publication.

We are unable to make **corrections of any kind** to the abstracts once they are published.

### Indexing

Abstracts published in *FEBS Open Bio* Supplement for the 43rd FEBS Congress will be included individually in the Conference Proceedings Citation Index published by Web of Science.

### How to cite these abstracts

AuthorOne, A., AuthorTwo, B. (2018). Abstract title. *FEBS Open Bio*, 8: Abstract number\*. doi:10.1002/2211-5463.12449

\* The Abstract number begins with the letters S or ShT and can be found atop each abstract's title in the PDF file.

phellandrene. These results helped identify prerequisites for the efficient heterologous production of terpene hydrocarbons by the photosynthetic apparatus, comprising: (i) requirement for over-expression of the heterologous terpene synthases, so as to compensate for the slow catalytic turnover of these enzymes, and (ii) enhanced endogenous carbon flux toward the terpenoid biosynthetic pathway upon heterologous expression of the MVA pathway, thereby supplementing the native MEP pathway in terms of carbon-flux toward the universal isopentenyl-diphosphate and dimethylallyl-diphosphate terpenoid precursors. The above prerequisites are critical determinants of yield in the photosynthetic CO<sub>2</sub> conversion to terpene hydrocarbons.

#### Newly introduced sensing concept in forensic and biometric applications

J. Halamek

State University of New York, University at Albany, Albany, United States

The analysis of biomarkers has been used in the field of forensics significant time mainly focused on DNA (usually from blood) for identification purposes. The process of matching DNA samples, however, is very time consuming and have caused serious backlogs worldwide. While this is a useful tool, it may not be the best method of analysis during an active criminal investigation. Although the forensic science field has developed rapidly over the years, the investigation processes are lengthy and majority of the routinely used forensic science techniques require proper sample collection at the crime scene followed by transportation to a laboratory facility before performing any informative analyses. The research concept, originated in our lab and presented here addresses this situation by introducing the use of bioaffinity-based tools for quick, straightforward and non-invasive analyses of sweat capable of serving as an alternative to the time-expensive DNA identification processes via the bioaffinity detection of small molecules in sweat. Furthermore, the bioaffinity concept is remarkably versatile and can be adjusted for the analysis of a wide range of substrates for the discernment of different physical traits. This research can impact field of the forensic and biometric science community by providing new methods for the non-invasive analysis/monitoring of skin surface. Ultimately, these systems are being incorporated into field-deployable devices and connected to handheld smart-devices which will allow for rapid analysis of body fluids that can be used and interpreted by operators with no scientific training, and thus revolutionizing the “front end” of forensic and biometric science.

#### Two-component regulation systems of dominated electrogenic bacteria in microbial fuel cells treating swine wastewater

I. Khilyas<sup>1</sup>, A. Sorokin<sup>2,3,4</sup>, O. Vassieva<sup>5</sup>, M. Cohen<sup>6</sup>, I. Goryanin<sup>7,8,9</sup>

<sup>1</sup>Institute of Fundamental Medicine and Biology, Kazan, Russia, <sup>2</sup>BMI Sciences Ltd., Edinburgh, United Kingdom, <sup>3</sup>Institute of Cell Biophysics Russian Academy of Science, Pushchino, Moscow Region, Russia, <sup>4</sup>Moscow Institute of Physics and Technology (State University), Dolgoprudny, Moscow Region, Russia, <sup>5</sup>Ingenet Ltd, London, United Kingdom, <sup>6</sup>Sonoma State University, Sonoma, United States, <sup>7</sup>OIST, Onna, Japan, <sup>8</sup>University of Edinburgh, Edinburgh, United Kingdom, <sup>9</sup>Tianjin Institute of Industrial Biotechnology, Tianjin, China

Two pairs of laboratory-scale microbial fuel cells (MFCs), one set inoculated with a beer wastewater-treating anaerobic digester

sludge and the other with swine wastewater sludge, were used for comprehensive analysis of electricity generation and waste treatment. Metagenomic analysis was conducted to determine potential metabolic capabilities and strategies for adaptation on the anodes of both MFCs by the dominant bacterial species. Two-component regulation systems enable bacteria to adapt to MFC environments. We found different bacterial chemotaxis-like chemosensory systems involved in a biofilm formation by dominant bacterial species on the anodes of MFCs: Flagellar assembly associated with the chemotaxis (Che) response regulators (*cheBVY*) (*Geobacter*, *Shewanella*, *Pelobacter*, etc.); the Chp chemosensory system responsible for the twitching motility and biofilm formation (*Geobacter*, *Pseudomonas*, *Acinetobacter*, *Xantomonas*); the diffusible signaling factors (DSF) (Clp and G54-dependent genes) involved in biofilm formation, motility and virulence (*Geobacter*, *Pelobacter*, *Flavobacterium*, etc.); the anti- $\sigma$ 54-dependent -  $\sigma$ 54-dependent genes regulating swarming activity and biofilm formation (*Geobacter*, *Shewanella*, *Pelobacter*, *Pseudomonas*, *Syntrophus* etc.); and flagellar assembly genes associated with quorum sensing (*flhCD*, *fliAC*, *motA*) (*Geobacter*, *Shewanella*, *Pelobacter*, etc.). Some bacteria, such as *Clostridium*, *Azotobacter*, *Pseudomonas*, *Arcobacter* and *Xantomonas*, show apartment adaptation to survival in MFCs by upregulating the *dlt* complex (CAMP repulsion), which should lead to a decrease in the negative charge of the bacterial surface. Additionally, the *agr* quorum-sensing system participating in biofilm formation was found only in *Clostridium*. Thus, bacteria found on the anode surface of MFCs have the same components of regulatory systems involved in biofilm formation.

### Tuesday 10 July

9:00–11:00, Panorama Hall

#### Proteases in cancer pathogenesis and immunity

##### S.31-1

#### Proteases as mediators of invasiveness and chemoresistance in glioblastoma

J. W. Bartsch

Philipps University Marburg, Marburg, Germany

Whilst Proteases are well-established modulators of tumor cell invasion mainly by degradation of the extracellular matrix, their role in chemoresistance is somewhat surprising. In my talk I will present recent data on the role of MMPs and ADAM proteases in acquiring chemoresistance in glioblastoma cells. To analyse the role of proteases, we are isolating glioblastoma stem cells and.

#### TIMPless systems inform tissue and stem cell homeostasis

R. Khokha

Princess Margaret Cancer Centre, University Health Network, Department of Medical Biophysics, University of Toronto, Toronto, Canada

The four endogenous tissue inhibitors of metalloproteinases (TIMPs) regulate the pericellular proteolysis of a vast range of matrix and cell surface proteins, generating simultaneous effects on tissue architecture and cell signalling. We have recently summarized the hierarchy of the relationships between TIMPs, metalloproteinases, their plethora of substrates, as well as cellular
