ABSTRACT

A method for optimization of the operating of the engineering products in terms of minimizing costs for consumers is proposed. The issues of economic justification of the service life of the machine and the conditions for its replacement with a new product are considered. The principle of exploitation during an economically justified service period is caused by initial cost and current operating cost for obtaining the best value to minimize cost for consumers during the exploitation period of the product. The solution areas for replacement of the products with the same exploitation indicators but with different price ranges were identified. The mathematical method for determining the operating costs of the product is shown. A widely used indicator is the product life cycle (PLC), which includes the steps of creating a product, its operating, and its disposal. Thus, at first, the idea of a new product in the form of a general construction arises, which is embodied in a set of design documentation. In the design process, the first optimal design problem is solved with certain criteria and optimization goals, which should be based on the requirements for the production and operating the product. At the stage of product creation, material means are invested and labor resources are involved, as a result, the product is put into production with a certain production series. In this case, the second optimization problem is solved, which, as a rule, aims to reduce production costs. After the product is sold on the market, the stage of its operating begins. At the same time, the interests of the consumer determine the third optimization problem - minimization of the operating costs and establishing the optimal service life, at the end of which the product is to be disposed of. The formulated optimization problems of the life cycle are ambiguous and closely related. The fact is that in most cases of commodity-market interactions there exists the so-called consumer dictatorship since the consumer determines the feasibility of acquiring a particular product, based on its needs and financial capabilities. However, a producer dictates is also possible, especially in a monopoly economy, when the consumer has no choice in the market. With antitrust laws in force, this is rare. The third optimization problem (operation phase) is the main and determining one, the remaining tasks have a subordinate character.

Keywords: *product performance, price, optimization, costs, service life, exploitation period, cost minimization*

1. INTRODUCTION

Industrial products are divided into wares and products, which is due to their size: wares are measured in pieces, products in tons, cubic meters, liters, etc. In machine building, the ware refers not only to a part, assembly, or a separate machine, but also such aggregated units like ship, spacecraft, etc. A feature of the introduced separation is that the products are subordinate to the product, often being a semi-finished product for the manufacture of the latter. The product is consumed, and the ware is operated, moreover, if the process of consuming the ware is of a one-time nature, then the operation of the product occurs during a certain period determined by its service life [1,6].

2. RESEARCH

A widely used indicator is the product life cycle (PLC), which includes the steps of creating a product, its operating, and its disposal. Thus, at first, the idea of a new product in the form of a general construction arises, which is embodied in a set of design documentation. In the design process, the first optimal design problem is solved with certain criteria and optimization goals, which should be based on the requirements for the production and operating the product. At the stage of product creation, material means are invested and labor resources are involved, as a result, the product is put into production with a certain production series. In this case, the second optimization problem is solved, which, as a rule, aims to reduce the production costs [4,5]. After the product is sold on the market, the stage of its operating begins. At the same time, the interests of the consumer determine the third optimization problem - minimization of the operating costs and establishing the optimal service life, at the end of which the product is to be disposed of. The formulated optimization problems of the life cycle are ambiguous and closely related. The fact is that in most cases of commodity-market interactions there exists the so-called consumer dictatorship since the consumer determines the feasibility of acquiring a particular product, based on its needs and financial capabilities. However, a producer dictates is also possible, especially in a monopoly economy, when the consumer has no choice in the market. With antitrust laws in force, this is rare. The third optimization problem (operation phase) is the main and determining one, the remaining tasks have a subordinate character [3]. Between the consumer and the manufacturer stands, as a rule, a seller who has his margin from the act of sale. His role in the PSC was aptly described by Henry Ford, calling trade the most legitimate way of theft. However, for the consumer, the seller and the manufacturer act in the same person, which determines the price of the product on the market. Therefore, when solving the third optimization problem, they must be considered together. The consumer at the stage of operation of the product, on the one hand, benefits from its use, and on the other hand has operational costs, which are divided into initial and current [1]. Initial costs: to purchase the product; for its installation and commissioning. They play the same role as capital investments at the production stage. Current costs depend on the purpose and design of the product, which may include costs for electricity, fuel, maintenance, spare parts, etc. This is an analogue of the cost of the product in the manufacturing process. Thus, to determine the cost of operating the product, one can use the formula for the annual costs [2].

$$Z = C + EK, \text{ manat/year,} \quad (1)$$

where C is the operating cost of the product, manat/year; K is the initial capital investment on the purchase of the product; E is the standard rate of return on capital investments ($E \approx 0,12 \div 0,15$) [2].

We make two remarks regarding formula (1). Firstly, in economic calculations that do not require optimization of formula (1), the value of E refers to the share of initial capital investments spent on a certain period of operation of the product, as a rule, for a calendar year, so the coefficient E has a size of 1 / year. Secondly, at present, there is a wide range of constantly developed and improved products. Leaving aside design features and variety in the technical characteristics of products, we note the large differences in the terms of their operation and financial means spent on their purchase and routine maintenance [1]. Therefore, for the general case, we assume that the life of the product is measured in conditional units of time (c.u.t), and cash costs in conventional units of value (c.u.v.).

Then, if the service life of the product is not known in advance, formula (1) can be written as

$$Z = C + K/(\tau + 1), \text{ c.u.v./c.u.t.}, \quad (2)$$

where τ is the current operating period.

The denominator of the second term in expression (2) has a unit, so at the initial moment ($\tau = 0$), the operating costs incurred corresponding to the price of the product. Indicator C represents the unit cost of operating the product, which is spent on a conventional unit of time, which in the general case will depend on τ . The value C will be constant only if the product remains unchanged during operation, that is, eternal, which is unrealistic [5]. Let us suppose in the first approximation that the unit cost of operation of the product is directly proportional to the period of operation:

$$Z = C_p \tau, \text{ c.u.c./c.u.t.}, \quad (3)$$

where C_p is the proportionality coefficient in $\text{c.u.c.}/(\text{c.u.t.})^2$. Substituting the expression (3) in formula (2), we obtain:

$$Z = C_p \tau + K/(\tau + 1). \quad (4)$$

Compared to formula (1), expression (4) determines not the absolute, but the relative (current) costs incurred for operating the product. Fig. 1 is shown the dependence of changes in costs (formula (4)) on the current operating time τ at the different K and constant-coefficient $C_p = 200 \text{ c.u.v.}/(\text{c.u.t.})^2$. Figure 1 is seen that the costs incurred are at a minimum at a certain point in the operation of the product. Let us designate by T , the operating period - economically justified period of service (EJPS) [3], that is, the term of the operating of the product, after which the specific costs incurred are of minimum value [1].

Figure 1: Dependences of the change in the specific costs C incurred on the operating period τ of the product at various initial costs K

When further operating of the product is unprofitable it is replaced, as a rule, with a more advanced product.

The value of T_e can be obtained from expression (4), taking the derivative based on time and equating it to zero:

$$T_e = \sqrt{K/C_p}, \text{ c.u.t.} \quad (5)$$

The minimum specific costs for the operating of the product are found from the expression

$$C_{min} = C_p T_e + K/(T_e + 1), \text{ c.u.c./c.u.t.} \quad (6)$$

From expression (5), it follows that the EJPS does not depend on the absolute initial cost K for the purchase of the product and not on the specific current costs of the joint venture for operating, but on their ratio: as larger it is, as long the optimal term of its operation, and vice versa [2]. With a decrease in the price of a product, its EJPS decreases (see Fig. 1, dashed line) i.e. a cheaper product should have a shorter operating period (service life). But more importantly, there is a strict relationship between the price of the product and its EJPS (see formula (5), which occurs as follows: During known C_p and T_e the price to the product should not be administered to shuffling. In such a case, we have the so-called justice price. Consider this issue in more detail. For the main, we take the dependence of the unit cost C spent on the time τ for the operating of the product at the initial cost of the purchase of the product $K = 5,000$ c.u.c. The minimum value of $Z_{min} = 1\,833$ c.u.c. at $T_e = 5$ c.u.v. (see Fig. 1). Consider two options for arbitrary assignment of the price of the product: $K = 7,500$ c.u.c. and $K = 2,500$ c.u.c [3,4]. In the first case (K_1) a profit is observed in favor of the manufacturer and the seller of the product $\Delta C = 417$ c.u.c., in the second case – in favor of the consumer $\Delta C = 416$ c.u.c. i.e. in the first case, there is a dictate of the manufacturer, in the second, the dictate of the consumer. To the price to be fair (optimal), its value is calculated according to the formula

$$K_{op} = C_p, \text{ c.u.v.} \quad (7)$$

In Figure 2 the results of calculations by formula (4) for the various coefficients C_p at the constant product price $K = 10000$ c.u.c. are given. Here the indicator C_{min} corresponds to the optimal service life of the product. With a decrease in the specific current costs, EJPS increases (see Fig. 2, dashed line). Consider the curve for $C_p = 200$ c.u.c./c.u.t.². At $C_{min} = 2\,653$ (c.u.c.) we have $T_e = 7,07$ c.u.t. Let this dependence be the main (real) for some product. Suppose that C_p at the stage of designing the product is determined with an error due to a number of reasons. If the error $Z_c > 0$ (for our example, this is curve for $C_p = 300$ c.u.c./c.u.t.²), then there is an excess of the planned indicator Z , i.e. $Z_c = 710$ c.u.c. In this case, the selected price does not satisfy the interests of the manufacturer of the product and is beneficial to the consumer. When $C_p = 100$ c.u.c./c.u.t.) the manufacturer wins [3]. In this way, the following principle of the optimal operation of any product can be formulated: to minimize consumer costs, the product must be operated for economically reasonable service life, the value of which is determined by the initial cost of its purchase and current operating costs.

Figure following on the next page

Figure 2: Dependences of the change in the specific costs incurred on the operating period τ of the product at various operating costs C_p

On the other hand, if the service life of the product is specified and specific operating costs are set, then to minimize the total costs of the manufacturer and the consumer, the price of the product should have a definite value that does not infringe on the interests of both the consumer and the manufacturer. It should be optimal (fair) both at the stage of manufacture and at the stage of operating, therefore, unlike the establishment of competition based on value, pricing according to the EJPS allows planning to be made [4]. Let us return to important expression (2) for the specific expenditure on the operating of the product and analyze the first term. So far, cases have been considered when the exponent C is directly proportional to the operating period based on the formula (3). Recall that the unit cost of operating of the machine always depends on the operating period. Indeed, if $C = \text{const}$, then the derivative of expression (2) will be equal to zero either for $T_e = \infty$ or for $K = 0$, which is absurd by engineering products. At the same time, $C(\tau)$ is determined by the processes that occur in the product during operating. It is known that the final breakdown of engineering products is due to wear (up to 80%), fatigue breakdowns (up to 15%), and improper operation. As a result of these factors during operation, the technical characteristics of the product deteriorate, i.e. its physical deterioration occurs. At the same time, they increase operating costs, consumption of consumables, electric power, and spare parts; labor costs for product maintenance, and repair. The table shows the formulas for indicators $C(\tau)$ and T_e . For the last two formulas, the exponent T_e is determined numerically by the method of successive approximations [1]. Let us discuss in detail the issue of replacing the old product with a new one to minimize operating costs. On Fig. 3, the dependences of the change in the specific costs incurred Z on the time τ of the operating for the old and new products are presented. Here, the moment of replacement coincides with the EJPS of the old product (T_{e1}). We assume that the old product is completely decommissioned and not sold. In connection with the acquisition of a new product, the unit cost per user increases sharply, which gradually decreases to a minimum: $\tau = T_{e2}$. After some time the specific costs incurred to operate the new product are compared with the costs of the old product if it were to continue to operate. From this moment, the user will benefit from the replacement [2,5].

Z.c.u.v.

Figure 3: Dependences of the change in the specific costs incurred τ on the operating period τ of the old (1) and new (2) products

Type of dependence $C(\tau)$	The formula for $C(\tau)$	The formula for T_i
Linear relationship	$C = C_{it}$	$T_i = \sqrt{K/C_i}$
Power-law relationship	$C = C_{it}^\alpha$	$T_i = (K/(\alpha C_i))^{1/(\alpha+1)}$
Exponent relationship	$C = C_i \exp(\beta\tau)$	$C_i \beta e^{\beta T_i} T_i^2 = K$
Sum of two power-law relationships	$C = C_{it}^\alpha + C_{it}^\beta$	$\alpha C_1 T_i^{\alpha+1} + \beta C_2 T_i^{\beta+1} = K$

For the old product:

$$C = C_{p1}\tau + K_1/(\tau + 1); \quad (8)$$

For the new product:

$$C = C_{p2}(\tau - T_{e1}) + K_2/(\tau - T_{e1} + 1), \quad (9)$$

Where

$$T_{e1} = \sqrt{K_1/C_{p1}}. \quad (10)$$

The time T_2 , we define equaling expressions (8) and (9):

$$C_{p1}\tau + K_1/(\tau + 1) - C_{p2}(\tau - T_{e1}) + K_2/(\tau - T_{e1} + 1) = 0. \quad (11)$$

To take into account all possible options, we see that the new product differs from the old one both in price and in current operating costs:

$$K = nK_1; \quad (12)$$

$$C_{p2} = mC_{p1} \quad (13)$$

Substituting expressions (12) and (13) into formula (11) and transforming the last expression taking into account formula (10), we obtain:

$$(\tau + 1)(\tau - T_{e1} + 1)[\tau - m(\tau - T_{e1})] + T_{e1}^2 + [\tau - T_{e1} + 1 - n(\tau + 1)] = 0. \quad (14)$$

Solving equation (14) for the different values of m , n , and T_{e1} , we determine the time T_2 . Obviously, as closer T_2 to T_{e1} (see Fig. 3), as faster the consumer will benefit from the replacement. On the other hand, for a certain combination of current costs and the price of a new product compared with the old one, an option is possible, in which case the consumer will incur losses during the entire service life of the new machine [3,6]. Consider the case when the new product in its performance and design is no different from the previous one but significantly different in price. This corresponds to the condition:

$$C_{p2} = C_{p1}; K_2 \neq K_1,$$

According to expressions (12) and (13), $m = l$; $n \neq 1$. Then equation (14) takes the form

$$(\tau + 1)(\tau - T_{e1} + 1) + T_{e1}[\tau - T_{e1} + 1 - n(\tau + 1)] = 0. \quad (15)$$

Solving equation (15) we get

$$T_2 = 0,5T_{e1}(n + \sqrt{n^2 + 4}) - 1. \quad (16)$$

On Fig. 4, the results of calculations by formula (16) are presented for the different n . For $n = 1$ the old product will be replaced with an equivalent product $K_2 = K_1$, for $n < 1$ they will purchase a cheaper product, for $n > 1$ - more expensive. The resulting solution field has two boundaries [4].

Figure following on the next page

Figure 4: Dependences of the change in the time T_2 on the indicator T_{e1} for the different values of n

The right boundary corresponds to $T_2 = T_{e1}$ i.e. from the time of replacement until the end of the operating the new product, the user has benefit. This is the case when the price of the new product is equal to the current operating costs of operating the old one at the time of replacement of products, i.e. $K_2 = C_{1min}$, where C_{1min} is determined by expression (6). The left boundary of the solution field is obtained from the condition that the consumer will receive the benefit only at the end of the operation of the new product, i.e.

$$T_2 = T_{e1} + T_{e2},$$

where $T_{e2} = T_{e1}\sqrt{n}$. Then

$$T_2 = T_{e1}(1 + \sqrt{n}). \quad (17)$$

Equating expressions (16) and (17) we obtain

$$T_{e1} = [0,5(n + \sqrt{n^2 + 4}) - \sqrt{n} - 1]^{-1} \quad (18)$$

Substituting the current value $n = K_2/K_1$ into formulas (17) and (18) we obtain the coordinates of the left boundary. Thus, the solution field has been defined for the replacement of products with the same performance indicators, but different prices. Obviously, as the closer the time when the products are replaced to the right boundary, as faster the consumer will begin to benefit from the operating of the new product. Consider the case when the price of a new product is equal to the price of an old one, but performance indicators have changed.

This case meets the conditions:

$$K_2 = K_1 C_{p2} \neq C_{p1}; \text{ or } n = 1, m.$$

Then from formula (14), we obtain:

$$(\tau + 1)(\tau - T_{e1} + 1)[\tau - m(\tau - T_{e1})] - = 0. \quad (19)$$

The solution of equation (19) for different values of m gives a field of optimal values with boundaries corresponding to T_{e1} and T_2 . The field of optimal solutions is much narrower, i.e. a change in operational indicators has a lesser effect on the possible economic gain of the consumer [5]. In addition to the current benefits of the replacement, the consumer can also receive absolute benefits, to determine the size of which one should compare the area under the curves 1 and 2 in Fig. 3. Area F_1 from the start of operation of the new product (T_{e1}) to point T_c , characterizes the total costs of the consumer for operating the new machine, area F_2 - the virtual costs of operating the old machine for the same period. Taking the integrals in the range $T_{e1} \div T_c$ from expressions (8) and (9), we obtain the desired areas:

$$F_1 = 0,5C_{p1}(T_c^2 - T_{e1}^2) + K_1 \ln \left| \frac{T_c + 1}{T_{e1} + 1} \right|; \quad (20)$$

$$F_2 = 0,5C_{p2}(T_c^2 - T_{e1}^2) - C_{\Pi 2} T_{e1}(T_c - T_{e1}) + K_2 \ln |T_c - T_{e1} + 1|. \quad (21)$$

If $F_1 = F_2$, then T_c will determine the time moment, starting from which the consumer will receive the absolute benefit of replacing the old product with a new one:

$$0,5C_{p2}(T_c^2 - T_{e1}^2) - C_{p2} T_{e1}(T_c - T_{e1}) + K_1 \ln \left| \frac{T_c + 1}{T_{e1} + 1} \right| - K_2 \ln |T_c - T_{e1} + 1| = 0. \quad (22)$$

Taking into account expressions (12) and (13) and introducing the dimensionless quantity $l = T_c/T_{e1}$ expression (22) takes the form:

$$0,5(1 - m)(l^2 - 1) + m(l - 1) + \ln \left| \frac{l T_{e1} + 1}{(T_{e1} + 1)(l T_{e1} - T_{e1} + 1)^n} \right| = 0. \quad (23)$$

When replacing the old machine with an equivalent one with the same performance indicators, i.e., under the conditions $m = n = 1$ expression (23) takes the form:

$$\frac{l T_{e1} + 1}{(T_{e1} + 1)(l T_{e1} - T_{e1} + 1)} = e^{1 - l}. \quad (24)$$

The range of values of l for which the consumer can receive the unconditional economic benefit from replacing products is $1 < l < 2$. For $l = 1$ expression (23) and (2) are satisfied identically. For $l = 2$ expressions (24) gives the upper limit $T_{e1} = 3,88$, and from expression (23) we obtain the formula for the upper limit T_{e1} upper which the consumer will never benefit from the new product:

$$1,5 - 0,5m + \ln \left| \frac{2T_{e1} + 1}{(T_{e1} + 1)^{n+1}} \right| = 0.$$

3. CONCLUSION

Thus, the proposed method of optimizing the operation of the machine allows us not only to determine the optimal service life but also to develop an effective strategy for replacing the old machine with a new product with a minimal financial loss. The results obtained can be the source data for the optimization of the design and manufacture of engineering products [6].

ABSTRACT

Nowadays, higher education is considered as a sphere of public policy with its economic and public dimensions rather than being merely an education topic. The role of non-state participants in the higher education field is more and more enlarging within the new policy contexts exceeding national borderlines. Plenty of participants at diverse levels, from transnational organizations to students as persons are included in the policy procedure. That is why the field of higher education policy represents a complex process where policy-making processes are intertwined with different participants and turbid borders. Quality assurance is one of the policy areas that best symbolize this complication with many stakeholders on the global, public and institutional grade. Globalization and international rivalry carry the quality issue to the position of prominence in many high education systems. For the Quality assurance system to proceed regularly and without interruption, higher education institutions are included in both internal and external evaluation processes. Education Quality Assurance Agency, the institution in charge of the external evaluation of the universities in Azerbaijan, plays a guiding role by providing feedback to the institutions which have completed the process. In the Azerbaijan higher education system, as in other countries, quality assurance has become an essential agenda item in recent years. The new higher education system approach of the Azerbaijan Republic Ministry of Education has been defined as mission differentiation and diversity, flexibility, and institutional autonomy which require a significant transformation in the current system. In this study, quality assurance in Azerbaijan higher education is explored following the conceptual framework of the policy process.

Keywords: *Azerbaijan higher education, Education Quality Assurance Agency, quality assurance, university*

1. INTRODUCTION

In recent years, the attitude towards the development of methodological foundations of issues related to quality assurance in the process of teaching and learning in the higher education system, in general, has become more relevant, and the effectiveness of both basic and applied research in this field has increased significantly. Quality is generally a philosophical category that expresses the certainty of any process and is an objective and general characteristic that manifests itself in the totality of the properties of that process. In the field of education, quality is accepted as the main feature that determines the level of learners according to predetermined norms (standards) according to the results of the teaching-learning process and the state of the education system in general. The results of the training are not only the level of knowledge and skills acquired by the student who has completed a certain stage of education, but also personal qualities that reflect his/her attitude towards the world and the development of society. The quality of higher education is an essential feature of the education system, which determines the level of compliance of actual learning outcomes with the requirements of normative documents and expected results. Quality in higher education should be considered as a key category that determines the level of compliance of knowledge, abilities, and skills acquired with the relevant state standards and the needs of the society and serves development. Higher education policy could be regarded as a good example in terms of both complexity theory and policy transfer.

On the other hand, the role of universities, which have traditionally been the implementers of higher education policies, is being transformed. Universities participate in the formation of higher education policies as both decision-makers and practitioners. University is one of the few institutions that have kept alive until now from the Middle Ages. In the XXI century, universities once more reconstitute their identifications and redefine their assignment with the paradigm alteration in higher education. The United Nations has declared the 21st century a "century of education" because of the undeniable role of higher education in the formation of highly intelligent human capital and the building of a strong economy that creates the basis for sustainable development. Higher education is considered as a sphere of public policy with its economic and public dimensions rather than being merely an education topic. The role of non-state participants in the higher education field is more and more enlarging within the new policy contexts exceeding national borderlines. The progress of society has always depended on the development of education and the correct assessment of its importance, and the current demand has accelerated the development of education. Scientific and technological advances have posed more complex challenges to the education system. Students, governments, national organizations, professional organizations, financiers, employers, different social sectors emerge as the actors of quality, stakeholder participation is highlighted and the role of stakeholders in the management of universities is increasing. Quality Assurance is one of the policy areas that best symbolize this complication with many stakeholders on the global, public and institutional grade. Thus, quality assurance in higher education is regarded as a multi-level and multi-actor structure. This transformation is manifested in Azerbaijan higher education, as well. In the current state of Azerbaijan higher education, qualified growth, and internationalization are considered as the most important agenda items. In this context, a new road map is drawn which focuses on diversity, flexibility, and quality assurance. To this end, a conceptual framework is presented in the first place and then the quality policy in Azerbaijan higher education is examined within the framework of the process approach. Azerbaijan's participation in the Bologna Process, the implementation of accreditation in higher education institutions, and the dissemination of the implementation of new democratic quality management models in the education system form the basis of successful quality assurance in higher education.

2. QUALITY ASSURANCE IN HIGHER EDUCATION

Quality assurance (QA) is one of the most intense fields of policy transfer among the Bologna reforms since it is considered as the basis for the creation of The European Higher Education Area (EHEA). It is one of the creator columns of the Bologna Process and contemplates the promotion of European cooperation in the field of QA in order to evolve comparable criteria and methodologies. The EHEA is an unprecedented global partnership in higher education, the consequence of the diplomatic volition of 49 countries with diverse academic, cultural and political traditions. The path to integration into the European Higher Education Area is through quality assurance. The British, French, and American models of quality assurance have attracted the most attention in the world educational practice. While the English model mainly provides for internal academic performance evaluation, the French model provides non-university evaluation. The American model includes the evaluation of educational institutions and programs by independent accreditation bodies. Along with all these models, we think that the creation of a quality management system in education is the application of new management technologies. The main focus is on the application of a quality management system as a technological process, and the goal is to create a mechanism that provides quality education in the main business processes of the university. Quality assurance is applied through common institutional settings and norms operating throughout the EHEA. On the other hand, European Association for Quality Assurance in Higher Education (ENQA) is a membership association that represents its associates at the European level and internationally.

ENQA members are quality assurance organizations from the European Higher Education Area (EHEA) that operate in the area of higher education. According to the information published on its official website, ENQA will pay special attention to the following fields of work in 2021, in line with its 2021-2025 strategic plan: [4]

- 1) Development of quality assurance within the EHEA/Bologna Process;
- 2) Analysis of quality assurance approaches in Europe;
- 3) Professionalisation of QA and staff at QA agencies;
- 4) Quality assurance capacity building beyond Europe.

The Standards and Guidelines for Quality Assurance in the European Higher Education Area (ESG) were developed in 2005 as a key component of Quality Assurance. Revised by ministers of education from different countries in 2015, ESG has been accepted as a methodological norm for Quality Assurance in these countries. Overall, according to the ESG, the cornerstone of quality assurance in higher education is internal evaluation. External evaluation is considered a condition for the reliability of internal evaluation results, and external evaluators are responsible for the quality of their activities. Therefore, ESG sets general principles for both internal and external quality assurance practices to be applied across the EHEA. At the European level, the adoption of the ESG was seen as a significant achievement of the Bologna Process as a sign of unanimity between key stakeholders.

2.1. Internal quality assurance IQA

IQA is any procedure to confirm or evolve the quality of higher education by the university itself. The European Higher Education Area Quality Assurance Standards and Guidelines state that “Institutions should have a policy for quality assurance that is made public and forms part of their strategic management. Internal stakeholders should develop and implement this policy through appropriate structures and processes while involving external stakeholders” [5]. To execute their liability higher education institutions must have their internal quality assurance system operating well. This structure specifies how and at what time terms HEI self-analysis is to be performed, which shows the superiorities and disadvantages of the activities that are being carried out, predicts the methods to accomplish deficiencies. IQA discusses how the samples of top practice utensils and compares the successes across other close organizations in the country and out. A higher school should be made ready to demonstrate for detached assessors the efficiency of quality assurance performances. These goals of internal quality assurance are implemented through the internal quality assurance system to be applied at the university:

- To supply students, employers, and other stakeholders with confident and comprehensive data about the learning quality, academic accomplishments, management of the higher school;
- To provide that the fields of performance the quality of which is unsatisfactory are specified, and urgent preventives are undertaken to develop the quality;
- To aid jointly with different means in intensifying the high quality of services and unique norms;
- To warrant the accountability of the university for the allocated governmental financial (monetary) sources.

IQA system must surround all the actors (educators, researchers, executives, students, public partners, graduates, and etc.) of the study and investigation procedure actively. Higher education institutions make a serious self-evaluation with the participation of their staff, teachers, scientists, administrators, and students and take a critical look at all areas of their activities.

The university then tries to identify its strengths and weaknesses, main goals, threats, compare itself with its main competitors, set a plan to overcome shortcomings and development paths.

2.2. External quality assurance EQA

EQA is any procedure to confirm or evolve the quality of higher education from outside the university. The European Higher Education Area Quality Assurance Standards and Guidelines state that “EQA should be defined and designed specifically to ensure its fitness to achieve the aims and objectives set for it while taking into account relevant regulations. Stakeholders should be involved in its design and continuous improvement” [5]. The intent of EQA is to verify the reliability and influence of the process of an IQA system without duplicating and misrepresenting them. The external quality assessment occurs through self-analysis, specialist group creation, the formulation of evaluation outcomes, and the notification of assessment consequences. Self-analysis is not only the initial of external assessment however it is a constituent component of the IQA system. It is very significant that the students take an active part in the process of self-analysis. Generally, self-analysis has a drawback in that it is prepared for external assessors (experts), not for themselves, internal utilization. Normally an expert group occurs three to six experts. While evaluating the main field of activity, subgroups of 3-6 experts can be formed. The content of the evaluation results depends on the object being evaluated, namely the educational programs, the level of scientific research, or the performance of the university. Evaluation consequences finish with generalized program assessment declarations, proposals for a university, and recommendations belong to program accreditation. The evaluation results are announced avowedly, are placed on the website, interpreted in press meetings, and discussed in the media. The official registration platform of external quality assurance agencies is The European Quality Assurance Register for Higher Education (EQAR) which lists these agencies in accordance with a prevalent framework agreed upon to provide the quality of higher education organizations and educational programs. In 2018, EQAR commenced the Database External Quality Assurance Results (DEQAR) to provide entrance to reports and decisions of agencies registered on the EQAR platform. DEQAR is a database of external quality assurance consequences for the activities carried out by these agencies. The inclusion of higher education institutions in internal and external assessment procedures means a continuous and uninterrupted quality assurance system.

2.3. Quality assurance agencies QAA

Quality assurance and accreditation in HE is determined as systematical administration and evaluation of processes adopted by HE organizations or systems to monitor achievement and to maintain accomplishment of quality development. Accreditation mentions a procedure of evaluation and review that enables higher education institutions to be identified or confirmed as meeting convenient standards. The purpose of accreditation is to provide that education ensured by higher education organizations meets the relevant quality standards. If Higher Education Institutions demand Quality Assurance Agency's assessment they meet the agency's criteria firstly then are accredited by that agency. Quality Assurance Agencies at the national level focus on the endeavors of internationalizing education through evaluating the solemnity of aim, the scope of the efforts taken so far at the policy and execution level. The Higher Education Accreditation Council (CHEA) is an association of colleges and universities in the United States that acknowledges institutional and program accreditation institutions. According to CHEA's official website, “CHEA is the only national organization focused exclusively on higher education accreditation and quality assurance” [6]. The Quality Assurance Agency for Higher Education is an independent organization that verifies standards and quality in UK higher education.

Missions of the Agency are “to safeguard standards and improve the quality of UK higher education wherever it is delivered around the world; to check that students working towards a UK qualification get the higher education they are entitled to expect.” [9].

Agency has four strategic aims that as follows:

- deal with the needs of students;
- maintain standards;
- control developments;
- evolve comprehension of the community regarding UK higher education.

Agency examines how HEI and alternative providers of UK higher education safeguard their academic standards and quality. Agency also ensures advice to the Privy Council of the United Kingdom, on institutions' demands for degree-awarding abilities and the right to be called a university. According to Standards and Guidelines for Quality Assurance in the European Higher Education Area (ESG) QAA should have clear and explicit goals and objectives that are part of its publicly available mission statement. These should translate into the daily work of the agency. QAA should ensure the involvement of stakeholders in their governance and work [5].

3. QUALITY ASSURANCE IN AZERBAIJAN HIGHER EDUCATION

Successful socio-economic and political achievements, national and multicultural values give confidence that the power of the Azerbaijan Republic, which is the intersection point of the East and the West, will increase even more. The Azerbaijani state has chosen to develop a socially-oriented market economy to further increase the welfare of the country's population. Although the oil sector is one of the foundations of socio-economic development in Azerbaijan, the non-oil sector is becoming the center of development. In the Azerbaijan higher education system, as in other countries, quality assurance has become an essential agenda item in recent years. The new higher education system approach of the Azerbaijan Republic Ministry of Education has been defined as mission differentiation and diversity, flexibility, and institutional autonomy which require a significant transformation in the current system. Recently, Azerbaijan has taken strategic steps to integrate into the European Higher Education Area. These include extensive interaction with the European Union, accession to the Bologna Agreement in spring 2005, and other steps. Massification and internationalization are the two sides of the coin that create the demanding agenda for quality assurance in Azerbaijan high education. The higher education system in Azerbaijan testified a noteworthy massification tendency in the last twenty years, in terms of the number of students. The priority of each country is to create a highly competitive human capital in order to be ready for the increasing competition in the world in the coming years. The main condition for this is fertile conditions that encourage modern education and innovation. The training of graduates and specialists who meet modern requirements at various levels in higher education institutions operating in the structure of the Azerbaijani education system, it is considered expedient to use the existing opportunities to effectively organize the educational process and solve problems related to quality assurance.

3.1. Quality assurance in accordance with the requirements of the XXI century

The long-term development of Azerbaijan's economy relies on modern and strong education to keep up with the growing competition in the world. It is through education that the share of human capital in national wealth is constantly increasing, and in a strategic period, "lifelong learning" based on the harmonious development of competencies, social skills, and abilities is of particular importance.

Quality assurance in the higher education system of the Republic of Azerbaijan in accordance with the requirements of the XXI century is regulated as follows:

- Modernization of the education system is being continued to strengthen higher education, which is the guarantor of the development of society, and integrative teaching practices are being developed by deepening content reforms;
- The education system focuses on instilling digital skills from school age, as well as instilling new skills, specialties, and professions that are fundamentally different from today to prepare the young generation for the future of digital technology;
- People's access to high-quality education is expanded, experts in accordance with international certificates are trained as part of the measures to develop the vocational education system in line with the requirements of the labor market;
- Essential measures are taken to ensure the competitiveness of higher education institutions at the international level in order to create highly professional human capital through strong education;
- The Ministry of Education of the Republic of Azerbaijan, regardless of the form of ownership and commitment, ensures that the state document on education given to graduates by educational institutions is received in the form of an electronic document from the "Central Education Information System".

3.2. The Education Quality Assurance Agency

There are at least three candidates for quality measurement in higher education - the institution that has the authority to make decisions about quality, the government and accreditation agencies, as well as international and regional accreditation bodies. In order to ensure the sustainable development of the education system in the Republic of Azerbaijan in accordance with modern conditions, The Education Quality Assurance Agency has been established under the status of a public legal entity within the Ministry of Education of the Republic of Azerbaijan. Education Quality Assurance Agency, the institution in charge of the external evaluation of the universities in Azerbaijan, plays a guiding role by providing feedback to the institutions which have completed the process. The purpose of the agency's activity is to organize an effective quality assurance system in the Republic of Azerbaijan, to create a world-leading education system in terms of quality results and scope, to support the access of knowledgeable competitive professionals to the labor market, skills, abilities, and experience.

The agency's activities are as follows:

- to carry out the accreditation of educational institutions;
- to recognize the qualifications of foreign countries related to higher education;
- preparing proposals and organizing training for the implementation of the accreditation of educational institutions;
- organizing consultancy and methodological support services regarding the establishment and development of internal quality assurance systems in educational institutions;
- to promote the sustainable development of the education system and state standards in this field and to increase the prestige and education quality of educational institutions;
- Participating in giving opinions for the licensing of educational activities;
- To examine and apply advanced international experiences in the relevant field.

Accreditation assessment is carried out by a Commission of experts established by the Agency. On the basis of the Final Report prepared as a result of the evaluation, the Accreditation Board of the Ministry of Education decides the accreditation of educational institutions for the next five years. Accreditation certificates are issued to the educational institution according to the relevant decision.

4. CONCLUSION AND SUGGESTIONS

Consequently, in my opinion, when talking about quality assurance in higher education, it is necessary to highlight four main factors:

- 1) amount of investment in higher education
- 2) the competence of the teaching staff
- 3) the level of applicants and graduates
- 4) content of the curriculum

Undoubtedly, generalized recommendations on these four elements will play an essential role in establishing a successful quality assurance system in higher education. While establishing quality assurance systems in education systems, higher education institutions must map out a route in consideration of the PDCA (Plan. Do. Check. Act) Cycle, and update their education policies and processes, academic programs, and teaching and assessing methods. At the same time, program designs must be continuously monitored and updated, programs must be aligned with student-centered teaching and learning, and students must be equipped with the required knowledge and skills. Students are required to acquire core competencies both in their fields of study and other fields with applied education models that focus on students and learning. Also, the advising system must be revised and improved while the success of students and learning outcomes must be continuously monitored. To that end, student satisfaction surveys, and evaluations of peers, instructors, graduates, and employers must be conducted. Other major requirements include enabling dynamism in the academic staff of higher education institutions, providing the physical conditions necessary for learning, increasing the quality and quantity of Research and Development outputs, and establishing digitalized agile management systems, whereas the most crucial step is to ensure continuous enhancement by closely monitoring the performances displayed throughout all these processes. In curriculum design, the primary considerations must be equipping students with a set of skills such as solving complex problems, critical thinking, creativity, and agile management. In all the programs they offer, higher education institutions must make sure that their students acquire core competencies in science, technology, engineering, and mathematics alongside the knowledge required for their field of study. Furthermore, new technological advancements and new media tools must be integrated into high education systems, while conventional teaching and learning methods must be replaced with digitalized field-specific learning methods in classes. Our primary goal is to establish a system that will guarantee that higher education institutions produce more qualified and versatile graduates. The process of fostering a quality culture in higher education institutions led to considerable changes. The main criteria needed for change include clarity, simplicity, focus, and accountability. Other important factors such as active student participation in the processes and formation of graduate tracking systems were designated as the main points open to improvement in higher education institutions. The most significant feature of the quality assurance system in higher education institutions is guaranteeing that the students enrolled in study programs could acquire the targeted competencies. So, higher education institutions must promote and disseminate program accreditation processes, which constitute a substantial instrument in education systems. It is also required to ensure active student participation in the processes and create a graduate tracking system. Creating integrated information systems is essential for the establishment of quality assurance systems in higher education. The university management system must encompass all the relevant processes and stakeholders and be designed in a way to enable data exchange. The management system must also be designed in line with the notion of accreditation and quality that represents the institutional identity, expressing that universities will be supported on the subject. In my opinion students, organizations, and government must be determined as the most effective stakeholders in higher education.

Recommendation on the participation of stakeholders:

- determine the profile and role of various stakeholders;
- influential methods for their involvement in external quality assurance activities;
- particular teaching outlines, according to the profile and role of various categories of stakeholders.

Quality management systems and marketing activities should be established at the level of modern requirements and world experience should be taken into account in order to obtain sufficient and reliable information about training qualified experts in higher education institutions.

ABSTRACT

When using financial and non-financial indicators to evaluate the performance of commercial organizations, it is easy to analyze the share of net profit in sales. As a result, it is possible to assess the return on capital or observe the positive dynamics of net profit during the year. While many internal audit functions provide consistent value for organizations, the process of measuring and transmitting that value is not as one-size-fits-all. Thus, there is a need to ensure the perception of both reality and the consistent value provided. In this case, the internal audit should focus on its mission, as well as how they serve and communicate the results to various stakeholders. It should help identify details that reflect the relevant and consistent value of the internal audit, taking into account the needs of stakeholders. Emphasis is placed on strong internal audit policies and procedures, the capabilities of internal audit staff, and measures to address the company's key risks. In this case, a balanced approach is recommended where updates and related statistics are conducted and reported. If this is done, the value of the internal audit will undoubtedly be measured more accurately. Key Performance Indicators (KPIs) set pre-established long-term goals. These are the financial and non-financial indicators that organizations use to assess and strengthen their success. It is very important to choose the right indicators to be used for measurement. To measure the effectiveness and efficiency of such work, it is necessary to measure the level of performance of the system through the KPI. In a competitive global environment, process organization requires customer orientation and the necessary flexibility. This article provides an example of the organization of the process, the application of key performance indicators, its role in internal audit.

Keywords: *KPI, internal audit, balanced scorecard, performance, Commercial Enterprise*

1. INTRODUCTION

The new working environment, which is the most important source of information, introduces new approaches to the use of traditional financial and accounting indicators to assess the performance of organizations. One of the newest approaches is to measure the performance of organizations by KPIs. KPIs are financial and non-financial indicators used by organizations to measure how well they have achieved their long-term goals. It is very important to identify and standardize all processes within the organization in order to create an effective system for measuring efficiency. The process approach is based on strategic management, Balanced Scorecard (BSC), technical standardization and quality management system. In many cases, the internal audit function is required to do more work with less staff and use technology in all its activities. Most Auditors are unable to determine the number of scheduled and completed audits on a regular basis, the number of identified high risk issues, the actual audit hours compared to budget hours, and the actual costs compared to budget expenditures, and whether these measures exist.

To do this, first of all, the true meaning of the audit must be understood, after which the preparation of internal instructions, defining everyone's obligations and goals, and defining key performance indicators. Internal audit implements its principle under the motto "Success is very close if everyone performs his duties properly." As many studies in recent years have shown, audit committees and senior management are struggling to consistently add "value" to their internal audit functions. It is important to understand the true mission of the internal audit and to adapt the results of the internal audit activity to that mission. In this regard, it is important to define the role of "assurance" and advice in internal audit. In today's environment, the guarantee function of internal audit is still important and will always continue.

2. APPLICATION OF KPI IN COMMERCIAL ENTERPRISES

As mentioned earlier, the process is the constitution of the organization. Such an expression can also be found in the literature: "Enterprises are not the center for the delivery of products or services, but mainly because they consist of processes, the work process is the basis of the organization's activities. In other words, the business management of some organizations means process management "(Skinjar et al., 2007; Stefanovic et al., 2010). In the twentieth century, Walter A. Shewharts said that a high-level product could only be achieved by process management. It is very important. Traditional organizations are very strict about changes in working conditions. The process approach allows organizations to focus on the main task of creating values that will satisfy their customers. Advantages of organizations with a process approach (Heleta, 1998):

- 1) Putting clients' opinions first in the work of internal audits,
- 2) Establishment of interactive management,
- 3) Identify the process manager,
- 4) Logical implementation of activities,
- 5) Employees only do what they have to do,
- 6) Organization of internal communication suppliers.

It is possible to control the efficiency and effectiveness of work through KPIs. In such an organization, all processes are defined and standardized. The hierarchical level of the identified processes is defined as follows:

- 1) The customer-oriented process plays an important role in building the perfect situation.
- 2) Elements of operational activities are defined as people, objects and internal procedures.
- 3) The after-sales activity management and performance measurement system pays due attention to the operation management.

The process described earlier is a necessary basis for identifying an organization with a KPI. Such standard activities allow system performance to be measured as needed. The importance of measurement is great. Sustainability measurement is one of the most important management principles for the continuous improvement of organizational performance (Besic & Djordjevic, 2007). There is a proverb about this in the literature:

"If you want to improve something, you have to measure it" (Radovic & Karapandzic, 2005). An effective organization knows that they cannot control this part if they do not have enough information about the process, product, or service. Commercial organizations have many values measured in the business process. Lord Kelvin said, "When you can measure something you are talking about, you will know something about it."

In order to stay competitive, the organization must be managed by employees, processes, planned activities, time cuts, supplier relationships, and other parts of the business.

An effective performance measurement system is used to understand, adjust, and improve performance in all departments of the organization (Summers, 2005). Measuring the performance of an organization means expressing some results qualitatively and quantitatively with selected indicators. Performance measurement allows effective organizations to quantify their success. Selecting the appropriate indicators to be used to measure and evaluate performance is a very important activity. From all the information that can be obtained, you need to choose a criterion that best represents the whole case. In addition to the control function indicators, there are two other functions:

- Development and guidance function - because it provides a basis for the formation and implementation of the organization's strategy;
- Motivation function - motivates management to achieve goals and all stakeholders to achieve these goals at a higher level (Pesalj, 2006; Stamatović & Zakić, 2010).

In all organizations, every employee should know that there are activities that are very important for the management team. At the same time, key performance indicators emerge that reflect the success of some business concepts. Key performance indicators (KPIs) are the financial and non-financial indicators used by an organization to confirm how successful it has been in achieving its long-term goals. KPIs are fixed indicators that make more sense when comparing data. They help to divert emotions in the work process and focus on what is truly meaningful and profitable. In commercial organizations, one of the most effective approaches in defining KPIs is to divide the whole work into relevant sections that represent different parts. For example, we can calculate the indicators used to measure performance in the sales department of a car dealership as follows:

$$\text{Gross profit from the sale of the vehicle} = (\text{Invoice price of the vehicle} - \text{the cost of the vehicle})$$

Gross profit is defined as the portion of sales revenue that exceeds the cost of those sales.

$$\text{Gross profit (\%)} = \frac{(\text{Sale price of vehicles} - \text{cost of vehicles})}{(\text{Sale price of vehicles})} \times 100$$

The effects of the current economic crisis have the greatest impact on car dealers. They often struggle to keep their business with a positive overall profit. A slowdown in the market can also affect sales with losses. The salesperson's annual sales (Annual unit sales / Number of salespeople) consists of the annual sales of the KPI and measures the average number of units sold by the salesperson in 1 year. These statistics are used to accurately assess the performance of the average sales team and the strengths and weaknesses of each team member. The total standard for a car dealer is 150 units per year for a newcomer, and a well-established dealer must sell 200 units per year. New car sales decline during the crisis. To get a good result, it is important to maintain the total profit in transport and sales of new cars. In addition, vehicle turnover is very important in the KPI, as it provides easy monitoring of stocks. The turnover of vehicles is calculated as follows:

$$\text{Vehicle turnover} = \frac{(\text{Annual unit sales})}{(\text{Units in stock})}$$

Vehicle turnover provides information on the number of vehicle turnover per year. If vehicle turnover is low, management should invest in sales specialist training and marketing advertising. Comparative data on the plan and sales of new cars are prepared within a year. This efficiency is not so easy to achieve.

However, it is important to make an effort to manage this criterion. If you have trouble getting a good result, it is a good idea to suggest a few countermeasures:

- 1) First of all, it is very important for sellers to have an accurate measurement system for this indicator,
- 2) management should organize an assessment of the level of technical skills and, if not appropriate, organize technical trainings;
- 3) Management should monitor the condition of equipment and tools to increase total capital and offer new equipment that can increase efficiency;
- 4) management should consider the application of a bonus system in order to reward the personal achievements of technical staff. This award must first identify productive employees.

The following indicator shows how productive productive workers are during working hours:

$$\text{Labor productivity} = \frac{(\text{actual working hours})}{(\text{budgeted working hours})} * 100\%$$

The criterion for this indicator is from 85% to 95%. If this indicator is low, then management should suggest countermeasures:

- 1) raising the professional level of hired employees;
- 2) introduction of a bonus system for employees.

Total Productivity OP (%)

$$\text{Labor efficiency} = \frac{(\text{standard working hours})}{(\text{actual hours worked})} * 100\%$$

This indicator is also known as productivity or performance efficiency. Demonstrates the ability to complete work within the schedule of goods allocated to technicians. The norm for this KPI is between 110 and 125%. In Europe, the figure is 104% on average.

3. THE ROLE OF KEY PERFORMANCE INDICATORS IN INTERNAL AUDIT

The first step to achieving significant dimensions is to gain an idea of the true "mission" of internal audit. This mission is defined in the International Standard as follows:

"Internal audit improves the organization's performance by adding value to the organization as an independent, objective assurance and consulting activity. At the same time, it helps bring a systematic, systematic approach to assessing and improving the effectiveness of the organization's risk management, control and management processes."

Internal audit adds value to the organization by assessing and making recommendations:

- Efficiency of operation and quality
- Trade risks
- Work and / or process controls
- Process and work efficiency
- Opportunities to reduce costs and expenses
- Effective corporate governance

Once the true mission of internal audit is understood, it is important to know the functions of internal audit in order to adapt its performance to that mission.

Some functions of internal audit can be noted as follows:

- Internal audit does not like surprises, so it reduces the use of unfounded information;
- Internal audit sets accountability within the organization;
- Internal audit should reduce the share of external audit and provide assurance;
- The main value provided by the internal audit is to ensure that the issues identified by them and the management take appropriate measures to address these issues.
- Internal audit not only guarantees inspections, but also helps and contributes to the achievement of the organization's goal and overall strategy.
- The internal audit team must consist of successful internal auditors. Successful internal auditors are people who perform their functions properly, have audit skills, are business partners with management, and identify and address risks.

Although there are different directions and appropriate priorities for different parties, the overall measure for the value of an internal audit is as follows:

- Strong internal audit policies and procedures governing internal audit activities
- Skills and attitudes of internal audit staff
- Evidence that the internal auditor's attention and audit results are consistent with the entity's key risks.

It is important to complete written standards policies and procedures, including internal quality control procedures and an External Quality Assessment Review, in order to have a true “Balanced Evaluation Card” that performs internal audit activities covering these areas and is used to transmit results. One point that many auditors, senior management, and the audit committee consider is the number of audit issues resolved before the final report. When this is done, the true partnership of internal audit with management is proven. There is a growing focus on providing methods and tools that the organization can reuse to move forward independently. Generally, in these cases, internal audit risks are identified using automated tools and / or a developed program. Some other key dimensions include:

- Reports issued on the 20th day of field work (eg 45 days)
- Actual annual audit plan hours compared to budget hours
- Number of completed audits and scheduled inspections
- Consistent use of inquiries at the end of each audit to obtain the opinion of the management of the audit organization and to report

In addition, it is the development of relationships between company employees and company management that adds value to organizations. This increases the internal audit staff's understanding of the business and their ability to add value. Management's measurement of the official opinion on each auditor is scheduled annually. An excellent measure of the value of internal audit is the number of employees transferred from internal audit to other positions in the organization. The fact that internal audit serves as a talent incubator for the organization as a whole is a consistent positive for many organizations. It also gains speed. One of the key outcomes that contributes to this process is internal audit, risk management, compliance, formal harmonization of external audit risks and coverage. Some companies complete this with an official document that is updated regularly. This document details the organizational risks, as well as the processes involved to eliminate the risks. Linking each internal audit report to the organization's key risk areas is a clear indication of the value received. This connection may include an emphasis on the risk effect of the audit issue and the audit result as a whole. This includes identifying the risks to achieving the organization's strategic goals.

Because internal audit is accustomed to understanding an organization's risks, it is important to look directly at the organization's risk management process or information technology risks (cybersecurity, etc.).

4. CONCLUSION

Continuous measurement of organizational performance through key performance indicators is a new concept used in companies today. Indicators are mainly used to measure how successful KPIs are. One of the prerequisites for an effective and efficient system for measuring performance is the interconnected organization of previously standardized processes. This process is shown in relation to the same KPI used in car dealers. Graphic examples of measured KPIs in car sales are also shown. The figures show the simplicity of the measurements and the explanation of the results, which is the most important advantage of using such indicators. As can be seen from these formulas, the measured values are always compared with some planned value. It is the direct management that manages to accomplish the task under consideration. In addition, the analysis conducted over several years shows that the organization is constantly improving its work. As a result, the importance of measuring KPI performance can be summarized as follows:

“I say KPIs are where performance is in the past, where it is now, and perhaps more useful in the future” (Smith, 2001).

ABSTRACT

The article explores the landscapes of summer and winter pasture of high livestock importance, including the areas suitable for forage supply in the Greater Caucasus territory. Though among cultural landscapes, the pasture and hayfield complexes present in this territory have been formed much earlier compared to others, the natural structure of it has been retained well in contrast to other transformed landscapes. Unfortunately, the pasture and hayfield landscapes that were subject to long-term agricultural use have been transformed due to related severe anthropogenic impacts. The essence of this study is the development of livestock areas in the Greater Caucasus not only based on seasonal grazing but also through creating loop livestock farms. Thus, the cultivation of forages in compliance with an effective agro technical approach may ensure the preservation of the landscapes' ecological properties in the study area. The establishment of closed farms in the field of research is also economically efficient and promising. In addition to the ecological changes in the landscape in nomadic livestock, animals' productivity in the direction of meat and dairy products is also low. Thus, closed farming is a more efficient area for increasing the fodder base and generating more economic income. Certainly, in the development of closed farms, our country can benefit from European countries' experience that has had their say in this area for many years. One of the most critical factors in establishing such farms is the training of qualified specialists, and our country has already taken significant steps in this direction. The article also compares the work done to increase the fodder base over the years and shows agricultural crops' sown areas.

Keywords: *Greater Caucasus, forage supply, natural forage base, mountain landscapes, livestock, pasture and hayfield complexes*

1. INTRODUCTION

To achieve a high level of development of livestock, first its forage base must be strengthened. The seasonal forage base of livestock is summer and winter pastures, while the forage crops are annual and perennial grasses, forage beet and corn. In the territory of the Republic of Azerbaijan, summer pastures include subalpine and alpine meadows of the Greater and Lesser Caucasus, the Zangazur Mountains, the winter pastures of the Kur-Aras lowland, the lowland Caspian coasts, Jeyranchol plateau and Ajinohur area. Pasture livestock is a form of extensive land use, and is one of the most ancient areas of human activity. Pasture complexes are mainly seasonal and are divided into both summer and winter pastures. Both types are characteristics of this study area, and these complexes have been formed since ancient times. Pasture and hayfield complexes are mainly seasonal, and include summer and winter pastures. Both types are peculiar for this study area. These complexes have been formed since ancient times.

Pasture complexes are older compared to others in the system of anthropogenic landscapes. Unlike other anthropogenic complexes, they have retained their natural structure since ancient times. Through long historical period the area under hayfields has been modified due to the impact of intensive land use which has added new traces to them.

2. HISTORY OF LIVESTOCK DEVELOPMENT IN THE REGION

Pasture livestock has been the leading economic activity in Azerbaijan over centuries. Long before the formation of vegetation and horticulture, mountain slopes, alpine and subalpine meadows, as well as humid mountain steppes within their upper and lower boundaries have served as pastures and hayfield areas for population. Certain types of settlements have emerged in the study area associated with the use of grasslands for livestock purposes. Specific forms of land use on pastures and hayfields were typical for the study area in earlier centuries of BC; nomadic, semi-nomadic and sedentary cattle breeding have been practiced. The lifestyle in the area was largely related to the productivity of available pastures. Herdsmen were leaving this area behind if pastures had poor fertility, but later returning back after its restoration over time. Although grazing has been practiced in unregulated manner since ancient times, land use in this area got improved over time. Leaving land out of use temporarily as a way for increasing land fertility remains an important feature of pastoralism in modern times.

2.1. The role of landscape types in livestock development

The subalpine and alpine meadows used as summer pastures and hayfields in the territory of the country are characterized by irregular economic effects. These landscape units are typically subjected to anthropogenic loading at highest degree during the summer months, and accordingly the most considerable modification is observed during this season [4]. During the winter months, due to extreme climatic conditions, anthropogenic impact on natural landscapes is mitigated. During the summer months, most subalpine meadows are used as both hayfields and pasture, while alpine meadows are used only as pasture. Land privatization, emergence of new forms of ownership, as well as intensive land use intensified the human-related transformation of landscapes occupying mountain and foothill regions where river inflow cones, river valleys, shrubs, eroded slopes. Landscapes affected by irregular farming have been formed on mountain slopes, foothills, lower arid and denudation mountain areas and lowlands with complex structure. In the high mountain meadows, semi-deserts plains and dry steppes, anthropogenic impacts are seasonal, and therefore soil degradation occurs more intensively [10]. Arid pastures are one of those landscapes spread in the country's territory that have undergone a drastic change and desertification. Especially in recent years, as a result of unregulated and excessive character of land use, biological potential and ecological conditions of dry steppes and semi-deserts have deteriorate more [8]. The bigger impact on this process had the distribution of land in Azerbaijan during farm privatization without taking into account the areas of forage cultivation, pastures and hayfields, and the number of domestic animals. The availability of natural pastures and hayfields as well as subalpine and alpine meadows in the Greater Caucasus part of Azerbaijan, and also historically formed habits among the local population makes feasible the development of livestock in the area. This condition makes necessary the creation of up-to-date food and light industries with the complex processing output, since the production of agricultural products can allow meet the needs of the population for food products not only at regional but also country scale [7]. Since ancient times pastures in Azerbaijan have been suitable for manage cattle-breeding all year round, an evidence that that the country's population has a wide experience in the field of animal husbandry. Before the 20es of the twentieth century no sector of the economy in Azerbaijan has experienced such extensive development way as it was typical for livestock. Relatively large-scale measures on improving of the quality of livestock began during the early Soviet period.

Thus, local cattle, sheep and pig species have been replaced by new, more productive and profitable species. In order to take highest advantage of fine-wool rams, selection and artificial insemination have been improved. In a short period of time, the creation of new breeds of sheep with longer wool and more efficient wool fiber has been conducted. Compared to native species, the new merino sheep with more profitable shearing opportunity were much more valuable also due to their durability toward migration in long distance, as well as in terms of efficient using opportunities in regard to both high-altitude summer pastures and semi-desert winter pastures [9].

3. THE ROLE OF LIVESTOCK IN THE MATERIAL SUPPORT OF THE POPULATION

Significant increase in livestock production is necessary to raise the welfare of the country's population as well as to address the food problem successfully [6]. This is because the increase in livestock production is achievable if growth in forage crop production is provided first of all. Close relationship of animal husbandry and planting is explained by the fact that the latter allow develop livestock, whereas the development of animal husbandry, in turn, plays a supporting role in the effective territorial organization of crop production. Non-consumable crop products are used in livestock and are converted into livestock food. In addition, livestock provides crop production with organic fertilizers.

3.1. Directions for expanding the food base in livestock development

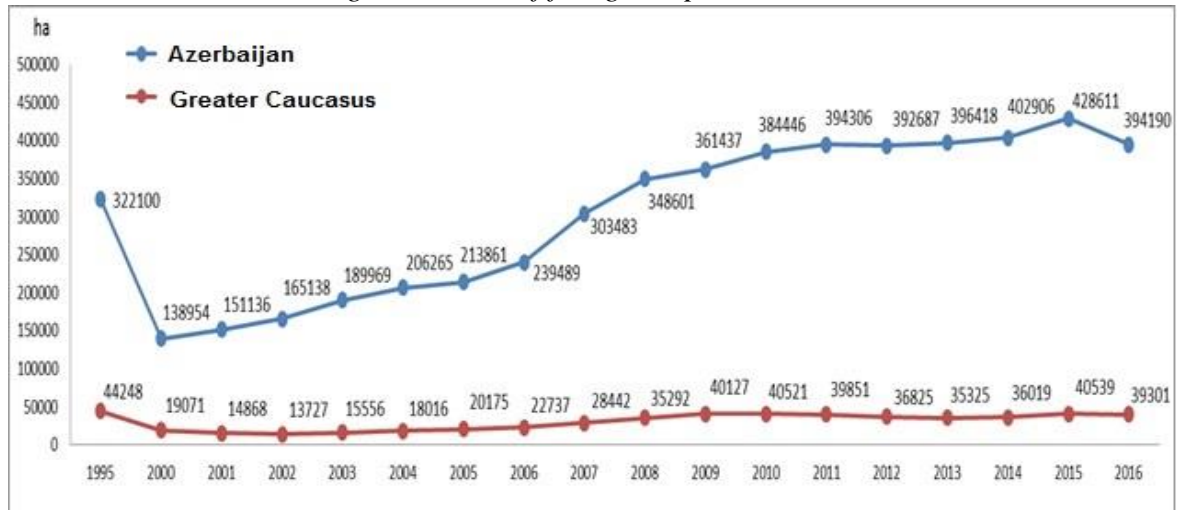

Under natural and economic conditions, the development of agricultural production and the specialization in subfields of planting serve as the basis for the formation of certain sectoral components. In the former Soviet period, large and small cattle farming were developing mainly on natural pastures. This had not a significant impact on the economic development of livestock. Instead, ways to develop the forage base were considered the following:

- extending of the areas under forage crops;
- increasing of the productivity in the areas of natural forage;
- complementing to the content of mixed forage, etc.

Also, during the years of Soviet period, plantations of forage crops in Azerbaijan have expanded rapidly. Plantations of forage crops were the second largest behind grain fields in area. Thus, in 1962 alone, 175.7 thousand hectares of forage crops were planted. Nowadays, plantations of forage crops in the country tend to expand more, making up 396.4 thousand hectares, of which, only 8.9% falls to the share of Greater Caucasus part of Azerbaijan. However, the current output of forage production yet is not enough to meet the growing needs of livestock. Low productivity of forage crops leads to a significant increase in the production cost. Moreover, low productivity challenges using of arable lands, labor and financial resources efficiently. This in turn leads to a decrease in livestock productivity.

Figure following on the next page

Figure 1: Area of forage crops in hectare

Source: *Agriculture of Azerbaijan, 2016. State Statistical Committee [2]*

In Azerbaijan, after 2000s, decrease in forage crops was recorded in 2012 and 2016 years only. In the Greater Caucasus region, decrease was recorded in 2001, 2002, 2011, 2012, 2013 and 2016. In 2011-2016, total area of forage plantations in the region was extended as much as 550 ha, including 25161 by Sheki-Zagatala economic region, and 144 hectares by Absheron economic region, whereas decrease at 1173 hectares and 447 hectares was observed in Guba-Khachmaz and Upland Shirvan regions respectively. The development of livestock and the strengthening of the forage base depend not only on natural sources of forage, but also on succulent forage crops. Thus, the green mass of succulent forage plants, dry grass, straw and silage are of high quality and are highly valued as they contains albumen, protein, fat, various vitamins and minerals. Beside with this, not only root crops, but also surface masses of succulent forage plants, as well as dry grasses have a high nutritional value [7]. This factor is one of the main factors in the development of livestock farming, and plays an important role in forage supply. Expanding of the area succulent vegetation could contribute to the solution of existing problem considerably in the future.

Table 1: Sown area, production and productivity of forage crops in Azerbaijan

Year	Corn for silage and green forage			Root crops		
	Sown area, thous. Ha	Production, min ton	Productivity, sent/ha	Sown area, thous. ha	Production, min ton	Productivity, sent/ha
1990	98,5	943,9	96	12,9	172,1	133
1995	36,9	182,3	47	5,2	26,4	51
2000	2,2	4,8	63	0,1	2,4	157

Source: *Agriculture of Azerbaijan, 2016. State Statistical Committee [2]*

In general, land used for cultivation of forage is considered beneficial in agronomic term as well as economically efficient. Areas under straw crop are used both to maintain the quality of forage and keep soil fertility. Each geographical region is characterized by the presence of species of fauna and flora specific to that area only. Living of humans and economic activities is affected by an environment. Therefore introduction of new flora and fauna in the formed biogeocenosis may lead to violation of the existing ecological balance [9]. An analysis of the level of forage production and forage supply in the Greater Caucasus region shows that the degree of using of hayfields in livestock varies by regions. In most regions, the share of hayfield forage among total forage is high. To develop livestock, first of all, it is important to create a high-quality forage base, protect natural forage plantations as well as maintain fertility of sown areas under forage plants. Natural forage areas consist of summer and winter pastures, hayfields and year-round grasslands used during the grazing season [1]. Natural pastures and pastures, which make up 20-25% of the forage base of livestock, are of great importance. The area of grasslands of grazing importance and pastures make 3,583,000 hectares in the country, of which 1,740,000 hectares falls to winter pastures and 597,000 hectares to summer pastures. As studies show, pastures are not used efficiently at present. Excessive grazing degrades grassland and steppe vegetation, has a negative impact on soil cover, leads to reduction in fauna species, while the productivity of lands becomes affected over years as well. This happens because hydrological regime of lands is affected by overgrazing, the growth of grass on a hardened soil is considerably weakened, as a result of which the dried, trampled and highly degraded soil becomes deprived of vegetation [8]. Development of livestock typically is followed by transformation of natural landscapes of pastures and hayfields in mountain meadows and grasslands, but also with transformation of forest landscapes, or shrubbery and forest landscape complexes. The increase in number of domestic animals in the mentioned complexes of the study area has led to gradual large-scale and long-term transformations on the places of local transformations. This feature is primarily associated with changes that happen in natural upper and lower boundaries of forests due to grazing. Summer and winter pastures of livestock importance, as well as forest lands, have an area 2 million 846 thousand ha hectares in total, or 75% of all state-owned lands available in the country. In the Greater Caucasus, our study area, is favorable region in terms of opportunities for the development of planting, vegetable growing and horticulture that have a special role in strengthening of the forage base. Agricultural crops in the region are grown in private backyards and farms. The land reforms implemented in the country have opened large opportunities for the involvement of more lands in plant growing and horticulture in compliancy with their natural and biological conditions, and for achieving abundant and high-quality crops. Fostering forage production allowed increase productivity in livestock and also the share of various grasses in plant growing, which led to a significant increase in the number of domestic animals and their species diversity. Employment of the population living in the highlands of the Greater Caucasus is related mainly to animal husbandry. Grazing of domestic animals in the region is observed mainly on lands of state fund, rural pastures, as well as on uncontrolled parts of forest lands and pastures [6]. In Azerbaijan, lack of highly nutritious elements in the composition of soil of arable lands, including pastures and hayfields, as well as of forage used in livestock leads to overloading of natural areas of forage value and also to erosion and salinization of soils conditioned by weakly controlled land use. Such impact leads to serious damage subjected to the forest fund, water resources and whole environment. To eliminate the problem, the State Program on Summer/Winter Pastures, Effective Use of Meadows and Desertification Prevention for the period 2004-2010, was adopted in 2004 [3]. The State Program was aimed at bringing the structure of forage crops in compliancy with the identified standards, as well as implementing of necessary measures on prevention of excessive grazing on pastures and hayfields in order ensure the development of livestock.

For a long time herds of domestic animals were kept on summer and winter pastures only, thus being apart from crop production. However, then, livestock began to develop based on the relation of vegetation farming and forage production to create a reserve forage base in addition to those pastures. Besides, today, domestic animals are fed in closed condition with using high technology [9]. To strengthen the forage base in the country, the government emphasizes expanding of areas under forage crops. As a result, the increase in productivity, as well as the increase in number of all domestic animals in livestock led to significant growth of livestock production.

Development of livestock is of great economic and social importance to meet daily needs of population. In the study area, like in other regions of the country, the forage base of livestock is not based only on natural hayfields and pastures but also on remnants of vegetables and horticulture crops.

3.2. The economic nature of the food prepared on the basis of new technology

In general, to ensure the efficient use of pastures and hayfields in the Greater Caucasus region, to prevent soil erosion on mountain slopes, salinization in foothills and plains, to develop the structure and storage conditions of livestock in accordance with modern requirements, as well as to ensure sustainable development in the region, the followings are necessary: protection of lands, owned by state and municipalities; prevention of overloading of pastures and hayfields; conservation of biological diversity against the background of development of livestock; breeding of high-productive species in livestock with considering of local natural conditions. It is extremely important to implement agro-technical measures to improve the conditions of summer and winter pastures. For this purpose, implementation of such measures as removal of various poisonous weeds and harmful plants, clearing of lands from stones and bushes, destroying of sources of pests and diseases, and sowing of seeds of specific grasses to enrich the grasslands, etc. are very important. The mentioned measures of agro-technical allow significantly increase productivity of summer pastures [5]. One of the main factors responsible for the intensive erosion and degradation on summer pastures is the premature taking of herds to pastures and also arising of paths on mountain slopes as a result of movement of livestock. When domestic animals are taken out to much wet pastures prematurely, sheep's claws easily break the valuable soil layer easily. Eventually, during next rainfalls, furrows on the place of these soil layers appear, and this gradually weakens the formation of useful grass cover on slopes. Such erosion processes are evident on the paths formed on the mountain slopes. Moreover, when it rains heavily, the piles of water that fill those paths may combine and originate flood. Another factor facilitating the processes of erosion and degradation on summer pastures is the improper creation of sheepfolds. Since ancient times it has been customary to build permanent sheepfolds to keep domestic animals in the natural condition. The sheepfolds often were made of stone structures.

It was defined that a long-term trampling and movements around the sheepfolds destroys grass cover and leads to loss of vegetation of forage importance. On the contrary, the creation of sheepfolds may favor the growth of poisonous and harmful vegetation without forage importance, thus, may have a negative impact on the health of livestock and their productivity. Creation of temporary sheepfolds instead of permanent ones is very important in terms of solving this problem. This way is of particular importance in both intermittent grazing and prevention of degradation. It was observed also that the restoration of pastures, heavily trampled by cattle, should be left for a while to allow soil cover be more fertile. In this case, productivity of grasslands rises as 20-25% as much in the first year, and 100% in subsequent years. It can be concluded that improper use of summer pastures lowers productivity on summer pastures, whereas intermittent and gradual grazing allows improve the quality of pastures and prevent erosion [8].

4. CONCLUSION

In view of the above, it is recommended to implement the following system of basic measures to increase the productivity of forage crops, hayfields and pastures, as well as to preserve the ecological characteristics of pasture and grassland landscapes:

- efficient use of natural areas of forage importance, additional sowing of grass seeds on pastures and hayfields, and creation of intensive forage areas on winter pastures should be conducted;
- effective crop rotation should be organized through proper land use;
- forage crops such as soybeans, sorghum, corn, sunflowers and beets playing an important role in the intensive growth of livestock production should be expanded;
- lands under sorts of secondary crop should be expanded in area, and the agro-climatic resources should be benefited more effectively.

There are sufficient land resources of livestock assignment in the Greater Caucasus region. It is feasible to increase the number of livestock in farms at the expense of strengthening of the forage base and expanding of pastures, and supply livestock farms with local natural resources. The transition to closed farming could improve the ecological condition of the pasture landscapes.

ABSTRACT

The axisymmetric problem of the theory of elasticity for the radially inhomogeneous transversely isotropic cylinder of small thickness is studied by the method of asymptotic integrating the equations of the theory of elasticity is used to study. It is assumed that the elastic moduli are arbitrary positive continuous functions of the cylinder radius. The lateral part of the cylinder is taken fixed, and the stresses are set at the ends of the cylinder, leaving the cylinder in equilibrium. Homogeneous solutions are constructed. The asymptotic behavior of the solution is studied as the thickness parameter tends to zero. The nature of the stress-strain state is explained. It was found that the stress-strain state is composed only of a solution having the character of a boundary layer, equivalent to the Saint-Venant edge effect of the theory of inhomogeneous transversely isotropic plates.

Keywords: *axisymmetric problem, radially inhomogeneous cylinder, boundary layer, boundary Saint-Venant effect, variational Lagrange principle*

1. INTRODUCTION

One of the properties of materials that affect the stress-strain state of the elastic bodies is their inhomogeneity. Various materials are being developed and created, the characteristics of which, in particular, the elastic moduli, can change continuously along certain directions. An important place in the theory of plates and shells is occupied by studies of the inhomogeneous thin-walled structures. The complexity of the phenomena arising from the deformation of the inhomogeneous plates and shells, and the variety of inhomogeneous structures have led to the creation of various applied theories, each of which is based on a certain system of hypotheses. The areas of applicability of the applied theories of inhomogeneous plates and shells have been little studied. The fact of the existence of various applied theories for the inhomogeneous structures poses the problem of their critical analysis based on a serious mathematical approach, i.e. from the perspective of three-dimensional equations of the theory of elasticity. In addition, a number of issues related to the study of the stress-strain state for the inhomogeneous structures can be correctly solved only within the framework of the theory of elasticity. Analysis of the stress-strain state of inhomogeneous shells on the basis of three-dimensional equations of the theory of elasticity is associated with significant mathematical difficulties. The solutions obtained on the basis of three-dimensional equations of the theory of elasticity can serve as a standard for verifying the accuracy of various applied theories of shells.

2. STATEMENT OF THE BOUNDARY VALUE PROBLEMS

Let us consider the axisymmetric elasticity problem for the radially inhomogeneous transversely isotropic hollow cylinder of small thickness the volume

$$\Gamma = \{r \in [r_1; r_2], \varphi \in [0; 2\pi], z \in [-L; L]\}.$$

The system of equilibrium equations in the absence of mass forces in a cylindrical coordinate system r, φ, z has the form [7]

$$\begin{cases} \frac{\partial \sigma_{rr}}{\partial r} + \frac{\partial \sigma_{rz}}{\partial z} + \frac{\sigma_{rr} - \sigma_{\phi\phi}}{r} = 0 \\ \frac{\partial \sigma_{rz}}{\partial r} + \frac{\partial \sigma_{zz}}{\partial z} + \frac{\sigma_{rz}}{r} = 0. \end{cases} \quad (1)$$

Here $\sigma_{rr}, \sigma_{rz}, \sigma_{zz}, \sigma_{\phi\phi}$ are the components of the stress tensor, which are expressed in terms of the displacement vectors $u_r = u_r(r, z)$, $u_\varphi = u_\varphi(r, z)$ as follows [6]

$$\begin{aligned} \sigma_{rr} &= A_{11} \frac{\partial u_r}{\partial r} + A_{12} \frac{u_r}{r} + A_{13} \frac{\partial u_z}{\partial z}, \quad \sigma_{rz} = A_{44} \left(\frac{\partial u_r}{\partial z} + \frac{\partial u_z}{\partial r} \right), \\ \sigma_{zz} &= A_{13} \left(\frac{\partial u_r}{\partial r} + \frac{u_r}{r} \right) + A_{33} \frac{\partial u_z}{\partial z}, \quad \sigma_{\phi\phi} = A_{12} \frac{\partial u_r}{\partial r} + A_{11} \frac{u_r}{r} + A_{13} \frac{\partial u_z}{\partial z}. \end{aligned} \quad (2)$$

Substituting (2) into (1) we obtain the equilibrium equation in displacements

$$\left(L_0 + \partial_1 L_1 + \partial_1^2 L_2 \right) \bar{u} = \bar{0} \quad (3)$$

Here L_k are matrix differential operators of the form

$$L_0 = \left\| \begin{array}{cc} \partial(e^{-\varphi}(b_{11}\partial + \varepsilon b_{12})) + \varepsilon(b_{11} - b_{12})e^{-\varphi}(\partial - \varepsilon) & 0 \\ 0 & \partial(e^{-\varphi}b_{44}\partial) + \varepsilon b_{44}e^{-\varphi}\partial \end{array} \right\|,$$

$$L_1 = \left\| \begin{array}{cc} 0 & \varepsilon(\partial(b_{13}) + b_{44}\partial) \\ \varepsilon b_{13}\partial + \varepsilon^2(b_{13} + b_{44}) + \varepsilon\partial(b_{44}) & 0 \end{array} \right\|,$$

$$L_2 = \left\| \begin{array}{cc} \varepsilon^2 b_{44} e^{\varphi} & 0 \\ 0 & \varepsilon^2 b_{33} e^{\varphi} \end{array} \right\|,$$

$\partial_1 = \frac{\partial}{\partial \xi}$; $\partial_1^2 = \frac{\partial^2}{\partial \xi^2}$; $\partial = \frac{\partial}{\partial \rho}$; $\bar{u} = (u_\rho; u_\xi)^T$; $u_\rho(\rho, \xi)$, $u_\xi(\rho, \xi)$ are components of the

displacement vector; $\rho = \frac{1}{\varepsilon} \ln\left(\frac{r}{r_0}\right)$, $\xi = \frac{z}{r_0}$ are new dimensionless variables; $\varepsilon = \frac{1}{2} \ln\left(\frac{r_2}{r_1}\right)$ is

a small parameter characterizing the thickness of the cylinder; $r_0 = \sqrt{r_1 r_2}$, $\rho \in [-1; 1]$, $\xi \in [-l; l]$ $\left(l = \frac{L}{r_0} \right)$; $b_{ij} = b_{ij}(\rho)$ are the elasticity characteristics considered as an arbitrary piecewise continuous function of the variable ρ ; $b_{ij} = \frac{A_{ij}}{G_*}$, G_* is some characteristic moduli as for example $G_* = \max A_{ij}(\rho)$.

Let us assume that the lateral surface of the cylinder is fixed, i.e.

$$u_\rho = 0; u_\xi = 0 \text{ at } \rho = \pm 1, \quad (4)$$

and at the ends of the cylinder the stresses are set

$$\sigma_{\rho\xi} \Big|_{\xi=\pm l} = f_{1s}(\rho), \quad \sigma_{\xi\xi} \Big|_{\xi=\pm l} = f_{2s}(\rho). \quad (5)$$

Here $f_{1s}(\rho)$, $f_{2s}(\rho)$ ($s=1,2$) are smooth enough functions satisfying equilibrium conditions.

3. CONSTRUCTION OF THE SOLUTION

We seek solution for (3), (4) in the form

$$u_\rho(\rho, \xi) = u(\rho)e^{\alpha\xi}; \quad u_\xi(\rho, \xi) = w(\rho)e^{\alpha\xi}. \quad (6)$$

Substituting (6) into (3), (4) we have

$$\begin{cases} (L_0 + \alpha_1 L_1 + \alpha^2 L_2) \bar{g} = \bar{0} \\ \bar{g} \Big|_{\rho=\pm 1} = \bar{0}. \end{cases} \quad (7)$$

where $\bar{g}(\rho) = (u(\rho); w(\rho))^T$.

To solve (7), we use the asymptotic method based on three iterative processes [1-5]. The first iteration process has trivial solutions. There are no solutions with the character of the edge effect corresponding to the second asymptotic process. According to the third asymptotic process, solution of (7) is sought in the form:

$$\begin{aligned} u^{(3)} &= \varepsilon(u_0 + \varepsilon u_1 + \dots), \\ w^{(3)} &= \varepsilon(w_0 + \varepsilon w_1 + \dots), \\ \alpha &= \varepsilon^{-1}(\beta_0 + \varepsilon \beta_1 + \dots). \end{aligned} \quad (8)$$

Substituting (8) into (7) for the first terms of the expansion we obtain

$$B(\beta_0) \bar{f}_0 = \bar{0}, \quad (9)$$

where

$$B(\beta_0)\bar{f}_0 = \left\{ t(\beta_0)\bar{f}_0, \bar{f}_0 \Big|_{\rho=\pm 1} = \bar{0} \right\}, \quad t(\beta_0)\bar{f}_0 = (B_0 + \beta_0 B_1 + \beta_0^2 B_2)\bar{f}_0,$$

$$B_0 = \begin{vmatrix} \partial(b_{11}\partial) & 0 \\ 0 & \partial(b_{44}\partial) \end{vmatrix}, \quad B_2 = \begin{vmatrix} b_{44} & 0 \\ 0 & b_{33} \end{vmatrix},$$

$$B_1 = \begin{vmatrix} 0 & \partial(b_{13}) + b_{44}\partial \\ \partial(b_{44}) + b_{13}\partial & 0 \end{vmatrix}, \quad \bar{f}_0 = (u_0; w_0)^T.$$

Spectral problem (9) describes the potential solution of the transversely isotropic plate inhomogeneous in thickness. In contrast to the isotropic case [8], for the transversely isotropic plate of inhomogeneous thickness, β_{0k} can take purely imaginary values.

By replacing

$$u_0 = -\beta_0^{-3}(p_0\psi''')' + \beta_0^{-1}p_2\psi' + \beta_0^{-1}(p_1\psi)', \quad w_0 = \beta_0^{-2}p_0\psi'' - p_1\psi$$

spectral problem (9) is reduced to the following one

$$\begin{cases} (p_0\psi''')'' - \beta_0^2 \left[(p_1\psi)'' + p_1\psi'' + (p_2\psi')' \right] + \beta_0^4 p_3\psi = 0 \\ \left(-\beta_0^{-3}(p_0\psi''')' + \beta_0^{-1}p_2\psi' + \beta_0^{-1}(p_1\psi)' \right) \Big|_{\rho=\pm 1} = 0 \\ \left(\beta_0^{-2}p_0\psi'' - p_1\psi \right) \Big|_{\rho=\pm 1} = 0 \end{cases} \quad (10)$$

where $p_0 = b_{11}\theta$, $p_1 = b_{13}\theta$, $p_2 = b_{44}^{-1}$, $p_3 = b_{33}\theta$, $\theta = (b_{13}^2 - b_{11}b_{33})^{-1}$.

System (10) is a generalization of the spectral problem of P.F. Papkovich [8] for the inhomogeneous transversally isotropic case.

At the next stage for determining $\bar{f}_1 = (u_1, w_1)^T$ and β_1 we obtain a boundary value problem

$$\begin{cases} t(\beta_0)\bar{f}_1 = (M_1 + \beta_0 M_2 + \beta_0^2 M_3 - 2\beta_0\beta_1 B_2 + \beta_1 M_4)\bar{f}_0 \\ \bar{f}_1 \Big|_{\rho=\pm 1} = \bar{0} \end{cases} \quad (11)$$

where

$$M_1 = \begin{vmatrix} (b_{12} - b_{11})\partial - \partial(b_{12}) + \partial(\rho b_{11}\partial) & 0 \\ 0 & -b_{44}\partial + \partial(\rho b_{44}\partial) \end{vmatrix},$$

$$M_2 = \begin{vmatrix} 0 & 0 \\ -(b_{13} + b_{44}) & 0 \end{vmatrix}, \quad M_3 = \begin{vmatrix} -\rho b_{44} & 0 \\ 0 & -\rho b_{33} \end{vmatrix},$$

$$M_4 = \begin{vmatrix} 0 & -\partial(b_{13}) - b_{44}\partial \\ -b_{13}\partial - \partial(b_{44}) & 0 \end{vmatrix}.$$

The condition for solvability of (11) is the orthogonality of the right-hand side of the solution to the adjoint problem

$$B^*(\beta_0)\bar{f}_0^* = B(-\bar{\beta}_0)\bar{f}_0 = \bar{0},$$

$$\text{where } \bar{f}_0^* = (u_0^*; w_0^*)^T.$$

From the solvability condition for β_1 we obtain

$$\beta_1 = \frac{E_2}{E_1},$$

where

$$E_1 = \int_{-1}^1 \left[2\beta_0(b_{44}u_0\bar{u}_0^* + b_{33}w_0\bar{w}_0^*) + b_{44}(\bar{u}_0^*w_0' - u_0(\bar{w}_0^*)') + b_{13}(\bar{w}_0^*u_0' - w_0(\bar{u}_0^*)') \right] d\rho,$$

$$E_2 = \int_{-1}^1 \left[\beta_0^2 \rho(b_{33}w_0\bar{w}_0^* - b_{44}u_0\bar{u}_0^*) - \beta_0(b_{13} + b_{44})u_0\bar{w}_0^* + (b_{12} - b_{11})\bar{u}_0^*u_0' - b_{44}\bar{w}_0^*w_0' - \rho(b_{44}w_0'(\bar{w}_0^*)' + b_{11}u_0'(\bar{u}_0^*)') + b_{12}u_0(\bar{u}_0^*)' \right] d\rho.$$

4. ANALYSIS OF THE STRESS-STRAIN STATE

The solutions corresponding to the third iteration process have the form:

$$u_\rho(\rho, \xi) = \varepsilon \sum_{k=1}^{\infty} F_k \left[-\beta_{0k}^{-3}(p_0\psi_k'')' + \beta_{0k}^{-1}p_1\psi_k' + \beta_{0k}^{-1}(p_2\psi_k)' + O(\varepsilon) \right] \times$$

$$\times \exp(\varepsilon^{-1}(\beta_{0k} + \varepsilon\beta_{1k} + \dots)\xi)$$

$$u_\xi(\rho, \xi) = \varepsilon \sum_{k=1}^{\infty} F_k \left[\beta_{0k}^{-2}p_0\psi_k'' - p_2\psi_k + O(\varepsilon) \right] \exp(\varepsilon^{-1}(\beta_{0k} + \varepsilon\beta_{1k} + \dots)\xi) \quad (12)$$

$$\sigma_{\rho\rho}(\rho, \xi) = \sum_{k=1}^{\infty} F_k (-\beta_{0k}\psi_k + O(\varepsilon)) \exp(\varepsilon^{-1}(\beta_{0k} + \varepsilon\beta_{1k} + \dots)\xi)$$

$$\sigma_{\rho\xi}(\rho, \xi) = \sum_{k=1}^{\infty} F_k (\psi_k' + O(\varepsilon)) \exp(\varepsilon^{-1}(\beta_{0k} + \varepsilon\beta_{1k} + \dots)\xi)$$

$$\sigma_{\xi\xi}(\rho, \xi) = \sum_{k=1}^{\infty} F_k (-\beta_{0k}^{-1}\psi_k'' + O(\varepsilon)) \exp(\varepsilon^{-1}(\beta_{0k} + \varepsilon\beta_{1k} + \dots)\xi)$$

$$\sigma_{\phi\phi}(\rho, \xi) = \sum_{k=1}^{\infty} F_k (b_{13}(b_{11} - b_{12})\beta_{0k}^{-1}\psi_k'' + (b_{33}b_{12} - b_{13}^2)\beta_{0k}\psi_k + O(\varepsilon)) \theta \times$$

$$\times \exp(\varepsilon^{-1}(\beta_{0k} + \varepsilon\beta_{1k} + \dots)\xi).$$

The stress state corresponding to the third group of solutions is self-balanced in each section $\xi = const$. The stress state corresponding to solution (11) has the character of a boundary layer and is localized at the ends of the cylinder.

The first terms (11) are equivalent to the Saint-Venant edge effect of an inhomogeneous transversely isotropic plate. For purely imaginary β_{0k} the Saint-Venant boundary layer attenuates very weakly. In this case, the stress-strain state of the transversely isotropic and isotropic cylinders is qualitatively different. When β_{0k} is not purely imaginary, the general form of the stress-strain state is qualitatively similar to the corresponding case for the isotropic radially inhomogeneous cylinders. In quantitative terms, they differ in the decay rate of the Saint-Venant boundary layers. To determine the constants F_k as in [1-4,9], we use the Lagrange variational principle. Since homogeneous solutions satisfy the equilibrium equation and boundary conditions on the lateral surface, the variational principle takes the following form

$$\sum_{s=1-1}^2 \int_{-1}^1 [(\sigma_{\rho\xi} - f_{1s})\delta u_\rho + (\sigma_{\xi\xi} - f_{2s})\delta u_\xi] \Big|_{\xi=\pm l} \cdot e^{2\varepsilon\rho} d\rho = 0. \quad (12)$$

Substituting (11) into (12) and considering δF_k as independent variations, we obtain the following infinite system of linear algebraic equations

$$\sum_{j=1}^{\infty} M_{nj} F_{j0} = \tau_n \quad (n=1,2,\dots). \quad (13)$$

Here

$$\begin{aligned} M_{nj} &= \int_{-1}^1 \left\{ \psi_n' \left[-\beta_{0j}^{-3} (p_0 \psi_j'') + \beta_{0j}^{-1} p_1 \psi_j' + \beta_{0j}^{-1} (p_2 \psi_j)' \right] + \beta_{0n}^{-1} \psi_n'' [p_2 \psi_j - \beta_{0j}^{-2} p_0 \psi_j''] \right\} d\rho \times \\ &\times \left[\exp\left(-\frac{(\beta_{0n} + \beta_{0j})l}{\varepsilon}\right) + \exp\left(\frac{(\beta_{0n} + \beta_{0j})l}{\varepsilon}\right) \right]; \\ \tau_n &= \int_{-1}^1 \left\{ f_{11} \left[-\beta_{0n}^{-3} (p_0 \psi_n'') + \beta_{0n}^{-1} p_1 \psi_n' + \beta_{0n}^{-1} (p_2 \psi_n)' \right] + f_{21} [\beta_{0n}^{-2} p_0 \psi_n'' - p_2 \psi_n] \right\} d\rho \times \\ &\times \exp\left(-\frac{\beta_{0n}l}{\varepsilon}\right) + \int_{-1}^1 \left\{ f_{12} \left[-\beta_{0n}^{-3} (p_0 \psi_n'') + \beta_{0n}^{-1} p_1 \psi_n' + \beta_{0n}^{-1} (p_2 \psi_n)' \right] + \right. \\ &\left. + f_{22} [\beta_{0n}^{-2} p_0 \psi_n'' - p_2 \psi_n] \right\} d\rho \exp\left(\frac{\beta_{0n}l}{\varepsilon}\right); \\ F_k &= F_{k0} + \varepsilon F_{k1} + \dots \end{aligned}$$

The determination of F_{kp} ($p=1,2,\dots$) is definitely reduced to use of the same matrices, which coincide with the matrices of system (13) [1-4,9]. In [10], the solvability and convergence of the reduction method for system (13) was proved.

5. CONCLUSION

- 1) The stress-strain state of a radially inhomogeneous transversely isotropic cylinder of small thickness with a fixed lateral surface has been studied. It is shown that the stress-strain state is composed only of a solution having the character of a boundary layer.

- 2) Asymptotic formulas for displacements and stresses have been obtained that make it possible to calculate the three-dimensional stress-strain state of a radially inhomogeneous cylinder of small thickness under various boundary conditions at the ends of the cylinder.

ABSTRACT

The young generation that emigrates from their homeland to receive foreign education may decide to continue their life overseas, which hinders a country's future advancement. The phenomenon of student outflow urges the government to employ policies to prevent such a process. If the government does nothing to bind its young citizens to their motherland, they can emigrate themselves without any state support. And those who left their motherland under the pretext of studying may decide to stay there, which means losing potentially high-skilled workforce. The following research argues that merit-based financial aid and the enclosure of official contracts between state and students can serve as tools to stem the process of emigration of gifted youth. Though the work is based on qualitative research methods, some numerical information is also collected and analyzed in addition to the face-to-face interviews. This paper aims to spread awareness about the negative consequences of student emigration, demonstrate to general society and the government the effectiveness of merit-based financial aid as a tool to alleviate the drain-away and promote such a solution.

Keywords: *student emigration, educational policy, economic advancement*

1. INTRODUCTION

Due to several factors that relieve the obstacles to student migration in the twenty-first century, particularly fewer political barriers between states and increasing self-governance of institutions (Morphew, 2006), students from all over the world can choose the location of their studying and not restrict themselves only by their motherland. While some adolescents may leave the country via the studying abroad program funded by the government, other emigrating students most frequently defray their studying abroad at their own expense. And while the former group has to return to their Homeland after graduating abroad by official contract, the latter has no obligation to re-emigrate. Nevertheless, outflows of both human capital and foreign currency constitute a drain on economic resources which restricts economic advancement (China & World Economy, 2003). Hence, because of brain drain, the developing countries lose their own and so rare valuable cadres which consequently prevents their infrastructure from developing. My observations demonstrate that the youth outflow issue is critical in Azerbaijan as well because many students are willing to or already studying abroad. Despite the significance of the student emigration problem, few studies were made about the ways of suppressing the issue and specifically addressing the question: How can financial aid based on merit mitigate the emigration of capable students in Azerbaijan? Primarily, the determinants of brain drain should be defined to analyze how state merit support projects influence students' choices regarding the country of study. The majority of out-migrating undergraduates are influenced by tuition prices (Tuckman, 1970). Nevertheless, Mixon and Hsing (1994) claimed that college cost is not a substantial determinant, and instead the multicultural and high-performing faculty stimulates the brain gain of the young generation (Zhang and Ness, 2010). In any way, the emigration of "the brightest" youth means losing precious cadres to governments, and such a process can be partially prevented by creating incentives and opportunities, such as scholarships.

2. HOW TO PREVENT BRAIN DRAIN?

In order to mitigate the drain- away the stipends based on merit can be utilized, firstly, to stimulate the students not to permanently outflow, as Presidential Stipend in Azerbaijan, or, secondly, to “tether” the youth (Redden, 2007), as Talentenprogramma in Holland (2015). The financial incentives have an immediate impact on engaging skilled adolescents or slowing the rate of their outflow (McColl, 2008). Thus, by contrasting the possible expenses of studying abroad and the opportunity to study locally for free or for fewer costs, students can be persuaded to get their tertiary education within the borders of their country. The other way of alleviating the emigration of “the brightest” youth is the “tethering” which implies governmental funding of students’ undergraduate or graduate education across the border by official contract, provided that the latter returns to the motherland after finishing the university and works there for a certain period, thereby, contributes to local economic development. Talentenprogramma is a stipend scheme funded by the Dutch administration which allows one year of study in a foreign state after graduating and such an award is given to approximately 40 students annually. Nearly 40% of all Dutch students have experience of studying in a foreign university, and, as a result of that course, the Netherlands’ education system is ahead of most other countries that signed the Bologna agreement (Oosterbeek and Webbink, 2011). Besides, Azerbaijan was among the countries that practiced such a system in 2007-2015. The returning graduates who start the business in their homeland help the country’s economy by sharing their advanced knowledge; therefore, it becomes worth investing in studying abroad (China & World Economy, 2003). So, by sending the students abroad with contracts the government can ensure that after the arrival of such youngsters, it will be able to benefit from their knowledge, perspectives, and outlook. Nevertheless, the need for state stipend policies is manifested in the fact that those who cannot receive merit-based scholarships due to limited positions available may defray their studying abroad with their savings. Therefore, they will not need any contracts and will not have the incentive to return after graduating. Despite the advantages of international mobility for those students, their emigration without returning harms their motherland’s future advancement. Studying abroad and the amount of time spent studying there increase the chances of staying abroad and, in other words, induces brain drain (Oosterbeek and Webbink, 2011). Thus, if ministers do not regulate the process of student emigration by enclosing official contracts with students and do not expand scholarship programs, more adolescents may leave the country without the desire to return.

2.1. Survey results

The survey was held to discover the percentage of Azerbaijani students who would like to study abroad and the number of those who would change their idea if they were offered a merit-based scholarship. The result of the mini-survey demonstrates that 5% of all respondents answered “No” to the question of “Do/Did you consider the variant of studying abroad?”. The second question of the survey was “Would you give up the idea of studying abroad if you were offered free education or discount in studying in Azerbaijan?” and 21% of overall participant number admitted that they would change their mind and choose to continue their tertiary education in their home country. The other 15% answered that they already study for free so they cannot be taken into account; the remaining 64 % insisted on their desire of studying abroad notwithstanding any possible financial incentives in Azerbaijan. Therefore, the number of those respondents who would not study abroad increased from 5% to at least 21%.

2.1.1. Interview results

Similarly, the interviews were conducted with college students. The questions and the responses to them were as following:

- 1) “What are the possible reasons that would motivate you to study abroad?”

Better education quality, broader opportunities abroad, the scholarship opportunities in foreign countries were listed among the factors. In order to prevent the process of student outflow, governments are recommended to improve the education quality in students' home countries. The respondents named ADA, Qafqaz, and police and military academies, among the universities with more or less high-grade education levels. Hence, it seems that the youth in Azerbaijan still believe that the education level can satisfy the students' needs.

- 2) “How would receiving the full merit-based scholarship influence your decision to study abroad, if your country provides more or less quality education?”

The Azerbaijani students who study at ADA and receive a full scholarship, told that they are satisfied with studying in Azerbaijan and “do not want to leave” because “if I get the full-merit-based scholarship, why should I decide to study abroad?”. Two American respondents answered that “scholarship would make a difference and alter their decision” if studying abroad is more expensive, but the local university they choose because of scholarship opportunity “should provide world-standard education and have world-recognized diploma”. Only one student from Moldova and another one who moved from Azerbaijan to the UK for educational purposes announced that they would not return to their home countries because, in their opinion, their faculties, Economics, and Biomedical science respectively, are not developed in their own countries. In addition, they doubt they will receive quality knowledge in their specialization and get the opportunities and independence in their home countries that they have currently.

- 3) “What are the possible ramifications of expanding the financial aid program?”

Such a measure will lead to the reduction of budget resources, but from a macroeconomic perspective, investment, especially in education is always beneficial for future economic development. Also, the merit-based scholarship can ensure that the students that receive the scholarship truly deserve it and the quality of students will further enrich the university community. Besides the aforementioned factors, applying merit-based scholarships, especially international ones, would attract student inflow from other countries, and, in other words, induce brain gain. A merit-based scholarship makes a big difference, especially in attracting the best students. Even knowing that Azerbaijan has a full scholarship, they look up to Azerbaijan in general. Regarding the consequences of contracts with students, such policy can improve the local literacy level and the economy because the educated and high-skilled students return to their mother countries

3. DISCUSSION

So, the main purpose of my study was first to determine the fundamental factors that induce “the best and brightest” students to study abroad, and then to propose the merit-based scholarship policy expansion as an effective measure to prevent student emigration. Primarily, by conducting the survey I aimed to check whether the solution to student outflow problems offered by this research is a useful tool to persuade students not to leave their country by creating incentives. The fact that 95% of answers to the first question were “Yes, I do/did consider studying abroad” emphasizes the criticalness of the student outflow issue and underlines the drawbacks in governmental educational policies. Nevertheless, according to the analysis of the second question, the presence of merit-based scholarship increases the number of “No” responses. The increment of at least 16% in the number of those who would not study abroad shows that applying merit-based scholarship is quite a successful policy and the correct path to follow in this research. Consequently, it was predicted that students seek better education opportunities when considering studying in a foreign country. So, the government should improve education quality to prevent the student emigration issue.

Increasing the level of education implies attracting new professional instructors, purchasing new books and equipment, renewing the university's library sources, building and repairing the university campuses (Big Ideas for Better Schools: Ten Ways to Improve Education, 2005). Nonetheless, such a solution to youth outflow may require years and decades to yield results; and a quicker measure is required. My paper suggests that applying more merit-based scholarships can serve as a helpful solution that can be implemented in a shorter time. The fact that scholarship opportunities in foreign countries were mentioned among the causes of student outflow confirms that the research has the right direction since if financial incentives abroad attract Azerbaijani students, it can also work in Azerbaijan the same way. Because the topic of my research concerns the student emigration problem in Azerbaijan, the fact that Azerbaijani respondents refused to choose another country for their tertiary education as long as they receive full merit-based financial aid reaffirms that the described scholarship policies "can make a difference". In fact, one American intern in Azerbaijan considers continuing his education in one of the European universities because of too expensive tuition in America. So, the responses of impartial parties and students receiving scholarships demonstrate that financial support given for academic excellence indeed slows the student outflow. Only two students expressed their unwillingness to return to home country: first, due to poorer opportunities for her faculty in the home country, and, second due to receiving the full scholarship abroad; however, the latter respondent's situation leads to the consequences of merit-based scholarships in terms of attracting foreign students, so her answer supports the purpose my research. If the Azerbaijani universities have a scholarship for people from a certain country or region, they can become a very attractive option for foreign students and, even if they decide not to go for a merit-based scholarship, it can attract people in general. ADA University and UNEC in Azerbaijan offer grants for foreign citizens which proves the role of Azerbaijan's scholarship policy for foreigners in the area of "young brain attraction". There may be negative ramifications of merit-based scholarship policy expansion on the government budget, but the positive consequences, in the long run, should not be neglected. It has to be iterated, "the contribution and knowledge of people who return to their home country after studying in a foreign country significantly surpass the investments nested into their studying or working abroad" (China & World Economy, 2003). In other words, if for one student to study abroad, say in the UK, the annual investment at the rate of \$30.000 is required and if the government defrays the tuition costs of 100 students for one year with the condition of the youngsters to return after their term expires, this implies the investment of \$3 million to the country's future advancement. Investment plays an important role in influencing economic and income growth. Simultaneously, a robust correlation exists between the average share of investment and average growth rates (Blomstrom, et al., 2017). Therefore, the \$3 million will cause the economy to advance; and the experience and knowledge of the students enrolled in the governmental program will far exceed this enclosure in the long run. At last, such a "tethering" policy will mitigate student emigration, as it binds the youngsters by official document and allows to punish one party in case of the contract breach.

4. CONCLUSION

In conclusion, when smart students leave their Homeland, they may decide to find their future careers and continue their life abroad, especially if they have no obligation to return. As a result, their country will lose its precious intellectual force. By interviewing the "best and brightest" students with various studying grounds and circumstances, it was deduced that merit-based scholarships can restrain student emigration by creating an inducement or binding them to stay within the borders of their home country and study in a local educational institution. Despite the time limitation, the research was able to collect and study the answers from different aspects.

It is expected to spread awareness about the negative consequences of student emigration via my paper, prove to general society, and even to the government the effectiveness of merit-based financial aid as a tool to alleviate the drain-away and to promote such a solution. It is also acceptable that the conducted work may persuade the ministers to expand the financing of stipends to stem the emigration of the smartest youngsters.

ABSTRACT

The article examines the role of the cluster concept in the innovative development of entrepreneurship, property relations in innovative companies and cluster policy as the main organizer of the state's economic policy. Although the effects of cluster programs are sometimes contradictory, the popularity of cluster policies has not decreased, and in most developed market economies, the process of clustering the economy continues at a rapid pace, and ways and means to improve the effectiveness of cluster programs are being sought. The article presents the concept of innovative development of entrepreneurship, which includes the essence of the state mechanism of innovative development, subjects of management and their balance. The cluster approach will ensure the growth of commodity production and strengthen the competitive position of industries and their regions. As a result of the changing situation in world markets, sharp fluctuations in prices for exported natural resources and products containing natural resources in production occur, which, in turn, leads to higher inflation. In order to neutralize the impact of inflation, it is proposed to create an investment fund to promote innovative development and allocate to this fund surpluses in comparison with the optimal amount of actual income from the export of natural resources, and in return provide them with benefits for the payment of aggregate tax, including value added tax, profit tax, excise tax and mineral extraction tax.

Keywords: *entrepreneurship, innovative development, cluster policy, public administration mechanism, investment fund, tax incentives*

1. INTRODUCTION

Clustering is one of the priorities for the development of a modern market economy based on globalization, integration, diversification and innovative development. The cluster and the cluster approach, which is a new institutional form of interaction between the state and economic entities, are a mechanism for the successful implementation of industrial policy. In countries with developed market economies, clusters as a mechanism of interaction have become a traditional form of organization of the business community, targeted cluster policy is being implemented in these countries, they have risen to leading positions in the rating of the competitiveness of the economy. The economic policy of the state, based on the cluster approach, includes a system for supporting the creation and development of clusters in certain regions of the country, increasing the efficiency of industries, enterprises, regions and the national economy as a whole. The role and importance of innovation is growing in the context of the clustering of the economy, since scientific and technological progress, high technologies create a solid foundation for sustainable, spiritual, intellectual and socio-economic development of the country.

From this point of view, the problems associated with the innovative development of business, which is a key component of the market economy and its leading direction, are especially relevant, and there is a great need for their scientific research.

2. CLUSTER AS AN INTERACTION MECHANISM

The term "cluster" was first introduced into the economic literature in 1990 by the American economist Michael Porter. In his opinion, a cluster is a geographically concentrated group of interconnected companies, specialized suppliers, firms in certain industries, as well as entities connected by their activities in their respective fields, competing, but at the same time working together [1]. In recent years, the process of clusterization of the economy has been accelerating all over the world, including in the Republic of Azerbaijan. Successful foreign experience has been accumulated in the application of the most effective forms of creation and development of industrial-innovative clusters and new management mechanisms. Thus, in a number of Asian countries, especially in Japan and South Korea, great success has been achieved in the formation of industrial and innovative clusters and in the innovative development of entrepreneurship as a mutual mechanism of industrial companies, scientific and educational institutions, as well as the commercialization of innovations. In Japan, large groups of combined industrial companies, narrow industrial specializations and modular conglomerates are the central link of the industrial and innovative cluster. Japanese clusters are also characterized by a high level of implementation of interconnected technologies, a special system of financing the organization of research and development (R&D) and the active participation of company employees in innovative activities. Conglomerates are less dependent on the financial market, which allows them to independently finance long-term R & D, encourage employees to innovate, and reward inventors and innovators. South Korea, based on the system of organizing R & D and innovation in Japan, with the exception of their investment policy, added methods for coordinating the activities of industrial and innovation cluster entities, new management tools for interaction, and also made sufficient use of the experience of foreign research centers and foreign investment. As a result, South Korea has not only reached, but also surpassed Japan, as well as the countries of Southeast Asia in terms of success in the creation and development of industrial and innovative clusters. According to experts, the level of clustering of the economies of the leading countries of the world is 50 percent. About half of US businesses operate in clusters and generate 60 percent of the country's gross domestic product. In European countries, 38% of the employed population work in more than 2,000 clusters. In China, there are 60 clusters that unite 30,000 companies, employing 3.5 million people and producing and selling products worth 200 billion dollars a year [2, p.5]. The cluster is created in three stages:

- 1) At the first stage, the foundations, goals and objectives of the cluster are determined. The strategic goal of the cluster is to increase the profitability of production, to form a high-tech complex of localized and interconnected companies for the production of certain products.
- 2) At the second stage, a decision is made on full-scale work on the project, the structure of the cluster is formed, a mechanism for the interaction of employees is developed and economic efficiency is determined, the tools for implementing the cluster initiative are determined.
- 3) At the third stage, a cluster management mechanism is formed, an action plan for the implementation of the clustering initiative is developed and control over its implementation is organized.

The cluster management mechanism is determined by the cluster coordinating council. The Coordinating Council coordinates the strategic, investment and technical partnership of the cluster, as well as oversees the activities of logistics, service and other companies within the cluster.

The Cluster Coordinating Council includes representatives from industry, science and education, innovation organizations and local governments. The main function of the Coordinating Council is the implementation of strategic planning, making appropriate adjustments to the activities of the cluster, depending on the degree of adaptation of the cluster to economic conditions and results of work. In addition, the Coordination Council forms a partnership that plans and regularly monitors the cluster's activities.

3. MODERN STATE POLICY IN THE FIELD OF CLUSTER SUPPORT

In recent years, developed countries, states and regions have begun to focus their economic development policies on the formation of clusters to increase the competitiveness and innovative potential of industries and regions, as well as to ensure sustainable economic development. We are not talking about individual large companies, universities and laboratories, but about a complex group of companies located in a certain territory, belonging to any area (interconnected areas), which characterizes sustainable interaction.

Supporting the commercialization of research results and co-financing R&D projects has become a priority. The economic advantages resulting from the activity of clusters include: [3, p. 696]:

- increasing competitiveness due to the high level of labor productivity;
- transfer of knowledge, especially new knowledge;
- the creation of new high-level enterprises and the development of entrepreneurship;
- creation of public goods, social capital and reputation;
- competition with local competitors that have a strong stimulating effect on business (entrepreneurship);
- development of complementarity between the activities (products) of the cluster participants;
- reduce transaction costs by creating a sustainable environment based on trust.

Clusters create a favorable environment for innovation by:

- Proximity as a result of concentration of companies, consumers, shippers and other organizations constantly stimulates innovation;
- the pressure of competition due to the presence of companies in adjacent territories leads to the development of innovative activities of individual firms;
- a favorable cluster environment for obtaining very important innovations for the development of innovation and commercial development;
- creating opportunities for a wide range of options in order to share the risks associated with innovation and use the results of investments in innovation activities;
- establishing close interaction between companies and research institutions to develop new knowledge and innovative technologies, given that the development and exchange of new knowledge is more active at the local level.

Clustering of the economy leads to the emergence of a new form of innovation - "aggregated innovative product". Joining a cluster does not lead to complete synchronization of diverse scientific and technical inventions, but to the creation of a sustainable system of dissemination of new knowledge and technology. It is the formation of a network of stable connections between all the participants of the cluster that acts as a catalyst for the transformation of inventions into innovations, leading to a competitive advantage with innovations. A group of economists believes that the world is moving towards a cluster network: "Adapting to the conditions of globalization and the rapidly growing dynamism of the environment, the world is moving to a new network order - a functional market system, the world economy and its entire subsystem are stratified into a cluster-network structure" [4].

Currently, there are programs for the development of clusters in more than 100 countries and regions of the world. Despite the fact that most successful clusters are created naturally, government support for the development of clusters is important. Studies show that the natural development of clusters does not always proceed optimally. Government support for clusters is called cluster policy. Cluster policy is related to other types of economic policy. Thus, the cluster policy takes a technological direction from industrial policy, a network direction from a territorial development policy, small business development from a policy of supporting small and medium-sized enterprises, research funding from a scientific and technical policy.

Modern state policy in support of clusters has many national characteristics. So it can be different and act as follows:

- a specific policy with a clearly defined strategy and allocated budget, which covers a number of industrial sectors and various aspects of cluster development;
- the policy formed on some aspects of cluster development: networking between the business environment or business and research organizations;
- policy as an element of other economic development strategies.

In general, cluster policy is a set of goals, objectives, priorities, principles, measures taken by public authorities at various levels and aimed at identifying, creating, mobilizing and strengthening clusters. It is necessary to reveal the concept of cluster policy in a narrow and broad sense. In a narrow sense, cluster policy means a set of government measures aimed at strengthening existing clusters or creating conditions for the formation of new clusters. In a broader sense, cluster policy includes the following types of government measures: measures aimed at creating a favorable innovation climate that directly affects the development of clusters; traditional measures of economic policy (support for small and medium enterprises, industrial, regional and other policies); special cluster policy to create and strengthen clusters.

4. CONCEPT AND STRATEGY FOR INNOVATIVE DEVELOPMENT OF ENTREPRENEURSHIP

A concept is a specific way of understanding any object, manifestation or process. In other words, the concept is a focused, concrete and targeted document for sustainable development, containing key messages, higher ideas and directions for action. The concept of innovative development of entrepreneurship is based on the creation of an organizational mechanism that allows you to combine different types of potential of economic entities. The goal is to create the necessary conditions for joint efforts to achieve the development of entrepreneurship, diversification of the economy, sustainable socio-economic development of regions and the country as a whole [5, p.43]. The creation of an effective organizational mechanism for regulating innovation, taking into account the interests of both the enterprise and the state in innovative development and the growth of gross domestic product, should be based on the balance of interests of participants in innovation process. Namely:

- an enterprise implementing innovative projects;
- an enterprise that generates innovative projects;
- investors;
- business entities and the state.

Achieving a balance of interests of all business entities requires the state to form a system that ensures clear interaction between business entities, science and education. And this is possible with the use of effective mechanisms and tools for innovative development based on the cluster approach.

The foundation of the national innovation system in the Republic of Azerbaijan was laid in the State programs for the socio-economic development of regions in 2005 and it was planned to develop in the Strategic roadmap for the development of the national economy in 2017. These documents define the main tasks and objectives of modernization and diversification of the economy:

- stimulating the demand for innovation in the business sector;
- technological equipment of enterprises;
- organization of production and export of new high-tech products;
- creation of new high-tech companies;
- creation of clusters based on market principles - a national cluster system, the purpose of which is to achieve a competitive advantage.

Participants of national innovation clusters can be:

- an enterprise (organization) that develops innovative projects;
- an enterprise engaged in the implementation of innovative projects;
- venture investors;
- entities in which the participants are registered.

According to the Decree of the President of the Republic of Azerbaijan No. 148 dated June 26, 2018 "On ensuring the activities of the Agency for the Development of Small and Medium Business of the Republic of Azerbaijan", enterprises of the small and medium-sized business (SME) cluster are created as commercial legal entities. The SME cluster project provides for the conclusion of business transactions with at least 10 interdependent micro, small and medium-sized enterprises and the supply of 50% of the cost of raw materials and other resources produced in the cluster from local producers who are members of the cluster. Areas of activity an SME cluster company must comply with one of the following areas:

- 1) Creation of new competitive products that were not previously produced in the Republic of Azerbaijan;
- 2) Production of products, more than 50 percent of consumption of which is paid for by imports;
- 3) Provision of hospitality and accommodation services (hotel, motel, camping, etc.)

The minimum investment in the project implemented by the Small and Medium Business Cluster Company is determined in the following amounts: Baku - 5 million manat; Settlements around Baku and Absheron region - 3 million manat; Sumgayit and Ganja cities - 2.5 million manat; other cities and regions - 1.5 million manat; Nakhchivan Autonomous Republic - 0.5 million manat. Companies in the SME cluster are exempt from paying value added tax, income tax, land tax and property tax for a period of 7 years from the date of their inclusion in the state register. The current wage system is characterized as follows:

- with the minimum wage level established by law;
- with a low purchasing power of the average wage;
- with a shadow and often non-monetary form of remuneration.

The negative nature of the consequences of an unsatisfactory wage system is manifested in the inability to perform the main functions of remuneration (reproductive, stimulating, social, and accounting and production) in a market economy [6]. It is clear that with an unsatisfactory level of wages, most of the population is unable to pay for vital services (housing and communal services, medical, educational, etc). This creates a problem of social inequality.

Low wages negatively affect the efficiency of the use of labor resources and the purchasing power of the population, which leads to the collapse of the consumer market, a decrease in production and employment in industries with advanced technologies and highly qualified personnel. Cheap labor hinders the introduction of new technology, as the low cost of human capital financially confirms the low technological level of production. Thus, low wages, on the one hand, reduce the competitiveness of industrial enterprises, and on the other hand, prevent the effective use of the innovative potential of the enterprise and increase the technological level of production.

5. PROPERTY RELATIONS IN INNOVATIVE COMPANIES

The list of owners of innovative companies must include employees who are innovators. In this case, let us clarify the concept of an innovative company. It is known that, in a general sense, an innovative company is a company that implements innovative projects. However, in this case, it is very difficult to distinguish the innovators in the companies and, accordingly, to divide the ownership status of the innovator-employee. In addition, as we noted earlier, it is not in the interests of the current owners of innovative companies. Therefore, the state should intervene in the innovation process in order to create favorable conditions for enhancing innovation. Thus, the key to the effectiveness of the national innovation cluster system is the balance of interests of all company owners - developers of innovative projects, owners of enterprises engaged in the implementation of innovative projects, venture investors, national innovation clusters and temporary innovator employees. In the process of building an effective mechanism for national innovative companies, it is important to identify the sources of their investment. Within the framework of this concept, a financial and investment mechanism is proposed for attracting investment in innovative activities with the participation of the state and private companies exporting natural resources. As you know, today the economy of Azerbaijan directly depends on the export of natural resources. Changes in the situation on world markets, first of all, lead to sharp fluctuations in prices for exported natural resources, which, in turn, leads to an increase in inflation in the country. The inflationary process begins to develop, prices for products that use exported natural resources begin to rise. This ultimately leads to an increase in the interest rate on the loan and a decrease in the availability of loans, as well as undermines the financial stability of all organizations and reduces their economic efficiency. The interrelated negative consequences increase the risk of investing in innovative projects, reduce the investment attractiveness of long-term innovative projects, and at the same time slow down the inflow of foreign capital into the innovation sector and restrict the inflow of local capital. All this undermines the socio-economic stability of the state and reduces its competitiveness. In order to neutralize these negative consequences and direct the excess revenues of the state and private companies from the export of natural resources in the innovation sector, it is proposed to create an investment fund to promote innovative development. Entities that export natural resources must necessarily transfer to this fund the surplus of actual income relative to the optimal amount. In exchange for the allocated funds, these entities should be granted a benefit for the payment of total tax, including value added tax, income tax, excise tax and mineral extraction tax. In this case, the exporting company remains in a situation of a tax labyrinth, in which the discount on the total amount of the tax payment is not applied if the contributions to the investment fund for promoting innovative development are not paid. The funds accumulated in the investment fund to promote innovative development by transferring excess income from the export of natural resources determine the high profitability of these entities.

6. CONCLUSION

- 1) Despite the contradictory consequences of cluster policy, its popularity has not diminished, and many developed countries continue to successfully use the cluster approach and are looking for ways to improve the effectiveness of cluster programs. The cluster approach has become an important organizer of the state's economic policy.
- 2) Interaction of enterprises of various industries within the cluster has become one of the priority areas for improving the competitiveness of the regions. The synergistic effect of the cluster formation will lead to an increase in the economic efficiency of enterprises, as well as to the mutual strengthening of the competitive positions of the regions where they are located.
- 3) The concept of innovative development of entrepreneurship is proposed, which includes the essence of the mechanism of state management of innovative development, the balance of management subjects and their interests.
- 4) Value indicators that allow us to assess the increase in the value of innovative enterprises should be considered as the main regulatory tools. At the same time, the emphasis should be placed on the fundamental value of the enterprise, on the basis of which it is possible to make objective management decisions.
- 5) As a result of changes in the situation on world markets, sharp fluctuations in prices for exported natural resources and products containing natural resources in production lead to inflation. To neutralize the impact of inflation, it is proposed to create an investment fund that promotes innovative development. Economic entities engaged in the export of natural resources must send to this fund an amount that exceeds the optimal actual profit from the export of natural resources. In turn, they should be exempted from aggregate tax payments, including value added tax, income tax, excise tax and mineral extraction tax.

ABSTRACT

The article addresses the company's approach as a whole, moving from the company's overall objectives and planned outcomes to the goals and results of each group, each person, and vice versa - from individual performance to the company's overall outcome. Any business operates with a specific strategy that is required to build the company's activities in accordance with long-term general plans, with a specific current scenario and specific performance results. The success of the current campaign is greatly influenced by the team's clear policies. For example, one of the consultancy firms developed a strategy of not collaborating with businesses interested with alcohol and cigarettes, reducing the circle of possible clients and eliminating very lucrative customers. This, of course, decreased the firm's current economic performance, but improved the social efficiency that the firm prioritizes over immediate outcomes, improving the firm's reputation. Politicians don't only restrict and guide the organization's operations; they also minimize potential options to activities that can be monitored, analyzed, and chosen as the most efficient.

Keywords: *financial stability, strategic management, efficiency, goal setting*

1. INTRODUCTION

Strategic management is now rooted in our society. In addition, “new ways of management,” such as system management, tactical management, and so on. This is, in practice, the same type of strategic planning. It is well established that the company's plan is a single structure that begins with the company's overall objectives and planned outcomes and progresses to the goals and results of each group, each employee, and vice versa - from individual performance to the company's overall performance. Any business operates in a rapidly evolving setting, and a strategy is only required to build the company's operations in compliance with long-term general plans and current specific plans, with a specific current scenario, with specific private outcomes obtained at lower levels, and strategy adjustment based on the specific results and situation. There would be no need for a plan if the internal and external environments were both stagnant and consistent. The challenges of evaluating concrete outcomes of operation as well as the internal and external climate are especially relevant in strategic management. Without it, no management, particularly strategic management, is feasible, with planning horizons of three to five years or even longer at the highest levels. However, up to 90% (Mintzberg, Alstrand B, and Lampel, 2000, p.336) of the time, plans exist just on paper, and actual activity follows its own course. Several methods that lead to such a condition can be identified here. To begin with, the technique is formulated at the highest levels and merely serves as a slogan. Secondly, the policy is formulated according to particular strategies, but it is applied poorly, failing to take into consideration the capacities of units and failing to communicate with them. Thirdly, the policy is formulated in collaboration with the lower classes, but it is not changed over time as the social and internal environment evolves, and the strategy quickly loses its importance. Another entirely incorrect solution is to correct the words almost immediately (for "objective" reasons) if intermediate alternatives are not met.

As a result, the organization's "strategy" is merely a representation of the present "company," rather than any strategy. The plan should encourage the team to work together to accomplish their objectives. Consider the factors that influence the strategic management system's efficacy. Yet, first and foremost, what exactly is strategic management?

2. STRATEGIC MANAGEMENT AND ACHIEVEMENT OF THE SET GOAL.

Strategic management is described as the management of achieving an objective, which includes the creation of policies that direct and restrict operations, as well as the creation and execution of programs to achieve the goal that do not go beyond the policies that have been implemented. From this and the preceding, the following key points that assess the strategic management system's effectiveness can be established.

- 1) Set a high but attainable goal - if the goal is too low, the results will be negligible.
- 2) The company's priorities (owner and manager), its structural divisions (unit managers), and ordinary staff are all aligned. And with such cooperation, harmony of priorities, can the whole team's efforts be directed at both setting the company's maximum objective (p. 1) and meeting the defined goal (all other points).
- 3) Creating a tree of priorities and plans that runs across the company's entire hierarchy, all the way down to the lowest-level workers - the strategy's execution is dependent on them (Zhemchugov A.M., Zhemchugov M.K, 2013).
- 4) Clear policies, the most important of which is the company's goal, or its social mission. She is the one who decides the key course of action and does not stray to the sides in order to produce short-term success at the expense of the long-term goal.
- 5) A consistent structure of disciplinary procedures in the event that obtained private outcomes differ from those predicted. A well-defined management accounting structure, with strategies and outcomes at all levels. The lack of such a method, or its unreliable operation, simply results in the plan remaining on paper.
- 6) A well-defined set of mitigation measures in the event of internal and external environmental deviations. The predictive predictor method. Without such a method, we can only hear of improvements once they have already had an effect on the outcomes, which will be exceedingly difficult, if not impossible, to fix.

As experience has shown, determining the highest attainable target is a difficult task (Zhemchugov A.M., Zhemchugov M.K, 2013). In most situations, the majority works "on what has been accomplished" - no examination of the company's future capabilities, no analysis of the external world, no new targets that are similar to potential are set. They actually set new financial goals that are 5-10% higher than previously set goals, but no special approach is required; instead, private cosmetic changes are made. Setting a high target entails first and foremost a view of the end product, a vision of when and how a high economic outcome can be accomplished. At least three types of targets are often present: goals for and production, goals for producing new, more efficient goods, and goals for developing a business in terms of resource, technological, and organizational development, in order to enhance its competitiveness and performance. The most effective topics at this point of growth include strengthening activity coordination and developing strategies and processes for effective management (currently, the unresolved nature of these issues gives up to 80 percent of the lag of our country in labor productivity from developed countries, and this is a lag of three to four times). Those key priorities include not only the development and creation of new goods, but also the development and implementation of efficient management and labor organization methods and practices, as well as goals that achieve the most impact without needing substantial investment but requiring major organizational changes. Any systemic reform, on the other hand, causes collective anxiety, which isn't just someone's apprehension - it's a major issue.

Particularly when proposed organizational changes do not have any harmful effects, people are fearful that these changes will impact them in any way, as shown by theory and experience (Ansoff I, 1999 358 p). If the changes are linked to reputation, role, influence, or reward, these changes are met with intense opposition (a whole "resistance group"), both overt and secret. And you will overcome this problem by inspiring the team to work against the organization's objectives, since setting and achieving high expectations would benefit both the corporation and each management and employee (but, in practice, this is far from always possible, and there will be resistance, and it must be predicted and taken into account). But it's much more successful if the corporation's and workers' interests are aligned, when they don't conflict, when there's unity and the company operates on self-organization rules (however, resistance of individual individuals is also possible here) (Zhemchugov A.M., 2014). The second argument is that good strategy is difficult without mission unity, even in serious situations, without the "right incentive.". This explains why, to date, only about 10% of the formulated techniques have been applied in practice by organizations (Mintzberg G., Alstrand B. and Lampel J, 2000, p.336). It is important that the external targets set for management and ordinary workers become internal conscious goals for them. The success of the current plan is highly affected by the team's consistent policies. For example, one of the consultancy firms developed a strategy of not collaborating with businesses interested with alcohol and cigarettes, reducing the circle of possible clients and eliminating very lucrative customers. This, of course, decreased the firm's current economic performance, but improved the social efficiency that the firm prioritizes over immediate outcomes, improving the firm's reputation. Politicians don't only restrict and guide the organization's operations; they also minimize potential options to activities that can be monitored, analyzed, and chosen as the most efficient. "When acts were dictated solely by external incentives and penalties, citizens would behave like a weather vane, always rotating in various directions", if we didn't have politicians (Bandura A and In R. Vasta (Ed.), 1989). It's important to remember that every company's key strategy is its goal, or the company's role in society. Other regulations govern and restrict the company's financial, technological, staff, and other operations. No management scheme will operate in theory without a consistent management accounting system and a clear system of disciplinary action. We must create programs to meet our objectives - programs and preparations for our operations - at all levels of the company's hierarchy - all divisions and staff - and at all levels of the company's hierarchy, including the outcomes needed at each point, timelines, and available resources. Often, at all layers of the hierarchy, maintain a physical log of the attainment of expected outcomes. Create and enforce the appropriate corrective steps if the predicted outcomes vary from the real ones. If, for example, we compare expected and real intermediate outcomes and find that we will not be able to reach a given end goal in a timely fashion, we must restructure our activities to ensure that the work is done on schedule. However, the adjustment should only begin where there has already been some delay and when there is a risk of failing to finish the job on schedule. A well-defined scheme of preventative steps: in the absence of full clarity about possible developments in both the internal and external climate, initiatives and strategies are created. As a consequence, in the case of changes in the internal and external environment that differ from the forecast, an effective adjustment of the policy and the execution of protective measures are needed - measures that ensure that changes in the internal and external environment have no detrimental effects on the company's performance. The biggest distinction between preventive and corrective acts is that corrective actions are only carried out when a divergence from a given outcome has already happened, they are carried out with a delay, and it is often too late to carry them out. Preventive steps are made only after the risk (or a potential opportunity) is identified, and the corporation operates ahead of time to ensure that the company's results do not suffer as a consequence of the detected danger, or rise as a result of the new opportunity. The aim of preventive measures is to avoid identified threats from affecting activity results (or mitigating

their impact), and to make the most of new opportunities found - to boost activity results. In reality, a mixture of corrective and preventive steps is expected for optimal efficiency, with monitoring of not only the obtained intermediate and final outcomes, but also the internal and external environment.

3. DEVELOPMENT AND IMPLEMENTATION OF FORWARD-LOOKING PERFORMANCE MANAGEMENT

The need for the production and execution of long-term maintenance of the enterprise's effectiveness is becoming exceedingly important at this time. Strategic management is a systematic system for assessing and executing an organization's strategic priorities, which is focused on predicting the global economic situation and devising plans to respond to the changes. The organization as a whole, as well as its individual divisions, are the focus of the management plan. Managers who perform administrative roles in an organization are the targets of management techniques. In the absence of an optimally defined approach for managing the enterprise's productivity, which is adaptable to future shifts in the external world, management decisions of particular institutional units of the enterprise become multidirectional in nature, inconsistencies emerge, and administrative operation as a whole becomes less efficient. The technique of enterprise performance management is an instrument for the prospective management of enterprise output in the face of changing developments in macroeconomic indicators, the structure of state control of business processes, and market conditions. This approach is a master plan of action, a system of management processes and methods aimed at determining the best ways to ensure the enterprise's long-term performance. Setting targets for the execution of the enterprise's financial and economic operations, deciding its focus areas and forms, maximizing the arrangement of investment capital formed, their allocation and usage, and establishing a management agenda for the most relevant financial and economic areas are all steps in the development of a management strategy. The key aim of the industrial business success improvement approach is to ensure the enterprise's long-term economic growth and development, which can, in turn, ensure the enterprise's market value as a property complex grows to its full potential. The main tasks of strategic management of enterprise performance are established in accordance with the goal, such as the formation of organizational support for the industrial enterprise's strategic management system; ensuring the optimal use of material, labor, financial, and investment resources; and developing an effective investment policy, as one of the components of the strategic management system; ensuring the long-term minimization of production, commercial, financial, and investment risks in the enterprise; investigating the state of the strategic management system and trends in the development of the efficient operation of an industrial enterprise, ensuring its solvency and financial stability, as well as the high turnover of its assets and capital; ensuring the quality of the strategic management system and trends in the development of the efficient operation of an industrial enterprise, ensuring the quality of the strategic management system and trends in the development of the efficient operation of. In order to effectively accomplish the key purpose of company management, it is important to execute these activities in their interconnection and interdependence during the development of an efficient enterprise activity management structure (Makarova V.I., Bobreneva E.A., Zelenkina M.E., V.N. Tatishcheva, 2006.- 253 p.). For the enterprise activity management scheme, the corporate success management strategy is a general company growth plan that is applied by practical strategies, such as a marketing strategy, project development strategy, innovation strategy, financial strategy, procurement strategy, and organizational support strategy. The structure of certain priorities and aims that the business management sets itself determines the option of practical methods in the organization. The analysis of market dynamics, as well as the strengths and disadvantages of rivals, characterizes marketing strategies.

Market research and review of market data are needed for making managerial decisions aimed at achieving the output strategy's goals and objectives. The production development strategy is a series of interconnected steps for the establishment of a product portfolio, infrastructure, and production organization that allows the company to achieve long-term economic growth. An innovative strategy can be defined as a method of designing and applying strategic, operational, and organizational technologies in the enterprise's key areas of financial and economic operation in order to ensure long-term productivity and growth. The financial plan aims to develop the requisite financial tools, as well as the enterprise's optimum capital structure based on the effective ratio of own and borrowed funds. Equity, or retained profits, are providers of the company's own assets. The key driver of development of the organization's equity is retained profits from the previous year and net benefit from the reporting year, which is developed, circulated, and used at the company after taking into account the revenue earned and the costs of manufacture and selling of goods. Long-term and short-term loans, credits, and other obligations are examples of borrowed money. As a result, the enterprise's successful financial capital management plan seeks to optimize net profit as the primary driver of equity growth while simultaneously maintaining the enterprise's long-term financial stability. Setting investment goals, determining priority areas and forms, optimizing the structure of investment resources, their formation and distribution, developing an investment policy on the most important aspects of investment activity, and creating new promising opportunities while taking into account changes in the external environment are all part of the process of developing an investment strategy. The operational support plan for the enterprise's operation management system is a multi-level transition system aimed at meeting long-term goals and priorities, which involves improvements to management's organizational structure, the creation of new horizontal and vertical management relations, operating processes, and organizational culture. The application of the core functions of controlling an economic organization is the basis for a systemic approach to managing the output of an industrial enterprise. A system study of an industrial enterprise's efficient management as a science is an analytical feature of a supervisor, is specifically manifested in management concepts and practices, and is an important part of the management process.. Organization, as a management function, entails establishing an organizational management system in which horizontal and vertical relationships emerge over the acceptance and execution of management decisions at various levels. An industrial enterprise's management organizational structure promotes coordination of all management activities, defines performer privileges and responsibilities, and decides staff professional activity and management style. Accounting, as a management activity, is responsible for forming, accumulating, classifying, and generalizing the requisite data, which should accurately and completely represent the processes happening in the enterprise's financial and economic operations during the reporting period. Accounting establishes a foundation for assessing the effectiveness of a corporate enterprise. The study offers a quantitative and qualitative evaluation of the company's financial position and financial performance. The study of cause-and-effect interactions on the dynamics and modifications in individual articles of land, as well as the origins of their formation, is used to conduct the research. A thorough examination of the organization's financial and economic practices enables you to recognize reserves as untapped assets, identify challenges, and establish key activities aimed at forming successful management decisions. The study is a method for objectively assessing the enterprise's current reporting and previous times, defining business unit issues, and formulating appropriate management decisions. Furthermore, the study is the first step in preparing and predicting the company's future operations. The preparation of the key metrics is carried out based on an analytical evaluation and review of the results from the monitoring cycle, as well as the established challenges of the organization, ensuring the creation of the management object to achieve the goal.

4. SYSTEM APPROACH TO PERFORMANCE MANAGEMENT

Planning is a method of designing strategies and planning standards aimed at effectively supplying the organization with appropriate tools and optimizing strategic decisions as a general management activity and as part of an integrated enterprise management framework for an industrial enterprise. The program, as a method for planning and the cornerstone of the company's long-term activities, guarantees continuity in the work of all departments and structures, as well as interconnection with business networks. The preparation process consists of many phases, including the development of general objectives, the identification of particular activities, the selection of the primary methods and means for achieving them, and the monitoring of their execution. Planning identifies and tracks the existing and future progress of the company based on real and regulatory evidence from the recent and previous periods. Three levels of financial preparation can be differentiated depending on the duration of the timeframe of which the established strategy pertains: structural, tactical, and organizational. Strategic preparation is undertaken over a long period of time and includes the development of qualitatively new priorities, strategies, scale, and areas of operation for the business. The transition of the enterprise to expected shifts in the global climate, the achievement of a secure business place, and maintaining financial flexibility and solvency of the enterprise in a competitive environment are all priorities of strategic planning. The development and practical implementation of a system of plans that determine the future state of the organization, as well as the ways, means, and means of achieving it; accurate and timely assessment of the potential consequences of changes occurring in the social, economic, and scientific-technical fields; forecasting negative situations and developing solutions are all tasks of strategic financial planning. The strategic planning method is a medium for justifying management actions in the field of the company's economic operation. At the tactical stage, financial preparation for ongoing operations is done, and monetary capital, or totally liquid assets required for the business for a certain time, are calculated. The aim of tactical preparation is to ensure that the established approach is applied in a coherent and phased manner. The aims of tactical preparation are to specify strategic goals in relation to a shorter time frame, to choose the most appropriate means to execute the policy, to ensure economic activity and performance, and to proportionally grow and maximize the company's capacity. Tactical preparation is accompanied by organizational planning. It operates for little longer than a year and includes the company's short-term expenses. Its mission is to ensure that all divisions of the enterprise work together on a regular basis to accomplish promising and existing objectives by making efficient use of resources. The nature of operational planning is the creation of scheduled activities in organizational units for brief periods of time based on tasks formed during tactical planning and taking into account an overview of the organization's actual performance over the previous year. An industrial enterprise's financial planning systems must be well-organized in order to ensure long-term sustainable growth and development. As a result, implementing organizational and logistical preparation as the primary feature of controlling the enterprise's productivity aims for a predictable, staggered rollout of the formulated strategy. The aim of an integrated control system is to validate and ensure the execution of all management decisions in the field of the organization's organizational, investment, and financial operations, which is an important part of the business performance management system. System regulation of an industrial enterprise's performance management is a monitoring system that guarantees the concentration of control actions in the enterprise's key fields, the prompt identification of deviations from the expected (planned) outcomes, and the implementation of effective organizational management decisions. Monitoring the execution of the major tasks of industrial and economic activity, evaluating deviations from current, expected, normative indicators, determining the causes of these deviations, developing organizational management decisions, and planning the operations of the organization are the main functions of system control.

The method of forming corrective control acts that get the control object into the desired state for the execution of the solution chosen during preparation is known as regulation as a general control mechanism. The orderly establishment of a hierarchical structure of mission allocation by responsibility centres, including the control of powers and obligations in their execution, is what coordination as a management mechanism is all about. The integration of the activities of the heads of departments and the company as a whole to accomplish the main purpose of the corporate unit, as articulated in long-term objectives, is the most important requirement for the enterprise's successful activity. As a result, the primary goal of teamwork is to ensure coherence in all aspects of the organization's function by creating logical connections between them. General management roles are intertwined and form a competitive organization when combined.

5. CONCLUSION

The most important management functions are business analysis and planning, which enable you to analyze, find challenges, and create solutions. The operations of an industrial company were disclosed in the work based on financial analysis for the previous duration (from 2003 to 2010), including:

- there is little equity in the company to finance inventories and expenses. The key explanation for this is that the corporation does not earn enough revenue from product sales, as well as a significant portion of the expense of the overall revenue system from inventory sales;
- the number of other investments much outweighs the company's other revenue. This is because the company's costs for selling and disposing of fixed assets, as well as fees, taxes, and forfeitures, outweigh other profits;
- In the filing era, residual profits were unfavorable, resulting in a poor net profit value and indicating the existence of the company's debts.

The key forms of cost optimization, including the cost of manufacturing, commercial, and operating expenditures, was recommended to maximize the enterprise's equity resources and reduce losing products in the work. There are two key choices for increasing revenue from product purchases: increasing the share of sales and increasing costs marginally without compromising product quality. Reserves for development of other profits and opportunities to reduce the value of other expenditures are considered during the planning phase. The long-term economic growth and prosperity of the business can be assured by the execution of a successful management plan. Evaluation of the efficacy of the developed general enterprise growth plan is one of the key tasks of strategic management of industrial enterprise output. Pricing is accomplished by a pricing policy, market research and analysis, the creation of a portfolio of orders with specific delivery dates, and the implementation of a distribution strategy. Expansion in current distribution channels and development of new markets are two ways to increase sales. Sales development is also aided by modernization, rehabilitation, product creativity, and competitive advantages. The cost of production is the most critical consideration in assessing the economic viability of management and expenditure decisions aimed at determining wholesale values and optimizing resource quality. The paper examines the most important cost-cutting practices. It is important to use science validated norms and guidelines for raw materials, materials, gasoline, and energy; to implement progressive labor standards that would maximize labor efficiency and reduce factory worker wage costs; to provide an efficient corporate management system, and to develop production infrastructure and technical processes. Fixed costs, like commercial costs, are a consideration in the benefit reversal action. Owing to reduced packaging, storage, shipping, advertisement, and other costs associated with retail purchases, a decrease in the share of commercial expenditures for the preparation period is likely.

For the projected period, optimizing overall cost of production and commodity sale would boost operating margin and profit from sales. In addition, it should be recognized that the key metrics of the enterprise's success have improved significantly as a result of the execution of corporate priorities and targets. Due to the rise in retained profits, the introduction of the financial planning mechanism and expected indicators would improve equity, ensuring the company's financial performance and profitability. Thus, the work considers both theoretical and operational facets of strategic management of industrial enterprise operation productivity, the execution of which would ensure long-term economic growth and development.

ABSTRACT

Digitalization is the introduction of digital technologies in different areas of life to improve its quality and development economy. It helps to perform routine tasks and make decisions without human intervention. The essence of digitalization in process automation is the transition of information to a more accessible digital environment, where it is easier to analyze it, and then get an accurate solution autonomously. The challenge of digitalization is to make the process flexible. The digital economy is not a separate industry, in fact it is a way of life, a new basis for the development of the system of public administration, the economy, business, the social sphere, and the whole society. The formation of a digital economy is a matter of national security and independence of every country in the world, competition of domestic companies. The article examines the impact of the digitalization process on society and the economy of the modern world. The aim of the study is to conduct statistical research and assess the level of digitalization of the economy countries of the world. The focus is on assessing the level, dynamics and directions of information and communication technologies development in the economies of the countries of the world on the example of the international index of digital economy and society (I-DESI). The strongest and weakest countries were identified, and the impact of components (sub-indexes) of the I-DESI index on GDP was studied. To assess the level of development of the digital economy in domestic and foreign assessment systems, several approaches are used. A wide range of methodological approaches is due to the intertwining of various concepts and interpretations of the digital economy. For this study, the digital economy and society index, which is a composite measure that studies the digital indicators of Europe, developed by DG CONNECT (the European Commission) to provide an evidence-based contribution to the assessment of digital development in the EU as a whole, is considered as an assessment of the level of digitalization. Based on the sub-indexes of this index, a multidimensional classification of the countries of the world was carried out. The main components method identifies the main factors that were used to identify their impact on the level of GDP in various clusters. The Statistica package is used for information processing and analysis. This study examined the values of sub-indexes of the I-DESI index in five dimensions: communication, digital skills, citizens' use of the internet, integration of business technologies, and digital public services. According to the hierarchical classification based on these sub-indexes, 2 groups of countries were identified. Using the k-means method, the features of each cluster are identified. Comparisons of cluster analysis results by sub-indexes were made based on data from 2020 and 2019. Using the main components method, five main factors were identified out of twenty indicators characterizing the I-DESI index and their influence on the level of GDP in various clusters was revealed. The analysis of twenty indicators of the I-DESI 2020 index, applied in the method of main components, by the directions of the index itself, the

economy in the context of GDP and the social sphere (life of society) through the HDI (human development index) in various clusters was also carried out. According to the research, two groups of countries were identified by the level of digitalization. This cluster is mainly represented by developing countries, which still have a large share of production in GDP. The level of GDP in the first cluster countries with a high I-DESI index was mainly influenced by factors that characterize fixed broadband and digital public services. Two groups of factors also influenced the GDP level of the second cluster countries. One group of factors combined variables that characterize new technologies in business, the other group - the use of the Internet by the population. The study of the development of the digital economy has allowed us to conclude that in general, the trend of rapid spread of modern technologies is developing around the world. This suggests that society in the context of the state and the individual needs to be mobile and ready to adopt new technologies in advance.

Keywords: *digitalization, digital economy, the main components method, multidimensional classification, the digital economy and society index*

1. INTRODUCTION

Digitalization is one of the key trends in the global economy. Today, almost half of the world's population is connected to the Internet, fifty years since its invention and thirty since the creation of the World Wide Web. Digital technology has become ubiquitous and part of everyday life. The main goal of digitalization is to improve the use of the potential of information and communication technologies to promote innovation, support economic development and stimulate scientific and technological progress in general, and ultimately contribute to the formation of “smart”, sustainable and inclusive economic growth in the region. A well-functioning digital market can make a good contribution to the development of the economy. However, like any dynamic process, digitalization creates certain conditions that require a number of skills from a person for high-quality coordination of interaction, for example, the ability to work with information and communication technologies, to use new possibilities of the digital space for professional and personal needs. In order to see which regions are developing faster, at what speed and how information technologies are spreading in them, it is necessary to find ways to reflect the readiness of the population to move to a new level of development. One of the most noticeable phenomena of the last decade is the transition to the next stage of globalization - digital transformation, which consists in a fundamental change in the structure of the world economy, its global virtualization due to the emergence of new forms of cross-border movement of virtual goods, capital, and labor. In this regard, measuring the impact of digitalization on economic development is becoming a major challenge for researchers. The article examines the impact of the digitalization process on economic development.

2. LITERATURE SUMMARY

In the scientific literature there is no unambiguous interpretation of the concept of "digital economy", despite the high practical significance of research in this area [Bucht R., Hicks R., 2018, Brennen S., Kreiss D., 2014]. Early interpretations defining the essence of the term "digital economy" considered Internet technologies as its dominant content element, paying attention to the interaction of people through network technologies [Tapscott D, 1996]), to the emerging information flows [Lane N. 1999] and areas critically dependent on digital technologies [Kling R., Lamb R. 2000]. In later periods, the attention of researchers began to be attracted by the transformation processes taking place in various sectors of the economy under the influence of the introduction of information technologies [Brynjolfsson E., Kahin B. 2000], as well as the structural components of the “digital economy” [Mesenbourg, T.L., 2001, Dahlman C., Mealy S., Wermelinger M., 2016].

The digital economy limits its functioning by the production of electronic goods, services and their distribution using e-commerce [Asanov R.K., 2016]. But in this case, the question remains unsolved - what place in this interpretation is given to intangible values. The digital economy of the main resources for the production of goods and services is information, knowledge and the use of digital technologies for storing, processing and transmitting information [Kutsman A.A., 2016]. The storage, processing and transmission of information through information technology together constitute only part of the functions performed by the digital economy. The challenges of the digital economy are as follows:

- changing the relationship with the consumer;
- undermining established partnerships;
- "necessary interdependence";
- creation of a new ecosystem of the digital economy [M. Wessel, E. Levy, R. Siegel., 2018]

The scientific literature focuses on the essence of digitalization, its sectoral aspects, as well as the factors and problems of the digital transformation of the economy digitalization as an accelerating expansion of the Internet as a communication tool, mobile Internet, social networks, as well as commercial platforms that have an important impact on the functioning of business, public institutions and individuals [Milosevic N., Dobrota M., Barjaktarovic Rakocevic S. 2018]. Digitalization is broader than the digital economy, since the process of introducing digital technologies takes place in all spheres of human activity, and not just in the economy. At the same time, digitalization is a particular manifestation of the broader phenomenon of informatization of society, i.e. digitalization is a modern stage in the development of informatization work [Plotnikov V.A., 2018]. The paper considers the communicative, infrastructural and sectoral aspects of the digital economy. Within the framework of the communicative approach, the issues of using information and computer technologies for economic and social interactions are considered. Ensuring effective communications between all subjects of the digital economy requires the availability of appropriate infrastructure [Nikolaev M.A, Makhotaeva M.Y. 2018]. Sectoral aspects of digitalization are also presented in [Akberdina V.V. 2018]. The stages of digital transformation of enterprises are considered in the work [Nikolaev M.A, Makhotaeva M.Y., 2019]. At the World Economic Forum in Davos in 2016, dedicated to the IV industrial revolution, it was noted that the fourth round of industrialization was launched by the introduction of automation and digitalization in the industry. The first three industrial revolutions were associated with mechanization, electrification and informatization. Now the digital economy is penetrating all areas of activity, and its growth is very sustainable. The development of the digital economy in the world is heterogeneous, in part due to different levels of economic development. Most of the studies on the impact of digitalization of the economy are devoted to its impact on economic growth. For example, Rosso studied the impact of digital transformation on GDP in the European Union, namely the impact of investment in the ICT sector on economic growth and its key indicators: GDP, productivity and employment. The positive influence of investments in the high-tech sector on the level of GDP of the countries of the European Union was revealed [Rosso L., 2016]. In other blocks of research, it was revealed that digitalization has a positive effect on GDP per capita, employment and employment growth [Chakravorti S., Chaturvedi R., 2017].

3. METHODOLOGY

Digitalization is one of the key areas of development of the world economy, which is currently considered as a significant factor in improving economic dynamics. Digitalization is currently seen as a leading factor in economic development. At the same time, the dynamic development of information infrastructure in the regions, the increase in the availability of broadband Internet

for the population and business are not accompanied by adequate changes in the indicators of economic growth. The scientific literature focuses on the essence of digitalization, its sectoral aspects, as well as the factors and problems of digital transformation of the economy. At the same time, much less attention is paid to the effectiveness of digitalization in terms of improving the dynamics of socio-economic processes. Most of the authors note the significant impact of digitalization on regional development, but the studies conducted have revealed the absence of a significant relationship between the level of digitalization and the dynamics of socio-economic development. The main idea of the study is to identify the impact of digitalization of the economy on the development of economic development by conducting econometric analysis and to prove the hypothesis of the existence of a high statistical relationship between the indicator of digitalization of the economy and indicators of economic growth. The study hypothesizes that digitalization within the framework of the structural approach has a positive effect on the development of the economy. The indicator of the development and competitiveness of the state is considered to be the level of GDP. In the modern era, digitalization is increasingly influencing it. To determine the relationship and assess the impact of factors characterizing digital development on the level of GDP per capita, a correlation and regression analysis was carried out. This analysis, carried out using the construction of regression models, will determine the main possibilities of the impact of digitalization on the development of the economy. Factors obtained in the course of principal component analysis were taken as independent variables.

4. ANALYSIS OF THE INFLUENCE OF DIGITALIZATION FACTORS ON ECONOMY DEVELOPMENT

In the research process, the study of the digital sphere is carried out directly, and the I-DESI index is taken for Y_1 according to the data of 2019. As independent variables, the main factors obtained by the principal component analysis were used from 20 indicators of the I-DESI-2019 index (indicators were selected from 24 indicators of the index, 4 were removed due to differences in normalization and inaccurate correspondence to determine the relationship between indicators). According to the results of the method of principal components (Varimax), five main factors turned out to be significant, the coefficients of information content of which satisfy certain conditions. According to the results of the regression analysis, 3 factors turned out to be significant, t-statistics, the p-level of which correspond to the normative values. The t-statistics, p-level values indicate a good significance of the factors in the model of influence on GDP.

Table 1: Regression totals for the dependent variable: Y_1

	Beta	Std.Error	B	t	Sig.
Constant			0,538765	123,5456	0,000000
f_3	0,433435	0,018632	0,022301	1,8076	0,020004
f_4	0,282304	0,018632	0,019709	2,2435	0,002654
f_5	0,690548	0,018632	0,044201	4,8623	0,000115

R: 0,92920, R Square: 0,86342, Adjusted R Square: 0,85889, F(3,18) 18,08932, p-0,00000, Std. Error: 0,003214

For countries with the most developed level of digitalization, the prospects for active interaction between the economy are of the greatest importance in the context of digital areas. The regression equation is:

$$Y_1 = 0.539 + 0.022 \cdot f_3 + 0.020 \cdot f_4 + 0.044 \cdot f_5$$

Where Y_1 is the I-DESI 2019, f_3, f_4, f_5 – are factors

From the regression models it can be seen that the strongest influence is exerted by f-factor 5 (f_5). With an increase in the level of use of modern services by 1 conv. units the I-DESI index will grow by 0.044 conv. units with unchanged values of other factors. The high value of the coefficient of determination characterizes the quality of the set of factors.

Table 2: Regression totals for the dependent variable: Y_2

	Beta	Std.Error	B	t	Sig.
Constant			32768,21	21,43567	0,000000
f_1	-0,222345	0,234087	-4622,09	-3,00023	0,032005
f_2	-0,180456	0,234087	-6432,11	-1,09765	0,002876

R: 0,6782, R Square: 0,4599, Adjusted R Square: 0,3431, F(2,19) 5,3467, p-0,0021, Std. Error: 11459,23

$$Y_2 = 32768,21 - 4622,09 \cdot f_1 - 6432,11 \cdot f_2$$

where Y_2 is the I-DESI 2019, f_1, f_2 – are factors.

With the growth of digital public services by 1 conv. units the level of GDP falls by \$6432.11 with the remaining factors unchanged. The reason for the behavior of the constructed model is in the volume of expenses for the creation of services, training and retraining of human capital. The influence of digital technologies occurs to a large extent on the life of society, its quality of life. In order to analyze the impact of digital technologies on the quality of life, a regression analysis was carried out.

As Y_3 - the HDI for 2019.

Table 3: Regression totals for the dependent variable: Y_3

	Beta	Std.Error	B	t	Sig.
Constant			0,876594	204,5890	0,000000
f_1	-0,217653	0,124561	-0,020345	-3,1213	0,033345
f_4	0,547652	0,124561	0,0240987	0,0235	0,001456

R: 0,82738, R Square: 0,68455, Adjusted R Square: 0,38678, F(2,19) 9,03456, p- 0,00102, Std. Error: 0,002786

$$Y_3 = 0.877 - 0.020 \cdot f_1 + 0.024 \cdot f_4$$

where Y_3 - HDI, f_1, f_4 - factors

With an increase in the spread of digital skills by 1 conv. units the HDI level grows by 0.024 conv. units with unchanged values of other factors. This factor has a significant impact on the level of human development, namely on its components: life expectancy, the expected period of education. According to the results of the analysis of the impact of digitalization indicators on the I-DESI index, 4 factors out of 5 turned out to be significant.

Table following on the next page

Table 4: Regression totals for the dependent variable: Y_1

	Beta	Std.Error	B	t	Sig.
Constant			0,654701	101,32344	0,000000
f_1	0,213452	0,215326	0,016789	3,09863	0,002109
f_2	0,092165	0,215326	0,021321	5,12098	0,009111
f_3	0,210021	0,215326	0,019766	5,43298	0,003241
f_4	0,612091	0,215326	0,038609	2,08765	0,000013

$R: 0,86724$, $R\text{ Square: }0,75211$, $Adjusted\ R\ Square: 0,68764$, $F(4,18) 12,43526$,
 $p-0,00022$, $Std. Error: 0,012219$

Taken together, 4 factors represent 9 significant indicators characterizing the introduction of technologies into business and public services.

The regression equation is:

$$Y_1 = 0.655 + 0.017 \cdot f_1 + 0.021 \cdot f_2 + 0.020 \cdot f_3 + 0.039 \cdot f_4$$

where Y_1 is the I-DESI 2019 index, f_1, f_2, f_3, f_4 -are factors

The strongest influence is exerted by factor 4 (f_4).

With an increase in the coverage of online users by 1 conv. units the I-DESI index will grow by 0.039 conv. units with unchanged values of other factors. The high value of the coefficient of determination characterizes the quality of the set of factors. Further, the level of GDP was taken as the dependent variable. The results of the primary analysis show that business technology and coverage indicators have a significant impact on the GDP level.

Table 5: Regression totals for the dependent variable: Y_2

	Beta	Std.Error	B	t	Sig.
Constant			12346,09	14,89765	0,000000
f_1	0,340982	0,245806	4252,21	4,07765	0,002034
f_4	0,280976	0,245806	1235,22	1,347867	0,022109

$R: 0,699$, $R\text{ Square: }0,489$, $Adjusted\ R\ Square: 0,456$, $F(2,20) 5,322$,
 $p-0,006$, $Std. Error: 3009,201$

$$Y_2 = 12346.09 + 4252,21 \cdot f_1 + 1235,22 \cdot f_4$$

where Y_2 is the level of GDP), f_1, f_4 – are factors.

According to the outcome of the regression analysis, these factors turned out to be significant in the GDP model. This means the expansion of technology in business allows you to reduce losses, optimize the production process, reduce production time and unnecessary personnel. All this allows the business to become more active and start generating more income. With an increase in business technologies by 1 conv. units the level of GDP will grow by \$4252.21 with the remaining factors unchanged. With regard to the social sphere, the influence of factors on the HDI is shown in table 6.

Table following on the next page

Table 6: Regression totals for the dependent variable: Y_3

	Beta	Std.Error	B	t	Sig.

$$Y_3 = 0,760 + 0,026 \cdot f_3 + 0,011 \cdot f_4$$

where Y_3 - HDI, f_3, f_4 – factors.

Three indicators included in factor 3 (f_3) and 4 (f_4) show information transfer rate and coverage. In other words, with an increase in the percentage of the population covered by mobile speed by 1%, the HDI level increases by 0.026 conv. units with unchanged values of other factors.

5. DISCUSSION AND CONCLUSION

According to the results of the study, it is possible to identify some features of the impact of digitalization on the development of the economy. The main vectors of technology development can be considered the business direction, digital personal skills, communication expansion, and government digital services. Digitalization is one of the key trends in the global economy. The countries with the strongest economies in the world have included the digitalization program in their economic development strategy. The digitalization of the economy represents a certain stage in the modern development of scientific and technological progress, which is associated with the widespread introduction of Internet networks, computer and information technologies, e-commerce, cloud services in industrial, social, public and other spheres of activity. The results of the study indicate that the digitalization of the economy has a contradictory effect on economic growth: the introduction of product (competitive) innovations contributes to growth, and the use of process innovations based on the redistribution, expansion and dissemination of knowledge as non-competitive goods can slow down the development of the economy. The digitization of assets and their accounting in production and consumption causes a decrease in their value, as a result of which a relative decrease in the size of GDP may occur, which in turn may entail a slowdown and even a decrease in the growth rates determined on the basis of this indicator. Analysis of economic growth rates shows that the development of digitalization processes in various industries and sectors of the economy has not yet had a significant impact on the growth rates of the economy of both individual countries and the world as a whole. The development of a sharing business based on the redistribution of existing goods and the provision of services can also slow down economic growth. In this sense, the first hypothesis about the inconsistency of the influence of modern processes on economic growth has been confirmed, but how significant the impact of digitalization processes on growth and economic development is requires further research. Development of the theoretical foundations of analysis, modeling and measurement of economic development in the context of digitalization is required. It is necessary, based on a meaningful analysis of such indicators as labor productivity, capital efficiency, etc., to develop new indicators of their performance, taking into account the specifics of network and sharing companies and the peculiarities of creating their useful results. The development of a sharing economy through the redistribution of material goods or their joint use makes it possible to increase the level of individual well-being. At the same time, there is often no increase in production volumes and, therefore, social welfare does not increase. The digitalization of the economy contributes to the growth of monopolization of the computer or network business during the period of globalization, which requires either the

reform of existing ones, or the creation of fundamentally new national and global institutions to regulate economic development in modern conditions. Analysis of the problems and features of the development of digitalization of the economy allows us to conclude that it is necessary to develop new economic theories that will reflect modern realities, will allow to justify new indicators or characteristics of the network business in the conditions of a sharing economy and assess their useful results, as well as ensure the improvement of methods for managing economic objects in the evolving digitalization.

ABSTRACT

In every society, the securities market plays an important role in broadening the field of financial relations. Facilitating economic entities' access to financial services and growing productivity in the diverse use of resources are two important aspects of the country's economic growth. In this regard, one of the key factors driving economic growth is the efficient use of capital resources in various sectors of the economy, and the securities market's position in obtaining these resources is undeniable. Therefore, the functioning of Azerbaijan's organized stock market is one of the most significant factors in the country's economic growth. This paper evaluates current state and potential opportunities for the securities market in Azerbaijan, and it shows that in contrast to other countries, Azerbaijan's securities market is very young. However, there has been a recovery and improvement in all segments of financial markets in the light of the country's accelerating economic growth and deepening structural reforms, and there is a solid potential for growth. Furthermore, it has to be given attention as a part of ongoing economic reforms in terms achieving economic diversification and stimulate non-oil sector growth. The President of the Republic of Azerbaijan has launched Securities Market Development Program in 2011 to further advance this sector. The advent of market makers to increase liquidity in the securities market, as well as the transparency of operations and the improvement of corporate standards, have all paved the way for this area's development. Some of the works achieved for the development of this sector in the recent years include increasing market awareness, explaining the benefits of the sector to the key players, as well as introducing the Baku Stock Exchange's Listing Advisory program.

Keywords: *Financial securities market, Azerbaijan, economic growth, economic reforms*

1. INTRODUCTION

Oil and gas have played a major role in the growth of Azerbaijan's economy since the country's independence in 1991. Azerbaijan signed an oil deal with a multinational oil firm in 1994, allowing it to sell its oil and gas on foreign markets and gain big profits (Hoffman, 1999, p. 8). As a result, non-oil sector growth and economic diversification have become critical components of Azerbaijan's economic reform agenda (Babayev, 2020.). In particular, the global market's fluctuating oil prices, as well as evolving trends in international economics and politics, have made a comprehensive economic reform agenda an inevitable policy problem for Azerbaijan (Babayev, 2019, p.537). Furthermore, Azerbaijan is determined to reforms. It is worth noting that agriculture, information technology, foreign transportation corridors, and entrepreneurship have all become policy priorities in Azerbaijan's economic reforms (Ismailzade and Babayev, 2020, p. 79; Babayev, 2020, p.92). Azerbaijan's government is also establishing support structures to assist in the development of the aforementioned areas. This includes structural reforms as well as improvements to the country's innovation and financial structures. It is important to mention that the country's financial system plays an inevitable role in the country's economic development (Babayev and Hajiyev, 2019, p. 312-219). Duisenberg (2001, p. 1) mentions that in the financial system *that* includes financial markets, instruments and institutions “funds flow from those who have surplus funds to those who have a shortage of funds, either by direct, market-based financing or by indirect, bank-based finance”.

The former British Prime Minister William Gladstone mentioned “finance is, as it were, the stomach of the country, from which all the other organs take their tone” (Duisenberg, 2001, p. 1). Securities markets are one form of financial market. Facilitating economic entities' access to financial services and growing productivity in the diverse use of resources are two important aspects of the country's economic growth. As a result, one of the key factors driving economic growth is the productive use of capital resources in various sectors of the economy, and the securities market's position in obtaining these resources is unavoidable. As a result, this industry which is essential for economic growth requires special attention in order to develop. It must be mentioned that the volume of the securities market, which is an integral part of the global financial markets, is growing day by day. The volume of securities currently traded in these markets is trillions of dollars. The total value of the US stock market alone is \$ 30 trillion, and the total value of the bond market is \$ 40 trillion. The question is, what are the main factors that attract investors and issuers (bond issuers) to these markets? (Babayev R, 2020). One of the main advantages of such markets for investors is liquid markets. That is, the capital you invest is invested in a security, not any property, and when an investor needs money, he can sell the security on the stock exchange as soon as possible. In addition, the security is not physically depreciated, and its maintenance does not require additional costs. On the other hand, you can use the security you have as collateral when taking a loan from a bank. The general advantages of issuing securities to companies are the recognition of companies in the national, regional or global financial markets, as well as increasing the efficiency of their activities. By developing financial markets, the state creates favourable conditions for the growth of the non-oil sector, as well as the development of entrepreneurial activity. When it comes to Azerbaijan's stock market, the government needs to advance this field in order to achieve economic diversification. Since it has been such a new and young sector, there are both potential opportunities and problems. As mentioned by Jeyhun Ibrahimov Chairman of Managing Board of Association of Azerbaijan Stock Market Participants during his interview in 2018, “securities market of Azerbaijan is using only a small part of its potential” (Azernews, 2018). He also mentioned in detail that with the necessary infrastructure, a modern trading system, potential buyers, and sufficient profitability, Azerbaijan's securities market has a lot of potential (Azernews, 2014). Kasumov has identified a number of potential issues in the field, including the lack of foreign investors, limited access for international investors to the local currency bond market, and limited liquidity of securities due to the absence of a secondary market, as well as the newness of the market for government and corporate securities, short maturity of government securities, inadequacy for the creation of a yield curve (no date). The current state and potential opportunities of the securities market in Azerbaijan will be addressed after the concept of the securities market is explained from a global point of view.

2. THE CONCEPT OF SECURITIES MARKET

A security is a financial commodity that can be sold. The term is used to describe any type of financial instrument, although the legal meaning varies depending on the jurisdiction (Bansal, 2017, p. 46). Bansal (2017, p. 48) writes that “securities market is a component of the wider financial market where securities can be bought and sold between subjects of the economy, on the basis of demand and supply. Securities markets encompasses equity markets, bond markets and derivatives markets where prices can be determined and participants both professional and non professionals can meet”. Stock markets, bond markets, and derivatives markets are examples of security markets. Economic and legal changes, as well as the organization of market infrastructure, have made the securities market possible and unavoidable. As it comes to the forms of securities markets, primary and secondary markets are used to exchange securities. Primary securities markets are those where market participants, such as governments and businesses, issue new securities for trading.

Secondary securities markets, on the other hand, are those where previously issued securities are traded by market participants. In other words, secondary securities markets exist for the exchange of used securities (Glen and Madhavan, 1998, p. 2). Securities are sold for a variety of reasons, including attracting new capital through the issuance of new securities, converting real assets into financial assets, making short and long-term money investments, and insuring operations through the securities market as well as raising investment for new projects (Glen and Madhavan, 1998, p. 8). We live in a time when different people make different investments and savings, and the advent of a reliable mechanism for converting savings into investments is becoming a crucial topic. Securities along with the financial sector and the state budget are one of the most critical choices for funding the economy in international practice (Mammadov, 2008, p. 29-40). By increasing the interest in the mobilization of financial capital, financial securities market ensures the redistribution of financial resources between different sectors and branches of the economy in a promising (future-oriented) and profitable form, in favour of dynamically developed industries. It should be noted that solving the problem of mixed debt, as well as payments between businesses and organizations, is one of the key responsibilities of the current market system and the transition to a market economy, as well as in the CIS region. The emergence of the issue problems is a new age of issues. When the main business or company is unable to pay taxes, the consumers (customers) do not pay the tax debts on the products they have bought. This condition, in turn, is reflected in the state's difficulties in implementing the budget plan due to a lack of tax revenues, and there are delays in state assistance to certain parts of the economy, or in short, aid is cut off. All of this has an effect on the economy as a whole, and the state's influence in political, economic, and other spheres is waning. Appropriate steps have to be taken at the level of state enterprises and circles on potential solutions to these issues in our time. Therefore, financial securities markets are needed. To resolve these problems, Azerbaijan should develop securities turnover. As a result, the organisation of this sector has the potential to influence the resolution of these problems, which have a direct impact on the country's current economy, and allowing economic parties to be more engaged in economic activity and more actively involved in business. Despite the fact that SMEs' turnover is critical to the economy in the new age, and the government is implementing large-scale reforms in this sector, there is still a scarcity of knowledge on this in Azerbaijan.

3. ANALYSYS OF THE SECURITIES MARKET IN AZERBAIJAN

Oil and gas have been the leading sectors of the Azerbaijani economy since independence in 1991. However, over the past 10 years, Azerbaijan's main goal has been to diversify its economy and carry out reforms in various areas of the country. Of course, this includes the country's financial system and the securities market. A diverse range of state programs have been introduced in the last decade to support agriculture, institutional reform, regional transport corridors, and consolidate institutional arrangement for the development of entrepreneurship. In order to handle liquidity problem of the economy, one way is to strengthen securities market in Azerbaijan. The President of the Republic of Azerbaijan has launched the State Program on Securities Market Development Program in 2011 to further advance this area. The State Program "Development of the securities market in the Republic of Azerbaijan in 2011-2020" has been implemented and contributed to the development of securities market (E-qanun, 2011). According to the strategy document on the "Development of the securities market in the Republic of Azerbaijan in 2011-2020", "the securities market is a set of legal and economic relations between the subjects of issuance, issue, circulation, payment, ownership, storage, conclusion of transactions with them, conducting other operations" (E-qanun, 2011, p.1). Documents also shows that the securities market serves as an intermediary in the timely conversion of securities into capital, a process known as liquidity.

The securities market is a series of economic relationships among market participants that reflect the issuance and circulation of securities. Securities are the primary subject of the securities industry. In today's market economy, the securities market is one of the most relevant markets, the document describes (p.1-2). The strategic document is a key paper elaborated by the government of Azerbaijan explaining the definition of securities market in Azerbaijan. As it comes to legislative framework and current state of securities market in Azerbaijan, financial securities market in Azerbaijan is regulated by Azerbaijan law on financial securities. At present, it is possible to trade stocks, corporate and government bonds, as well as currency and commodity-based derivatives in Azerbaijan. In addition, there are REPO agreements between other banks, including the Central Bank. There are dealers in the market who make market-makers to trade some corporate bonds and all kinds of derivatives at any time, which is a factor that stimulates supply and demand. Annual yields on government bonds range from 1.5 to 4.25%, annual yields on corporate bonds between 8-13%, yields on equity valuation up to 60%, and yields on credit-backed securities more than 100% per annum. Simplification of documentation, further acceleration of account opening operations can be included in the list of steps taken to attract the attention of foreign investors. With the exception of some two-citizen countries and their citizens, the lack of any other restrictions has especially increased the interest of foreign investors in the market. With the support of the state program, the services provided by market participants are in the process of rapid electronicization. This is a well-thought-out step to increase the interest of foreign investors. Certain tax and transparency reforms in the field will be accelerated in the future. Furthermore, the government needs to conduct further awareness program in this sector to broaden awareness. The strategy document titled "Development of the Securities Market in the Republic of Azerbaijan in 2011-2020" envisages a number of key activities to advance this sector which includes mobilization of temporarily free financial resources for specific investments, formation of market infrastructure meeting world standards, development of the secondary securities market, transformation of property relations, improving the market mechanism and management system, ensuring real control over fund capital on the basis of state regulation, reduction of investment risk, formation of portfolio strategy, development of pricing, as well as forecasting perspective development directions (E-qanun, 2011, p-2-4). In general, the most traded investment instrument in the Azerbaijani securities market is identified as bonds of the State Oil Company of the Republic of Azerbaijan (SOCAR). These are SOCAR bonds issued by the State Oil Company of Azerbaijan (SOCAR) for the domestic market. SOCAR Bonds account for more than 76% of transactions in the Azerbaijani bond market (Banco.az, 2017). The important role of capital markets can be seen as a manifestation of the sustainable and sustainable economic policy pursued in Azerbaijan. Thus, the development of the securities market, which is an integral part of the financial policy pursued by the state, expands the scope of the non-oil sector by ensuring the diversity of financial instruments and the depth of financial markets. At present, the interest of companies operating in the public and private sectors in the securities market is growing day by day in Azerbaijan. For example, the placement of bond securities of the state-owned AzerGold (government owned gold company) Closed Joint-Stock Company by the initial public offering is a clear example of this. The bonds offered by AzerGold, one of the leaders in the non-oil industry in the field of precious metals, will serve to diversify the company's financial resources and direct resources to new projects, develop the country's securities market, as well as create profitable and reliable investment opportunities. This, in turn, will provide an opportunity to make low-risk, high-income profits against the background of the negative impact of the coronavirus pandemic on the world economy. In addition, citizens - individuals and legal entities will have a chance to contribute to the development of the national economy and the mining industry with AzerGold bonds. Both institutional (banks, insurance companies, investment companies) and individual investors (individuals) will earn 4% per annum by

purchasing AzerGold bonds from the initial public offering market. The bonds are expected to have a face value of \$ 100, a maturity of 3 years and a volume of \$ 20,000,000. The bonds will be sold at auction on the Baku Stock Exchange. Interest is paid to investors four times a year on a quarterly basis. These conditions are currently considered one of the most favourable offers for the country's financial market (Babayev, 2020). Some of the works achieved for the development of this sector in the recent years include increasing market awareness, explaining the benefits of the sector to the key players, as well as introducing the Baku Stock Exchange's Listing Advisory program. However, awareness is needed to be increased about this sector.

4. CONCLUSIONS

The development of financial markets in the country leads to the efficient use of available economic resources. Financial intermediaries significantly reduce transaction costs through scale savings and specialization, and facilitate the attraction of small funds to the market. Formation of liquid financial instruments in the market through financial instruments by reducing transaction costs eliminates difficulties with the place and time of trade. The existence of liquid capital turnover allows stocks, bonds, etc., which can be easily sold to economic entities with free cash allows to invest (capital investment) in non-liquid production facilities by purchasing financial instruments. The development of financial security market provides a wide range of opportunities for companies to finance both large and private projects, as well as to attract borrowed funds. In this case, firms have the opportunity to choose the optimal ratio of borrowed funds in a particular way. Also, the value of securities is formed on the basis of information about the issuer of securities. In this case, it leads to a more efficient allocation of financial security market development resources and effective investment (capital investment) decisions. This factor determines the advantage of financial security market turnover over the banking sector. Thus, the need for companies to disclose information leads to the dissemination of this information and more effective investment (capital investment) decisions. Banks, on the other hand, receive the information themselves and make their own decisions based on this information. Financial securities also reacts to the efficiency of companies and, in fact, exercises control over the management of companies. Evaluating the results, achieved in constructing the Azerbaijan's securities market, we can mention the following positive results: The necessary trading infrastructure has been constructed, that is now quite effective and developed even in comparison with the most mature markets. The professional intermediaries and their staff are sufficiently competitive and can effectively fulfil their functions. The legislation is detailed and up to the best international standards. However, more awareness job must be conducted on the participants of the market, and transparency of the sector should be increased in years ahead. The establishment of the Baku Stock Exchange, introduction of reform programs in the sector is promising. However, as mentioned before the financial securities market in Azerbaijan has not achieved its full potential despite the fact the most popular product is SOCAR bonds. While the former Financial Supervisory Authorities of the Republic of Azerbaijan established a training centre on financial markets, the centre could not reach its objectives in terms of raising awareness on financial markets specifically securities market, and eventually exposed to closure. This sector is needed to be brought to the government attention within current reform agenda.

EVALUATION OF THE QUALITY LEVEL OF THE MACHINE INDUSTRY PRODUCTS BY THE INDEX QUALIMETRY METHODS

Zabit Aslanov Yunus

*Azerbaijan State University of Economics (UNEC), Azerbaijan
aslanov.zabit@mail.ru*

ABSTRACT

Quality indices are used to assess the quality level of heterogeneous products. They make up an index of quality control. The article describes the methods for determining quality indices and defect indexes of professor A.V. Glichev and professor V.K. Fedyukin. The quality index depends on the relative quality index and the relative volume of a certain type of product. The defect index depends on the defectiveness factor of the n-th product and the weighting coefficient of a certain defect. The contribution of each i-th type of product to the defect index is shown in the diagram in the form of a circular sector. The quality index and the defective index are universal indicators that evaluate the quality of the enterprise's products. The paper assesses the quality level of heterogeneous products being repaired by a machine-building enterprise. To get a real idea of the product quality level, you should use pie charts based on relative indicators of the product quality. It demonstrated that average losses caused by the defects per unit of one product typical size were permissible by the production capabilities of the enterprise. Having evaluated the quality level of 50HP32 radial piston pump, YMP-7511 engine, SMZH-81 hydraulic jack using two different methods, it was found that in both cases the quality index of heterogeneous products in considered period is higher than the base. The defectiveness index is acceptable in a considered period by the production capabilities of the enterprise. The main direction of index qualimetry is the evaluation of changes, the speed of the "movement" of the product quality indicators, and processes.

Keywords: *coefficient of weight, index, quality, evaluation, defectiveness, central angle*

1. INTRODUCTION

When evaluation of the quality level of heterogeneous products, the quality index, and the defectiveness index is used. These indexes are universal indicators that can evaluate the quality of the enterprise's products as a whole and analyze its changes for several years [1]. The quality index is a comprehensive indicator of the quality of heterogeneous products released within a considered period equal to the weighted average of the relative values of the quality indicators of these products [2]. The defectiveness index is a comprehensive indicator of the quality of heterogeneous products released within a considered time equal to the weighted average of the coefficients of defectiveness of this product (the defectiveness coefficient is the weighted average number of defects per product unit) [2]. In this article, we evaluated the quality level of heterogeneous products (50HP32 radial piston pump, a YMP-7511 engine, a SMZH-81 hydraulic jack), repaired by Maker LLP – Karaganda Casting and Mechanical Plant. Evaluation of the quality level of heterogeneous products using the quality indexes and defectiveness indexes as implemented by two methods of Professor A.V. Glichev and Professor V.K. Fedyukin.

2. RESEARCH METHODS

During the evaluation of the quality level of heterogeneous products according to the method of A.V. Glichev, as like during the comprehensive evaluation of the quality of the products of one kind, the main index is the average weighted quality index, determined by the formula [3]:

$$V_{\theta} = \prod_{k=1}^M (\theta_k)^{a_k} \quad (1)$$

in this formula, θ_k is the value of the relative quality indicator of the "K" type of the product [3]:

$$\theta_k = \frac{W_k}{W_k^\delta}, \quad k=1, \dots, M \quad (2)$$

In this formula, W_k is the value of the single or comprehensive quality indicator of the "K" type of the product;

W_k^δ – is the base value of the quality indicator of the "K" type of the product;

a_k – is a relative volume of the "k" type of the product (coefficient of weight) [3]:

$$a_k = \frac{C_k}{\sum_{k=1}^n C_k} \quad (3)$$

$$\sum_{k=1}^n a_k = 1, \quad a_k \geq 0, \quad (4)$$

In this formula, C_k is the volume of production of the product of the "K" type in cash. Another quality indicator, which also used in a comprehensive evaluation of the quality level of heterogeneous products according to the method of V.K. Fedyukin is the weighted average geometric quality index I_{kv} , which is determined by the formula [4]:

$$I_{kv} = \prod_{n=1}^N (K_n')^{a_n} \quad (5)$$

In this formula, K_n' is a relative quality indicator of the "N" type of the product, determined by differential method, i.e. [4]:

$$K_n' = \frac{P_n}{P_n^\delta}, \quad (n=1 \dots N), \quad (6)$$

In this formula, P_n – is the main single or comprehensive indicator of the quality of the "N" type of the product;

P_n^δ – is a basic indicator of the quality of the "N" type of the product;

N- is the number of manufactured products;

a_n – is relative volume of the product of the "N" type, i.e. coefficient of weight.

The coefficient of weight a_n is determined by the formula [4]:

$$a_n = \frac{\theta_n a_n t^N}{\sum_{n=1}^N C_n} \quad a = 1 \sum_{n=1}^N a_n \geq 0, \quad n \quad (7)$$

In this formula, C_n – is planned or real production volume of the "N" type of the product in cash (in retail, wholesale prices). The defectiveness index is equal to the weighted average coefficient of defective evaluated product and is determined by the formula [3, 5]:

$$I_\partial = \sum_{n=1}^N a_n \sqrt{R_\partial}, \quad (8)$$

In this formula R_∂ – is coefficient of defectiveness of the product of the "N" kind, which is the indicator of the quality of the production of this product;

N- is the number of the types of products being evaluated;

a_n – is the coefficient of the weight of this type of product, which is determined by the above formulas.

The coefficient of defectiveness is determined during selective (or complete) inspection control of finished products. It is a characteristic of average losses caused by the defects per unit of a certain type of the product, and is equal to [3, 6]:

$$R_{\partial} = \frac{1}{n} \sum_{i=1}^m \varphi_i S_i \quad (9)$$

In this formula n - is the number of inspected copies of the products (selection volume);
 m - is the number of all the types of defects encountered in this product during the selection;
 S_i – is the number of the defects of the "I" type of the defects;
 φ_i – is the coefficient of the weight of the "I" type of the defects (in shares of costs or points).

3. RESEARCH RESULTS

To obtain a visual overview of the level of quality of heterogeneous products, you can use circular charts built on relative indicators of the product quality and their coefficients of weight. The contribution of each "i" type of the product to the quality index is indicated in the diagram as a circular sector, the r_i radius of which is equal to the value of the relative indicator of the product quality, and φ_i – central angle to the coefficient of weight expressed as a conditional value in degrees or radians [5]. Central angle for the "I" type of the product is determined as $\varphi = 2\pi\alpha_i$ or $\varphi = 360\alpha_i$. The level of the quality of heterogeneous products was determined based on a weighted average geometric index of the quality by the formula (1) mentioned here as a weighted average circular index. It is equal to the radius of the circle the area of which is equal to the sum of the areas of the diagram sectors [6,7]. Based on the data obtained as the result of the evaluation of the quality level of heterogeneous products according to the method of A.V. Glichev and V.K. Fedyukin, it is necessary to build the diagrams of the quality indexes and defectiveness indexes of heterogeneous product. Initial data for the building of the diagram of the quality index of heterogeneous products according to the method of A.V. Glichev are shown in table 1.

Table 1: Initial data for the building of the diagram of the quality index of heterogeneous products determined according to the method of A.V. Glichev

Type of the product	Relative quality indicator θ_k	Coefficient of weight a_k	Central angle φ_k , degrees
50HP32 pump	1,01	0,03	10,8
YMP-7511 engine	1,03	0,72	259,2
SMZH-81 jack	1,025	0,25	90

The value of the weighted average geometric quality index is graphically displayed by the circle in the form of a dashed line and is $V_{\partial} = 1,028$. $V_{\partial} > 1$ means that the quality level of products repaired by the enterprise in the considered period exceeds the quality level of the base period by 3%. The diagram of the quality index of heterogeneous products, determined by the method of A.V. Glichev, is shown in Figure 1.

Figure following on the next page

Figure 1: The diagram of the quality index of heterogeneous products, determined by the method of A.V. Glichev

Initial data for the building of the diagram of the quality index of heterogeneous products according to the method of V.K. Fedyukin are shown in table 2.

Table 2: Initial data for the building of the diagram of the quality index of heterogeneous products determined according to the method of V.K. Fedyukin

Type of the product	Relative quality indicator K'_n	Coefficient of weight a_n	Central angle φ_n , degrees
50HP32 pump	1	0,03	10,8
YMP-7511 engine	1,02	0,7	252
SMZH-81 jack	1,02	0,27	97,2

The value of the weighted average geometric quality index is graphically displayed by the circle in the form of a dashed line and is $I_{kv} = 1,019$. $I_{kv} > 1$ means that the quality level of products repaired by the enterprise in the considered period exceeds the quality level of the base period by 2%. The diagram of the quality index of heterogeneous products, determined by the method of V.K. Fedyukin, is shown in Figure 2.

Figure 2: The diagram of the quality index of heterogeneous products, determined by the method of V.K. Fedyukin

The building of a diagram of the defectiveness index of heterogeneous products is similar to the building of a diagram of the index of quality of heterogeneous products. The contribution of each "i" type of the product to the defectiveness index is indicated on the diagram as a circular sector the radius r_i of which is equal to the value of relative defectiveness indicator of the product, and central angle φ_i –the coefficient of weight expressed as a conditional value in degrees or radians [6]. Initial data for the building of the diagram of the defectiveness index of heterogeneous products determined according to the method of A.V.Glichevare shown in table 3.

Table 3: Initial data for the building of the diagram of the defectiveness index of heterogeneous products determined according to the method of A.V.Glichev

Type of the product	Relative defectiveness indicator Q_k	Coefficient of weight a_k	Central angle φ_k , degrees
50HP32 pump	1,33	0,03	10,8
YMP-7511 engine	1,09	0,72	259,2
SMZH-81 jack	2,25	0,25	90

The value of the defectiveness index is graphically displayed by the circle in the form of a dashed line and is $V = 1,11$. The diagram of the defectiveness index of heterogeneous products, determined by the method of A.V.Glichev, is shown in Figure 3.

Figure 3: The diagram of the defectiveness index of heterogeneous products, determined by the method of A.V.Glichev

Initial data for the building of the diagram of the defectiveness index of heterogeneous products determined according to the method of V.K. Fedyukinare shown in table 4.

Table 4: Initial data for the building of the diagram of the defectiveness index of heterogeneous products determined according to the method of V.K. Fedyukin

Type of the product	Bas indicator of defectiveness $R_{\partial b}$	Relative defectiveness indicator Q_n	Coefficient of weight α_n	Central angle φ_n , degrees
50HP32 pump	3,20	1,32	0,03	10,8
YMP-7511 engine	4,14	1,09	0,7	252
SMZH-81 jack	1,25	2,26	0,27	97,2

The defectiveness index of heterogeneous products according to the method of V.K. Fedyukinis determined by the following formula (8):

- The value of the defectiveness index is graphically displayed by the circle in the form of a dashed line and is $I_{\theta} = 1,95$. The diagram of the defectiveness index of heterogeneous products, determined by the method of V.K. Fedyukin, is shown in Figure 4.

Figure 4: The diagram of the defectiveness index of heterogeneous products, determined by the method of V.K. Fedyukin

Found defectiveness index suggests that average losses caused by the defects per unit of one product typical size are permissible for the considered period by the production capabilities of the enterprise.

4. CONCLUSION

Having evaluated the quality level of 50HP32radial piston pump, YMP-7511 engine, SMZH-81hydraulic jack using two different methods, it was found that in both cases the quality index of heterogeneous products in considered period is higher than the base. The defectiveness index is acceptable in the considered time by the production capabilities of the enterprise. The main direction of index qualimetry is the evaluation of changes, the speed of the "movement" of the product quality indicators, and processes.

ABSTRACT

Each state independently determines for itself the main directions of the budgetary and tax mechanism. It is necessary that the fiscal mechanism is well adapted to new social relations and consistent with world experience. At present, it acts as the main instrument of the state's influence on the development of the economy, determining priorities and economic and social development. The state of the domestic economy depends on the fiscal policy pursued. The state will have to fulfill the main tasks with the help of fiscal policy: create predictable fiscal conditions, balance the state and regional budgets, and reduce the shadow sector of the economy. The present main directions of budgetary and tax policy are aimed at the implementation of the budgetary and tax strategy for the medium term, the unconditional fulfillment of both previously adopted and accepted expenditure obligations, and increasing the efficiency of budget expenditures. In this regard, budget and tax regulation is an integral part of the state's interests. In order to implement the principle of a balanced budget, so to minimize the budget deficit, the process of drafting, approving and implementing the budget must proceed in accordance with the rules: budget regulation follows tax regulation. This sequence is unchanged. In the coming period, implement measures in the region aimed at preserving and developing tax potential, ensuring fiscal sustainability in the medium and long term is necessary.

Keywords: *fiscal policy, budget, tax regulation*

1. INTRODUCTION

The present main directions of budgetary and tax policy are aimed at the implementation of the budgetary and tax strategy for the medium term, the unconditional fulfillment of both previously adopted and accepted expenditure commitments, and increasing the efficiency of budget expenditures. The low efficiency of the implementation of state programs or a formal approach to their implementation is evidenced by the continuation of the practice of increasing the volume of budget allocations for individual state programs with a low or below average degree of their effectiveness, as well as the lack of adjusting the values of the corresponding indicators of state programs with a significant change in budget allocations for the implementation of the envisaged activities.

2. INTERACTION OF THE STATE WITH ECONOMIC ENTITIES OF THE MARKET ECONOMY

The development of microeconomics contributed to the establishment of the public sector economy, which led to the creation of the concept of public goods by P.Samuelson. The most intensive development of the scientific foundations of the economy of the public sector, for which the revenues and expenditures of the state are equally significant, was the study, first of

all, at the microeconomic level, of the interaction of the state with other economic entities of the market economy as the influence of the state on the economic situation and behavior of organizations and households. Public sector economics analyzes the economic behavior of the state as one of the subjects of the economy, as a specific organization among other organizations, with special emphasis on interaction and its consequences. The activity of the state in a market economy is expressed in financial flows, income and expenses, as the entrepreneurial activity of the public sector of the economy. The state acts as an independent economic (economic) entity, as a participant in social reproduction, as an organizer of this process, providing natural resources limited by the territory and creating conditions for the sphere of material production and providing social needs, while simultaneously producing public goods and services of a social nature. The existence of taxes is due to the need to finance public needs supplied by the state to its citizens. The states need funds to cover the costs of providing public services and implementing social programs; such funds can be accumulated through tax types of income or non-tax instruments for forming the revenue side of the budget. Government spending and taxes are the most important components of the government's fiscal policy. Taxes form the financial basis of government regulators of the economy. Fiscal policy is a set of government measures to change government spending and taxation, aimed at ensuring full employment and the production of equilibrium GNP.

3. BUDGETARY AND TAX REGULATION AS INSEPARABLE COMPONENTS OF THE SPHERE OF INTERESTS OF THE STATE

Budgetary and tax regulation are inseparable components of the state's sphere of interests. In order to implement the principle of a balanced budget, i.e. in order to minimize the budget deficit, the process of drawing up, approving and executing the budget should proceed in accordance with the rule: budget regulation follows tax regulation. This sequence is unchanged. At the same time, there is, of course, a feedback. By introducing amendments to tax legislation, the state adjusts the mechanism for fulfilling the revenue side of the budget, in turn, the revenue side of the budget is formed based on the needs of the state for the implementation of the tasks facing it, that is, the expenditure side. Consequently, the introduction of amendments to the legislation on taxes and fees creates the necessary reserves for financing government expenditures. It should be noted that the introduction of bills is possible only on issues related to the jurisdiction of authorized bodies to regulate budgetary relations. Thus, the fiscal mechanism should be understood as a model for the distribution of tax powers between different levels of government for the legal impact (regulation) on economic relations in the field of taxation, on the one hand, and balanced financing of budgets of different levels, on the other hand. Of course, in this context, legal regulation means the action of the regulatory function of taxation, one of the mechanisms of which is to stimulate investment and business activity, which must be reflected in the tax policy of the state. The contradiction is a consequence of the extensive type of development of fiscal relations, which determines the nature of fiscal regulation. This type is characterized by strict criteria for the allocation of state funding, the presence of a quota system, as well as an equal distribution of tax payments in favor of the budgets of the regional and local levels. The intensive type is devoid of these shortcomings, which allows a differentiated approach to be used, and, thus, to achieve a balance of budgetary interests. Meanwhile, the arguments in favor of decentralization of state budgetary powers are quite serious and should be taken into account to create a system of budgetary structure aimed "at ensuring economic efficiency, budgetary responsibility, social justice, political and territorial integration." A clear delineation of tax powers on an ongoing basis and the assignment of revenue sources to budgets of various levels will allow at the tactical level to take into account the specifics of tax bases and increase tax collection, and at the strategic level to improve the self-sufficiency of regional budgets.

Securing tax sources of budget revenues for the regions should correspond to the volume of obligations of the regions in the socio-economic sphere of relations in order to balance the budgets. An analysis of the construction of multi-level tax systems shows that strengthening the role of fiscal regulation is possible with a harmonious combination of centralized tax regulation, taking into account the specifics of the functioning of the tax system at the regional level. To increase the efficiency of the implementation of the incentive function by taxes, it is necessary to determine the vector of reform to improve, first of all, the regulatory and legal framework, to eliminate existing contradictions. At the same time, the implementation of the reform is under the condition of observing the integrity of the state and building a balanced tax system, so that the norms for the transfer of taxes to the budgets of various levels are of a long-term nature. One of the most important tasks of state authorities is to equalize the financial capabilities of the regions to implement the powers assigned to them. The long-term economic policy of the state should be aimed at the implementation of investment projects, for example, the orientation of the tax mechanism to stimulate investment. Tax reform must be carried out in combination with budgetary regulation. It is also necessary to take into account the world experience of reforming tax systems in terms of determining the possibility of using certain elements as building materials for building a model of the fiscal mechanism.

4. THE MAIN PRIORITIES OF FISCAL REGULATION

The main objectives of budgetary policy are:

- integration of the processes of strategic forecasting and budget planning;
- introduction of the principles of proactive budgeting in order to involve the population of the municipalities of the region in the budget process;
- further improvement of inter-budgetary relations.
- increasing the efficiency of providing targeted inter-budgetary transfers;

In terms of budgetary and tax policy, investment incentives should include measures in these areas:

- Formation of stable fiscal conditions. Recently, a lot has been done in terms of creating stable and predictable fiscal and financial conditions: “budget rules” have been introduced, the foundations for long-term budget planning have been laid, and key parameters of the tax system have been fixed. In addition, it is planned to legislate the suspensive norms for the entry into force of changes in the elements of taxation, which worsen the position of taxpayers or significantly change the tax ones. The continuity of budgetary and taxation policies and the consistency of implementation of the adopted decisions should increase confidence in the established institutions and contribute to an improvement in the investment climate.
- Formation of fair competitive conditions. In order to eliminate the unfair competitive advantages of the shadow sector and the growth of revenues of the budgets of the budget system, a set of measures will be continued to improve the administration of revenues of the budget system, including through the digitalization of tax administration and the integration of all sources of information into a single information space. The development of a new form of tax control - tax monitoring, will allow large companies to organize extended information interaction with the tax authority and provide access to data in real time. Tax monitoring allows you to quickly coordinate approaches to taxation, advise on completed and planned transactions by providing a reasoned opinion of the tax authority, reduce the labor costs of organizations to support tax audits, submit revised tax returns, explanations and required documents. This access allows a risk-based approach at the transactional level to be applied and only those transactions that contain elements of risk are verified.

In the sphere of inter-budgetary relations, it is possible to implement the following tasks:

- improvement of the legal regulation of the system of delineation of powers between the levels of public authority;
- legislative clarification of the powers of state authorities and local self-government bodies;
- Conducting an assessment of the regulatory impact of existing regulatory legal acts that establish additional requirements for the exercise of powers by public authorities and local governments;

It should ensure that all budgetary expenditures are covered by budget expenditure reviews, which will allow:

- to maintain the optimal volume and structure of expenses for the implementation of functions and obligations of a permanent nature, taking into account current social, market, technological and other realities;
- to stimulate the main administrators of budgetary funds to search for internal reserves for optimizing budget expenditures in order to ensure financing of priority areas of state policy;
- to ensure the introduction of a permanent assessment of the feasibility and relevance of relevant measures, mechanisms for their implementation and financial support, results and the availability of alternative instruments to achieve the goals of state policy.

Based on the results of the review, the use of standards that have lost their relevance, the non-transparent formation of the contract price and its overestimation, a significant differentiation of identical costs of different government agencies and other proposals for improving the efficiency of costs can be revealed.

5. CONCLUSIONS

In the coming period, it is necessary to implement measures in the region aimed at preserving and developing tax potential, ensuring fiscal sustainability in the medium and long term. The budgetary policy for the medium term should be focused on increasing the efficiency of budget expenditures in order to meet the needs of citizens in high-quality and affordable public services. During its formation and implementation, it is necessary to solve the following tasks:

- ensuring the reliability of economic forecasts and prerequisites underlying budget planning, limiting the budget deficit and public debt of the region;
- coordination of strategic and budgetary planning to ensure long-term stability and sustainability of the regional budget;
- full-scale implementation of the principles of program-target planning and the transition to the program budget;
- standardization of the provision of public services, bringing the provision of services by various institutions to a single format, improving the quality of services provided by clearly defining the content of each service;
- development of new forms and improvement of the quality of the provision of public services, introduction of elements of competitive relations into the activities of state and municipal institutions;
- optimization of the network of budgetary institutions, taking into account the need for the volume of public services provided by them;
- strengthening control over the placement of orders and the execution of contracts, agreements concluded as a result of placements, in order to efficiently use budget funds;

In the coming years, the policy in the field of inter-budgetary relations will be aimed at ensuring the balance of budgets of all levels in their formation and execution by solving the following tasks:

- creating incentives to increase the revenue base of local budgets, improve the efficiency and quality of organization and implementation of the budget process at the municipal level;
- implementation of constant monitoring of local budgets;
- provision of additional financial assistance to local budgets, subject to bringing budget parameters to the real economic situation;
- creation of incentives for improving the quality of municipal finance management, increasing the efficiency of spending budget funds;
- ensuring control over the spending of subventions provided from the regional budget and the quality of the provision of delegated public services.

FEATURES OF HUMAN RESOURCE MANAGEMENT INNOVATIVELY ACTIVE COMPANIES

Aygun Abdulova

*Resident Assistant at Azerbaijan State Economic University (UNEC), Azerbaijan
Sabah.aygun2015@gmail.com*

ABSTRACT

The article examines the features of human resource management in domestic innovation-active companies. The approaches of domestic and foreign experts to the problem under consideration are described. The results of a pilot study of the opinions of the heads of 118 domestic companies are presented, groups of innovatively active (33%) and non-innovative companies (67%) are distinguished. The features of the strategy and practice of human resource management, contributing to innovative activity, are analyzed. The authors come to the conclusion that in those companies in which innovative projects are carried out, there is a holistic strategy for their implementation, including software practices aimed at the formation of innovative working behavior of personnel. Scientific achievements and advanced technologies have radically changed and continue to change the way of the world economy, forming the structure of a post-industrial society. These patterns directly affected Azerbaijan, which faced serious problems associated with the insufficient efficiency of the system of organizing, managing and supporting scientific and technological progress, mechanisms of reproduction and rational use of innovative resources of science, as well as the implementation of its achievements in the economy. Human resources is a term that characterizes, from a qualitative, substantive point of view, the staff or all personnel of an enterprise, labor force or labor resources of an industry, territory, region, country as a whole. Along with the traditional features that are inherent in the elements of the defined population - personnel, personnel, labor force, labor resources, the term "human resources" includes the ability to create, defines potential opportunities for the all-round development of employees, general culture and moral reliability, a certain effect of cooperation and self-organization, first of all, collective forms of labor organization and acceptance decisions, "quality circles", "team spirit", as well as improving labor relations, self-motivation, entrepreneurship.

Keywords: *human resource management, innovative work behavior, innovative activity*

1. INTRODUCTION

At the current stage of economic development, the ability to create innovation is becoming the cornerstone of a company's long-term success. Almost every company striving to become an industry leader is looking for ways to develop and create innovative solutions. Innovation is among the priorities of the overwhelming number of companies around the world. Innovative solutions are a product of intellectual activity, so companies strive to attract creative employees, develop their abilities and skills that contribute to the creation of innovations. In the foreign business community, to define the term "innovation" they use the methodological document "Oslo Leadership", developed by the Organization for Economic Cooperation and Development (OECD) jointly with Eurostat. It provides the following definition:

- “Innovation is the end result of innovative activity, embodied in the form of:
 - new or improved products or services introduced to markets;
 - new or improved technological processes;
 - new methods of production and its organization, used in practice;
 - new markets and product promotion” [Oslo Guide, 2006,p6]

In the Oslo Guide, innovation refers to the creative activity associated with the creation and implementation of innovations. Innovation activities include scientific, technological, organizational, financial and commercial actions that actually lead to the implementation of innovations and are conceived for this purpose. An innovation-active company is a company that meets the following conditions: “A firm can engage in many activities that are not related to research and development, but participate in the creation of innovations. This activity can enhance the firm's ability to innovate, or its ability to successfully absorb innovations developed by other firms or organizations” [Oslo Guide, 2006, p44]. Currently, many experts recognize the need to implement a strategy for the country's innovative development, where all resource opportunities (personnel, financial, material and technical) should be focused on achieving this goal. Only on the basis of an innovative breakthrough is the transition to a fundamentally new quality of life of the population possible. According to employees of the McKinsey consulting group, creating an innovative economy will allow Azerbaijan to return to the group of world technological leaders and ensure sustainable long-term development based on the growth of labor productivity, regardless of the dynamics of the world market situation. That is why the search for ways to stimulate innovative development is one of the most urgent tasks of the modern period. The works of many domestic and foreign authors are devoted to the study of the problems of innovation management, however, the problem of human resource management in innovatively active companies cannot be considered solved until now. Foreign research in this area is represented to a much greater extent than domestic. And although abroad works devoted to the general problems of the relationship between the quality of human resource management and the innovative orientation of an organization appeared at the end of the last century, on a large scale empirical studies of the role of HR strategies and practices in innovative development began to be carried out at the beginning of the 21st century. In the work of D. Mate et al. [Mate et al., 2010] it is indicated that the problem of the relationship between human resource management and innovation is rightly called the modern “black box”. In general, this relationship is characterized as complex, multifactorial and dynamic, which further complicates the process of its analysis and interpretation. A scientific direction has emerged abroad that focuses on the human component of the innovation process: innovative work behavior (IWB). Innovative work behavior is considered as a complex of mental and physical activity of workers, aimed at solving a number of tasks that contribute to the achievement of the main goal - innovative development [Kanter, 1988; Messmann, Mulder, 2011]. Innovative work behavior can be viewed as a phenomenon that mediates the relationship between human resource management and innovation in an organization. This study is a pilot project that is part of a large-scale study, the purpose of which is to identify global and local strategies and practices of human resource management inherent in innovatively active companies in developed and developing countries. The main objectives of the pilot project are as follows:

- determination of the characteristics of human resource management activities that affect the formation of innovative work behavior and are essential for the implementation of the innovative activity of domestic companies;
- Assessment of the severity of these characteristics in the practice of human resource management of the surveyed companies;
- identification of the features of human resource management activities related to the innovative activity of companies.

Thus, in the context of this article, we consider personnel management as an activity aimed at achieving a certain result - the implementation of innovations - and determined by appropriate strategies and practices that contribute to the formation of innovative working behavior of employees.

From our point of view, new studies of methods of managing innovative activity should contribute not only to the development of management theory, but also to the scope of their practical application.

2. RESEARCH

The world is entering an era of competition for the possession of human resources, which are a form of the existence of intellectual power in whose heads innovative ideas are born. Azerbaijan will not be able to achieve a leading role in the international arena without the development of the country's scientific potential, where innovation should be defined as the end result of creative work that has been implemented in the form of new or improved products, a new or improved technological process, used in economic circulation. Since innovative ideas are born in the minds of smart people, it is necessary to decide what kind of personnel skills are needed for the development and implementation of innovations. The problem of staffing scientific and engineering activities is extremely important for Azerbaijan. Today, there are 4 main centers of scientific progress in the world - the United States (35% of world R&D spending at purchasing power parity), the European Union (24%), Japan and China (about 12% each). Unfortunately, the Russian Federation is not included in the group of leaders - Russia accounts for less than 2% of world spending on R&D at purchasing power parity and 1% at exchange rates. Thus, Russia lags behind the United States in R&D spending by 17 times, from the European Union - 12 times, from China - 6.4 times, from India - 1.5 times. It should be noted that China has now reached the third place in the world in terms of R&D expenditures, which is almost one and a half times more than in Russia, despite its huge population. Today, there is a tendency for China to oust Japan from the second place, and in the 2020s it can be compared with the United States. By the number of scientific publications (120 thousand in 2008). The PRC is already in second place. China accounts for 8.5% of all scientific publications in the world, including 20.8% of publications on materials science, 16.9% - on chemistry, 14.2% - in physics. The share of Chinese publications on crystallography (31.7%), metallurgy (31.2%), interdisciplinary physics (22.1%), and applied mathematics (21.1%) is especially high. The PRC has adopted and is successfully implementing state programs for technological and scientific development.

In India, government spending on R&D is 0.9% of GDP, and in 2012, according to the government's DOS program 1.2% of GDP will be boosted. India's share in scientific publications is 3%. But in chemistry this figure is 5.7%, pharmacology - 4.3%, physics - 3.7%. The share of Indian publications in organic chemistry (8.3%) and medicinal chemistry (6.5%) is even higher. India is ranked fourth in the world (after the United States, Japan and China) for R&D in information technology and communications. We observe that science has turned into a highly competitive field of activity today. The main trend in changing the conditions of international competition in the field of innovation is a shift in emphasis from competition for the possession of the latest achievements to competition for the possession of creative human resources. Among all the comprehensive measures that form the basis of the national economy and on the development of which progress in the future depends, in the first place in many developed countries are human resources. For example, in most Japanese Firms R&D expenditures exceed investments in machinery and equipment. In Japan, innovation has become a kind of "national idea", and "innovation", "innovative development", "innovation cycle" and other derivatives of this concept have become the core that integrates the main blocks of a comprehensive economic strategy. In Japan, the "New Strategy for Economic Growth" has been developed and is being successfully implemented, in the first place of which is the field of "Human Resources: Innovation". The main focus improvement and modernization of this area is the development of the capabilities of each individual. As part of the implementation of the strategy, it is planned to direct investments in human potential - to educate modern leaders, make the education system and human resource development more flexible, including

diversifying the education system, strengthening its practical focus in technical and commercial higher schools, and developing cooperation between industry and the academic sector. The special attention paid in Japan to the development of the human factor of the innovation process and human capital in general is a response to the changing nature of international competition. Today, there are strong tendencies and prerequisites that in the modern world the power of a country and its influence in the world is determined not only by "hard power", that is, by economic and military potential, but also by "soft", namely by social values, culture, political ideology, the ability to cooperate. Modern "knowledge workers" no longer have a rigid dependence on the organization, since they can produce their information product outside its structures, having the necessary means of production in their personal property [*Baker W. E., 1999*]. Such an employee offers the employer not his ability to work, but his result, not labor, but the consumer value embodied in one or another innovative product or new production technology. Therefore, the management of creative and innovative activities of employees becomes the cornerstone of a modern organization, the content of a new strategy and the embodiment of a new structure. The model of a flexible organization, which allows to use the knowledge and creativity of each individual employee, has been called an "innovative organization", where team organization of activities; involvement of all employees of the organization in innovative activities; innovative organizational culture and project work [*Amabile T. M., 1997*]. The human resource management function in an innovative organization is a long-term strategy tool aimed at removing barriers to innovation. In human resource management, learning, innovation and creativity are of great importance. This, of course, requires a fundamentally different approach to the organization of human resource management. In essence, we are talking about the formation of innovative human resource management, which is a border area between two areas of management science and practice: innovation management and human resource management. Based on this, innovative human resource management can be defined as a specialized professional activity aimed at improving the management system in the field of work, with human resources, in order to develop the creative, innovative potential of employees and stimulate innovative behavior of personnel.

3. RESULTS

This study presents the results of work of employees of the Azerbaijan State Economic Universities lecturer. The target group of the study was made up of heads of companies doing business in the Azerbaijan. The survey was conducted using an online questionnaire on a voluntary basis. Information about the survey was disseminated through various channels (posting on facebook websites) during the spring and summer of 2020. The development of the survey was carried out in three stages. At the first stage, based on the literature data, a prototype was developed, which was sent out at the second stage to experts in the field of innovation management (academic colleagues and practitioners - heads of personnel management departments of Azerbaijan companies). Based on their recommendations, the questionnaire was finalized (third stage) and posted on the facebook based on the online testing IT platform, which further simplified the processing of the results. Such a procedure for forming a questionnaire, in our opinion, contributed to the solution of one of the tasks set - to identify the characteristics of human resource management activities that are essential for the formation of innovative behavior and the implementation of innovative activity of domestic companies. In the final version, the questionnaire included blocks of questions related to the following aspects of innovation management and human resource management:

- 1) features of corporate values;
- 2) specifics of planning;
- 3) characteristics of the categories of employees involved in innovations;
- 4) forms of support for innovative activities in the company;

- 5) forms of innovative and creative activity of employees;
- 6) types of innovative projects in which employees participate;
- 7) changes in innovation activity in recent years;
- 8) the forms in which the company organizes the innovative activities of the personnel;
- 9) problems faced by creative employees and innovative projects in the company;
- 10) forms of recognition of the talent and merit of innovators in the company;
- 11) sources of information on scientific and practical achievements in the professional field;
- 12) supporting innovative activities that are important for employees;
- 13) types of knowledge exchange in which managers have participated in the last half of the year;
- 14) the types of knowledge exchange that the manager organized for his subordinates during the last six months;
- 15) qualities that are appreciated and encouraged by senior managers in their subordinates.

In addition, questions related to age, size, industry and distribution of companies by region were included in the text of the questionnaire. The respondents were asked to choose one or more answers, which which fully corresponded to their opinion. For each question, it was also envisaged to add comments and / or formulate different answers. 118 respondents representing companies from eight federal districts of the Russian Federation took part in the online survey (Table 1). The structure of the sample of respondents is as follows:

- 48% - top managers;
- 34% - middle managers;
- 4% - lower-level managers;
- 14% - specialists and employees.

Table 1: The scope of the companies

Industry	Percentage of companies
Consumer goods and services	21
Mechanical engineering	20
Education	18
Consulting and other services	14
Healthcare and medicine	8
Financial sector	7
Chemical and petrochemical industry	6
Construction, real estate	3
Agriculture	3

Table 2: Company size

Number of employees, people	Percentage of companies
Up to 50	25
51 to 100	16
101 to 250	14
251 to 500	13
501 to 1000	6
1001 to 2000	7
2001 to 5000	9
Over 5000	10

Table 3: Age of companies

Age of companies	Percentage of companies
Less than 2 years	9
2 to 5 years	14
6-10 years	25
11 to 15 years	15
More than 15 years	37

4. ASSESSMENT OF THE INNOVATIVE FOCUS OF PERSONNEL MANAGEMENT ACTIVITIES IN DOMESTIC COMPANIES

To solve the second task of this work - assessing the severity of the characteristics of human resource management activities that are essential for innovative development - we studied the results of filling out the questionnaire by managers of all 118 companies. Leaders as Innovation Leaders. Innovation needs leaders who can build like-minded teams and unite around the goals of innovative development, there are broad categories of personnel and those possessing the competencies of inspiration, motivation for innovative activity. In fact, leaders serve as a trigger for transformations, including innovative ones. For the success of such transformations leaders themselves must be “charged” with innovations, unconditionally believe in them, profess the principles of innovative development, and also appreciate in the people around them the qualities that are inextricably linked with innovations. The research results showed that 74% of top managers and 63% of middle managers are involved in innovation processes. The innovative activity of the respondents is expressed in various forms, such as: generation of ideas and innovation (47%); examination of colleagues' ideas (41%); organizing and participating in the exchange of experience (33%); creation and support for an innovative climate (32%); initiation of organizational changes (31%); help and support of innovators (25%); attracting creative employees to the company (21%). In this situation, it is logical to assume that innovative values should become the core of the system of value orientations of managers. However, the study showed that among the value orientations of managers, innovative values are not dominant and, moreover, the system of value orientations of the respondents is characterized by inconsistency. On the one hand, survey participants appreciate in employees: personal responsibility (81%); cooperation and teamwork (72%); continuous professional and personal development (52%); the ability to work in a situation of uncertainty (47%); proactivity (43%); openness to new things (42%), i.e. qualities that are indisputably important from the point of in terms of innovative development of companies. On the other hand, only for a minority of respondents are significant: creativity of employees (35%); long-term orientation (24%); trust (21%) and respect (23%). For many, the efficiency of employees is more important (41%).

5. CONCLUSION

This work represents the first stage on the way of researching human resource management systems of innovatively active companies. One of its main tasks was to test the hypothesis about the presence of features that characterize the strategy and practice of personnel management in domestic innovation-active companies. The hypothesis was generally confirmed. At the present time, the models for managing the activities of innovative activity of companies cannot be considered finally formed. Nevertheless, in those companies in which innovative projects are nevertheless carried out, there is a holistic strategy for their implementation, using practices focused on achieving the main goal - the implementation of innovations.

The analysis made it possible to draw the following conclusions:

- At present, the leaders of the surveyed companies do not have a holistic understanding of the strategy and practice of managing innovative activity, including the specifics of human resource management activities aimed at shaping and stimulating innovative behavior. A significant gap can be noted between the mental and real recognition of the need for innovation by leaders.

Companies surveyed. So, 66% of CEOs agree with a statement about the need for organizational innovation, 74% of top managers consider themselves to be participants in the innovation process, but only 33% of companies have successfully implemented innovative projects.

- Significant contradictions in the organization of human resource management activities of the companies under study were noted. These contradictions affected all the main elements of activities (practices) in human resource management: assessment, motivation and incentives, training and development of personnel. Management methods preferred by respondents in the role of leaders do not coincide with their own expectations in the role of executors of innovative projects. These contradictions can play the role of a real "brake" of innovative activity, since management practices do not achieve the intended goal and do not contribute to the development of the required forms of innovative behavior.
- Innovative activity of companies is associated with certain characteristics of personnel management activities. The data obtained support the assumption that innovation-active companies choose, formalize and implement in practice a model of personnel management that combines strategies of a high degree of efficiency and involvement.
- A pilot study conducted revealed some shortcomings Statistics of the questionnaire formed with the help of expert assessments. In the future, it is necessary to focus the questions to a greater extent on the specifics of personnel management activities, as well as to change the assessment scale. We propose to eliminate these shortcomings during the main research.

FUNDAMENTAL DIRECTIONS OF STATE SUPPORT FOR EXPORT ACTIVITIES OF SMALL AND MEDIUM-SIZED ENTREPRENEURSHIP IN AZERBAIJAN

Ayten Mekhraliyeva

Azerbaijan State University of Economics (UNEC)

Baku, Abbas Sahhat 45 A, AZ1007, Azerbaijan

Aytenmekhraliyeva18@mail.ru

ABSTRACT

The purpose of this study is to study the state of support for small and medium-sized businesses, as well as a theoretical and methodological analysis of the economic problem, study the possibilities of expanding this support, develop proposals and recommendations based on scientifically grounded forms, moreover, to determine the importance of increasing export activity in ensuring economic development, the main conditions for increasing the country's export potential, to stimulate exports based on an assessment of the current state of export operations, to increase the country's export potential and stimulate its use. to develop proposals and recommendations to improve the legal framework. The objectives of the study are: to determine the importance of export activity in the modern system of economic relations, to study the main conditions for increasing the export potential in the Republic of Azerbaijan and the stimulated means of using the export potential, to substantiate the need for legal regulation of state intervention to increase the export potential of Azerbaijan and promote its implementation, to analyze the system of legislative acts regulating the implementation of export operations, to study the existing mechanisms of state support in the field of export stimulation in our country, assessment of the use of export potential based on the analysis of the current state of the country's export operations, identification of challenges facing the current state of export potential, to study the main directions of using the experience of foreign countries in increasing the export potential and stimulating exports, to determine the directions of improving the legal framework in order to increase the export potential and stimulate exports in our republic, etc.

Keywords: *Export policy, Economic Growth, Small and Medium-sized Enterprises, SMEs Role in Economy, Socio-Economic Development*

1. INTRODUCTION

If we look at the practice of economic development of the countries of the world, we can see that the national economic development of countries is possible through integration into the international trade system. Countries that adopt a closed economic development model face serious challenges in ensuring sustainable national economic development. The reason for this is that these countries are left out of the international trade system and do not use import-export operations effectively. Due to the exceptional importance of import-export operations in the development of national economies, the issue of the favorable position of countries in the international division of labor and the optimal use of export potential of countries remains relevant. As indicated in the strategic roadmap, which reflects the perspective development directions of the country's economy, among the important issues considered in the foreign economic strategy of the Republic of Azerbaijan for the future are increasing and realizing export potential, increasing the competitiveness of products on world markets. The issues of compliance with meat standards, increasing the range of exported products, improving the structure of imports by creating import-substituting production facilities, and promoting the "Made in Azerbaijan" brand in foreign markets are reflected. In order to address these issues, the implementation of which is identified as a goal in the foreign economic strategy, in order to

promote exports, the state should provide the necessary support to enterprises and organizations engaged in exports and stimulate exports. With the implementation of this policy, in the post-oil period, exports can become one of the main alternative ways to generate foreign exchange inflows into the country's economy. In modern times, oil and oil products play an important role in the structure of our country's exports. There is a sharp difference between the realized share of the export potential of traditional industries and some agricultural products with an international competitive advantage and its total export potential. Cotton, tobacco, vegetable products, wine, sugar, hazelnuts, etc. only a part of the export potential of the products is used. A small part of the export potential of the non-oil sector is realized, and the fact that there are only a few types of exported products is one of the important problems. Poor development of the processing industry is one of the main factors negatively affecting the realization of export opportunities. The export potential of the non-oil sector can be optimally used by stimulating exports, improving its legal regulation, eliminating the gaps in them by examining the activities of state support mechanisms that promote exports. When we look at the structure of exports, we can see that both individual businesses and SMEs have a small share in exports. These factors reflect the need to take the necessary incentives. Reducing dependence on imports and accelerating the development of priority areas that promote exports, improving the legal framework for exports is one of the urgent problems. From this point of view, it is very necessary and urgent to reveal the essence of the stimulation and legal provision of the use of export potential, to study its scientific-theoretical bases and directions of its improvement.

2. SME EXPORT POTENTIAL: THEORETICAL AND METHODOLOGICAL BASIS

From the perspective of economic development of countries, we can see that export activity, which is an important part of international trade, is of great importance for the national economy. The socio-economic reality of the modern era reflects the inability of any national economy to achieve economic development by consuming only the products it creates. The main reasons for this are the inability of energy resources, raw materials, existing technologies and the scale of production to meet its demand. Therefore, foreign trade is of special importance for the countries. As a result, international competition is intensifying. When formulating export strategies, countries must take into account every factor that contributes to the competitiveness of their products and increases the volume of exports. In modern times, the optimal solution of problems such as improving the welfare of the population, ensuring the sustainability of socio-economic development has been the subject of joint discussion of all countries. The solution of the relevant problems can be achieved by increasing the volume of foreign direct investment, achieving an increase in production using innovative methods in production, the use of technological innovations, as well as the solution of the problem of assortment of export products. In addition to ensuring the sustainability of economic development, exports play an important role in opening the national economy abroad. From the perspective of the country's economy, exports create the conditions for a significant supply of resources to the country. From the point of view of enterprises, the fact is that the rational use of these raw materials, as a result of which production costs can be minimized.

2.1. Study of legislative acts ensuring the implementation of export operations in Azerbaijan

One of the steps taken to create a favorable business environment in our country, the development of entrepreneurship, the elimination of artificial barriers to it is the adoption of the law "On Licenses and Permits." The adopted law defines the economic as well as the legal basis for the application of licenses and permits, the directions of economic activity requiring a license in the country, the characteristics of the applied permits, the principles of its application by the state, licensing procedure, licensing during its application regulates the responsibilities

and rights of the bodies participating in its activities, their officials, license holders. With the adoption of the law, transparency in licensing activities has been achieved, albeit partially. The importance of the law can be illustrated in the following figure:

- the number of licensed and permitted activities has been reduced;
- licensing procedures have been simplified, albeit partially;
- the amount of state fees for licenses and permits is minimized;
- requirements for issuing licenses and permits have been simplified;
- issuance of licenses and permits on a one-stop-shop basis;
- the developed electronic portal was made available to entrepreneurs;
- corruption in the field of licensing, at least partially prevented;
- the deadline for obtaining licenses and permits has been shortened.

Despite the reduction of the number of documents required for licensing and permits with the adoption of the law, the number of documents is still higher than in neighboring countries.

The law stipulates the cases of refusal to issue a license in Article 20, and after checking the compliance of the information provided by the applicant, when drawing up an act of refusal, the refusal must be justified in accordance with the law. However, the law does not specify the legal and economic aspects of refusing to issue a license. Also, the lack of discounts on state fees for obtaining licenses and permits to promote small and medium enterprises has a negative impact on the realization of export potential. The concession is not reflected in the law. In order to promote entrepreneurship in foreign practice, licenses are issued based on minimum quality standards if entrepreneurs have the necessary material and technical equipment in the field in which they will operate.

2.1.1. Mechanisms for the implementation of state support to SME in the field of export stimulation

Restructuring of existing mechanisms used by the state to accelerate the development of entrepreneurship in our country, the optimal use of non-oil export potential, the application of nanotechnologies in production, the organization of new processing plants for the development of the processing industry, export financing, real sector investment, SME financing can increase access to resources. As reflected in the strategic roadmaps, the state should first streamline regulation to increase the efficiency of its foreign economic activity, in particular, increase the efficiency of customs tariffs and non-tariffs, as well as the use of tax mechanisms and other economic and administrative regulation methods. In our opinion, in order to stimulate the realization of export potential in our country, work should be done on the following priority areas:

- implementation of institutional changes in the sphere of foreign economic activity in accordance with the economic situation of the market, improvement of the normative-legal base;
- state stimulation of economic activity of exporting firms;
- establishment of branches and representative offices of enterprises with great export potential in foreign countries, as well as revitalization of economic activity as a result of increasing the flexibility of the institutions of interstate chambers of commerce;
- special attention to information services, product packaging, as well as the organization of advertising activities and flexible marketing activities;
- establishment of production cooperatives with foreign colleagues, use of scientific and technological innovations in the organization of production of consumer goods, expansion of the application of new methods in production;

In order to revitalize the competitive environment, increase the importance of entrepreneurship in the country's economy, modern economic mechanisms must be formed to ensure the sustainability of economic policies pursued by the state to protect the private sector, as well as to build on international experience.

Figure 1: Comparison of loans with the corresponding period of 2019, in million Azerbaijan manat

Dynamics and analysis	2020 year	2019 year	Comparison
Number of projects	908	1 573	-42.3%
Total value	397	638.6	-37.8%
Concessional loan	126.9	175	-27.5%
• Including micro, small and medium enterprises	106.8	-	-
Debt to Value	31.9%	27.4%	4.5%
Average loan amount	0.140	0.111	26.1%
Average loan term	6.5	7.0	-7.1%
Jobs to be created	2 725	5 363	-49%

Source: The diagram was created by the author based on the information of the Entrepreneurship Development Fund <http://anfes.gov.az/>

The decrease in the number of business entities wishing to benefit from the preferential financing mechanism provided by the Fund in 2020 compared to the same period in 2019 was due to the negative impact of the coronavirus pandemic on the business environment and economic activity. At the same time, as 50 million manat of the Fund's funds are intended for the implementation of the existing loan portfolio subsidy mechanism, these funds were not used to provide soft loans (Figure 1). The Fund's soft loans are provided to business entities through authorized banks or non-bank credit organizations on their own behalf and at their own risk. Concessional loans are aimed at financing the priority areas identified by the acts of the President of the Republic of Azerbaijan, as well as the decision of the Supervisory Board of the Fund within the socio-economic development of the country. By the Decree of the President of the Republic of Azerbaijan dated June 4, 2020, the "Rules for granting soft loans at the expense of the Entrepreneurship Development Fund of the Republic of Azerbaijan" were approved and the Charter of the Fund was amended. As a rule, in areas requiring long-term investment in agriculture (eg, tea, horticulture, etc.), the loan term for small loans has been increased from 3 to 5 years, and for medium-sized loans from 5 to 7 years.

The main purpose of the mechanism is to reduce credit risks and increase the access of small and medium enterprises to soft loans. At the same time, due to changes in the circumstances related to force majeure (natural disasters, epidemics, etc.), the Rules provide for the restructuring of credit institutions' debt obligations to the Fund and the postponement of credit obligations in the manner prescribed by the Fund's Supervisory Board.

3. ASSESSMENT OF THE CURRENT STATE OF EXPORT OPERATIONS

In January 2021, Azerbaijan's exports amounted to 1.6 billion US dollars. The non-oil sector exported \$ 146 million worth of goods. Exports in the non-oil sector increased by \$ 5.2 million or 3.7 percent compared to the same period in 2020. In January this year, 52.7 million to Turkey, 42.8 million to Russia, 10 million to Switzerland and Georgia. Non-oil goods worth \$ 6.4 million and \$ 4.3 million were exported to China. Refers to the non-oil sector exported in January 2020 In the list of goods, dates (\$ 16.7 million) were first, cottonseed meal (\$ 14.3 million) was second, and shelled hazelnuts (\$ 10.2 million) were third. In general, fruit and vegetable exports in January 2021 37 million, cotton fiber exports 14.3 million, aluminum and its derivatives exports of products 13.8 million, exports of chemical products 3 million, exports of ferrous metals and their products 7.8 million, cotton yarn 3.2 million, alcoholic and non-alcoholic beverages 1 million, sugar 1.5 million, vegetable and animal fats and oils 1.7 million, tea Exports amounted to 760,000 US dollars. During February of the current year, 20.1 (20,060,664.97) million USD worth of exports were made through the "Single Window" Export Support Center. Valuable ingots, pomegranates, apple juices, soft drinks, beer, feijoa and quince soft drinks, saffron jams, vegetable and sunflower oils, medical leech, salted sheep intestines, chrome-plated animal skins, internal organs of large and small horned animals, cheese by legal entities and individuals, feijoa and quince spirits, fresh frozen sturgeon meat, dry fruits, condensed milk, ice cream, bird vaccines, exhaust catalysts, steel fittings, steel pipes, steel squares were exported. Among the above-mentioned products are the export of valuable ingots (64.5%), (steel reinforcement (11.7%), sunflower oil (10.1%), cheese (6.1%), fruit juices (1.9%). Certified products were exported to 22 countries - Switzerland (64.5%), Russia (10.4%), Georgia (9.4%), Turkey (7.2%), Ukraine (0.8%), Exported to other countries (7.8%) - (USA, Baltimore, Dubai, Palestine, Poland, Egypt, Belarus, Ivory Coast, Australia, Iraq, Canada, Belgium, Hong Kong, Israel, Kazakhstan, UAE, Uzbekistan) Exports of goods by air (64.9%), automobiles (28.2%), rail transport (6%) and mixed transport (0.9%). It should be noted that the development of SMEs in Azerbaijan is a serious problem. For this reason, macroeconomic policy measures need to be taken to address a number of issues, including clear goals, from the point of view of Azerbaijani citizens, especially entrepreneurs and relevant government officials. Therefore, the implementation of institutional changes that support the development of SMEs and the creation of an enabling environment for their development is of strategic importance. Ensuring the sustainable development of modern entrepreneurship is the basis for the implementation of the strategy of socio-economic development of Azerbaijan. It is the foundation of the innovative and productive nature of the economy. At present, the private sector in Azerbaijan accounts for over 84% of the country's GNP. In the past years, the obligation to create conditions for accelerated rates of stable socio-economic growth has gained widespread popularity in the country. In addition to creating a favorable business environment in the country, it is imperative to establish contacts between entrepreneurs, facilitate their activities, organize networks in crisis situations and regulate relations between the public and private sectors (Figure 2). The development of small and medium enterprises (SMEs) in Azerbaijan is of particular importance in terms of economic diversification, increasing competitiveness, employment, meeting the demand for consumer goods from local resources and ensuring economic development.

Thus, looking at the share of SMEs in GDP and employment in developed countries, it can be concluded that one of the main challenges ahead is to make SMEs the main driving force in ensuring sustainable economic development in Azerbaijan.

Figure 2: Number of micro, small and medium business entities operating by economic activity and types of property

Source: The State Statistical Committee of Azerbaijan Republic

The Strategic Roadmap identifies key areas for economic reform and development in SMEs in the short, medium and long term. This document includes a strategic vision for 2020, a long-term vision for the period up to 2025, and a target for the period after 2025. The Strategic Roadmap outlines not only the strategic goals and objectives for the relevant period, but also the priorities set for achieving the goals set for those years and the measures to be implemented within those priorities. The name of the event, main and other executors, outcome indicators and specific implementation period are reflected. Effective implementation of these priorities in the short term will form the basis of the next steps to be implemented in the medium and long term, thus ensuring the efficiency of the implementation process. The implementation of the Strategic Roadmap will be ensured through communication and cooperation with non-governmental organizations, local and international private sector partners.

In order to achieve the strategic goals set out in the Strategic Roadmap for the development of SMEs in the country and to ensure maximum use of relevant opportunities, the following have been identified as strategic goals:

- Further improvement of the business environment and regulatory framework in the country in order to increase the impact of SMEs on Azerbaijan's GDP in the long run;
- Ensuring efficient and effective access to financing resources in order to create a sustainable network of SMEs;
- Internationalization of SME activities and increasing access to foreign markets in order to increase the country's foreign exchange reserves and ensure compliance of goods produced in the country with international standards.

Table 1: Rating of non-government exports in the non-oil sector for January 2021, in million US dollars compared to the same period last year

NON-STATE EXPORTERS	2020	2021
"MKT PRODUCTION COMMERCE" LLC	6.5	8.4
"ALMEYVE" LLC	0	5.2
"BAKU STEEL COMPANY" LLC	2.8	3
"CRITICAL FRUIT" LLC	0	3.7
"AQROVEST" LLC	1.9	3.1
"SUN FOOD" LLC	1.7	3
"LAND LOGISTIC" LLC	0	3
"P-AQRO" LLC	3	2.9
"METAL TRADE LTD" LLC	0,043	2,6
"RAM INTERNATIONAL TRANSPORT AND TRADE LTD" LLC	1,6	2,5

The "Export Review" has compiled a rating of both non-state and state-owned exporters on exports in the non-oil sector in January 2021. The following companies are represented in the top ten in the ranking of non-state exporters for January 2021: "MKT Production Commerce" LLC, "Almeyve" LLC, "Baku Steel Company" LLC, "Critical Fruit" LLC, "Agrovest" LLC, "Sun Food" LLC, "Land Logistic" LLC, "P-Agro" LLC, "Metal Trader LTD" LLC and "Ram International Transport and Trade LTD" LLC (Table 1).

Table 2: Ranking of main state exporters in the non-oil sector by January 2021, in million US dollars compared to the same period last year

STATE EXPORTERS	2020	2021
"SOCAR POLYMER" LLC	11	14.7
"MARKETING AND ECONOMIC OPERATIONS DEPARTMENT" LLC	11.5	14.6
"AZERALUMINUM" LLC	7.8	12.2
"AZERGOLD" JSC	9.4	9.9
"AZERPAMBIQ AGRICULTURAL INDUSTRIAL COMPLEX" LLC	1.2	5.2
"AZERENERJI" OJSC	7.7	0.35
"AZERIPEK" LLC	0	0.239
"AZERBAIJAN RAILWAYS" LLC	0	0.191
"AZERTUTUN AGRICULTURAL INDUSTRIAL COMPLEX" LLC	0	0.064
"AZERBAIJAN AIRLINES" CJSC	0.595	0.055

Source: The table was created by the author based on the information of the Center for Analysis of Economic Reforms and Communication of Azerbaijan Republic

The list of state-owned companies involved in export operations in the non-oil sector is headed by Socar Polymer LLC and the Marketing and Economic Operations Department of the State Oil Company of Azerbaijan. Then the following companies are represented in this list: "Azeraluminium" LLC, "Azergold" CJSC, "Azerpambig Agrarian Industrial Complex" LLC, "Azerenergy" ATSC, "Azeripek" LLC, "Azerbaijan Railways" CJSC, "Azertutun Agrarian Industrial Complex" LLC and "Azerbaijan Airlines" CJSC. The information on the rating of these exporters in the infographics provided through (Table 2).

4. CONCLUSION

In response to the challenges facing the economic development of our country, it is necessary to make a number of institutional and structural improvements. The balance of payments deficit, the negative impact on the financial and banking sector and the non-oil budget deficit have shown the need for the country's transition to a new model of development. It is possible to note some agricultural products of our republic, which have a large export potential. These products include pomegranates, figs, potatoes, natural honey, grapes, saffron, walnuts, hazelnuts, etc. can be attributed. It should be noted that saffron products may have promising export opportunities in the future. At present, the demand for saffron in the domestic market is met by products imported from Iran to our country, which negatively affects local production and hinders the development of saffron. At the same time, the absence of saffron in the Cabinet of Ministers Resolution No. 103 on export-stimulated products has a negative impact on the use of its promising export opportunities. In the future, our country can get large foreign exchange reserves from the export of viticulture and wine products, which have great export potential. However, the lack of competitiveness of wine products in European markets is due to its low quality, as well as the fact that the packaging and advertising of wine products do not meet modern market requirements. Due to the fact that our country is not a member of the WTO, the small export quota set by our countries for wine and wine products of national origin also has a negative impact on the use of its export potential. Although some work has been done to improve the regulatory framework for export stimulation, we believe that in order to achieve a significant increase in the country's export performance, increase the share of non-oil exports in the structure of exports, adopt new laws and eliminate gaps in existing legislation. adaptation is inevitable. The issue of Azerbaijan's membership in the WTO is important in order to increase the export performance of our country and expand the activities of our exporters in foreign markets. Legislation on regulation, intellectual property, as well as investment does not comply with international standards, as well as WTO requirements. In order to increase the attractiveness of investment in the non-oil sector, an incentive mechanism should be created to ensure that foreign investors are interested in investing in the sector, and foreign investors and local investors should be treated equally. It is necessary to improve laws and regulations on investments and bring them into line with international law. There is no legislation on the provision of low interest rates on export loans by banks to exporters to finance exports, and a regulatory framework for export insurance should be established. In order to reduce the tax burden on small and medium-sized businesses that play a special role in exports, it is necessary to transfer the patent tax system applied in many countries to international practice, and the patent tax system should be reflected in the Tax Code. Russia, Kazakhstan, Belarus, etc. are among the countries where the patent tax system is applied. takes place.

5. PROPOSAL

In order to increase the export potential of our country and its realization, it is necessary to liberalize foreign trade as much as possible. The predominance of extractive industry products in the structure of exports reflects the need to increase exports of high-tech processing products.

Weak diversification of exports, both in terms of species and geography, and the very low share of non-oil exports in exports underscore the importance of effective government regulation that creates a healthy competitive environment and transformation into a high value-added export-based economy. In our opinion, the closure of the non-oil import deficit is possible due to the increase in export potential, and the implementation of the following measures can yield positive results:

- The use of advanced technologies that create high added value in industry, management, communications, finance, agriculture, information and other fields, and the invitation of highly qualified specialists to our country as a workforce during the import of these technologies may be considered expedient.
- One of the important measures in increasing and realizing the export potential is the membership of the Republic of Azerbaijan in the WTO. WTO membership can create new opportunities for the country's exporters, simplify foreign trade procedures, lower customs tariffs, increase import and export operations, reduce monopolies, eliminate monopolies, revitalize the free competitive environment, and liberalize foreign trade.
- In order to diversify the export of agricultural products and processed products from a geographical point of view, the maximum use of logistics opportunities to realize the access of these products to the target markets can have an effective impact. Improving the legal and regulatory framework for foreign trade to increase access to international markets for exports of goods and services produced in our country.
- Simplification of foreign trade procedures, minimization of time spent on documentation as a result of flexible execution of documentation in real time, reduction of the number of required documents may make firms interested in export.
- It is important to maximize the unification of tariffs and non-tariffs applied in order to protect the domestic market, to ensure the accuracy and transparency of rate change procedures.
- Positive results can be achieved by eliminating bureaucratic barriers to cooperation with international financial institutions, directing the obtained loans to the implementation of strategic goals related to exports.
- Effective results in export growth can be achieved by accelerating the process of establishing free economic zones and focusing on the export-oriented nature of the established free economic zone.
- It is forecasted that the reduction of the number of activities requiring licenses and permits and the elimination of gaps in the Law of the Republic of Azerbaijan "On Licenses and Permits" will be a positive impetus for the realization of export potential.
- It is expedient to create an agricultural insurance system and ensure favorable insurance conditions.
- The use of the patent tax system can create conditions for the growth of exports. As a result, the legalization of the shadow economy will be possible, and confidence in ownership will increase.
- The reduction of interest rates by the Central Bank, reduction of the required reserve ratio, minimization of interest rates on business loans of commercial banks were assessed as one of the necessary steps taken to increase exports, and the implementation of these measures is considered appropriate to increase exports.
- The establishment of logistics centers and the establishment of a system to monitor their effective operation can be a positive impetus to export growth.
- It is considered acceptable to eliminate gaps and improve a number of legislative acts included in the legal framework of foreign economic activity.

BUDGET AND TAX POLICY OF THE GOVERNMENT OF AZERBAIJAN AGAINST THE CORONAVIRUS

Azer Agarzayev

*Azerbaijan State Economic University (UNEC), Baku, Azerbaijan
syako97@mail.ru*

ABSTRACT

The challenge of COVID-19, thrown to virtually all human beings, forced them to take urgent decisions. The COVID-19 epidemic required the government to adopt operational solutions to minimize the spread of the virus, as well as to support the economy and the population. Similar to the main areas of anti-crisis policy, the developed and developing countries are differentiated, first, by the volume of support and, secondly, by the set of tools used. Resolutions adopted by the Government of Azerbaijan fully agree with international practice in the areas of support. In this regard, the stated volumes and priority tools of neutralization of the negative socio-economic consequences of the pandemic in Azerbaijan differ from the leading economic world. The most important tasks of the Strategy for the further development of Azerbaijan in the conditions of the pandemic are the improvement of tax administration, the continuation of the course on the reduction of tax breaks and the simplification of the tax system. The main objectives of tax reform in Azerbaijan are to ensure financial security and the development of small and medium enterprises in the country, the creation of favorable conditions for entrepreneurship and budgeting. The creation of a favorable institutional environment for small and medium-sized businesses contributes to the diversification of the economy, the expansion of the non-oil sector on the principles of development, the opening of new jobs and, at the same time, its modernization. Timely reform of the system of state management allows Azerbaijan not only to adequately respond to the challenges of the pandemic period, but also to formulate tasks and defense mechanisms for the entire post-pandemic system of key interference. This work is dedicated to the study of tax policy in Azerbaijan in overcoming the pandemic. There is a review of scientific literature and normative legal acts, synthesis and analysis of the information obtained, as well as comparisons and analogies.

Keywords: *Tax policy, pandemic, tax system, tax benefits and holidays*

1. INTRODUCTION

According to the order, to assess the impact of the coronavirus pandemic on the economy of Azerbaijan, it was instructed to create a working group headed by the Minister of Economy. The working group was instructed to approve the criteria for identifying entrepreneurs affected by the coronavirus within 15 days; prepare a package of proposals and submit it to the Cabinet of Ministers on measures that will allow in the short and medium term to reduce the impact of coronavirus on the business environment and ensure economic growth; determine the amount of possible damage to entrepreneurs. «The Central Bank of Azerbaijan has extended the term for full deposit insurance from March 4 to December 4, 2020, regardless of the amount of deposits, currency and financial condition of banks» (Мамедов,2020). According to the “Order of the President of the Republic of Azerbaijan on a number of measures to reduce the negative impact of the coronavirus pandemic (COVID-19) and the sharp fluctuations in the global energy and stock markets caused by it, on the economy of the Republic of Azerbaijan, macroeconomic stability, employment in the country and business entities »Programs were developed to provide state support to various sectors of the economy and the sphere of entrepreneurship. Azerbaijan is implementing economic support measures worth up to 3.3 billion manats (about US \$ 2 billion, or 4% of GDP). The volume of measures to support the Azerbaijani economy in 4 months of 2020 exceeds 4.3% of GDP.

Obviously, the funds are spent not only on anti-storm stabilization - support of citizens and business entities (by the end of May, a total of about 4 billion manat were spent directed to 1.4 million citizens), but also on a structural breakthrough of the national economy in new, globally changed conditions. The total volume of anti-crisis measures, including fiscal holidays and tax rate cuts, at the end of five months of 2020 reaches 4.3% of GDP (Mamedzade, Karavaev (2020)). It is worth emphasizing that in recent years, large-scale work has been carried out in Azerbaijan to stabilize the economy, industrial industrialization has been underway, effective measures have been taken to increase transparency in the tax and customs spheres, which ultimately brought significant surplus revenues to the budget.

2. BUDGET POLICY IN THE CONTEXT OF A PANDEMIC

Fiscal policy in many countries acts as a balancing mechanism in two areas - as a tool to ensure the conditions for economic growth and all-round sustainable development of the economy, with one side, and a viable budget system. One of the main objectives of the authorities, the existing budget policy, is the positive impact of the adopted managerial decisions on the economic development of the country as a whole, as a guarantee of the growth of the budget. It is also important to manage budget management not only with the fulfillment of obligations, but also with the development of society and the smoothing of inequality, especially in relation to a well-thought-out balanced policy. The preparation, discussion and adoption of the state budget for 2021, unlike previous years, coincided with a time of great tension and excitement for the people of Azerbaijan, which ended in a glorious victory. Thus, the outbreak of the coronavirus (COVID-19) pandemic at the beginning of this year and its outbreak has affected the social and economic development of the Republic of Azerbaijan, as well as other countries, and hindered the implementation of projects and programs in many areas. When calculating the revenues of the state budget for 2021, the negative impact of the coronavirus (COVID-19) pandemic in 2020 will continue in 2021, OPEC + agreement on the reduction of oil production, changes in the energy market, as well as forecasts of international financial institutions and our country. macroeconomic indicators were taken into account. At the time of the project, the price of a barrel of oil was calculated at \$ 40 and the state budget revenues for 2021 were projected at 25,427.0 million manat, which is 1,303.0 million manat or 5.4 percent more than the 2020 forecast. 54.2% or 13776.0 million manat of state budget revenues fall to the oil sector, 45.8% or 11651.0 million manat to the non-oil sector. 88.6% or 12200.0 million manat of the state budget revenues in the oil sector are transfers from the State Oil Fund of the Republic of Azerbaijan, and 11.4% or 1576.0 million manat are revenues from the oil sector through the tax authorities. 48.7% or 5674.0 million manat of the state budget revenues in the non-oil sector were received by the tax authorities, 33.5% or 3900.0 million manat by the customs authorities, 7.6% or 880.0 million manat by the customs authorities. Transfers from the Guarantee Fund of public debt and guarantee liabilities, 2.1 percent or 250.0 million manat from the Central Bank's profit, 8.1 percent or 947.0 million manat other income. Expenditures of the state budget for 2021 are envisaged at 28543.0 million manat, which is 1050.8 million manat or 3.8 percent more than the forecast for 2020. The main factor that characterizes that the state budget expenditures are aimed at improving the welfare of the people and contributes to the sustainable and sustainable development of the country's economy is that it is socially oriented and investment-oriented.

3. TAX POLICY OF AZERBAIJAN IN THE CONTEXT OF A PANDEMIC

Timely reform of the public administration system allows Azerbaijan not only to adequately respond to challenges during a pandemic, but also to formulate tasks and protective mechanisms for the post-pandemic period in a number of key areas in the system of national interests of the country.

Currently, the tax system, which is an integral part of the ongoing in the country and determining the socio-economic line of development of economic reforms, is undergoing reform. The ongoing tax reforms include supporting the development of entrepreneurship, reducing the "shadow economy", increasing transparency, expanding the tax base, increasing the economic efficiency of tax incentives, and improving tax administration. The ongoing reforms will open up new opportunities for the tax system to adapt to the tasks set, establish modern business relations and increase the role of the tax system in the development of the country's economy. The important tasks of the Action Strategy for the further development of Azerbaijan in the context of a pandemic are to improve tax administration, continue the course to reduce the tax burden and simplify the tax system. The main goals of the tax reform in Azerbaijan are to ensure financial security and the development of small and medium-sized businesses in the country, to create favorable conditions for entrepreneurship and to increase state budget revenues. The creation of a favorable institutional environment for small and medium-sized businesses contributes to the diversification of the economy, the expansion of the non-oil sector according to the principle of branching, the creation of new jobs and, at the same time, its modernization. Tax policy in the context of global instability, first of all, should be aimed at supporting the real sector, be stimulating in protecting investment policy and economic competitiveness, should be flexible and support the development of innovative spheres. The need to revise the existing tax rates seems to be an urgent task from both economic and social points of view. The use of a progressive scale will allow, firstly, to increase the incomes of not only the republican, but also regional budgets, which can be used to implement social programs aimed at improving the quality of life of the population. The two Doing Business indicators - Starting business and Paying taxes - are directly related to tax issues. Our country has significantly improved its position in both indicators, over the past year Azerbaijan has risen from 18th to 9th place in terms of "Starting a business", and from 35th to 28th place in terms of "Payment of taxes". "Reducing the "shadow economy", developing the infrastructure of electronic payments and strengthening the institutional base, expanding the introduction of innovative technologies, attracting individuals and business entities to use electronic payment services are of particular importance in the activities of the State Tax Service to achieve progress in increasing the volume of non-cash payments. In order to increase the volume and expand the coverage area of non-cash payments, the tax service is constantly focusing on international trends in this area" (Mamedov, Gasimov.2020). The State Tax Service approved the Action Plan for the implementation of the "State Program for the Expansion of Digital Payments in the Republic of Azerbaijan in 2018-2020" and established modern standards for more effective organization of activities in this area (<https://www.taxes.gov.az/ru/page/umumi-melumat>).

4. THE PROGRAM OF TAX INCENTIVES, PRIVILEGES AND TAX HOLIDAYS FOR BUSINESS ENTITIES IN A PANDEMIC

In addition, on June 2, Azerbaijan adopted amendments to the Tax Code and introduced temporary tax breaks and vacations designed to reduce the negative consequences for enterprises. Measures included abolishing land and property taxes throughout the year, as well as reducing income taxes and social security contributions for businesses particularly hard hit by the pandemic. The government also seeks to provide financial support to individual entrepreneurs and business owners and help them pay wages; for this, an online platform is used to transfer funds directly to the bank accounts of the persons concerned. By the end of July 2020, over 100,000 microentrepreneurs received 63.55 million manats (37.4 million US dollars), while nearly 30,000 entrepreneurs' applications for assistance in paying wages were approved for a total amount of about 98 million manats (57, \$ 7 million). In August, entrepreneurs who retained workers received additional financial assistance in the amount of a

monthly wage fund. In addition, the Agency for the Development of Small and Medium-Sized Enterprises has begun to conduct online seminars for entrepreneurs facing economic difficulties associated with the pandemic to raise their awareness and provide them with information on existing support measures. According to the amendments, from January 1, 2020, hotels and other tourism facilities, the activities of tour operators and travel agencies, the catering sector, car passenger transportation within the country, including taxi activities, are completely exempt from property and land taxes for a period of one year (<https://tourism.interfax.ru/ru/news/articles/69737/>). In addition, the activities of delivery services, the sphere of organizing exhibitions and stage activities, cinemas, museums, theaters and concert halls, activities of sports and recreation facilities, educational courses, out-of-school educational institutions, and psychological centers are exempted from taxes on property and land. The release will also affect other areas, whose activities have been partially or completely suspended due to the quarantine regime introduced by the Cabinet of Ministers. Along with this, from January 1, 2020, for a period of one year, a number of additional benefits will be introduced for the above areas, depending on the tax regime. Payers of income tax (or income tax - IF) will receive benefits in the amount of 75% (of the tax amount payable), payers of simplified tax - in the amount of 50%. For taxpayers who are not micro entrepreneurs, the deadlines for payment of taxes on profits (or income tax - IF) and property assessed for 2019 have been extended until September 1, 2020. Also, the accrual of interest on unpaid taxes, contributions for compulsory social insurance and unemployment insurance has been postponed from April 1, 2020 to January 1, 2021. The program of tax incentives, privileges and tax holidays for business entities operating in areas that have suffered losses from the coronavirus pandemic:

- 1) Provision of privileges for a certain period for micro-business entities under a simplified tax.
- 2) Exemption for a certain period of taxpayers from payment of property and land tax
- 3) Exemption in an appropriate volume and for a certain period of taxpayers from paying income tax (income tax).
- 4) For the catering sector - a reduction in the simplified tax rate, exemption from taxation of payers of income tax (income tax).
- 5) Exemption for a certain period from VAT of certain categories of taxpayers.
- 6) Exemption from the implementation of current tax payments in the fields of activity, which will be provided with benefits;
- 7) Extension of the deadline for payment of income tax (income tax) based on the results of 2019.
- 8) Extending the deadlines for paying taxes and the deadlines for filing tax returns.
- 9) Exemption for a certain period from VAT for goods necessary to meet the food and medical needs of the population (exemption from VAT on imports and sales of certain goods).
- 10) For the purpose of flexible regulation and provision of food, medical and other important needs of the population, exemption of raw materials and materials used for the production of goods for the specified purpose from VAT.
- 11) Tax exemption for donations from individuals and legal entities to the Corona Virus Support Fund (for income tax and income tax).
- 12) Application of VAT at a zero (0) rate to free services provided in order to prevent the epidemic.

According to the Ministry of Economy of Azerbaijan, these tax benefits are estimated at 114 million manats (\$ 67 million) (<https://www.oecd.org>).

5. CONCLUSION

As a conclusion of the study, we note that over the past ten years, the priorities of the economic development strategy in the country have been to improve the investment and business environment, aimed at the development of small and medium-sized enterprises in Azerbaijan, the adoption of regulatory legal acts in this industry, or their improvement by making changes and additions to the current legislative acts, as well as attraction of local and foreign investments, modern technology and management experience, thereby ensuring the production of high-quality and competitive products. It is worth emphasizing that in recent years, large-scale work has been carried out in Azerbaijan to stabilize the economy, industrial industrialization has been underway, effective measures have been taken to increase transparency in the tax and customs spheres, which ultimately brought significant surplus revenues to the budget. The important tasks of the Action Strategy for the further development of Azerbaijan in the context of a pandemic are to improve tax administration, continue the course to reduce the tax burden and simplify the tax system.

ABSTRACT

After the independence of the Republic of Azerbaijan in 1991, the main leading area of national economic development fell to the oil sector. Despite the country's economic difficulties in the first years of independence, foreign investment in the oil and gas sector in 1995 by the world's leading companies boosted the economy. The signing of the so-called "Contract of the Century" agreement with the oil companies of developed countries (DCs) in 1994 played an important role in increasing the country's financial capacity, boosting economic growth and maintaining currency stability in the following years. The full operation of the Baku-Tbilisi-Ceyhan oil pipeline in 2006 led to the peak of oil export revenues to Azerbaijan between 2006 and 2012 and led to the rapid development of the national economy. Azerbaijan's new oil strategy started with the "Contract of Century" between newly-independent Azerbaijan and multinational oil corporations reached the following achievements. Ensuring rapid access of Azerbaijan to the world energy market through the involvement of international oil corporations in oil and gas projects, foreign business circles as a whole, establishment of an export pipeline system to ensure free and rapid access of Azerbaijani oil to the world market, signing of 26 oil agreements with foreign oil companies since the contract the Deal of the Century. The oil strategy of Azerbaijan provided the flow of billions of dollars into the national economy, and the gained money supports the reform today non-oil export sectors including manufacturing, agriculture, non-oil industry as well as entrepreneurship. This paper illustrates that the oil strategy of Azerbaijan today provides the flow of petrodollars to Azerbaijan, and this in turn provides liquidity of the reform in non-oil sectors.

Keywords: *Oil strategy, Azerbaijan, non-oil sector, diversification*

1. INTRODUCTION

After the independence of the Republic of Azerbaijan in 1991, the main leading area of national economic development was oil and gas sectors. Despite the country's economic difficulties in the first years of independence, foreign investment in the oil and gas sector in 1995 by the world's leading companies boosted the economy. The signing of the so-called "Contract of the Century" agreement with the oil global companies of developed countries in 1994 played an important role in increasing the country's financial capacity, boosting economic growth and maintaining currency stability in the following years (Spatharou, 2002, p.29). The full operation of the Baku-Tbilisi-Ceyhan oil pipeline in 2006 led to the peak of oil export revenues to Azerbaijan between 2006 and 2012 and led to the rapid development of the national economy (Balat, 2006.p, 118). Azerbaijan's oil strategy was about constructing oil and gas pipelines systems from the Caspian to the West, the development of oil and gas transportation infrastructure as well as providing access of national energy sector to western capital and western markets freely (Kaynak and Nasirova, 2005, p. 34; Ismailzade and Babayev, 2020, p.

80). However, the sharp fall in world oil prices, which began in 2015, and the decrease in oil production in Azerbaijan began to have a negative impact on the country's income. Given that Azerbaijan is a revenue-generating economy from oil exports, falling production and volatility in world oil prices have made the development of the non-oil sector and economic diversification at the expense of oil revenues crucial for the sustainability of the economy. Improving competitiveness, identifying areas for research into the integration of the non-oil export sector into the world economy and preparing proposals are extremely important both for the relevance of research and for the development of the national economy in practice. It is important to note that the only way to reduce the country's dependence on oil revenues is to build a non-oil export sectors, integrate them into the world economy and ensure the country's revenues from different sources. Since 2004, it has been emphasized both in the official speeches of the President of the Republic of Azerbaijan, Mr. Ilham Aliyev, and in the programs for the economic development of the Azerbaijani economy and its regions. The development of the non-oil sector and the need to increase non-oil exports are reflected in the development concept "Azerbaijan 2020: vision for the future", "Strategic Roadmap for the national economy of the Republic of Azerbaijan", "Social development of the regions of the Republic of Azerbaijan in 2019-2023", State Program of Economic Development” and other documents. In 2016, the “Strategic Roadmap for the National Economic Prospects of the Republic of Azerbaijan” approved by the Decree of the President of the Republic of Azerbaijan No. 1138 dated December 6, 2016, in order to increase Azerbaijan's income from non-oil exports, determining agricultural production, tourism, heavy industry, machine building, logistics, trade, small and medium businesses, as well as information technologies as priority areas. Despite all the necessary measures the analysis of Azerbaijan's economic exports in 2019 show that 91.6% of Azerbaijan's total exports, including oil; fell on mineral fuels, which brought Azerbaijan \$18.4 billion in revenue. Exports of agricultural products are second with a small percentage and do not bring significant revenues compared to oil products. The analysis of these indicators raises challenge that the country's revenues will decrease in the post-oil period and makes the study of the integration of the institutional structure of the non-oil export sector into the world economy and the development of proposals in the required areas an extremely important. This paper examines the development dynamics of main non-oil sectors prioritized by the government of Azerbaijan and shows that the oil strategy has been providing the flow of petrodollars to Azerbaijan, and this in turn provides liquidity of the economic sectors for reform.

2. KEY NON-OIL SECTORS AND THEIR DEVELOPMENT DYNAMICS

President Ilham Aliyev spoke at a Davos World Economic Forum interactive session on Strategic Outlook: Eurasia in 2018 and said that “as a source of big income, we should look at technology, innovation, manufacturing, entrepreneurship, and agriculture” as an alternative to oil (President.az, 2018). Also, the directions of the non-oil export sector determined by the Azerbaijani government include support for the agricultural and processing sectors, the industrial sector and entrepreneurship. In addition, tourism, information technology development and the establishment of logistics centres are important for the Azerbaijani government. The UAE, Nigeria and Norway models on economic diversification show that successful integration into the global economy and strengthening of competitiveness are among the most important indicators for increasing the export potential of the economy. The analysis of the models from an international perspective shows that the most successful and appropriate model for Azerbaijan is the UAE model (Babayev, 2019, p.77). The UAE has an open economy; it integrated into the world economy; has a competitive economy as well as its WTO membership have enabled the UAE today to reduce its dependence on oil exports by 12%. Neither Nigeria nor Norway, a success story in oil revenue management, has achieved this. The agricultural sector is one of the most important sectors in the Azerbaijani economy that can be

reformed. Agriculture is the most profitable sector in Azerbaijan's exports after oil. After 2018, after the oil sector, the sector that brings 3% of income to the country falls on agriculture (Aliyev and Gasimov, 2018, p. 177-195). The main way to the global integration of agriculture is to increase agricultural exports and diversify markets by attracting investment in this area. In addition, the state must make significant investments in infrastructure and irrigation. At the same time, there is a serious need to increase productivity and increase the competitiveness of products produced in industrial processing enterprises which can support this sector. Azerbaijan's agriculture sector employs 37 percent of the population and has been regarded as one of the country's earliest engagements by the local population since ancient times. Azerbaijan's agricultural exports are second only to oil exports in terms of foreign trade indicators. Azerbaijan's agricultural sector has enormous potential due to its fertile soils, natural water supplies, and diverse climate zones. In recent years, the government has made major investments in agriculture, and large-scale reforms are in the works. According to experts, the agricultural sector will expand rapidly in the coming years. The state's agricultural growth priorities are outlined in the Strategic Roadmap for Agricultural Development (2016: 41). The state's goal is to improve agricultural production's competitiveness by 2025. (2016: 45). The strategic map shows that modern farms need the implementation of technologies and agricultural automation in order to improve productivity (2016: 45). The non-oil export field also involves industrial production. As it comes to the industrial sector, it is divided into light and heavy industrial sectors. The industrial sector, mining industry, manufacturing industry, energy, coal, steam processing, distribution and supply, and water supply, as well as waste management, are all part of Azerbaijan's national industry. Textiles, fabrics, carpet weaving, leather goods, and footwear manufacturing are all part of the industrial sector (Ministry of Industry of Azerbaijan, 2016: 2). The light industry is characterized by its low capital requirements and reliance on manual labor to drive production. Despite Azerbaijan's significant investment in the development of industrial facilities and parks, the majority of existing industrial enterprises are inefficient. To endorse industrialization, Azerbaijan has chosen "import substitution." However, this technique, which was widely used by Latin America's and Africa's least developed countries between the 1930s and 1980s, struggled to yield results (Yilmazkuday, 2003, p.2-14). Since industrial development necessitates significant investment, the majority of the funds invested in this sector were genuine petrodollars raised by Azerbaijan as a result of its oil strategy. However, it still needs to be reformed. The growth of small and medium-sized businesses (SME) and their potential for export remains a third important component of the non-oil export market. SMEs are at the centre of the global economy and play a key role in job growth. The Strategic Roadmap, which includes several activities for SMEs such as the establishment of a centralized SME department, the establishment of clusters, the creation of business incubators, and start-ups, has aided entrepreneurship in Azerbaijan (2016: 5). Furthermore, the growth of technologies in Azerbaijan has been reflected in the country's main strategic maps in order to boost efficiency and competitiveness in various sectors. The government believes that all sectors should benefit from innovation-driven growth (Babayev, 2019: 140; Babayev and Hajiyev, 2019:312).

3. ANALYS AND POLICY RECOMMENDATIONS

The relationship between Azerbaijan's oil policy and the growth of non-oil sectors can be summarized in a single sentence. Azerbaijan's oil policy has brought oil revenues to the country, which has aided in the massive implementation of reforms in the following fields.

3.1. The agricultural sector

The agricultural sector is one of the most important sectors in the Azerbaijani economy that can integrate into the world economy. As mentioned earlier, agriculture is the most profitable sector

in Azerbaijan's exports after oil. After 2018, after the oil sector, the sector that brings 3% of income to the country falls on agriculture. The main way to the global integration of agriculture is to increase agricultural exports and diversify markets by attracting investment in this area and moving to an open economy model. In addition, the state must make significant investments in infrastructure and irrigation. At the same time, there is a serious need to increase productivity and increase the competitiveness of products produced in industrial processing enterprises. At present, Azerbaijan's agrarian policy is set in the right direction. Another role of the state is to simplify exports to farmers and provide access to information. Simplification of tax, transaction and export regulations in the local context will increase the interest of farmers and individual investors in the country's agriculture. In order to accelerate trade while increasing agricultural productivity, World Trade Organization (WTO) membership makes it inevitable that Azerbaijan will have ample opportunities to integrate its agricultural system into the world economy.

3.2. Entrepreneurship

The development of small and medium enterprises is one of the main promising areas for increasing the exports of the non-oil sector in Azerbaijan. It is the involvement of small and medium-sized enterprises in agriculture, processing and light industry that can lead to development in the field and increase the export potential of businesses operating in the national economy. Therefore, it is important to establish a national competition system to be ready to compete in the world economy. It must be mentioned that the role of the state is to create a fully competitive environment for the development of small and medium enterprises and create the most favourable conditions for the growth of new firms. When applying Porter's Diamond Model, it is easy to see that countries need four key factors to increase their competitiveness. The first is the existence of factors of production (capital, raw materials), the structure and level of competitiveness of the national economy, the existence of clusters and consumers (Grant, 1991: p. 535-548). The level of competition and the competitive philosophy of firms lead to more development the greater the competition. Firms that are developed and strengthened by competition in the domestic economy and increase their profits can easily withstand the competition that dominates the world economy. Therefore, the only step facing the Azerbaijani state should be the formation of a fully competitive environment in the country's economy. In this regard, although the reforms that started in 2019 go in this direction, judicial reforms in 2020 and the formation of a competitive environment in the economy and the creation of equal opportunities for entrepreneurship can create opportunities for the integration of domestic firms into the world economy. The application of a free trade model in the country's economy and accession to the WTO open up great opportunities for firms to integrate into the world economy. However, given the local competitive environment and the level of development of firms, it is important to note that prior to integration, there is a need to strengthen the competitive environment, improve legislation, introduce working mechanisms, and have an independent, flexible and low-cost judicial system. This, in turn, goes through institutional reforms, good governance and infrastructure investment. It is very important to learn and apply foreign experience to promote business activities. Surely, Azerbaijan's policy through the newly established Small and Medium-Sized Development Agency (KOBIA) is a good measure. The provision of consulting services to entrepreneurs, the strengthening of business education, the establishment of incubators, and export support are part of a successful policy to strengthen small and medium-sized enterprises. While loans and financial access to the Entrepreneurship Support Fund are all part of a successful public policy, the government's greatest role is to create a competitive environment for integration and remove all barriers to firms' empowerment. Minimizing the administrative costs associated with permits for companies engaged in export activities can increase the number of these companies.

3.3. Industry

Light and heavy industries with comparative advantages of Azerbaijan should be identified. State investments in inefficient enterprises should be saved and invested in areas with comparative advantage. From the history of light industry to the history of carpet weaving, silk, cocoons, and cotton garments, the Azerbaijani economy can compete abroad. It is important to note that although Azerbaijan is currently building many new industrial enterprises, it is mainly used to meet domestic needs. As for heavy industry, the Strategic Roadmap for the Development of Heavy Industry and Mechanical Engineering in the Republic of Azerbaijan states that traditional heavy industry and machine building in Azerbaijan include “ferrous and nonferrous metallurgy, chemical industry, aerospace industry, military industry, household appliances, electricity, energy and transport. production of equipment, agricultural machinery” (p. 5). At the same time, the map notes that the work done for the development of industry is public investment, the construction of industrial parks, and the training of personnel working in the field of industry. There is a serious need to assess Azerbaijan's industrial policy. There is a serious need to identify specific areas, reduce efficiency areas and prepare effective areas to compete in the world economy. Strengthening the national education system should be part of the policy and should be implemented in parallel. While there are prospects for the integration of industry into the world economy, it is important to note that a few results have been achieved in this area. Azerbaijan's economy is developing industry to meet the needs of local consumers, which could result in the country losing significant incomes and facing major failures in the post-oil era without government support. Industrial liberalization, integration into the world economy, and increasing competitiveness. According to Porter's diamond model theory to determine the competitive advantage of countries, the advantage of competition in the economy indicates that the country is more successful in international competition. This is true in all three sectors of Azerbaijan's industry.

4. CONCLUSIONS

In conclusion, it is important to note that Azerbaijan's oil strategy mainly associated with the full operation of the Baku-Tbilisi-Ceyhan oil pipeline in 2006 led to the peak of oil export revenues to Azerbaijan between 2006 and 2012 and led to the rapid development of the national economy. The gained money from oil has enabled the Azerbaijani government to invest in the development of the non-oil export sectors in order to achieve economic diversification. Successful implementation of economic reform in Azerbaijan has a direct association with oil income that provides funding for supporting reforms and entrepreneurship. As for the Azerbaijani economy, the country's documents show that the development of the non-oil sector is one of the most important for the country's economy. For many years, the Azerbaijani economy has been dependent on oil revenues. Although between 90 and 95% of the country's export earnings are currently provided by oil exports from various sources, several areas have been identified as priorities for the development of the non-oil sector. These areas include the agricultural sector, the development of light and heavy industry, the development of small and medium enterprises, tourism, communication technologies, innovations and technology development. The country has adopted strategic development maps for the development of these areas, and large public investments are being made in the development of these sectors. Starting in 2019, large-scale institutional reforms have been launched to diversify the economy, and joint projects are implemented with international organizations. It must be mentioned that WTO membership, trade liberalization and integration into the world economy in Azerbaijan is a necessary process to increase the export potential of the non-oil sector. However, the first factor hindering the country's economic liberalization is the country's dominance in oil products in trade. The current alternative is that dependence on oil poses a serious issue to the economy in the future.

However, increasing the competitiveness of the economy, building the industrial, processing and agricultural sectors with quality indicators of the world economy can accelerate Azerbaijan's WTO membership and integration into the world economy. Competitiveness and institutional harmonization must be ensured, and government agencies must continue to carry out institutional arrangements for economic development.

ABSTRACT

In this article, we propose to consider the problem of human interaction as a biological species with a multitude of synthetic and strange substances in general, which have recently been intensively added to the huge amount of natural xenobiotics produced by plants, fungi, microbes and viruses. This problem is considered to be general biological, where chemicals, among other things, were and especially now are the most powerful factor of evolution and natural selection. Nutrition is one of the most important factors mediating human relationship with the external environment, and determining the state of health. Rational nutrition creates conditions for the normal physical and mental development of the body, supports high performance, contributes to the prevention of diseases, and provides significant attention to the ability of the body to withstand the effects of adverse environmental factors of the physical, chemical and biological nature. Currently, the problem of xenobiotics as a whole has not only been developed, but also has not been touched. It should be noted that the identification of particular aspects of the effect of xenobiotics on humanity does not exhaust the problem of the relationship of living beings with chemical compounds of the environment. The value of the chemical factor of natural selection with the development of civilization will increase until a certain point, when scientists and society realize the tremendous importance of studying this problem and will not learn to control this system of the body.

Keywords: *xenobiotics, human health, environment, balanced diet, harmful factors*

1. INTRODUCTION

The ability and necessity inherent in all living nature to perceive and use the most diverse information from the environment have developed for millions of years to the highest level that academician V. I. Vernadsky called as “noosphere”, hereby emphasizing that this concept also covers economical and informational fields of this environment. In this chain, the chemical environment is the most important evolutionary factor that studies living organisms and humans as well [1]. Nutrition is one of the most important factors mediating human relationship with the external environment, and determining the state of health. Rational nutrition creates conditions for the normal physical and mental development of the body, supports high performance, contributes to the prevention of diseases, and provides significant attention to the ability of the body to withstand the effects of adverse environmental factors of the physical, chemical and biological nature [2]. It is known that the impact of harmful factors of external and internal human environment leads to the emergence of mutagenic, carcinogenic, allergic and other effects that really depend on the “dose” and “time” of exposure to humans. Therefore, a detailed analysis of these phenomena on the basis of advances in biochemistry, immunology, molecular pharmacology and bio-cybernetics allowed the concept of an immunochemical functional system of homeostasis to be formulated, according to which a living organism

maintains a continuous dialogue with the chemical environment, and through this dialogue provides its adaptation to emerging changes in itself [3]. It is known that chemicals can cause diseases, and simultaneously can protect and heal a person. It is necessary to emphasize that the use of these substances for medicinal purposes has already played an enormous role in the development of mankind, comparable in its significance to the discovery of fire in ancient times, the development of agriculture and cattle breeding, or the recent development of atomic energy. Humans cannot develop without pharmacology (or rather, without pharmacology and immunopharmacology) [4].

2. THEORETICAL ANALYSIS

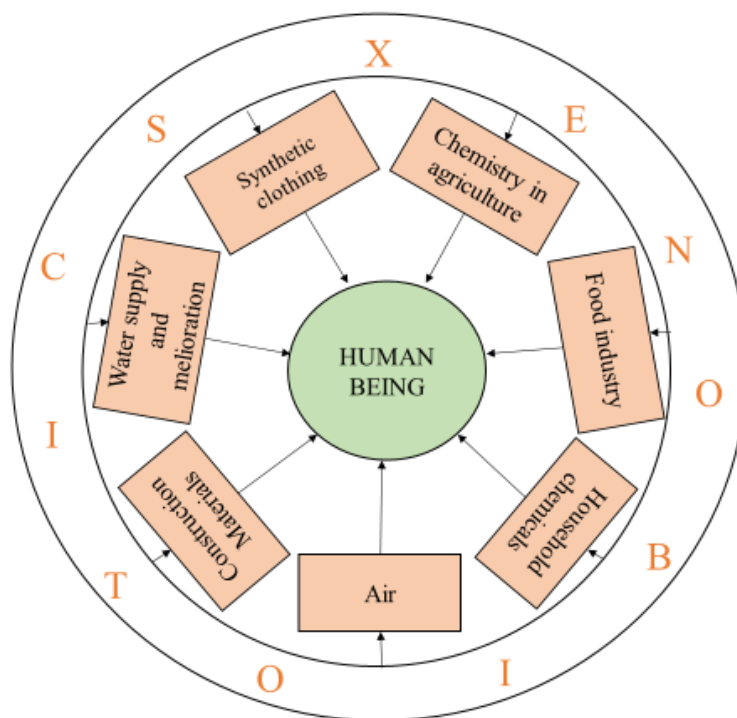

At first glance, the idea expressed by us may seem phenomenal. But the mankind could not increase its number, create a modern civilization, live in big cities, and communicate intensively if vaccination methods, disinfectants, antibiotics, sulfamides, food preservatives, etc. had not been discovered. Achievements of pharmacology and immunopharmacology are powerful factors that alter, and at the same time weakens the natural selection among people. This allows you to put natural selection under conscious control and realize the potencies of the human gene pool much more widely [5].

Figure 1: Disruption of the DNA structure of the body

However, a huge amount of various chemical substances, introduced by mankind into life, create new, mostly uncertain and alarming situations. A significant part of these compounds is strange for humans and other creatures of the biosphere. The concept of unusualness is specific and concrete: for a given organism, a compound that is not a habitual component of food, drink, a gaseous medium over a sufficiently long period of evolutionary development will be strange. The name of such substances xenobiotics takes its root from here (from Greek - stranger, - life) [6]. Many natural substances that have long existed in the biosphere are, nevertheless, genuine xenobiotics for humanity or its individual populations. This is explained by the fact that the regions in which such substances occur are recently started to be inhabited by humans (for example, migration of the European population to tropical regions). The rapidly growing man-made flow of chemicals in millions of ways affects the livelihoods, destroying the harmony of biochemical transformations in the biosphere. A man as a part and generation of the biosphere assumes the largest and most sophisticated share of this chemical avalanche. For example, a modern person receives an average of about 7 kg of xenobiotics annually. Medicines and industrial pollution, insecticides, household chemicals, all food additives and preservatives, substances with which a person deals at work (occupational hazard) are the main components of the world of new chemistry (new for human as a biological species) [7].

Figure 2: Main sources of complex effects of xenobiotics on human body.

Considering the problem of the relationship of living beings with chemical compounds of the environment, they usually speak of some obviously dangerous substances: poisons (heavy metals, carbon monoxide, etc.), carcinogens (polycyclic hydrocarbons, azo dyes), mutagens, etc. This is natural. A modern man daily receives a certain amount of xenobiotics with food, drugs, through the skin and lungs. There are many compounds among xenobiotics that are relatively poorly soluble in water. Such substances, as a rule, dissolve well in fats, and in a living organism they are embedded in membranes, hydrophobic regions of protein molecules, and DNA. Living beings fight for the chemical purity of their internal environment, actively converting such xenobiotics through chemical reactions into water-soluble compounds and then removing them from the body in usual ways. The ingestion of xenobiotics (including drugs) into the body of premature babies, whose system that removes fat-soluble xenobiotics functions very poorly, can lead to tragic consequences [8-10]. Let these substances particularly in doses; actually received by a person, (the average person!) be harmless. However, such regular absorption of strange chemicals can have a significant effect on the body. The enormous genetic diversity of people and dozens, hundreds of xenobiotics that enter each organism make such situations not exotic, but rather ordinary. It is very important that children are generally much more sensitive to xenobiotics. Besides these individual aspects, there is also a population-evolutionary aspect of the same problem. It has been established that there are individuals with whom the introduction of xenobiotics causes the appearance of intracellular enzymes that processes fat-soluble xenobiotics, and individuals with whom this reaction is weak. Which group, by the will of the “genetic game,” this or that person will get is of paramount importance (but little understood by doctors and other specialists yet) for his fate.

3. CONCLUSION

Currently, the problem of xenobiotics as a whole has not only been developed, but also has not been touched. It should be noted that the identification of particular aspects of the effect of xenobiotics on humanity does not exhaust the problem of the relationship of living beings with chemical compounds of the environment.

The value of the chemical factor of natural selection with the development of civilization will increase until a certain point, when scientists and society realize the tremendous importance of studying this problem and will not learn to control this system of the body.

ABSTRACT

The purpose of the article is to consider the financing of scientific and innovative activity in the Republic of Belarus. Improving the effectiveness of an innovative development strategy of organizations in national social and economic systems is one of the key objectives in today's conditions of strong competition.

Keywords: *Innovation activity, Planning, Financial resources, Social processes*

1. INTRODUCTION

Improving the effectiveness of an innovative development strategy of organizations in national social and economic systems is one of the key objectives in today's conditions of strong competition. Manufacturers strive to create a unique product (work, service) that will distinguish them from other organizations of the same industry, this way creating additional competitive advantages. To strengthen this process in order to generate and implement innovations it is advisable that organizations function on a basis of cooperative resource model. It is based on cooperation of partner organizations (temporary or consequently permanent) of the research and education sector, the real economy sector, the business sector, the government sector and public sector. The process of cooperation itself provides access to scarce resources of partner organizations, which in turn is an opportunity to create a competitive product both for the national and foreign market.

2. DIRECTIONS OF BUDGET FINANCING OF SCIENTIFIC AND INNOVATIVE ACTIVITY

One of the most important steps in the process of innovation activity, which should be thoroughly planned together with the process of generating innovation in order to overcome emerging obstacles (or initially defined ones), is searching financial resources for the proposed innovative solutions (proposals). Without financial resources it is impossible to properly implement an innovation project (on a sufficient technical, professional and competent level, considering the expected results). According to the results of the author's previous studies, based on international surveys (2021a) of representatives of scientific and educational organizations, industrial enterprises, business entities, state authorities and public organizations about problematic aspects that prevent the increase in the effectiveness of innovation activity in organizations operating within the cooperative resource model, the biggest obstacle was the insufficient funding. One of the most important steps in the process of innovation activity, which should be thoroughly planned together with the process of generating innovation in order to overcome emerging obstacles (or initially defined ones), is searching financial resources for the proposed innovative solutions (proposals). Without financial resources it is impossible to properly implement an innovation project (on a sufficient technical, professional and competent

level, considering the expected results). According to the results of the author's previous studies, based on international surveys (2021a) of representatives of scientific and educational organizations, industrial enterprises, business entities, state authorities and public organizations about problematic aspects that prevent the increase in the effectiveness of innovation activity in organizations operating within the cooperative resource model, the biggest obstacle was the insufficient funding. This matter is a state priority as a tool to stimulate innovation. Percentage of the scientific activity in the GDP of the Republic of Belarus has increased from 0,5 to 0,59 % from 2015 to 2019 respectively (2020), which indicates the strengthening role of science in the state, an institution that contributes to the development of innovative potential of the state and its competitiveness on an international level (in 2019, however, this indicator decreased by 0,01 % comparing to the preceding year). For comparison, the percentage of scientific activity in the Republic of Bulgaria during the first 10 years after accession to the EU had been steadily decreasing (from 0,29% to 0,2% of GDP), which is 3 times less than the EU average (0,64%). It should be noted that the national expenditures on research and innovation have changed: there has been a drastic decrease in the percentage of the foreign investments (to 3,63% in 2019 comparing to the preceding year) and funds from other organizations (to 4,47%). At the same time, the role of state funding (+3,33% as of 2018) has increased, as well as of the organizations on the self-sufficiency principle (+4,5% compared to the preceding year) in the structure of the sources of funding that provide the planned national costs for research and development (Fig. 1) (2020).

Figure 1: Structure of the sources of funding for domestic expenditures in research and development in the Republic of Belarus for 2016-2019, %

The largest share of the sources of funding for domestic expenditures on research, scientific and technological activities and innovations belongs to budget funds (44,25% of total amount of all sources of funding in 2019) (Fig. 2). Budget funds, in turn, cover financing expenditures of the republican budget on research, scientific and technological activities and innovation, republican centralized innovation funds and local innovation funds.

Figure 2: Structure of the republican budget expenditures on research, scientific and technological activities and innovations for 2019, million rubles

The statistical data demonstrate that the areas with the highest financing priority are basic and applied research (34,2% of total amount of funding), state research programmes, state scientific and technological programmes (20,9%), development of material and technological base of scientific organizations (12,5%). The largest share of the budget funds on research, scientific and technological activities and innovations the Republican centralized innovation fund allocates for applied scientific research (42.2%) and implementation of the State programme of innovation development (34%) (Fig. 3).

Figure 3: Expenditures of the Republican centralized innovation fund on research, scientific and technological activities and innovations in 2019

The largest share of the expenditures of local innovation funds is allocated for implementation of the State programme of innovation development (41%), development of material and technological base of the entities of innovation infrastructure (29%) and financing the expenditures of industrial laboratories (20,1%) (Fig. 4) (2021b; 2021c).

Figure 4: Dynamics of the budget funds allocated for research, scientific and technological activities and innovations in 2019-2020 (2021b), million rubles (2021c)

Analysis of the domestic current expenditures on research and development by type of work indicates a relative stability in annual dynamics: for the period from 2011 to 2019 basic research is approximately 12,2% - 17,1% of the total amount of the domestic current expenditures, applied research - 26,1% - 36,8%, experimental development - 48,8% - 60,4% (Fig. 5) (2020).

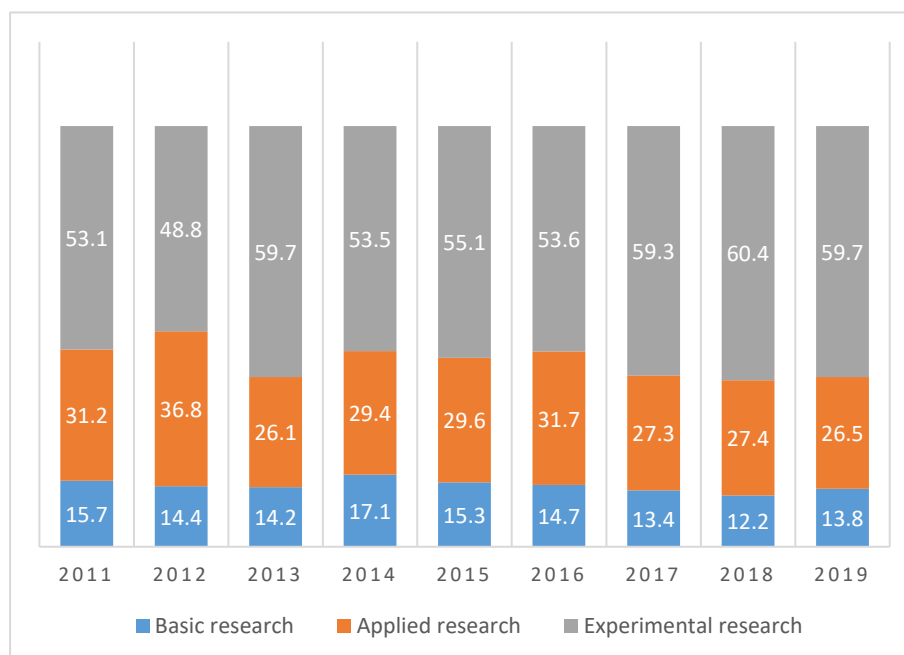

Figure 5: Structure of the domestic current expenditures on research and developments by type of work, % (2020)

It is noteworthy that the basic research financing increased in 2019 compared to the preceding year (+2,6%), even though from 2015 to 2018 this indicator tended to decrease annually. This may indicate the process of updating the priority areas of research, scientific and technological activities and innovation in the country in order to gain new knowledge to solve promising and current problematic tasks.

3. CONCLUSION

Analysis of the expenditures of industrial organizations on technological innovation showed a significant increase in funding in 2019 (665.64 million US dollars, 20% more than the previous year's level in dollar equivalent (2021d)), which indicates the desire of the country's organizations to find solutions to enhance the innovative activities in order to increase the competitiveness of manufactured products in foreign markets. It should be noted that over the last 2 analysed periods (2018-2019) the share of budget funds (2020) of industrial organizations allocated for technological innovations decreased (-9,2% compared to the specific indicator of 2017; -3,3% compared to the level of 2018), which indicates the allocation of the budget funds for priority social tasks, increasing the importance and objectives of industrial organizations in developing high-technology and competitive products. Furthermore, the share of imported innovative industrial products on the domestic market has been growing since 2017 (from 32% in 2017 to 40% in 2019), which is a sign of insufficient competitiveness of domestic products on the international market. At the same time, in 2019 the dependence of the export of innovative industrial products on the market of the Russian Federation had increased (35,4% of innovative industrial products were exported to the Russian Federation in the total volume of exported innovative industrial products outside the Republic of Belarus; compared to 26,5% in 2018). The intensification and effectiveness of research and innovations is determined by the development of the country's intellectual potential. According to the Human Development Report 2020 "The Next Frontier: Human Development and the Anthropocene", at the end of 2019 the Republic of Belarus was ranked 53 among 189 other countries assessed by the human development index (index value 0,823), staying very close to the countries with very high human development (together with the Russian Federation (52nd place), Kazakhstan (51st place) and Bulgaria (56th place)) (2021e). Further development of the country's intellectual potential, revitalization of research, implementation of innovations closely depends on financing. For this purpose, specialized funds are created at the national (regional) level and priority programmes financed by private organizations, as well as foreign companies are approved (Terziev, Klimuk, 2021f; 2021g; Terziev, Georgiev, Klimuk, 2021h; 2021i).

ABSTRACT

The oil and gas sector has high export revenues, but this does not relieve it of the need to solve the problems of financing large-scale, highly risky investment and innovation projects. Currently, leading oil and gas companies are seeking to finance innovation activities at their own expense, formed on the basis of net profit and depreciation. In the context of globalization, in order to ensure high rates and quality of economic growth, increase its competitiveness and efficient use of resources, the main task is to develop innovative activities of enterprises of all sectors of the economy, including the oil and gas complex. State financing in the form of budgetary and tax benefits is directly related to technologies at an early stage of development, since these stages are characterized by significant technological barriers, time-consuming and non-guaranteed commercial benefits. Other various methods of state support and private financing from venture funds and various other funds, institutes and organizations are characteristic of the subsequent risk stages associated with the stage of demonstration of a prototype and its commercialization. However, this mechanism should be based not only on the optimization of tools and methods for financial support of innovative processes of oil and gas sector enterprises taking into account foreign experience.

Keywords: *state, financing, economic development, oil and gas sector*

1. INTRODUCTION

Funding in the oil and gas sector is large in nature and long term. The increase in the profit of oil and gas companies is directly affected by the reduction in costs, which leads to an increase in both liquid cash and an increase in the competitiveness of the project as a whole. Distinctive features of financing projects in the oil and gas complex are that investment projects have a wide range of risks that have a great impact on the key economic indicators of an investment transaction. In addition, these projects are directly dependent on the prevailing global energy situation, which affects their economic efficiency. The main advantage of project financing is the ability to concentrate significant financial resources on solving a specific business problem, and to localize project risks on the project company. It is created specifically for the implementation of a specific project, is responsible for its implementation and usually has no financial history or property for collateral. Responsibility and risks are distributed among the project participants and are regulated by a set of contracts and agreements.

2. OIL AND GAS INDUSTRY - AS AN IMPORTANT ELEMENT OF THE WORLD ENERGY MARKET AND PART OF THE GLOBAL SYSTEM

The oil and gas sector has high export revenues, but this does not eliminate the need to solve the problems of financing large-scale high-risk investment and innovation projects. Currently, leading oil and gas companies are trying to finance innovative activities at their own expense, formed on the basis of net profit and depreciation charges. Thus, in contrast to the traditional financing mechanism for innovative enterprises, the sources of which are their own and borrowed funds, foreign companies widely use venture capital, the maneuverability of which contributes to the acceleration of the introduction of new innovative technologies at the early stages of the innovation cycle. In the context of globalization, in order to ensure high rates and quality of economic growth, increase its competitiveness and efficient use of resources, the main task is to develop innovative activities of enterprises in all sectors of the economy, including the oil and gas complex. The oil and gas sector, along with other industries, has a significant impact on all sectors of the national economy. At the same time, the oil and gas industry is an important element of the world energy market and part of the global system of all energy supply, and also forms a competitive production complex, which currently not only fully meets the country's needs for oil, gas and oil products, but also due to its active export activity creates a significant share of foreign exchange earnings in the state budget. However, despite such a key role of the oil and gas complex in providing the state with financial resources, the current situation is characterized by a number of negative trends that affect its development. The existing mechanism for financing innovative activities of the oil and gas industry (OGP) in foreign countries allows oil and gas companies to organize a single research network, consisting of national and leading foreign research institutes, centers and universities and is necessary for joint focus on the study and adaptation of best practices in the oil and gas industry of the world. , the development of the national complex and the improvement of technologies, as well as for the implementation of the results of our own national scientific structures, which reduces possible risks, contributes to an increase in the efficiency and level of commercialization of innovations, as well as the general level of the innovation process in the country's economy as a whole. It should be noted that in foreign practice, the key point is that each stage of the innovation cycle, especially alternative energy, has its own source and method of financing. Therefore, in the current conditions, the solution to the problem of strategic development of the oil and gas complex is acquiring special relevance based on the activation of innovative activities of oil and gas companies, the introduction of high-tech subsoil use technologies and the transition to the implementation of the import substitution policy, which will not only allow the national economy to improve its competitiveness and create the foundation for sustainable growth based on innovations, but also provide it with energy and environmental security, as well as the possibility of implementing a geopolitical strategy in the world market. To implement the strategy of innovative development of the oil and gas complex, domestic companies need not only to ensure a high level of development, implementation and implementation of innovative technologies, but also to solve the problems of financial support for their innovative activities.

3. PROBLEMS OF VENTURE FINANCING OF THE OIL AND GAS SECTOR

The oil and gas sector of the economy is the most attractive for investment. Foreign oil and gas companies resort to this form of financing for innovative activities by creating corporate venture funds as their internal divisions, which allows them to use both the company's free capital and external resources. Currently, corporate venture funds of both the largest international companies and national ones are successfully operating in the world. Venture funding allows them to keep in touch with governments, various research companies, centers, innovation organizations of any country, invest in small start-ups and provide financial resources for all

stages of the innovation process, not only internal, but also external development. In turn, this enhances commercialization, expands access to a wide range of technologies in various industries, reduces technological gap with competitors, increases the profitability of innovative projects, and also ensures a balanced innovation portfolio. At the same time, the main feature of using venture financing is not only to increase high profits, but also to expand the activities of oil and gas companies in the world. Thus, the development of alternative and renewable energy is largely due to venture investment. State funding in the form of budgetary and tax incentives is directly related to technologies at an early stage of development, since these stages are characterized by significant technological barriers, time-consuming and non-guaranteed commercial benefits. Various other methods of government support and private funding from venture capital funds and various other funds, institutions and organizations are characterized by subsequent risky stages associated with the stage of demonstrating a prototype and its commercialization. Therefore, comparing the features of the innovation activities of domestic and foreign companies of NGP, there is a need to form an effective mechanism for financing the innovative activities of NGP enterprises, which should become one of the important factors in the structural transformation of its economy and increasing competitiveness in the world market. However, this mechanism should be based not only on the optimization of tools and methods of financial support for innovative processes of oil and gas sector enterprises, taking into account foreign experience, but also take into account the main factors that influence the development of oil and gas companies at the present time:

- long-term and high capital intensity of projects;
- high dependence on imported technologies;
- lack of a competitive environment;
- focus on financing internal developments;
- monopoly;
- stricter control by government agencies.

4. WAYS TO IMPROVE THE EFFICIENCY OF PROJECT FINANCING AND BANK LENDING TO THE SUBJECTS OF THE FUEL AND ENERGY COMPLEX

In the context of a decline in the profitability of oil production in the economy, there is an acute issue of attracting private investment in the real sector. Price shocks in the oil market amid sharp fluctuations in the internal situation in the commodity market are one of the factors that impede the systematic formation and use of financial resources for the development of the oil and gas sector. In connection with the above aspects, the article touches upon the actual topic of project financing and bank lending to the subjects of the fuel and energy complex. At the same time, it was emphasized that the dominant role in the system of financial support of the oil and gas complex is played by investments. In order to comply with the principles of bank lending, an objective need to carry out systematic calculations of the price of credit resources, comparison of credit and lease payments has been identified. Of particular practical interest is the mechanism of municipal targeted lending, for the implementation of which, in our opinion, it is advisable to calculate the effects of proactive budgeting, assess the economic benefits of municipal-private partnership. A sufficient degree of discussion on this issue is due to the fact that financing the oil and gas complex is a systemic and complex task of managing the fuel and energy sector, and restrictions on the level of the municipality can cause disproportions in financial flows of consolidated budgets. In the course of the research, one of the key goals of the development of the raw materials economy was achieved - a wide range of sources of financing and lending to companies in the oil and gas sector was identified. Due to the fact that one of the priority tasks for the development of the economy of the oil and gas and energy industries includes the implementation of program measures for long-term socio-economic development.

At the same time, certain difficulties in attracting credit resources are experienced by the oil and gas production sector in the context of instability of prices for oil and gas resources exported abroad, leading to inaccurate forecasts of macroeconomic development, and, as a consequence, the weakening role of the financial mechanism for the functioning of the oil and gas industry. All over the world, the oil and gas sector is given special attention, it is exposed to the influence of the state in connection with the decisive role of hydrocarbons in solving energy, financial and economic problems. In the context of limited access to external funding sources, it is important to find optimal financing mechanisms for organizations in the oil and gas sector in order to direct them to investment projects. Depending on the level of project financing, its risks should be considered. The risks are specific to the energy and oil and gas industries. With this in mind, let us turn to the dynamics of individual indicators of the development of the studied sectors of the economy. For the effective functioning of the oil and gas industry it is necessary to ensure: expanded reproduction of the mineral resource base; create favorable conditions for the implementation of large investment projects; optimize the tax burden on oil and gas enterprises; to ensure the maximum possible use of competitive domestic equipment and technologies in all technological processes; stimulate the development of small and medium-sized businesses in the oil and gas industry. The efficiency of traditional oil and gas companies is determined by the sustainability of their economic growth. At the same time, one of the main issues is the establishment of compliance with the criteria that can characterize: the choice of forms and methods of financial support; determination of the boundary values of the technical, economic, financial and production characteristics of the activities of organizations that ensure the recoupage of state budget expenditures; determination of the volume of government spending that can be aimed at stimulating the activation of the growth point. Systematization of external and internal sources of financing allows you to organize a rational movement of cash flows and determine the sources of investment resources of organizations. In addition to budget funding for oil and gas companies, there are many alternative sources of meeting the need for working capital for the development of the oil business. So, in conditions of a decrease in the liquidity of funds that can be used to finance investment projects, NGP companies turn to borrowed capital. Financing from borrowed funds is carried out in two main areas: debt and equity. The prevailing mechanisms for attracting debt capital are bank loans along with the placement of bonded loans.

5. CONCLUSION

Thus, as a result of our research, we have identified a wide, but not an exhaustive list of sources of financing and lending to NGP companies. Due to the fact that the implementation of program measures for long-term socio-economic development is one of the priority tasks for the development of the economy of the oil and gas and energy industries, therefore, the primary role is played by budget financing as an external source of investment attracted for the implementation of projects in NGP. A set of tasks to maximize the efficiency of attracting credit resources and other sources of borrowed capital, as the most expensive external source, comes to the background. The third role is assigned to corporate profits and other internal sources of financing involved in the circulation of flows accumulated by oil and gas enterprises. It is quite obvious that the key sources of financing for oil and gas companies are concentrated in a single organizational and economic mechanism: forecasting targeted budget financing, organizing the attraction of external borrowed sources and corporate management of investments, capital and profits. Taking into account the adaptation of this mechanism to the practice of the operation of the oil and gas complex, it is advisable to develop a strategy for the long-term selection of targeted sources of financing and prevention of external risk factors: negative inflationary processes, unfavorable political decisions, deterioration of monetary policy, etc.

The greatest attention to the assessment of internal factors: the adequacy of equity capital, break-even and profitability, the effectiveness of management decisions, including in terms of ongoing investment projects.

Department of Economics and Business
vasif.aliyev@unec.edu.az*

ABSTRACT

As an environmental factor in the cultural atmosphere, it affects the activities of enterprises and managers in the country. The purpose of this study is to determine whether the activities of country managers are related to national cultural values and how these values affect country managers. For this purpose, in the article I tried to explain the history of the development of culture and management, how it developed and changed. At the same time, I tried to show that intercultural differences lead to management differences by referring to the research of GLOBE-an interdisciplinary study on culture and management, Trompenaars, Schwartz, Hofstede.

Keywords: *Management, culture, cultural dimensions*

1. INTRODUCTION

Culture, which is our social identity, is formed from generation to generation in social environments and changes in relationships. Culture is the norms that govern our behavior, attitudes, thoughts, and actions, and in many cases it is the answer to why we act that way and think differently. Just as each person has a culture that distinguishes them from others, every society has its own culture. The stronger the promotion and unity of cultural values that separate one society from another, the stronger the culture will be. It is a culture that makes society a society, directs it to common thoughts and behaviors by ensuring equality and solidarity. An organization operating in a society creates its own organizational culture influenced by the culture of that society, uniting its employees under many cultural elements such as common interests, values, understanding and attitudes, ensuring sharing and solidarity. Organizational culture also plays a role in the formation and change of social culture. The presence of employees from different cultures, especially in international organizations, reveals intercultural differences within the organization. Institutions with a strong organizational culture will benefit from these differences, along with cultural differences within the organization, which will also enrich the organizational culture. Institutions can gain a competitive advantage by creating and managing a more effective organizational culture without neglecting this.

2. CULTURE

"Culture" is derived from the Latin word "kultura", which means work, service, improvement, as well as education, development and progress. The origin of this concept comes from the words "kolo", "kolere", which means to engage in soil science, to work with the soil, "cultus" - "reworked". In the ancient Latin language, this word had the same meaning and explained the meaning of "agri culture", ie the idea of preparing the land for planting. The main source of information that helps us to consolidate this idea is the book of the same name "De agri kultura" by Mark Porci Cato, dedicated to agricultural issues. In the later stages of historical development, terms related to other areas of culture began to take shape: "civilization", "education", "upbringing", "progress", "development" and so on. Although culture is defined by many disciplines, it is one of the most complex words in English [6, p. 1]. According to Münch and Smelser, the word culture was not widespread before the 19th century.

The concept of culture was first used by Charles A. Ellwood. He described culture as a socially addressed, common name used for all norms of behavior. In this sense, culture encompasses not only concepts such as language, art, science, law, management, and religion, but also material means or man-made objects that embody cultural achievements and are the product of intellectual culture, such as buildings, equipment, and means of communication. Kroeber and Kluckhohn defined culture as the "intellectual side of culture", the development of the mind, tastes, norms of behavior, that is, the conditions of purification. Culture, which is a combination of many factors such as religion, values, social norms, customs, nutrition and decision-making habits, aesthetics and nationalism, is defined as an integrated system of characteristic behavioral patterns of members of society and influencing many things within national boundaries. It also has a profound effect on management concepts and strategies. According to Nalchaoglu (2004, p. 5), "Culture is everything produced by man." According to Bennett (1998, p. 17), "applied results are related to values or perceptions in society." Ergur, on the other hand, described culture as an activity of symbol production that arose as a result of people's ability to think about their own existence and to change nature in order to understand their own existence. Gökalp, while clarifying the culture, spoke about two concepts and expressed them as national culture and humiliation. He said that while national culture consisted of the people's traditions, customs, oral and written literature, language, music, religion, morals, aesthetics and economic products, the reprimand belonged only to highly educated real intellectuals. While national culture is national, it is expressed internationally. One person said that under the influence of national culture, he would probably value only the culture of his own nation, but he would respect the cultures of other nations as well. [19, p. 104-105]. Discretion is perceived as a unique, unchanging event, a continuous system of core values that distinguishes it from another group by its choices. Like Gokalp, King defined culture as a trait that people possess, both materially and symbolically. It is the joint programming of thoughts that differentiates members of a group or category. The culture of a group is the main assumption learned by group members. Adaptation problems within the group and adaptation problems of those who join the group later are factors that need to be addressed. Cultural structure can be defined by values, symbols and norms. According to Minkov, the main elements of measurable culture are values, norms, beliefs, social relations, individual perceptions, cognition, behaviors and stereotypes [8, p. 4-9]. According to Ögüt and Kocabacak, culture is the sum of the knowledge, beliefs, art, morals, traditions and all kinds of skills and habits possessed by a society. It has been observed that the main factor behind the success or failure of institutions is related to the culture they have [18, p. 151].

3. MANAGEMENT

The English word "management" means the process of dealing with things or people, organization. For people at different levels of management in various sub-areas of management (public management, business management, education management, etc.), the words manager (department head, branch manager, hospital manager, school principal) and chairman are widely used in our lexicon. The word "chief" (chief of police), which has the same meaning as the word "chairman" in security agencies, is also used. In English, the verbs "manage" and the nouns "management" and "manager" have been used since the 16th century, and the oldest of these is the word "manager" [4, p. 81-94]. There are other words related to management in English. One of the most commonly used is the word "administration", especially in North America. In addition, in English, for example, for managers in various positions related to education management, "head", "principal", "rector", "leader", "deputy", "master", "mistress", "officer", "adviser" ", "inspector" are also used. Linguistically, the word management comes from the Latin words "manus" and "hand" and is similar to the word used in Italian as "maneggiare".

The word "maneggiare" in Italian was first used as "manage" in connection with the training of horses, and then expanded to mean skill (for example, teaching to play any musical instrument). It has been determined that the word "husbandry" is related to the French words "menage" and "household". Today, the word "management" encompasses the meanings of both the words "manege" and "menage" and can be said to be used by different cultures, different managers with different meanings. As a result, the concept of management can be perceived differently by different cultures (societies) [4, p. 81-94]. Adam Smith, considered the founder of modern economics, used the words "manage", "management" and "manager" in his 1776 book, *The Wealth of Nations*, and also referred to "badmanagement". These words are used in the book in connection with both business processes (organization, planning, direction, etc.) and human resources within the enterprise (human resource management). John Stuart Miley (1806-1873), one of the most important figures in the British economy, also followed Adam Smith's use. Later in the 19th century, the word "management" was used in books written by some American authors. The word "management" in the book *Fundamentals of Scientific Management* by Frederick W. Taylor in 1911, considered the founder of the science of management (scientific management), has become a word used in almost the same sense in the field of management science today [4, p. 81-83]. Although both Smith and Mili use the word "management" in management processes and the word "manager" in relation to the human resources within these processes, Today, the use of the word "manager" in the United States is not limited to management processes, but also refers to a group of people belonging to the highest social class in the United States as numerous "managers". Those who belong to this class are those who make management a profession, who do not have a specific job, and who use their skills and powers on behalf of business managers. These managers are not directly involved in the production processes in enterprises, but are considered necessary in motivating the people involved in these processes and in the production of the product, and indirectly contribute to production [4, p. 83]. The word "management" in American culture means proactive, optimistic, and pragmatic. According to Hofstede (1993), this word has no exact equivalent in other world languages, and there is no other word or term that is fully compatible with this word. Therefore, in German and US English, there are words such as "leadership", "leading" and "directing", but the word "management" does not correspond to the style of expression in the United States. Thus, it is not considered possible to translate this word into another language as a word or term. It is also claimed that it is extremely difficult to translate into Russian, Czech, Slovak, Hungarian, Polish and German. [1, p. 63-68].

4. DIFFERENCES IN CULTURE

Because societies have different lifestyles, they also have different cultures. Although social cultures are different, each culture has some values that vary from society to society. The interrelationships between these values, which ensure the continuation of the social life of society and its citizens, affect international business behavior. Language is the primary indicator of the existence of societies and the most powerful tool in building culture. Language is the clearest indicator of intercultural differences. Language, which informs about the cultural values and characteristics of societies, is considered to be a system of symbols that enables people to understand each other and interpret the future by thinking about the past. The protection of social culture and the transmission of cultural heritage from generation to generation is also carried out through language [17].

4.1. Relationships and Beliefs

Beliefs are people's perceptions of a particular situation or concept. The more similar the beliefs of the people in a society, the stronger the cultural beliefs of the society will be. Behaviors are formed as a result of beliefs, feelings and reactions. Attitudes of people with positive or negative

evaluations of objects, thoughts and events also vary from society to society. That is, different societies may perceive and evaluate the same events differently. [15]

4.2. Technology and material culture

Material culture includes tools and products created by humans, machines and vehicles, in other words, material or physical tools. For example, a pine tree is not part of culture, but a New Year's tree is part of material culture. Technology is also a concept closely related to culture. The technical and technological level of a society affects the level of demand of that society, the quality and form of the products required, and the means needed to produce and distribute products and services. For example, Hoover, a washing machine manufacturer, conducted a study of product design advantages in the French and German markets, which found that German housewives think that large and bulky washing machines are more durable, while French housewives prefer small and light washing machines that do not take up much space in the kitchen. (Rachli, 2011: 20).

4.3. Aesthetics

Aesthetics provides information about the art of a culture. Especially subcultures have their own aesthetic values. For this reason, aesthetic differences should be assessed regionally, not nationally. The aesthetics of a particular culture helps to interpret the symbolic meanings of various artistic expressions. The sharing environment created by the rapid development of technology and communication in recent years has reduced the importance of aesthetic values in terms of cultures. Aesthetic values are also used in the study of the traditions and roots of societies. Aesthetics, known as the concept of beauty and quality reflected in the art, theater, music and dance of a culture, also largely shapes the management activities of international enterprises. Multinational enterprises should be aware that aesthetic values differ from country to country [16].

4.4. Social institutions

Each society has its own social structure, which is formed by cultural features and ensures the observance of these features. Cultural changes over time necessitate changes in social structure and institutions. Social institutions define the role of people in society. In all societies, individuals live in families and work together as a group. But the concept of social structure, its importance and the roles of individuals vary from society to society. Just as there is a difference between blue and white-collar workers within an enterprise, certain social classes in each society are more privileged than others. The social class of an individual is decided according to his / her personal characteristics and the groups he / she belongs to. Hereditary membership is a group membership in which an individual is born by sex, family, age, ethnic origin, race, place in the caste system and ancestors. *Congenital membership* is membership obtained through religious associations, political relations, professional relations and friendships, ie membership acquired later. In addition to the differences in social strata in each society, the importance given to them is also variable. In collectivist countries such as Japan, individuals are known by the groups to which they belong. In India, the separation of social classes is determined by the caste system. According to the caste system, the jobs that individuals will work for, the class to which they belong, and the jobs that they have the right to do are determined by birth [2, p.127-136]. Education, which is considered an indicator of the level of development, not only contributes to social culture, but also ensures the formation of culture. A society that does not cultivate and develop human strength is also economically impossible to develop. Education is a necessary cultural value for the sustainability of social culture. It is possible to pass on the cultural values we have to new generations, to adapt to today's living conditions through education. Cultural transfer of innovations and developments

in different societies is also carried out through education. Most of the staff of international companies that invest in societies with low literacy rates are from their home countries. However, in this situation, they face the problem of adapting to the culture of the new society. To overcome this, enterprises train their employees in the culture of the new society and try to shorten and facilitate the adaptation period [2, p.127-136].

4.5. Religion

A religion that affects all social and cultural values has always existed in human history. The most important function of religion, which shapes the values of the individual, is to ensure peace in a society that depends on it. Religion that exists in a society constitutes the moral and ethical system of that society. The appearance of religion in the business world, which has a profound effect on the norms of attitude and behavior of society and individuals, is especially evident in the entrepreneurial, consumer and social structure. The influence of religion on a society depends on the strength of the dominant religious groups. In Muslim societies, because religion is related to social life, its influence on work behavior is greater than its influence on other societies [15].

5. RESEARCH ON CULTURAL DIMENSIONS

Since the first half of the 20th century, great advances have been made in social anthropology. Many sociologists have studied their cultural structures. First, in 1951, two American sociologists, Parson and Shils, conducted a five-point classification of world cultures [10, p. 71]. This classification includes the following comparisons:

- Comparison of emotional behavior with neutral behavior
- Comparison of personal inclination with social inclination
- Comparison of universality and grouping
- A comparison of who people are and what they do
- Comparison of classification according to certain regularities with the extracurricular environment

The next step is to identify the problems and values that are important to all social groups based on scientific and statistical data. In 1954, two American sociologists, Alex Inkeles and psychologist Daniel Levinson, conducted a major study of national cultures and recommended the following basic classifications to reveal the structure and characteristics of all cultures in the world. Their classification includes the following concepts: [3, p. 29]

Relation to social status

- Social inequality
- Communication between the individual and the group
- A review of the social status of men and women
- Behaviors and reactions in uncertainty and sudden situations

In the context of the above, the concept of cultural dimension throughout the text of this study refers to the definition given by Merkin (2006). Therefore, cultural dimension is a hypothesis that varies from culture to culture.

5.1. GLOBE Cultural Dimensions Research

GLOBE is an intercultural leadership study that covers 62 different countries representing different geographies of the world. GLOBE is a combination of the initials of the words Global Leadership and Organizational Behavior Effectiveness. The GLOBE project aims to determine the extent to which factors such as a country's industrial and economic development,

governance, widespread religion, and climatic conditions affect leadership and cultural values. In the study, information and data were collected through a variety of methods, such as questionnaires, cross-interviews, media analysis, review of archival records, and assessment of inconspicuous features. The study tested 27 hypotheses and involved 951 employees and 17,300 managers. Researchers from the GLOBE project developed a 9-item classification of values proposed by Hofstede. The cultural dimensions used in the GLOBE project are listed below:

Avoid uncertainty

- Corporate collectivism
- Group-based collectivism
- Performance orientation
- Human orientation
- Time orientation
- Future orientation
- Self-confidence

In addition to comparing the cultural dimensions of the countries studied in the GLOBE study, cultural clusters of countries with similar cultural characteristics were also created.

5.1.1. Trompenaars Culture Dimensions Research

Fons Trompenaars, a compatriot of Hofsteden from the Netherlands, is also an interesting researcher in this field. Trompenaars conducted a survey of 8,841 managers from 43 different countries. He analyzed the data and identified 7 related directions and dimensions. The 7 dimensions he identified were similar to those measured by Hofsteden.

- Achievement - Definition (Ascription)
- Individualism – Collectivism
- Neutral - Emotional (Affective)
- Specific – Diffuse
- Universalism – Particularism
- Sequential – Synchronous
- Internal control - External control

In the concluding part of his study, Trompenaars stated that there are different values and judgments underlying cultural differences between countries, but that other factors also play a role.

5.1.2. World Values Research

The World Values Survey (WVS) is also known as the Inglehart Survey. It covers an example that has been applied in about 100 countries and represents 90% of the world's population. Societies are measured by secular-traditional and self-development-vital dimensions. The research is prepared in the form of waves, and the first wave was prepared in 1982. It is conducted using a common survey for all countries. The World Values Survey is the largest social survey of human thought, behavior, beliefs, and values, covering approximately 400,000 participants. [14]

5.1.3. Schwartz Cultural Dimensions Research

Shalom H. Schwartz (1992) introduced a new approach to research on cultural dimensions by identifying that cultural values are derived from individual values. Schwartz's study claimed that people living in different cultural structures had seven different value traits, and that individual and socio-cultural assessments were possible using these values. These values are determined by simultaneous research in different cultural structures and are influenced by cultural, religious, historical, philosophical and geographical factors and differences. Schwartz gradually expanded his work to more than 60 countries and the number of participants reached 60,000. The cultural dimensions defined by Schwartz are given below: [12]

- Conservatism
- Intellectual Autonomy
- Affective Autonomy
- Hierarchy
- Egalitarianism
- Mastery
- Harmony

The above-mentioned studies were later expanded to 73 countries and 7 transnational cultural clusters were established [11].

5.1.4. Hofstede Cultural Dimensions Studies

Geert Hofstede's 1967-1973 study of 117,000 different IBM employees in 71 countries (Hofstede, 2001) was considered by many authors to be the most effective, widely used, most comprehensive, and conceptually based of cultural measurement research (Cross and Erdmann, 2000) and is shown as a leader in this field. In addition, Hofstede's theory of cultural value dimensions, first proposed in 1980, has been evaluated as a breakthrough and transformation in different disciplines (eg, Schwartz, 1992; Trompenaars, Hampden-Turner, 1999). According to another study, Hofstede has been among the top 10 authors in terms of scientific research for the past 30 years. Hofstede revealed human relations in a culture by dividing them into 6 main dimensions. These dimensions are given below: [3,4]

- Power Distance
- Uncertainty Avoidance
- Individualism- Collectivism
- Masculinity- Femininity
- Long Term /Short Term Orientation
- Indulgence-Constraint

The above criteria are used as a criterion for determining the cultural characteristics of countries and comparing them. The rationale for this decision is based on the distinctive features of the Hofstede study described above. These concepts of cultural dimension, developed by Hofstede, will be explored in more detail than the cultural dimensions of other researchers.

6. THE IMPORTANCE OF INTERCULTURAL DIVERSITY IN MANAGEMENT

The importance of culture in terms of science stems from its contribution to information production. Just as the cultural effects of science arise from the combination of information or the creation of an instantaneous source of information, such as a new discovery, it also has guiding properties on cultural components. The relationship between science and culture is a relationship based on mutual relations. Culture is also very important in the field of management, which is based on the human factor.

The cultural perspective in this area has changed in parallel with the development of management science. The classical management approach, which emerged in the 1870s, is the first management approach to cover three perspectives: the scientific management approach, the management process approach, and the bureaucratic approach. The intellectual basis of the classical management approach is based on the economic human model. For this reason, a person who stays away from emotions is thought to be more effective by acting rationally. This approach, which advocates the employment of people in routine work and the creation of the best and only perfect structure for the organization, is not interested in the concept of culture because it considers the enterprise as a closed system and the employee as a passive being. For this reason, the importance of culture in terms of classical management is not discussed. The neoclassical or behavioral management approach adopted after classical management is also called the human relations approach to the value given to people. This approach is based on the possibility that an employee who is satisfied with the workplace will master the job and be more productive. This approach, which takes into account the satisfaction of both the manager and the employee, is the first approach that realizes that people have different desires, goals, character and beliefs. This approach, which advocates taking into account the employee's traditions, beliefs and expectations for economic efficiency, emphasizes the concept of individual culture, although it has not yet been named. The modern management approach adopted after the neoclassical approach generally consists of two main perspectives: a systemic approach and a situational approach. The system approach is an approach that accepts all the features of culture and reflects it in management science, and according to its basic assumptions, the system is an open system and interacts with the environment. The assumptions of this approach, which considers the enterprise as a system, are similar to those of culture. The emergency approach focuses on social behavior and environmental conditions, especially the technological factor discussed in cultural factors. The approach, which does not take into account the universality of management, claims that the management style depends on organizational strength and environmental conditions. This perspective also makes it necessary to take into account the environment of the enterprise, the values of the manager and the employee, ie the culture of the organization. In modern management, there are areas of management such as diversity management, intercultural communication management, multinational business management, change and development management, general quality management, strategic management, government management, purpose management, conflict management, chaos management, team management that directly address cultural influences. In addition to management, applications such as benchmarking, learning organization, change engineering, outsourcing, virtual organizations, network organization, restructuring, agglomeration organization, human resource development and strategic partnerships are also implemented taking into account cultural influences. The importance of culture from the point of view of management science arose when management strategies and motivational techniques were adopted at one time, in one culture, and not accepted in another culture. This result highlights the need for an emergency approach to management due to cultural influences and different management approaches, such as cultural synergy management in intercultural organizations. If we look at research and this area, we will see that as a result, intercultural management will emerge.

7. RESULT

From the past to the present, the failure of strategies developed without taking into account the values within the enterprise, on the other hand, the role of the human factor in the success of Japanese companies has led enterprises to explore their social realities and cultures. Today, it has been scientifically proven that management and administration activities need to adapt their practices to the social culture, and that success can be achieved.

Because Japanese and American management concepts and strategies can only be explained by social structure and culture. Indeed, every culture and belief system can create a healthy foundation for its people to be more successful by providing a more comfortable and peaceful environment than other cultures. In enterprise management and management strategies, in short, there is a model of organizational culture that is specific to the society itself and its culture. In this context, organizational culture is a subculture of social culture and is often perceived as a specific application of social culture to the business world. In this study, first of all, the relationship between social culture and organizational culture is focused on the structures of Japanese and American management culture and the social culture of these countries. Then, taking into account the social identity and structure of Turkish society, lifestyle, value dimension, in short, the social culture, the main features of the Turkish management culture were tried to reveal as much as possible using research. When evaluating the data obtained from these studies, the following main conclusion emerges: our social culture, and ultimately our management culture, interacts with the cultures of both Eastern and Western societies. The culture of management bears the traces of Eastern culture in terms of decision-making system, organizational structure and sense of responsibility, and the traces of Western society in terms of wage policy and rising system. As a result, the most important point to note here is the words of Professor Inglehart, Coordinator of the World Values Study: "The lack of models that are indifferent to cultural factors is becoming more apparent every day." According to Peter Druker, management and administration activities are also deeply connected with culture and social structure. For this reason, to be successful, the values of society must be known and analyzed at the scientific level. For example, the "human first" factor, which is just beginning to take root in Western societies, is a social fact. This topic requires an interdisciplinary approach and more research. However, this requires a team effort, both in time and technically. Practical work on the topic was used as much as possible in this study. Therefore, the study should be evaluated in this context.

THE ROLE OF DIGITAL ECONOMY IN THE DEVELOPMENT OF FINANCIAL SYSTEM

Gultakin Gabil Mammadova

Azerbaijan State University of Economics (UNEC)

Baku, Istiqlaliyyat str.6, AZ1001, Azerbaijan

gultakin.memmedova@mail.ru

ABSTRACT

The digital finance is one of the key components of public policy, and it is particularly relevant in terms of the efficient utilization of financial resources, improving the quality of management in the financial system, and the formation and implementation of perfect financial services in coordination with international standards in modern globalization condition. The digital financial market of Azerbaijan is currently experiencing a rapid growth period, driven by digital financial decisions for more mature markets, such as the application of online payments and transfers, which are typical for emerging economies, and on the other hand, investment insurance, crediting and management. This area was one of the first to introduce advanced technologies such as biometrics and blockchain, and was the driving force behind the application of the national digital identification system. The economic structures, including the public sector, regulators, digital financial companies, banks and other financial institutions, should further promote innovation in this area by strengthening relevant regulatory and partnership relations in the digital financial system. The aim of the research is to investigate the theoretical and practical issues of the formation and development of the digital economy in the growth of the financial system based on the experience of developed market economies. Research methods such as scientific abstractions, comparative and empirical analysis, and logical generalization were used in the research. The practical significance of the research is to enrich the scientific and practical knowledge of the experts working in this area, as well as for the development and implementation of the digital economy in the fiscal policy of developing countries. The article reveals the role of the digital economy in the development of the financial system, and its impact on improving the existing financial infrastructure by highlighting the essence, content and character of digital finance in a global context. The importance of financial innovation in the digital financial system of the country has been identified, the potential benefits of digital finance such as efficiency, competitiveness and new business models have been emphasized, and the importance of partnerships with digital financial service providers is emphasized. The expansion of SMEs opportunities by enhancing of digital finance as well as improving the efficiency of regulatory processes and control over financial market participants have been substantiated by the application of innovative technologies. The current situation of the digital economy in the financial system of Azerbaijan has been analysed and evaluated, the existence of potential opportunities for the wider use of digital financial technologies in the country have been revealed, and relevant recommendations have been made in their implementation.

Keywords: *financial system, digital economy, digital finance, financial innovation, innovative technology*

1. INTRODUCTION

The digital financial market of Azerbaijan is currently experiencing rapid growth, driven by the application of online payments and remittances typical of emerging economies and digital financial decisions for more mature markets such as investment insurance, lending and management. This field was one of the first to apply advanced technologies such as biometrics and blockchain and was the driving force in the application of the national digital identification

system. Governing bodies should continue to promote innovation in this area by strengthening appropriate regulatory and partnerships in the digital financial ecosystem, including the public sector, regulators, digital finance companies, banks and other financial institutions.

2. THE ESSENCE AND CONTENT OF FINANCIAL TECHNOLOGY OR DIGITAL FINANCE IN A GLOBAL CONTEXT

The financial sector is undergoing significant changes due to the rapid development of new financial technologies, commonly referred to as “fintech”. The financial sector has historically surpassed the other sectors of the economy with the opening of deposits, lending and the rapid introduction of technological innovations and new ways of their widespread use. The financial sector has traditionally been a leader in the adoption of technological innovations, but so far the focus has been on computerization, increasing the efficiency of existing processes and the introduction of additional operating channels. Recent developments in Fintech represent a fundamental change in the entire financial services industry. New players and market participants are creating business models that are radically different from traditional business models. Despite some subtleties, the terms “digital finance” and “fintech” are usually used synonymously. Digital finance is linked to the digitalization of financial services and the financial sector of the digital economy as a whole [1]. In our opinion, the digital economy is an economy characterized by the maximum satisfaction of the needs of its participants through the use of modern information and communication and financial technologies, as well as the availability of infrastructure that provides full access to all participants of financial and economic activities. In comparison with the traditional financial services, digital financial solutions are not limited to "licensed" or state-regulated operators. Most digital financial players are not directly covered by the regulatory system, including mobile operators, digital financial startups and digital companies. They stimulate innovation beyond traditional financial institutions. Nevertheless, banks and other financial institutions remain key players in providing financial services, especially in emerging market economies. The "subversive" nature of emerging technologies destroys traditional business models of financial institutions and encourages them to create new strategies to stay profitable. Therefore, banks and other regulated financial institutions are rapidly adopting digital financial processes and changing their products and services. Digital finance uses existing infrastructure to implement a number of evolving technologies and create new services. At the same time, it can contribute to the improvement of the existing financial infrastructure. Programming interfaces for the interactive and open application of most solutions can help ensure the access of many digital financial solutions. Owing to the open application programming interface, the same technologies can be used globally, allowing entrepreneurs to develop, test and improve consumer services at a very low cost, and make decisions that support integration based on shared technologies or platforms.

3. POTENTIAL BENEFITS OF DIGITAL FINANCE

The processes taking place in the digital financial sector open up new opportunities for banks for increasing business efficiency and development. Traditional players in the financial sector are taking advantage of these opportunities to find new solutions to old problems, while big players are investing heavily in digital finance and actively implementing innovative pilot projects. At the same time, new players are directly developing and selling new products using new supply channels and new business models. The potential advantages of digital finance can be summarized as follows:

- **Efficiency:** By removing the barriers to the expansion of digital financial services and offering a wider range of products to a wider range of consumers, the financial services industry can bring significant benefits both in terms of increasing its efficiency and

customer satisfaction. Approximately 60% of the unregistered adult population notes "lack of sufficient funding" as one reason, sometimes for other reasons [2].

- Competition and new business models: The development of technology and regulatory framework suitable for services such as electronic money and platform models has allowed the new player class to share different financial services and provide a wide range of targeted financial services to customers.
- Data analysis: Data obtained as a result of the growing number of digital platforms and applications can be used to record recorded telephone conversations, activity on e-commerce platforms, Internet-connected devices, social networks and professional networks, as well as digital transactions.

These factors contribute to the emergence of new forms of partnerships to serve different market segments.

3.1. Partnerships with digital financial service providers

Traditional banks no longer see digital financial companies as competitors, but instead collaborate with them to reach new population groups and improve regular operations. Partnerships allow financial institutions to take advantage of financial innovation quickly, cheaply, and efficiently through the digitalization of financial services. Such a partnership is mutually beneficial. Banks are gaining access to new markets and customers. The partnership allows both parties to diversify payment mechanisms using mobile or digital payments, respond quickly to changes, and adapt to the situation using flexible techniques and new technologies. In addition, they can develop innovative services such as mobile lending without large investment and research costs. The partnership also allows digital finance companies to address market access and regulatory challenges. In addition, banks have huge customer networks and infrastructure, the ability to analyze big data, and a well-known brand. Samples of existing partnerships include: the utilization of open application software interfaces in order to facilitate developers' tasks; utilization of new technologies to make digital payments or small-scale capital investments, which are not very convenient or difficult for a large bank; improvement of identification and customer identification methods, including biometrics; use data analysts to raise awareness and engage customers; as well as options for providing "non problematic" services. The partnership allows credit institutions to take advantage of digital financial services. Digital methods allow such organizations to provide basic financial products to those in need quickly, cheaply and easily. Such organizations use new marketing channels to reach customers and meet their needs, develop new products and services according to customer needs and use the data to present products to consumers who are considered risky due to the lack of traditional indicators. Innovative ways of combining technology with human communication are also important in the service market. Agents in the "advanced" services market can help customers with low digital literacy feel more comfortable using the financial system, choose products, solve problems and increase customer confidence when using new services. Expanding the capabilities of the financial partnership model through utilization of cloud platforms can significantly reduce costs and increase the efficiency of services.

4. ANALYSIS OF THE CURRENT STATE OF DEVELOPMENT OF THE DIGITAL ECONOMY IN THE FINANCIAL SECTOR OF AZERBAIJAN

The digital transformation of the financial sector in Azerbaijan continues at a rapid pace, setting an example for other areas, allowing Azerbaijan to become one of the world leaders in this field. Expansion of digital finance in the financial system of Azerbaijan is one of the main priorities in the "Strategic Roadmap for the Development of Financial Services in the Republic of Azerbaijan" approved in 2016 [3].

The priority is to improve the regulatory mechanism to accelerate the digital transformation of the financial system by 2020. In the context of the priority envisaged in the road map, in September 2018, the "State Program for the expansion of digital payments in the Republic of Azerbaijan in 2018-2020" [4] was adopted. The program identifies four areas for development to achieve its goals. These include further improving the institutional environment for digital payments, revitalizing the banking sector, shaping the digital ecosystem, and strengthening advocacy and awareness of digital payments (Table 1 and Table 2).

CASH-FREE STRATEGY of AZERBAIJAN	
<i>Sub-strategies</i>	<i>Components of a cashless society</i>
A) Reducing the scale of the cash economy	Favorable institutional environment
B) Expanding the cashless economy	A society with high financial literacy Modern payment ecosystem Advanced financial system

Table 1: State Program on "Expansion of digital payments in the Republic of Azerbaijan in 2018-2020" (Source: [4])

Directions	Priorities
<i>1. Further improvement of the institutional environment for digital payments</i>	. development of a favorable business environment . increasing the efficiency of the tax system . strengthening the social protection system
<i>2. Revival of the banking sector</i>	. Acceleration of the banking sector recovery . formation of an active money market
<i>3. Formation of digital ecosystem</i>	. development of digital entrepreneurship . development of e-commerce . Improving the legal framework for payment services . introduction of new digital payment technologies . development of digital banking . Wide application of smart payment means . development of existing electronic payment services . increasing financial inclusion in the region and remote areas . stimulation of digital payments
<i>4. Strengthen awareness and advocacy on digital payments</i>	. raising financial literacy . raising public awareness of digital payments

Table 2: The main directions and priorities of the State Program (Source: [4])

The development of digital finance is regulated by the Central Bank of Azerbaijan, which oversees financial markets, financial activities and the licensing of new financial technologies. The central bank also controls the cryptocurrency market. The new guidelines propose a number of measures to regulate the use of financial technologies, including the adoption of relevant legislation, as well as the development of remote identification platforms, platforms for financial products and services, the use of blockchain and cloud computing technologies in the field. It is recommended to use open application software interfaces for effective interaction. The goal is to create a level playing field for new market participants and increase the competitiveness of Azerbaijan's financial sector.

5. FEATURES OF RISK MANAGEMENT AND WAYS TO IMPROVE THE DIGITAL ECONOMY IN THE AZERBAIJANI FINANCIAL SYSTEM

Today, the development of production and financial resource management technologies in a number of countries is carried out within the framework of state programs for the transformation and creation of the digital economy: “Industrie” in Germany, “Advanced Manufacturing Technology” in the US, “Strategic Concept for Innovation and Advanced Technologies” in China, “Innovate UK” in England, “National Digital Economy” in Australia, creation and implementation of IoT platforms in the Russian Federation, development of applied services projects are also implemented [5]. Another risk group in the digital economy is organizational and management risks, which are directly related to the structure and organization of the financial system, as well as fundamental decision-making. Given this group of risks, it should be noted that the various distortions in the financial system are of great importance. Moreover, the greater and larger extent of such distortions, the wide organizational and managerial risks that affect the financial system. Professor B.A. Heifetz in his research, speaks about two main imbalances: the widening gap between financial and real economies and the imbalance of forces in the global economy, and the role of new economic leaders in the process of globalization [6, p. 48-56]. According to him, certain risks for the financial system are the increase in the financial depth of the economy, which is the ratio of the value of financial assets to world GDP, as well as the dominance of two major currencies in the international economy - the US dollar and the euro. The role of currencies such as the rupee and the Russian ruble is inconsistent with the size of national economies on a global scale). If we talk about external organizational and management risks, it should be noted that they are also specific to the digital economy. In this regard, we can pay attention to a number of global imbalances in the financial system of Azerbaijan. Thus, in our opinion, the digital economy is not a substitute for the real economy, but only a part of it, or rather, some business processes that have moved to the IT sphere. Human society exists in the material world and in the digital economy its material needs will not be lost. For example, although food is purchased online, it still needs to be produced. However, the digital economy can develop certain sectors and fields of the economy, some of which can even be transformed. Digital finance creates new challenges that can negatively affect financial integrity, consumer protection and financial stability. Ensuring equal conditions in the provision of services and strengthening consumer protection is one of the most important tasks. While overly cautious or flexible regulation may hinder the expansion of fintech services, the lack of effective regulation faces increasing risks and sensitivities for the financial sector and consumers. In terms of risk, traditional risks, including commodity and organizational risks, remain, and new types of risks arise in connection with the application of new technologies for money laundering and terrorism financing, piracy and data seizure, and increasing consumer sensitivity. In particular, the use of big data and new forms of processing in credit risk assessment, online operations and consumption rules exacerbate the problems of data protection and consumer privacy [7]. To ensure equal opportunities for all players in the sector, it is important to find the right balance between regulating the activities of existing financial service providers and creating conditions for new players. It is important that both of them have access to the financial infrastructure and customer data (or customer interface).

6. CONCLUSION

Azerbaijan has ample opportunities for better utilization of digital financial technologies.

- Development of an appropriate regulatory framework that helps to create favorable conditions for the further development of digital finance in Azerbaijan and ensures the stability, security, efficiency and integrity of the financial system.

- The use of technology (RegTech / SupTech) to flexibly regulate and maintain the balance between service delivery and innovation in the privacy and security of users, as well as to increase the transparency of financial products and services, guarantee customer rights and protect financial markets from unreasonable operational risks.
- Focus on cyber security and prepare to manage new risks.
- Strengthening Azerbaijan's financial infrastructure for the acceleration of the transition to a cashless economy by developing an ecosystem approach taking into account all players in this area.

Stimulation the development of comprehensive capabilities of digital identifiers and ensure full digitalization and compliance with regulatory requirements for customer attraction and service processes.

- Utilization of distribution registry technology to provide financial services and increase transaction efficiency, transparency and customer satisfaction.

A significant inequality in the pace of digitalization of various sectors of the economy should be noted. One of the important points in the implementation of digital transformation in the financial sector is to ensure the security of information technology, utilization and protection of data in information systems, as these technologies have become the main tool for doing business. However, it must be acknowledged that the penetration of advanced information technology is confusing banking functions, and banks are gradually losing expert functions to virtual communities, and the logical transition to the digitalization of the financial system will be the full transfer of banking services to the online space. It is important to recognize new opportunities provided by technological advancement and use them to develop new products, manage customer relationships, and increase operational efficiency. It should not be forgotten that the impact of new technologies can lead to changes in sources of income, the transformation of markets and the breakdown of business relations, the change of leaders.

ABSTRACT

*Wheat used for human consumption is customarily processed into flour. The most important fraction of the by-products obtained during grain processing is bran, which constitutes approximately 25% of the microstructure of the grain. The bran fraction also consists of the starchy endosperm and the aleuron layer, because it is impossible to completely separate all the anatomical parts of the wheat grain. Bread made from white and refined flour is devoid of many biologically active compounds. Furthermore, these compounds are concentrated in bran. It is known that the use of whole-grain products reduces the risk of disease. A research aim is to research the effect of fermentation by using a phytase-based complex enzyme preparation to change the microstructure of anatomical parts and some indicators of wheat composition. *Hordeum vulgare* L. "Karabakh 22" (R2 P 1) wheat sort was fermented in solution of phytase-based (manufacturer of *Penicillium canescens*) complex enzyme preparation for 15 hours at a pH 5.5 in a 55 ° C thermostat. The drug contains xylanase and phytase, selobiohydrolase, β -glucanase (phytase 12005 units / g, xylanase activity - 801 units / g). A pH 4.5 citrate buffer was used to maintain the pH level. Grain: water ratio is 1: 1.5. The concentration of the enzyme preparation was 0.7 g / l. Local grains and dry grains was used as examples. The analysis was carried out under the JMO L JSM 6390 electron microscope. Antioxidant activity was determined by spectrophotometric method in alcohol extract. The polypeptide content of the total protein in the grain was determined by gel-chromatography. Determination of phenolic compounds was carried out by high-efficiency liquid chromatography on the Milichrome-5-3 device.*

Keywords: grain, protein, enzyme preparation

1. INTRODUCTION

Heavy metals accumulate mainly in the peripheral areas of the grain. Grinding process is applied in the technology to minimize the amount of harmful substances in food. The current modern technologies of grain crops processing during the production of food products are based on the production of various types of flour by peeling the shell of the grain, in which more than 20% of the flour mass is lost. Studies show that the perfect type of flour contains almost no heavy metal salts. [1]. Foods with higher nutritional properties can be obtained through proper formation of hierarchical structures [2]. Degradation of these matrices by enzyme hydrolysis affects the structure and biologically active compounds. [3]. The application of innovations in the production and processing of grain crops (wheat, oats, barley, and etc.) is always of some interest. [5]. The aim of the study was to determine the effect of the fermentation process on changes in the microstructure of the anatomical parts and some parameters of the composition of the wheat grain using a complex enzyme preparation based on phytase. During the grinding process, some of the biologically active components, such as vitamins, biogenic minerals, dietary fiber, as well as essential amino acids and proteins, are extracted. The spread of civilizational disorders (obesity, atherosclerosis, diabetes, etc.) through the use of refined

products, including grain crops, in food is a concern for physicians, nutritionists and physiologists. In this regard, methods to reduce the amount of toxic elements in grain raw materials are of particular importance to increase the safety of grain and its processed products. The application of biotechnical operations such as cellulose-based biocatalysts used in the decomposition of extracellular adsorbents to implement this process is promising. [4]. First of all, they are enzymes that catalyze changes in the natural structure and break-down of cellulose fibers, release cellulose microfibrils from the cell wall matrix and break-down hemicellulose and pectin, and catalyze the break-down of phytonutrients [6]

2. RATIONALE OF ENZYME PREPARATIONS RATIONAL DOSES

In order to reduce the amount of toxic elements, cellulolytic enzyme preparations such "Celloviridin G20x" and phytase-based laboratory preparation F 4.2B (P-215) FD-UF, Novozymes: Pentopan 500 BG and Fungamyl Super AX preparations, and preparation of Quest– Biobake – 721 company, has been used to modify the structure of fruit and seed shells of wheat grain. Enzyme preparations were applied during the soaking phase of the grain. The process was carried out in a thermostat at a temperature of 55 ° C and a pH of 5.5. The optimum temperature and pH for the action of enzymes in enzyme complexes have been determined. A citrate buffer has been used to maintain the pH of the medium. The most important factors affecting the enzyme hydrolysis process of non-starch polysaccharides in the shell of grain are the soaking duration and the dose of the enzyme preparations applied. The selection of rational doses of enzyme preparations is carried out experimentally. After soaking the grain for 15 hours and washing with water, the amount of sanitary-normalized lead and cadmium toxic elements is determined. During soaking of wheat grain, enzyme preparations as CelloviridinG20X - at a dose of 0.06-0.12% of the dry matter content of the grain (cellulose activity 1.78-3.57 units/g), on the basis of phytase - at a dose of 0.07-0.12% of grain weight (phytase activity 7.5-12.0 units/g), Biobake 721 - at a dose of 0.07-0.12% of the dry matter content of the grain (xylanase activity - 0.47-0.76 units/g), Pentopan 500 BG - at a dose of 0.002-0.006% of the dry matter content of the grain (xylanase activity 0.05-0.16 units/g) and Fungamil Super AX - at a dose of 0.008-0.012% of the dry matter content of the grain (xylanase activity 0.2-0.3 units/g), was included.

2.1. Effect of enzyme concentration and soaking duration on the amount of lead and cadmium in wheat grain

Under normal natural pH, cadmium forms a complex with large amounts of ligands. The element can be easily transferred to plants in the form of organic metal complexes. Cadmium readily takes over most of the metabolic positions in active substances found in cell walls. [7]. Amino acids, amino sugars and polysaccharides contain suitable donor atoms for the formation of cadmium-containing compounds. The amount of cadmium in the wheat grains begins to decrease rapidly from the first hour of soaking, and after 15 hours of soaking, this process slows down somewhat by the action of phytase and CelloviridineG20X-based enzymes. Lead forms a highly stable chelate with organic ligands containing S, N, O donor atoms. The main part of the lead is covered with colloids. A decrease in the amount of lead in the grain is observed when soaking wheat grains in water and solutions with rational doses under optimal conditions for the action of enzyme complexes (pH 5.5, temperature 55° C) of enzyme preparations. The most significant reduction in metal is observed within 6-15 hours regardless of the type of enzyme preparation used to soak the wheat grains. The results show that the use of cellulose-based biocatalysts during the soaking phase of wheat grain reduces the amount of toxic elements and radionuclides in the grain. Under the influence of cellulose-based biocatalysts, a modification of the natural structure of the cell wall matrix of the fruit and seed shell of the grain.

2.1.1. Changes in the microstructure of the grain surface under the influence of enzyme preparations

The surface of the grain should first react to the action of water and solutions of cellulolytic enzyme preparations. A change in the relief of the grain surface was observed when soaked for 15 hours under the influence of water (sample) at a temperature of 55 ° C. After soaking in water, the cuticular part of the micro-relief of the grain surface was in the form of open bundles of undamaged fibers, the transverse lines of the microfibril matrix of the cell walls were more clearly visible. The nature of the changes in the structure of the surface of the grain is determined by the type of preparation and its enzyme complex. Under the influence of Celloviridine G20X, the fibrillar transverse sutures composed of cellulose microfibrils and hemicellulose molecules were degraded. Opened fibrillar paracrystalline areas are suitable for water, colloids and chelates. The cellobiohydrolase enzyme, which is part of the enzyme complex of the preparation, breaks down the outer layers of cellulose microfibrils with an amorphous structure. The use of phytase and Biobake 721-based enzymes causes the breakdown of hemicellulose in the tissue. Under the influence of Fungamil Super AX, the shell, consisting of longitudinal fibers of structural polysaccharides, has a smooth structure. As a result, under the influence of Celloviridin G20X, cavities appear on the surface of the grain. Thus, the effect of the preparation is more uneven, the microrelief of the surface is deeper, the shape of the depressions is less accurate, and numerous open chains of polysaccharides are visible.

3. STUDY OF EFFECTS OF SOAKING DURATION IN SOLUTIONS ON WHEAT GRAIN

To study the effect of soaking duration on the microstructure of wheat grain stored in cellulolytic enzyme preparations, the grain was soaked for 6 hours. As a result of wetting, phytase-based Celloviridin, Biobake 721 enzyme preparations, were clearly visible on the grain surface as drops. However, in samples treated with Fungamil Super AX and Pentopan 500 BG, the amorphous formations passing under the upper layer of the fruit peel can be seen on the surface of the substrate. It is possible that Novozymes preparations contain strongly absorbed enzymes that penetrate the deeper layers of the substrate. During six hours exposure, the enzyme preparations had no significant effect on the microstructure of the grain surface. This case confirms the formation of holes on the cuticular surface, and their size and nature are determined by the type of preparation. The shells of wheat grains are composed of layers. When the wheat grains are kept in water for 15 hours, the peel of the fruit and seeds swells, their total thickness increases and the thickness is on average 26.16 µm. Under the influence of a cellulolytic enzyme complex - celluloses, β-glucanases and xylanases sequentially change the structure of the cell wall of non-starch polysaccharides. They are hydrolyzed and hydrolysis products with higher water absorption capacity - poly - and oligosaccharides, pentosans are formed. The products of hydrolysis swell by filling the intercellular spaces. A gap appears between the fruit and the peel. After processing the wheat grain with a complex enzyme preparation, the thickness of the fruit peel was 20.64 microns. The distance between the fruit and seed shell was 30.32 - 35.15 µm, and the thickness of the seed membrane was 14.99 µm. It was determined that the proteolytic activity of the wheat grain changed slightly when it was soaked for 15 hours. However, under the influence of cellulolytic enzyme preparations, an increase in the proteolytic activity of wheat was observed. During the 8-hour soaking, the proteolytic activity of the wheat increased insignificantly, followed by a gradual increase. Grain soaked in Fungamil Super AX enzyme preparation has the greatest proteolytic activity and in this case its amount increases by 29.22% in 15 hours compared to the sample. Compared with grain soaked in water, proteolytic activity increased by 14.58%, phytase-based enzyme preparation - 17.14%, Biobake 721 - 21.03%, and Pentopan 500 BG - 24.60% after 12 hours of

soaking with the use of Celloviridin Q20x enzyme preparation. The amount of protein in the grain decreased by 7.4% after soaking in water for 15 hours. Gliadin is the predominant fraction in wheat protein. During the soaking of wheat grains in water, the amount of albumin proteins, globular and gliadin fractions decreased, but the amount of gluten increased.

Practice options	The amount of protein, %	albumin, %	globular, %	gliadin, %	gluten, %
Dry grain	12,30	1,00	3,62	4,52	3,01
Grain not soaked in enzyme preparation	11,40	0,86	2,59	4,22	3,45
Celloviridin G20x	11,20	0,80	2,48	4,20	3,34
Biobake 721	11,10	0,82	2,32	3,94	3,46
Pentopan 500 BG	10,80	0,66	2,40	3,84	3,67
Fungamil Super AX	10,70	0,60	2,34	3,78	3,68
Phytase based	11,00	0,75	2,37	3,99	3,60

Table 1: Effect of cellulolytic enzyme preparations on the protein fraction of grain

4. CONCLUSION

Research has shown that the fermentation process using a phytase-based complex enzyme preparation at pH 5.5 and 55 ° C for 15 hours affected changes in the microstructure of the anatomical parts of grain. There has been a breakdown of the cross-links between individual microfibrils and fibrils composed of hemicellulose molecules. A gap appeared between the fruit and the seed shell. After processing the wheat grain with a complex enzyme preparation, the thickness of the fruit peel was 20.64 microns. The size and structure of the aleurone layer in the fermented grain changed compared to natural wheat grains. Cracks 8-20 µm wide appeared on the grain surface, bounded by a large cuticle with a microfibrillar parallel texture. Interfibrillar paracrystalline openings are suitable for infiltration of water, colloids and chelates. The dynamics of changes in the amount of heavy metals in wheat grains during soaking in solutions of cellulolytic enzyme preparations showed that the use of the studied enzyme preparations reduces the amount of lead and cadmium in grains. Celloviridin Q20X enzyme preparation has a certain effect on changes in the protein complex. Phytase-based preparation is close to Celloviridinu G20x enzyme preparation in its effect on the protein complex. The most significant changes occur in the enzyme preparation Fungamil Super AX. Thus, the protein fraction of processed grain is more variable.

ABSTRACT

A social accounting matrix is a square matrix that reflect all transactions between economic agents in a specific economy for a specific period of time (usually one year). While it is a comprehensive snapshot of the economy recording economic flows related to production, income generation and its distribution and redistribution among economic agents, it is also an important basis for different types of models. A SAM extends the classical input-output tables, and because reflects both distribution and redistribution of income alongside with production linkages, economy can be analysed in a more consistent way using SAM compared to IO models. Therefore, in this paper, a SAM multiplier model was used to estimate the impact of tourism sector on other sectors of the economy, and at the contrary, the impacts of changes in other sectors on tourism sector. Tourism is one of the main sector of economy and until pandemic it was considered an important area for both emerging and developed economies to compensate for weak export earnings from other goods and services. With the development of the non-oil sector in Azerbaijan as one of the main directions of the economy, the development of the tourism sector was in the spotlight. However, during the Covid-19 pandemic, the tourism sector is one of the most negatively affected sectors. In this regard, the assessment of the impact of changes in this sector on other sectors and the country's economy as a whole is important both in terms of analyzing the current situation and also identifying areas for economic recovery in the post-pandemic period.

Keywords: *covid-19, input-output models, multiplier analysis, social accounting matrix, tourism*

1. INTRODUCTION

The tourism sector, one of the fastest-growing sectors since the middle of the twentieth century, is an important sector for both developed and developing countries, that makes a significant contribution to the economy. The World Travel & Tourism Council has been quantifying the economic and employment impact of Travel & Tourism for nearly 30 years, considering the importance of the sector to the global economy. The 2019 annual research reveals that the sector accounted for 10.3% of global GDP and 330 million jobs or 10.4% of total employment in 2019. Over the past five years, one in four of all net new jobs created across the world has been in Travel & Tourism (World Travel & Tourism Council: Travel & Tourism - Global Economic Impact & Trends 2020, June 2020). Tourism suffered the greatest crisis on record in 2020 following an unprecedented health, social and economic emergency amid the outbreak of the COVID-19 pandemic. International tourist arrivals (overnight visitors) plunged by 74% in 2020 over the previous year due to widespread travel restrictions and a massive drop in demand.

The collapse in international travel represents an estimated loss of USD 1.3 trillion in export revenues - more than 11 times the loss recorded during the 2009 global economic crisis. The latest UNWTO Panel of Experts survey shows a mixed outlook for 2021. Almost half of respondents (45%) envisaged better prospects for 2021 compared to last year, while 25% expect a similar performance and 30% foresee a worsening of results (<https://www.e-unwto.org/doi/abs/10.18111/wtobarometereng.2021.19.1.1>). Having considered Azerbaijan is a country abundant in natural resources especially oil and gas, The direct impact of changes in oil prices on the Azerbaijani economy has highlighted the importance of developing the non-oil sector in the country. Azerbaijan's financial authorities have implemented several infrastructure projects to support the development of the non-oil sector, taking advantage of the growing exclusive opportunities for oil exports. The tourism sector in Azerbaijan has developed rapidly, especially since 2000, and efforts have been made to gain a competitive advantage in the international tourism sector. Thus, one of the priority areas for the economy is the development of tourism. The increase in investment in this sector, the creation of new types of tourism, the introduction of the "Asan Visa" system, and the hosting of many international events have led to an increase in the number of tourists visiting the country. In 2019, the share of tourism in non-oil GDP was 3.9 percent (https://economy.gov.az/uploads/fm/files/diger/Qeyri-neft_2019.pdf). During January-September 2020, the value-added in the field of tourist accommodation and catering amounted to 653.0 million manats, and the share of this sector in non-oil GDP was 1.8 percent. The impact of the coronavirus (COVID-19) pandemic has not passed unnoticed in the tourism sector of Azerbaijan, as in other countries. In January-September 2020, 686.3 thousand tourists came to Azerbaijan from 155 countries, and this is 3.5 times less compared to last year (<https://economy.gov.az/uploads/fm/files/iqtisadiyyat/qeyri-neft.pdf>). The tourism sector is closely interrelated with other sectors of the economy. Thus, the development of this sector has a significant impact on other sectors providing access to the tourism sector. The activities of travel agencies and tour operators, wholesale and retail services, and health services, which use the products and services of the hotel and restaurant sector as revenue, are also contributing to the development of this sector. An intersectoral analysis is based on input-output tables and provides a map of the dynamics of the economy over a period of time (Həsənli Y, 2011). Thus, the "Input-Output" models developed based on "Input-Output" tables are important for the analysis and forecasting of intersectoral relations of the country's economy. And it is also widely used to analyze tourism sector (Briassoulis H., 1991; Fletcher J., 1989). In the last century, a "Social Accounting Matrix" (SAM) was developed based on the principles of "input-output" tables, but covering a wider aspect of the country's socio-economic system. SAM is part of the SNA and is calculated and compiled by government statistics agencies in most countries. Numerous studies have been conducted to estimate the impact of tourism on the Azerbaijan economy using "input-output" models (Hasanli Y. And Salihova S., 2017; Baizakov et al., 2019; Hasanli, Y. and Salihova, S., 2020). The purpose of this study is to analyze the impact of the tourism sector on other sectors of the economy using SAM based multiplier model.

2. METHODOLOGY

Social Accounting Matrix is an accounting system that reflects all the transactions in the economy and describes the flow of resources between economic agents in a tabular form. In other words, SAM is a square matrix in which the sum of rows defines the expenditures of each entity and columns define the income of this entity (Pyatt G. and Round J., 1985). Due to its convenient design and a large amount of data, it reflects the important and necessary features of the socio-economic structure in general, as well as the structure of production and income distribution. At the same time, SAM is a key source for many economic models, including general equilibrium models.

One of these models is the SAM-based multiplier model. A SAM multiplier model is an extension of the input-output model and is designed to analyze the effects of macroeconomic policy (Breisinger C. et al., 2009). The multiplier model is used to study the multiplicative effects of changes in exogenous demand on endogenous accounts. In multiplier models, one or more accounts are presumed to be exogenous, and the response of other accounts to certain changes in these accounts is investigated. Changes in exogenous demand occur as a result of changes in any of its components - export demand, government spending or investment demand. This change has multiplicative effects on endogenous accounts both directly and indirectly. The general effect of changes in exogenous demand on endogenous accounts is the sum of the direct and indirect effects on that account. The first step in creating a simple multiplier model is to decide which accounts are exogenous and which are endogenous. Usually, the government account, the capital account and the rest of the world account are considered exogenous factors. Production accounts (production activities and commodities), factor accounts, and households are considered endogenous accounts. For simplicity, exogenous accounts are combined into a single account. Table 1 describes SAM accounts separated into endogenous and exogenous ones. The elements of the T matrix include economic relationships between endogenous accounts. The vector X represents the flow of resources from exogenous accounts to endogenous accounts, and vector I represents the flow of resources from endogenous accounts to exogenous accounts. The vector Y represents the sum of the elements in a row or column of endogenous accounts, and these sums are equal to each other under the equilibrium condition, since they are equal to the income and expenses of that account, respectively.

Table 1: SAM (accounts separated into exogenous and endogenous accounts)

Accounts	Endogenous accounts				Exogenous accounts	Total
	Activities	Commodities	Factors	Households.		
Activities		T ₁₂			X ₁	y ₁
Commodities	T ₂₁			T ₂₄	X ₂	y ₂
Factors	T ₃₁				X ₃	y ₃
Households			T ₄₃		X ₄	y ₄
Exogenous accounts	I ₁	I ₂	I ₃	I ₄		
Total	y ₁	y ₂	y ₃	y ₄		

Source: Round J., 2003

The basic approach to SAM-based multiplier models is to calculate column ratios, as in input-output tables. Then we get matrix A from the T SAM matrix by dividing each column element of this matrix by the sum of the columns, and it is clear that the following equation will be satisfied:

$$T=AY \quad (1)$$

We can write the following equation for each account:

$$y=Ay+x \quad (2)$$

From here, we can find y as following:

$$y=(\hat{I}-A)^{-1}x=M_{AX} \quad (3)$$

Where, M_A is the multiplier matrix. When matrix A is fixed, MA will also be fixed, and then equation (3) determines the equilibrium value of y corresponding to any change in x (Round J., 2003). To get an idea of how this model works, let's say we want to explore the possible effects of changing public spending. This change includes salaries and wages paid to civil servants. In this case, Equation (3) determines how this change affects the costs of production activities, and especially household income. More precisely, the reduction of government spending reduces the level of production and household income. This effect occurs directly. However, this decrease also indirectly causes changes in other accounts as a result of multiplier effects. The overall effect of changes in exogenous demand on endogenous accounts is the sum of the direct and indirect effects on that account.

3. DATABASE OF THE RESEARCH

The database of the article includes the micro-SAM of Azerbaijan developed using the latest available input-output table and other relevant statistics for 2016 released by The State Statistical Committee of the Republic of Azerbaijan. For this purpose, the inter-sectoral balance sheet, consisting of 96 areas, was initially aggregated into 16 areas. Then, using this table, a micro SAM was established using Azerbaijan's macro SAM for 2016 (Həsənli Y. and Rəhimli G., 2018). As mentioned above, in multiplier models, first of all, endogenous and exogenous calculations are distinguished. We took activities, commodities, factors and households accounts endogenously and the remaining accounts exogenously. Then we get the matrix as in table 2. Note that in micro form the intersection of rows and columns in activities and commodities with other accounts calculations represent a 16-dimensional matrix or vector. Here, in general, the sum of these vectors or matrices is reflected.

Table 2: macro social accounting matrix for Azerbaijan economy

	Activities	Commodities	Wage	Capital	Households	exogen	
							total
Activities		85466,10366					85466,1
Commodities	29962,3				33500,8	50627,6	114090,7
wage	9693,1					440	10133,1
capital	45257,8					2907,3	48165,1
households			9733,2	22542,88		0	32276,1
exogen	552,9482	28624,6	399,9	25622,2	-1224,7		
total	85466,1	114090,6889	10133,1	48165,07	32276,0751

4. FINDINGS AND RESULTS

Based on the micro-SAM of Azerbaijan, the impact of the 10 million investment in the tourism sector on other endogenous accounts was estimated and the result was as in table 3.

Table following on the next page

Table 3: The impact of the increase in the volume of the final product of tourism sector by 10 million manats

		Sectors		total
ACTIVITIES	1.1	Agriculture, hunting, forestry and fishing	0,728766	11,1063
	1.2	Mining	0,234979	
	1.3	Manufacturing	0,773557

	2.10	communication	0,204035	
	2.11	Finance, insurance and pension services	0,265784	
	2.12	profession, scientific and technical activities	0,289497	
	2.13	public administration and defence	0,002643	
	2.14	education	0,066517	
	2.15	health and social services	0,111933	
	2.16	other services	0,643875	
	3.2	labor	0,960737	
	3.2	capital	5,92448	
	4	households	3,695678	

Source: Authors' calculations

As can be seen, investments in the tourism sector increased the total output in this sector the most, while the final demand in this sector increased by 10.2 million manats. This impact increased the country's domestic production by 11.1 million manats and final supply by 18 million manats.

Also, labor payments increased by 1 million, capital gains by about 6 million, and household incomes increased by 3.7 million manats. And the sectors most affected by the tourism sector are manufacturing and trade. Table 4 shows the multiplier effect of the investment of 10 million manats in other areas in the tourism sector.

Table 4: The impact of 10 million manat increase in the volume of the final product of other sectors on tourism sector

	Sectors	toursim output	toruism demand
1.1	Agriculture, hunting, forestry and fishing	0,13	0,24
1.2	Mining	0,15	0,29
1.3	Manufacturing	0,05	0,1
1.4	production and distribution of electricity and gas	0,2	0,29
1.5	water	0,17	0,31
1.6	Construction	0,1	0,19
1.7	Trade services, repair of vehicles	0,17	0,31
1.8	transport and storage	0,1	0,18
1.9	hotel and restourant services	5,5	10,2
1.10	communication	0,15	0,29
1.11	Finance, insurance and pension services	0,18	0,34
1.12	profession, scientific and technical activities	0,1	0,19
1.13	public administration and defence	0,2	0,38
1.14	education	0,26	0,49
1.15	health and social services	0,18	0,33
1.16	other services	0,16	0,31

Source: Authors' calculations

As can be seen, the areas that generate the most growth in the tourism sector are 'education', 'public administration and defense', 'finance and insurance' and 'health and services'. Thus 10 million manats investment in education increases final supply of tourism by 0.5 million, and the same amount of investment in 'public administration and defense', 'finance and insurance' and 'health and services' increases 0.38, 0.34 and 0,33 million manats respectively.

5. CONCLUSION

The article assessed relations between the tourism sector and other sectors of the economy using the SAM-based multiplier model. Estimating Multiplier effects created by 10 million manats investment in tourism sector indicates that This impact increased the country's domestic production by 11.1 million manats and final supply by 18 million manats. Also, labor payments increased by 1 million, capital gains by about 6 million, and household incomes increased by 3.7 million manat. And the sectors most affected by tourism sectors are manufacturing and trade, while the sectors which have more impact on tourism are 'education', 'public administration and defense', 'finance and insurance' and 'health and services'. As can be seen, the sectors that are affected by tourism are the ones tourism sector uses their products and services as input, and the sectors that affect the tourism sector mostly are the ones use the output of tourism or development in these sectors are important in terms of attracting tourists. Therefore, to promote the tourism sector in post-pandemic period development of these sectors needs to be preferred areas when considering investment strategies.

ABSTRACT

Hazardous food products originating from microbiological contamination are in the first place, measured by the nature and degree of danger to people's health. All of the activity of microorganisms in the product causes chemical and physical changes. In most cases, these processes are undesirable they deteriorate consistence, taste and even spoil the product. Microorganisms causing food poisoning are of particular importance. According to the list developed by World Health Organization, the degree of food poisoning and frequency of food poisoning cases occurred mostly in milk and dairy product care attributed to the first category (food poisoning, which is the main source of food and its components). The application of HACCP system in milk processing enterprises plays an important role for the human body in order to produce safe products. Thus, HACCP system developed in order to maintain and control the placement of the emerging threats at each point of production. HACCP quality system developed individually for each institution and process separately. The end, result of each production evaluated by the quality of the product. Great importance attached to the quality of food, because it depends on human health and even life. Today, the concept of "quality product" for the consumer means a safe product with health-promoting features and visual appeal. Food safety is important and, above all, the object of sanitary and hygienic control. Food safety is always a focus, as there is always the possibility of danger to the consumer in the food market. Responsibility for controlling the production and safety of food products lies not only with producers but also with state regulators. The food safety system, which includes the elements that make up such a system, is the most effective tool for consumer protection. These include the regulatory framework that establishes product requirements, metrology, conformity assessment, control systems and market control. The basic model of quality management and food safety is the HACCP system. The article explores this system in more detail and explores the prospects for the application of the system.

Keywords: *Food safety, food products, HACCP system*

1. INTRODUCTION

Dangerous situations can arise at all stages of the production chain, at any point in the production process, storage and sale of the product. Quality and safety indicators are very important in any production, and in order to avoid doubts about the quality of the finished product, it is necessary to monitor it at every stage of production. To ensure the required level of quality of food products, a continuous technological process of processing is required, which is ensured in the production of the conveyor. Production automation is the highest step in achieving a continuous flow of production and continuity of processes. It accelerates technological processes, eliminates temporary breaks between separate operations, reduces the duration of the entire cycle of processing of raw materials, significantly improves the sanitary conditions of production, allows strict adherence to recipes and food preparation regimes. The place among the technical methods of improving the quality (factors) of the product belongs to the constant improvement of the technological base of the enterprise. Achieving a high level of product quality is possible only with the application of the latest technology, strict adherence to technology discipline, provide that the production is highly technical equipment.

Hazards in food can occur at any stage of the food chain, and in this regard, adequate management of the entire food chain is very important. Food security is ensured through the joint efforts of all parties involved in the food chain.

2. THE ROLE OF THE HACCP SYSTEM IN THE FOOD INDUSTRY

At the state level, a warning model of food safety management based on HACCP (Hazard Analysis and Critical Control Point) principles have been adapted and successfully implemented in enterprises around the world. It is a food safety management system that provides control at absolutely all stages of the food chain, at any point in the production process, as well as storage and product sales, where a potentially dangerous situation arises. The HACCP system is mainly used by food companies. In developed countries, each manufacturer develops its own HACCP system, which takes into account all the technological features of production. If the developed system is subject to changes, it can be adapted to any changes in the processes of production equipment for the purpose of conformity. The standard, which reveals a new system of management of the KMT, restores the management of the control process of the KMT. According to ISO 22000, the quality of food depends mainly on its production process. The study of threats to NGOs should be part of the planned work to ensure the production of a safe product. There is always the possibility of a dangerous product entering the food chain, so the organization should have a special recall operation. Food companies use the HACCP system in their enterprises to protect their food or brand as the product progresses in the market. An important and undisputed advantage of the HACCP system is its ability not to detect, to anticipate and to warn of errors with the help of step-by-step control over the entire chain of food production. This is a guarantee of food safety for consumers, and is the starting point and key issue in the work of the entire food industry. The use of production management, certified and HACCP-based systems allows food companies to produce not only products that meet the highest European safety standards, but also products that can withstand tough competition in the European food market. The HACCP can be an excellent argument for confirming compliance with regulatory and legislative requirements. Within the framework of the internal control system in the food industry, the HACCP concept is called upon to prevent threats to consumer health. The experience of the United States, as well as the requirements of the European Union 93/43 / Guidelines on Food Hygiene, were taken into account during the preparation of the national version of the state standard of the safety management system. However, national sanitary and hygienic documents and federal laws "On Ensuring the Unity of Measurements", "On Food Safety Quality", "On Sanitary and Epidemiological Welfare of the Population" are the basis of the system. HACCP plays a very important role in ensuring the NCO, but it is one of the components of the overall system of food security, the main of which is the provision of mandatory conditions. The practical application of the HACCP system in enterprises is a very positive example of the success of high results in ensuring the NCO. However, an enterprise usually has serious problems implementing this system. Globally, the HACCP-based warning model of governance has been adopted and is being used successfully in enterprises. It is a management system with GMO, which controls all stages of the food chain, at a certain point in the production process, including storage and product preparation, where a dangerous situation is likely to arise. The HACCP system is used by food companies. In many DDCs, all manufacturers form their own HACCP system, which takes into account all the technological features of production. Then, in September 2005, ISO 22000 "Food Safety Management Systems, Requirements" were approved, which unified the requirements of the safety management system and harmonized them with other standards of management systems. In contrast to the state standard, the new standard contains additional requirements in the field of document management, management responsibilities, information exchange, emergency preparedness, development of mandatory initial programs, and a developed system of measures

and management. In total, these requirements are aimed at maximizing product safety. Hazards in food can occur at any stage of the food chain, so adequate management of the entire food chain is critical. Therefore, in accordance with the HACCP standard, it is necessary to identify and manage risks to avoid negative consequences. The most important issue is to ensure the safety of food products, to protect the health of consumers through integrated management, to conduct audits for food safety, as well as to manage risks during production. Different food hazards unite several groups. The risk assessment in each group includes three main criteria: severity, frequency of occurrence, and time of onset of the adverse effect. Characterizes the type of effect that causes the severity of the danger, ranging from poorly expressed and temporary discomfort to more serious but reversible consequences; or irreversible consequences, including death. The frequency of occurrence indicates the number of events or the intensity of this effect. The effect of the hazard from the time of the hazard to the immediate onset of the effect reflects the time of onset of the immediate effect. Estimating the amount of these three criteria presents known difficulties in many cases. Only in some cases it is possible to observe a person directly. Often there is only data based on fractures or indirect epidemiologies and other systems of analysis. However, it is possible to give a relative risk assessment for different areas of food security and to get an overview of the whole problem by analyzing each individual area. Types of threats are divided into unequal groups according to the degree of risk - from maximum to minimum risk:

- threats of microbial and viral origin;
- dangers or deficiencies associated with an excess of nutrients in the human diet
- threats from the external environment with foreign compounds associated with food contamination;
- hazards of natural origin, conditioned by the characteristics of the chemical composition of natural raw materials;
- dangers associated with social toxicants: smoking, alcohol, drugs;
- hazards of food additives used in food production technology.

To reduce risk exposure, a small business needs to develop a culture of risk management. However, unlike other types of modern business entities, small businesses usually have a minimal administrative apparatus. Even so, some small businesses have implemented a food safety system in accordance with HACCP principles. They do not have a narrowly specialized manager in their staff, as well as personnel in strategic, financial, operational or risk management. Only a few local small businesses today have access to outside consulting services to provide advice in this area. In this context, the issue of effective risk management is usually left to the head of the enterprise or a small group of managers. They are usually not risk specialists and do not spend much time on this issue. Often, such companies do not have sufficient resources to deal with the consequences of risk realization, as well as limited credit resources and lack of financial support from the state. Hazards in food can occur at any stage of the food chain, so adequate management of the entire food chain is critical. Food safety is ensured through the joint efforts of all parties involved in the food chain. According to the assessment of health risks, research can be conducted within the HACCP system. This system provides control at all stages of food production, where dangerous situations may arise, at any point in the production process, storage and sale of the product, and is mainly used by food producers. In this case, special attention is paid to the critical points of control that the types of risks associated with the use of food can be prevented, eliminated and reduced to an appropriate level as a result of targeted control measures. To implement the HACCP system, manufacturers not only research their own products and production methods, but also apply this system and its requirements to suppliers of raw materials, auxiliary materials, as well as wholesale and retail systems.

The main purpose of the HACCP system is to ensure the production of a safe product through the detection of hazards and proper control. This system provides control at all stages of the food chain, at any point in the production process, storage and sale of the product, where dangerous situations may arise. In this case, special attention is paid to the critical points of control, that all types of risks associated with the use of food are dangerous to human health. And in this case, they can be prevented, eliminated and reduced to an appropriate level as a result of purposeful control measures. The HACCP system is a state-of-the-art management system that routinely identifies specific risks and control measures to ensure food safety. Hazard analysis is the process of collecting and evaluating information about hazards and the situation that led to them, and is important from the HACCP security perspective. Hazard analysis is part of the HACCP system. Its goal is to identify hazards in the production process, prevent or reduce hazards to an appropriate level, and manage hazards. In modern systems of official food control, the main responsibility for product safety passes from the state regulatory body to the producer. After that, the manufacturer is fully responsible for the safety of the product. The role of the public authority is to ensure that these obligations are met by the producer and, if necessary, to enforce them. The task of the manufacturer is to ensure the safety of products with the following elements: to take measures to warn of the production of dangerous products, not to place dangerous products on the market, not to mislead the consumer. In most developed countries, the manufacturer must also provide control and, if necessary, remove the product from the market in a timely manner.

3. ESTABLISHMENT OF CRITICAL CONTROL POINTS

In today's market economy, adherence to the principles of consumer satisfaction is a key issue for food producers. First of all, continuous improvement of quality is carried out in strict compliance with the relevant legislation to ensure product safety for consumers. According to experts, there is a comprehensive policy in the field of food and nutrition to shape the health of the population: it is the provision of optimal nutrition and stable safe food. Food safety is a global target, and weakening food safety controls could lead to bankruptcy. At present, the range of food products is constantly expanding, the nature of food is changing. Under the new economic conditions, the enterprise processing raw materials is in the process of formation and improvement of technological processes, which adversely affects the quality of food products. Food production techniques are a more complex process and require strict adherence to technology and production discipline, hygienic rules. The existence of constant change makes there an urgent need to develop new tools and management methods to help the enterprise become more efficient. The development of recommendations for management and risk assessment in the face of uncertainty can be seen as a prerequisite for the sustainable development of the enterprise. The application of statistical methods in risk assessment in control and organizational practice allows to increase the quality of products and social processes, productivity and occupational safety life cycle processes, the effectiveness of conservation and rational use of natural resources.

4. CONCLUSION

Food safety hazards may arise at certain times, and at any stage of the production cycle, it is imperative that control procedures be applied in accordance with established requirements. Today, the term "quality product" for the consumer refers to a safe product with health-promoting features and visual appeal. Food safety has a special meaning and it should be noted that it is a special object of sanitary and hygienic control. Sanitary rules characterize food safety as the absence of risks to the health of present and future generations, defined by the requirements of sanitary-hygienic rules, hygienic standards with the compatibility of life and food.

Food safety can be described as the absence of mutagenic, carcinogenic toxins or other ineffective effects of products on the human body. The creation of safe conditions is guaranteed by adhering to regulated levels of storage of contaminants and other substances that pose a threat to health. The organization of the production process itself is of special importance. One of the ways to organize production is to determine the scheme of the technological process. Determining the technological scheme in accordance with the requirements of the technological instructions relevant to the production of a particular type of product allows you to look at each operation separately, to create their sequence in a single technological process and determine what is necessary. Not only producers but also state regulators are responsible for ensuring food safety control. Ensuring the safety of food products that include components of such a system is the most effective means of protecting consumers. Examples of these tools are regulatory framework, conformity assessment, control system, metrology and market control. This paper discusses the HACCP system (HACCP - Hazard Analysis and Critical Control Points) and its application. HACCP is a food safety management system. It provides control at all stages of food production, every point of the process of production, storage and sale of products. A dangerous factor in the HACCP system is a biological, chemical or physical factor that can reasonably cause illness or damage if it is not controlled.

ABSTRACT

The article discusses the issues of choosing the optimal cost accounting method in a higher educational institution, which enables effective management decisions in a higher educational institution (HEI) to improve the quality of education and the competitiveness of the institution. Scientific novelty lies in the development of methodological foundations for the development of an optimal cost accounting method in a HEI. Applied value - Within the framework of the study, an optimal method of cost accounting in the system of a HEI was proposed, the main stages of the development and implementation of this method were described. Economic efficiency of work - The development and implementation of an optimal cost accounting method in a HEI will improve the quality of the provision of educational services, thereby increasing the competitiveness of a higher educational institution at the world level.

Keywords: *management accounting in HEI, expenses, cost accounting methods, cost calculation, cost rationing*

1. INTRODUCTION

Factors like establishment and functioning of transnational corporations, increased concentration of capital and competition, expansion of production have significantly changed the requirements for maintaining and organizing accounting. At present, the separation of such accounting subsystems as financial accounting, tax accounting and management accounting is already firmly entrenched in commercial accounting. Budget accounting, as an integral part of the national accounting system, cannot exist in isolation from modern trends in the development of accounting science. However, most government agencies are limited to budgetary accounting. The introduction of the principles of management accounting is still a fundamentally new element of the organization of accounting for them and requires a long preparatory process associated with the development of methodological recommendations, retraining of personnel and analysis of the experience of specialists who have taken the first steps in the formation of their own management accounting system. Building management accounting is a complex process related to solving a number of problems, both organizational (administrative) and problems linked to usage of accounting software. The adoption of adequate management decisions by the leadership of HEI in these conditions is largely associated with the efficient operation of the mechanism for planning, accounting, analysis and control of income, expenses and performance results.

2. RESEARCH

To determine the most effective method for calculating the cost of educational services and operational costs of the HEI (in the context of the forms of training and specialties) we examined the existing methods of accounting for costs.

The process-based costing method is used in the extractive industries, as well as in the energy sector. Also, the process-based approach can be applied in processing industries with a simple technological production cycle, for example, in asphalt plants, in the cement industry, etc. [1]. Thus, this method is characterized by a mass type of production, a limited range of services and products, a short production cycle, a single unit of calculation and measurement, the absence or small amount of work in progress. As a result, in the case of the process-based method, the service provided or the products produced acts as both a costing object and a cost accounting object simultaneously. In relation to the activities of universities, this method cannot be used, since the cycle of delivering the services in the field of education is long: from four to six years. One of the most common methods of cost accounting and costing is considered the normative method, which represents following mechanism: certain types of costs are accounted for at the current rates provided for by normative calculations. With the normative method of costing and costs accounting, the operational accounting of deviations of actual costs from current norms is carried out separately, indicating the place of formation of the causes, deviations and the executors of the formation. This method takes into account the changes that are made to the cost rates as a result of the introduction of technical and organizational measures, and also establishes the level of impact of such changes on the cost of the service [2, p. 177]. Rationing of costs of higher educational institutions is required for calculating the cost of educational services, determining deviations in standard and actual costs, as well as researching the reasons that resulted in such deviations. Crossover calculation as a costing and cost accounting method is used in industries with continuous and batch production, in which products go through all 4 stages of production sequentially. The object of calculation with the crossover method is the product of each completed production stage, including those in which several products are received simultaneously. The essence of crossover (line-by-line) calculation is that direct costs are reflected in the current accounting not by type of product, but by stages of production. Thus, the stage of production is considered the object of accounting. Regarding the use of this method for calculating the cost of educational services and accounting for costs in the HEI, it is worth noting that there are no production stages at the HEI. In the educational process, a stage is considered a half-year (semestr), according to the results of which students take exams. Thus, this method cannot be applied in HEIs to account for the costs of providing educational services. The next method of cost accounting and costing is the order method. With this method, the object of calculation and accounting is a separate production order, which is issued for a predetermined quantity of products. Accounting calculation is only made after receiving the order. Simply put, with the order method, the costs are attributed to each individual order. In the case when the order is represented by a single item, then its cost is determined by summing up the costs. As a rule, when using the order-based costing and cost accounting method, the product / service is manufactured for individual customers and in the quantity determined by the order of this customer. With regard to higher educational institutions, the use of a order-based method for cost accounting and costing of educational services is possible. In 1936, J. Harrison, an American economist, created the doctrine of "direct costing" for cost accounting. According to this method, only direct costs should be included in the cost price. With regards to this method, only variable costs are included in the cost of production, and fixed costs are written off to the operating result and accounted for separately. Applied to HEIs, this cost accounting method should be used in institutions where training is carried out in one specialty and several forms of training, or in one form of training and several specialties. The full costing method assumes that all production costs (both fixed and variable) are involved in calculating the cost of production. When using this method, only administrative, general and selling expenses are considered recurring. This method allows you to get an idea of all the costs that the university incurs in connection with the provision of educational services. But cost of educational services is calculated only at the end of the reporting period, which is why the use

of full costing does not allow timely and effective cost management. Another method for costing and costs accounting is ABC method - a method that is a two-stage method of allocating management and supporting costs of the organization. In universities, the use of this method is aimed at solving management accounting problems, where the share of direct costs is lower than indirect costs. The essence of the ABC-method consists in the distribution of the indirect costs of the educational institution for the business process, and then for the objects of calculation. In our opinion, the most effective method for solving these issues in the activities of higher educational institutions is cost regulation, i.e. development of progressive norms. When rationing the costs of the HEI, all structural divisions of the institution should be included in this process. For example, the management body of the university, represented by the rector or his deputy, will be in charge of the management and coordination of the process, as well as its organization and control; the accounting department will be responsible for monitoring compliance with established standards; the planning and economic department of the university will be engaged in the development and revision of the relevant standards. F.R. Khamidullina identified the following approaches and methods of rationing the costs of universities [3, p. 58]:

- 1) a structural approach, which represents the study of a phenomenon by means of its decomposition into its constituent structural elements, the study of their interaction;
- 2) a systematic approach, which consists in studying the phenomenon as a dynamically developing unit, analyzing it in all its dependencies;
- 3) calculation method, which is based on calculation data for all norm-forming elements.

The process of rationing the costs of educational institution has its own specific features, which depend on the nature of the services provided and the type of funds used. The rates of expenditure of funds of a higher educational institution will be attributed by:

- the methods of establishment - for estimated costs;
- the level of aggregation - for group and individual expenses;
- the level of detail - for aggregated and primary costs;
- the nature of the change in consumption - for absolute costs;
- validity period - for annual expenses.

The data on the available funds of the educational institution will serve as the basis for the rationing of indirect and direct costs. To determine the direct costs of the university, you can apply the methodology for calculating the cost of educational services. The following formula determines the rate of expenditure on wages of the professional-teaching staff of their specialty:

$$\Sigma P = T_{\text{ч}} * n ,$$

where n - is the number of hours of study load in accordance with the curriculum;
 $T_{\text{ч}}$ - is the average hourly tariff rate;
 ΣP - is the rate of expenditure on the salaries of the teaching staff in the specialty.

At the same time, the deviation of the normative-planned from actual consumption for this variable is influenced by such factors as:

- 1) Change in the average hourly rate of the professional teaching staff:
 - as a result of changes in the size of wages;
 - as a result of changes in the structure and composition of the professional- teaching staff.
- 2) Change in the number of hours of study load in the specialty.

As for the regulation of the indirect costs of the HEI, it is more laborious. If in its traditional form the normative method is aimed at reducing costs, then in HEI, an increase in costs is not always considered a negative trend. In higher educational institutions, it is worth adhering to the following rule: the higher the quality of costs, the more effective the result. Thus, there is a need to allocate productive costs, an increase in which is considered a positive trend, as well as the allocation of unproductive costs, an increase in which will be considered a negative trend.

In this case, the productive costs include:

- 1) direct costs: costs of operating technical teaching aids and their maintenance, costs of maintaining technical and technological equipment, scholarships for students, costs of salaries of management and professional teaching personnel;
- 2) indirect costs: expenses for the implementation of sports and recreational activities and cultural events, educational expenses, expenses for lectures and the publication of scientific papers.

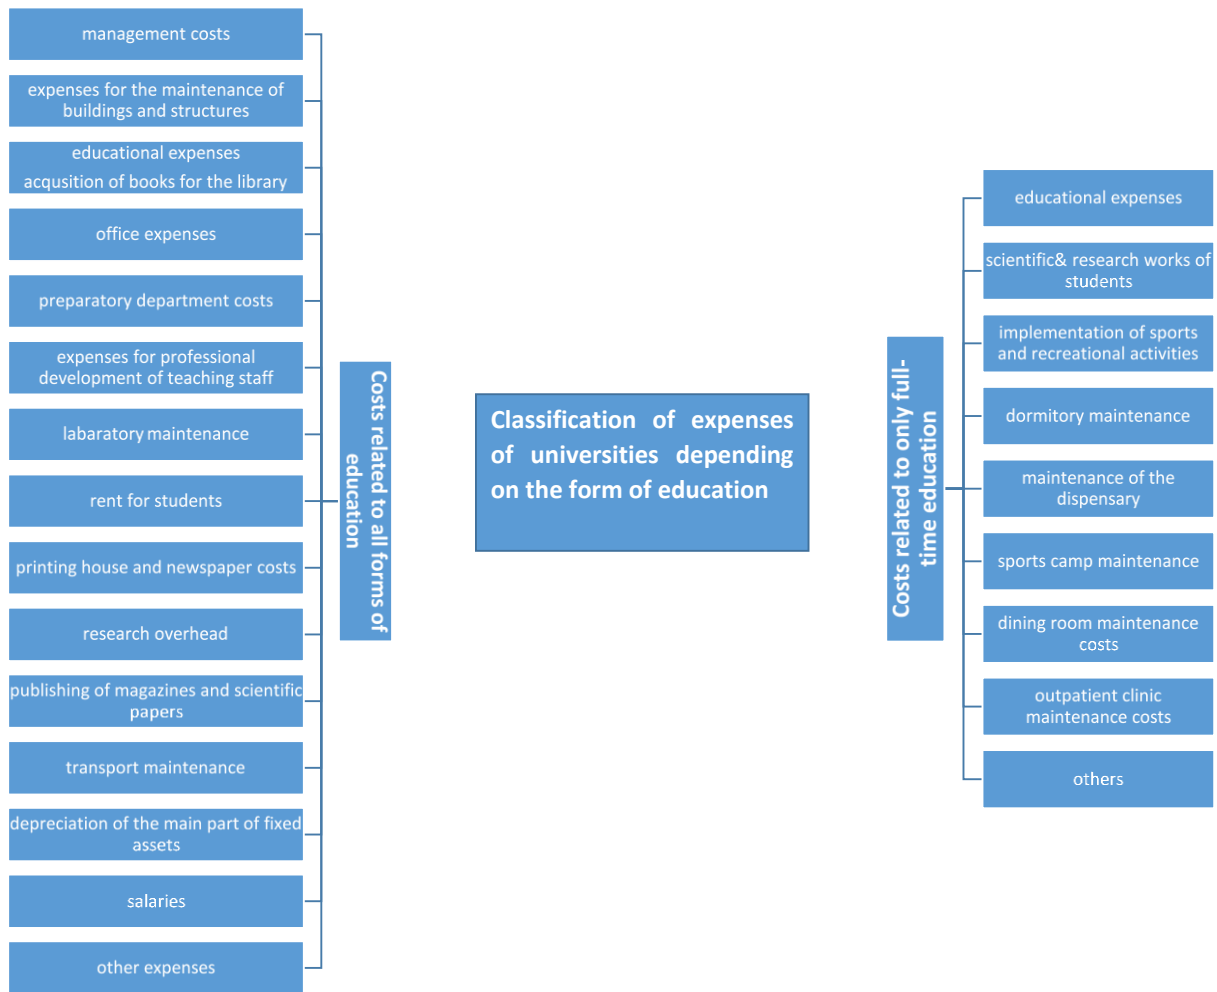

The unproductive costs include: transportation costs and the cost of maintaining the administrative staff. Rationing of costs of higher educational institutions is required for calculating the cost of educational services, determining deviations in standard and actual costs, as well as researching the reasons that resulted in such deviations. Based on the existing methods for determining the cost of educational services, we have developed a new methodology, which is based on the principle of calculating the cost of educational services by items: the costs of the university are classified into indirect and direct costs. The direct costs of the university include costs that can be immediately transferred to the cost price. In particular:

- expenses for the maintenance and operation of technical and technological equipment;
- scholarships;
- salaries of management personnel;
- salary of the teaching staff [4, p. 14].

Based on the proposed methodological approach, the direct costs of a higher educational institution will be determined by discipline blocks, forms of education, specialties, and types of occupation. The indirect costs of the university are related to the functioning of the infrastructure of the university, they include the cultural, household, social costs and costs for production services of the educational process; administrative expenses. As a result of the fact that the direct costs of universities can immediately be included in the cost price, this allows avoiding inaccuracies in their assignment to the object of calculation. As for the indirect costs for individual objects, such accuracy cannot be observed. Indirect costs are usually allocated to the costing object in proportion to the determined direct costs or to another distribution basis. Indirect costs are differentiated on the basis of percentages of costs for all forms of education and full-time education, due to the fact that indirect costs are different for different forms of education. Let us present the classification of the costs of a higher education institution depending on the form of education in Figure 1.

Figure following on the next page

Figure 1: Classification of expenses of universities depending on the form of education (compiled by the author of the study)

Consequently, a standardized approach to costs accounting and costing of educational services allows you to determine the cost in the context of specialties, forms of education and levels of education. It is important to emphasize that on the basis of the current standards and norms, the planned indicators of the activity of an educational institution, it is possible to determine the standard cost of educational services, while annual accounting data can help to determine actual cost. In our opinion, the standardized method of costs accounting and costing of educational services requires additions:

- in terms of determining the salary of the professional - teaching staff, which is due to the change in the salary system;
- in terms of determining the salary of management personnel. The salary of management personnel depends on the salary of the teaching staff, in particular, on the ratio of the number of management personnel to the number of professional - teaching staff and the ratio of management personnel's salary to the salary of the teaching staff;
- the percentage of overhead costs is of a normative nature. Basically, the indirect costs of the university are provided by extrabudgetary funds, as a result of which the level of interest and the structure of overhead costs in different universities are different. Consequently, the percentage of overhead costs is not of a normative nature, in each university it should be determined individually;
- in terms of determining the costs of operation and maintenance of technical training facilities.

The costs of technical training aids are determined as follows:

$$3TCO = T_{TCO} * P_{TCO} / Q_{cp},$$

Where,

P_{TCO} - is the cost of 1 hour of operating time of technical teaching aids in a discipline;

T_{TCO} - is the number of hours of using technical teaching aids;

Q_{cp} - is the average number of students in a class using technical teaching aids.

3. CONCLUSION

Since in HEI in the implementation of the educational process of a specific discipline there is no planning for the use of technical teaching aids, it is not possible to determine this indicator. In the course of the study, the optimal method of management accounting of expenses in universities was substantiated, which reflects the structure of expenses of an educational institution - a standardized method for recording income of a university. A standardized (normative) approach to costs accounting and costing of educational services allows you to determine the cost in the context of specialties, forms of education and levels of education. It is important to emphasize that on the basis of the current standards and norms, the planned indicators of the activity of an educational institution, it is possible to determine the standard cost of educational services, while annual accounting data can help to determine actual cost.

APPLICATION OF THE BANCASSURANCE MODEL IN AZERBAIJAN: PROBLEMS AND PROSPECTS

Kamal Ibrahimov

*Doctoral student at the Department of "Finance and Financial Institutions",
Azerbaijan State University of Economics, Azerbaijan
az.kamal.ibrahim@gmail.com*

ABSTRACT

The article explains the essence of the bancassurance model, comments on the results of the analysis of the current state of the banking and insurance market in the context of world experience and notes the main trends in its development. The coverage of some problems of the Bancassurance model is of particular importance. The article examines the changes in the intersection of banking and insurance segments of the European financial market. The interaction of banks and insurers is important for modern financial markets. One of the modern forms of interaction between banks and insurance companies is bank-insurance synthesis, ie the process of integration of banks and insurers for the purpose of selling both insurance and banking products. At the same time, there is a merger of sales channels, insurance of banking risks, access to each other's internal financial resources. The type of bank insurance, which is quite widespread in the West, has not developed in Azerbaijani banks. There are several reasons for this. First, the relatively small size of the business of Azerbaijani banks makes such insurance very expensive for banks. Second, the lack of experience of Azerbaijani insurance companies severely limits the range of possible participants in such insurance by insurers. Finally, the lack of legislation and regulations for Azerbaijani banks to protect against risks, as well as relevant business traditions, does not force banking institutions to take out such insurance. Due to low demand from customers, the share of financial and commercial risk insurance contracts in the portfolios of insurance companies is also small. The main risk is the high level of dependence of insurance companies on the banking sector. The type of bank insurance, which is quite widespread in the West, has not developed in Azerbaijani banks. Today, the regulator is tasked to increase the share of insurance premiums in non-oil GDP by 1.8% (against the current 0.8%) by 2020. There is a need to create new insurance products in order to expand the insurance market, cover the uninsured population with insurance products, increase access to financial services and support the diversification of the economy. The share of insurance premiums is expected to reach 1.4% by the end of 2021. Another problem in the insurance market is the lack of services offered. While more than 300 insurance products are used in the world, only 40 insurance products are used in Azerbaijan. Thus, our research suggests that there are a number of serious problems that banks and insurance companies need to address in the application of the "bank insurance" model at the current stage of development. In our opinion, the effective development of the "bank insurance" model requires a common interaction of regulators, banks and insurance companies. We believe that raising the level of awareness about the need to apply the "bank insurance" model will significantly activate the "bank-insurance" model in Azerbaijan and raise it to a higher level of quality. The purpose of the article is to clarify the nature and principles of organization of the banking insurance market, to explain the interaction of its participants, to identify the advantages, disadvantages, modern trends and conditions necessary for the future development of this process in Azerbaijan. This topic is studied for the first time in the Azerbaijani economic literature.

Keywords: *Financial market, bank-insurance market, banks, insurance companies, sales channels of insurance products, problems of bank-insurance market*

1. INTRODUCTION

The interaction of banks and insurers is important for the modern financial market. But only those insurance companies that are ready for innovative types of cooperation and offering unique conditions for conducting joint business will be able to obtain advantages in building long-term relations with banks. It is also necessary to propose the creation of new, more profitable, types of financial corporations. For a mutually beneficial partnership, diversify the line of products that are profitable for both the insurer and the bank. One of the modern forms of interaction between banks and insurance companies is bank insurance - the process of integrating banks and insurers in order to sell both insurance and banking products. In this case, there are: combination of sales channels; bank risk insurance; access to internal financial resources of each other. This achieves a synergistic effect. Insurance mechanisms make it possible to transfer to the insurer almost all the risks that may arise in the course of banking activities. Comprehensive insurance of banking risks is widespread abroad, and sometimes even mandatory. This type of insurance allows you to "close" a significant part of the risks arising in the course of banking. It is an important component of a comprehensive risk management system for any bank focused on long-term development and caring for its image and reputation. For the Azerbaijani bank insurance market, this is becoming an urgent problem in the near future.

2. CONTENTS OF THE CONCEPT OF "BANK INSURANCE"

For the first time the term "bank insurance" appeared in France, where cooperation between commercial banks and insurance companies began earlier than in other European countries. It was originally used to refer to the simple distribution of insurance products through a banking network. Recently, the term has been used to describe all kinds of relationships between the banking and insurance industries [Бабенко (2016).p.12]. The process of providing insurance services and selling insurance products through banks is called bank insurance (the term "bancassurance" was introduced in France). This was facilitated by the adoption of regulations allowing banks and insurance companies to hold significant stakes in each other, subject to the preservation of legal independence [Басова, 2012]. In the scientific literature, the concept of "bank insurance" is considered in a narrow and broad sense. In the studies of the Expert RA rating agency, bank insurance is understood as the sale of insurance products through the bank sales channel, as well as insurance of the risks of the banks themselves. This is bank insurance in the narrow sense, from a functional point of view. In our opinion, this should also include specific services related to compulsory insurance of individual deposits that they have in commercial banks. It should not be forgotten that the very concept of "market" presupposes the presence of sellers and buyers, and not only insurance services, but also services offered by banks. Therefore, in the narrow sense of the term "bank insurance", from our point of view, it would be fair to include banking services, the consumers of which are insurance companies: settlement and cash services and services for the placement of temporarily free funds of an insurance company [Кудрявцев,2015]. In the work of N.V. Skvortsova and S.A. Urmatskikh notes that the term "bank insurance" should be understood as the process of integration of banks and insurance companies in order to sell both insurance and banking products, combining sales channels and the partner's client base, insurance of the banks' risks, as well as access to each other's internal financial resources [Скворцова, 2014]. In accordance with this classification, the following definitions are proposed: bank insurance in the narrow sense is a relationship associated with the implementation of banking and insurance services, in which banks and insurance companies can act as end consumers, and, accordingly, sellers, and as intermediaries in the sale these services; in a broad sense, bank insurance can be viewed not only as a relationship regarding the implementation of banking and insurance services, but also as a relationship between members of affiliated structures (business groups, financial and industrial

groups, etc.). “Bank insurance is a new organizational and functional structure in the modern financial market. The interpretation of the term "bank insurance" can be approached from two points of view. From an institutional point of view, bank insurance is a way of organizing cooperation between banks and insurance companies. From a functional point of view, bank insurance is the organization of a system of cross-selling of banking and insurance products through one point of sale, mainly through a network of bank branches and bank branches [Демченко, 2014]. Thus, the conducted research has shown that currently there is no common understanding of the term "bank insurance". At the same time, there are four main approaches to defining its content:

- insurance of risks of commercial banks;
- distribution of insurance products through the banking network;
- distribution of both banking and insurance products to one client base;
- integration of all relations between a commercial bank and an insurance company.

According to the authors, bank insurance should be understood as the process of integration of commercial banks and insurance companies in order to sell both insurance and banking products based on combining sales channels and the partner's client base, insuring the risks of the banks themselves, as well as access to the partner's internal financial resources. In addition, bank insurance should be based on the principles of strategic partnership:

- equality, respect and consideration of the interests of the parties;
- the parties' interest in participating in the contractual relationship;
- the unity of the structure and functions of management, etc.

3. BANK INSURANCE AS ONE OF THE MOST IMPORTANT COMPONENTS OF THE BANKING SYSTEM IN DEVELOPED COUNTRIES

Bank insurance is one of the most important components of the banking system in economically developed countries. The level of development of bank insurance in individual countries and geographic regions is due to:

- existing historical traditions of organizing financial relations;
- national legal restrictions;
- new conditions for the functioning of banks and insurance companies in a relevant external environment.

The modern centers of bank insurance are developed countries in such regions as Western Europe (France, Germany, Great Britain, Spain, Italy), certain Asian countries (Japan, Singapore, Hong Kong, Thailand, Malaysia). The last decade has been marked by the rapid spread of bank insurance models in South America, East Asia, Central and Eastern Europe, and South Africa. Over the past ten years, in France, Spain, Portugal, Italy and Belgium, the sale of insurance products through banks has become one of the most successful areas of the financial business. About 90% of European banks are involved in bank insurance. In France, almost 100% of banks carry out bank insurance operations. Most of the insurance products sold are related to the life insurance of bank customers. For example, in Spain, bank insurance provides more than 65% of collected life insurance premiums, in France - 60%, in Belgium and Italy - 50% each. It should be noted that bank insurance is not practiced in Germany and the USA due to legislative restrictions on the joint activities of banks and insurance organizations. In a number of developing countries, such as Argentina, Chile, Brazil, Mexico, bank insurance is developing through the interaction of foreign financial institutions and banks with an extensive branch network. In contrast to the countries of Europe and the United States, the domestic bank insurance model began its formation during the immaturity of the banking and insurance spheres, which determined the goals of this cooperation different from those in the West.

In 1985, British and French insurance companies formed the first strategic alliances with banks: the British insurance company Standard Life invested in the Bank of Scotland, and the French GAN acquired Credit Industriel et Commercial. In addition, in 1980 in France, Banque Nationale de Paris Paribas created its own insurance company Natio Vie. This form of banking insurance integration has justified itself, which is evidenced by the efficiency of the Paribas group, which still occupies a dominant position in France. At this stage, there is an accelerated development of bank insurance in Western Europe: during 1986–2018. In France, the income of banks from the sale of life insurance products increased 12 times, an average of 28% annually. According to the European insurance and reinsurance federation, for 2008–2018. the most efficient concept of bank insurance functioned in the financial market of France, where the share of sales of insurance products through the banking network of branches and branches reached more than 60%. The development of bank insurance in the countries of Central and Eastern Europe takes into account the principles of the European model. However, with the gradual entry of foreign banks and insurance companies from the USA, Japan, China, Australia into this market, the basic conditions for organizing integration interaction between financial intermediaries are being transformed - the North American and Asian experience is increasingly taken into account. In most countries of Western and Northern Europe, the bank insurance market is underdeveloped or developing - the share of bank insurance in the total volume of life insurance premiums ranges from 10–47%. Only in France has the analyzed indicator over the past four years exceeded 60%. In the countries of Southern Europe, the bank insurance market is considered developed. The largest share of bank insurance in the total volume of life insurance premiums is noted in Portugal (74.1% in 2013), Spain (71.4%); Italy (71.9%). According to the European insurance and reinsurance federation, the largest share of non-life bank insurance is observed in Portugal (15.3%), France (12%) and Spain (10.2%). Thus, bank insurance in developed European countries is mostly aimed at combining life insurance banking services. In the United States, consumers generally do not associate banks with sales of insurance products, although there is a trend towards high rates of life insurance sales through the bank network. Collaboration is largely based on general sales agreements. The sphere of bank insurance is traditionally regulated in the United States: the Glass-Steagall Act has been in effect since 1933, and the 1956 restriction was supplemented by the Bank Holding Companies Act. The outlook for bank insurance has increased since the adoption of the Gramm-Leach-Bliley Act, which replaced the Glass-Steagall Act. The reasons for the underdevelopment of bank insurance in the United States are: a high degree of fragmentation of the financial industry; restriction in the use of a single information system by several financial intermediaries; significant role of insurance agents and brokers in the financial market. The Canadian national financial market is considered to be developed. Here banks are not allowed to officially sell insurance products to their clients. Only in 1992, the country entered into force regulations that allowed banks to invest in insurance companies with significant financial resources, modern information technology support, an extensive branch network in the world. However, banks became quite serious competitors for insurance companies, as they had the opportunity to serve consumers not only of banking, but also of insurance products. This fact led to the emergence of enhanced control over the activities of financial institutions. Since 2006, banks in Canada have been prohibited from carrying out any transactions related to the sale of life and non-life insurance products. Summing up some of the results, it should be noted that the main models for organizing bank insurance are European (continental) and North American. Despite the theoretical feasibility of financial convergence and financial integration of banks and insurance companies, the extent to which the concept of bank insurance differs from country to country. This concept is being implemented at an accelerated pace in the countries of the European regions. Collaboration between banks and insurance companies in European countries is mainly aimed at consolidating life insurance banking services.

4. ANALYSIS OF THE GENERAL SITUATION IN THE FINANCIAL SECTOR OF AZERBAIJAN

Considering the development of the banking system of Azerbaijan since the early 1990s, five stages can be distinguished:

- 1) 1990-1992 - the period of formation of the national banking system;
- 2) 1992 - 1994 - a period of rapid growth in the number of commercial banks in conditions of hyperinflation;
- 3) 1995-2003 - optimization and restructuring of the banking system in the context of macroeconomic stabilization.
- 4) 2003-2014 - The transformation of the country's large foreign exchange earnings into public investment as a result of business and consumer demand, as well as optimistic expectations associated with economic growth, further increased the demand for banking services. During this period, the financial depth (GDP of assets / non-oil sector) reached 77%, and the loan portfolio increased 30 times.
- 5) "Since 2014, as a result of a sharp decline in oil prices and the economic crisis faced by trading partners, against the background of processes taking place in the country, in particular, a decrease in the rate of economic growth, institutional and structural reforms, a deficit in the balance of payments and the non-oil budget, changes in the financial and banking sectors, in Azerbaijan there was a need for a new approach to innovation and economic development of the financial services sector "[Mamedov, Abbasbeyli, 2020].

Considering the need to improve the banking sector, amendments were made to the laws in the country: "On the Central Bank of the Republic of Azerbaijan", "On banks", "On insurance of bank deposits". Thanks to the new laws, the possibility of banking control was realized, based on the Basel principles, a favorable atmosphere was created for depositors and creditors in order to strengthen the protection of their rights and interests. The use of these forms and methods had a positive impact on the banking system of the Azerbaijani state, showing its stability in times of global economic turmoil. Based on the data on the banking system for 2020, the average level of capital adequacy in Azerbaijan was 18%, while, according to the Basel methodology, the minimum level is 8%, and according to the CBA's terms, it is 12%. As of the end of May 2020, 26 banks were actively operating in the country. Of these, 2 are state-owned and 24 are private banks. Twelve banks have foreign capital. There are seven banks with foreign capital ranging from 50% to 100%. In the remaining five banks, the share is up to 50%. The country also has two local branches of the NB of Iran and the NB of Pakistan. Among the domestic banking system, based on the size of assets, three fundamental credit and financial institutions can be distinguished, these are the International Bank of Azerbaijan, Pasha Bank and Kapital Bank. The loan portfolio is distributed as follows: legal entities - 60%; consumer loans - 30%; mortgage loans - 10%. International experts note that "including the IMF and rating agencies, they believe that there is still insufficient capitalization in the banking system in Azerbaijan." The share of banks and non-bank credit organizations in the total assets of the Azerbaijani financial system in 2019 was 88 percent and 9.7 percent, respectively, and the share of insurance companies in total assets was 2.3 percent. The average annual growth rate in the insurance market, a segment of the Azerbaijani financial system, in 2010-2015 was 20 percent. In 2015, the volume of insurance premiums in Azerbaijan increased and amounted to 444 million manat [Мамедов З.Ф., Vugar Namazov. 2020]. However, the share of insurance premiums in GDP is only 0.8%. High interest rates in the banking sector are a major risk for insurance companies. The effective functioning of the insurance market in Azerbaijan depends primarily on the availability of the necessary regulatory framework. Insurance activity in Azerbaijan is quite numerous: Civil Code of the Republic of Azerbaijan, laws ("On insurance activity", "On medical insurance of citizens in Azerbaijan", "On compulsory personal insurance

of passengers"), decisions and orders of the Government of Azerbaijan, Ministry of Finance, Economic It is regulated by normative-legal acts of the Ministry of Development, as well as orders and instructions of the Central Bank of Azerbaijan. At present, 20 insurance and one reinsurance companies operate in the insurance market of Azerbaijan. 4 of them are life insurance companies and 16 are non-life insurance companies. At present, 73% (414.9 million manat) of all fees in the market fall to voluntary insurance and 27% (153.6 million manat) to compulsory insurance. The share of voluntary insurance on payments was 73.5% (137.3 million manat), and the share of compulsory insurance was 26.5% (49.6 million manat). At the same time, the fees of the ten leading insurance companies in Azerbaijan amounted to 508.99 million manat (89.54% of total insurance premiums). Supervision of the insurance sector in accordance with a risk-based approach can be beneficial in terms of building a sound financial system. The purpose of state regulation and control of insurance activity in Azerbaijan is to ensure the formation and development of an effective market of insurance services, to create the necessary conditions for the activities of insurance organizations of various organizational and legal forms, to protect the rights and legitimate interests of all subjects [Мамедов З.Ф., Vugar Namazov. 2020].

5. PROBLEMS IN THE BANK INSURANCE MARKET

We have identified and systematized the following main problems in the bank insurance market:

- costs of time and resources for the sale of bank insurance products;
- lack of desire among banks to consider new projects;
- high commission fees of banks;
- "imposing" of bank insurance products;
- inconsistency of performance indicators of insurance companies;
- inconsistency of the staffing;

We will characterize each of the listed problems and suggest ways to solve it.

5.1. Cost of time and resources for the sale of bank insurance products

Today there are a lot of financial products that are of interest to insurance companies. However, from the point of view of the bank, they are not interesting, due to the fact that it takes many times more time to sell this product than to sell one banking product. To interact with banks with insurance firms, insurance firms need to offer banks simple and technological projects. Banks cannot effectively sell the products of insurance companies, so it is necessary that insurers offer them innovative projects that only a bank can sell on the market.

5.2. Lack of interest among banks to consider new insurance projects

All insurance projects can be divided into three groups:

- 1) projects that protect the loan portfolio;
- 2) projects on which the bank can earn;
- 3) "new projects" that banks can try.

The first two groups include the most well-known types of insurance in banks - auto hull insurance, insurance of pledges of legal entities and individuals, mortgages and partnership programs. Banks do not bear risks with these projects. The "new projects" include insurance programs such as D&O, BBB (comprehensive bank insurance), insurance of crops, animals and land, Profitshare. Because of this, insurance firms need to expand the product line of bank insurance products by offering banks simple, profitable and high-tech projects.

5.3. High commissions

Banks charge insurance firms high commissions, and therefore, banks' commission income increases. The high commission is justified by the fact that bank employees do not have a sufficient level of knowledge and experience in the field of sales. Thus, the commission received is directed to cover the costs of conducting special trainings for specialists. Increasing sales is impossible without properly structured work with personnel. A bank specialist must adhere to the following principles: a clear understanding of goals, the amount of income, transparency and openness of the organization, as well as the development of professional and personal skills. Also, for the successful sale of insurance products by banks, you need to properly motivate your employees, conduct special trainings on the sale of bank insurance products.

5.4. "Imposing" of bank insurance products

When drawing up a loan agreement, bank employees often not only recommend life and health insurance, but impose the purchase of an insurance policy, while giving out a positive decision of the bank to issue a loan. However, insurance significantly increases the cost of the loan and thus reimburses the eliminated bank charges for the client. The imposition of additional services is a violation of the law, but the banks systematically neglect it. To solve this problem, it is necessary to carry out inspections more often by the Federal Antimonopoly Service.

5.5. Inconsistency of performance indicators of insurance companies

The consequences of the financial crisis have forced banks to tighten requirements for the accreditation of insurance companies. During the crisis, banks often faced defaults by some insurers. Banks began to analyze their financial stability more thoroughly, develop and implement their own methods for assessing financial stability. To analyze reliability, banks request financial statements from insurers, after which they calculate indicators that characterize the real financial condition of insurance companies. On this basis, many insurance firms question the quality of the reliability assessment methods used by banks.

5.6. Lack of standard reporting of bank insurance groups

We found that at present, there is no standard reporting of bank insurance groups, which reduces the information content about the bank insurance market. We consider it expedient to form an official website "Bank insurance in Azerbaijan", displaying the performance indicators of bank insurance groups in accordance with the regular unified reporting form for the mega-regulator in terms of sales of bank insurance products. The solution to the problem of banks' overstated requirements for accreditation and the lack of a single base for assessing insurance companies is seen in the development of a unified methodology for assessing insurance companies.

5.7. Incompatibility of technologies of banks and insurance companies

The close interaction of banks and insurance companies is hindered by weak technology, large transaction costs of establishing and modernizing IT systems. The presence of the proper software allows for the semi-automatic issuance of policies and in real time to provide information on the concluded contracts, premiums and sums insured to the insurer. It is very important to take into account the technical component so that the above cooperation is carried out without interruptions. If some information is lost, or it is assimilated incorrectly, then problems arise for all parties to the partnership. High manufacturability organizes comfortable working conditions for the bank's sellers and ensures the timely creation of reports of the insurance company.

5.8. High risks of interaction

It is important for banks and insurance companies to take into account all the risks associated with the counterparty (reputational, financial, legal, etc.). First, the separation of the legislative base from the real situation on the market is important, which causes the prompt adoption of the law "On bank insurance". On the part of the insurance company, there are risks associated with competition, pricing policy, with the risk of increased unprofitability, and even there is a risk of the bank leaving the partnership through the establishment of a captive insurer or simply an alliance with another insurance company. Banks are faced with the problem of having significant overdue debt on loans issued. To reduce the risks of banks and insurance companies, it is necessary to constantly improve the product line of bank insurance, applying a co-oriented approach to the development of new products.

5.9. Low demand of the population for insurance products

In the emerging economically unstable situation in the financial market, it is important to take into account the interests of the client. Banks are currently marketing simple bank insurance products, in particular as insurance for borrowers in consumer lending.

Strengthened development of the bank insurance market can be subject to an increase in the efficiency and quality of sales. Cross-selling must be optimized and made available to the customer. Business must be scaled up, coupled with the various interests of the bank's client: borrower, depositor, investor, etc. Research has shown that social protection of the population in Russia is at a weak level, therefore, increasing insurance coverage of citizens through bank insurance will benefit the entire society.

5.10. Low level of financial literacy of the population

The development of the bank insurance market is hampered by the low degree of development of the financial culture of the population. Insurance is often perceived in lending as a load on the loan, a surplus obligation that must be fulfilled in order to purchase a loan. However, overseas borrowers seek to hedge against the potential risks of default on a loan through an insurance program offered at a bank, or independently of a bank at an insurance firm. We consider it expedient, regularly under the control of the FAS, to consult clients in banks on the need, role and essence of insurance products.

6. CONCLUSION

Thus, our research indicates the active development of bank insurance at the present stage of development, and the presence of a number of serious problems that banks and insurance companies must solve together. In our opinion, for the effective development of bank insurance directions, common interactions of regulatory bodies, banks and insurance companies are needed. We believe that the decrease in the price of bank insurance products is mainly due to the bank commission; increasing and diversifying insurance coverage for the proposed programs; increasing customer awareness of the essence and necessity of insurance programs - all this will significantly intensify bank insurance in Azerbaijan and raise it to a higher quality level.

ABSTRACT

The purpose of the research is to study the relationship between the endowment of natural resources and the economic development of the country using the example of Azerbaijan. The presence of rich oil and gas fields and the involvement of Azerbaijan in global projects for the transportation of oil and gas led to the dominance of the gross domestic product of the oil and gas sector. Thanks to the measures taken by the government of the Republic of Azerbaijan in the 2010s to diversify the economy, the non – oil sector began to develop. The study carried out a correlation analysis and linear regression multiple analysis of empirical data, reflecting the impact of oil production, investment, employment and other indicators on the Gross Domestic Product. It was found that the availability of natural resources does not have a predominant effect on economic growth in Azerbaijan. For natural resources to be of great benefit to citizens, efficient management of natural resource export revenues is essential. The research results show that the abundance of natural resources should not impede successful economic development. The problems associated with the country's increased vulnerability to external shocks, the risk of “Dutch disease”, often associated with a strong dependence on natural resources, are quite serious, but they can be solved with the help of appropriate institutions and policies.

Keywords: *Azerbaijan, economic development, Gross Domestic Product, natural resource endowment, oil production*

1. INTRODUCTION

It seems clear that a country endowed with natural resources has natural advantages and should, other things being equal, develop faster than countries without natural resources. However, this is not fully supported by the actual data. From 1970 to 1990, the per capita income of countries lacking significant natural resources grew 2-3 times faster than in resource rich countries (Venables, 2016). In practice, there are examples of countries where hydrocarbon wealth has not led to economic growth (Nigeria, Sierra Leone, Zambia, Angola) and examples of countries that have fully benefited from their wealth (Norway, UK, Canada) (Barma, Minh, Vinuela, 2012, p.68). The presence of a large amount of natural resources is a competitive advantage, but it is important to understand that under certain circumstances the oil and gas industry turns from a locomotive of the economy into its curse (Cameron, Stanley, 2017, p.24). In Azerbaijan, the numbers of explored and industrial reserves, which are registered in the State Balance of Mineral Reserves, numerous underground water deposits, deposits of various ores of ferrous, non-ferrous and precious metals, non-metallic raw materials, construction materials, are over 450, not taking into account oil deposits and gas (Shekinski, 1995). This means that in our country there are 5.2 deposits of natural resources for every 1000 sq. km of territory. The main natural resources of Azerbaijan are oil and gas. On the territory of Azerbaijan there are some of the oldest oil fields in the world. Historically, the oil sector has traditionally been dominant in Azerbaijan. According to British Petroleum, at the end of 2019, Azerbaijan's proven hydrocarbon reserves reached 1 billion tons of oil and 2.8 trillion cubic meters of gas (World Energy, 2020). The purpose of this study is to identify patterns between the provision of natural resources, primarily hydrocarbon resources, and the economic development of the country.

The methodology was based on the correlation and regression analysis of seven independent variables, reflecting the impact of these indicators on the gross domestic product. As a result of econometric analysis, it was found that the endowment of natural resources does not greatly affect the economic growth in Azerbaijan. For natural resources to become even more beneficial to citizens, more efficient and transparent government management of revenues from the sale of natural resources is needed.

2. LITERATURE REVIEW

Jeffrey Sachs and Andrew Warner, in their article “Natural Resource Abundance and Economic Growth,” noted that between the 1970s and 1990s, economic growth rates were lower in countries that had a higher share of natural resources in their exports (Sachs, Warner, 1995). This work was one of the first to include in the study the relationship between resource dependence and some institutional elements of the economy. The theory of the negative impact of natural wealth on economic growth has been called the resource curse, or the paradox of abundance. In principle, this concept applies to all minerals, but most often they talk about the problems of countries rich in hydrocarbons (oil curse), since trade in hydrocarbons accounts for 90% of all trade in minerals (Kaznacheev, 2017). It should be noted that the concept of resource curse does not apply to renewable natural resources. For the first time, the term “resource curse” was used by Richard Auty in his work “Sustaining Development In Mineral Economies: The Resource Curse” to describe the relationship between a decrease in economic growth and an increase in resource dependence, which is expressed in an increase in the importance of a certain natural resource in the economy country (Auty, 1993). It is this position that has been discussed, rethought, criticized many times over the past 25 years. The inverse relationship between the volume of natural resources and economic growth in a country, which is clearly observed in the experience of most countries, is explained in different ways. Of course, such a contradictory situation as the deepening crisis in countries, despite the fact that the availability of rich natural resources should bring great economic benefits, could not and did not escape the attention of international organizations, large research centers and researchers. Beginning in the 1990s, a number of international organizations, major research centers and individual researchers began to investigate this contrasting situation in most resource rich countries, and such research continues today (Ploeg, 2011). However, in most cases, researchers come to the conclusion that the impact of income from rich natural (mineral) resources on the socio-economic situation of the country depends, first of all, on the quality of institutions formed in society (i.e., the effectiveness of public administration, the level of development of the judicial system, civil society, etc.), effective government performance and the level of human capital stock (Acosta, 2013). These studies show that among countries with rich mineral resources, only a few (for example, Norway and Canada) have been able to demonstrate the efficiency of using the revenues from these resources. This is due to the fact that these countries have well-established institutions (Gelb, 2010). In the 90s of the last century, the predominant version of the answer to the question of how the resource curse can negatively affect the economy became the explanation, called the Dutch disease. The Dutch disease is a negative effect exerted by the influence of the strengthening of the real exchange rate of the national currency on economic development as a result of a boom in a particular sector of the economy (Magud, Sosa, 2011). In theory, the reason for the boom is irrelevant, but in practice, the effect is usually associated with the discovery of mineral deposits or higher prices for the export of extractive industries. However, a number of studies have argued that the manifestations of the Dutch disease – the redistribution of factors of production and a decrease in the pace of technological development - are more likely to manifest themselves in comparatively developed economies. In less developed countries, where the stocks of physical and human capital, the quality of institutions, the level of infrastructure, employment remain low, income from natural resources can have a

positive effect if converted into capital accumulation, solving the institutional and infrastructural problems of the economy (Bhattacharyya, Roland, 2010). While many emerging market economies do “depend” on raw materials to varying degrees, some evidence suggests that natural resource abundance does not necessarily negatively impact economic growth and development, and indeed, it can actually contribute to growth and development (Alexeev, Conrad, 2009; Jalloh, 2013). The skyrocketing cost of a country's raw materials can boost its development if the revenues generated from this are channeled into productive savings and efficient investment (Dakshina, McComb, Schiller, 2020). As numerous historical examples show, natural resources can thus be transformed into domestic investments and, as a result, into the accumulation of physical capital, into obtaining advanced technologies, as well as into higher qualifications of specialists, thanks to the lack of opportunities for diversification of the economy, the entry of new industries into the international market, and, as a result, sustainable economic development, significantly increase (Ahmadova, Hamidova, Hajiyeva, 2020).

3. METHODOLOGY

The analysis that reveals the dependence of economic growth on the extraction of natural resources (primarily oil), employment and investment was based on the econometric model used by Balavac & Pugh (2016). This model was developed jointly with the UNEC teacher Esmira Ahmadova. According to this empirical model, GDP is used to measure economic growth. Data analysis covers the period from 2000 to 2018. The choice of this period is justified by the fact that in 2000, full – scale production and transportation of Azerbaijani oil to the world market begins. Thus, oil production from the Azeri – Chirag – Guneshli field began in 1997, and in December 1999 the first two tankers filled with Azerbaijani oil entered the world markets (Energy Charter, 2011).

The proposed model provides seven independent indicators:

- x1 – oil production, in thousands of tons;
- x2 – oil price, in dollars per barrel;
- x3 – internal investments, in million manats;
- x4 – foreign investments, in million manats;
- x5 – employment, a thousand people;
- x6 – GDP per capita, in manats;
- x7 – fruit exports, in thousands of dollars.

The choice of these variables is justified as follows: oil was taken as the main natural resource in Azerbaijan, since this resource was the basis of the country's economy for decades. To determine the dependence of GDP on world oil prices, the indicator x2 was selected. Proceeding from the fact that in the structure of the non-oil sector, most of it is accounted for by fruit exports, this indicator was also taken into account when constructing the model. According to the State Statistics Committee of the Republic of Azerbaijan, in 2018 the share of mineral fuels, mineral soil sand products in exports amounted to 90.6%, and from the non-oil sector, a large part - 3.0% - accounted for the export of fresh fruits. The analysis also examined the relationship between GDP and governance effectiveness. To calculate governance effectiveness, data from the World Bank the World wide Governance Indicators were used. However, this indicator was not adopted in the model, since the analysis showed a weak relationship between GDP and governance effectiveness, which indicates the weakness of institutions.

4. RESULTS

Correlation analysis of empirical data is shown in Table 1.

Table 1: Indicators of socio-economic development of Azerbaijan

Years	GDP, million manat*	Oil production, thousand tons	Oil price, in dollars per barrel	Domestic investments, million manats	Foreign investments, million manats	Employment, thousand people	GDP per capita, manat	Fruit export, thousand dollars

Source: The State Statistical Committee of Azerbaijan Republic

The calculations were performed using the statistical environment R. Pearson's correlation analysis is as follows (table 2):

Table 2: Pearson's product-moment correlation

	x1	x2	x3	x4	x5	x6	x7
R	0.7800	0.6263	0.9223	0.8874	0.9697	0.9982	0.8351
p-value	8.176e-05	8.176e-05	0.004111	4.04e-07	7.65e-12	7.65e-12	4.438e-09
t-statistics df	5.1405	3.3133	9.8445	7.9405	7.9405	16.374	10.88
Df	17	17	17	17	17	17	17

Source: Author's calculations using R software

As we see from Table 2, the minimum calculated Pearson's correlation coefficient has turned out to be 0.6263. Despite the fact that it is not very high, difference of this coefficient from zero is statistically significant (p-value<8.176e-05). There is a linear relationship between Azerbaijan's GDP and oil production, according to the Chaddock table.

But this dependence is not so significant compared to other indicators. A strong correlation positive relationship is observed between GDP and employment, GDP per capita, which is obvious. These indicators are statistically significant. A noticeable, but not strong, significant correlation dependence is also observed between GDP and the price of oil. A significant relationship was revealed between GDP and export of fruits. As a result of the correlation analysis, it was revealed that domestic investment has a greater impact on Azerbaijan's GDP compared to foreign investment. The results of correlation analysis make it possible to apply linear regression multiple analysis to find regression coefficients reflecting the dependence of Azerbaijan's GDP on the factors considered. As a result of the regression analysis performed in the R medium, the following regression model has been obtained:

$$Y = 91.10384 + 0.006 \cdot x_3 + 0.791 \cdot x_5 + 1.003 \cdot x_6 \quad (I)$$

(0,160) (0,003) (0,021) (0,005)

Model (I) reflects dependence of Azerbaijan's GDP on indicators such as domestic investment (x_3), employment (x_5), and GDP per capita (x_6). Based on the model, we can see that with an increase in domestic investment by AZN 1, Azerbaijan's GDP increases by AZN 6,000. With an increase in employment by 1 thousand people, GDP increases by AZN 791 thousand. With an increase in per capita GDP by 1 manat, the model shows an increase in GDP by AZN 1.003 mln. t-statistics, which test the hypothesis of the insignificance of each coefficient, have automatically been calculated. And here we see that the hypothesis that the free coefficient b_1 is equal to zero is rejected; the hypothesis that the coefficient b_2 is equal to zero is rejected; the hypothesis that b_3 is equal to zero is not rejected; and the hypothesis that b_4 is equal to zero is rejected. All coefficients are significant, which means they can be interpreted. The econometric characteristics of the model are presented in Table 3.

Table 3: Econometric characteristics of the model (I)

Parameters and quarterly data	Test results	Parameters and quarterly data	Test results
R- squared	1	DW	0,8
Adjusted R-squared	1	Akaike info criterion	-172.3
F-statistic	1.155e+06	Schwarz criterion	-167.6
p-value	2.2e-16	Residual standard error	0.002248
Skewness	-0.244411	Kurtosis	-1.054026

Source: Author's calculations using R software

The coefficient of determination of the model is quite high and is 100%. This indicates availability of functional dependence and 100% dispersion is explained by the observed independent parameters x_3 , x_5 and x_6 . Using the Fisher criterion, we check the found regression model for adequacy to the initial data. The calculated value of the Fisher criterion in model II (see table 3) is greater than the table value, at all levels of significance, which corresponds to the condition $F_{est.} > F_{table}$. Let us carry out a Jarque-Bera normality test with the null hypothesis H_0 : the distribution is normal. The result is shown below:

Table 4: Jarque-Bera Normality Test

Parameters and quarterly data	Test results
X-squared:	0.7702
p-value:	0.6804

Source: Author's calculations using R software

Jarque-Bera statistics is close to zero, which means the hypothesis of a normal distribution of residues is accepted. As a result of the study, a positive autocorrelation equal to 0.8 and multicollinearity has been found in the model residues. In this regard, dependence of per capita GDP on independent indicators has been constructed, according to the data in Table 1. As a result of the modelling, the following multiple-factor regression model has been built:

$$x_6 = 6.869369e-24 + 0,73922 * x_1 + 0,3632 * x_2 + 6,2387 * x_5 \quad (II)$$

Where x_6 is GDP per capita of Azerbaijan, x_1 is oil production, in thousand tons, x_2 is oil price, and x_5 is employment. All coefficients of model (II) are significant. It turns out from the model that with an increase in oil production by 1 thousand tons, GDP per capita of Azerbaijan rises by AZN 0.74, with an increase in oil prices by USD 1 per barrel, GDP per capita rises by AZN 0.36, and with an increase in employment per 1 thousand people, GDP per capita rises by AZN 6.24. The characteristics of this model are presented in Table 5.

Table 5: Econometric characteristics of model (II)

Parameters and quarterly data	Test results	Parameters and quarterly data	Test results
R-squared	0,9969	DW	1,6
Adjusted R-squared	0,9963	Akaike info criterion	-50
F-statistic	1607	BIC	-45.3
p-value	2,2e-16	Residual standard error	0,000
Skewness	0,4992	Kurtosis	0,0087
Heteroscedasticity	0.2763	VIF	6.11
p-value:	0.5991		3.9
			2.4

Source: Author`s calculations using R software

It should be noted that when analyzing time series, the problem of multicollinearity often arises, which is considered a frequent occurrence. This assumption requires verification. To quantify multicollinearity, we calculate VIF. Calculations showed that none of the VIFs exceeds 8, which means that multicollinearity is not observed in the model. The p-value for heteroscedasticity testing is greater than 0.5. This indicates that heteroscedasticity is absent, and homoscedasticity takes place. The results of testing for availability of autocorrelation in the model residues have showed that the model residues have a normal distribution and the Durbin-Watson statistics is 1.6. This indicates absence of autocorrelation in the model (II). As a result of the econometric analysis, a multiple regression model was built that fully satisfies the Gauss - Markov assumptions. Therefore, the estimates obtained using the model are unbiased, consistent and effective. The constructed three-factor regression model is quite adequate to the modern development of Azerbaijan and can be used to analyze and forecast the GDP of Azerbaijan.

5. CONCLUSION

An econometric analysis based on a multiple regression model has showed the relationship between Azerbaijan's GDP and employment, GDP per capita, and domestic investment. From an economic point of view, this is justified by the fact that achieving full and effective employment is inseparable from formation of human capital, therefore, from investments in education, healthcare, and vocational training (Gylfason, 2001). Thanks to government measures, the unemployment rate is reduced, and the conditions for formation of human capital are ensured, that contributes to the fullest disclosure of the country's labour potential. The positive impact of domestic investment on GDP dynamics is explained by the fact that they are directed mainly to the non-oil sector, while foreign investors are interested in oil and gas

production (Aliyev, Dehning, Nadirov, 2016; Hamidova, 2019). The analysis showed a positive, but not predominant effect of natural resource endowment on the level of GDP per capita. In accordance with the obtained result, it can be noted that natural resources themselves do not bring harm or benefit to economic development. The result of their use depends on complementary factors, the level of education and the quality of institutions that reliably protect property rights. In the case of insufficient protection of property rights, the efforts and costs of over diversifying the economy may be ineffective. However, despite investments in infrastructure and human capital, a diversification strategy that ignores institutional issues is likely to fail. Investing in infrastructure can help companies reduce costs, but does not guarantee ownership of the profits earned. Therefore, if the development of infrastructure is not complemented by an improvement in the institutional environment, the result of infrastructure costs may be the emergence of infrastructure facilities alone, without the expected increase in investment in the creation and development of modern companies. Investing in infrastructure can help company's lower costs, but does not guarantee ownership of the profits earned. Therefore, if the development of infrastructure is not complemented by an improvement in the institutional environment, the result of infrastructure costs may be the emergence of infrastructure facilities alone, without the expected increase in investment in the creation and development of modern companies.

PROBLEMS OF FORMATION AND DEVELOPMENT OF ECOLOGICAL TAXATION

Leyla Mehdiyeva

*Associate Professor at Azerbaijan State University of Economics (UNEC),

ABSTRACT

Currently, there is no unity of approaches to the definition of the concept of environmental tax, the modern understanding of the essence of this type of payment does not have uniform, clearly formed semantic boundaries. This means that the formation of such borders is the task of every state. The purpose of the study is to study the formation and development of an effective ecological taxation. Because, an effective system of environmental taxation is one of the main instruments of public policy, which has many advantages compared to traditional methods of environmental regulation and other instruments of environmental policy. The main advantage of taxes and other market instruments in comparison with traditional methods of environmental regulation, such as standards, quotas, prohibitions, is efficiency. In general, efficiency means that the taxpayer can achieve the same environmental effect at a lower level of his costs or achieve a greater environmental effect at the same cost level. It is primarily about establishing a different tax burden depending on the extent of environmental damage caused by the activities of the taxpayer. Taxation becomes objective when the one who pollutes the most and pays the most. It is also important to note that the transition to environmental criteria in the taxation of transport does not eliminate the need to take into account the wear of the roadway, which actually takes place. Abroad, this is the purpose of the heavy vehicle tax, which is usually calculated depending on the indicators of the weight of the car, as well as the number of axles of rotation

Keywords: *taxes, government, economy, finance*

1. INTRODUCTION

The development of the tax system should be carried out in the direction of its greening based on the recognition of taxes as significant instruments of economic and environmental policy. This, in turn, requires the development and adoption of measures necessary for the implementation of the functions of the tax system, which contribute to the protection of the environment and the preservation of the health of the population and therefore are of great socio-economic importance for the state. Environmental taxes also have such inherent features as: flexibility, fiscal capacity, impact on consumption, transparency and price predictability. These features provide the advantages of environmental taxes over other environmental policy instruments.

2. THE ESSENCE AND PURPOSE OF THE ENVIRONMENTAL TAX AND ITS RELATIONSHIP WITH THE ENVIRONMENTAL POLICY OF THE STATE

The environment affects how people live and how society develops. It follows from this that an environmental impact can be considered negative if it worsens the living conditions of people. Accordingly, the ecological problem is not the loss of nature in itself, but the loss of man arising from the violation of the quality of ecology. Environmental payments are diverse, but, despite the differences, they have common features, which makes it possible to speak of a particular payment as environmental. In world practice, the concept of environmental tax is usually disclosed through the definition developed by Eurostat for the purpose of international statistical accounting.

In accordance with this definition, an environmental tax is a tax, the tax base of which is the physical characteristic of an object recognized as having a negative impact on the environment, or another object associated with it. Such a tax base can be, for example, the volume of emissions of pollutants. The purpose of the tax, its relationship with the environmental policy of the state and, accordingly, the direction of spending its revenues also today play an important role in answering the question of whether a particular tax is environmental. In addition, in modern conditions, the environmental tax is not considered as compensation paid to those who suffered from pollution, and its size does not correlate with the losses of the victims. An environmental tax is a tax, the amount of which depends on the level of environmental damage caused by the use consumption of the object of taxation and accounted for through individual elements of the tax or their combination. This definition brings environmental taxes closer to their original economic meaning, since it is based on the rule: who pollutes more, pays more tax. If this rule is not observed, then the tax, in our opinion, cannot be considered truly ecological. In order for a tax to be considered environmentally friendly, it must pursue objectives related to environmental protection. And for this it is necessary that it fulfill its not only fiscal, but also regulatory function, which is manifested in the creation of incentives for taxpayers to use those taxable objects that are distinguished by the best environmental indicators. This effect is achieved by differentiating the tax burden in proportion to the level of pollution, which in turn can be achieved only when the amount of the tax depends on the amount of environmental damage caused by the taxpayer. Thus, the original, or classical, concept of an environmental tax is based on the fact that such a tax is intended to:

- in monetary terms, reflect the damage caused by the taxpayer to a person or a set of persons as a result of environmental pollution;
- to compensate for the losses of these persons, that is, to perform the function of monetary compensation for damage.

If we go back to the modern definition of an environmental tax given by Eurostat, then there is only one condition that is sufficient for the tax to be recognized as an environmental tax - it is the presence of an object of taxation that negatively affects the environment. That is, it is enough to introduce a tax on any source of pollution, and such a payment will be considered environmental, regardless of the order of its calculation and the direction of spending its proceeds. A situation arises when the essence of the environmental tax is extremely simplified. Environmental taxes related to road transport include excise taxes on fuel, excise taxes on vehicles and transport taxes. But it is precisely excise and transport taxation that is now the main source of increasing the environmental significance of the tax system. Excise taxes on transport and fuel, transport tax form a field for tax transformations. These transformations may initially have different goals, but their main essence is to have an economic impact on the behavior of the taxpayer. And in terms of fuel and vehicle taxes, this is about creating incentives for the taxpayer to use clean fuels and clean vehicles. Summing up, it should be noted that the reform of taxes on an environmental basis is the greening of the tax system, when the same taxes are given a new purpose - to be an instrument of environmental policy. In this case, the socio-economic role of the tax in the country's economy increases. It helps society to eliminate unwanted production methods and reduce the consumption of environmentally unsafe products. Distinguishing environmental taxes from the total set of tax payments is important for a better understanding of the directions for further reforming the tax system, identifying taxes that should become environmental, addressing the need to introduce new taxes and changing existing ones, more fully implementing the country's environmental policy, and working out ways to spend tax revenues and finally, to ensure the correctness of international comparisons.

3. PROBLEMS OF ORGANIZING AN EFFECTIVE SYSTEM OF ENVIRONMENTAL TAXATION

An effective system of environmental taxation is one of the main instruments of state policy, which has many advantages over traditional methods of environmental regulation and other instruments of environmental policy. In the classical form, environmental taxes reflect the magnitude of negative external costs caused by environmental pollution. Their peculiarity lies in the fact that they express in monetary form the losses for society that arise as a result of the taxpayer's activities, but are usually not taken into account by the taxpayer himself, since they do not directly relate to his production costs. In this regard, environmental taxes are based on the "polluter pays" principle, according to which the named losses must be compensated by the one who caused these losses. However, in practice, for a number of reasons, it is rather difficult to implement such a concept in its pure form. Currently, a tax can be considered environmental if there is a connection between its size and the negative impact on the environment of the object of taxation. These impacts can be different, and therefore a wide variety of environmental charges can be observed. The main advantage of taxes and other market-based instruments over traditional methods of environmental regulation, such as standards, quotas, bans, is efficiency. In general, efficiency means that a taxpayer can achieve the same environmental effect at a lower level of its costs, or achieve a greater environmental effect at the same level of costs. First of all, we are talking about the establishment of a different tax burden depending on the scale of environmental damage caused by the taxpayer's activities. Taxation becomes objective when the polluter pays more. From an economic point of view, the introduction of environmental taxes is due to the objective need to express in monetary terms those losses for society that are created by the activities of the taxpayer due to its negative impact on the environment. The latter possesses the properties of a social good in the sense that any number of people can be its consumer and no one can be excluded from consumption. Since the environment does not have an owner, the price is not assigned to it in the market, as a result of which the losses for some, arising from the impact on the environment by others, are not taken into account. And that part of production and consumption, which takes the form of environmental degradation, loss of environmental quality and sometimes irreversible damage to vital environmental processes, remains unpaid by the taxpayer. But environmental taxes, burdening the taxpayer, make him pay for this damage and further reduce its level. The concept of taxation, in which the amount of the tax should pay off the losses of society, was formed by Pigou, who said that a tax that corrects negative externalities should be equal to the marginal social cost. Indeed, it is impossible, for example, to establish a specific number of people who have been contaminated by vehicles, as well as to determine how much the health of each of them has deteriorated, and even more so to express these losses in monetary form, given the large number of cars themselves, each of which is a source of pollution. At the same time, environmental taxes can be returned to the population in the form of a public good if their revenues are spent on the development of the health care system. Or, for example, tax revenues can be used to finance specific environmental protection measures and programs to eliminate environmental damage caused by the taxpayer's activities, and then the amount of the tax is set depending on the funds that must be collected for this. In these cases, the tax can be considered as compensation, but not direct, but indirect action.

4. MEASURES TO REFORM ENVIRONMENTAL TAXATION

In our opinion, the reform of taxes on an ecological basis is the greening of the tax system, when the same taxes are given a new purpose - to be an instrument of environmental policy. In this case, the socio-economic role of the tax in the country's economy increases. He begins to adjust the ways of production that are undesirable for society and reduce the consumption of environmentally unsafe products.

And proposals to change the procedure for calculating the transport tax, making it an ecological payment, is an integral part of the global trends in the development of taxation along the path of greening. Distinguishing environmental taxes from the total set of tax payments is important for a better understanding of the directions for further reforming the tax system, identifying taxes that should become environmental, addressing the need to introduce new taxes and changing existing ones, more fully implementing the country's environmental policy, and working out ways to spend tax revenues and finally, to ensure the correctness of international comparisons. Despite the conceptuality of the described theoretical views, certain difficulties arise in their implementation in practice. The first problem that will have to be faced when establishing taxes for air pollution is the lack of an objective opportunity to assess the losses of society from harmful emissions, taking into account the number of pollution sources and the number of those who are negatively affected. Even if we take one object of exposure to harmful emissions - the health of the population, it is impossible to accurately determine under the influence of which particular factor it has worsened. Revenues from environmental taxes, including taxes on air emissions, may form trust funds and be used solely to fund environmental and / or health programs. For example, in Sweden, revenues from environmental taxes are used to create technologies that help reduce harmful emissions into the atmosphere. In some cases, due to their collection, the rates on other taxes, usually social taxes, are reduced. From the above, it follows that countries, when establishing legal responsibility for committing offenses in the field of taxation of air emissions, should first of all analyze the relationship between the amount of the fine and the economic benefit that is obtained as a result of the violation, as well as environmental damage caused by illegal actions. Another equally attractive direction in the development of taxation of harmful emissions into the atmosphere is tax incentives for environmentally efficient technologies. The advanced foreign experience demonstrates a whole arsenal of tax instruments to stimulate innovative developments in the field of ecology. One of the main goals of such support is to attract private business to actively participate in financing priority projects in the field of environmental protection. Measures to reform the taxation of air emissions can only have a tangible effect if all countries of the world join efforts to save the environment. In this regard, an integrated approach is required, tax instruments should be combined with other environmental mechanisms. Only a systematic approach and rationality of actions on the part of the leaderships of the countries can change the current situation for the better.

5. CONCLUSIONS

Environmental taxes are an important tool for greening the country's economy. They are based on the theory of negative external costs, developed by A. Pigou, which arise in society when an economic entity has a negative impact on the environment. According to the scientist, the rate of the environmental tax should be set per unit of pollutant and be equal to the marginal social costs in order to achieve a balance between the volume of production of the taxpayer and the losses to society arising from this production. As foreign experience shows, the following can contribute to enhancing the positive effect of reforming environmental taxation:

- The introduction of additional and the increase in the amount of existing environmental taxes should be carried out in compliance with the principle of budget neutrality, which is that if environmental taxes increase, taxes on labor and capital decrease and, accordingly, the tax burden of payers does not change in general.
- Incentive taxes should prevail over fiscal ones. In this case, we are talking not only about the quantitative predominance of taxes that encourage the introduction of environmentally friendly technologies and the creation of environmentally friendly products or limit “dirty”, resource-intensive and waste-intensive production.

Of the funds received by budgets of different levels from the collection of fiscal energy, transport and resource taxes, a sufficient share should be allocated for the implementation of environmental programs.

DIAGNOSTIC ANALYSIS OF THE DEVELOPMENT OF THE RECREATION AND TOURISM SECTOR

Gulnara Ali Mamedova

Azerbaijan State University of Economics (UNEC), Azerbaijan
gulnara.ali63@gmail.com

ABSTRACT

The article discusses recreational and tourist areas from the point of view of a systematic approach. The principles of diagnosing the development of recreational and tourist areas are outlined. The main groups of factors influencing the development of the recreational and tourist system are identified: statistical (natural, cultural-historical) and dynamic (demographic, socio-economic, material and technical, political). The economic aspect of recreational and tourist activities is revealed, the multiplicative effect of recreational and tourist activities in the region is shown. The role of recreation and tourism in terms of social and environmental factors of development of individual territories and the country as a whole is disclosed. Diagnostics of the development of the recreational-tourist system in the structure of the general system of the region helps to identify positive and negative socio-economic processes occurring within the recreational-tourist system, and indicates the advantages and disadvantages of a particular region in the development of the tourism industry. Thus, the purpose of diagnosing the development of the recreational-tourist territory is to study the state of the recreational-tourist system, determine the level of development and use of the recreational-tourist potential and its impact on socio-economic regional processes. The object of the study is the recreational-tourist system, as a set of economic sectors involved in the production of recreational-tourist services. According to the point of view of some scientists, the tourism object includes three main components - a tourist region (place), a tourist organization and a tourist enterprise. A tourist uses a range of services that are provided to him in a specific place (or region) where tourist activities take place. Due to its attractive factors, this place becomes a tourist center. Tourist places differ in features that interest the tourist and determine his choice. This definition is given from the point of view of the user (tourist, vacationer). When a tourist chooses his travel destination, he compares among themselves the various places and the level of service that are provided there. Therefore, the diagnosis should be made taking into account the assessment of the satisfaction of the needs of tourists. However, one should not forget that the recreational-tourist system should contribute to the development of the region with minimal damage and discomfort to the local population, therefore a second aspect of diagnosis arises, from the point of view of the need to develop the region and the cultural and historical traditions of the local population. Only an integrated approach to the diagnosis of the recreational and tourist system will allow us to assess the potential and development opportunities of the region, as well as reveal the needs of tourists who determine the range of tourist services in a particular region.

Keywords: *tourism, recreation, recreational-tourist territories, recreational-tourist systems, economics*

1. INTRODUCTION

The tourism industry in modern conditions significantly affects the development of the global economy. In most countries of the world, a significant part of the welfare of the state is based on income from the organization of tourism activities. Due to economic growth, increasing the cultural and material level of the population, increasing free time, tourism claims to be the leading export industry in the world. For the successful development of the tourism industry, it is necessary to create a competitive tourism industry that provides growing consumer demand and makes a significant contribution to the socio-economic development of countries [1,2,3].

In many countries of the world, tourism is developing as a system that provides all the opportunities to get acquainted with the history, culture, customs, spiritual and religious values of a given country and its people, and gives income to the treasury. Not to mention the fact that this system “feeds” a lot of individuals and legal entities, one way or another connected with the provision of tourism services. In addition to a significant income item, tourism is also one of the powerful factors in enhancing the country's prestige and its importance in the eyes of the world community and ordinary citizens. Today, tourism has become a phenomenon that has entered the daily life of almost a third of the world's population. World tourism in the XX - early XXI century acquired extremely rapid development ... Such a trip to the tourism sector requires comprehensive and fundamental research on various aspects of its development [2, p. 76; 3, p. 213]. Tourism is one of the prerequisites for economic growth in Azerbaijan. It is worth noting that tourism is in great demand. Because here an important factor is human service, health and cultural development. The range of services offered to tourists, the structure of its value is the main investment in the development and implementation of infrastructure, projects and facilitates the identification of investment sources. The main sources of financing: efficient use of resources and rationalization of relevant resources based on the state budget and credit resources. There are three approaches to the tourism market:

- a) The fundamental principle and area of economic development.
- b) As an integral part of the global integration system.
- c) The economy of the interaction of sales and sales of tourism products, acting as a mechanism [4,5,6].

The monograph of the senior researcher of the Institute of Economics of ANAS, Doctor of Philosophy, is devoted to studying the current state of the tourism sector in Azerbaijan and identifying opportunities for the formation of competitive tourism in the country. Leyli Allahverdiyeva. A correlation analysis of the tourism competitiveness index and per capita GDP showed a link between tourism development and the country's economic development. At the same time, an analysis of the relationship between some tourism indicators of the countries of the world and the degree of state regulation of foreign trade allowed us to put forward some considerations about the impact of foreign trade liberalization on tourism development [6,7].

2. FORMULATION OF THE PROBLEM

In modern business conditions, the tourism industry is one of the main driving forces of economic recovery. World experience shows that in order to effectively manage the tourism development process in countries, diagnostics of recreational and tourist territories is necessary. The diagnostic methodology is based on two approaches: integrated and systemic. Each approach can be represented by a set of methods, and each method is specified by the methods of its implementation in different situations and conditions. In addition, the methodology uses the methods of analysis and modeling to a greater extent in the process of research and the selection of alternative ways to improve the economic system. The diagnostic methodology organically includes a system analysis of complex business systems. A systematic approach requires taking into account the specific features of regional situations, the use of appropriate tools and the real possibilities of making appropriate tools and the real possibilities of making managerial decisions to change them (regulation). It is necessary to determine what is included in the basic properties of the recreational- tourist system, which ensures the formation and satisfaction of the needs of the vacationer, what factors affect this process. What constitutes a recreational and tourist service, what features it has. With the improvement and market transformation of the economic structure of recreational and tourist activities, it becomes one of the most important sectors in the economy.

The industry requires significant funds necessary to create the infrastructure components of the reaction and tourism sectors: roads, vehicles, water supply, sewage and other units. Promotion of recreation and tourism to the rank of priority sectors, based on modern natural, labor and financial opportunities, is extremely necessary. But not only investments are needed, but also time, and, most importantly, a well-thought-out promising program for the development of the recreational complex and stable conditions for its implementation. It should be noted that the diagnosis of the development of the recreational-tourist territory requires a thorough development of the methodological base, in the process of studying which the theory of diagnostics of the recreational-tourist territory is developed. Recreational and tourist development is a form of private, sectoral and territorial development, reflecting only one aspect (recreation and tourism), which can be adequately described on a fundamental basis. All this dictates the need in the research process to find answers to such questions: what are the initial resources and dynamic qualities of the recreational and tourist territory, what is the capacity of the local services market, will the investment climate for recreational territories be formed in the coming years.

3. RECREATIONAL AND TOURIST AREA AS A TERRITORY

Recreational-tourist area as a territory in structure is a combination of land and watersurfaces in the areas of regions with specific climatic conditions (land, water, forest, mountains). They are necessary for the development of recreational and tourist activities in this territory, taking into account the demographic, social, historical features of the region and its geographical location. The main properties of the recreational and tourist territory are the development and saturation of its recreational and tourist facilities, which determine the development of the territory. At the same time, development, on the basis of which the processes of growth and development of recreation and tourism are taking place, determines the degree of saturation of the recreational and tourist territory with the infrastructural elements (objects) of recreational and tourist activities and their connections. Since the saturation processes depend on the level of intensity of development of the recreational and tourist territory in the region, the processes of development of the territory by the recreational and tourist elements of the productive forces in different recreational territories will have different degrees of saturation (development), which will entail an increase in the differentiation of the quality and standard of living of the population [7,8]. A saturated recreational territory is a territory that accommodates many objects of recreational and tourist activity (sanatoriums, boarding houses, recreation centers) and the organization of other industries (hotels, restaurants, cafes, water parks, etc.) that accompany recreational activities. They are in a certain set of economic interests and relations between participants in the production of recreational and tourist services. The more such objects on the recreational and tourist territory and the closer the connection between them, the more developed and mastered it seems. The development of the recreational-tourist territory is due to the systematic organization of the reproduction of resources in this region of the region – labor, natural, material, organizational, informational, etc. In this context, the recreational-tourist territory becomes a connecting component of the interaction of individual elements of the productive forces of recreation and tourism. The interaction of resource elements of recreation increases reproductive potential, ensures the development of recreational and tourist areas in the region. The main feature of the recreational and tourist territory is the attraction of local and foreign vacationers and tourists, the involvement of recreation and tourism in public production as:

- recreational industry of material and intangible production of the region (economic activity for the production of recreational services);
- recreational production and social infrastructure facilities;

- creation of new and expansion (development) of recreational objects of natural and artificial origin within the region (creation of new jobs);
- the formation of new ties and relations for the development of recreation and tourism in the country and region. That is, the involvement of the recreational and tourist territory in the processes of public organization of the reproduction of the productive forces of the region and the country [9,10].

The main feature that characterizes a recreational and tourist territory can be its location, which shows where it is located in the region and how the productive forces of recreation and tourism are combined with each other and with the productive forces of the region. As a measure (means of measurement), indicators (indicators) about the depth and nature of the processes occurring in the recreational and tourist area are used. The groups of such indicators should include: indicators reflecting the scale of the recreational and tourist territory; indicators showing the effectiveness of recreational and tourist activities in the economy of the region; indicators that convey the state and reproduction of recreational potential; indicators for assessing the development of recreational and tourist areas; indicators expressing the level of cooperative relations of the recreational and tourist industry in the economic sphere of the region and the country, as well as financial indicators of recreational and tourist activities and their relationship with indicators of the financial system of the region; indicators for assessing the saturation of the recreational and tourist territory of the region with elements of productive forces.

4. RECREATIONAL AND TOURIST AREA – AS A SYSTEM

Recreational and tourist territory is a system of elements of the productive forces of recreation and tourism, which are the material carriers of each element separately and at the same time represent some integrity of interrelated elements: natural potential, material (recreational) potential, labor potential (people employed in the field of recreation and tourism), etc. The successful functioning of the recreational-tourist system directly depends on the level of productivity of its elements, the variability of the territorial structure of the recreational-tourist territory, the increasing role and volume of the recreational-tourist resource component in the recreational-tourist territory, the significance of the administrative impact in the region on the development of recreational-tourist activities. The development of a regional recreational and tourist system should not violate its resistance to external and internal factors. The main properties of the recreational and tourist territory as a system are stability, integrity, complexity and vitality, self-regulation, hierarchy. Thus, the recreational and tourism sector is a complex system in the structure of the region's economy. As a system, it functionally acts in three aspects: recreational and tourist activities, the social component, and the environmental component [10,11]. Signs allow us to judge the state of the recreational and tourist industry in the economy of the region. They can be distinguished in relation to the system properties of the recreational-tourist system, for example, in relation to:

- to sustainability – as a share of the recreational industry in the structure of the region's economy, as a place of the organizational structure of the management of recreational and tourist activities in the regional economy's management system;
- to integrity – maintaining and building up recreational potentials (natural, industrial, labor) within the regional system;
- to complexity – placement on the recreational and tourist territory of other sectors of the economy of the region to participate in the development of recreational and tourist activities (multiplier effect);
- to vitality – signs of simple and expanded reproduction of the elements of the productive forces of the recreational and tourist area.

The main feature of the recreational-tourist system is the interconnectedness of its elements among themselves and with the elements of the regional system. In addition, with all the variety of tourist services in the recreational and tourist system, they all have four common characteristics: intangibility, the continuity of production and consumption, variability of quality, and inability to store. The intangibility or intangible nature of tourism services means that it is impossible to demonstrate, see, try or study before receiving. The continuity of the production and consumption of tourism services means that the service can only be provided when an order arrives or a client appears. As a measure (means of measurement), indicators are used that characterize the depth and nature of the processes occurring in the recreational-tourist system associated with the involvement of individual elements of recreational production in the social production of the region. Such indicators may include: indicators of the stability of the recreational-tourist system; indicators of its integrity; indicators characterizing the recreational and tourist potential of the region, indicators characterizing the use of the natural resource potential of the region; indicators characterizing the viability (reproduction) of the recreational-tourist system [12,13]. In different regions, recreational and tourist systems are developing in their own way. This is due to the presence of recreational and tourist potentials in the regions (natural resource, recreational and infrastructural, industrial, investment, informational, etc.), which form recreation and tourist systems in the region with individual signs of attractiveness. Therefore, for each recreational and tourist system in a particular region, a specific goal of diagnosing its development should be formulated. Nevertheless, a more general goal can be formulated as identifying the problems of a particular region (they can be typical and atypical for other regions) and developing recommendations. And also the goal of economic diagnostics of the development of regions (territories) should be the realization of the possibilities of obtaining an objective assessment of regional situations and problems (processes and phenomena) necessary to ensure (through appropriate decisions) the effective development of regions. Proceeding from this, the goal of diagnosing the development of recreational and tourist territory should be to study the state of the recreational and tourist system and develop a system of parameters for the level of development and use of recreational and tourist potential for the formation of scientific tools for diagnosing the development of the territory and the impact of regional processes on it. The object of the study is a recreational-tourist system, understood as a set of industries involved in the production of recreational-tourist services, as well as emerging industrial relations. The subject of the study is a set of theoretical, methodological and practical issues related to the process of diagnosing the development of a recreational-tourist system, identifying its general condition, detecting "recreational pathologies", bottlenecks. Diagnostics of recreational and tourist areas should be based on a set of principles. Under the principle in scientific theory is understood the most abstract definition of an idea (the initial form of systematization of knowledge). A principle is a rule that has arisen as a result of subjectively conscious experience of people. In this case, the general principles of the development of the territory must be observed: objectivity, multi-aspect, hierarchical and constructive [14,15]. Objectivity means that the general territorial characteristics should reflect the specific characteristics of the recreational and tourist industry. The multidimensionality (complexity of the assessment) is due to the variety of types of recreational and tourist services included in the recreational and tourist industry. Hierarchy allows you to divide the territory into zones, subzones, areas, subareas that are in clear mutual communication and subordination. Constructiveness is determined by the clarity of the tasks set during the development of recreational and tourist areas. The principles for diagnosing the development of recreational and tourist territories constitute the fundamental starting points obtained as a result of studying the state of recreational and tourist systems, identifying territorial "diseases", "pathologies", "pain points and bottlenecks", which guide the establishment of relations in developing elements of recreational and tourism resources in the

future. Based on them, taking into account specific factors and conditions, the development of recreational and tourist systems should be improved. The principle of science implies that the diagnosis of regional recreational and tourist systems is a system of forms, methods and tools for using objective economic laws, as well as away to coordinate and balance the economic interests of the region. The principle of consistency requires that, when studying and analyzing the recreational and tourist system within the framework of the region's economy, the integrity of the economic complex as an object of management be ensured in order to identify various types of ties with the region, country, and internationally.

Since the study justified three aspects of the development of the recreational and tourist area, three more groups of principles were identified:

- 1) Production aspect – directly the production of recreational and tourist services with the parameters of the existing infrastructure, indicators of its development and load. The first group of principles includes:
 - the principle of unity determines consideration of the problems of recreational activities in combination with the problems of the regional economy;
 - degree of openness of the territory;
 - –degree of recreational and tourist development of the territory (developed, medium and underdeveloped area);
 - structure of recreational and tourist functions, depending on the prevalence of the use of recreational and tourist resources (medical, tourism, sports, etc.);
 - the principle of production (provision) of recreational and tourist services and other types of economic activity, which are designed to provide the necessary level of life, not only for permanent residents in this territory, but also for vacationers;
 - the principle of approximation of the recreational and tourist system to natural and recreational resources, to areas and centers of production and consumption of finished products (recreational and tourist services);
 - the principle of rational concentration (agglomeration) in the form of territorial-production complexes and recreational-tourist sectors, linked accordingly to the main specialization of the region, their location;
 - the principle of cooperation in the production of recreational and tourist services with various enterprises with a comprehensive reduction in inefficient transport, subject to the maximum possible comprehensive development of the economy of the region of accommodation;
 - perspective development of the territory.
- 2) Social aspect, which allows the analysis of tourist flows, the degree of satisfaction of tourist demand, the compliance of effective demand with offers on the market. The second group of principles is formed by the foundations that flow from the social aspect of the recreational area. The main ones are:
 - the principle of ensuring an expanded recreation of the physical and spiritual forces of the population of countries, their recovery, recreation, entertainment and raising the cultural level of development;
 - the principle of solving the unity of socio-economic problems of permanent residents of the recreational area and vacationers;
 - the principle of using financial resources received from recreational and tourist activities in this territory to solve social problems in the region;
 - the principle of solving the problem of local employment in the field of recreation and tourism.
 - There are several principles that apply to the first two groups.

- The principle of complexity requires interconnection and interdependence in the study, measurement and generalization of the influence of individual factors on the formation of indicators of the functioning and development of recreational and tourist systems in the region.
 - The principle of dynamism is the timely identification and prevention of the reasons for the decline in economic (quantitative) and social (qualitative) indicators of the development of recreational and tourist systems, as well as the study of ways to eliminate negatively acting factors on the functioning of systems and consolidate the action of positive factors.
- 3) Ecological aspect, which allows the analysis of the capacity of the recreational and tourist territory and the determination of permissible anthropogenic loads on this territory. The third group of principles is determined by the rational combination of nature and economics:
- the principle of using the natural resources of recreational and tourist areas to renew the vitality of the population;
 - the principle of preventing the negative impact of the production of recreational and tourist services and the harmful effects of recreants on the environment.

The listed principles cannot be considered in isolation from one another, they interact with each other, complementing or replacing each other. To determine the prospects for the development of recreation and tourism in the region and their impact on the regional economic and social system, it is advisable to identify the main groups of factors of influence on the development of the recreational and tourist system. These are statistical factors, which include a combination of natural and cultural-historical factors and which have stable, unchanging values. A person only adapts them to tourist needs, makes them more accessible for use [15,16]. Natural factors are expressed in an ecologically clean natural environment, comfortable climate, terrain, underground riches (healing and mineral waters, caves and the like). Cultural and historical factors - monuments of architecture, history, culture, etc.). A group of statistical factors plays a major role and significantly affects the subsequent development of recreation and tourism, and, consequently, the regional economic system. The second group is dynamic factors, which include demographic, socio-economic, material, technical and political factors. They can have different estimates, meanings and can change in time and in space. But only a combination of static and dynamic factors lead to the economic effect of recreational and tourist activities in the region. In addition, the factors that influence the development of recreation and tourism in the region are divided into external (exogenous) and internal (endogenous). An important point in the development of the recreational and tourist system is the identification and elimination of the negative impact of external and internal factors on the development processes of recreation and tourism in the region, which is possible by conducting diagnostics of the development of the territory. External (exogenous) factors are influenced by demographic and social changes. These factors to one degree or another affect the structure of the free time of the population, which creates objective socio-democratic conditions for the development of recreation and tourism. The external factors that influence the development of recreation and tourism also include economic and financial factors: improvement (worsening) of the economic and financial situation; increase (decrease) in personal income; higher (low) tourist activity, depending on the part of the income allocated for the rest; growth (decrease) of the part of funds allocated by social insurance funds and other organizations to cover the costs of treatment, recreation, tourism and travel. In addition, external factors also include changes in political and legal regulation; technological changes; development of transport infrastructure and trade, as well as changing conditions for the safety of travel and leisure. Internal (endogenous) factors are primarily material and technical factors associated with the development of accommodation

facilities, vehicles, recreational catering, retail, etc. Internal factors also include tourism market factors. These are the processes of supply and demand, the growing role of market segmentation, the increasing role of coordination of activities in tourism and the processes of monopolization, the growing role of the media and public relations in the promotion, advertising and implementation of tourism services, the increasing role of personnel in tourism, etc. In addition, there are some other factors specific to the field of recreation and tourism that significantly affect the creation of a quality tourism product.

- 1) Discreteness (discontinuity) in the production of tourism services and the integrity of their consumption, manifested as a certain contradiction in solving the problems of managing the quality of tourism products.
- 2) The possibility of re-production of tourism services at an equally high level, or the duration of quality. The solution to this problem for many tour product manufacturers is an impossible task, which, in turn, often causes a sharp decline in the competitiveness of the entire enterprise.
- 3) Since the tourism sector refers to a type of activity where the manufactured product, being intangible, is consumed simultaneously with its production, the personnel of the company working in the tourism sector have no chance of correcting the marriage and, as a result (given the fierce competition in the tourism market), there is no chance of a customer return.

The recreational-tourist system is social in nature and the final product (service) education, providing expanded reproduction of the physical and spiritual forces of the population, leisure, entertainment, and consumers of this kind of services are people. Since the development of the recreational-tourist system, like any other, is characterized by qualitative and quantitative changes in individual characteristics: the economic, social and environmental component, we consider the development of the recreational-tourist system as a triune process: recreational-tourist activity, the social orientation of recreation and tourism, environmental stability recreational and tourist system.

5. RECREATIONAL AND TOURIST ACTIVITIES (ECONOMIC ASPECT)

Like any regional complex, a recreational-tourist system functions not as an isolated phenomenon, but as a set of interconnected elements, within which each element has a clearly defined place and function. “The economic complex of a region is a functioning system, and, therefore, possessing a certain stability and at the same time a developing and changing system. The recreational and tourist system of the region should also be considered as one of the economic complexes. To ensure its functioning and development, it is forced to attract land from the environment as a natural source of mineral, biological and recreational resources for the production of various kinds of consumer goods and services. Functioning, the recreational economic system of the region uses these resources to create the necessary social benefits for recreation and health. The recreational and tourist industry is becoming increasingly important for the development of the economy and social sphere of countries, is rapidly integrating into the global tourism industry. Today, the development of the recreational and tourism industry is extremely important for states, since it significantly affects such sectors of the economy as transport, hotels and restaurants, retail, communications, construction, food processing, agriculture, consumer goods, insurance, financial mediation, activities in the field of culture and sports. The recreational and tourist industry is one of the most promising areas of structural adjustment of the economy. It is an important factor in overcoming the crisis in the economy, revitalizing the local economy, stable and dynamic increase in budget revenues, and one of the main sources of foreign exchange, increasing employment, and developing market relations.

Recreation and tourism is a complex object of economic activity. It is the core of a highly aggregated complex of industries involved in the creation and implementation of a tourism product. It is characterized by a high degree of multiplicative influence on a wide range of economic areas; it can really act as a locomotive of regional development (Fig. 1). The tourism multiplier is a numerical coefficient characterizing its indirect impact on the development of related sectors and showing how many times the internal regional product will change as a result of changes in tourist spending. Due to the multiplicative recreational and tourist effect, generating a wave of cycles of economic activity in the industries involved in tourist services, the socio-economic benefits of recreational and tourist activities significantly exceed the revenues of the industry itself. A well-developed recreational and tourist industry contributes to the influx of significant amounts of foreign currency, ensures the stabilization and increase in foreign exchange earnings in the country and regions. At the same time, the receipt of foreign currency occurs not only in the form of payment for tourist services, but also as an exchange of currency for the daily needs of tourists. Recreation and tourism is the only branch of the country's economy in which dynamic growth is currently being observed, thereby increasing its investment attractiveness. Tourism business in the whole world is one of the most promising areas of entrepreneurship. Since the beginning of the 60s, tourism has been developing very dynamically. Profits from it amount to tens of billions of US dollars. The importance of recreational and tourist activities for the economy of the region is diverse and very significant. The creation of travel companies and the development of their business brings great benefits: to customers – products, services; working staff – salary, businessmen – profit; the region – money at the expense of taxes and fees. Any enterprise or institution can make a profit from direct industrial and commercial activities, or maybe by investing profits (capital) in other enterprises. It is travel companies that can be very beneficial investors because of the rapid turnover of capital goods and high profitability. From an economic point of view, the effect of tourism in the form of additional demand for goods and services is of great importance. Therefore, tourism has a certain impact on the development of regional industries producing consumer goods. The increase in tourist flows significantly increases the demand for souvenirs, local handicrafts, and has a beneficial effect on the revival of folk crafts, traditions and folklore.

Figure following on the next page

Figure 1: The mutual influence of recreational and tourist activities and the economy of the region

The peculiarity of tourism lies in the fact that it brings to life a new form of consumer demand – the demand for tourists coming for vacation, for a variety of goods and services that regional industry can offer. An increase in sales of local industry products naturally increases the revenues of the region in which it is located. Demand for a complex of goods and services formed by the tourist movement requires the expansion of their production. In addition to additional income, the sale of such products can serve as an advertisement for a tourist center. Thanks to this, the production of consumer goods is developing intensively, benefiting its region and raising the standard of living of the population.

6. RECREATION AND TOURISM ARE A SOCIAL FACTOR

The role of recreation and tourism in economic activity is determined primarily by the fact that it is part of both the social and economic spheres. The main functions of the social sphere in the recreational-tourist system are as follows:

- bringing tangible and intangible benefits of the recreational and tourist area to the consumer; maintenance of the consumption process;
- creating conditions in the recreational and tourist area for changing activities and recreation; health promotion;
- the formation of the general educational and cultural-technical level of the population.

Currently, the need for rest takes a leading place in the social needs of the population. In areas with favorable natural and socio-economic conditions, recreation areas are being created, sanatoriums, boarding houses and rest houses, children's health camps are being built, tourist routes are being laid, which contributes to the formation of recreational resort complexes in the regions. In addition to recreation, the result of recreational and tourist use of the natural resources of the territory is a healing effect, which is manifested in an increase in working capacity, restoration of psychophysiological resources, rational use of free time, reduction in morbidity, mortality, and other social indicators. Recreation and tourism, occupying an important place in society, take on a significant part of the most important social functions in the region: they help to ensure employment of the population and increase their income, focus on maintaining and restoring the recreational and tourist resources of the region. Recreational and tourist activities must be socially oriented. It can combine two principles: serving the interests of man, society as a whole and generating income at micro- and macroeconomic territorial levels. Then the main concepts of the social recreational and tourist industry should be self-development, self-financing and self-government. In this regard, it is advisable to note the social aspects of the impact of tourism in the region and on the recreational and tourist territory, i.e. the influence that the development of recreational and tourist activities has on the regional social structure, relations in society, as well as on social strata and institutions. Tourism and recreation can and should become an effective means of rational use of free time, spending substantial leisure time, studying the history of the native land. If in other types of use of resources we get a direct economic effect from their use, then the social effect during recreational and tourist use turns into other areas – into an economic one (the achieved increase in working capacity increases labor productivity, the time of illness is reduced, healthcare costs are reduced, etc.). The difficulty of collecting information related to the remoteness of the results of rehabilitation from the place of its receipt (both in time and territorially), the lack of clear methods for determining the economic effect of recovery do not allow to reliably determine the economic efficiency of natural resources in recreational use.

7. THE ECOLOGICAL SIGNIFICANCE OF THE DEVELOPMENT OF RECREATION AND TOURISM (ENVIRONMENTAL ASPECT)

Tourism cannot develop without interaction with the environment. The restoration of vitality occurs on the basis of the use of natural resources of the recreational and tourist area. The development of natural recreational resources is a necessary condition for the effectiveness of the healing process leading to an improvement in the state of health, an increase in life expectancy, and the prevention of a number of diseases. In other words, natural recreational resources are capable of exerting a certain physiological, mental, and at the same time restoring strength and health effect on people. Consequently, the natural environment of a recreational and tourist area under certain conditions may constitute a place for the restoration of human strength, i.e. resort and recreational potential. In the process of recreational and tourist activities, an environmental change will inevitably occur as natural resources are the "main means of production." Therefore, the objects of ecotourism are nature monuments, nature reserves, wildlife sanctuaries, speleotourism, parks of landscape gardening art, arboretums, forests, etc. The expanding recreational and tourist activities are faced with the problem of resolving the contradiction and continuously searching for the correlation between the development of natural resources and the preservation of their quality, the preservation of untouched unique natural sites and the satisfaction of the recreational needs of the population. With the development of recreation and tourism, the environmental impact increases dramatically and can become negative. Consequently, for the use of recreational and tourist resources, a fee similar to that in other areas of management should be established. Of great importance are measures to prevent the negative consequences of the technogenic activities of enterprises,

which is the basis of the modern innovation policy of forming an appropriate market for the development of mass recreation and tourism. The environmental impact of recreation and tourism can be direct, indirect and incentive, as well as positive and negative. However, by managing its development and clear planning, it is possible to reduce the negative impact and increase the positive. The positive impact of recreation and tourism includes the following factors: the protection and restoration of historical monuments, the creation of national parks and reserves, the protection of coastlines, the conservation of forests, etc. The negative effects of recreation and tourism, unfortunately, often prevail over the positive impact. In particular, this impact on the quality of water in rivers, seas, lakes and on air quality due to the use of vehicles with internal combustion engines; noise from the activities of various entertainment venues; the destruction of local and wild flora by tourists making fires; destruction of historical monuments by vandals, leaving inscriptions on them, etc. These are examples of only minor damage to the environment. It should be noted that environmental protection is a simpler and cheaper measure than correcting the harm done in the future. Environmental policy should be aimed at a long-term period to ensure long-term recreational and tourist activities. However, many countries, especially developing ones, ignore this, preferring commercial and financial momentary benefits. The needs of the population in leisure and tourism are growing so fast that the state does not have time to create new recreation areas. As a result, the current needs in recreational and tourist areas exceed the possibilities of satisfying them. This leads to an overload of existing recreational and resort areas, which has a negative impact on natural resources. The needs of the tourist, the sequence and measure of their satisfaction are significantly different from the constant human needs of life. The desire to move, to change their usual location to a new place is caused, first of all, by intangible needs. The need to acquire new knowledge about previously unfamiliar places and visit favorite places is one of the basic needs of a tourist. Hence, a tourist's need is a need for a cultural, cognitive, social, moral or physiological good that a person or group of people experiences and which can be satisfied only as a result of a real, comfortable movement to places of non-daily stay or residence. The need for a kind of rest or recreation, in a tourist service is formed by the condition of the individual, the community of people, the environment and depends on the condition of the person, his character, health, age, financial capabilities, the surrounding community, the level of general, religious, economic, physical and other types of culture. Needs awaken motives for their satisfaction, which can only happen by real movement to places of rest. Based on the definition of tourist needs, the concept of tourist services can be defined as assistance in meeting the diverse needs of the individual by comfortable moving to non-daily places of stay or residence. The need for a kind of rest or recreation, in a tourist service is formed by the condition of the individual, the community of people, the environment and depends on the condition of the person, his character, health, age, financial capabilities, the surrounding community, the level of general religious, economic, physical and other types of culture. Needs motivate them to meet, which can only happen by real movement to places of rest. Based on the definition of tourist needs, the concept of tourist services can be defined as assistance in meeting the diverse needs of the individual by comfortable moving to non-daily places of stay. According to F. Kotler, "services are objects of sale in the form of actions, benefits or gratifications" [16]. From this definition it follows that the services are not saved and the client is offered something that does not have material forms. Firstly, the service does not exist until its provision, i.e. the product is created in the process of providing the service. Secondly, very often the provision of services requires special knowledge and skill, which is difficult for the buyer not only to evaluate, but often to understand. Involving the buyer in the process of production and consumption of the service means that the seller must take care not only about what to produce, but also how to produce it. Therefore, the correct selection and training of personnel in contact with customers is necessary to ensure the quality of services and the formation of customer

loyalty to a particular company. All this makes the perception of the quality of a tourist product in many ways subjective, depending on the individual characteristics of each tourist. The recreation and tourism industry is characterized in that the main attention in it when creating a product quality system is drawn to the quality of service. Quality of service is the key to commercial success. Hotels and restaurants, travel agencies and travel agencies often with absolutely identical material base and orientation differ from each other only in the quality of service, which for some is the main trump card in the competition.

8. CONCLUSION

Diagnostics of the development of the recreational-tourist system in the structure of the general system of the region helps to identify positive and negative socio-economic processes occurring within the recreational-tourist system, and indicates the advantages and disadvantages of a particular region in the development of the tourism industry. Thus, the purpose of diagnosing the development of the recreational-tourist territory is to study the state of the recreational-tourist system, determine the level of development and use of the recreational-tourist potential and its impact on socio-economic regional processes. The object of the study is the recreational-tourist system, as a set of economic sectors involved in the production of recreational-tourist services. According to the point of view of some scientists, the tourism object includes three main components - a tourist region (place), a tourist organization and a tourist enterprise. A tourist uses a range of services that are provided to him in a specific place (or region) where tourist activities take place. Due to its attractive factors, this place becomes a tourist center. Tourist places differ in features that interest the tourist and determine his choice. This definition is given from the point of view of the user (tourist, vacationer). When a tourist chooses his travel destination, he compares among themselves the various places and the level of service that are provided there. Therefore, the diagnosis should be made taking into account the assessment of the satisfaction of the needs of tourists. However, one should not forget that the recreational-tourist system should contribute to the development of the region with minimal damage and discomfort to the local population, therefore a second aspect of diagnosis arises, from the point of view of the need to develop the region and the cultural and historical traditions of the local population. Only an integrated approach to the diagnosis of the recreational and tourist system will allow us to assess the potential and development opportunities of the region, as well as reveal the needs of tourists who determine the range of tourist services in a particular region.

ABSTRACT

The whole of strategies and methods constitutes a special risk management mechanism, which is risk management. Risk management incorporates a part of financial management. Duties such as purposeful search performed on the reduction of the risk level and organization of works, obtaining an income and its increasing are based the risk-management. The ultimate purpose of risk-management is the same with the purpose of entrepreneurship. It is closely connected with maximum reduction of risks and obtaining an income. Risk-management incorporates a system of management of the risk, which arises from entrepreneurial activity, with financial relations. The main purpose of management of economic risks in enterprise consists of minimizing of financial losses. This management process is regard to valuation of the level of separate economic risks, their prophylactics and insurance. The calculation of the level of economic risks is carried out on the following stages: identification of the types of separate economic risks related to the activity of enterprise; valuation of the degree of probability for occurrence of separate economic risks; determination of possible financial losses related to separate economic risks. The valuation of bankruptcy probability takes a special place in diagnostics of risks and management of production-sale activity. So, management of other aspects of assets, capital, investments, risks and financial activity of the enterprises must have mutual related character. Such mutual relations are provided in the process of complex management of financial condition of trade enterprise and in its optimizing. The optimizing of financial condition of enterprise is one of the main terms of successful economic development in its future perspective. Also, the financial crisis of enterprise creates strong danger for its bankruptcy. Therefore, the distribution of risk factors on commodity production in industrial enterprises to ranks in marketing researches is an important direction.
Keywords: *international markets, risk management, strategic marketing, marketing researches, processing industry enterprises*

1. INTRODUCTION

The work of managers on marketing in modern economy becomes complicated gradually. It regards not to complication of external environment of business, but also development of marketing and transition from fulfillment of marketing functions in enterprise to strategic marketing. Though marketing functions are investigated in appropriate literature, its place and role in strategic management system is not disclosed in detail. The existence of marketing service in enterprise doesn't show the existence of efficient strategy. The connection of marketing and strategy, its mutual influence and its difference with management shall be investigated. The practice shows that, marketing is not stable and doesn't stop in one point, it is a science being in dynamic development.

2. RISKS FACED BY INDUSTRIAL ENTERPRISES IN INTERNATIONAL BUSINESS

The emergence of commercial situations when industrial enterprises enter the international market is accompanied by certain risks. It is considered one stage of marketing researches. At this stage of Marketing Research, the commercial situation (event) in food production enterprises should be determined and the ratio of domestic and foreign trade turnover of

products in international business should be investigated. The indicators on separate activities of processing industry enterprises don't always overlap with their general indicators. So, the decrease of their number from 534 up to 393 is observed in enterprises on production of food products (see, table 1).

	2005	2010	2014	2015	2020
Number of acting enterprises - total	534	409	389	382	393
governmental	31	14	18	18	16
non-governmental	503	395	371	364	375
Number of individual entrepreneurs recorded to engage in industrial activity, persons	2 362	2 431	3 752	4 079	4 290
Capacity of industrial product (works, services), with current prices of appropriate years, million manat	1 095	1 925	2 597	2 547	3 257
Physical capacity index of industrial product, in comparison with previous year, by percentage	102.7	102.3	102.0	102.9	104.8
The part of area in general capacity of industrial product made in the country, by percentage	2.4	1.5	2.0	2.5	4.3
The part of non-governmental sector of area in non-governmental sector of country industry, by percentage	16.6	8.6	10.2	12.6	12.5
Average list number of workers, thousand persons	13.0	15.1	20.6	18.8	18.8
In comparison with previous year, by percentage	113.0	86.8	109.6	91.3	100.0
The part of area workers in general number of persons working in industry, by percentage	6.7	8.3	10.5	10.0	10.1
Average monthly salary of a worker, manat	46.1	224.0	337.2	352.6	371.6
Existence of main funds for the end of the year, million manat	371.7	779.9	857.7	884.2	910.4
In comparison with previous year, by percentage	107.8	106.3	108.5	103.1	103.0
Investments to the main capital, million manat	28.0	27.1	92.4	87.9	63.6
The part of investments put to the area in total capacity of investments oriented to industrial sector, by percentage	0.67	0.63	1.2	1.0	0.6
Price index of manufacturers of industrial products, , in comparison with previous year, by percentage, by percentage	96.7	106.9	98.8	102.9	102.9

Table 1: Main indicators in the activity of enterprises engaged in production of food products (Source: www.stat.gov.az)

Price indexes of producers in enterprises on production of food products were 102,9% in 2015 and 102,9% in 2020 (see, table 1). Here, the assumed situation may be indicated in the following form:

$$P(A/H) = \frac{1,029}{1,316} = 0,781$$

Schematically, this process may be described as follows (see, figure 1).

Figure 1: Determination of commercial situations (event) in food industrial enterprises by means of Bayes method

Naturally, the expansion of the probability of occurrence of commercial situations is accompanied by certain risks. Modern trends in the functioning and development of firms in the consumer market are formed in conditions of uncertainty of both external and internal environment. This requires trade managers to be proficient in managing firm risks. Risk-management as a system consists of two half-systems: controllable half-system (control object), controlling half-system (control subject). The impact of the control subject on the control object, i.e. control process itself may be only performed at the moment of the exchange of information fixed between the controlled and controlling half-systems. Regardless of its full meaning, the control process always seeks to receive, transmit, process and use information. Formation of an effective risk management system in companies is a serious step towards ensuring its effectiveness, by meeting the interests of all interested persons of the company. Risk-management is a process for taking and carrying out management decisions aimed at minimizing the probability for formation of adverse results and minimizing potential losses in decision-making. The application of risk management system allows to ensure stability and improve the financial situation. In this regard, the risk management system should be integrated into the daily management system of the company. Risk management depends on the effective interaction between risk-management participants. The process of Risk management takes place both in the internal and external environment of the company. In order to ensure perfect risk management, first of all, it is necessary to organize an effective system of interaction within the company. The division of risk factors for the production of consumer goods in industrial enterprises into ranks often creates conditions for their successfully putting on the international market. Therefore, the development of technology and factors for selecting the firm's organizational and production activities acts as an important problem. A detailed analysis of these factors allows for a reasonable choice of the most effective organizational and legal form of the enterprise's activity, taking into account the specific intentions and preferences of the founders. The sale of goods to buyers is carried out through certain points of sale, and their whole form the retail network of a particular region.

3. DOMESTIC AND FOREIGN TRADE TURNOVER IN INTERNATIONAL BUSINESS

The essence of marketing is to follow the whole path of the movement of goods from producer to consumer. The nature of foreign marketing is to explore both domestic and foreign markets. We have tried to determine the export turnover of enterprises explored for prospective in the foreign marketing market. The forecast period for the study covers 2015-2020s. It is observed as a result of studies that foreign marketing on food products has risen from 5% up to 25% in 2015-2020. Investigation of commercial situations and risks when putting on the foreign market shows that local enterprises making various products can significantly expand the foreign marketing. In particular, it is observed that enterprises making food products have risen the export turnover from 5% up to 25%.

4. CONCLUSION

As a management system, risk-management incorporates the determination of the purpose of risks and risk capital investments, the probability of an event that may occur, arising out of risk degree and level, the analysis of environment, identification of risk management strategy, selection of those required for risk and its reduction strategies, purposeful management of risks. The highlighted procedures are the stages of risk-management organization. The first stage in the organization of risk-management is to identify the purpose of risk and risk capital investment. The purpose of the risk is to achieve the desired result. It can be success, interest, income and so on. The purpose of risk capital investment is to obtain maximum income. The second important thing in the organization of risk-management is the availability of environmental information, which is important for any decision-making. There are many types of risks that companies can face at every moment. Any area of the economy, including trade, service and production areas exposes to the risks associated with its own operating mechanism and environment. Each company should be created a system of risk assessment and control over them to prevent such risks and minimize the volume of their negative impact. When entering the international market, it is necessary to identify the main advantages and disadvantages of the enterprise. Enterprises producing consumer goods should be based on both domestic and foreign trade turnover indicators when putting on the foreign market.

UNIQUENESS OF RECOVERY OF THE DIFFUSION OPERATOR FROM THE SPECTRAL DATA

Guldane Mammedzadeh

Azerbaijan State University of Economics (UNEC)

Baku, Istiqlaliyyat str. 6, AZ1001, Azerbaijan

guldane.mammedzadeh@mail.ru

ABSTRACT

The theory of inverse spectral problems attracts the attention of many researchers interested in the theory itself and in its applications. Research in the field of inverse problems of spectral analysis includes finding spectral data that uniquely define an operator, proof of the corresponding uniqueness theorems, constructing an algorithm of recovery of the operator from the spectral data and finding conditions for the solvability of inverse problems. One takes for the main spectral data, for instance, one, two, or more spectra, the spectral function, the spectrum and the normalizing constants, the Weyl function, sequence of signs, scattering data. Depending on the choice of spectral data, the inverse problems differ in their formulations. By now, the problems of reconstructing the Sturm-Liouville and diffusion operators with separated and nonseparated boundary conditions without a spectral parameter have been well studied. Research related to boundary value problems with a spectral parameter in boundary conditions plays a very important role in many theoretical and applied problems of mathematical physics. Application of the method of separation of variables to mixed type partial differential equations, in which differentiation with respect to time is included in the boundary conditions, leads to such problems. Similar problems often arise when studying a number of problems - the construction of systems for protecting devices from shock, vibrations of a string with a load at the end of the string, torsional vibrations of a shaft, vibrations of antennas loaded with lumped capacitors and inductances, etc. In this paper we consider the diffusion operator with real coefficients. The boundary conditions are nonseparated. One of these boundary conditions depends quadratically on the spectral parameter. Some spectral properties of the operator are studied. An asymptotic formula for the spectrum is given. The problem of recovering the coefficients of the diffusion equation and boundary conditions is researched. The spectra of two boundary value problems and a certain sequence of signs are used as spectral data.

Keywords: *Diffusion operator, Inverse problem, Non-separated boundary conditions, Solution algorithm, Uniqueness theorem*

1. INTRODUCTION

Many applied problems from the field of mathematical physics lead to the consideration of boundary value problems with a spectral parameter in boundary conditions (see [1-3]). A large number of works are devoted to the study of such problems. Direct and inverse problems of spectral analysis for the Sturm - Liouville operator with separated boundary conditions and with a spectral parameter in the boundary conditions have been completely solved in many works (see [4-13]). The problems of recovering problems with nonseparated boundary conditions depending on the spectral parameter are considered in [14-18], in which at least two spectra and some additional spectral data are used to recover the unknown coefficients of the differential equation and boundary conditions. Note that the main results and methods related to inverse problems for Sturm-Liouville and diffusion operators with nonseparated (including periodic and quasiperiodic) boundary conditions are presented in [14]. In this paper we study the inverse spectral problem of reconstructing the diffusion operator with nonseparated boundary conditions, one of which depends quadratically on the spectral parameter. A uniqueness theorem is proved and an algorithm for solving the inverse problem is obtained.

The spectrum of two boundary value problems and a certain sequence of signs are taken as spectral data. We denote by $W_2^n[0, \pi]$ the Sobolev space of functions $v(x)$ ($0 \leq x \leq \pi$), equipped with the usual definition of norm

$$\|v\|_{W_2^n} = \left(\sum_{k=0}^n \int_0^\pi |v^{(k)}(x)|^2 dx \right)^{\frac{1}{2}}.$$

Note, that $W_2^0[0, \pi] = L_2[0, \pi]$.

We consider the boundary value problem generated by the diffusion differential equation

$$y''(x) + (\lambda^2 - 2\lambda p(x) - q(x))y(x) = 0 \quad (0 \leq x \leq \pi) \quad (1)$$

And boundary conditions

$$\begin{aligned} y(0) - y(\pi) &= 0, \\ y'(0) - m\lambda^2 y(\pi) - y'(\pi) &= 0, \end{aligned} \quad (2)$$

where $p(x) \in W_2^1[0, \pi]$, $q(x) \in L_2[0, \pi]$ are real functions, λ is the spectral parameter, m is a real number. We denote this problem by $B(m)$.

Note, that $B(0)$ is a periodic boundary value problem. Direct and inverse spectral problems in this case (as well as in the cases of antiperiodic and quasi-periodic boundary conditions) are completely solved by different methods. (see [19-26]). Note that inverse problems in case of $m \neq 0$ have not been studied previously.

2. ON SPECTRUM OF THE BOUNDARY VALUE PROBLEM

A number λ_0 is called an eigenvalue of a boundary value problem $B(m)$ if equation (1) has a nontrivial solution at $\lambda = \lambda_0$ that satisfies boundary conditions (2); in this case $y_0(x)$ is called the eigenfunction of the problem $B(m)$ which corresponds to the eigenvalue λ_0 . The set of eigenvalues is called the spectrum of the problem $B(m)$. The spectrum of the problem $B(m)$ coincides with the set of zeros of an entire function of exponential type

$$\Delta(\lambda) = c(\pi, \lambda) + m\lambda^2 s(\pi, \lambda) + s'(\pi, \lambda) - 2, \quad (3)$$

which is called the characteristic function of the boundary value problem $B(m)$. Let $c(x, \lambda)$, $s(x, \lambda)$ be the solutions of the equation, (1), satisfying the initial conditions

$$c(0, \lambda) = s'(0, \lambda) = 1, \quad c'(0, \lambda) = s(0, \lambda) = 0.$$

It is known [6] that the following representations are valid for functions $c(\pi, \lambda)$, $s(\pi, \lambda)$ and $s'(\pi, \lambda)$:

$$c(\pi, \lambda) = \cos \pi(\lambda - a) - c_1 \frac{\cos \pi(\lambda - a)}{\lambda} + \pi a_1 \frac{\sin \pi(\lambda - a)}{\lambda} + \frac{1}{\lambda} \int_{-\pi}^{\pi} \psi_1(t) e^{i\lambda t} dt, \quad (4)$$

$$s(\pi, \lambda) = \frac{\sin \pi(\lambda - a)}{\lambda} + c_0 \frac{\sin \pi(\lambda - a)}{\lambda^2} - \pi a_1 \frac{\cos \pi(\lambda - a)}{\lambda^2} + \frac{1}{\lambda^2} \int_{-\pi}^{\pi} \psi_2(t) e^{i\lambda t} dt, \quad (5)$$

$$s'(\pi, \lambda) = \cos \pi(\lambda - a) + c_1 \frac{\cos \pi(\lambda - a)}{\lambda} + \pi a_1 \frac{\sin \pi(\lambda - a)}{\lambda} + \frac{1}{\lambda} \int_{-\pi}^{\pi} \psi_3(t) e^{i\lambda t} dt, \quad (6)$$

Where

$$a = \frac{1}{\pi} \int_0^{\pi} p(t) dt, \quad a_1 = \frac{1}{2\pi} \int_0^{\pi} [q(t) + p^2(t)] dt,$$

$$c_0 = \frac{1}{2} [p(0) + p(\pi)], \quad c_1 = \frac{1}{2} [p(0) - p(\pi)],$$

and the function $\psi_j(t)$ ($j = 1, 2, 3$) belongs to $L_2[-\pi, \pi]$. Taking into account these representations and using the Paley-Wiener theorem [19, p. 47], from (3) we obtain the formula

$$\Delta(\lambda) = m\lambda \sin \pi(\lambda - a) + (2 - ma_1\pi) \cos \pi(\lambda - a) + mc_0 \sin \pi(\lambda - a) + f(\lambda) - 2, \quad (7)$$

where $f(\lambda) = \int_{-\pi}^{\pi} \tilde{f}(t) e^{i\lambda t} dt$, $\tilde{f}(t) \in L_2[-\pi, \pi]$.

Using representation (7) and Rouché's theorem, it is easy to establish by the standard method (see, for example, [17]) that the boundary value problem $B(m)$ has a countable set of eigenvalues μ_k ($k = \pm 0, \pm 1, \pm 2, \dots$) and we get the following asymptotic formula for $|k| \rightarrow \infty$:

$$\mu_k = k + a + \frac{a_1}{k} + \frac{2[(-1)^k - 1]}{\pi m k} + \frac{\tau_k}{k}, \quad \{\tau_k\} \in l_2. \quad (8)$$

In what follows, we will suppose that $m < 0$ and the following condition is satisfied: for all functions $y(x) \in W_2^2[0, \pi]$, $y(x) \neq 0$, satisfying conditions (2), the inequality

$$\int_0^{\pi} (|y'(x)|^2 + q(x)|y(x)|^2) dx > 0$$

holds (this inequality is satisfied if $q(x) > 0$). When this condition is satisfied, the eigenvalues of the boundary value problem $B(m)$ are real and nonzero.

3. INVERSE PROBLEM. UNIQUENESS THEOREM

We denote

$$\sigma_n = \text{sign} [1 - |s'(\pi, \lambda_n)|], \quad n = \pm 1, \pm 2, \dots, \quad (9)$$

where λ_n are the zeros of the function $s(\pi, \lambda)$, i.e. the eigenvalues of the boundary-value problem generated by the equation (1) and the boundary conditions

$$y(0) = y(\pi) = 0. \quad (10)$$

According to the formula (8) the spectrum $\{\mu_k^{(j)}\}$ of a boundary value problem $B(m_j)$ ($m_1 \neq m_2$) can be represented as

$$\mu_k^{(j)} = k + a + \frac{a_1}{k} + \frac{2[(-1)^k - 1]}{\pi m_j k} + \frac{\tau_k^{(j)}}{k}, \quad \{\tau_k^{(j)}\} \in l_2, \quad j = 1, 2. \quad (11)$$

The inverse problem is formulated as follows.

Inverse problem - Recover the boundary value problems $B(m_1), B(m_2)$ knowing the sequences $\{\mu_k^{(1)}\}, \{\mu_k^{(2)}\}$ and $\{\sigma_n\}$.

Theorem - If $p(0) = p(\pi)$, then the boundary-value problems $B(m_1), B(m_2)$ are uniquely determined by their spectra $\{\mu_k^{(1)}\}, \{\mu_k^{(2)}\}$ and sequence of signs $\{\sigma_n\}$.

Proof - According to the asymptotic formula (11) we have

$$\begin{aligned} \mu_{2k}^{(j)} &= 2k + a + \frac{a_1}{2k} + \frac{\tau_{2k}^{(j)}}{2k}, \\ \mu_{2k+1}^{(j)} &= 2k + 1 + a + \frac{a_1}{2k+1} - \frac{4}{(2k+1)\pi m_j} + \frac{\tau_{2k+1}^{(j)}}{2k+1}. \end{aligned}$$

Hence, the parameter m_j can be determined by the formula

$$m_j = \frac{2}{\pi} \lim_{k \rightarrow \infty} \frac{1}{k(\mu_{2k}^{(j)} - \mu_{2k+1}^{(j)} + 1)}, \quad (12)$$

as $\lim_{k \rightarrow \infty} \tau_k^{(j)} = 0$. The characteristic function $\Delta_j(\lambda)$ (as an entire function of exponential type) can be recovered as an infinite product.

According to (3) we get

$$\begin{aligned} \Delta_1(\lambda) &= c(\pi, \lambda) + m_1 \lambda^2 s(\pi, \lambda) + s'(\pi, \lambda) - 2, \\ \Delta_2(\lambda) &= c(\pi, \lambda) + m_2 \lambda^2 s(\pi, \lambda) + s'(\pi, \lambda) - 2. \end{aligned} \quad (13)$$

Therefore the characteristic function $s(\pi, \lambda)$ of the boundary value problem (1), (9) can be defined as

$$s(\pi, \lambda) = \frac{\Delta_1(\lambda) - \Delta_2(\lambda)}{(m_1 - m_2)\lambda^2}. \quad (14)$$

Hence we obtain the zeros λ_n , $n = \pm 1, \pm 2, \dots$ of the function $s(\pi, \lambda)$.

Consider the function

$$u_+(\lambda) = c(\pi, \lambda) + s'(\pi, \lambda), \quad (15)$$

$$u_-(\lambda) = c(\pi, \lambda) - s'(\pi, \lambda). \quad (16)$$

According to (13) the function $u_+(\lambda)$ is recovered by the formula

$$u_+(\lambda) = \Delta_1(\lambda) - m_1\lambda^2 s(\pi, \lambda) + 2. \quad (17)$$

Now we will show that in addition to the spectra (from which, as was shown above, functions $u_+(\lambda)$, $s(\pi, \lambda)$ and parameters m_1, m_2 are uniquely reconstructed), it suffices to specify another sequence $\{\sigma_n\}$ in order to reconstruct the function $u_-(\lambda)$ and the function

$$s'(\pi, \lambda) = \frac{1}{2}[u_+(\lambda) - u_-(\lambda)]. \quad (18)$$

As λ_n , $n = \pm 1, \pm 2, \dots$ are the zeros of the function $s(\pi, \lambda)$, then putting $\lambda = \lambda_n$ in the equality $c(\pi, \lambda)s'(\pi, \lambda) - c'(\pi, \lambda)s(\pi, \lambda) = 1$, we get

$$c(\pi, \lambda_n)s'(\pi, \lambda_n) = 1. \quad (19)$$

Squaring both sides of each of the relations (15) and (16) and subtracting the resulting equalities, we have

$$u_-^2(\lambda) - u_+^2(\lambda) = -4c(\pi, \lambda)s'(\pi, \lambda).$$

Putting $\lambda = \lambda_n$ in this equality and taking into account (19), we get

$$u_-^2(\lambda_n) - u_+^2(\lambda_n) = -4.$$

Therefore

$$u_-(\lambda_n) = \text{sign } u_-(\lambda_n) \sqrt{u_+^2(\lambda_n) - 4}. \quad (20)$$

Taking into account intermittency of zeros of functions $s(\pi, \lambda)$ and $s'(\pi, \lambda)$ and the representation (6) of the function $s'(\pi, \lambda)$, we infer that

$$\text{sign } s'(\pi, \lambda_n) = (-1)^n.$$

Hence by (9), (16) and (19) we have

$$\begin{aligned} \text{sign } u_-(\lambda_n) &= \text{sign} [c(\pi, \lambda_n) - s'(\pi, \lambda_n)] = \\ &= \text{sign} \left[\frac{1}{s'(\pi, \lambda_n)} - s'(\pi, \lambda_n) \right] = \text{sign} \frac{1 - [s'(\pi, \lambda_n)]^2}{s'(\pi, \lambda_n)} = \\ &= \text{sign} \frac{1 - |s'(\pi, \lambda_n)|}{(-1)^n} = (-1)^n \sigma_n. \end{aligned}$$

Putting it in (20), we get

$$u_-(\lambda_n) = (-1)^n \sigma_n \sqrt{u_+^2(\lambda_n) - 4}. \tag{21}$$

According to (5) we have

$$\lambda s(\pi, \lambda) = \sin \pi(\lambda - a) + o\left(\frac{1}{|\lambda|} e^{\pi|\text{Im}\lambda|}\right), \quad \lambda \rightarrow \infty.$$

Since $p(0) = p(\pi)$, then from representations (4) and (6) it is clear that the function $u_-(\lambda)$ is an entire function of exponential type not exceeding π and

$$\lambda u_-(\lambda) = \int_{-\pi}^{\pi} [\psi_1(t) - \psi_3(t)] e^{i\lambda t} dt \in L_2(-\infty, \infty).$$

Then according to the theorem 28 (see [16]) the function is uniquely determined by the sequences $\{\lambda_n\}$, $\{\sigma_n\}$, $\{u_+(\lambda_n)\}$ by the interpolation formula

$$u_-(\lambda) = 2s(\pi, \lambda) \sum_{n=1}^{\infty} \frac{(-1)^n \lambda_n \sigma_n \sqrt{u_+^2(\lambda_n) - 4}}{(\lambda^2 - \lambda_n^2) \dot{s}(\pi, \lambda_n)}, \tag{22}$$

where the dot above the function means differentiation with respect to λ . Uniqueness of the constructed function $u_-(\lambda)$ follows from the fact that formula (22) sets up a bijection between l_2 and the space of entire functions of exponential type not exceeding π belonging to $L_2(-\infty, \infty)$. Hence the characteristic function $s'(\pi, \lambda)$ of the boundary value problem generated by the equation (1) and boundary conditions

$$y(0) = y'(\pi) = 0 \tag{23}$$

is reconstructed by formula (18), in which functions $u_+(\lambda)$ and $u_-(\lambda)$ are determined by relations (17) and (22) respectively. The coefficients $p(x)$, $q(x)$ of equation (1) are uniquely determined by the zeros ν_n , $n = \pm 1, \pm 2, \dots$ of the function $s'(\pi, \lambda)$ and the sequence $\{\lambda_n\}$ [7]. Thus, according to the given sequences $\{\mu_k^{(1)}\}$, $\{\mu_k^{(2)}\}$ and $\{\sigma_n\}$ both coefficients $p(x)$, $q(x)$ of equation (1) and the parameters m_1 , m_2 of the boundary conditions are uniquely determined, i.e. boundary value problems are completely recovered. Q.E.D.

4. SOLUTION ALGORITHM FOR THE INVERSE PROBLEM

Bearing in mind the proof of the uniqueness theorem we arrive at the following solution algorithm for the inverse problem.

Algorithm - Let the sequences $\{\mu_k^{(1)}\}$, $\{\mu_k^{(2)}\}$ (spectra of the problems $B(m_1)$, $B(m_2)$) and $\{\sigma_n\}$ be given (see. (9)).

- 1) Using asymptotic formula (11), the parameter m_j ($j = 1, 2$) is found by formula (12).
- 2) With the help of the sequence $\{\mu_k^{(j)}\}$ and the number m_j , construct the function $\Delta_j(\lambda)$ in the form of an infinite product.
- 3) Reconstruct the function $s(\pi, \lambda)$ (the characteristic function of the boundary value problem (1),(10)) using (14) and find the zeros λ_n of this function.
- 4) Construct the function (15) using (17).
- 5) Find the value of function (16) at points λ_n from (21).
- 6) Reconstruct the characteristic function (16) using the interpolation formula (22).
- 7) Define the characteristic function $s'(\pi, \lambda)$ of the boundary value problem (1), (23) by (18).
- 8) Determine the coefficients $p(x)$, $q(x)$ from the sequences of zeros of the functions $s(\pi, \lambda)$ and $s'(\lambda, \pi)$ by a well-known procedure (see [7]).

5. CONCLUSION

The paper investigates the problem of reconstructing the diffusion equation (which is a generalization of the Sturm-Liouville equation) with nonseparated boundary conditions, one of which depends quadratically on the spectral parameter. A pair of dissimilar boundary value problems is considered (boundary value problems are called similar if their characteristic functions differ by a constant). A uniqueness theorem for recovering the coefficients of the diffusion equation and boundary conditions from spectral data is proved. In addition, using the proof of the uniqueness theorem, an algorithm for solving the inverse problem is compiled. The obtained results can be used to solve various classes of inverse problems of spectral analysis for differential operators. Note that the research can be continued to recover boundary value problems with more general boundary conditions.

ABSTRACT

The basis of economic growth in modern global economic development is the transport, especially, air transport. Air transport eliminates political and economic limit problems in strengthening international economic relations. The economically and socially beneficial air transport industry creates potential opportunities for economic growth by coordinating national economies. The influence of air transport on the development of world trade is an indisputable fact that leads to the prosperity of agriculture and the development of inaccessible territories. The role of agriculture in world trade. Impact of the pandemic on agriculture.

Keywords: *air transport, transport industry, economic growth, air transport in agriculture, agriculture in world trade*

1. INTRODUCTION

When analyzing the national economy of a country, first of all, its macroeconomic indicators are considered. Only then can we determine that these indicators are formed depending on the economic policy of the state, political and economic processes in the world market, especially the factors affecting international trade. Economic growth is one of these important indicators, as well as one of the main goals of the country's economy. An economically and socially profitable air transport industry creates the potential for economic growth through the coordination of national economies. The influence of air transport on the development of world trade is an indisputable fact leading to the prosperity of agriculture and the development of hard-to-reach territories. The role of agriculture in world trade is both the main source of food and agricultural raw materials in the world. It is designed to meet the growing needs of the population for food, and the needs of industry for raw materials. Food and its production, distribution, exchange, and consumption are an integral part of the functioning of the world system and have a special place in the world economy and politics. Food is directly related to people's livelihoods, its scarcity is perceived as a disaster. The food market determines the state of the economy and the social stability of society, therefore its development is controlled in all countries. Today, the world's agriculture employs over 1 billion economically active population. World agriculture accounts for about 5% of the world's products. The impact of the pandemic on agriculture has become a clear example of the need to innovate in the agricultural industry. Air transport can be counted as one of the types of innovations in agriculture. Aircraft have had and continue to influence agriculture. The role of aircraft in agriculture is irreplaceable, whether it be in sowing fields, disinfection, as well as in irrigation, this is a small of the listed benefits of aircraft in agriculture. Airplanes have contributed to the development of inaccessible landscapes, thereby alleviating the burden of farmers and benefiting the whole world, because the growth of agriculture leads to the growth of the economy as a whole.

2. THE AIR TRANSPORT IN THE INTERNATIONAL ECONOMIC RELATIONS

Crossing the borders of the national economy, international economic relations, internationalization, integration of production, exchange of specialists, creation of conditions for import and export of factors of production and goods, in short, open and free economy are considered important factors leading to economic growth. It is theoretically based on the theory of comparative advantage of the English economist David Ricardo. The theory deals with the advantages of the international division of labor and specialization in the example of two countries. There is also a trade link between the UK, which specializes in better clothing, and Portugal, which produces cheaper wine. International trade, which is beneficial to the world economy and national economies and has a direct impact on economic growth, is also highly dependent on transport. The development and improvement of transport contribute to international economic development, diversification of international economic relations, and increased integration. Air transport differs from other modes of transport due to its impact on international trade relations, integration opportunities, and the development of interstate economic relations. This difference depends on the speed, elasticity, reliability, safety, etc. of the mode of transport. is to have the main distinguishing features such as. Air transport is the only means of transportation for geographically, politically, and economically limited areas, for high-value products, and for people who want to travel long distances in less time.

2.1. The role of air transport in the economy of Republic of Azerbaijan

Air transport also plays an important role in the economy of the Republic of Azerbaijan. Diagram No. 1 below shows the revenues of the Republic of Azerbaijan from transportation in 2018 by modes of transport. Revenues from transportation in the general transport sector of the country amounted to 6,231.9 million manats (about 3,665.8 million US dollars). 33% of these revenues or 2,066.9 million manats (about \$ 1,215.8 million) are related to air transport. Air transport performance is leading compared to other modes of transport, except for pipeline transport.

Figure 1: Revenues from transportation in the transport sector (in thousands of manats)

2.2. “ASAN Visa”

Like other countries, the Republic of Azerbaijan pays special attention to economic growth. To achieve economic growth, the state has implemented several measures and projects in the field of air transport.

These measures and projects include:

- Strategic Roadmap for the development of logistics and trade in the Republic of Azerbaijan - approved by the Decree of the President of the Republic of Azerbaijan dated December 6, 2016, No. 1138. The decree assesses the participation of the private sector in the work to be done in the field of airlines, the improvement of airport infrastructure, the establishment of a low-cost airline, etc.
- Strategic targets for airlines such as the “ASAN Visa” system - this system was established by the Decree of the President of the Republic of Azerbaijan No. 923 of June 1, 2016 “On simplification of the procedure for issuing electronic visas and establishment of “ ASAN Visa ”system.” Currently, foreigners and stateless persons from 95 countries' e-visas are issued at airports. It is possible to get an accelerated visa within 3 hours through the "Easy Visa" system.

Construction of a new terminal at the Haydar Aliyev International Airport began in 2011 and a new airport complex was commissioned in 2014. There are potential opportunities to increase international freight and passenger traffic. As a result of this work, international passenger and international cargo transportation by air have developed over the years (Figure 2). Thus, in 2018, 1,785,000 international passengers and 206,000 tons of international cargo were transported. The indicators of international passenger and international cargo transportation by years are as follows:

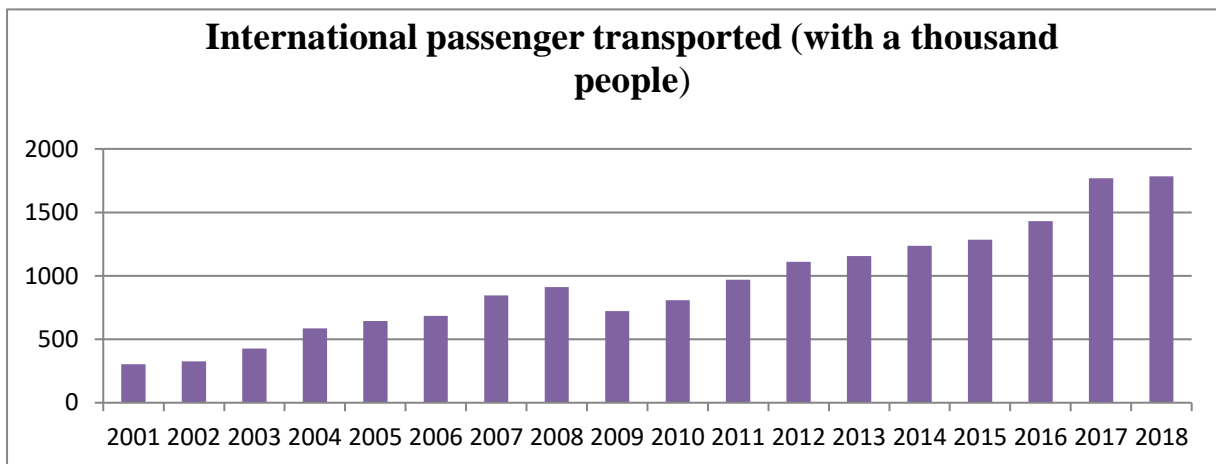

Figure 2: International passengers transported (thousands of people)

Figure 3: International cargo transported (thousands of tons)

Aviation is one of the most important industries in the modern world economy. Due to its economic and social impact, this industry is showing significant positive results in the rapidly growing transport network and the global economy. According to the Air Transport Action Group, a non-profit organization of which the World Bank and international aviation organizations are members, the share of the aviation industry in GDP, which has fluctuated around \$ 75-80 trillion in the world economy over the past five years, is about \$ 2.7 trillion, or 3.4-3.6% (Figure 4). According to the report, more than 60 million jobs are currently created in the global aviation industry. Thus, in terms of economic benefits, economic effects can be grouped as direct, indirect, and forced effects.

Figure 4: Aviation industry (\$ 2.7 trillion); Share in GDP (\$ 75-80 trillion)

Direct impact means that airports, cargo, ground services, etc. are involved in the transportation of goods and passengers by air. areas of economic activity. In figures, the world spends an average of 4 billion a year. passengers and about 62 million tons of cargo. 10.2 million people are involved in these services. In terms of economic value, the direct impact on world GDP is \$ 704.4 billion, or about 0.88%.

2.3. Air transport in the tourism

Air transport also plays an important role in the tourism industry, which has become one of the leading economic sectors in modern times and is an important area in terms of economic growth. Air transport in this area accounted for 897 billion US dollars or about 1.12% of GDP. More than half of passenger traffic for tourism purposes is carried by air. The second place in passenger transportation is road transport, the other places are water and railway transport. Based on the above information, it can be noted that the benefits of air transport to GDP, economic growth, employment, and development of the world economy are significant. Unlike other modes of transport, air transport depends on the level of development of international economic relations, political and economic policies of countries, trade openness. Air transport also plays an important role in the development of economic relations between countries. Given this, the development of air transport has always been a priority for all countries. Because air transport is the most important mode of transport leading to economic growth.

3. AIR TRANSPORT ROLE IN THE DEVELOPMENT OF THE AGRICULTURAL SECTOR

The role of air transport in economic growth is undoubtedly indisputable, as evidenced by their role in the agricultural sector. Growth rates in the agricultural sector affect economic growth in general. Air transport plays a significant role in the development and growth of modern agriculture. Today, in agriculture, air transport is not a luxury, and therefore widespread introduction and use of agricultural aircraft and helicopters. They are mainly used for spraying liquid chemicals that contribute to control pests, weeds, diseases of crops and help farmers to

maximize crop yields. Agricultural aircraft are used for insecticides and fungicides and are also used for planting fields, fertilizing crops, and even irrigating areas. Modern agriculture uses advanced aerial technology and global positioning systems (GPS) and geographic information data (GIS) to help aerial applicators deliver a product with incredible accuracy, minimizing product drift to surrounding areas. As agricultural aircraft can handle large areas of it, mainly used in open fields. Recently, UAVs have been used for small croplands. The air tractor, which is one of the leading manufacturers of specialized aircraft for agriculture, whose aircraft can operate in hard-to-reach positions.

3.1. Agriculture in the modern world economy

Agriculture is one of the most important structures in the modern world economy, which ensures the satisfaction of the population in nutrition and industrial raw materials. Global agricultural exports have more than tripled in value and doubled in value since about 1995 to exceed \$ 1.8 trillion in 2018.

Figure 5: Global agricultural 1995 to exceed \$ 1.8 trillion in 2018

3.2. Food crises and the pandemic

While total trade fell sharply in the first half of 2020, agricultural and food exports increased 2.5% in the first quarter compared to the same period in 2019, with further increases in March and April. But the crisis has seen upward pressure on food prices and, consequently, on producer incomes. Besides, global food supplies and production levels for widely consumed staple foods such as rice, corn, wheat are at an all-time high. For the impact of the pandemic on jobs and productivity has increased the number of hungry people in the world. The State of Agricultural Commodity Markets 2020 (SOCO 2020) argues that global trade and well-functioning markets are at the heart of the development process, as they can stimulate inclusive economic growth and sustainable development, and increase resilience to shocks. "We need to rely on markets as an integral part of the global food system. This is all the more important in the face of serious shocks, whether caused by COVID-19, locust outbreaks, or climate change," wrote the FAO Director-General. Qu Dongyu in the introduction to the report. According to Dr. Glauber's forecasts, the WTO predicts the impact of COVID-19 on global trade in 2020 under three recovery scenarios, namely:

- Agricultural trade-in value terms in 2020 will fall 6.5% in a V-shaped recovery, 11.2% in a U-shaped recovery, and 12.7% in an L-shaped recovery.
- In 2020, the underlying value of processed food trade is projected to fall 7.4% in a V-shaped recovery, 12.6% in a U-shaped recovery, and 13.4% in an L-shaped recovery.

The food crises of past years have made the world more prepared for today. Chart 5 shows that in 2019, global stock-to-consumption ratios for staple foods were much higher than in 2008, under tough conditions for these foods. Stocks of only rice and wheat in China were enough for 13 months for domestic consumption.

Figure 6: World stock-to-use ratio of select food commodities (Percentage)

Given these facts, it can be argued that food supplies cannot be called a strategy to be followed at present; instead, one of the most significant measures to tackle food insecurity is keeping open channels for international trade (International Food Policy Research Institute, 2020). Food security requires a transition to a new type of agriculture. There is increasing attention from international organizations and national governments for the transition to precision farming. Precision farming includes precision farming and precision livestock farming. Mainly air transport is used in Precision farming. In addition to air transport, the latest technologies are also used. Precision farming elements can be represented in diagram 6. These elements are used and will be used in the future.

Figure following on the next page

Figure 7: Precision farming

Analysis of global trends in the development of agricultural production is proof that the Agro-Industrial Complex in recent years has been based on a wider application of information and telecommunication technologies, electronic automated systems, as well as air transport.

4. CONCLUSION

Taking into account these facts, we can say that air transport has made and continues to contribute to the development of the agricultural sector, which in turn leads to economic growth. Today, air transport provides international connections, thereby making the concept of a "global village" real, connecting more than 220 countries with regular flights. More than 36,000 airport pairs operate non-stop. World Bank studies have shown that 80% of cities in the world, large and small, can be communicated through a maximum of two transfer points. It is clear that the aviation aspects and interdependencies of sustainable development in agriculture are neither intuitive nor easy to understand or manage effectively. As well as the problems of agricultural development facing aviation itself, it is not limited to the harmful effects on the environment, which define the traditional territory of aviation "environmental" interests. Collectively, aviation may need to move to a "sustainable development platform" to offer a well-founded case to maintain its license to operate and develop sustainably in agriculture. It is imperative and imperative to seize every opportunity to enhance the focus on aviation's aggregate contribution to overall sustainable development goals. Balanced consideration of economic, social, and environmental interests and concerns in both public and individual decision making. Overall, aviation can play a useful role in sustainable development.

feyzullaev@bk.ru*

ABSTRACT

In the modern world, in a tough competitive environment, quality factor is of more importance. The process of quality management should have a finished look only after achieving high results in the field of quality. This article has conducted a study on quality management in an educational institution, on identifying tools that influence the achievement of quality indicators of the main directions of an enterprise management system approach. A system of factors influencing product quality has been developed in four directions: quality planning, quality assurance, quality control, quality improvement. In order to determine the effectiveness of the formed quality management system of an educational institution, the main components are proposed that are combined into the following groups: quality of the planning, analysis and control system; the quality of the organization of the educational process; the quality of the process management; the quality of the final product and the positioning of the institution. The optimal management styles of higher education institutions are analyzed and justified. At the same time, world-class authors' development was used in the field of analysis of the quality of management processes. The author's definitions were given to consumers and the result - the end product of the educational process. The achieved results of the research can be used by higher institutions in the course of determining the main directions of the organization's quality management process.

Keywords: *quality, quality management, process efficiency, quality management, complex indicator*

1. INTRODUCTION

The first researcher of quality is considered the Greek philosopher Aristotle. Back in the IV century BC in his work “Metaphysics”, he defined the quality as follows: “quality, on one hand, refers to the species difference of an entity; for example, a person is a certain qualitatively defined animal, because this animal is two-legged, and the horse is four-legged; and the circle is a certain qualitatively defined figure, for this figure is without corners, so the quality is the distinctive aspect of the essence”[1]. Quality is a complex category that can be viewed from different positions such as philosophical, social, technical, legal, economic [2](see pic. 1.).

2. METHOD

Using the methods of observation, grouping, induction, deduction and classification, a system of factors influencing product quality in different directions was analyzed and developed.

3. THEORY AND ANALYSIS

One of the pressing issues of modern production process is product quality management. The study of quality issues and its impact on consumer demand all times were in the field of view

of scientists. The history of the development of research in the field of quality in the times of Soviet Russia was accounted for the 20-30-th years of the last century. In 1921, the Central Labor Institute was created, headed by A. K. Gastev. The works of A. K. Gastev still have not lost their scientific and practical significance, and his book *How to Work*, being an introduction to science of the system of work organization, is of particular interest from the point of view of developing the theory and practice of quality management in Russia [3]. A significant contribution to the formation and development of the theory and practice of quality management was made by such domestic scientists as G. G. Azgaldov [4], O.K.Antonov, A.V.Glichyov[6], B.V.Gnedenko, K.I.Klimenko, M.I.Kruglov[7], D.S.Lvov, V.I.Sedov, V.I.Siskov, A.I.Subetto[8], V.P.Panov, D.L.Tomashevich, Ya.B.Shor[9], L.Ya.Shukhgalter and others [10]. One of the outstanding Russian scientists who made a great contribution to the development of the theory and practice of quality management both in Russia and abroad was Vasily Vasilyevich Boytsov. He formulated the theoretical and methodological foundations of quality management of all elements of the life cycle of technical objects. V.Boytsov was at the origin of the creation of a modern domestic state standardization system, the reference base of the country, which occupies an important place in solving issues of production organization and improving product quality. From 1963 to 1984 he headed the State Standard of the USSR. His scientific developments were reflected in numerous publications (“Problems of automation and mechanization of small-scale production”, “Complex normalization of elements of the production process”, “Engineering methods for quality assurance in mechanical engineering” and others). In the Soviet Union, a schematic diagram of the mechanism for managing the quality of products was developed at AUSRIS (All-Union Scientific Research Institute of Standardization) Glicev and M.P. Babin in the second half of the 1960s [11]. Simultaneously with the concept of the mechanism of product quality control in the 1960s, a model was introduced on the pages of the Russian translation of a brochure by Dutch experts J. Ettinger, J. Sittig, later called the “quality loop”. Nowadays, other approaches to the system quality issues solution proposed by quality specialists in different years, currently referred to as “patriarchs” or “mentors” in quality - J. Juran[12]., A. Feigenbaum[13], Chris Felix Brandon, Robert I. Cole, Tito Conti, Jens J. Dulgaard, Edward Fuchs, Soo Mi Pak Dalgaard, Yoshio Kondo, Gregory Watson, William Edwards Deming[14]., Schuhart Walter Andrew[15]., etc. Currently, the concept of "quality" is a complex indicator. The quality management process has become an integrated systems approach. Today, the first step towards the integration of quality management systems into integrated enterprise management systems has become the formalization of the body of knowledge in the field of quality and the complex of methods and means of its provision. In the future, it is expected to use TQM models and ISO 9000: 2000 standards as the basis for the creation of integrated management systems, taking into account the specific features of a particular enterprise. But for the organization of effective quality management, it is necessary to follow four basic procedures:

- 1) quality planning;
- 2) quality assurance;
- 3) quality control;
- 4) quality improvement.

Quality planning is an action involving the definition of the necessary characteristics of the object and the establishment of their target values. Quality management calls such actions the setting of quality objectives. Also, quality planning includes defining the processes and resources needed to achieve goals. Quality assurance is a systematic (regular) activity, through which you can fulfill the established requirements. It includes works on production, management, material support, maintenance, etc. Quality control is an activity to assess the compliance of a control object with the established requirements.

Assessment activities may include measurements, tests, observations, monitoring, verification, calibration, and other measures that result in a comparison of the values of the observed characteristics with the specified ones. Quality improvement is the implementation of actions by which you can increase the ability of the organization to meet the requirements for the object. Under the notion of “object”, quality management considers products, processes, a management system and the organization as a whole [16]. In order to determine the effectiveness of the formed quality management system, it is possible to combine the main components into the following groups (see pic.2):

- 1) The quality of the system of planning, analysis and control;
- 2) The quality of the organization of the educational process
- 3) The quality of process management;
- 4) The quality of the final product and the positioning of the university

Let's consider and analyze in detail the quality management of each of the selected groups. The quality of the planning system depends on the following factors: the reliability of the initial information, the time spent on planning, the qualifications and skills of the workers. What is the weak link in this top three? Why is it considered that quality planning in companies is lame? Maybe the problem is in the principles of planning, and maybe in the management of the planning process itself. According to my numerous observations, often the management of the enterprise sees a problem in the workers involved in planning, i.e. question the qualifications, abilities and competencies of the performers themselves. I disagree with this, for the simple reason that not all performers can be unqualified; this calls into question the quality of the work of the personnel management service. Sometimes executors do not have specific final source data and are limited by the time for processing this information. The reason for improper planning is incorrect formulation of tasks, poor quality management of the planning process, and lack of specificity in decision making. Analyzing the effectiveness of processes is even harder to assess. Why the results of the analysis may be poor quality? Because the data being analyzed is obsolete, not true, the analysis is belated. The collection of necessary information is often lost in the department institute segment; it is possible that it is falsified in this final point. But the question is, do we need such an analysis? In order for the analysis to be effective it is necessary to observe the following principles: transparency, simplicity of perception, target character, necessity. Observance of these minimum necessary principles will give us the opportunity to get a qualitative and capacious analysis, without excesses. Qualitative analysis should give a truthful result, identify the causes of deviations, and contribute to the elimination of comments. What about the quality of control in higher educational institutions? Often, the leadership of a higher education institution, being overly focused on control, even forget about the importance of continuity of the educational process. Total control, and unsystematic – is the "calling card" of Russian higher educational institutions. The observation of the author shows that annually the number of controlling and controlled indicators in educational institutions is growing exponentially. In this regard, the existing management approach in higher educational institutions expresses the well-known law of the dialectic of the transition of quantity to quality. Thinking that the preparation of a larger number of documents, maximum request for requirements will lead to a qualitative result in the field of control, in fact, in the pursuit of quantity, the company does not receive the required minimum tasks. Hence the opposite effect: a formal approach to the performance of tasks. The periodic appearance of new forms of reporting and analysis that are not properly coordinated, inconsistent with the usual requirements for documenting management activities and organizing work with documents that contradict economic concepts and the existing regulations at the enterprise, leads to a complete dampening of the work of the performers. It turns out that the company is not able to systematize these requirements and actually carry out quality control of the implementation of tasks and

processes. The second section covers the issue of the quality of educational process. Here we must take into account at least three quality components: the level of preparation of work programs of disciplines, the quality of staffing the educational process, the quality of the organization of educational process. The first of these components relates to the formal factor, and the quality control of this document is carried out by incompetent workers in this field. The quality of the preparation of these documents greatly influences the final result of the educational process. Own departments having qualified personnel in the field of checking work programs could have a significant role to play in solving this issue. The quality check of the work programs of the disciplines should be carried out by these departments before the formation of the educational process. At present time, in many higher educational institutions, the departments themselves have to understand, analyze, and identify shortcomings of work programs, as well as determine the feasibility of teaching a particular discipline in courses. Such a superficial assessment often goes against the goal of institution. Therefore, the quality of preparation of work programs of disciplines must be at the proper level. And this question is one of the most important and an indicator of the quality of the educational process. The quality of staffing of the educational process, the question of an internal nature depends on the management skills of the staff of the institution itself. The factors affecting quality are: level of education, practical work experience, oratorical skills, words and training of an employee, etc. The quality of staffing a higher education institution depends not only on the qualifications of the potential applicant, but also on the internal factors and employee loyalty, stress resistance etc. However, it is not possible to verify these characteristics of the applicant, since the process of admission to work takes place by voting on the academic councils of the institute and the university consistently. In order not to be mistaken with the choice of the school security service, it is necessary to collect information about each applicant. Although everything is already known about one's own employees who have been working in the institution for more than one year, it's not easy to gather information about external contestants. The quality of work of the labor collective cannot be assessed in the conditions of mistrust of them. Competitive struggle for power and efforts to increase its significance - its "I", leads to ignoring alternative views, to totalitarianism, the authoritarian style of managing the organization. Opinions of middle management, top managers of managed societies can make a significant contribution to improving the quality of various processes. A clear distribution of functions and powers, compliance with regulations, the immutability of the rules of behavior - these are the main components of ensuring high-quality work of labor resources. Currently, in many road-building companies there is no record of such parameters. Providing an enterprise with financial resources is one of the significant tasks. The company must have a stock of financial resources, both own and borrowed. In the conditions of "expensive money" it is inappropriate to keep large balances on current accounts, money must work. The stock of open credit lines is a pledge of success; is a job ahead of time and a competitive advantage of a company over its competitors. Due to this reserve, you can fearlessly participate in various auctions and contests; make a worthy competition to opponents. Another issue is the price of borrowing. Undoubtedly, any company wants to get loans and loans at the lowest possible rate. However, this is not always the case. Experience shows that interest rates on attracted funds depend on the market situation: the prices of money in the interbank market, in the deposit market, the key rate of the central bank, the importance of the borrower for the credit institution, the company's reputation in the market, personal relations of the company management of the borrower and the lender, etc. The current uncertainty in the economic policy of the state leaves a negative imprint in the relations between borrowers and creditors and has already led to the freezing of the lending process, lengthening the time for consideration of applications, to an increase in interest rates to 19% due to risk premiums. These and other factors lead to a decrease in the quality of financial support of the enterprise.

The quality of the organization of the educational process directly depends on the above factors: well-prepared work programs of disciplines, timely provision of resources, and high-quality organization of the educational process. Evaluation of the quality of the final result is given by the customer. Therefore, the fact of recognition of diplomas, and the recruitment of graduates of an educational institution by the customer can be considered as a sign of the quality organization of the educational process. The third section for a comprehensive quality assessment includes the group “quality of management of an educational institution”. The most important component in this group is process management. In many higher educational organizations, an algorithm of business processes has been formed. However, it did not work at full capacity. The role of the Board of Trustees, as well as the President in the management of many educational institutions is minimal; in fact, these bodies do not perform their basic functions. Control by the Board of Trustees on various issues is a mechanism of success of an educational institution proven by international experience. Members of the Council need to attract qualified, interested people from enterprises of different industries. To improve the quality of the work of the Board of Trustees, the participation of independent directors is also necessary; this will give an additional impetus due to an alternative view on existing problems. The choice of a predominantly authoritarian management style by many Russian companies (other management styles: democratic (collegial) and liberal (permissive)) does not mean that this style has some negative sides. But at the same time, one should not forget that the head with this style is a supporter of centralized management, has sufficient power, rigidly dictates his will to the performers and most often addresses the needs of lower levels based on the concept that people are by nature lazy, avoid work and responsibility, and to make them work, you need to use coercion, control, and threat. He makes decisions alone, based on personal experience and intuition; directivity determines the functions of subordinates, preventing them from taking the initiative; strictly controls their actions, stops all criticism, and gives the performers a minimum of information; only he knows the actual state of affairs in the team and prospects for further development. Formally, such a manager relies on the established management hierarchy, the current management structure and the system of rights and obligations of employees. However, an authoritarian power that does not know compassion and compromise is not necessarily characteristic of a strong personality. More often, this leadership style is preferred by weak and primitive bosses, who are striving to become “indispensable” [17]. With a liberal management style, a liberal leader should master the principle of delegation of authority, maintain good relations with informal leaders, be able to set tasks correctly and determine main areas of work, coordinate staff interaction to achieve common goals. The most dangerous test for a liberal management style is the emergence of conflict situations, a kind of battle of ambitions, the likelihood of which is very high in a team of gifted, extraordinary personalities. To improve the quality of management cannot be content with only one management style. It is necessary to obtain a synergistic effect from the use of the different possibilities of each management style using administrative, economic and socio-psychological methods. An employee who is not interested in his work will not stay long in the company. The loss of skilled experienced personnel who are still able to work and generate income for the company will, in time, adversely affect efficiency. This will be the result of poor-quality management of all processes of the enterprise. The last group of quality assessment includes the quality of the final product, the quality after-sales service, the quality of trusting relationships. The final product of an educational institution is a high-quality construction and installation work for the construction, repair and reconstruction of highways that satisfies the customer and consumers. We would call such a product a “product to meet consumer requirements of stakeholders” (PMCRS). But at the same time, another characteristic feature of the PMCRS is the satisfaction of the personal needs of producers, through the material, moral, and other benefits created in the course of performing work and services.

The quality of after-sales service is manifested through the fulfillment of warranty obligations. The better the final PMCRS, the less the need for warranty work and post-warranty service. The quality of trusting relationships is assessed between the enterprise and its employees, suppliers, customers, credit and financial organizations, and other counterparties. The tense situation in the team, creates an atmosphere of mistrust between managers and managed. Constant pressure, the search for "extreme", humiliation, underestimation, and sometimes frank insult to the feelings of subordinates - an erroneous management approach, the purpose of which is to increase the efficiency of the company as a whole. This can lead to the division of the team into groups, a decrease in productivity, work output and, ultimately, a drop in the quality of work, participation rates, and work discipline. A similar attitude towards suppliers of various goods and services is fraught with a decline in the company's reputation.

4. CONCLUSION

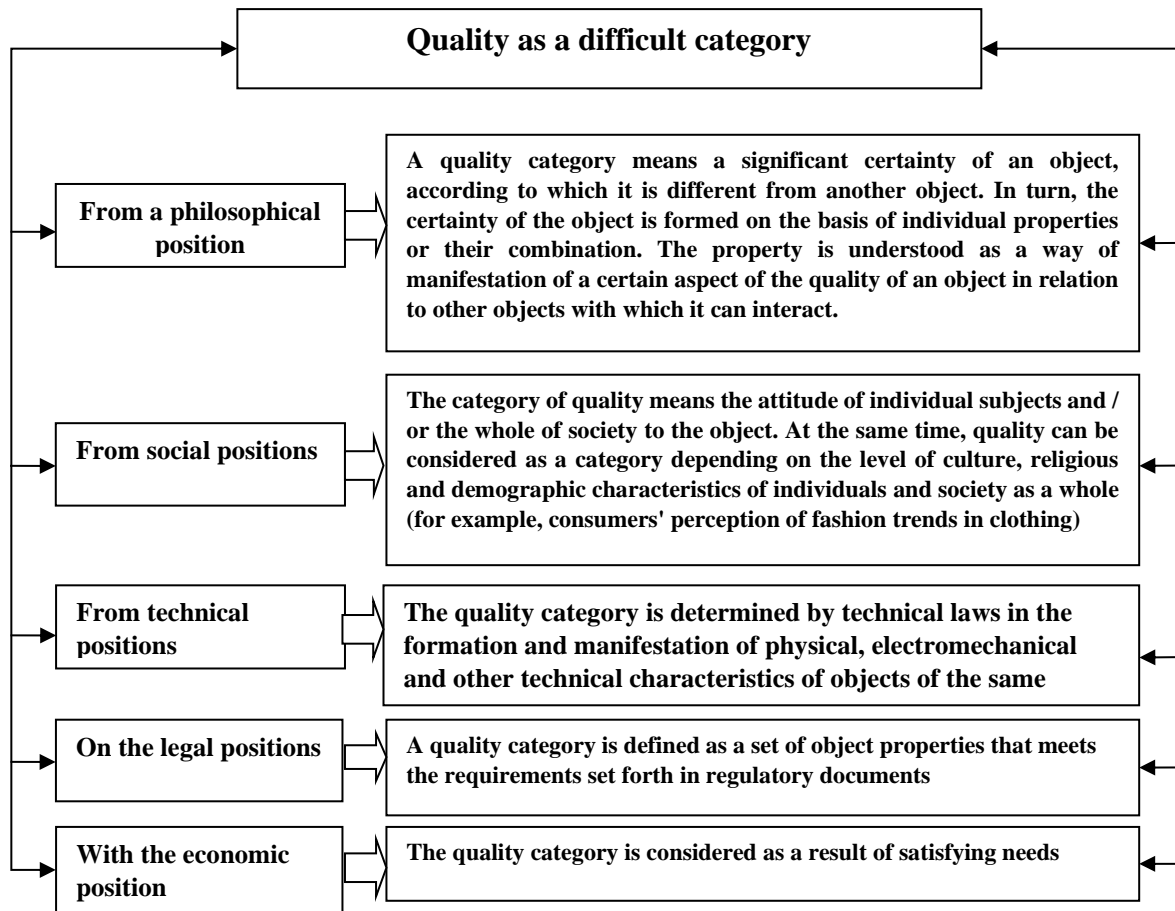

In conclusion, I will cite the words of E. Deming: "The problem is not quality improvement. Quality improvement is the solution to the problem." Companies need to analyze, identify, and find solutions to existing problems of the enterprise. He noted that "interfering with a stable process (i.e. making changes in response to ("common causes")) only worsens the system's performance." Two of the 14 key principles of E. Deming sound like this: "put an end to the dependence on mass control, give workers the opportunity to be proud of their work" [18]. Only in this way it is possible to achieve high-quality implementation of the stages of the production process.

THE PROBLEMS OF FORECASTING OF THE SELECTION OF SOURCE OF FINANCING OF OIL AND GAS PROJECTS

Mirelem Hasanli

*Professor at Azerbaijan State University of Economics (UNEC),
Department of "Finance and financial institutions", Azerbaijan
m.hasanli@unec.edu.az*

ABSTRACT

The oil and gas complex is the most important structural element of the economy, one of the key factors in overcoming crisis phenomena. Revenues of oil and gas companies form a significant part of the state budget, provide more than half of the country's export potential. The oil and gas complex is a capital-intensive industry requiring significant investments in both the exploration and production and refining sectors. In the exploration and production sector due to the depletion of the resource base of traditional hydrocarbon production areas, subsoil users are forced to develop more inaccessible deposits in the northern latitudes or on the shelves of the seas, which is associated with an additional amount of capital investment. Firstly, at present, the oil and gas complex, which determines the development of the national economy, is faced with a number of problems, the main solution of which is the introduction of high-tech technologies, the development of innovative activities. Secondly, statistical data show that in terms of their level of innovative development, significantly behind the foreign one due to insufficient funding. At present, the main source of financing the innovative activity of oil and gas companies is their own and state funds, while in world practice the implementation of innovative activity is due to the developed financial support process based on the interaction of science, business and the state. Thirdly, in addition to their own funds, foreign oil and gas companies use external sources of financing.

Keywords: *state, oil and gas sector, tax incentives*

1. INTRODUCTION

The oil and gas market was extremely volatile and is characterized by a number of price shocks. Moreover, each period in which price shocks were observed requires its own interpretation. Market volatility can be explained by the presence of many factors, among which the main ones are the shock of supply and demand, as well as shocks in the financial markets, oil and gas revenues play a leading role in the formation of the national financial system, as it is a powerful source of new economic growth and stimulation of the financial platform for business development. However, along with budget financing, modern mechanisms to support the real sector of the economy require a more progressive method of financial support. In this regard, let us consider the existing practice of project financing of the real economy. The oil and gas complex is the most important structural element of the economy, one of the key factors in overcoming the crisis. The revenues of oil and gas companies form a significant part of the state budget and provide more than half of the country's export potential.

2. INVESTMENT PROJECTS IN THE OIL AND GAS SECTOR OF THE ECONOMY: TERMS OF IMPLEMENTATION AND A HIGH DEGREE OF RISK

The oil and gas business is significantly influenced by the conjuncture of the world oil market, which, in turn, is characterized by a high degree of instability and uncertainty due to situational crisis phenomena on a global scale. It should be noted that a significant drop in world oil prices worsens the profitability of Russian companies and forces them to look for other sources for financing and subsequent development of domestic oil refining capacities. The oil and gas complex is a capital-intensive industry requiring significant investments in both the exploration

and production and refining sectors. In the exploration and production sector, due to the depletion of the resource base of traditional regions for hydrocarbon production, subsoil users are forced to develop more difficult-to-reach deposits in the northern latitudes, or on the shelf of the seas, which is associated with an additional volume of capital investments. The volume and availability of financing for an investment project directly affects the development and successful implementation of the project. Investment projects in the oil and gas sector of the economy have long implementation periods and a high degree of risk; therefore, it is important to determine the most profitable sources of project financing and their rational combination. Thus, the problem of choosing a source of financing is relevant today for capital-intensive and capital-intensive industries. The aim of the study is to develop and substantiate a methodological approach to the assessment of investment projects, taking into account financing options in the oil and gas industry under conditions of uncertainty and risk. In accordance with the set goal, the following tasks were formulated:

- improving the methodological approach to the assessment of investment projects, taking into account financing options in conditions of uncertainty and risk;
- approbation of the developed methodological approach in the study of the effectiveness of the development of an oil field, depending on the choice of the source of funding;
- sensitivity analysis of project performance criteria to key parameters of funding sources.

The accumulated financial potential will make it possible to carry out the necessary capital investments. Intellectual potential will make it possible to most effectively use the knowledge and experience of workers in the oil and gas industry in the design and development of both oil and gas fields and unconventional sources of hydrocarbons, management experience - to plan the systematic development of the surveyed area. Small oil companies do not always have the ability to finance oil projects from their own resources. In addition, a feature of small oil companies is a high level of proceeds from the sale of raw materials, which makes it difficult to classify them as small or medium-sized businesses. Therefore, small oil companies in most cases cannot qualify for state support, which the state guarantees to small and medium-sized businesses. In this regard, the problem arises of attracting external resources and efficient allocation of financial resources. In order to consider the influence of the choice of various sources of financing on the final indicators of the effectiveness of the development of an oil field, the following options were selected: financing of the project at the expense of its own funds; debt financing, taking into account reinvestment; financing the project only by attracting borrowed capital. In world practice, the implementation of innovative activities, the creation and implementation of new technologies of oil and gas complex occur due to a developed process of financial support based on the interaction of science, business and the state. As a rule, the state finances not only targeted socially significant programs, but also by creating favorable competitive conditions in the form of indirect financing of innovative activities of enterprises stimulates them to increase research costs, increases their innovative activity.

3. ORGANIZATIONAL AND ECONOMIC MECHANISM FOR FINANCING COMPANIES IN THE OIL AND GAS INDUSTRY

The public sector, by participating in the financing of targeted projects, contributes to an increase in their innovative activity, diversification and the creation of a competitive environment through tax incentives. Therefore, in the interests of implementing strategic national priorities, measures are proposed to optimize the financing of innovative activities of NGP.

It is expected that venture financing through the creation of corporate funds, joint and state financing through tax incentives will allow the oil and gas complex to become the main consumer of innovations and increase the competitiveness of the industry in the world market:

- Revise methods of indirect financing, introduce tax incentives for organizations engaged in innovative activities in the production, processing and transportation of oil and gas, differentiation of tax depending on profitability.
- Creation and development of financing for innovative projects on the basis of a corporate venture fund.
- Creation of a competitive environment in the oil and gas complex, conditions allowing the development of natural minerals in the most efficient way; attracting external direct and venture investors.
- Create a corporate venture fund, defining its main parameters, potential sources of projects (internal and / or external), the role of the fund in the company.
- Increase co-financing; provision of innovative projects to third-party organizations; increased demand for external developments.
- Reducing the duration of the technological cycle; improving the efficiency of financial support for innovative activities of companies.

It is quite obvious that the key sources of financing for NGP companies are concentrated in a single organizational and economic mechanism: forecasting targeted budget financing, organizing the attraction of external borrowed sources and corporate management of investments, capital and profits. Taking into account the adaptation of this mechanism to the practice of the operation of the oil and gas complex, it is advisable to develop a strategy for the long-term selection of targeted sources of financing and prevention of external risk factors: negative inflationary processes, unfavorable political decisions, deterioration of monetary policy. However, the companies of the studied branch of the economy should pay the greatest attention to the assessment of internal factors: the adequacy of equity capital, break-even and profitability, the effectiveness of management decisions, including in terms of ongoing investment projects. Thus, the methodology for forecasting the socio-economic development of regions is based on a combination of three principles:

- coordination of prospective values of indicators that determine the economic development of both the country as a whole and its regions;
- taking into account the trends that have developed in retrospect in the dynamics of the regional structure of the country's economy, determined by changes in the sectoral structure of the regional economy;
- taking into account large investment projects accepted for implementation, which in the forecast period determine qualitative changes in the sectoral structure of the economy of individual regions and the regional structure of the country's economy as a whole.

The expected qualitative changes in the regional and sectoral structure of the economy in the future depend on the consequences of the implementation of large investment projects, which are forecasted for implementation in various sectors of the economy. Forecasting and planning the development of energy systems is impossible without long-term and reliable forecasting of the development of the economy and social sphere of states, regions and municipalities. The territorial infrastructure, the basis of which, along with the transport, is the fuel and energy complex, largely determines the success of the implementation of long-term regional programs and strategies. The effectiveness of decisions on the development of infrastructure and improving the energy security of the region is determined by the objectivity and validity of the information obtained from the forecasts. The problem of forecasting the development of individual economic complexes acquires significant difficulties in the context of global

economic and political instability, as well as the ongoing restructuring of individual industries and enterprises. The dynamics of development and structural shifts in the economic complexes of the regions are determined, on the one hand, by the general strategic directions of economic development. To substantiate forecasts for the development of regional energy, theoretical approaches, methods and models are required that correctly and fairly fully reflect the specificity of forecasting territorial economic systems. In addition, a reliable informational justification for the forecast is required, including programs of socio-economic development, investment programs for energy development, strategies for restructuring and modernizing energy-intensive industries.

4. CONCLUSION

Thus, as a result of a comparative analysis of the specifics of financing oil and gas projects, the following conclusions were drawn. First, at present, the oil and gas complex, which determines the development of the national economy, is faced with a number of problems, the main solution of which is the introduction of high-tech technologies, the development of innovative activities. Secondly, statistical data show that in terms of its level of innovative development, NGP lags significantly behind foreign ones due to insufficient funding. Currently, the main source of financing for innovative activities of companies in the oil and gas sector is their own and public funds, while in world practice, innovation is carried out through a developed process of financial support based on the interaction of science, business and the state. Third, foreign oil and gas companies, in addition to their own funds, also use external sources of financing.

ABSTRACT

A cluster is a relatively fixed and stable collection of specialized enterprises that produce competitive products in the industry. In other words, clusters are systems of business entities operating in a similar sector, complementing each other and having communication capabilities in a particular geographical area. Within the cluster, there is competition between small and medium-sized businesses operating in a similar field. One of the main conditions for business entities and other participants to act at the same time is to gain a competitive advantage. At the same time, with the introduction of the system, the costs of business entities are reduced, marketing opportunities are expanded, productivity is increased, exports are increased, research and development capabilities are strengthened. This leads to the launch of new products, the establishment of new relationships, increased employment, regional development, and the improvement of infrastructure services. Geographically suitable area, abundance of natural resources, availability of scientific base, professional staff and developed infrastructure are important factors for the creation of industrial clusters. In order for industrial clusters to operate sustainably, reliably and productively, the state's cluster policy must be perfect and provided with working mechanisms. In this case, first of all, the state should develop a targeted cluster strategy and define specific approaches to clusters, their application models, goals and objectives, priority development directions. The most effective, competitive and perspective direction of small business development is its cooperation with large business through the formation of clusters. The development of a cluster network provides certain benefits to both government and business. Such benefits for the government include increasing the tax base, reducing dependence on individual business groups, increasing opportunities for economic diversification; for business, improvement of personnel infrastructure, creation of scientific and technical research infrastructure, reduction of costs, access to international markets and etc.

Keywords: *clusters, competitiveness, small and medium business, innovation activity, conditions of clustering*

1. INTRODUCTION

Clusters are the grouping of closely related industries in the region that serve to increase the material well-being of the population through the export of goods and services. The fact that clusters cover all links in the supply chain, as well as the integration of infrastructure, distinguishes them from traditional industries. Clusters concentrated in areas with high flows of goods and services create value for the country's economy. Clusters are formed by the fact that enterprises with certain similarities, trade and production relations operate in the same geographical area. It is not appropriate to limit clusters to companies within them. They include organizations, institutions and structures that help create economic value. The interaction of producers, consumers and competitors in a given area increases economic activity and specialization. Competition in a certain area increases the need for new technology, which leads to the formation of industrial clusters. Industrial clusters are formed as a result of the interaction of factors that are important for increasing the country's competitiveness. Geographical boundaries and competition are key factors in the concept of cluster. Industrial clusters have

emerged as a result of the development of competition and mutual relations. Under the influence of the three effects of the cluster (scale, coverage, synergism), they can increase labor productivity and reduce the cost of production. The main positive effect of the cluster is the synergistic effect, which occurs during the overall standardization of the product. In the last 20-30 years, a group of developing countries with strong industrial potential in the world economy has emerged. The economic potential of countries such as China, India, Brazil, Russia, Mexico, Indonesia and Turkey is constantly growing due to the rapid development and innovation of modern industries. China, the world's leader in the pace of accumulating strong economic potential, ranks second in the world economy after the United States due to the complex, rapid development of industries. The rapid development of industries is expected to make China a major player in the world economy from 2025 through clustering. One of the key points in this process is to give preference to more efficient use of industrial clusters in increasing industrial potential, organizing the production of highly competitive export products.

2. THE IMPACT OF CLUSTERS ON INCREASING THE COMPETITIVENESS OF THE NATIONAL ECONOMY

The creation of industrial clusters is important in the formation and development of the competitiveness of the economy. The main goal here is to support the development of industry, to ensure the coordination of the necessary infrastructure with other areas, to create the necessary financial resources. The main obstacles to the development of industrial clusters are incomplete infrastructure, weak relations with other participants, lack of human resources, lack of marketing research. In modern period, industrial clusters create a more favorable innovation environment for industry. Competition and cooperation increase innovation activity. The main factors affecting the competitiveness and innovation activity of the national economy are: faster access to information on innovations; constant monitoring of innovations; availability of qualified personnel exchange between firms; formation of a regional value chain; increase in product range; meeting domestic demand; efficient use of available resources. The deepening of the international division of labor, the expansion of exchanges, in other words, economic globalization is of great importance for the functioning of the national economy in all countries of the world. Most developing countries, countries with economies in transition, have partially renounced patronage and comprehensive state support for the economy. Clusters have special features such as strong relations between its participants, geographical concentration, information network, precise specialization within the cluster, tendency to innovation. It can be argued that a typical cluster includes both small and medium-sized companies. The fact that modern industrial clusters occupy a special place in the economy is a socio-economic process. This process is closely linked with the development of new technologies, especially in such industries as metallurgy, mechanical engineering, instrument making, energy. The process of industrialization changes society's vision by stimulating investment and economic development. In recent years, as in all sectors of the Azerbaijani economy, great progress has been made in the development of industry, and the volume of industrial production has increased significantly. In addition, numerous projects have been implemented to create competitive modern industries, improve the infrastructure of industry, create new jobs, and the country's industry has entered a new stage of development. The creation of industrial parks that will have a significant impact on the development of industry in Azerbaijan is also one of the main issues in the focus of our statehood today. To stimulate the development of technology parks, the country's tax legislation provides for benefits, income, property and land taxes for individuals and legal entities working in industrial and technology parks, as well as park management organizations and operators. Various technological parks are being created in connection with the development of industrial clusters. Here, the state also takes on a great responsibility.

Because the creation of technological parks, the construction of infrastructure, the construction of roads are issues at the expense of the state. All this is done at the expense of the state budget for the efficient operation of the private sector, which is the basis of industrial clusters.

3. MODERN EXPERIENCE IN FORMATION OF INDUSTRIAL CLUSTERS

The concept of long-term socio-economic development of the country envisages the formation of a network of differentiated production clusters, high-tech innovation clusters that realize the competitive potential of individual industries and territories. It is important to consider a number of issues when forming a cluster in small business, which is an important sector of the economy. These include the propensity of most small enterprises to innovate, the commercial orientation of their innovation activity, the high sensitivity of small enterprises to interaction, the high level of competition in the small business environment, the existing infrastructure and regulatory framework of small business. In the network of cooperation with large businesses, small business organizations act as part of the production structures of large organizations. This form of cooperation allows large businesses to enter new sales markets, gather important information about advanced new technologies, and increase business activity on other similar issues. Countries that develop their economies on the basis of a cluster strategy gain an economic advantage if there is a concentration of similar industries (clusters) and enterprises in these countries. This is due to the interaction of enterprises and organizations in the field and area within the clusters. Small enterprises operating within the cluster network manage to solve a number of problems. Such issues include the spread of innovation, the simplification of the organization of production, the ability to compete in new technological decisions. It is clear from the above that the cluster helps to complement the activities of its participants, creates a competitive advantage in the industry, stimulates business activity. Research shows that cluster theory is based on the assumption that the efficiency of the "scale of production" affects enterprises, their regional interaction. In a cluster network, organizations are not united on the basis of common property and management system. Clustering is a geographical concentration of enterprises, which reflects the resources of the region, production processes, and certain interactions in this direction. Clusters are divided into 3 parts. The first type of clusters leads to the emergence of components or services that reflect the synergistic efficiency of specialized raw material suppliers in this collaboration. Cluster marketing, finance, etc. leads to an increase in demand for such specialized services. Such clusters are usually distributed in proportion to the distribution of the population in the region. They can include local health care, utilities, retail, construction services, production of construction materials and etc. The second type of clusters consists mainly of resource-dependent industries located in areas with the necessary natural resources. Examples are clusters of extractive industries. The third type of clusters is created to increase the competitiveness of such industries. Such clusters are based on industries that combine according to professional types. These clusters are not dependent on natural resources. Because in some cases they sell their products and services in other countries. They are created to increase the competitiveness of industries. The main conditions for clustering include: the creation of clusters by administrative decisions in a market economy; formation of clusters with state support measures at the regional level, targeted nature of support for clustering, focus on areas with higher competitive potential; constant monitoring of cluster policy priorities, availability of reliable tools for their selection; defining the principles and mechanisms of cluster support. Clusters are more innovative for the following reasons: cluster participants are able to respond more quickly to consumer needs; consumers and suppliers are included in the innovation process; as a result of intra-enterprise cooperation, expenditures on research and development are reduced; Firms in the cluster are under intense competitive pressure. The cluster implies high innovation activity. Small entrepreneurs coming together in a cluster network have the opportunity to increase their competitiveness in other areas.

These areas include: achieving higher economic growth compared to competitors by focusing on high innovation projects; increase productivity by taking advantage of working in the same geographical area; stimulating the creation of new directions of development. The main obstacles to the development of small business in the country on the basis of the cluster model can include the follows: the lack of an effective methodological base for the implementation of cluster technology; lack of sufficient information of business representatives, executive authorities on the application of clustering; lack of specialists in the field of cluster organization; perspectives of cluster activity; non-involvement of cluster industries in innovation processes. As can be seen from the above characteristics of the cluster, the task of clustering is to strengthen other forms of capital movement at various levels, especially at the regional level, and to develop effective cooperation between business, government and other participants in innovation activities, both within the cluster and between cluster networks. The main purpose of creating cluster networks is to diversify traditional cooperation between innovation participants, effective application of high technologies, increase innovation and investment activity of the region, industry, sector and the economy as a whole, and training specialists.

4. CONCLUSION

With the application of the principles of modern market economy, competition between economic entities in various sectors of the economy is expanding. Research shows that the formation of a national economy based on market relations in modern times is a key criterion for its effective integration into the world economic system, first of all to ensure the competitiveness of the country's economy, especially industry. As a result of reforms in the country's economy in recent years, certain achievements have been made. To strengthen these achievements, increasing the competitiveness of the country's economy in the process of integration into the world economy should be a priority for industrial development. To this end, the level of industrial infrastructure should fully meet the needs of the industry, and investments in infrastructure necessary for production should be made taking into account the growing demand for infrastructure services in this sector.

ABSTRACT

The process of increasing international trade uncertainties is the main trend of the world economy. There has been an increase in scientific and practical interest in regional economic ties. This paper examines and summarizes the main trends and key areas in the field of regional economic relations of developing countries. The combination of a COVID-19 pandemic and a collapse in oil prices has affected all aspects of the economies in the Middle East, Africa, Central Asia and Eurasia. The most significant regional factors have been identified. The pandemic has further exacerbated trade restrictions and protectionist trends. Overall, trade performance has declined significantly in recent years in the context of the pandemic, slowing trade liberalization and increased protectionist measures. According to the WTO, in 2019-2020, 60% of new trade measures implemented by the G20 countries were related to the pandemic. The pandemic has also disrupted global value chains in developing countries and exacerbated as well as the growing importance of geopolitics, national security and the declining importance of multilateral decision-making. Internal industry prioritization has led to major disruptions in the regional supply chain. In the current situation, it is not clear how the global value chains will change with the reduction of the risks associated with the pandemic, as well as the emergence of reshoring trends. Changes are likely, although the economic underpinnings of most global value chains are still in place. This policy aspect becomes all the more relevant in a context of possible retrenchment or reconfiguration of GVCs, brought about by escalating trade conflict among major developed economies. In the context of an unstable world economy in developing countries, the trend of regional economic integration is increasing. It follows from this that regional economic cooperation may to a greater extent determine trade relations in the future, since its role in the restoration of the economic systems of developing countries is increasing. However, in order to develop complex ties and bring relations to a new level corresponding to the changing realities of the world economy, Central Asia and Eurasia need innovative approaches to interaction and economic recovery.

Keywords: *Central Asia and Eurasia, COVID-19, GVCs, regional trade integration, reshoring*

1. INTRODUCTION

The countries of the world and their governing institutions are in the process of comprehending the new economic reality and looking for their own answer to the question: how not to destroy their own economies in the fight against coronavirus? States are looking for new tools for interaction with partners, as well as effective measures to support business. However, many development strategies and economic concepts of integration have become irrelevant at the same time. Global economic and integration trends have changed. Faced with a new large-scale risk, today all national economies, industrial corporations and megalopolises, as points of concentration of all economic, labor and energy resources, are trying to adapt to new conditions and find a development strategy. New economic uncertainties, the possibility of which before the pandemic could not be imagined, opened up not only large-scale risks, but also new opportunities for the development of the economy and business inside the country. A number of industries and corporations have a unique opportunity to join forces in the development and implementation of strategies and become more competitive in the global economic field.

However, a number of pressing questions arise regarding the economic policies of developing countries:

- Are developing countries and their markets ready for global restructuring and global cooperation?
- Will their business structures be able to identify the best “working” solutions in a crisis and share them with each other?
- What is the role of the state and international corporations in these processes?

We consider regional trade integration, firstly, as a growth factor and an important crossroads between the EU, EAEU, Asia and Africa. Due to its location and its economic importance, the Middle East region has historically played an important role in world trade and connected the crossroads of the main trade routes of Europe, Asia and Africa. Middle East and North Africa region (MENA), EAEU countries are involved in various bi- and multilateral trade agreements, often referred to as the "spaghetti bowl". The “Spaghetti Bowl” (or “Noodle Bowl”) phenomenon describes the trade-distorting effects caused by the multitude of Regional Trade Agreements (RTAs) (table 1) signed in the last three decades (As RTAs allow for a different treatment of imports from different countries, rules defining a product’s country of origin play a crucial role in these agreements) (Schüle, Ulrich et al. 2016). There are: a) regional organizations such as the League of Arab States; b) as well as subregional ones, the Cooperation Council for the Gulf States (GCC) - Bahrain, Kuwait, Oman, Qatar, Saudi Arabia and the United Arab Emirates (UAE); c) Meanwhile, a number of noteworthy trade promotion initiatives have been launched with major trading partners such as the United States (MEFTA initiative) and the European Union (Association Agreements) and investment in the region, as well as to create a foundation for openness, inclusive growth and stability; d) Several Middle East and North Africa region countries are also active members of the African Union. In the region, trade integration has been pursued primarily through trade agreements that focused on progressively lowering tariffs for manufactured goods and, to a lesser degree, for agricultural production and services. The European Union has been a privileged partner for several Middle East and North Africa region countries (Cooperation and Association Agreements were signed with Algeria, Egypt, Jordan, Lebanon, Morocco, Syria, and Tunisia in 70's). Over 80% of exports are still destined for markets outside Africa, with the European Union and the United States of America accounting for over 50% of this total. The last decade witnessed a shift from these traditional partners to the emerging economies of China, India and Brazil, among others (Alemayehu Geda et al. 2015). They mainly provided market access for industrial goods and preferential market access for agricultural products to the European Union. The main objectives of the Euro-Med FTAs were to: a) promote trade and establish the conditions for the gradual liberalization of trade in goods, services, and capital between the EU and South Mediterranean (SM) partner countries; b) stimulate intraregional integration by promoting trade both within the Mediterranean region and with the member States of the EU Community. The Eurasian Economic Union (EAEU) was established in 2014 by a treaty signed initially by the Russian Federation, Belarus and Kazakhstan, followed by Armenia and Kyrgyzstan, member States that accessed to EAEU soon after the entry into force of the treaty in January 2015 (EEC). The EAEU is an international organization of regional economic integration and has international legal personality. Its main objectives are (UNCTAD 2020 a): (i) to create proper conditions for sustainable economic development of the member States in order to improve the living standards of their population; (ii) to seek the creation of a common market for goods, services, capital and labour within the Union; (iii) to ensure comprehensive modernisation, cooperation and competitiveness of national economies within the global economy. The aspiration in the EAEU is to increasingly negotiate with other partners as a united front. Free trade zones with the EAEU (Elena Kuzmina 2019): The EAEU signed the first FTA Agreement

with Vietnam in 2015 (The Agreement immediately had the FTA + format, which stipulates not only the rules of duty-free trade, but also other formats of interaction); The second agreement was signed in 2018 with Iran (This agreement is signed for three years and limited); The agreement with Singapore in 2019 became the third such document of the Eurasian Union with third countries; Trade and economic cooperation between the EAEU - China, entered into force in 2019 (The document is not an FTA agreement, but it defines a single format for trade cooperation between the EAEU and the PRC). India is one important objective, according to the EEC Trade Policy Department, coming six months 2021 will be held negotiations with New Delhi on creating a free trade zone between India and the trading bloc. Trade between India and the EAEU in 2020 reached \$9 billion, but the bloc sees potential for more. As protectionism is the norm internationally, EAEU defenses are roughly commensurate with those the United States and the EU take to shield their own steel markets against China's anti-competitive practices (Eurasianet, Jan 14, 2021, a).

Region	Notifications of RTAs in force

Europe	150

*Table 1: RTAs in force, participation by region
(Source: WTO Secretariat - March 13, 2021)*

Paradoxically, there are more and more voices which rise to proclaim the uniqueness of the processes of economic integration between developing countries given the nature of their actions and their earnings (Koné, Salif, 2012). For the African region, a clear determination to expand intraregional trade is an important step. Growing uncertainties in international trade and populist protectionist measures in advanced economies are increasing the premium to regional intra-African trade. Therefore, African countries are learning from the experiences of East Asia and Latin America, even as protectionism ends, they are joining forces to build productive trade capacity through regional value chains. Therefore, in theory, a trade integration strategy for countries in the African region strengthens their trade opportunities. The resulting experience will allow to gradually increasing share in the international market. Integration infrastructure is a critical factor for intra-African and international trade. Indeed, there is still a colonial mining infrastructure in Africa, one of which is a railway line from Kasese in Uganda to a port in the Indian Ocean to transport copper for export. Infrastructure in the region is now branching out with new initiatives such as the Cape Town to Cairo road, the Northern Corridor, and China is encouraging investment in the construction of a road from Kampala to the Atlantic Ocean. Of particular importance is the railway line from Dar es Salaam to Rwanda and other African countries. However, integration and the move towards new industrialisation is not without challenges. It should be noted that African countries face key infrastructure deficits which are key to boosting industrialisation. The AfDB estimates that Africa's infrastructure deficit accounts for 30 % to 60 % of productivity losses of firms and 40 % to 80 % of this is due to deficits in the energy sector in half the countries (Ahouassou A. 2017).

Thus, the integrating infrastructure created today will be necessary for the implementation of promising infrastructure tasks. Fifty-four AU member States have signed the AfCFTA, with the exception of Eritrea. To date, 35 of the African Union's 55 member States have ratified the agreement. Africa's free-trade area became reality on 1 January 2021, promising to make it easier to do business across the continent. The new regional market, created under the African Continental Free Trade Area (AfCFTA) agreement is estimated to be as large as 1.3 billion people across Africa, with a combined gross domestic product (GDP) of \$3.4 trillion. This has a potential of lifting up to 30 million Africans out of extreme poverty, according to the World Bank (Franck Kuwonu 2021). African countries opened their domestic markets under the African Continental Free Trade Area (AfCFTA) on 1st January 2021 under the continental free trade agreement and duty-free trading of goods and services across borders is now underway despite the COVID-19 pandemic and other teething problems. In light of the COVID-19 pandemic, AU discussions have reverted back to the 2012 Pharmaceutical Manufacturing Plan for Africa (PMPA), which seeks to promote local manufacturing of essential medicines (AU 2012). It should be noted that talks of regional pharmaceutical hubs have been ongoing in some RECs, such as the Southern African Development Community (SADC) and Economic Community of West African States (ECOWAS). COVID-19 has not only distorted trade flows but also beggar-thy-neighbour trade policies (CEO Insights 2020). Facing multiple difficulties and shortages of essential resources to fight against the disease, many countries are turning to mercantilist forms of protectionism, albeit temporarily. On the future of international free trade, the remark by the WTO Director-General Roberto Azevêdo might serve well as an encouragement. He said that: "Once the medical crisis begins to recede, trade will allow countries to help each other grow, bringing faster and stronger economic recovery for all of us" (Azevêdo 2020). Nothing has disrupted supply chains quite like the COVID-19 pandemic, which has resulted in factory lockdowns and reduced demand. Growing global uncertainties have long inspired researches to predict the end of globalization and a rise in reshoring (Figure 1).

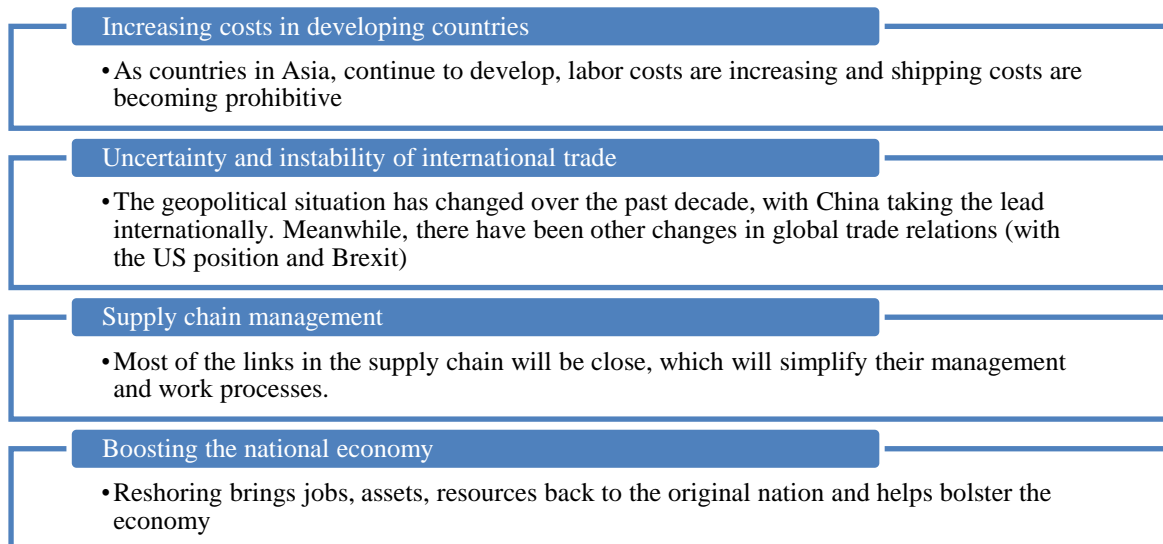

Figure 1: Several factors make reshoring appealing (Designed by author)

Most of the negative tendency mentioned above shows that many will look to end their reliance on manufacturing in remote parts of the world, particularly when it comes to the production of critical supplies. As a result, the shift towards reshoring is likely to accelerate rapidly in the coming years.

2. METHODOLOGY

Analytical reviews of international economic organizations very often argue that South-South integration is inferior to North-South integration. This article focuses on the question of whether the success of regional integration relations in dynamically developing countries really depends on factors such as the similarity of their economic structure, market size and domestic demand, as well as the provision of their economies with relatively cheap labor. It is shown that there are other more important political, economic and institutional reasons explaining the problems of the functioning of economic relationships in developing countries. To discuss this issue, case studies of international organizations and expert assessments on the Middle East, Africa, Central Asia and the EAEU will be used. We used three scenarios as a methodological approach to formulate a research on trade integration developing countries: Baseline scenario, continuation of past trends simulated over three or more decades; "Instability wave" scenario under a COVID-19 pandemic and recession/unstable world economy. At the same time, longer-term damage can be avoided with rational economic integration moves. Such policy choices are crucial when save lives and health on one hand and economic growth on the other; Tariff and trade liberalization scenario in line with AfCFTA modalities starting in 2020-2035.

3. LITERATURE REVIEW

Given the unsatisfactory performance of the most developing countries in promoting intra-regional trade to date, questions such as ‘is there an adequate potential for intra-regional trade?’ and ‘what are the major obstacles to intra-regional trade?’ are relevant. The study shows that more and more economic players are joining the integration groups, and the agreements are deepening. The Eurasian Economic Union comprises an effective regional competition regime since the entry into force of the EAEU Treaty in 2015. Several national laws of its member States have been amended in that respect in order to comply with the new sets of rules for competition (UNCTAD 2020a). On the one hand, the EAEU has not been an impeccable “success story”. The EAEU's progress has slowed after initial rapid progress. On the other hand, it has achieved much. The EAEU is best viewed not as an exception to general rules of regional economic integration, but rather as a functioning customs union with its own successes and stumbling blocks, enriched by several additional quite developed areas of economic integration (Evgeny Vinokurov 2017). The effectiveness of the Eurasian regional competition law system can be assessed according to a combination of factors, both endogenous and exogenous. The design of the legal framework has entrusted the EEC with exclusive competencies regarding anticompetitive practices affecting crossborder markets of the region (UNCTAD 2020b). The potential for intra-Africa trade and the role of RECs in that process is a contested issue. It is argued in the literature that in spite of the proliferation of RECs, the continent has not shown success in expanding intra-regional trade. Despite significant potential, the poor integration performance has triggered a number of studies that assessed the potential and performance of regional economic communities in Africa using the popular gravity model. At the same time the research findings and conclusions are similar. As shows the experience of regional trade integration in Africa region has been disappointing in achieving one of its main objectives of increasing intra-regional trade and fostering policy coordination (Geda and Kibret, 2008, WB. 2014; WB. 2020; Woolfrey, S., Apiko P. and Pharatlhathhe, K. 2019; Vanheukelom, J., Byiers, B. Bilal, S. and Woolfrey, S. 2016; WTO. 2020; Simo, R. Y. 2020; Solomon E.M. and van Klyton, A. 2020; Mbapndah, A.L. 2019). Dr. Mukhisa Kituyi, Secretary-General of the United Nations Conference on Trade and Development (UNCTAD), emphasized what countries can gain and what challenges to expect. Excerpts: «Africa needs to build the capacity and structural transformation necessary to be a competitive international player. The creation of a continent with a free trade area is therefore an important step towards building, collectively, the competitiveness of African labour and African products internally and internationally»

(Zipporah Musau 2018). Of the literature analysis, we can also remark Hugon (2001) by adopting the concept that developing countries are engaged in economic integration processes whose shapes range from the sectoral co-operations to economic unions with partial transfers of sovereignty.

4. RESULTS

The processes of any economic integration cross similar stages and all require opportune primary conditions. But, in fact, the economic integration processes between developing countries differ. The consolidation of CIS and EAEU agendas looks unusual, since the former has a slightly wider composition and includes countries like Azerbaijan, Moldova, Tajikistan and Uzbekistan. Turkmenistan is on the periphery of the CIS as an associate member. Of this set countries, Uzbekistan, with its 33 million population, is a country that the EAEU would very much like to attract. Having received observer status in the bloc at the end of 2020, Tashkent took a small step towards joining (Eurasianet, Jan 14, 2021,b). Major studies on trade relations between countries in the African region show that what African countries sell within the region has more added value than what these countries sell to the rest of the world, that is, mainly natural raw materials. In other words, intra-African trade creates more jobs in the country of origin than countries in the region that trade with the rest of the world. Therefore, countries in the Africa region hope to generate more industrial and value-added jobs in the region through intra-African trade. Accordingly, it will increase competitiveness, which they can then use for the rest of the world. As a result, it was able to correct the distortions in the domestic market, which were a burden on the consumers of the domestic market due to excessive protectionism. Tariffs are not the only problem; one of the main challenges to intra-African trade is the nontariff barriers and also technical support for national negotiators. This is the role that UNCTAD played in relation to the AfCFTA, and it is now being strengthened in preparation for the next phase, with more emphasis on trade in services, to create a common continental e-commerce market. Much stands in the way of realizing the potential of intra-African trade. Many countries in the region are producing similar goods, so UNCTAD is working with member states and their institutions to build capacity and translate AfCFTA's promises into real economic benefits. Trade integration can be essential for achieving inclusiveness, provided structural reforms are implemented, complemented by industrial and innovative strategies. Together with additional industrial policies, trade can help reduce the level of technological backwardness, mainly in the manufacturing sector. Trade integration of the considered countries within the region and with the rest of the world remains below expectations for both economic and political reasons. For the Middle East and Africa, these include the exclusion of agricultural goods and services from association agreements with the European Union, and the maintenance of high non-tariff trade costs. The low level of integration between the EAEU countries is partly due to insufficient reform of the legal framework for investments and the lack of convergence of positions on regional production chains. Economic cooperation has also proven to be problematic, while regional conflicts and business environments also hinder regional trade integration and hinder manufacturing integration and its potential for inclusiveness.

5. DISCUSSION

In recent decades, there have been frequent discussions about regional cooperation in the Middle East, Africa, Central Asia and the EAEU region. It is noteworthy that even the previously intensively discussed issues do not lose their relevance. That's a mainstream truth. As many major trading nations sign trade agreements among themselves, creating a "spaghetti bowl" of trade arrangements that bypass the World Trade Organization (WTO), the organization is becoming less relevant for international trade negotiations.

Therefore, the WTO needs to make these transparency mechanisms more robust and link them to national transparency (Maria Panezi 2016). The study shows how the cumulative effects of the COVID-19 pandemic, falling oil prices and current international trade uncertainties have affected the main aspects of the economies of the countries of the Middle East, Africa, Central Asia, the EAEU and within the framework of regional relations. Discussions also focused on regional industrialization strategies in the context of AfCFTA and how they will work in practice; a number of RECs have adopted regional industrialization strategies, albeit with varying degrees of success (Philomena Apiko et al 2020). However, barriers to trade in services are much more complex than barriers to trade in goods due to NTBs related to market access, regulatory requirements and restrictions on workers and movement of people (Sáez et al. 2015). Trade openness can go a long way towards achieving inclusiveness. However, trade reforms must move in parallel with other policy reforms. The contribution of trade openness to inclusive growth can be uneven. This article examines the growing regional economic integration, especially in Eurasia, as well as the growing importance of this region in the global economy, and outlines the challenges to greater regional integration. It was found that the strategically located economy of Central Asia and the EAEU has become an increasingly important part of the post-Soviet Eurasian economy over the past two decades and is becoming more integrated into itself. However, realizing this vision will depend on addressing several pressing regional integration challenges, including improving the quality of transport infrastructure, ports and logistics, reducing barriers to trade and international investment, narrowing the development gap, and strengthening regional economic governance. Tackling these challenges requires a combination of coherent national and regional policies. Political relations between the EU and Russia are at a significantly difficult stage. The Crimean crisis, the Russian-Ukrainian conflict and other geopolitical problems have led to the fact that European-Russian relations have reached a "low point." However, there is no alternative to dialogue with Russia on important economic topics such as trade, energy, the fight against COVID-19, as well as regional economic interaction. Russia is one of the most important neighbors of the Central Asian countries, the EAEU and one of the most important actors in world politics. However, Russian, and even more so, Central Asian companies lack high technical capabilities in some areas, for example, to conduct drilling operations in the shelf zone. Therefore, it is likely that it will not be possible to do without a technological partnership with Western oil and gas giants, and the companies of the countries of the region will still be able to claim only insignificant shares in joint ventures operating on the shelf. Covid-19 has led many multinational enterprises to seriously consider transforming their manufacturing processes. They were faced with the need to take into account the new reality and answer the question of whether production on a remote continent still makes sense. The alternative is to return certain production processes back to their regions, to the USA and Europe. This regionalization also opens up enormous opportunities for Russia. In this regard, enterprises are thinking about transferring other industries here. However, transnational companies will begin to localize production in Russia only if they are able to build production that is competitive for the world market. Unlike in previous years, now we are no longer talking about the production of "local for local" (Falk Tischendorf 2020). An important issue is the establishment of clear requirements for regional integration. Discussions with enterprises from various industries continue on this topic. Despite the fact that many companies are ready to manufacture a Russian product, they complain that they cannot find appropriate suppliers of components in Russia, or that these suppliers cannot provide or are unable to maintain the required quality. Of course, it is impossible to rebuild an entire regional supply chain in one day. The challenge is to motivate businesses with feasible prescriptions, and these prescriptions should in no way lead to quality degradation.

6. CONCLUSIONS

The regionalization of economic space is multifaceted. It is more supported by supranational institutions and by regional trade agreements (RTAs). It can result, however, from practices of GVC constituting trade, technological, and manufactured networks in regional space. It can also result from a fragmentation of the global space taking in strategies of segmentation by transnational business activities. The modern world is an incredibly complex economic and political system, where many factors influence trade integration and supply chains. The most negative impact of the pandemic and the most sensitive for international business and trade has been the disruption of supply chains. Active dialogue, sustainable trade and logistics systems and digitalization can become tools for strengthening integration relationships. As matter of facts global economy is slowing, and commodity prices according World Bank Group are likely to remain stable. In this context, the creation of the AfCFTA vast regional market is a major opportunity to help member countries diversify their exports, grow faster and attract FDI. Managing this diversity of factors requires intensive international and regional dialogue - especially with the rapid growth in demand for international supplies, which, even despite the pandemic, increased in 2020. By 2025, according to forecasts of various experts, the number of containers delivered from China to Europe will grow to one million. All this flow of goods will pass from Asia along the logistics corridor of Central Asia, Azerbaijan and Georgia. Therefore, Europe needs to build a dialogue at the political level with Azerbaijan, Georgia and with all the EAEU countries. Through cooperation with the EAEU, Europe through the South Caucasus and Central Asia will be able to gain access to the largest Asian markets. Therefore, Azerbaijan, Georgia and the countries of the Central Asian region are considered promising "hubs through which one can connect to many Asian markets." Despite the geopolitical challenges, the dialogue between the regional trading blocs of developing countries must continue and become more intense. Trade agreements can take years for the impact to be felt. The developing countries have to learn these processes within existing regional integration mechanisms and scale up best practices. As regulation, doing business and trade facilitation are found in many developing countries as major obstacles to intra-regional trade, regional economic community (RECs) may need to be directed at addressing these challenges.

ABSTRACT

The paper says that food security is one of the main goals of the agricultural and economic strategy of the political leadership of our state. In addition, in its general form, it forms the vector of movement of the national food system to the ideal state, representing a continuous process. Such branches of agriculture as cotton growing and tobacco growing are being revived, olive, nut and almond orchards are being laid, tea plantations are being expanded, and agricultural land is also being expanded, soft loans are being issued, and agricultural services are being expanded. To this end, work has begun in the regions of the country to put tens of thousands of hectares of cultivated land into circulation. Today, our country actively promotes the national brand Made in Azerbaijan in foreign markets, expanding the geography of export. The introduction of export incentives for persons engaged in the export of non-oil products has significantly increased domestic production and exports of these products. For this purpose, the Association of producers and exporters of wine, pomegranate, hazelnuts, fruits and vegetables, persimmons, bee products, etc. was established earlier with the support of the Ministry of Economy. In comparison with similar indicators for previous years, there were significant fluctuations in the dynamics of imports of livestock products. During the analyzed period, there was a decrease in the volume of egg imports with some fluctuations. One of the priorities for the development of the agricultural sector is to strengthen the export potential. In 2015-2019, an increase in exports of some types of crop production was achieved.

Keywords: *agricultural land, agro-industrial complex, consumer protection, foreign trade, export, favorable investment environment, food security, import substitution, international trade*

1. INTRODUCTION

The most important trend of the modern international economy is globalization, i.e. the transformation of the interconnected economies of individual countries into one global, planetary economy. The increasing international trade, on the one hand, and the cooperation of production, on the other, lead to the fact that the phrase "the product is produced in country X" has an increasingly vague meaning. Countries import goods, services, and resources used to produce and export other goods and services. Thus, a certain part of the value of national exports is accounted for by imported resources and components. So-called "global value chains" are being formed, sometimes linking a significant number of countries. In order to increase the range and volume of exported products, the Head of state signed a decree dated January 6, 2006 "On the appointment of trade representatives in embassies and consulates of the Republic of Azerbaijan in foreign countries". In order to create a favorable investment environment in the Republic of Azerbaijan, the head of state signed an Order dated January 18, 2018 "On a number of measures to promote investment activities and protect the rights of foreign investors".

2. STATE CONTROL IN THE FIELD OF FOOD SECURITY

Support for local entrepreneurs was included in the activities of the newly established Food Security Agency in accordance with the Decree of the President of the country Ilham Aliyev "On additional measures to improve the food security system in the Republic of Azerbaijan"

dated February 10, 2017. This structure is the central executive authority that carries out the regulatory regulation of food safety (development and approval of sanitary norms and rules, as well as hygienic standards), risk analysis, state registration of food and materials, their packaging, provision of a safety certificate for food products exported to foreign countries, state control in the field of food safety and protection of the rights of food consumers at all stages of food production, taking into account the level of risk of products, including production, procurement, packaging, storage, transportation, including export-import operations. It should be noted that food security has always been and remains the focus of the government of the country, since the availability of high-quality and high-calorie food is an indispensable condition for the full life of citizens of any country, and we are no exception in this regard. Food security is one of the main goals of the agricultural and economic strategy of the political leadership of our state. In addition, in its general form, it forms the vector of movement of the national food system to the ideal state, representing a continuous process. According to the amendments made to the "Rules of Sanitary Protection of the Territories of the Republic of Azerbaijan", the Food Security Agency together with the customs authorities will carry out the food security inspection from the point of view of food safety of food products imported into the country through the state border checkpoints. An important document aimed at promoting the export of non-oil products was the Decree of the Head of state of March 1, 2016 "On additional measures related to the promotion of the export of non-oil products". The Decree notes that depending on the local components produced in the territory of Azerbaijan and used in the production process and the specific weight of the cost of non-oil products created in the territory of Azerbaijan, as well as on the type of these exported products, persons engaged in the export of non-oil products in the territory of the Republic of Azerbaijan will be paid export incentives at the expense of the state budget. The basic amount of the export incentive paid for export operations is from 3 to 6% of the customs value provided for in the export customs declaration of the actually exported goods. Later, on October 6, 2016, the Cabinet of Ministers of Azerbaijan approved the "Rules for the payment of export incentives to persons engaged in the export of non-oil products", as well as the "List of non-oil products to which export incentives will be applied according to the commodity nomenclature of foreign economic activity". The list of products subject to export promotion includes natural honey, dried fruits, persimmons, pomegranates, confectionery (including such oriental sweets as baklava and shekerbura), canned vegetables, fruits, nuts and hazelnuts, jams, fruit jelly, marmalades, fruit and nut puree and pasta, fruit and vegetable juices, including pomegranate juice, sauces and condiments, natural or artificial mineral waters, carbonated water, non-alcoholic beverages, wine and grape must, vermouth or other flavored natural grape wines, alcoholic beverages (cognac, brandy, liqueur), wine distillates, naphthalene ointment, clothing, shoes and other products made of genuine leather, silk fabrics, handmade pile and lint-free carpets, cotton clothing, etc. The introduction of a mechanism for the return of part of the costs for the export of non-oil products, where about two million manats were returned to Azerbaijani exporters, was a clear indication of the state support for business. In accordance with the Decree of the head of state dated January 11, 2018, "The procedure for determining and regulating the mechanism for paying part of the expenses paid by the state budget for organizing export missions to foreign countries, researching foreign markets and marketing activities, promoting the Made in Azerbaijan brand to foreign markets, obtaining certificates and patents in foreign countries in connection with export, for research programs and projects for export development was approved. For these purposes, the head of state allocated 3 million manats from his own fund for the start of the project. According to the above-mentioned decree, the amount that specialized legal entities and individuals receive for analyzing foreign markets is also increased from 20 thousand to 30 thousand manats. In addition, the number of export missions that can be organized with the participation of Azerbaijani entrepreneurs within one calendar year

increases from 10 to 25. The number of international fairs and exhibitions, where Azerbaijani entrepreneurs can participate as a single stand, is increasing from 5 to 10. Entrepreneurs who take part in international fairs and exhibitions on an individual basis will be able to receive financial support in the amount of 50% of all expenses necessary for participation, including rent and creation of a stand, transportation costs and others. At the same time, the maximum amount of such support should not exceed 10 thousand manats. Exporters will also be able to apply for support to obtain an international certificate. The cost of support should not exceed 60 thousand manats and should not exceed 50% of the total amount of expenses. In addition, since November 2016, decisions were made on payments to encourage the export of wine, cotton yarn, canned food, water and juices, hazelnut and other products to Russia, USA, Germany, Turkey, Belarus and other countries. Recently, Azerbaijani wines have aroused great interest among consumers. If we recall, for many centuries, viticulture was the leading branch of agriculture and the main source of economic well-being of the people, and the peak of progress occurred in the 70s-early 80s of the last century, when the total area of vineyards in Azerbaijan reached 286 thousand hectares, and the gross harvest averaged up to 2.1 million tons per year.

3. STRENGTHENING OF EXPORT POTENTIAL AS ONE OF THE PRIORITY DIRECTIONS OF AGRICULTURAL SECTOR DEVELOPMENT

Today, this branch of agriculture is gradually reviving. In 2019, 877.3 thousand decaliters of wine products were produced in Azerbaijan, of which 532.3 thousand decaliters were exported. In accordance with the state program for the development of winemaking for 2018-2025, the export of the local "drink of the gods" is planned to increase fivefold. Also, such branches of agriculture as cotton growing, tobacco growing are being revived, olive, nut and almond orchards are being laid, tea plantations are being expanded, agricultural land is also being expanded, soft loans are being issued and agricultural services are being expanded. To this end, work has begun in the regions of the country to put tens of thousands of hectares of cultivated land into circulation. To date, the shortage of walnuts in Europe is 100,000 tons of fruit. The constant growth of the already high demand guarantees a high demand for the grown products. With relatively small investments, you can consistently get high returns for decades, which are still supported by trouble-free implementation. Every 5 years, the profit increases by an average of 45% (depending on the selected varieties and climatic conditions), as the trees themselves grow and their fruiting increases. A young seven-year-old walnut tree will yield a yield of approximately 17 kg (depending on the fecundity of the variety, it can reach up to 20 kg). Up to 200 trees can be planted on one hectare. So the average yield per hectare will be 3.4 tons. The purchase price of unpeeled walnuts today is \$ 1.5 per 1kg. As a result, in the first year, you can reach profitability with the help of the income received from 214 invested funds. It brings many benefits: oxygen to nature, useful products and medicines to people. Nut leaves and buds are used in pharmacology. The bark from the walnut tree is used for the production of natural paint. This type of business is not only comfortably profitable with the prospect of constant growth, but also brings a lot of benefits to people and the environment, which makes it humane and in demand. Abroad, the yield of nuts varies depending on climatic conditions and varieties. In California, 7 t/ha of nuts are harvested, in France - 5-6 t/ha, in Moldova-3-3.5 t/ha. Economic calculations show that walnuts and hazelnuts have approximately the same profitability. Usually there is a difference between them between the technology and the start-up capital, but the total costs are the same. Judge for yourself-a walnut according to the 10 * 10 scheme is one hundred seedlings at the price of 4.60 mans./seedling, the price of one hazelnut seedling, depending on the variety and origin, is 2.30 mans, 35-40 seedlings are needed for 1 ha, so the price of laying is actually equal to a garden with walnuts. The content and technological care of hazelnuts in their natural (technological) form differ, but the cost is about the same \$400/ha.

Now let's compare the revenue – walnut yields 3 tons/ha, if you multiply them by 40% of the yield at the price of 9.70 man./kg and this will give 11660 thousand. man / ha, hazelnuts also have a yield of 2 t/ha, and not peeled, directly from the field, costs about 8 man./kg, which in monetary terms is about 17352 thousand man./ha. That is, it is impossible to say unequivocally that hazelnuts are more profitable than walnuts. For example, in Europe and the Gulf countries, the consumption of nuts per year averages about 5 kg per person. In our country, this figure does not exceed 1 kg per person. At the same time, to obtain a sufficient amount of useful substances, it is necessary to eat at least 3.6 kg per year per person. Therefore, our market is open to walnut products. The EU countries are constantly in need of this product, and the inexhaustible Chinese market is also ready to buy all the walnuts offered to it. Potential customers – trade, confectionery industry, perfumes, paint and varnish industry and others. The main advantages of the walnut business: - the possibility of long-term storage, - simple conditions for packaging, storage and transportation, - almost all components of walnut production are used in industry, including the kernel, shell, leaves, and especially valuable wood. Thus, the cost of 1 kg of walnut kernel in the first 10 years is 1.77 euros, and with each subsequent year its cost will only decrease, because the yield will continue to grow, but the costs will not. Labor costs for the organization of growing walnuts in forest culture on an area of 1 ha are small, so there is no need for hired labor. The farm workers themselves are able to serve the plantings. In our case, the cost of nuts is predetermined by the market wholesale prices of their harvesting and transportation to the receiving point, where the fruits are used as raw materials for the production of confectionery. This type of activity is a highly profitable business that does not require an impressive capital for development. As practice shows, seedlings quickly take root after planting, tolerate temperature fluctuations and are resistant to various pests. The process of caring for trees is simple, and the harvest (and the availability of profit) is guaranteed for many decades. This branch of agricultural production is recommended for specialized farms as an additional source of direction, including for farms. Today, our country actively promotes the national brand Made in Azerbaijan in foreign markets, expanding the geography of export. The introduction of export incentives for persons engaged in the export of non-oil products has significantly increased domestic production and exports of these products. For this purpose, the Association of producers and exporters of wine, pomegranate, hazelnuts, fruits and vegetables, persimmons, bee products, etc. was established earlier with the support of the Ministry of Economy. In comparison with similar indicators for previous years, there were significant fluctuations in the dynamics of imports of livestock products. During the analyzed period, there was a decrease in the volume of egg imports with some fluctuations. One of the priorities for the development of the agricultural sector is to strengthen the export potential. In 2015-2019, an increase in the export of some types of crop production was achieved. It should be noted that domestic products under the Made in Azerbaijan brand have already been exhibited at Gulfood 2017 in Dubai, Prowein 2017 in Dyuseldorf and Worldfood Moscow 2017, Belarus, the USA, Japan, and China. In addition, the Ministry of Economy has organized eight export missions to foreign countries, and other measures are being taken to realize the country's export potential and promote our products to world markets. Today, there are more than a hundred companies with Chinese capital operating in our country, participating in various projects. By the way, Azerbaijan's trading houses have been established in Belarus, Ukraine and China. It is planned to create a trading house in Russia as well. In addition, to ensure the rational use of land, ensure food security and increase export potential, work continues on the creation of agricultural parks. In recent years, through the creation of modern enterprises, agricultural parks, large farms, horticultural and greenhouse farms in industrial parks and zones in Azerbaijan, it is planned to significantly reduce dependence on imports, increase the level of self-sufficiency, while steadily increasing the country's export potential.

Thus, at the end of 2019, according to the State Statistics Committee of Azerbaijan, Azerbaijan's foreign trade turnover amounted to \$ 33.3 billion, including exports of \$ 19.6 billion, or 98.8%, and imports – \$ 13.6 billion, or 93.5% . In the structure of exports, as in previous years, and in 2019, the main volume fell on oil – 77.5%. In the structure of imports in 2019, the main volume fell on machines, mechanisms, electrical devices, equipment and spare parts for them – 21.3%. In 2019, Azerbaijan carried out its main export operations with Italy – 28.7% of total exports, Turkey-14.6%, Israel-6.8%, India -4.9%, Germany -4.7%, China-3.8%, and Russia – 3.7%. Among the private companies exporting Azerbaijani non-oil products abroad, they distinguished themselves: LLC "Aqrodoctor" and LLC "CTS-Agro". In 2019, Azerbaijan carried out its main import operations with Russia – 16.8%, Turkey-12.0%, China-10.5%, Switzerland -9.0%, the United States-5.6%, Germany-5.2%, Ukraine-3.4%, and Iran -3.3%. The performance of 141 global economies is assessed on the basis of the Global Competitiveness Index 4.0 (GCI 4.0), which reflects their ability to compete with other countries in the context of the Fourth Industrial Revolution. The 12 most important components of long-term growth are considered: the quality of institutions, the state of infrastructure, the penetration of IT and modern communications, macroeconomic stability, the consumer market, the labor market, the financial system, the size of the domestic market, the state of public health, education and skills of people, the dynamics of business development and the ability to innovate. Each global economy is assigned a GCI 4.0 on a scale from 0 to 100, where 100 represents the ideal state when the factors in question cease to be barriers to productivity growth. It should be noted that in 2019, Azerbaijan ranked 58th among 137 countries in the "Global Competitiveness Report 2019", compiled annually by the World Economic Forum (WEF). Many states rely on the agricultural industry, and this allows them to provide their own market with their products, and therefore not depend on other states. Due to the export of agricultural products, they replenish their budget with currency. In addition, the development of agriculture stimulates other areas of production and contributes to the creation of new jobs.

4. CONCLUSION

Thus, our country is able to fully provide itself with agricultural products, as well as increase the volume of export supplies. In 2015-2019, the volume of food imports to the country in value terms increased by 2.6 times. In recent years, hundreds of millions of dollars' worth of food products have been imported into the country. According to preliminary estimates, about one-fifth of this growth is due to imports of higher quality and expensive products, as well as to rising prices on the world market. Data reflecting the situation in foreign trade in food products do not always allow for an unambiguous comparative analysis of the nomenclature of these products. By the way, this is not a problem peculiar only to our country. During the analyzed period, the share of food imports in 2019 in relation to 2015 increased by 12.5%, and the level of exports in 2019 in relation to 2015 increased by 18.2%. Most of the imported crop and livestock products are products that can be produced or expanded in our country. In other words, the country's agricultural potential has the potential to significantly replace imports.

ABSTRACT

The current article studies the trends in the formation of cashless payments in Azerbaijan, as well as the status and prospects for establishing a cashless economy in the country. The methodology of the paper is a survey as well as economic analysis of indicators such as the number of debit and credit cards, the use of contactless payments, the spread of payments through mobile devices, and the volume of cashless transactions during the last years. The use of electronic money is spreading. The article explored the factors affecting admittance to the cashless society and consumer' reasons behind choosing to utilize or not to utilize electronic payment, including a lack of confidence in the security and availability of innovative literacy or internet access. The data was collected from 179 citizens of the Republic of Azerbaijan using a questionnaire. The increase in electronic money usage depends on the awareness of society and government encouragement. Results of the survey showed the benefits and threats of the cashless economy and in the formation of the digitalization development activities. The paper's main output showed an increase in economic cashless payments, goods and services payments, e-commerce, consumer credit, social payments, pensions, and subsidies will lead to economic growth increase and integration processes in the Republic of Azerbaijan. The results showed that education, rate of literacy and age are key factors that affected respondents` attitude to cashless transactions. Finally, this paper suggests that an understanding and recognizing of the factors affecting the intention to use digital payment is critical to practitioners who plan and foster new forms of banking activities in the current competitive environment.

Keywords: *Cashless economy, cashless transactions, cashless society, consumer, digital payment*

1. INTRODUCTION

The use of electronic payment instruments throughout the community brings up something called Cashless Society. The cashless transfer is becoming the preferred option, and there are many reasons for that. First, people can easily pay their bills, shop, make transactions and manage all the finances using their electronic devices. The primary objective of this research is to define the level of awareness and attitude of Azerbaijani society, as well as to study the current position of the country toward the cashless economy. Advances in information technology and consumers' increasing openness to the use of it contributed to improvement in

the electronic payment system. As a result, the traditional system of cash payment is gradually being replaced. An increasing number of people find the relatively new method of payment more convenient because there is no need to travel, which saves time and money, and the risks associated with holding cash are avoided, but still, the cash system dominates economic transactions in Azerbaijan. Electronic payment can also help increase the efficiency of financial management, for instance, and the recipient can get money and manage it in real-time. Many research studies have been conducted in the field of non-cash business, however, few were found regarding the case of Azerbaijan. The authors are therefore interested in studying factors that influence participation in the cashless society, including reasons why consumers decide not to use electronic payment services, including the impact of transaction-related factors including convenience, security, cost, incentives and procedures on cashless transactions. The authors anticipate that the results of the research would serve as guidance on how to improve the digital economy strategy and promote Azerbaijan's electronic payment system.

2. LITERATURE REVIEW

The structure of the payment system has changed over the past decades by virtue of technological development. In developed countries like the US, UK etc., the use of cash for transactions has been replaced by non-cash payment instruments. (Humphrey, 2004). According to the World Payments Report 2016, globally non-cash transaction volumes have increased to more than 90% in most of the developed countries (Patel and Amin, 2012). For others, there is still a long journey to cover. Reistad (1967) proposed the term “cashless society” as a society in which transactions with electronic funds take over those with paper currency. It does not mean the complete exclusion of cash from the payment system, but one in which the number of cash-based transfers is maintained to the minimum level (Achor and Robert, 2012; Yaqub et al., 2013). Over time, there have been several forms of the payment system. It went through evolutionary changes starting from the barter system, precious metal used as the means of payment, money made from precious metal and gold to money. (Fabris, 2019). The problem with a barter economy was its inefficiency, as it involved high transaction costs in terms of efforts and time. Therefore, paper money and coins have been evolved (Chinnammai, 2013). The second half of the twentieth century observed better approaches for contemplating techniques for retail payments (Bátiz-Lazo & Efthymiou, 2016). The introduction of plastic cards, pre-paid payment cards, Electronic Fund Transfer and Internet banking all aimed at making payment more convenient (Akinola, 2012). Regardless of the level of cashlessness, it is possible to identify the main common drivers that lead to the Cashless Society. One of the main ones is an innovation triggered by the development of technology (Fabris, 2019). Efficient payments such as NFC (Near-field Communication), QR codes and mobile payments made the transfer of money and settlement of transactions more secure, reliable and efficient (Maurer, 2016). Another relevant driver of a cashless society is trust in digital technologies (Achor, 2017 & Smithin, 2000). The Trust between the payee and payer, confidence in the safety and protection of the payment, privacy, as well as conviction that the procedure is beneficial (Kapron & Meertens, 2017; Akinola, 2012). Satisfaction, application functionality and convenience of use influence the use of electronic payment services (Teerawanitchaikul, 2013). Likewise, the utilization of mobile technology significantly lessens the cost of sending money over large distances, gives the certainty of the process and diminishes the risk of theft (Rouse & Verhoef, 2016). However, if the costs of Internet usage and electronic transaction fees are higher than those of other payment methods, it will discourage people from using mobile banking (Ampunsuk, 2013). Previous research has demonstrated that prior internet knowledge and information on online banking perceived ease of use, and perceived usefulness positively influenced the adoption and use of online banking in Azerbaijan. (Ismaylova, 2020). In the absence of well-established bank networks in developing countries, most people prefer cash

and tend to display distrust toward electronic payment (Afi, 2013). The adoption of the cashless economy policy can enhance the growth of financial stability in the country. Much has been done in making the people aware of the cashless economy and a large proportion of the people are awaiting the introduction of the cashless economy. The Cashless economy initiative will be of significant benefit to developing economies. (Kumari & Khanna, 2017). One of the advantages is transparency by making it harder for some people to undertake widespread anonymous and untraceable transactions over and over again (Kenneth S. Rogoff, 2016). The utilization of cash enables protection in transactions and assist in the evasion of taxation (Achord, Chan, Nardani, & Rochemont, 2017).

3. BACKGROUND

Various projects are being implemented in Azerbaijan to raise public awareness of digital payments. However, it is observed that public perception of cashless payments is considerably low, especially in the regions. Lack of awareness of certain groups of the population (pensioners, homemakers) is particularly serious, negatively impacting the cashless transition of the country. According to the data of 2017 E-commerce remained underdeveloped in the country. Less than 1/3 of the population had a bank account, and only 25% had a debit card, many of which were social insurance and salary cards. Mobile money was rarely used due to limits on the amount of a transaction and other restrictions. Overall, just 5% of the population purchased something online, a low rate compared to the world average of 24%. Retail e-commerce in 2016 made only 0.04% of GDP and though its indicator doubled between 2016 and 2017 from \$ 15 million to \$ 27 million. It was still relatively low, which was closely related to cashless payment underdevelopment. Azerbaijan ranked 68 of 144 countries on the B2C e-Commerce Index, due to low penetration of e-payments, including credit and debit cards, a shortage of domestic online shops, underdeveloped logistics, absence of trust by both buyers and sellers, and lack of digital literacy of people in general. The government intention to increase the level of financial inclusion and the expansion of cashless payment is reflected in the Strategic Road Map on Financial Services Development in the Republic of Azerbaijan and the State Program on Digital Payment Expansion in 2018–2020. In addition, understanding the problem, the Government included the development of e-commerce as one of the priorities of the State Program. The Program was strategically expanding the cashless payments in the economy and thereby minimize the volume of cash payments, to strengthen the base of financial resources of the banking sector, and reducing transaction costs associated with cash circulation. The Central Bank of Azerbaijan launched the Instant Payment System (IPS) in pilot mode, stipulated in the framework of the “State Program on Expansion of Digital Payments in the Republic of Azerbaijan in 2018–2020,” with the purpose of presenting new digital payment technologies in the country and growing the access to payment services. As of now, the integration works on 13 banks and the State Treasury Agency on the IPS platform has been completely finished and B2B, C2C payments have been provided in the pilot mode. As IPS will allow to conduct payment transactions between individuals, businesses and government agencies in the regime 24/7/365 through bank accounts using simplified identifiers (PIN code, TIN, mobile number, e-mail) and money will be quickly accessible to the beneficiary's bank account. The launch of IPS will expand the efficiency of electronic payments, as well as provide prompt liquidity for members. The opportunities provided by IPS will invigorate the development of electronic payments among business entities and a significant decrease in the size of the cash economy in Azerbaijan. Due to the implementation of the measures specified in the Strategic Road Map and the Program by the end of 2019, in terms of a number of transactions non-cash payments accounted to 43% of card transactions and in terms of the amount was 19%. As comparison, these figures were 3% and 2% in 2010. At the same time, there was a significant expansion in the number of bank cards in the country.

During 2020, the volume of plastic cards expanded by 26% to 9.14 million. Currently, the quantity of POS-terminals in the country is 56.9 thousand, and the number of ATMs is 2688. Additionally, 29 banks provided Internet banking services and 24 banks offered mobile banking services during the 2020. In 2020 the volume of cashless payments in card transactions amounted to over \$1.2 billion, which is 58 per cent higher than that in the same period of 2018. The share of cashless payments amounts to 20.4 per cent of the total card turnover. This exceeds the indicator of the same period of 2018 by 4.2 per cent. During the COVID-19 pandemic banks of Azerbaijan Republic became more active in expanding e-banking by increasing the use of contactless technologies. For the aim to stimulate cashless transactions during a pandemic and lessen the costs of economic entities for these services, the Central Bank of Azerbaijan decided to reduce the service fees charged to banks in interbank payment systems, to decrease the tariffs for payment cards of entrepreneurs by 50 %.

4. RESEARCH METHODOLOGY

This study examines the perception of the cashless transaction, the effect of incentives encouraging people to avail cashless transactions, as well as poor internet connection and lack of security as impediments to the development of the cashless economy in Azerbaijan. During the research, the following research questions will be answered.

- H1: Cashless transactions are more convenient than cash transactions for daily transactions
- H2: Lack of security and safety in transaction are the main concerns in cashless payments
- H3: Poor Internet connectivity, lack of technical knowledge are the obstacle for cashless transactions.
- H4: There is a significant relation between age and choice of payment method

This study is based on primary data. Primary data were collected through a survey method conducted in Baku, Azerbaijan in January – February 2021. It is based on a well-structured questionnaire that was conducted to study the awareness and perceptions of customers toward cashless transactions. The questionnaire was used for collecting data. The questionnaire was developed based on past experience of the researchers and review of literature on the topic done by the researchers. The questionnaire consists of eleven questions out of which four questions related to the profile of respondents. Five level Likert scale was also used in the questionnaire with eight statements. The stratified random sampling technique was used for research and the sample size is 179. The data collected was analyzed based on simple statistical tools and techniques for explaining the results regarding the perception and awareness toward cashless transactions. Chi-square test is used for testing the hypotheses.

5. ANALYSIS AND DISCUSSION OF RESULTS

Demographic conditions of respondents, such as gender, age, occupation, education, have made a significant influence on the perception, awareness and use of cashless transactions.

Table following on the next page

Demographic Group	Category	Frequency	Percentage
Gender	Male	89	49.7%
	Female	90	50.3%
Age Group	Below 24 years	32	17.9%
	25–35 years	44	24.6%
	36–45 years	34	19%
	46–55 years	30	16.7%
	56–64 years	27	15.1%
	Above 65 years	12	6.7%
Occupation	Full-time Employee	88	49.2%
	Student	20	11.2%
	Pensioner	19	10.6%
	Part-time employee	14	7.8%
	Unemployed	38	21.2%
Education level	Higher Secondary	39	21.8%
	Bachelors/Diploma	72	40.2%
	Masters	33	18.4%
	Doctorate/PhD	17	9.5%
	Professionally qualified	18	10.1%

*Table 1: Demographics of Respondents
(Source: Primary data)*

Table 1 illustrates the demographic profile of respondents, which show that 90 or 50.3% of respondents, are female, where 89 or 49.7% are male. Out of 179 respondents surveyed, 17.9% respondents' age is below 24 years, 24.6% respondents' age is between 25 and 35 years, 19% respondents' age group is between 36 and 45 years, 16.7% respondents' age is between 46 and 55 years, 15.1% respondents' age is between 46 and 55 years and remaining 6.7% respondents' age is above 65 years. 49.2% of respondents are full-time employee, 11.2% are students, 10.6% are pensioners, 7.8% are part-time employees and the remaining 21.2% are unemployed. Among 179 respondents surveyed, 21.8% of respondents have a Higher Secondary degree, 40.2% have a Bachelors degree, 18.4% have a Masters degree, 9.5% have a Doctorate degree and the remaining 10.1% are professionally qualified. Education and rate of literacy are the key factors affected respondents' attitude to the cashless transactions.

Methods	Frequency	Percentage
Cash	109	60.9%
Credit/debit card	42	23.5%
Mobile or online banking	69	38.5%
Other	6	3.4%

*Table 2: Use of Cash-Transactions methods by the respondents
(Source: Primary data)*

Table 2 shows that methods to use the cashless transaction by the respondents. 60.9% of the respondents were used Cash, 38.5% of the respondents used mobile or online banking, 23.5% of the respondents through credit or debit card and 3.4% used Pay Points. The study reveals that the respondents used cash for paying for regular household expenses.

Frequency	Number of Respondents	Percentage
Daily	2	1.1%
Weekly	26	14.5%
Monthly	74	41.3%
Only in case of emergency	53	29.6%
Never	24	13.4%

*Table 3: Frequency of Cash Withdrawal from ATM
(Source: Primary data)*

Table.3 indicates frequency of cash withdrawal from ATM by the respondents. 41.3% of respondents performed cash withdrawal in monthly basis, 29.6% of the respondents conducted cash withdrawal only in cases of emergency. 14.5% of the respondents are stated that weekly, 13.4% of respondents never conducted cash withdrawal. The remaining 1.1% of the respondents stated that daily.

Frequency	Number of Respondents	Percentage
More than 2 times per month	19	10.6%
1-2 times per month	56	31.2%
More than 2 times per year	17	9.5%
1-2 times per year	26	14.5%
Never	61	34.1%

*Table 4: Frequency of Shopping on the Internet
(Source: Primary data)*

Table 4 shows the recent frequency of shopping on the Internet by the respondents. 34.1% of respondents had never been shopping on-line, 31.2% of the respondents are stated that 1-2 times per month, 14.5 % of the respondents are stated that 1-2 times per year, 10.6 % of respondents more than 2 times per month.

Reasons	Number of Respondents	%age
Due to the COVID-19 pandemic.	63	35.1%
To shop at any time	69	38.5%
To save time and money	78	43.5%
To buy goods not available in Baku	94	52.5%
To get better selection	57	31.8%

*Table 5: Reasons for purchasing on-line
(Source: Primary data)*

Table 5 shows the reasons to purchase on-line. 52.5% showed the possibility of buying goods unavailable in Baku as the main reason, then 43.5% stated that with the help of online shopping they can save time and money, 38.5% believe they can shop any time, 35.1% of respondents indicated COVID-19 pandemic and 31.8% believe that there is a better selection online.

Opinion	Number of Respondents	%age
Strongly Agree	59	33%
Agree	61	34.1%
Neutral	40	22.3%
Disagree	14	7.8%
Strongly Disagree	5	2.8%
Total	179	100%

*Table 6: Statement: Cashless transactions are more convenient than cash transactions for daily transactions
(Source: Primary data)*

The data in Table 6 indicate that, 33% of respondents strongly agree, 34.1% of respondents agree, 22.3% of respondents are neutral, 7.8% of respondents disagree and remaining 2.8% of respondents strongly disagree about cashless transactions are more convenient than cash transactions for daily transactions in Azerbaijan. It is concluded that majority of the public (67.1%) felt that cashless transactions are more convenient than cash transactions for daily transactions in Azerbaijan.

χ^2 -test

- H0: Cashless transactions are no more convenient than cash transactions for daily transactions
- H1: Cashless transactions are more convenient than cash transactions for daily transactions

Observed Frequency (O _i)	Expected Frequency (E _i)	(O _i -E _i)	(O _i -E _i) ²	(O _i -E _i) ² / E _i
59	35.8	23.2	538.24	15.03
61	35.8	25.2	635.04	17.73
40	35.8	4.2	17.64	0.49
14	35.8	-21.8	475.24	13.27
5	35.8	-30.8	948.64	26.5
Total (χ^2)				73.02

*Table 7: χ^2 -test in respect of convenient of cashless transactions
(Source: Authors calculations)*

Calculated value of $\chi^2=73.02$. The critical value of χ^2 at 4 degrees of freedom at 5% level of significance is 9.488. Calculated value is greater than Critical Value i.e., $73.02 > 9.488$, Hence, H0 is rejected and the alternative hypothesis which proposes that cashless transactions are more convenient than cash transactions for daily transactions is accepted.

Table following on the next page

Statement	Opinion	Number of Respondents	Percentage
Lack of Security and Safety in transaction are the main concerns in cashless payments	Strongly Agree	23	12.8%
	Agree	59	33%
	Neutral	54	30.2%
	Disagree	38	21.2%
	Strongly Disagree	5	2.8%
Poor internet connectivity is the obstacle for cashless transactions	Strongly Agree	43	24%
	Agree	82	45.8%
	Neutral	30	16.8%
	Disagree	21	11.7%
	Strongly Disagree	3	1.7%
Lack of technical knowledge is the obstruction for cashless	Strongly Agree	41	22.9%
	Agree	74	41.3%
	Neutral	31	17.3%
	Disagree	27	15.1%
	Strongly Disagree	6	3.4%
e-Commerce is cost effective, safe and improves the way the customers use, including buying of goods/services.	Strongly Agree	35	19.6%
	Agree	82	45.8%
	Neutral	40	22.3%
	Disagree	17	9.5%
	Strongly Disagree	5	2.8%

*Table 8: Analysis of Respondents Perception in respect of Internet Banking
(Source: Primary data)*

The data in Table 8 show that 12.8% of respondents strongly agree, 33% of respondents agree, 30.2% of respondents are neutral, 21.2% of respondents disagree and the remaining 2.8% of respondents strongly disagree that lack of security and safety are the main concerns in cashless transactions. It is concluded that the majority of the public (45.8%) strongly agree with this statement. The data in Table 8 indicate that, 24% of respondents strongly agree, 45.8% of respondents agree, 16.8% of respondents are neutral, 11.7% of respondents disagree and the remaining 1.7% of respondents strongly disagree that poor Internet connectivity challenges cashless payments. It is concluded that most of the respondents (69.8%) strongly agree with this statement. The data in the above table show that 22.9% of respondents strongly agree, 41.3% of respondents agree, 17.3% of respondents are neutral, 15.1% of respondents disagree and the remaining 3.4% of respondents strongly disagree that lack of technical knowledge is the obstacle for cashless transactions. It is concluded that most of the respondents (64.2%) believe that technical knowledge is crucial for a cashless economy. As shown in Table 8, 19.6% of respondents strongly agree, 45.8% of respondents agree, 22.3% of respondents are neutral, 9.5% of respondents disagree and the remaining 2.8% of respondents strongly disagree that e-Commerce is cost effective, safe and improves our way of living, including good and services purchase. It is concluded that most public (65.4%) agreed with this statement.

- H_0 : Lack of Security and Safety in Transaction are not the main concerns in cashless Payments
- H_1 : Lack of Security and Safety in Transaction are the main concerns in cashless Payments

Observed Frequency (O _i)	Expected Frequency (E _i)	(O _i -E _i)	(O _i -E _i) ²	(O _i -E _i) ² / E _i
23	35.8	-12.8	163.84	4.58
59	35.8	23.2	538.24	15.03
54	35.8	18.2	331.24	9.25

More than 65	0	0.16	-0.16	0.03	0.16
Total (χ^2)					239.48

Table 12: χ^2 -test in respect of relation between age and choice of payment method

(Source: Authors calculations)

Calculated value of $\chi^2=239.48$. The critical value of χ^2 at 15 degrees of freedom at 5% level of significance is 24.996. Calculated value is greater than Critical Value i.e., $239.48>24.996$, Hence, H_0 is rejected. The study revealed that age plays an important role in the choice of payment method.

6. LIMITATION AND FURTHER RESEARCH

The study has a couple important limitations that influence the generalizations of the findings. This study was conducted on a smaller sample size of 179 respondents in Baku city. The size of the sample is insignificant to make generalizations on the awareness of the cashless economy. Future studies should consider a significant number of respondents proportionally distributed from different regions of Azerbaijan. We observed the opinion of individuals (customers), however, it is also possible to explore the view of businesses starting from small shops to global companies. In addition, we explored the positive correlation between age and electronic payment use, in further research education, gender, occupation influence should also be considered.

7. CONCLUSION

This study focused on the awareness of cashless payments, perception and attitude to e-Commerce among Azerbaijani consumers. It investigates the impact of perceived ease of use, incentives, lack of security and safety, poor Internet connectivity, lack of technical knowledge, e-Commerce adoption on the use of cashless payment among respondents. This study adopts a quantitative approach using a questionnaire survey among 179 respondents in Azerbaijan. The results reveals that hypotheses regarding perceived ease of use and incentives of cashless transactions are supported. Study also confirmed that lack of technology knowledge, followed by Internet connectivity and security obstruct the transition to a cashless economy. The finding reveals that due to these factors that cash remains preferable method of payments, despite the increase level of non-cash payments. The study concludes that education, rate of literacy and age have a significant impact on the choice of payment method. In addition, e-Commerce use would motivate people to adopt non-cash payment services. Therefore, the government and financial institutions should raise awareness among consumers, so that they understand how non-cash payment services would be more beneficial, easy to use, and less risky to improve their intention to use Internet banking services in Azerbaijan.

ABSTRACT

The agricultural sector, which is one of the real and non-oil sectors of the economy, plays an important role in the life and well-being of people, especially those living in rural areas. Features of agriculture, which is one of the areas of material production, are primarily conditioned by natural and biological factors. It can save small and recurring risks by using risk reduction techniques (such as irrigation, crop management, and pest prevention), self-insurance tools such as savings, and conventional credit in farms. However, agricultural producers are unable to handle the less but more severe losses that affect agricultural activities. In this case, farmers transfer risks to other parties through financial instruments such as insurance when they are available and accessible. Owing to agricultural insurance, farmers take measures in advance against losses that may arise from risks and gain more confidence in the activity of the farm and increase its well-being. As a result, the socio-economic well-being of farmers living in rural areas is also relatively ensured. The development of agricultural insurance, which is one of the optimal methods of risk management in agriculture, has become a global trend, and major steps have been taken in this area in the country. During the government measures a law was adopted in this area and an Agricultural Insurance Fund was established. However, the next steps should be taken to systematically consider the next steps and bring Agricultural Insurance into operation. That all these nuances lead to positive trends on a global scale, the choice of optimal development directions by the existing climate in the country's agricultural insurance, and the study of solutions to existing problems in this area have become an actual issue.

Keywords: *agricultural insurance, farming, finance, risk, socio-economic*

1. INTRODUCTION

Agricultural insurance-insurance of agricultural crops or animals. Often, agricultural insurance is carried out under a property insurance license (different from fire insurance). In the practice of crop insurance, several types of insurance products are divided-fire and hail insurance, separate hail, multi-risk insurance (or combined), insurance against named risks. The most common insurance against named risks and insurance against hail, fire. Multi-risk insurance-insurance against most or a set of numerous risks, usually weather, but may also include risks of damage to crops by diseases or pests, wild animals, illegal actions of third parties, and others. Multi-risk crop insurance is a term that comes from the North American insurance practice. In European practice, it is called combined insurance (Spain). In some countries, multi-risk insurance is mistakenly called complex insurance, which is not methodologically correct (complex insurance-insurance of various objects under the same insurance contract/policy, for example, animals, crops, machinery, buildings) [3]. Multi-risk insurance is usually expensive, so it usually develops in the presence of state subsidies or other forms of state support.

The loss rate for multi-risk insurance is higher than for other types of agricultural insurance products. Recently, crop insurance based on weather and yield indices has been actively introduced in some countries. The main objective of these new products is to reduce administration costs and reduce the risks of anti-selections and information asymmetry. The impact of these types of risks is more local, for example, they are not so common in geographical areas as floods, frost, or droughts. That is why the private companies, which exist in the insurance services market in Europe at the time, these companies were able to concentrate a sufficient number of different insurance contracts in their portfolios. These contracts which concluded with agricultural crop producers have different profiles in accordance with various directional risks, thus it was enabling the optimization of the overall risk of the portfolio and the implementation of profitable operating activity. Management of agricultural production risks in farms is based on the optimal combination of material-technical means and available financial resources. Agricultural producers can retain small and recurring risks in their own farms using risk mitigation methods (e.g: irrigation, management of products, and prevention of pests, as agro and measures of zootechnics), self-insured tools such as savings to resources, and a conventional loan. At the same time, farmers have difficulty managing the less likely risks that impact agricultural activities and the risks that cause more serious damage. In this case, farmers transfer these risks to other parties (usually agrarian insurance companies) through insurance mechanisms. Private insurance systems created for agricultural crop producers at that time are still operating in some European countries, such as Germany, Great Britain, and Ireland [3]. The development of agricultural insurance, which is one of the optimal methods of risk management in agriculture, has become a global trend, and major steps have been taken in this area in the country.

2. SOCIO-ECONOMIC ASPECTS OF THE AGRICULTURAL INSURANCE

The low attractiveness of agricultural production in comparison with other sectors of the economy is largely due to its inherent increased exposure to risks. The availability of effective tools to reduce risks in agriculture should have a positive impact on its investment attractiveness and increase the sustainability of the agricultural sector. From this perspective, insurance can provide a positive impact on long-term growth in the agricultural sector and thus on the stabilization of rural incomes. At the same time, world experience shows that insurance can become a poorly effective tool for risk management and ensure the irrational use of financial and other resources. With the deepening integration into the global space, these issues are also on the agenda in countries with economies in transition. However, the solution to these issues largely depends on how well the legal framework, organizational and market infrastructure is developed. In this regard, countries with economies in transition may face a more complex question due to the underdeveloped institutional prerequisites. In addition, it should be noted that in these countries, the above problems are solved in parallel with the process of optimizing the use of basic production resources [2]. The main task of the transition period is to overcome and correct the consequences of the false economic decisions that were made in many socialist countries in the past, in order to optimally allocate and use the main factors of production: mainly land, labor and capital. Production factors should find their application where they will get the best return. In the case of subsidized insurance of agricultural crops, the distortion of economic signals can disrupt the process of optimal placement of agricultural production. Economic entities will not have the appropriate incentives to adapt their business to the objective economic and climatic conditions under which production is conducted [2]. Therefore, the development of risk management tools in agriculture, including insurance, should take into account the world experience and innovations in this area in these countries, as well as the specifics of the transformation process.

From this point of view, we would like to conclude with the most important aspects of insurance mentioned in the literature, the consideration of which is necessary for the development of an economically sustainable, socially fair and effective insurance system:

- Schemes should not distort market (price) signals;
- Insurance rates and refunds should ensure broad participation in the insurance program. This requirement is especially important at the first stage of the insurance program launch;
- Insurance should not compensate for losses due to incorrect production decisions;
- When developing an insurance product, it is necessary to take into account the phenomenon of natural hedging;
- Mandatory use of deductibles: the policyholder's participation in losses in the event of an insured event can significantly reduce the problem of moral hazard;
- Insurance schemes should be easy to understand and should have a transparent implementation mechanism;
- Strict control of administrative costs should be introduced, especially in the case of subsidized insurance by the state;
- Insurance should be offered only for crops whose production is profitable in a particular region. Insurance should not compensate for losses in marginal regions with high risk and low production potential;
- The role of the state is, first of all, to create the necessary legal, economic and organizational framework;
- Before launching an insurance program on a national scale, it is necessary to test it in pilot regions;
- A clear distinction should be established between the risks of a catastrophic nature and the insured risks, as well as a mechanism for regulating programs of compensation for damage from a catastrophic risk;
- Insurance must be voluntary. Agricultural producers should decide for themselves which risk management tool is best able to solve their problems.

3. ANALYSIS OF CURRENT STATUS OF AGRICULTURAL INSURANCE SYSTEM IN AZERBAIJAN

International experience in selecting a model of agricultural insurance in accordance with the characteristics of the insurance market of Azerbaijan, agricultural conditions and state policy has been investigated. At the same time, successful agricultural insurance companies, as well as the United States, Turkey, Spain, Austria, Canada, Germany, Israel, etc. the experience of countries has been studied. Thus, the main advantages of the agricultural insurance system in the US, Spain, Turkey and Canada have been identified:

- Insurance premiums subsidies
- Wealth of affordable insurance products
- Joint financing against catastrophic risks
- Database for product development
- Positive economic benefits of high participation

As a result of the researches, issues of improvement of legislation and analysis of data, and then implementation of institutional measures were kept in the focus of attention. In the Republic of Azerbaijan it was decided to improve the Agrarian Insurance Policy for the Prevention of losses caused by natural disasters or other causes and on June 27, 2019, the law of the Republic of Azerbaijan “on Agrarian Insurance” was adopted and The “Agrarian Insurance Fund”, the Central Institute of Agrarian Insurance System, was established [4].

In order to formalize the new agricultural insurance, which came into force on January 1, 2020, the relevant measures are being continued. Thus, by the decision of the Cabinet of Ministers of the Republic of Azerbaijan No. 431 dated October 30, 2020 “Agrarian Insurance rules”, by The Decision No. 238 dated July 6, 2020 “Agrarian Insurance” Information System regulations” and “Agrarian Insurance” Information Systems to be integrated into the information system and the list of information intended to be obtained from them has been approved. In the “composition of Agrarian Insurance subject” approved by the Cabinet of Ministers Decision No. 479 dated December 17, 2019, insurance of 14 names of “agricultural bitkilari and crop products”, including rice, tea, cotton, as well as tangerines, oranges and lemons belonging to the Citrus bitkilari group is planned. At the same time, “composition of the risks guaranteed by Agrarian Insurance” was approved by the decision of the Cabinet of Ministers of the Republic of Azerbaijan No. 505 dated December 27, 2019. The risks on agricultural insurance items include natural disasters (earthquake, landslide, Hurricane, hail), burns and actions of third parties on agriculture and plant products [6]. The following problems and shortcomings in the country's agricultural insurance system have prevented the system from operating:

- a) limited database (insufficient number of contracts to calculate tariffs, inaccessibility of required environmental and phenological information);
- b) lack of methodology for calculating tariffs in the field of agricultural insurance;
- c) lack of underwriting experience in agricultural insurance;
- d) insufficient level of operations with foreign and domestic reinsurers in the relevant field;
- e) high losses on agricultural insurance [1].

Taking into account the above-mentioned problems, the insurance of all plants and all risks pose a threat to the financial sustainability of the Agrarian Insurance Fund. At the same time, taking into account the gradual transition of countries to full-scale insurance in international practice, it was proposed to insure 14 agricultural crops at the initial stage. The Agrarian Insurance Fund in Azerbaijan has selected specific insurance items for the following risks in agriculture:

Table 1: On subjects of insurance and guaranteed risks on crops [6]

	Crop name	Guaranteed risks	The need to choose the subject
1	Wheat	Hail, Fire, Storm, Hurricane, Landslide, Earthquake	It is necessary in terms of strengthening food security
2	Barley		
3	Corn		
4	Potato		
5	Sugar beet		
6	Orange	Hail, Fire, Storm, Hurricane, Landslide, Earthquake, Loss of quality due to hail	It is the subject of import substitution policy
7	Lemon		
8	Tangerine		
9	Tea	Hail, Fire, Storm, Hurricane, Landslide, Earthquake	
10	Tobacco		
11	Rice		
12	Grapes	Hail, Fire, Storm, Hurricane, Landslide, Earthquake, Loss of quality due to hail	It is necessary in terms of strengthening export potential
13	Hazel	Hail, Fire, Storm, Hurricane, Landslide,	
14	Cotton	Earthquake	

Also, in case of payment of an additional insurance fee, under the agreement with the insurance contract, the possibility of insurance against the risks of the spread of plant diseases and pests, as well as special dangerous pests, is offered to farmers. The requirements for the improved ACS to apply for insurance to the relevant insurance company after registration in the Electronic Agricultural Information System to farmers who want to benefit from agricultural insurance have also been established. At the same time, with the decision no 08/2 of the Board of Directors of the Central Bank of the Republic of Azerbaijan dated March 4, 2020, on the determination of the "minimum amount required by the insurer" "the minimum amount required for the" joint insurer implementing the management of the Agrarian Insurance System on behalf of the Agrarian Insurance listed. The first Agrarian Insurance contract was concluded as a pilot on November 25, 2020, and insurance was carried out by The Agrarian Insurance Joint-Stock Company formed from a legal and organizational point of view. Currently, Agrarian Insurance Fund provides relevant insurance services to farmers through Agrarian Insurance Joint Insurance Company on agriculture crop products (including perennial crops and their products), agricultural animals and agricultural animals, and aquaculture products. From 2020, the Agrarian Insurance Fund has started to insure agricultural products, arable land and farm animals with state support. Thus, on November 3, 2020, dairy cows were insured for the first time in a livestock farm in the Tartar region. After that, insurance of arable lands and farm animals was started in other regions of the Republic. To conduct an economic analysis on the current state of agricultural insurance in Azerbaijan, it is necessary to look at the dynamics of changes in statistical indicators. The following table presents the data for the 2015-2020 in the field of plant and animal husbandry in Azerbaijan. So, Although insurance premiums collected on crop insurance in 2020 amounted to 9.2 thousand manats, no insurance payments were made. Insurance premiums in the livestock sector amounted to 2.84 million manats, insurance payments amounted to 613.0 thousand manats. The total amount of agricultural insurance premiums was 2.8 million manats [5]. The 2015-2020 years trend of agrarian insurance premiums and payments is described in the following chart:

Figure 1: Agrarian insurance premiums and payments trend in Azerbaijan for 2015-2020, thousand manats

Source: Central Bank of Azerbaijan (<https://www.cbar.az/page-189/insurance>) [5]

It is shown that agricultural risks are higher than those of other sectors, increasing insurance literacy in this area, enlightenment of farmers and requiring government support for insurance companies.

4. CONCLUSION

Proper agricultural risk assessment is a prerequisite for the development of sustainable agricultural insurance programs. Besides, formation of agricultural and hydrometeorological information base and further improvement of information infrastructure are required. In addition, supporting for the development of innovative agrarian insurance products and services is important for servicing to small-scale farms and expanding the overall market. In other words, agricultural insurance products should be tailored to the customers who are targeted. Several factors must be taken into consideration when developing a comprehensive agricultural insurance strategy for the country:

- a) understanding the economic and social importance of the agricultural sector;
- b) distribution of agricultural producers in agribusiness segments;
- c) risk assessment that affecting agricultural production;
- d) harmonization of risk management strategies implemented by agricultural producers and the state;
- e) assessment of financial sector activity in rural areas.

Although important work has been done at the state level in the field of Agrarian Insurance in Azerbaijan, there are still problems in attracting the private sector due to sectoral characteristics. Thus, in order for private insurance companies to be interested in insuring agricultural risks, reinsurance companies are not operational. At the same time, The Agrarian Insurance Fund has started its activity since 2019 and is expected to show its effect on the development of this sector in the coming years.

xankishiyevacamala@gmail.com*

ABSTRACT

The article considers the study of the needs of finding new sources of economic growth in Azerbaijan - first of all, in the field of innovative development, which, with the explosive development and large-scale penetration of new technologies in all spheres of human activity, takes on new meaning. The significance of the ongoing global changes suggests that Azerbaijan, like the whole world, is entering the largest technological period in its history, when the wealth of natural resources ceases to be the main growth factor, giving way to a knowledge paradigm. Together, these changes are rated as a "new industrial revolution." The widespread use of information and communication technologies and the need for a transition to the Information Society and the knowledge-based society provide economic growth in conditions of increased environmental protection, accelerating the reduction of physical consumption in favor of information and the capitalization of knowledge, moving the center of gravity of investments in fixed assets, investments in human capital. According to these conditions, information is a key resource for a new model of the economy, i.e. digital economy. The new economic model is characterized by the growing incorporation of knowledge into new products and services, the increasing importance of learning and innovation, globalization and sustainable development. This article is considered appropriate to consider this new model of the economy, highlighting specific functions and main components. In turn, the digital economy is characterized by a set of procedures that radically change the relationship between business partners and investors, introducing a consistent growing civic consciousness.

Keywords: *innovation policy, technological revolution, digital economy, globalization*

1. INTRODUCTION

At all times, technological innovation has had a decisive influence on the formation of global economic trends. Today, the so-called digitalization, the result of rapid innovative breakthroughs and scientific discoveries in the field of information and digital technologies, is the primary stimulator of expanding and reformatting international economic relations. Not only Azerbaijan faces the challenges of economic development. In the late 2000s and early 2010s, the majority of industrialized countries showed a tendency toward a decrease in labor productivity growth rates. Since 2011, the values of productivity growth have fluctuated at borders not exceeding 1% per year (this is two or more times less than in the period 1990-2013). The potential for further growth in labor productivity, under the conditions of the existing economic and technological structure, turned out to be close to exhaustion in both traditional production and non-productive sectors. The digital economy is not just an economic activity in the production of digital (virtual) goods and services, but an economy in which an increase in its performance is achieved by expanding the satisfaction of the needs of customers integrated into digital processes; development of innovative cooperation in the markets using information networks to create digital ecosystems; technological improvement of products and services based on digital solutions; digital restructuring of business processes and organizational forms of company management. Thus, we can say that the digital economy is a system of social, economic and technological relations, functioning in the global information space through the widespread use of networked digital technologies.

It generates new types and forms of production and promotion of products and services to the consumer, which lead to continuous innovative changes. From a technological point of view, it is the result of the mutual imposition of fundamental breakthroughs in the development of several branches of intellectual activity, including the creation of cyber physical and cyber biological systems, fundamentally new materials, new means of production, information technology, genetic engineering, renewable energy sources, etc. Transition to the digital economy is characterized by technological explosions, which is understood as a combination of technologies that makes it possible to create s products and services on the one hand, the formation of new areas of activity, and on the other - to destroy or radically alter existing economic sectors. Technical development is exponential: every year new high-tech technologies become more advanced (increasing the capacity and speed of information processing), and their physical embodiment - all better (reducing the size and cost of material information carriers). It can be assumed that it was the change in technological mode and the next industrial revolution that caused the emergence of the digital economy. According to many experts, we are talking about changing the paradigm of economic development - the digital revolution, comparable in importance to the agricultural, industrial and scientific-technical. The use of the term “revolution” does not speak of the spasmodic nature of changes (which, unlike political revolutions, in all four cases are cumulative in the gradual transition of quantity into quality), but about their radicalism — the formation of a new model of the economic structure of society. The paradigm shift in economic development is characterized primarily by a change in the nature of the division of labor.

2. RESEARCH

The digital revolution of the beginning of the XXI century marks the separation of development centers from production and service units, the redistribution of most of the created social wealth into the sphere of intellectual and organizational activity. In contrast to the industrial one, the reverse process takes place: the individualization of products and the return of the production of a significant part of consumer goods and services to households based on the improvement of household appliances, and in the near future - the independent production of many goods at home through 3D printers. Due to computerization and automation of the vast majority of operations, including those related to decision-making, there is a crowding out of living labor by robotic complexes and artificial intelligence systems. The result of the digital revolution is a gradual transition to network forms of economic interaction, which are based on the formation of sustainable ties between business entities based on a constant direct exchange of information and building mutual trust between a very wide circle of people. The study of the needs of finding new sources of economic growth in Azerbaijan, primarily in the field of innovative development, which, under the conditions of explosive development and large-scale penetration of new technologies in all spheres of human activity, takes on new meaning. The significance of the ongoing global changes suggests that Azerbaijan, like the whole world, is entering the largest technological period in its history, when the wealth of natural resources ceases to be the main growth factor, giving way to the knowledge paradigm [3]. Together, these changes are assessed as the “new industrial revolution” [1], leading to the formation of a new socio-economic formation - the “digital economy”, based on the large-scale introduction of Nano-, bio-, information-communication, and cognitive technologies, and the transition from mass production of standardized products to flexible high-performance production that produces individualized products [2]. The World Economic Forum and the G20 (G20) define the digital economy as a wide range of economic activities, including all jobs in the digital sector, as well as digital classes in non-digital sectors. These include events that use digitized information and knowledge as a key factor in production, modern information networks as an important area of activity, and information and communication technologies (hereinafter - ICT) to increase

productivity and optimize economic structures [4]. As an example, in particular, in 2017, the Chinese e-commerce giant Alibaba generated sales of 168.3 billion yuan (25.3 billion US dollars) in just 24 hours during the “Lonely Day” event. Similarly, Amazon’s US company has doubled its net sales revenue in three years, as a sign of growing confidence in digital technology, Alibaba is pumping another \$ 2 billion to its e-commerce platform in Singapore, resulting in a total investment of 4 billion dollars in 2017, and Amazon launched its first two-hour Prime Now service in Singapore in July 2017, all at a time when the traditional retail sector is facing growing challenges. In the United States, long-standing retail giants such as Walmart and Macy’s are closing stores amid falling sales, while Toy’s R ‘Us filed for bankruptcy in September 2017. [5] The widespread use of information and communication technologies and the need for a transition to the Information Society and the knowledge-based society provide economic growth in conditions of increased environmental protection, accelerating the reduction of physical consumption in favor of information and the capitalization of knowledge, moving the center of gravity of investments in fixed assets, investments in human capital. It goes without saying that the Information Society integrates the object of sustainable development on the basis of social rights and equal opportunities, freedom, cultural diversity and innovative development, environmental protection, and restructuring of industry and business. In addition, individual initiative, solidarity, cooperation and mutual trust in the workplace are key success factors in the information society. The digital economy is citizen-oriented, so we are faced with a new citizen orientation, which is subordinate to service providers, which pays taxes for receiving funds, including how government money is spent. Thus, the digital economy has dynamic facts that are consistent with structural updates and an information plan. [6] It should be noted that new digital technologies make access, storage and transmission of information more easy and affordable, therefore we are dealing with digital information that can be transformed into new economic and social values, creating enormous opportunities for the development of new products and services. According to these conditions, information is a key resource for a new model of the economy, i.e. digital economy. The new economic model is characterized by the growing incorporation of knowledge into new products and services, the increasing importance of learning and innovation, globalization and sustainable development. This article is considered appropriate to consider this new model of the economy, highlighting specific functions and main components. In turn, the digital economy is characterized by a set of procedures that radically change the relationship between business partners and investors, introducing a consistent growing civic consciousness. Due to the global nature of this type of economy, we presented some aspects of the digital economy in the European Union, given that this may be a possible solution to the economic crisis, the release of a new model of the economy based on the digital economy, analyzed in its various aspects by many political factors and various institutions and international organizations [6]. On the European continent, authorities intend to consistently support the development of the digital economy in the coming years, believing that it will attract about 110 billion euros. Strengthening the digital economy can act in different ways, the main of which is the creation of a scale economy for service providers and the liberalization of some European citizens, which will become a real power train to achieve a unique digital space accessible from any European country. The Internet has become a true multi-billion-dollar industry, a vital infrastructure for the global economy. The Internet decides how people live, bringing a greater variety of goods and digital services, lowering prices, improving data collection, several channels and social networks. For firms, the shift to digital has forced them to rethink their business models and constantly adapt to survive in the global market. The digital economy is seen as the pinnacle of the economy as a whole because of its economic consequences, which are associated with a reduction in resource consumption, an increase in innovator and entrepreneurial spirit, an increase in labor productivity, a speed of production and a change in

economic phenomena and processes, an increase in value added, etc. In the new economy, the development promoter is digitization (using information technology to produce the distribution of goods and services), in particular, the use of the Internet and other information technologies (smart cards, voice based on calculations, wireless, databases, telecommunication and expert systems) in service sector, which includes 80% of jobs. The economic crisis and the sustainable recovery of Europe can be achieved by using the potential of the digital economy, in particular, on the continent, where there is a generation of young, good specialists in the field of digital technologies, which is a powerful incentive for the development and promotion of innovation. This “resource” is a powerful incentive for the development of the market in the direction of development and innovation, since from the very beginning work influences and dominates the growing market [7]. All of the above factors represent the most important trends in the digital economy and a number of conclusions that indicate the role and importance of this new type of economy. As part of the Digital Azerbaijan project, our republic sets the following tasks for the implementation of this project for 2017. - 2020 In particular:

- creation of a new regulatory framework in the field of digitalization of the economy;
- stabilization in the field of broadband services;
- creation of a digital infrastructure for public services;
- ensuring cybersecurity at the EU level;
- launch of a new industrial strategy in the electronics industry.

The digital economy requires increased knowledge of new products and services, the importance of training and innovation, globalization and sustainable development. A huge amount of information is changing the functioning of markets, which makes it possible to restructure enterprises and the emergence of new opportunities for creating value from existing information. Thus, the digital economy is the state of the economy, information obtained in various ways, stored in databases, and its integrated use produced from premises or placed in public positions and related events and transactions of individuals and organizations. It should be noted that the digital economy is an increasing use of information technology (hardware, software, applications and telecommunications) in all aspects of the economy, including internal operations of organizations (business, government and non-profit structures), transactions between enterprises and transactions between physical persons acting both manufacturers and consumers. At the same time, information technologies make it possible to collect and process large volumes of information, stimulate innovation, which opens up great opportunities for organizations to improve quality and efficiency. Thus, it can be determined that this is the main driving factor in the global economy. This type of economy has brought huge benefits, but most importantly, developed countries and developing countries must provide appropriate policies and programs for digital transformation. Thus, in order to be successful in today's economy, people need knowledge and understanding of computer and website skills. Moreover, information technologies have significantly increased the ability to develop new business models, products and services, processes and fundamental inventions. [8] Thus, new laws, rules, standards and regulations, developed with the support of both business opinion and civil society, stimulate the development of some new services of the information society (trade and electronic transactions, computerization of public services, access of citizens and economic agents to public information, etc. etc.), and also ensures compliance with ethical rules for working and living in a new company (protection of confidentiality and personal data, confidential transactions, protection of consumer rights, etc. d.). Many risks, threats and problems of the development of the digital economy require the adoption of measures to neutralize them. Unfortunately, this cannot be done quickly and exclusively at the expense of state resources (since the task of developing the digital economy is positioned as nationally significant) it is impossible.

Integrated efforts are required using both public and private resources. Among the priority tasks that determine the direction of activity, in our opinion, you can specify:

- stimulating the creation and development of a business focused on the digital economy. Already today, a number of companies are operating in the world that can be recognized as world leaders in their segments of the digital economy. The state can provide them with targeted support: provide guarantees for bank loans, including export loans, compensate for part of the costs of patenting, form targeted investment funds, provide support through the public procurement mechanism, etc.;
- additional support for small and medium-sized businesses in the field of creating digital technologies, platforms, and the provision of digital services. This can be achieved, for example, by providing certain benefits to relevant companies (for example, in respect of insurance payments or tax contributions) developing digital technologies, creating healthy competition between such companies, providing them with orders and standards that the final product must meet;
- the formation and scaling of digital platforms for the main sectors of the economy. Now in Azerbaijan and many other countries there are portals for the provision of state and municipal services, platforms for making payments, the tax authorities are transitioning to accept electronic reporting, plastic cards are being introduced for social payments, etc. It should be noted that Azerbaijan has significant problems associated with the introduction of IT in local governments. Local governments themselves are not able to solve these problems, taking into account the subsidized nature of their majority, special support for their digitalization is required from the regional and republican authorities;
- an increase in the training of IT professionals;
- formation of sectoral, regional and countrywide cyber security systems. In particular, it is necessary to finalize legislation regarding the fight against cybercrime, create defense units in law enforcement agencies, develop secure technological solutions, and ensure interaction between all participants in the global digital economy. It should be remembered that security should not impede the growth and development of technology. Cross-country cyber security information exchange should be strengthened.

The digital economy is a new type of economic relations that is already present in all sectors of the world market and is actively developing. The digital economy may soon become a leading segment, a driver of growth and development of the economic system as a whole. This is due to the fact that the digital economy has some advantages over material commodity-money exchanges, such as the speed of delivery of goods or the almost instant provision of services. Another advantage of the digital economy is the lower cost of producing and executing transactions. One of the key advantages of the digital economy over the traditional one is that electronic goods are virtually inexhaustible and exist in a virtual form, while material goods are almost always limited in number and access to them is much more difficult. Today, the electronic economy is already beyond the scope of purely business processes. Digitalization is being introduced into social processes, the successful life activity of people is increasingly dependent on it, in addition, there is a large-scale introduction of digital technologies in the work of government organizations and structures. Digitalization efforts in Azerbaijan are based on the development strategy of the information society and the provisions of the state program "Digital Economy". These documents stipulate the holding of many events and set the basic mechanisms for the digital transformation of the Azerbaijan economy, as well as determine the sources and amounts of financing of the measures planned for implementation. Considering the situation as a whole, Azerbaijan does not occupy a leading position in terms of the development of the digital economy of Azerbaijan, but it is confidently held in the group of countries following the leaders, improving its position from year to year.

At the same time, competition in the area under consideration remains very fierce, therefore, one cannot stop there, the joint work of the state and business on the further development of the digital economy is necessary. In this activity, it is necessary to take into account a number of problems, risks and threats highlighted in the article in order to focus resources and efforts on their neutralization.

3. CONCLUSION

It should be noted that, despite the activation of the modernization agenda and the systematic development of an innovation policy, the “technological” positions of Azerbaijan amid insufficient changes in the world. When choosing priority areas for accelerated development, the emphasis should be placed both on the outstripping development of fundamentally new high-tech sectors and markets, as well as on deep technological modernization of traditional industries and industries, and the development of the digital economy. The combination of these two lines can ensure the frontal launch of the technological revolution already in the medium term, and in the long term achieve economic growth. The tools for the development of the digital economy proposed in this study make it possible to intensify the processes of building up the economic potential for the technological breakthrough. Subsequently, they will be transformed into a set of recommendations for practice and public authorities, which will allow them to change some laws in the field of supporting high technologies and innovations, as well as adjust the directions of strategic development of economic institutions and forecast models of economic development.

TRANSITION TO A DIGITAL ECONOMY AND ENSURING SUSTAINABLE COMPETITIVENESS IN GLOBAL MARKETS

Khankishi Khankishiyev

Azerbaijan State University of Economics (UNEC)

Baku, Istiqlaliyyat str.6, AZ1001, Azerbaijan

khanbiznes@rambler.ru

ABSTRACT

The problem of digitalization of the economy, the challenges facing business, the state and society as a whole in this regard, the challenges posed by the digital economy, and the opportunities it provides are the object of intensive reflection. Its importance is reflected in the launch of the Global Digital Competitiveness Rating, which is focused on assessing the availability of opportunities and the degree of readiness of the countries included in the rating for digital transformation. The assessments of the progress achieved, as well as bottlenecks and problem areas of the transition to the DE, contained in the rating, are of undoubted interest both for politicians and for business, including in Azerbaijan. Analyzing the formation of the digital economy as a key area of the 4th industrial revolution, it is necessary to dwell on its structural characteristics, without understanding which it is difficult to organize effective management of the relevant processes by regulatory bodies, taking into account their innovative nature. The answer to this question is also important for enterprises (organizations), helping them navigate the radical transformations taking place in the economy, and not only for those of them that belong to the high-tech core of the modern economy. As for the technologies on which the DE development is based, then, according to the well-established ideas among experts, they include the following main ones: analytics of large databases, advanced robotics and sensors, neuroethologies and artificial intelligence, the Internet of things and the industrial Internet, virtual and augmented technologies. reality, cloud computing and a number of others. Meanwhile, for economic analysis, as well as for the orientation of business, and, we will repeat once again, not only the part of it that is employed in the information and communication sector, but also for those working in other, including traditional, sectors of the economy, the first is of considerable interest. from the levels highlighted above for the deployment of the 4th industrial revolution and the formation of the DE, namely, the level of markets and sectors of the economy.

Keywords: *cybersecurity, digital economy, digitalization, digital environment, digital infrastructure*

1. INTRODUCTION

The digital economy, which is based on a qualitatively new type of information and telecommunication technologies, covering and transforming all spheres of modern industrial and social life, although it is in the process of formation, already today has a powerful potential, which, in its implementation, provides a chance for achievement by both companies and countries. leading positions in key areas of socio-economic development. At the same time, as one of the well-known developers of the concept of the 4th industrial revolution, Chairman of the WEF Klaus Schwab emphasizes, it is about leadership in an increasingly global competition in the field of efficiency, productivity and innovation, as well as in ensuring high living standards and well-being understood in a broad sense, including the use of fundamentally new digital forms of communication between people, the use of the opportunities provided by artificial intelligence in meeting the needs of people on the basis of individualized principles [7]. The problem of digitalization of the economy, the challenges facing business, the state and society as a whole in this regard, the challenges posed by the digital economy, and the

opportunities it provides are the object of intensive reflection. Its importance is reflected in the launch of the Global Digital Competitiveness Ranking, which is focused on assessing the availability of opportunities and the degree of readiness of the countries included in the ranking for digital transformation. The assessments of the progress achieved, as well as bottlenecks and problem areas of the transition to the DE, contained in the rating, are of undoubted interest both for politicians and for business, including in Azerbaijan. In this context, the Information Economy Report 2017, prepared by UNCTAD and dedicated to digitalization, trade and development, deserves special attention [3]. The digital society, based on a complex of essentially radical innovations - technological, organizational, institutional, social, etc., raises many sensitive topics. These include, first of all, the question of who is the sovereign of a person's personal data. Further, does the development of digital technologies lead to the establishment of information monopolies or even some kind of "digital dictatorship." Are there technologies that allow for total control over an individual and his data by various state structures and international social networks, or, conversely, within its framework, favorable conditions are created for digital democracy with the transformation of a citizen into a sovereign of digital data and an active participant in ongoing radical transformations. In this regard, K. Schwab notes that new technologies and platforms can provide citizens with increasing opportunities to interact with governments, to publicly articulate their opinions and even to try to circumvent government control. However, at the same time, governments may gain new, technologically enhanced power to strengthen control over the population, based on the systems of comprehensive surveillance provided by the digital infrastructure. However, according to Schwab, in the context of the digital revolution, such attempts by governments will encounter increasing opposition, not only from the society, which does not want to put up with such methods of political decision-making, but also due to the modification of the role of politics itself in the face of increasing competitive pressures. and also as a result of the redistribution and decentralization of power, which become possible thanks to new digital technologies [7]. Among those affecting large segments of the population is the question of who becomes the main beneficiary of the 4th industrial revolution, whether it will lead to a further increase in economic inequality or will contribute to its weakening. And, further, - how to resolve the conflict, which consists in the fact that in the conditions of its deployment, the demand for highly qualified personnel increases, and the need for less educated and insufficiently qualified workers, who are still the majority in many countries, may decrease.

2. FORMATION OF THE DIGITAL ECONOMY

The process of transition to DE, the problems to be solved, are characterized by many facets, the understanding of which requires complex in-depth research. In this article, given its limited size, the authors focus on the following interrelated topics, the selection of which took into account the degree of their relevance, as well as the level of development in the literature. We are talking, firstly, about the structural aspects of the transition to the digital economy as a key link in the 4th industrial revolution in identifying those that may be of primary interest from both theoretical and practical points. Secondly, the main changes that are taking place in the business processes of modern enterprises (organizations) will be studied, including in the conditions of the formation of digital platforms, thanks to which the interactions of business entities are largely organized in a new way. Third, it is proposed to study the relationship between countries' transition to the digital economy and ensuring their sustainable competitiveness, taking into account the innovative nature of the ongoing changes. And, fourthly, possible ways of reflecting in the system of higher education the new requirements that are now imposed on specialists will be highlighted. Analyzing the formation of the digital economy as a key area of the 4th industrial revolution, it is necessary to dwell on its structural characteristics, without understanding which it is difficult to organize effective management of

the relevant processes by regulatory bodies, taking into account their innovative nature. The answer to this question is also important for enterprises (organizations), helping them navigate the radical transformations taking place in the economy, and not only for those of them that belong to the high-tech core of the modern economy. As for the technologies on which the DE development is based, then, according to the well-established ideas among experts, they include the following main ones: analytics of large databases, advanced robotics and sensors, neuroethologies and artificial intelligence, the Internet of things and the industrial Internet, virtual and augmented technologies. reality, cloud computing and a number of others. Meanwhile, for economic analysis, as well as for the orientation of business, and, we repeat once again, not only the part of it that is employed in the information and communication sector, but also for those working in other, including traditional, sectors of the economy, the first is of considerable interest. from the levels highlighted above for the deployment of the 4th industrial revolution and the formation of the DE, namely, the level of markets and sectors of the economy. The core of the DE is indeed the information and communication technology (ICT) industries. In this case, it is of interest, developed by the efforts of the OECD (Organization for Economic Cooperation and Development), a variant of structuring the ICT sector, which complements the current 4th edition of the UN Standard Classifier of Activities (ISIC, Rev.4), reflecting to a certain extent principles of the cluster approach. The proposed definition of the ICT sector, as noted by the authors of this approach, makes it possible to form an internationally comparable statistical basis for measurements by combining those types of economic activities that are formed on the basis of the creation of information and communication goods and services. And to some extent, the cluster approach applied in this case can be regarded as an attempt to more fully reflect the processes of structural and sectoral transformation that accompany the 4th industrial revolution. It should be noted in this regard that Azerbaijan uses a classifier of types of economic activities formed on the basis of ISIC. This makes it possible to carry out not only a comprehensive analysis of this segment of the Russian economy, but also to implement international comparisons, identifying strengths and weaknesses in its development. The need for this is all the higher since a number of research centers are actively studying this segment in priority countries from the point of view of its development, which include, in particular, China [2]. To form a more comprehensive understanding of the structural components of the DE, it is advisable to refer to the UNCTAD Report on the Information Economy 2017 [3]. In this document, following [1], the following three links are distinguished. Firstly, it is the core of the DE, which forms the ICT sector. Secondly, the narrow area of the DE, which, along with the core of the DE, also covers various digital services (for example, call center services) and services of digital platforms (for example, Facebook or Google). Thirdly, a wide area of DE is highlighted, which includes, along with the core of DE and its narrow area, also sectors 4.0 of the industry. These include e-business, e-commerce, artificial intelligence (AI) called the algorithmic economy, ultra-precision agriculture, sharing economy such as Uber, as well as on-line platforms for recruiting personnel and concluding contracts with freelancers. The latter are understood as free workers performing labor functions on the basis of freelance cooperation with the employer, possibly on a remote basis. As noted above, the digital economy is currently undergoing a phase of robust growth. And its place in the modern economy can be judged by the following data. As for the CE core, i.e. production of goods and services in the ICT sector, then in 2015 their volume reached 6.5% of world GDP, and employment in this sector amounted to 100 million workers. Exports of ICT services in the sector increased in the period 2010–2015. by 40%. Sales in the e-commerce sector were \$ 25.3 trillion in the same year, of which 90% came from B2B e-commerce and 10% from B2C (business-to-consumer) e-commerce [3]. However, there are many unsolved problems in this area. So, despite the increase in the period 2010–2019 the number of Internet users in the world by 60%, still more than half of the world's population does not have access to these services

[Ibid]. At the same time, this, like other indicators of the degree of penetration of DE technologies into everyday life, should not be interpreted as unconditional indicators of social progress. For example, the famous German neuroscientist Manfred Spitzer warns about the dangers arising from the overload of our minds with digital information coming from computers, smartphones, tablets, etc., which can lead to impaired cognitive abilities and its consequences are akin to "digital dementia"... Of interest are also comparative data on the level of digitalization of the economy and society as a whole in various countries, which are contained, in particular, in the Global Digital Competitiveness Rating. The comparative assessment of countries in this ranking is based on their ability to perceive and effectively use digital technologies as a means of ensuring the transformation of regulatory practices, business models and society as a whole. This assessment is carried out on the basis of three complex factors, which have received the following generalized names: knowledge, technological environment, openness to the future. Each of these factors is further broken down into three sub-factors, which, in turn, are detailed using six indicators. The knowledge factor is understood as a system of knowledge (know-how), which are necessary for the discovery, understanding and creation of new technologies and which are subdivided into the following three sub-factors: talent, education and retraining, scientific concentration. The technology environment factor is subdivided as sub-factors into regulatory framework conditions, capital and technological framework conditions. Openness to the future is detailed through the sub factors of adaptive capacity, business flexibility and IT integration [4]. According to this rating, the top ten countries in terms of digitalization in 2017 included the following (from first to tenth places, respectively): Singapore, Sweden, USA, Finland, Denmark, Netherlands, Hong Kong (SAR), Switzerland, Canada and Norway.

3. THE SPECIFICS OF BUSINESS PROCESS MANAGEMENT IN THE CONTEXT OF THE DIGITALIZATION OF THE ECONOMY

The successful development of DE, as can be concluded from the above, is possible only with the coordination of efforts implemented at the macro and micro levels. For this reason, it is important to find out what impact the digitalization of the economy has on the management of business processes in modern enterprises, as well as what changes in the relationship between enterprises are being made by the industrial platforms that are currently actively developing and functioning on digital principles. Digital concepts and technologies are fundamentally changing all types of activity, including production and economic. An increasing number of them, having gone from the use of personal computers, networks of the Republic of Kazakhstan, the Internet to the widespread use of mobile devices (including smartphones), are acquiring digital forms. Qualitatively new aspects of the management of industrial and economic activities are associated with the active development of the Internet of Things (IoT), which, in turn, is conditioned by the evolution of the Internet and the development of distributed networks as an important link in the information infrastructure of the DE. At the same time, the Internet of Things is understood as the concept of connecting physical objects by a computer network, which ensures the autonomy of devices and their ability to transfer data without human intervention. Already today, on this basis, experts point out, it becomes possible to organize the operation of assembly lines and entire enterprises according to a network principle, significantly reducing production costs and accidents caused by the human factor, optimizing production stocks and giving production a customized (focused on meeting individual needs) character [10]... Business Process Management (BPM) today focuses on cross-functional areas and aims to effectively organize business processes throughout the entire life cycle of products and services. This is of fundamental importance for a gradual transition to the implementation of the principles of a circular economy based on closed supply chains and ensuring a high level of socio-economic and environmental efficiency and safety.

At the same time, as experts note [6], if in the past several decades BPM has focused on analyzing and solving technological problems associated with reducing waste, optimizing costs and taking into account dynamic changes, which was the focus of and widely used methods like Lean Management and Six Sigma, the use of digital technology opens up a qualitatively new perspective. Thus, mobile technologies and the Internet of Things, by equipping objects with sensors, computing power and communications, enhance the fusion of the physical and digital world. Analytics of large databases, including the latest advances in cognitive technologies, make it possible to use information processed in this way in production for diagnostic and predictive purposes. The foundation is being created for information-driven business models, including remotely, to automate the solution of unstructured tasks and the interaction of people and machines using the so-called social robotics. Finally, 3D / 4D printing is disrupting traditional supply chains and value networks, allowing for decentralized and deferred manufacturing capacity. So, in the context of the digitalization of the economy, in the field of radical changes is the management of the main business processes of an enterprise (organization), up to their re-conceptualization. These include planning and management of production and industrial complexes, logistics, supply chains, both at the strategic and tactical levels. In the same row - advertising, sales, financial services and personnel management. Relationships within the organization and with all of its external stakeholders are being transformed, including, first of all, customers. Inside the enterprise, personnel are being replaced by “agents”. The relations of the state with business and society are changing, and a digital state and e-government are being formed. In a digital economy, it is in many ways necessary to define in a new way such key elements of business processes as mission and strategy, human resource management and process culture. In the DE, strategies, management, methods, IT and attitude to human resources should be client-centric (client-oriented). When strategizing and prioritizing, you need to create value propositions and benefits for informed customers. Management procedures should establish appropriate and transparent reporting and decision-making processes, developing traditional management technologies. Information technology is needed at all stages of the life cycle of business processes, and they must provide massive personalized processes. In human resource management and staff development, the focus should be on competencies in analytics, privacy and data protection practices, as well as innovative technologies. The formation of the DE is accompanied by radical changes not only in the management of business processes of individual enterprises, but also in the organizational forms of their interaction with each other. These changes are in no small part related to the formation of digital platforms. Digital platforms are multi-level digital frameworks that define the conditions for the interaction of their participants. Revealing the role of digital platforms, Kenney M., and Zysman J. emphasize that if the factory was the organizational center of the industrial revolution, then today's changes are organized around digital platforms. At the same time, digital platforms structure and facilitate relationships between economic agents in society. Well-known examples of digital platforms are Google, Amazon, Facebook with multi-billion-dollar turnover, but many specialized platforms, including industrial ones, perform similar functions. For example, Kenney, Martin, and John Zysman distinguish the following types of them in this regard: platforms for other platforms that facilitate the formation and provision of cloud services and other tools with which other platforms are built (examples are Amazon Web Services and Google Cloud Platform); mediator platforms (LinkedIn), platforms that act as retailers (Amazon, eBay); service-oriented platforms (for example, Airbnb - an online platform for rental housing), etc. [8]. Along with this, specialized platforms for industrial products and services, including engineering and transportation, stand out, examples of which are Amazon business, Mercateo, Industry buying, Grainger, and Instafreight. “Platformization” is increasingly embracing innovation markets. German authors Tobias Kollman and Nolger Schmidt, when revealing the role of information platforms, draw attention to the fact that they

are becoming the central business model of the digital economy. These search engines, acting as electronic intermediaries between suppliers and buyers, provide a lubricant function for the economy, expanding existing markets and creating entirely new ones. Google and similar digital platforms as search engines informally unite suppliers and buyers who, without the intermediation of these platforms, would either have to spend much more effort on such a search, or, perhaps, could never find each other [9]. The result is, we note from ourselves, overcoming (or significant weakening) of information asymmetry and reducing transaction costs associated with the search for information and the conclusion of contracts between market agents. Continuing the analysis of the functions performed by information platforms and the changes they bring to the modern economy, the authors compare them with the “invisible hand” of the market by A. Smith. In addition, due to a sharp reduction in transaction costs and, as a result, huge popularity among consumers, a certain part of the wealth is shifting in the platform economy from producers to consumers and their operators. This is reflected in the market value of integrator companies. For example, the four largest platforms (Alphabet, Amazon, Facebook and Alibaba) are now worth more than all Dax30 companies, which continue to operate largely the old fashioned way [Ibid]. As can be concluded, in the broadest sense, platforms mediate social and economic interactions online. Economic communities that produce goods and services of value to customers form what are called ecosystems. The complexity of the B2B landscape initially leads to the emergence of multiple platforms, but consolidation can be expected in the medium to long term in the platform segment. Information platforms, as well as the use of their services, are becoming an important factor in the competitive struggle. Experts, in particular, predict an increase in competitive pressure in mechanical engineering due to new forms of differentiation of supply and demand. Many platforms have been created and continue to be created, allowing industry partners from certain ecosystems to form alliances to share resources and competencies, complement their product lines with products and services of partners, and thereby intensify the interaction of ecosystem partners with customers (own and partners' customers), such as and income from network effects. As a result of this development, such business models as open innovation, cooperation within platforms are increasingly spreading in the world, and companies appear that play the role of an integrator. When assessing a kind of "platformization" of business processes and, in general, the formation of the economy of information platforms, one should bear in mind the presence of various facets of these changes. Indeed, as already partially noted above, the result of the analyzed processes is a weakening of information asymmetry and a significant reduction in transaction costs, since the costs of preparing business agreements with partners are reduced, and platform standards simplify communication and implementation of transactions. New services and business models are becoming available, such as proactive diagnostic maintenance and services that provide services (car sharing, white-sharing, etc.) instead of a person's car or bicycle ownership. Parallel to this, the benefits of network effects are growing. However, at the same time, the threat of severing relations with business partners from those companies that are still abandoning the potential of platforms increases, which increases the risk of destruction of existing business structures. In addition, a significant part of the added value and income of companies is moving from real business, as well as from consumers, towards digital services (on platforms), which is facilitated by unresolved pricing issues and a lack of clarity about the willingness of customers to pay for digital services. Experts also draw attention to the fact that during the reorganization of the economy, today's platform owners are able to acquire power that exceeds that which was possessed by factory owners in the early period of the industrial revolution [8]. This creates the danger of abuse of their dominant position, and can also lead to a significant exacerbation of social conflicts and deepening of socio-economic stratification in society.

The issues of information security and consumer sovereignty deserve special attention, which, in particular, is indicated by the scandalous situation with the leakage of personal data of tens of millions of users of the Facebook platform.

4. DIGITAL ECONOMY AND ENSURING SUSTAINABLE COMPETITIVENESS IN GLOBAL MARKETS

The formation of the DE is an important factor that determines the level of competitiveness of modern business leaders, as well as of entire countries. Countries that are among the advanced in the development of technologies and the use of DE tools, as a rule, are distinguished by a high level of competitiveness and sustainable development. Table 1, as a confirmation of this conclusion, presents a comparison of the indicators of countries belonging to the leaders of the global competitiveness rating (2017-2018), as well as world rankings of digitalization and sustainable development. manuals.

Table 1: Comparison of the leading countries in the global rankings of competitiveness, digitalization and sustainable development

#	Global ranking competitiveness (2017–2018)	IMD Global Ranking digital competitiveness 2018	Global ranking sustainability 2018
1	Switzerland	Singapore	Sweden
2	USA	Sweden	Norway
3	Singapore	USA	Finland
4	Holland	Finland	Denmark
5	Germany	Denmark	Switzerland
6	Hong Kong	Holland	Canada
7	Sweden	Hong Kong	Australia
8	United Kingdom	Switzerland	New Zealand
9	Japan	Canada	United Kingdom
10	Finland	Norway	Luxembourg

Source: <https://gtmarket.ru/ratings/networked-readiness-index/networked-readiness-index-info>

At the same time, DE development is characterized by extreme unevenness, which requires from the lagging regions to intensify efforts in this area, the effectiveness of which will determine their position in global markets. As for developing countries, as well as countries with emerging markets, according to the recommendations of experts and the parameters presented in the ratings of competitiveness, digitalization and sustainable development, the priority tasks for them include the integrated development of industrial, financial, digital, social, environmental and management infrastructure (see Table 2).

Table following on the next page

Table 2: Comparison of indicators of global competitiveness, digitalization and sustainability in the group of developing and emerging markets

Country ratings	Global ranking competitiveness (2017–2018)	IMD Global Ranking digital competitiveness 2018	Global ranking sustainability 2018
China	27	10	60
Russia	38	45	55
India	40	44	56
Mexico	51	48	47
Turkey	53	46	53
Kazakhstan	57	32	42
Azerbaijan	69	85	64
Brazil	80	51	50
Ukraine	81	60	58

Source: <https://gtmarket.ru/ratings/networked-readiness-index/networked-readiness-index-info>

However, as follows from a comprehensive analysis of global rankings (Table 2), a broader interpretation of the infrastructure component as a necessary basis for DE development in the context of increasing competitiveness and sustainable development is also advisable. A special direction in the analysis of infrastructure components of a new type is the development of digital infrastructure platforms. Note that the key feature of such platforms is the ability to recharge them in a way and use them in various sectors of the economy. For example, the end-to-end industrial Internet platform, on the one hand, makes it possible to accelerate and simplify the transition of domestic industry to the “rails” of Industry 4.0, and on the other hand, to stimulate the development of “smart” transport, ensuring the connectivity of vehicles and road infrastructure. The formation of the DE, as the defining direction of the 4th industrial revolution, is based on the complex implementation of radical innovations - product, process, marketing, organizational, social. At the same time, entrepreneurs are increasingly becoming the initiators of such innovations, who are looking for useful ideas and developments in the "field of science" for successful promotion to the market and for strengthening their positions in the competitive struggle. In this regard, it should be noted that today companies operating in mature markets, where the competitive situation is very tight, have to fight literally for a fraction of a percent of cost reduction. And the victory in this super-tough competition goes only to those who competently use the possibilities of digitalization of the economy and production. The innovative context of the digital economy deserves special attention. Complementing what has been said on this issue above, we emphasize once again that in relation to the digital economy we are talking to a significant extent about radical innovations that must be implemented in a comprehensive manner. The task is not only to develop high-tech business in key areas of the 4th industrial revolution and its successful entry into high-tech global markets. Along with this, the digitalization of the economy gives rise to products, processes and organizational forms that are massively distributed and which radically change all spheres of production, consumption and behavior in modern society. At the same time, it is appropriate to recall the lessons of the past, when the introduction of computers required a radical restructuring of management processes, the education system and training of professional personnel. No less, and possibly more serious organizational and managerial changes are to be implemented in the era of digitalization of the economy. At the same time, CE is not a panacea for all ailments and diseases of modern production and society as a whole. The benefits inherent in it are not realized automatically. The introduction of digital technologies requires not only careful preparation, but also experimental testing, as well as, taking into account the scale of the required financial resources, a thorough assessment of their real effectiveness (both current and future). It requires, as the experience of leading companies confirms, qualitative changes in the culture of production, taking into account the fact that these changes should cover not only the company's

personnel, but also its main external stakeholders. The transition to the 4th industrial revolution and the formation of the DE presupposes the use of innovative approaches, as well as the setting up of various kinds of experiments and the participation of personnel in them. And the potential inherent in the CE can be realized only by developing the staff's readiness for changes and the ability, including the necessary qualifications, to be their conductor and an active participant, which makes new requirements for the system of training and retraining of personnel, and also makes it necessary to introduce new accents into the mechanisms of their stimulation. The DE leads to a world that is distinguished by: huge potential for development, hyper-high connectivity, hyper-high speed, new risks, hyper-high competitiveness. This fully applies to business processes, which, recall, combine the following interconnected links and stages: marketing → product / service development → production → supply / delivery → customer service. DE, creating the ability to analyze large amounts of data, forms the basis for assessments and decision-making along this entire chain in real time. And, like any innovation, the DE will meet resistance (loss of traditional jobs, digital fatigue) and unexpected risks until it finds some relatively sustainable path for its development. Achieving sustainable competitiveness by business in the digital era depends on adequate understanding and consideration in practice, on the one hand, of opportunities and chances generated by digitalization, and, on the other, challenges and threats, to business and its stakeholders in the era of the DE, including total control over the state all business processes regardless of space and time. As for the chances and their transformation into real business opportunities, then, summarizing what has already been said on this issue above, they include continuous possession, including online, full information about the company, the emergence of new forms of financing (crowdfunding), participation of local companies in global supply chains, access to international markets with products; strengthening the position of women in business, etc. Among the challenges that can be both a source of success for business and the reason for its failures is mastering innovative drivers of business success. The threats also include the dangers associated with the loss of an employee's sovereignty over himself, the growth of social inequality, the need to protect consumers from uncontrolled penetration into their privacy, new criminality, not to mention the whole complex of threats associated with ensuring information security in the digital era. Among the mega-trends of the DE, which relate to both production and consumption, the following trends appear, which should be understood not only by business and regulatory bodies, but also from the point of view of modernizing the system of higher education. Among those actively discussed in this context is the intensifying process of replacing people with modern machines. The role functions of many economic agents are changing: clients are increasingly cooperating with computers; the boundaries of enterprises, especially in connection with the spread of the phenomenon of open innovation, are becoming less rigid, and their activities - more and more transparent; employees are increasingly preferring network structures to hierarchies; traditional relationships between employer and employee take the form of cooperation. The formation, in the true sense of the word, of research universities, along with the support of the changes carried out for this purpose on the part of the administration and management units, as well as the leadership style on the part of the leadership, implies ensuring that the specialist is called inclusive leadership, i.e. active and motivated, and responsible participation in the implemented innovative changes of the whole team.

5. CONCLUSION

Concluding the analysis and its results, we note that it is impossible to hope for the release of innovation-oriented specialists to higher educational institutions without giving an innovative character to the educational process. The creation of research universities in the full sense of the word means supporting the changes made for this purpose by administrative and

management departments, as well as ensuring the active, interesting and responsible participation of the entire team in innovative changes. There should be more university graduates with basic digital economy skills in Azerbaijan. More IT professionals and people need to be freed up who can confidently use these technologies to motivate people to embrace the new directions the digital economy requires. Employers should be involved in this issue. They are happy that their employees are developing and gaining additional knowledge. Large companies, including those with government participation, could create training services and courses. We believe that our actions in this direction should be based on the following four target areas, detailed measures on which serve to achieve them. These target issues include:

- 1) creating a system of motivating citizens to acquire the necessary skills and participate in the development of the digital economy;
- 2) compliance of the education system with new challenges, assistance in the integrated development of students, training of qualified personnel for the digital economy;
- 3) creation of basic conditions for training digital economy personnel (including the development and testing of the concept of key competencies and models that ensure effective interaction of the digital economy with business, education and society as a whole in a digital economy);
- 4) assistance to employers in the development of employees, taking into account the requirements of the digital economy.

Given the need to develop, apply and use innovative approaches that accompany the transition to the 4th industrial revolution, the creative component of the educational process is becoming increasingly important. In this context, universities face special tasks not only in ensuring the training of highly qualified specialists for an innovative economy, but also in ensuring that all components of the educational process comply with the principles of innovation, and not on a bilateral basis, without a company approach. should be analyzed.

CONCEPTUAL APPROACHES OF WORLD SCIENTISTS TO INTEREST-FREE FINANCIAL MARKETS

Parviz Rustamov

*Azerbaijan State Economic University (UNEC),
Baku, Istiqlaliyyat str.6, AZ1001, Azerbaijan
rustamovparviz@yahoo.com*

ABSTRACT

The purpose of the modern management system is to study the scientific and theoretical approaches of world scientists Aristotle, Nizami Ganjavi, Ibn Khaldun, Ismail Mutlu, Seyid Qutubi, Abu Ala Mawdudi, Yahya Abdurrahman, Muhammad Yunus and Servet Bayindir in the field of interest-free financial markets. The goal is to identify and research the contributions of world scientists to interest-free financial markets. The methodology of the article is a systematic and comprehensive study of the scientific approaches of world scientists Aristotle, Nizami Ganjavi, Ibn Khaldun, Ismail Mutlu, Seyid Qutubi, Abu Ala Mawdudi, Yahya Abdurrahman, Muhammad Yunus and Servet Bayindir in interest-free financial markets. Because these approaches have a great impact on the organization, management and development of interest-free financial markets. The importance of the application of the article is to apply the results in the management of interest-free financial markets. All this will lead to an innovative approach to the management of interest-free financial markets, the systematic development of this area, sustainable and sustainable operation. The scientific results of the article - Improving the management of interest-free financial markets, reflect the conceptual theoretical innovations in this area. The results of the study serve the application, improvement and development of interest-free financial markets. The originality and scientific novelty of the article is that the main scientific-theoretical directions of the scientific approaches of world scientists in interest-free financial markets are studied, theoretical and practical views, theories on the formation of this field as a scientific and practical direction were studied and generalized, and its necessary scientific aspects were studied. From this point of view, the research work can be considered commendable in terms of research of scientific approaches to the management of interest-free financial markets.

Keywords: *Islamic finance, Islamic financial management, Islamic financial system, interest-free financial markets, interest-free financial market management, Islamic management system*

1. INTRODUCTION

When studying the theoretical and practical approaches of interest-free financial markets in the modern management system, it can be seen that this field is very important and relevant. Each of these approaches has its own set of rules and principles. First of all, it is important to consider the nature and content of interest here. I would like to note that the nature of interest is given interesting information in the holy sources, especially in the Holy Quran (The Quran). Thus, in Ismail Mutlu's book on "Interest", the term is expressed in terms of percentages with different definitions, which mainly consist of the following:

- Interest is a set that is conditional on a certain amount of money being invested or borrowed. That is, it is the return on investment without labor and without taking any risks;
- Interest is a majority condition that the debt to the party be repaid in kind or in cash;
- Interest - profit from the loss of another;
- Interest is the price paid for the use of money;
- Interest is a debt that increases over time;
- Interest is a profit that is not shared with the loss. (Mutlu İsmail, 2003).

As we know, interest is an economic fact that has been known since ancient times, applied and subject to positive or negative assessments. This fact, which has not lost its significance throughout the history of the economy, is still considered one of the most important indicators that distinguish political and economic regimes. Because of this importance, since its inception, interest has been among the research topics of philosophers and economists, especially the heavenly religions. Islam, the last of the heavenly religions, has taken up this problem, which is of great interest to society, within the framework of a law based on its own moral laws, and has shown a religious-legal attitude towards interest.

2. ARISTOTLE'S SCIENTIFIC APPROACH TO INTEREST-FREE FINANCIAL MARKETS

Aristotle (384-322 BC), a disciple of Plato, was one of those who had such an attitude towards usury. Aristotle, on the other hand, found it unnatural to be rich because of interest, and argued that money would not personally produce a product and that money could not be used as a means of gain or wealth. He likened the percentage to "an eggless hen." According to Aristotle, who likened money to an endless hen that does not lay eggs and says that "money cannot breed," money is very different from a human, a plant, or an animal because of this feature. His interest in his book Politics is as follows: "The most disgusting interest is interest, because the profits from it come directly from the very existence of money, and the reason for the birth of money is contradictory. Because money is created for exchange, while interest increases the amount of money, and thus is the most unnatural way to earn money. Aristotle (384-322 BC) did not consider it right to make money from money like his teacher Plato. According to him, there are two ways to gain wealth, which mainly consist of the following:

- Natural - this includes shepherding, farming, fishing, hunting and other natural methods.
- Unnatural - this includes activities that are carried out only for the purpose of making money using unnatural methods. One of the unnatural ways to get rich using this method is interest.

3. NIZAMI GANJAVI'S SCIENTIFIC APPROACH TO INTEREST-FREE FINANCIAL MARKETS

The most prominent figure in the development of the Islamic financial and economic system is Nizami Ganjavi, a great Azerbaijani poet, philosopher and thinker who lived and created in the 12th century. He was well educated and studied history, ethics, philosophy, logic, theology, astronomy, chemistry, physics, medicine, botany, mathematics, interpretation of the Holy Quran, music, fine arts, etc. was deeply acquainted with the sciences. His works, called "Khamasa" and combining five great poems, are known for their rich approaches to social, economic and other sciences. Nizami Ganjavi, living in the era of developing feudalism, was not indifferent to the social, economic and economic problems of his time. From this point of view, his works are rich in socio-economic approaches. One of the important issues in his socio-economic approaches is labor, wealth and their relationship. In his works, he praised the work of those who created material and spiritual wealth, and wrote images of people whose physical and mental abilities were above all else. Nizami Ganjavi exposed those who lived in wealth, those who were addicted to gold, those who lived with rifles, and saw the meaning of life in work, in the service of humanity. He wrote: "Do not teach your body to enjoy, because the result of unemployment is bloodshed ... If you are alive, keep your hands and feet at work," "In any case, you work, work is life." In "Treasure of Secrets" and other works, Nizami Ganjavi shows that labor is a human activity, he saw the difference and superiority of man over other living beings, labor and professional activity. He criticized those who practiced haraam habits, saying, "Neither lust, nor sleep, nor food, should have any meaning in life." Nizami Ganjavi called people to understand, to think, to "show courage in revealing every secret of life."

In his works, Nizami Ganjavi showed that the ultimate goal of production is to meet the needs of man for survival: "The ultimate goal in any endeavor is nothing but food and clothing." Therefore, the labor process has a social meaning, where everyone works for himself and for others, everyone is dependent on everyone, and everyone is dependent on everyone: "If we look at the field of the world, we are all farmers for each other." This approach further develops the idea of the division of labor and its impact on the growth of wealth. In Nizami Ganjavi's works, if the state does not take care of art, craftsmanship and farming, if everyone does not create conditions for their profession, "everyone will not be able to benefit from their profession", wealth will decrease, taxes will not be paid, treasury will be empty and social justice will be violated. The great Azerbaijani poet, philosopher and thinker Nizami Ganjavi concluded from his socio-economic approaches that he did not agree with the society he lived in and its injustices, he lived and created it with the ideas of "regulation" and "reconstruction". (Vəliyev T. S., (1995).

4. IBN KHALDUN'S SCIENTIFIC APPROACH TO INTEREST-FREE FINANCIAL MARKETS

In his Introduction, Ibn Khaldun made an in-depth analysis of the issues raised in his theory of development, even though he used the works of his predecessors and scholars of his time. The theory of development in his "Introduction" and the model of governance referred to here are focused on the activities of the ruler. A number of recommendations have been made in this model, which mainly include the following:

- The power of the ruler (al-mulk) is manifested only through the application of the Shari'ah.
- Sharia is applied only by the ruler.
- The ruler derives his power only from the people (ar-ricial).
- The people can only stand on their own two feet.
- Wealth can be obtained only through development (improvement).
- Development can only be ensured by justice (al-adl).
- Justice is a measure of God's evaluation of people (al-mizan).
- The ruler is committed to ensuring justice. (Muhammad Umer Chapra, (2018).

In his work, Ibn Khaldun pointed out a number of issues in the concept of "Social Physics", which mainly consist of the following:

- showing a conscious attitude to work;
- combating mismanagement and greed;
- Realization of the impossibility of property and social equality.

Research on the classical Islamic system of economic governance has been reflected in the writings of many Islamic scholars and thinkers. However, Ibn Khaldun wrote his name in golden letters with his approach to the history of Islamic economic thought. (Hacızadə E. M., 2006).

5. SEYID KUTUBI'S SCIENTIFIC APPROACH TO INTEREST-FREE FINANCIAL MARKETS

Professor Sayyid Qutubi's book, "Interest", contains a number of reasons for Islam's harsh stance against interest and the specific truths that explain them, including the following:

- 1) The primary truth, which is the absolute conviction of the heart, is that Islam will not exist where interest exists. If Islamic scholars and muftis comment on anything else, know that this is a lie and a deception. Islam is resolutely fighting against the effects of interest on human life, thought and morals.

- 2) The interest rate system is not only a problem of faith, morality and life, but also a problem of economic life. Because interest is the most terrible order that destroys the happiness of mankind. Although it looks attractive and claims to improve the overall economic system, it destroys close human and moral values.
- 3) Moral order and practical order are completely interrelated in Islam. Man must be faithful to his promises and commitments in managing all his actions. Undoubtedly, man's activities must be observed, tested and tested throughout his life, and he will be held accountable for all his deeds in the Hereafter. There is no single moral and practical order of life in human activities. On the contrary, they both regulate human activity. So both are a form of worship. If a person lives a pure life, he will be rewarded, and if he lives a bad life, he will earn a sin, and this will be recorded in the book of deeds and he will be held accountable for it. A successful Islamic economic system cannot be built without morality and ethics. If a person stays away from morality and ethics in his life, the success he will achieve in his practical life is nothing but strife.
- 4) The purpose of an interest-bearing borrower is not to do any useful work for humanity, but only to do business to make a profit from his work. Since the main way of working here is to make a special profit, he will exploit people to the fullest to achieve his desires. Thus, the picture of the world today and the main reason for this is to work with interest.
- 5) Islam consists of a mature order. When he forbade the rules of interest, he laid the foundation of his order on the principles of ownership. It regulates all spheres of socio-economic life in its own way. Thus, all this can be done without interfering with the development of closely linked socio-economic and human relations.
- 6) Islam - there is no need to liquidate any enterprise or organization while organizing life in accordance with its own thinking and special order, eliminating the interest rate regime, developing socio-economic life, and carrying out natural processes. He is simply against the hegemony of interest and the problems it brings. He is regulating his place with a stable and healthy relationship. If banks operate on an interest-free basis, such organizations are considered Islamic institutions.
- 7) There is an important fact that a person who wants to become a Muslim must believe. That is, the life of human society can never be based on anything that God has forbidden, and will not continue on that condition. At the same time, it is impossible from the point of view of religion, which has the right to have the last word about life, to lay the foundation for certain unjust methods of life.

The world of humanity, which was previously oppressed under the yoke of this order until it was abolished by Islam, is still being crushed by the blows of the new order. Unfortunately, the new world of humanity is fleeing from the Islamic order, which will save itself and bring salvation. Professor Seyid Kutubi's book "Interest" had its own approach to solving the problems caused by interest. In his work on interest, he argued that the first reason was that, despite his material well-being, he suffered from a morally depraved human spirit, devoid of spirituality, faith, and submission to God, in accordance with the requirements of faith in God and consent to be caliph on earth. is to stay away from great human goals. One of the reasons for this situation is the scourge of interest. Interest is a sad scourge of the economy. It ensures the development of the economy, but prevents the orderly, equal development, good deeds and the regular distribution of blessings among all people. The benefit of this is that some interest-bearing businessmen stand behind large safes in banks and lend to traders and industrialists to make a profit. These are not in the interests of the people, the needs of society as a whole, the needs of society as a whole, the goals of social and individual peace everywhere, but they will impoverish and destroy millions of people, even the lives of all mankind. even if it enters. they are focused on the most profitable goals.

It is obvious that there is no peace and tranquility in the human society that carries out its relations with interest. God will destroy the blessing of interest. In a society that carries out these disgusting interest operations, it is impossible to find anything but misery, hardship and calamity. Islam does not consist of a word spoken in the language. He is the regulator of the proper organization of life and all things. It is like denying some of its rules and rejecting all of them. There is no doubt that interest is haraam. It is the job of the "sinful disbelievers" to make interest lawful and to regulate life according to the interest system. Only God can take refuge in them from their evil and wickedness. (Seyid Kutub, 1998).

6. ABU ALAW MAWDUDI'S SCIENTIFIC APPROACH TO INTEREST-FREE FINANCIAL MARKETS

Abu Ala Mawdudi's greatest contribution to the Islamic financial and economic system was his 1960 book, "Interest". In the book "Interest" by Abu Ala Mawdudi, the specific features of the Islamic order are shown in a unique way. Islam, which opposes the existing economic systems in the world, takes a golden mean between economic systems and combines a scientific and perfect order. Its main principle is to give man all kinds of personal and natural rights, as well as not to upset the balance of the distribution of wealth. On the one hand, it gives a person the right to personal property and the right to save property. On the other hand, it imposes certain legal restrictions on these rights and powers, both morally and materially. The main purpose of all this is to prevent the excessive accumulation of natural resources and national resources in one center, to ensure the continuous circulation of national resources and natural resources, and to ensure that every member of human society receives its rights and shares. To this end, the Islamic order has approached the economy with principles that are completely different from the principles of any system in the world in terms of its spirit, principles and methods. Thus, the view of the Islamic economy can be briefly explained as follows. In economic life, the individual interests of each person and the socio-economic interests of all people are closely linked. Therefore, instead of contradicting the socio-economic principles of Islam, there is mutual assistance, harmony and solidarity. If a person fights against the common public interest and accumulates the wealth of human society in his own hands, if he intends to spend his profits only for himself, it will not only harm human society, but will also be detrimental to him. In the same way, if the general social order of society is sacrificed to the personal interests of a few people, not only people but also society itself will eventually have problems. Thus, doing good will lead to the prosperity of human society, and doing good in human society will lead to a prosperous life. The goodness and happiness of both must be based on the right balance between people's feelings of interest and regret. Under this rule, no one should have the right to acquire wealth in a harmful way, so the wealth acquired in a proper and proper manner should not be accumulated, but should be circulated as much as possible. The purpose of the economic order underlying this meeting is to ensure that neither a handful of people become millionaires nor all other people remain hungry and poor. The purpose of this order is not to prevent some people from becoming millionaires, nor to make all of them equal in socio-economic terms, despite their natural differences. The main purpose of the issues mentioned here is to ensure that the economic needs of all members of human society are met. If everyone in human society remained within the limits of their natural activity without harming others, if they were frugal in spending this profit, if they could help people, there would be no economic imbalances and inequalities in the order of capitalist society. Because while such an economy does not prevent one from becoming a millionaire, thousands of people are not allowed to go hungry because of the wealth of this person. On the other hand, this economic order naturally requires that all people be given a share of the wealth God has given them, and at the same time does not impose artificial restrictions that make it impossible for this person to acquire wealth according to his own strength and ability.

According to Abu Ala Mawdudi, the main elements of the Islamic economic order include the following important directions.

- 1) Free economy with some borders and restrictions;
- 2) Zakat is obligatory;
- 3) Determination and adoption of the law of inheritance;
- 4) Prohibition of interest.

Islam draws its support from morals and laws to establish a practical order on the accepted middle economic path and meeting between communism and capitalism. Islam, with its spiritual upbringing, prepares every individual in society to voluntarily submit to the order of thought. He imposes a number of restrictions on people through his Islamic laws, which require them to abide by this regulatory mechanism and not to go beyond its borders. These moral principles, legal provisions are the conditions and elements of this economic order. Thus, it is advisable to take a good look at them in order to better understand their character and spirit. (Əbu Ala Mevdudi, 2004).

7. YAHYA ABDURRAHMAN'S SCIENTIFIC APPROACH TO INTEREST-FREE FINANCIAL MARKETS

Professor Yahya Abdurrahman addressed the new generation of bankers, Muslim or non-Muslim, who held positions in the interest-free banking system, and considered it expedient to follow the following issues:

- Work hard and never give up because of your faith in God. Do your best to work for your "possible" thoughts, ideas and ideals so that you can achieve what everyone says is "impossible";
- Remember that we, as those who believe that it is possible to lead an interest-free life, do not discredit, eliminate or condemn a traditional interest-based banking and financial system, and in return do not adapt to an interest-based lifestyle, we are in favor of seeing it. What we really support is to draw people's attention to the possibility and existence of a system that combines a different way of life in the face of an interest-based system;
- When faced with a setback or difficulty on this path, or when there is a difficulty such as not being able to reach the goal, do not feel defeated or unsuccessful, and never leave the battlefield and retreat. You will be criticized by some well-meaning Muslims or non-Muslims, or by those who do not have enough life experience and experience, or by some people who have no idea about the future; these criticisms should never shake you. Listen to them carefully and try to solve or try to solve the problems that are in the center of your attention within the possibilities and limitations at your disposal. Never be careless in the face of such criticism of your work. Listen to the opinions of other people on the topics you are working on, and listen to them with sincerity, attention, and respect, whether they are criticisms or not;
- Get in touch with well-meaning and constructive critics, but never hold a grudge against your critics and see them as your rivals or bridge bridges between you; because do not forget that in the future you may one day come and need such people;
- Address and communicate with people in a language they can understand, explaining the similarities and differences between interest-free banking regulations and all transactions, products and contracts, interest-based traditional banking, financial regulations and disciplines;
- Try to build relationships between organizations instead of individual relationships between people; because organizations, enterprises, continue their activities for generations; Among human beings, it ends with the death of that man or woman or other causes;

- Keep your faith and discipline in the interest-free structure alive and be sincere in your relations with the people and do not deviate from honesty; if you act with an open heart, you will win the hearts of the people;
- Communicate with all members of the public in a humble and respectful manner. Do not brag about the services that you and your subordinates and the organization you work for provide to other people in the community. Do not complain about the fact that the people's representatives do not know the value of your services and work. Remember that our ultimate goal is to gain God's approval and approval;
- We must also keep in mind that if serious relations with these circumstances and conditions are lost, God will be able to remove His protection from us;
- Make sure that you never set any tricks or traps against the laws of the country with interest-free discipline and legal system.

Remember that no one, no matter how religious, holds the keys to Paradise and God's Kingdom. We are always in the service of God and the Son of man. (Yahya Abdurrahman, 2015).

8. MUHAMMAD YUNUS' SCIENTIFIC APPROACH TO INTEREST-FREE FINANCIAL MARKETS

According to Professor Dr. Muhammad Yunus, in order to eradicate poverty, policy must have a broader and deeper meaning than an approach to the creation of ordinary employment. Thus, the real eradication of poverty begins when people can control their own destinies. Therefore, it is not the work that saves the poor, but the invested capital that, in many cases, quickly eliminates poverty at little or no cost to the taxpayer and allows the poor to manage their own lives. As you can see, there are limitations to individual entrepreneurship, but in many cases it is the only solution to help the fate of people who our economy refuses to include and who do not want to take on the responsibilities of taxpayers. (Muhammød Yunus and Alan Jolis, 2016).

9. SERVET BAYINDIR'S SCIENTIFIC APPROACH TO INTEREST-FREE FINANCIAL MARKETS

Professor Servet Bayindir's book, «Islamic Finance in Terms of Fiqh and Economics-2», shows that in the Qur'an, a person's life activity is described by linking it to the beginning of an economic activity consisting of housing and food. Therefore, the world is a promised place to live and enjoy the means of subsistence and to be resurrected in time. In order to survive, people need to have certain knowledge in specific areas, such as nutrition, shelter, clothing, protection, defense and housing. Here, all human needs are met by living things obtained under goods of economic value. Thus, the place where the rain is produced and the sustenance is produced has been given to the service of human beings by God, the true owner of all beings in heaven and all the wealth on earth. God is the sole possessor of beings. Man has the special qualities that God has established in all beings, the power to use the blessings bestowed upon him sparingly, and the power to dispose of them. The basic principle in this matter is to establish a relationship with the Creator in this sense, acknowledging that God is the true owner of creation. In order to have wealth in human society (to protect property relations), it is necessary to follow certain rules in order to benefit from and dispose of this wealth. The rules and principles set by Islamic economics in this regard are not fully understood by modern economists and are not reflected in modern economic theories. In other words, economic theories that have emerged since the founding of economics are far from Islamic principles in this regard, and in some cases even anti-Islamic. Legitimacy is the main criterion for owning, using and consuming property. Thus, the property must be legally owned and ordered to be used in the same way. Confiscation of property permitted under a license agreement, inheritance, will, grant of all kinds, and trade based on mutual consent are among the main methods of obtaining legal wealth.

Interest, gambling, theft, usurpation, bribery, fraud, religious exploitation, etc. and it is one of the methods of obtaining wealth by false means. Man has the opportunity to acquire wealth not only through superstitious means but also through legal means in order to acquire wealth and ensure the socio-economic security of his life. Economics is considered to be a science that adopts the methods and principles applied in the process of production, circulation and distribution of existing natural resources for the healthy and balanced continuation of socio-economic life. Numerous theories and guidelines have been developed to achieve the desired socio-economic well-being and sustainable development using the available natural resources in the most efficient way. The sum of all this knowledge is the common heritage of mankind. The views put forward have always been met with considerable respect by Muslims because they coincide with the principles of the Qur'an and its rules, which are indirectly practiced in the Sunnah. Thus, those who do not conform to the principles of the Qur'an are either corrected, and those who cannot be corrected are rejected and expelled. For example, in today's modern economic thought, theft, usurpation, bribery and deception are not considered legitimate economic activities, as in Islam, and ways to obtain interest and other superfluous goods are seen and validated as anti-Islamic means of gain. Therefore, theories on the subject of modern economics should be evaluated within the framework of these criteria, and not with generally rejected or fully accepted approaches. Many areas of today's economic life have emerged as a result of methods, inventions, and economic methods and institutions developed in historical processes to meet the basic needs of human beings. Among the human needs are the food sector, the textile sector, the housing sector, the arms sector for self-defense, the medical sector for a peaceful, quality and healthy life, and the information for intellectual development. sector, entertainment, recreation and sports sector, communications sector related to the circulation of goods, services and information, etc. formed. (Servet Bayandır, 2015).

10. CONCLUSION

We conclude from the research that the scientific-theoretical approaches of world scientists Aristotle, Nizami Ganjavi, Ibn Khaldun, Ismail Mutlu, Seyid Qutubi, Abu Ala Mawdudi, Yahya Abdurrahman, Muhammad Yunus and Servet Bayindir in the interest-free financial markets in this area are socio-economic. and creates great opportunities for cultural development and expansion. For sustainable and sustainable development in interest-free financial markets, it would be expedient to take into account the following results:

- According to Aristotle, he removed money from the process of commodity-money relations and promoted the activity of money in the form of capital. As a result, the harm of usury to human society was clearly reflected in his works.
- According to Nizami Ganjavi, he explained and commented on his views on the exchange of goods, market, price, money and its functions, usury and interest in his works in a unique way. His advice, recommendations and comments on a number of socio-economic and practical activities of people, about the place and role of man in life are still relevant today.
- According to Ibn Khaldun, if the state does not protect the natural human rights of farmers, artisans, merchants, scientists, does not create conditions for them to operate freely, does not implement fair tax and financial policies, does not eliminate usury, the system of society will be violated and the state will be destroyed. that precautionary measures must be taken to prevent all this.
- According to Sayyid Qutubi, interest is nothing but a violation of one's identity, morals and conscience against one's brother and society. In general, a person disrupts the life of society and causes feelings of greed, jealousy and selfishness towards each other.
- According to Abu Ala Mawdudi, it is not enough to create some moral virtues in the internal structure of people alone to protect the distribution of income and this turnover of wealth.

Thus, the laws of human society must regulate the proper organization of the acquisition and use of wealth.

- According to Yahya Abdurrahma - you need to be open and transparent in your comments about the "added value" provided by interest-free discipline. It should be borne in mind that the interest-free financial management system exists to serve all peoples of the world.
- According to Muhammad Yunus - if people build their business with interest, it is their disaster, if they build their own business systems, it will improve their socio-economic situation. Of course, they need help. Thus, it is not the work that saves the poor, but the capital invested that, in many cases, quickly eliminates poverty at little or no cost to the taxpayer and allows the poor to manage their own lives.
- According to Servet Bayindir, in order to achieve the socio-economic development of society in the modern system of governance, it must be regulated in accordance with the economic principles contained in the Holy Quran.

As a result, all the activities carried out for the sustainable and sustainable development of interest-free financial markets must be based on the principles of justice, social justice, social equality, and take into account the scientific approaches of world scientists in this field.

POTENTIAL FOR ECONOMIC DEVELOPMENT AND SECURITY OF THE NATIONAL ECONOMY

Feyruz Shamilov

*Doctoral student at the department of “Economic Theory”,
Azerbaijan State University of Economics (UNEC), Azerbaijan
feshamilov@mail.ru*

ABSTRACT

The economic security of the country and the sustainability of growth in modern conditions are of paramount importance, since they provide guidelines for making the most important socio-economic decisions. Constantly occurring changes in socio-economic dynamics give rise to the possibility of crisis phenomena, which in turn actualizes the problem of ensuring economic security and sustainable growth. Modern transformations in the economy of the Republic of Azerbaijan have a multifaceted nature, which is influenced by internal economic conditions and trends in the world process. Significant changes in the conditions of globalization have led to radical changes in national economies, which are under positive and negative, objective and subjective, stable and temporary influences. Reproduction of the national economy at a progressive pace presupposes the achievement of economic stability as one of the conditions, which is not an end in itself for economic development. The goal of economic development is to improve the level and quality of life of the population. The condition for ensuring the economic security of an individual country is the ability of the economy to resume the process of expanded reproduction in all sectors and branches of the economy. In this regard, a study of the features of economic and social dynamics is carried out by industries and spheres of economic activity of the republic.

Keywords: *development potential, ensuring national security, economic diversification, quality of economic growth, innovation orientation*

1. INTRODUCTION

In the modern geopolitical conditions of world economic development, huge changes are taking place in economic relations. The ongoing changes in socio-economic transformations are enormous, and the prospects for development are in the interval between the exit from one crisis to another and the transition to high-quality economic growth. In many countries, the problems of integration into the world economy in the prevailing conditions and the achievement of the stage of sustainable development are being solved. Participating in global processes, the republic's economy must combine the possibilities of efficient use of all resources, preserving territorial integrity and ensuring national security. The dynamics of social and economic development, the ongoing changes in economic systems, the possibility of more efficient use of available resources require the deployment of research on the nature of growth and ensuring economic security.

2. THE SIGNIFICANCE AND RELATIONSHIP OF ECONOMIC GROWTH, DEVELOPMENT AND SECURITY

Opportunities for economic growth and security, as processes reflecting the state of the economy, are complex, multidimensional, and at the same time quite contradictory. The development of an economy of any type is determined by the stage of economic growth and the provision of national security. The ability of the national economy to maintain internal equilibrium development ensures the stability of the system within certain limits. But at the same time, the state of the system, in which it is stable, shows its stability. The national economic system maintains its stability and stability due to synchronous, constantly occurring

changes. Each socio-economic stage in its development is unique, and the modern period of the market economy combines the factors of globalization and the conditions for ensuring national security. Despite the great achievements of the world economy, they have not eliminated significant gaps in the level of development of individual countries. There is a spatial and temporal discrepancy between the means and the goal of economic development, reflecting the originality of a certain stage of economic growth. With all the differences in the concepts of economic growth, economic development and national security, they are very adjacent, but not identical, combining similar features, as well as mutually conditioning each other. If economic growth is understood as an increase in the volume of the country's economy, then economic development is understood as a general improvement in the state of the country's economy, which implies primarily economic growth as such and, secondly, the qualitative characteristics of the results of economic activity, reflecting the level of competitiveness and social environment. The main difference between economic growth and economic development is that economic development includes economic growth, i.e. has a more capacious content and in the future they imply each other. The essence and differences between economic growth and development were defined by J. Schumpeter as follows: "Put as many post carriages in a row as you wish - you will not be able to get a railroad" [1]. In accordance with his theory, economic growth is determined by quantitative changes in the economy, i.e. an increase in the scale of production, and the development of the economy with qualitative positive changes, innovations in production, services, consumption. Therefore, if economic growth means a positive development of the real volume of production of a particular country, then economic development presupposes an increase in the level of production on an innovative basis along with an increase in the quality of life of the population. But economic growth can occur, and without development, if the results of economic activity are used by certain segments of the population. Further, the sustainability of economic growth will also be determined by inclusiveness and the state of the environment, which characterize the development of the national economy. These problems are related to the diversification of the economic structure. Note that structural shifts remain one of the main factors of economic growth in the modern period, and the implementation of structural diversification is possible with effective government policy. Economic growth is objectively the main factor in ensuring economic security. State economic policy through stimulating economic growth is designed to ensure national security. The economic growth observed in certain years, as well as the dynamics of the main macroeconomic indicators, show that the economic growth of the corresponding years cannot be considered self-sufficient due to the obvious dependence of the state of the economy on the conjunction of energy prices. Let us emphasize, as noted by the authors in the future, "The modern growth model, solving the problems of new industrialization on an innovative basis, must also respond to new global challenges, including climate change, be environmentally oriented, weaken social stratification, and generally improve social welfare" [2]. The level and growth rates of individual countries have changed over a fairly long period depending on the socio-economic structure, the rate of scientific and technological progress, demographic processes, and international economic relations. Despite all this, the consistently growing growth rates are periodically interrupted, suspended, and reduced due to the resource opportunities of investment, labor, natural, financial, and innovative nature.

3. STUDY OF THE DYNAMICS OF ECONOMIC GROWTH AND SECURITY

Differences in the economies of individual countries are predetermined by such characteristics as geographic location, availability of natural and labor resources, structure of production and use, foreign economic activity, historical conditions, development of market relations, which predetermine national characteristics and the state of economic security. It should be noted that the quality of economic growth in the Republic of Azerbaijan has its own characteristics,

preconditioned by structural dynamics. The main dynamics is expressed in the fact that the share created in the oil and gas sector in the republic's GDP for the period under study, although with fluctuations, decreases from 44% in 2005 to 37% in 2019 and, accordingly, the share created in the non-oil sector increases with fluctuations. sector from 48% to 54%, which is generally positive. The comparison of the concepts of economic development and economic security deserves attention, and as noted by the philosophers of this point of view, development and security appear to be two different, but closely interrelated conditions of life in any sphere. In this case, the defining condition is still development, and this development only ensures security. Thus, “ensuring economic security should be considered as a necessary condition for the normal functioning and progressive development of the economy” [3]. The national interests of any country are based, first of all, on economic security, the provision of which in any period is determined by the ability of the economy to function in conditions of expanded reproduction. Thus, it can be noted that, although in recent years there has been a slight increase in the rates of economic growth in the republic, this growth has not passed to a stable stage, because fluctuations interrupt the nature of the duration of growth. In connection with the operation of objective economic laws, it remains necessary to accelerate the diversification of the structure of the economy, to increase the share of industries with high added value and, consequently, to stimulate the expansion of technological exports. Note that in the sectoral structure of the gross value added of the Republic of Azerbaijan, its share created in the extractive industry is decreasing from 45.6% in 2005 to 38.6% in 2019 and an increase in the share of gross value added created in the manufacturing industry from 7% to 5.5%, which characterizes its positive orientation. In accordance with this, and based on the structure of the economy by spheres of economic activity, it is necessary to ensure the further development of the non-resource sector and exports with the flow of capital from the raw materials sector to the processing industries and the outstripping growth of knowledge-intensive information industries. There remains a need to channel capital investments into non-resource sectors of the economy that have a high share of added value. Note that the quality of economic growth and ensuring national security is characterized to a large extent by the growth rates and the structure of industrial production. So, during the study period, the growth rates of the manufacturing industry began to outstrip the growth rates of the mining industry, since the ratio between them in 2005 amounted to 116.0% to 141.5%, then in 2019 - 111.5% to 100.4%, thereby expressing a progressive trend, but this trend has not yet sufficiently affected the structure of industrial production, in which the mining industry remained in the share of 85%, and the manufacturing industry - 12% include the production of machinery and equipment accounted for only 0.3% (GVA). The structure of the produced product predetermines the structure of foreign economic activity, in which the share of the republic's mineral products in exports is 90.9%, which indicates the need for a radical change in reproductive proportions. The solution of these tasks in the republic will provide a long-term potential for dynamic growth, a consistent increase in the well-being of the population, an increase in the country's competitiveness and economic security. At the same time, structural diversification should be aimed not only at using domestic financial resources, but also to stimulate the activities of foreign firms to invest in the production of non-resource sectors and sectors of the economy. The most important condition for ensuring economic security is the ability of the economy to function in the type of expanded reproduction on an intensive basis. Economic dynamics are changeable and are reflected in the level of economic security, depending on specific circumstances and time period. Note that after several periods of recession associated with ongoing crises in many countries, economic growth in the Republic of Azerbaijan began to recover in the following order: the rate of GDP of the republic compared to the previous year had the following value 2005 -126.4%, 2010 - 105.0 %, 2015 -101.1%, 2016 -96.6%, 2017 -100.2%, 2018 -101.5%, 2019 -102.2%. However, the next year, the republic's economy faced the global problem of a pandemic and the need to

liberate and restore the liberated territories of the country. The economic security of the country, in the final analysis, is a special stable state of the national economy, predetermined by its constantly developing combination of its properties and abilities. Since the reality is that Azerbaijan is an oil country, this circumstance is, accordingly, the basis of its economic development. In these conditions, both GDP, and GVA, and the national income, and the country's budget are based on the development of the oil and gas sector. This natural resource potential sets the optimal use of mineral reserves as the main task of economic policy, as well as reducing the dependence of the country's economic and social needs on oil exports and ensuring independent economic development. In the context of modern globalization, the processes of ensuring the country's economic growth and security are developing more and more complexly and contradictory. Also, the dynamics and state of security characterizes the process of using GDP. The analysis showed that during the study period, the share of final consumption increased from 52.6% in 2005 to 67.6% in 2019, amounting to more than 2/3 of the total, which characterizes an increase in social orientation. The share of total accumulation decreased from 41.5% in 2005 to 20.1% in 2019, which is associated with a worsening situation in the raw materials sector. Further, the share of net exports in the used GDP had strong fluctuations, but in general in recent years it has increased significantly, amounting to 16.5% and 12.3%, also depending on the volume and structure of raw materials export. In general, the structure of use is determined by the value of consumption and accumulation, accounting for more than 80%, which are affected by the share of net exports. Next, we will analyze the dynamics of the ratio between the intermediate product and gross value added in the total output of goods and services. During the analyzed period, this ratio grew in favor of gross value added, the share of which increased from 57.2% in 2005 to 66.1% in 2018. This dynamics grew simultaneously with the growth rate of the republic's GDP, with the exception of 2015-2016, associated with the raw materials and price situation. At the same time, in recent years, the rates of growth in the spheres of economic activity have been positive. Thus, the growth rates in the manufacturing industry in 2018 and 2019 amounted to 106.4% and 111.5%, in agriculture 104.6% and 107.3%, in information and communication 109.8% and 115.9%, and in total in all spheres (GVA) 101.5% 102.2%, i.e. progressive industries grew at a faster pace than other industries. At the same time, we note that if the rates by industry show the dynamics of economic growth or its decline, then the specific weights characterize the state of economic security. Economic security acts as the reverse side of economic growth, on the basis of which economic sovereignty is based. The ultimate purpose of ensuring economic growth and security is to solve a whole range of social tasks to increase motivational incentives, life, educational, cultural level of the country's population. Development is one of the components of economic security, because if the economy does not develop, then the possibilities of its survival, as well as resistance and adaptability to internal and external threats, are sharply reduced. The ability for self-development and progress is especially important in the modern, dynamically developing world. The economy now more than ever needs diversification, that is, the development of various competitive industries and, above all, it concerns the processing industries, machine building. Thus, the study showed that there is a certain relationship between the dynamics of economic growth and indicators characterizing economic security, significant or weak, depending on the characteristics of the functioning of the economy in the domestic and foreign markets. Improving the quality and standard of living, being the goal of a socially oriented market economy, in fact, becomes not only the result of economic growth, but also its condition. Here, the causal interdependence of economic growth and security at the country level is manifested. The required quantity and quality of economic growth makes it possible to reach the threshold values of economic security, thereby strengthening the country's potential, from which, in turn, it becomes possible to change the socio-economic dynamics with a higher level of development.

To ensure economic development, it is necessary to promote in every possible way the gradual transition to closed production cycles with the optimal use of natural, capital and labor resources. The achieved level of economic, social, innovative, foreign economic development will ensure the safe functioning of the economy and the progressive development of the country. Certain indicators of economic growth and security may reflect the similarity of the economic situation or their divergence depending on the focus of the study. Improving life, being the goal of a socially oriented market economy, in fact, become not only the result of economic growth, but also its condition. The improving mutual influence of the level of economic growth and national security will become the basis for building a social and innovative model of the country's development. For the transition of the republic's economy from a state of instability to stability and progressive growth, a set of measures should be provided for technological, structural, investment, innovation, and financial restructuring. We also note that, despite the presence of differences in national security and economic growth with their ramifications, they do not exclude each other, but complement each other and relate to each country to a greater or lesser extent, depending on the specific socio-economic dynamics. Of course, the concept of economic security does not exist outside space and time, it is a form and reflection of threats of an economic, environmental, political, social nature. The national security of the country is determined by the system of its national interests, which imply the protection and efficient use of natural resources, the improvement of the structure of the market economy, the development of the innovation and social sphere. Being a collective, synthetic category, economic security is closely related to the following concepts: economic stability, economic development, economic independence, economic growth, economic sovereignty, national interests, threats to national security, etc. The state should act as a guarantor and spokesman for economic security, protecting and ensuring the living conditions of all its subjects. In addition, it is necessary to take into account the factors that undermine the stability of the socio-economic system of the state. It is also necessary to take into account that in the modern period, economic security is formed in the context of the development of globalization processes and market relations. When identifying the conditions for ensuring the economic security of an individual country, it is necessary to take into account the following basic properties: preservation of a single economic space, ensuring the observance of national interests; the ability of the economy to resume the process of expanded reproduction in all sectors and industries; ensuring the least dependence of the country's economy on external factors, stimulating investment and innovation; maintaining social stability. National economic security should objectively reflect the entire multifaceted interconnected system of interests of the country, expressing the potential and possibilities of its economic development, and, consequently, economic sovereignty, i.e. national economic system. The role of the state in the economy is essentially proportional to the resources that it manages, natural, capital, labor, as well as the budget. In this regard, the decree "Azerbaijan 2030: National Priorities for Socio-Economic Development" was adopted by the decree of the President of the Republic of Azerbaijan, according to which, in order to ensure the country's sovereignty, sustainable economic growth should serve to form a dynamic and inclusive society and every member of society will be provided with the results of this development [4]. As a result, the goal of forming a socially-oriented, innovative economy will be achieved.

4. CONCLUSION

In the modern period, the socio-economic situation of the country is determined by the ability of the economy to structural changes, i.e. economic progress is assessed not by quantitative indicators of growth, but by innovative and social development, which ensures the sustainability of growth and national security. Along with this, economic security is considered as a combination of factors that ensure the independence of the national economy, sustainable

competitiveness, and the ability to constantly renew and improve. Also, the content of economic security is multi-level, including the individual, micro, meso, macro or national and world economic levels. The study showed that with factorial, structural features, negative and positive trends, the economy of the Republic of Azerbaijan has the ability to achieve sustainable economic growth and ensure national security under the coordinating, regulating, stimulating influence of the state.

ABSTRACT

In the light of recent global economic volatilities, macroeconomic sustainability challenges have recaptured significant policy attention in Azerbaijan. The essence of these challenges is largely shaped under the impact of the transition and resource-rich character of the national economy. In the new phase of economic reforms launched in 2016, the urgency for economic diversification is not only explained by the necessity of structural transformation but also maintaining long-term economic development. In this research, current macroeconomic sustainability challenges are analyzed through three aspects. Brief analyses reveal that despite continuous reforms and an increasing share of the non-oil economy, the capacity of the tradable sector to reduce dependence on the oil sector is still limited. Such underdevelopment level of the tradable sectors creates an additional burden on the fiscal sector which also adversely affects fiscal sustainability and transition into more resilient policymaking. Finally, chronicle challenges regarding exchange rates restrict monetary policy independence and effectiveness of the structural policies. Authors consider that there is a need to redesign the economic diversification strategy and review it as a comprehensive set of macroeconomic, financial, and structural reforms.

Keywords: *Economic diversification, macroeconomic sustainability, economic development, resource abundance, volatilities*

1. INTRODUCTION

During the independence years, the Azerbaijan economy has gone through fluctuation cycles under the impact of several structural and contextual factors. All these cycles raised serious concerns regarding achieving and sustaining macroeconomic equilibrium without adversely affecting the socio-economic situation. Until the commencement of oil boom years, macroeconomic sustainability challenges mainly covered preserving fiscal and monetary balance, addressing socio-economic problems that appeared after transitioning into the market economy as well as devastating consequences of the war. While looking through programs funded by international financial institutions such as the International Monetary Fund (IMF) or World Bank, it seems that macroeconomic sustainability challenges were also related to the institutional environment including low efficiency of economic policymaking, weak fiscal discipline, and regulatory frameworks. The oil boom period starting from 2004 gave an excellent opportunity to eradicate all these deficiencies as well as to shift into a proactive policymaking phase in preserving macroeconomic sustainability. Mainly convenient external economic environment as well as economic policy frameworks and strategies adopted during this period, let Azerbaijan enjoy two-digit economic growth, implement massive infrastructure investments, eliminate poverty, raise living standards and finally use financial resources at its

own discretion to address economic problems. However, this period gave birth to new concerns regarding maintaining macroeconomic sustainability in the example of economic diversification. During rapid economic growth years, economic diversification has always been one of the topics of the economic reform agenda. However, its ranking amongst other agenda topics has been exposed to some changes under the impact of the fluctuations in the global energy markets. From our point of view, the current state of the global and national economy makes economic diversification a top priority for the government to take comprehensive measures targeting not only short-term growth but also long-term development goals. In these regards, there is a need to revise the approach toward the interpretation of the concept of 'economic diversification' and using it as an economic policy tool. Instead of being judged as a panacea, economic diversification should serve as a tool to modernize the national economy and foster its adaptation to the changes in the global economy stemming from technological and industrial advancements.

2. LITERATURE REVIEW: ECONOMIC DIVERSIFICATION, RESOURCE ABUNDANCE AND ECONOMIC DEVELOPMENT

The problem of economic diversification is very relevant for developing economies, particularly for resource-rich countries. Studies regarding economic diversification generally assess it either as a way to eliminate development challenges in the least developed economies or as a tool to maintain long-term sustainable development in rapidly growing resource-rich countries. In both options, economic diversification is inherently related to the development of national economies on sound institutional and structural grounds. Referring to the Prebisch-Singer hypothesis, economic growth cannot be based on resource-based products because world prices of the primary exports, despite some cyclical upwards, generally tend to decline in comparison to the manufactured export goods (Kaulich, 2012). Indeed the main problem of a limited diversified economy is just not related to the fluctuations of the prices of resource-based products in the global markets. Limited diversification and dependence on the resource sector make national economies more vulnerable to the internal and external shocks as well as make it lag structural and institutional adaptation to the global economic system. Therefore, besides enabling a country to reduce its exposure to commodity price volatility, economic diversification should be understood as a means to jump into the development race rather than as a goal in itself (Benavente, 2016). As economic diversification can be generally looked through in the context of development economics, its conceptual interpretation, as well as its linkages with other macroeconomic and structural factors, raises substantial discussions regarding what kind of policy strategies and tools should be chosen to get the ultimate goal of development. One of the widespread approaches regarding economic diversification assesses it as a strategy that enables transformation of the economy from using a single source to multiple sources of income spread over the primary, secondary and tertiary sectors (UNFCC, 2016). Effective diversification of income sources enables countries to mitigate external shocks, reduce the balance of payment volatilities as well as achieve a more balanced allocation of employment over the economic sectors (Gelb and Grasmann, 2010; Papageorgiou and Spat 2012). In other words, through reducing dependence on narrow fields of activities, economic diversification can offer a broad maneuver space for the countries in their domestic and external economic policies. Esanov (2012) defines economic diversification as a process in which the economy becomes more diverse in terms of goods and services it produces. Freire (2017) argues that economic diversification is the ultimate result of innovation based on the assumption that each new economic activity, including producing a new goods or service, generates a novelty which stems from the innovation process and technological change. This approach generally requires reviewing economic diversification in the light of technological and industrial differences between advanced and developing economies.

Therefore, research on economic diversification should not be analyzed just in terms of contemporary macroeconomic policies that affecting the current state of the economy, but it should also focus on the development patterns or path-dependence of the economy (Hausmann and Rodrik, 2006) and should seek better ways to turn innovation and technological changes to the drivers of progress. Thus economic diversification should serve to the implementation of strategic goals such as (i) achieving more resilient short-term growth trends and transforming these dynamics into long-term economic development cycles and (ii) accelerating comprehensive structural transformation which should encapsulate upgrading the industrial capacity of the economy. Realization of these goals should allow countries to improve their international competitiveness and achieve better positioning in the global economic system. As appears, economic diversification requires a broad mixture of macroeconomic as well as institutional and structural policy tools. Besides its separate interpretation as an economic concept, the impact of the economic and political landscape on the economic diversification and mutual linkages between these concepts constitute objectives of the studies on economic diversification. In this regard, two main strands of studies can be classified which analyze the inherent relationship of economic diversification with other economic factors. The first strand of such studies uses an indirect channel for studying the correlation between economic diversification and development. In this context, more preference is given to understand whether natural resource abundance and economic development are somehow correlated with each other or not. In other words, does being a resource-rich economy make it compulsory to conduct economic diversification policies for the sustaining of the development? Empirical studies introduce a mixed outcome on this issue. Some studies (e.g. Bravo-Ortega and De Gregorio, 2007; Pineda and Rodriguez, 2010) show a positive relationship between resource wealth and economic development while Auty (1993), Sachs and Warner (1995), and Neumayer (2004) have found that resource abundance adversely affects economic development in the long horizon. From our point of view, it can be misleading to review resource abundance as either a blessing or curse while there are sufficient 'success' and 'failure' case studies on both sides. There is no doubt that economic factors generally create some obstacles for resource exporters in terms of sustaining long-term growth dynamics. However, it also appears that the effect of resource wealth does not definitely lead to pre-determined, standard failure scenarios for the countries, and the experience of each resource-rich country is largely shaped under their policy responses and development strategies (Neary and van Wijnbergen, 1986; Gelb and et. al, 1988). In this regard, in the process of economic development, institutional and political economy factors and their impact on states and economic policymaking play a key role rather than resource abundance. Any country with inadequate institutional capacity and flawed economic policymaking will fail to achieve resilient economic development with or without resource abundance. Therefore, governance, policymaking, regulatory and surveillance capacity of the state institutions, openness to international trade, development level of financial markets as well as maturity of political system, human capital and other factors should also be given significant attention. The second strand of studies reviews economic diversification in the context of structural transformation of the economy and the role of stakeholders (particularly state and private sector) in this process. A sufficient number of studies have been addressed to analyze what kind of policy approaches can yield more efficient outcomes in the process of economic diversification. Through differentiating vertical and horizontal diversification, Morris et al. (2012), Bond and Fajgenbaum (2014), Goldhorpe (2015) have conducted studies on what kind of measures can be more effective in terms of realization of economic diversification in the light of structural transformation. On the other hand, there is not unique approach regarding the role of state intervention in the structural transformation process. While there are success stories associated with the widespread usage of state capitalism in the process of promoting industrial transformation, particularly in the cases of some East

Asian countries, Hirschman (1981) considers that a state's active guidance through its fiscal resources can entail efficiency problems in the process of targeting industries. Nonetheless, particularly in less developing as well as in transition economies, through both implicit and explicit fiscal channels, policy and administrative guidance, state intervention can yield more benefits for fostering the transformation process if necessary fundamental institutions and market economy mechanisms had been built. However, the number of factors affecting the efficiency of the state intervention varies based on the examples of different economies which make it difficult to put straightforward hypothesis regarding this issue.

3. ECONOMIC DIVERSIFICATION IN AZERBAIJAN: INTERPRETATION AND URGENCY CHALLENGES

Since regaining its independence, Azerbaijan economy is going through two major strands of economic transformation. The first one is the transition from a command economy into a market economy while the second one encapsulates the transition from resource to the non-resource-based economy. At first glance, it can be thought that in its original interpretation the concept of economic diversification is only applicable regarding the second transition strand. However, it should be mentioned that under a much broader context of structural transformation, economic diversification has been one of the major challenges in the process of transition from a command economy. Due to the provincial economy features inherited from the Soviet period, collapsing economic relations with former Soviet economies adversely affected national production capacity in the initial years of independence. Therefore, transition into a new economic system did not only reflect institutional and regulatory aspects but also required quick re-adaptation of the industrial capacity to new economic realities. In this regard, major economic policy packages, as well as projects conducted by international financial institutions such as IMF and World Bank, mainly focused on mitigating shocks and vulnerabilities as well as enabling macroeconomic sustainability through reactive policy tools. In this period, economic diversification was not amongst the top priorities of the economic reform agenda while economic policies were designed to bolster and upgrade existing infrastructure rather than the implementation of a more comprehensive and forward-looking transformation strategy. Thanks to the commencement of the oil boom period in the middle 2000s, the Azerbaijan economy has enjoyed double-digit growth dynamics. This period also enabled policymakers to conduct comprehensive economic policy programs by focusing on both current economic vulnerabilities and addressing future designing of the economic system. In this section, through focusing on the narratives used in several official policy strategies, the interpretation of the concept of economic diversification is analyzed. In the early and momentum years of rapid economic growth (2004-2011), development of various economic sectors, expansion of the production capacity as well as stimulation of export-oriented industrial production were perceived as standard and sufficient policy objectives for economic diversification and rural development. At this stage, economic diversification has been addressed through a general point of view rather than specifically designed strategies. Beginning from the early 2010s, economic diversification narratives began to capture more space in official policy documents. In this regard, "Azerbaijan 2020: Vision into the future" Development Concept which was adopted by Presidential Decree in late 2012 can be considered as the first official document in which the strategic outlook of the authorities regarding the diversification of the economy has been explicitly indicated. However, in this document, economic diversification was mentioned as an ultimate goal of the development process without clear and detailed information on what kind of measures and approaches would be used to realize it. "Strategic Roadmap for National Economy Perspective of the Republic of Azerbaijan" which was adopted by the Presidential Decree in December 2016 was the most comprehensive and detailed strategy which also encapsulated a SWOT analysis of the national economy.

Adoption of this document coincided with the recession period in which due to the sharp oil price fluctuations in 2015, manat was exposed to devaluation two times which worsened fiscal balance and financial stability. Prior to the Strategic Roadmap, authorities took several measures to increase economic activity and maintain stability in financial and real sectors. In this regard, the adoption of the Strategic Roadmap was not just a temporary reaction of the authorities to the contracting business cycle; it was also an outlook for the future in which economic diversification and supporting economic growth through new growth drivers were listed as medium-term objectives (Strategic Roadmap, 2016). In this document, concrete targets such as increasing non-oil exports per capita from USD 170 to USD 450 by 2025, increasing non-oil FDI in non-oil GDP from 2.6% to 4% by 2025, creating new jobs in tradable sectors indicate the urgency and priority level of economic diversification for policymakers. At the same time, other strategic targets covering strengthening fiscal resilience and improving monetary policy robustness, rethinking the role of the public sector in economic activity as well as fostering privatization and reforming of the state owned enterprises (SOEs) are also directly and indirectly, related to the economic diversification.

4. SUSTAINING MACROECONOMIC STABILITY: THE STATE AND ROLE OF THE ECONOMIC DIVERSIFICATION

Despite sharp fluctuations in the external sector since 2015, macroeconomic sustainability has been an ultimate policy goal achieved through comprehensive and continuous policy actions. In this section macroeconomic sustainability is briefly analyzed in terms of three aspects: *(i)* GDP's composition and its growth dynamics; *(ii)* fiscal balance; *(iii)* exchange rate dynamics.

4.1. GDP and its composition: tradable vs non-tradable sectors

According to the State Statistical Committee of the Republic of Azerbaijan, excepting some years, GDP dynamics has been downward mainly under the impact of the volatile external sector over the last decade. In the light of the average low level of oil prices over this period, a positive GDP trend is either achieved thanks to partial recovering of the oil prices or the expansionary fiscal policy which supported domestic economic activity. Despite positive growth dynamics are mostly preserved in the non-oil GDP over the recent decade, this sector is not able to fully compensate for adverse spillover shocks in the global oil prices due to several reasons. First of all, the share of tradable sectors in the non-oil GDP is smaller than non-tradable sectors which can also be observed while looking through trade balance and overall industrial production as well as their composition. Secondly, active state intervention to the real sector as well as access to finance shortcomings made non-oil GDP more dependent on the 'external' funding (specifically, dependent on the funds mainly coming from fiscal and quasi-fiscal sectors rather than the private sector). This tendency additionally increased the vulnerability of the non-oil economy to the oil price changes. The procyclical and discretionary fiscal expansion has also increased dependence on the state's financial support (Strategic Roadmap, 2016) as well as elasticity of the tradable sector to the changes in the fiscal sector. Therefore, despite the rising share of non-oil GDP that mainly concentrated in the non-tradable sectors including construction, services, public catering, and others, oil price fluctuations in the global markets can substantially restrain these sectors in any time. Vulnerabilities stemming from these sectors can be explained by two factors. The first one is the low capacity of these sectors to generate value. In other words, the value generated in non-tradable sectors relies either on the spending earned in the production sectors (in the case of Azerbaijan, dominantly in the extractive sector) or acquired through other sources (such as borrowing from the banking sector or remittances). Moreover, as non-tradable sectors outweigh the domestic tradable sectors over time, it increases the usage of imported goods (as well as services) and demand for other supplementary non-tradable sectors.

On the other hand, while looking at industrial production capacity, it becomes obvious that despite some increase in the manufacturing sector both in real and nominal terms, nearly half of its composition comes from the manufacturing of food products, construction material as well as refined petroleum products. This structure of domestic industrial production reveals itself through a low level of exports per capita and export sophistication (Hampel-Milagrosa et. al, 2020) as well as in less economic complexity. Without improving manufacturing capacity to produce sophisticated products and export them, economic diversification will be restricted to quantitative indicators such as the number of goods produced or exported rather than qualitative benchmarks such as economic complexity and technological capacity. This type of diversification definitely exhibits serious shortcomings in terms of supporting long-term and resilient economic development. These highlighted problems stemming from such composition of GDP and industrial production also raise fiscal constraints and exchange rate concerns which to be discussed below.

4.2. Fiscal sector and its sustainability challenges

As a transition and resource-rich country, fiscal policy has been a dominant factor in shaping and supporting the whole economic system in Azerbaijan. Pursuing a macroeconomic policy relied on active state capitalism which enabled capital accumulation during the oil boom years (Strategic Roadmap, 2016) also led to leveraging of fiscal sector. In this regard, the task of the fiscal policy was not restrained only providing public goods as originally deriving from its nature; it also included subsidizing the real sector and stimulating aggregate demand to cover supply shocks which mainly originated in the mining sector. The dilemma of the fiscal sector in this context appeared: how to sustain positive growth patterns through a gradual shifting in the main drivers of economic growth without disrupting macroeconomic equilibrium? This dilemma still preserves its urgency and priority for the policymakers and the solution of this dilemma requires a comprehensive set of policy measures in various directions. The revenue and spending composition of the state budget still exhibits higher elasticity to the oil price fluctuations while restricts the countercyclical behavior of the fiscal authorities. As accentuated previously, the non-oil economy still needs continuous subsidies from the state which makes it indirectly dependent on the oil price changes. Overreliance on the transfers from the State Oil Fund (SOFAZ) hampers both the realization of fiscal rules adopted in 2018 and creates a macro-fiscal burden on the SOFAZ. Moreover, the recent oil price volatilities reduce the maneuver space for the state in terms of both supporting growth in the short term and implementing smooth shifting into strict fiscal rules without disrupting overall economic activity. Active state capitalism faces challenges in terms of realizing targeted support to the tradable sectors. The current composition of industrial production reveals the dominance of low value-added sectors or in other words, the sectors that can be characterized with low processing capacity. In recent years, thanks to the state's activity, new facilities, factories, and industrial parks began to operate in the non-oil sector of the economy. However, the problem regarding these facilities is that they mainly focus on less technologically sophisticated production. On the other side, missing industries and fragmented linkage between existed industries make it difficult to use locally produced intermediary goods for production. Such a missing chain of production logically urges importing of intermediary goods from other countries which in its turn reduces the share of the value generated by domestic industries. On the other side, problems relating to the access to finance which appears through a mixture of the high cost of financial intermediation, underdeveloped non-bank financial institutions as well as structural challenges of the banking sector make it difficult for the fiscal authorities to refrain from subsidizing tradable sectors. Insufficient activity of the private sector, SMEs' financing challenges, inefficiency in the finance sector as well as immature market environment urge the state to subsidize economic activity even though such activity in some cases leads to market failures.

The mixed character of the state's regulatory and commercial activity imposes an additional burden on the fiscal institutions, mainly through SOEs. While such mixed regulatory and commercial activity can be assessed as a legacy of the tough transition period, SOEs receive huge financial support from the state budget to finance their operations benefiting from their quasi-fiscal status. In the current phase, the major challenge is not just improving the accountability and operational activity of the SOEs as well as redesigning their stance in the real economy. In this regard, the most recent actions taken regarding modernizing and improving SOEs should be welcomed as a complementary part of the economic diversification while looking at the great picture.

4.3. Exchange rate dynamics: harmonization of short and long-term targets

Exchange rate stability has been one of the indicators which characterized the state of macroeconomic stability during both oil boom years and the post-oil period. It should be mentioned that debates regarding what kind of exchange rate policy should be pursued to prevent Dutch Disease and support non-oil sectors have attracted substantial attention during all these years. In this context, empirical and academic findings generally criticize monetary policymaking conducted during oil boom years under the pretext that this policy was partly effective in terms of eliminating resource curse. The dynamics of the exchange rate affect macroeconomic sustainability through three channels: (i) price stability; (ii) balance of payments channel (mainly through current account balance) and (iii) financial stability.

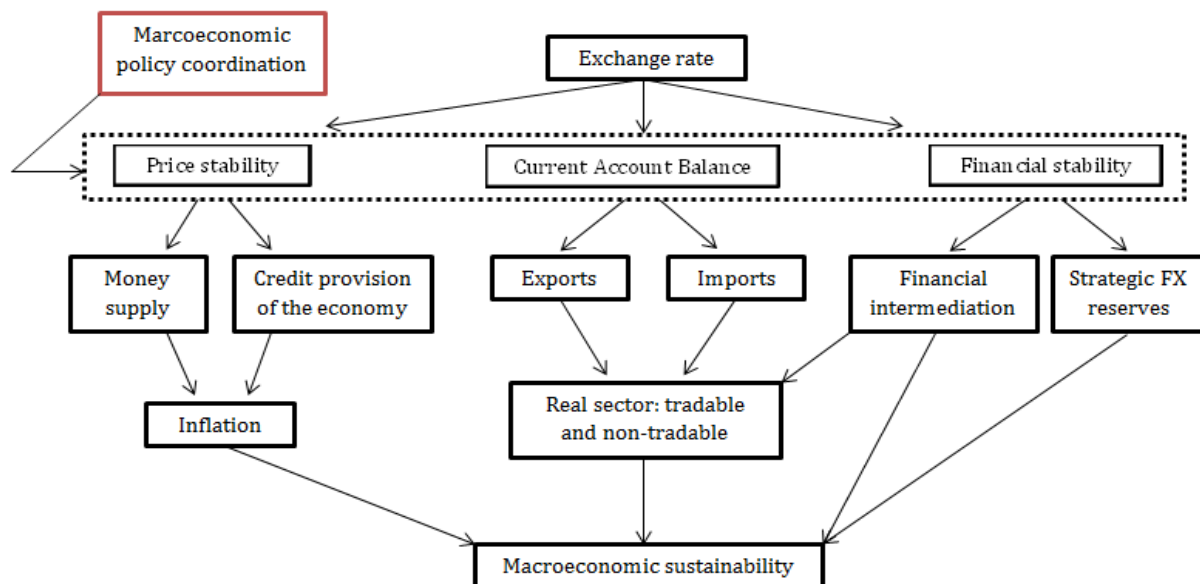

Figure 1: Exchange rate transmission channels to the macroeconomic sustainability

Hyperinflation legacy from initial years of independence has played an important role in shaping the institutional memory of the monetary authorities. In this regard, price stability which is naturally amongst top policy objectives for monetary policymakers has also been prioritized over independence years in the light of inflationary pressures. However, the realization of this objective became more complicated once Azerbaijan started to experience huge oil inflows which entailed further inflationary pressures stemming from increasing aggregate demand and imports. Additionally, the introduction of the new currency in 2005 is observed with rising inflation levels to 16.7% in 2007 and 20.8% in 2008 as well as rising nominal average wages and income while nominal and real effective exchange rates were exposed to appreciation. At this stage, the Central Bank of Azerbaijan (CBAR) did not have enough maneuvering space other than pursuing managing exchange rate policy through

sterilization of huge oil inflows aiming to smooth inflationary pressures and achieve price stability. However, this policy stance led to the sharp appreciation of manat during 2004-2008 which negatively affected economic diversification and competitiveness of the non-oil sector (Hasanov, 2010; Hasanov, 2013; Hampel-Milagrosa et. al, 2020). Such strict exchange rate targeting policy dominated until 2015 when negative oil shocks hit the economy and caused a substantial shrinking of the CBAR's strategic reserves. A similar policy stance still continues to exist in which de-facto fixed exchange rate policy is pursued to keep price stability and inflation under control which partly contradicts the economic diversification strategy. Such prioritization of policy targets involves several inherent vulnerabilities. Firstly, the current policy approach is still vulnerable to oil price shocks as it was during the oil boom years. Secondly, this policy is highly costly which urges authorities to intervene market during new oil price shocks. However, the maneuver capacity of the authorities is not as larger as the oil boom years. Thirdly, the current exchange rate policy also adversely affects the banking sector which indeed should play a more active intermediary role to bolster current economic reforms. This negative effect on the banking sectors stems from increasing market uncertainties as well as restrictive monetary conditions which make banks refrain from providing credits at affordable conditions. Fourth but not least, such a policy stance emits wrong impulses to both domestic and foreign economic actors (investors) regarding the independence of monetary policymakers as well as firmness of the vision of fiscal authorities. Another key transmission channel of the exchange rate to macroeconomic sustainability is the current account balance. While oil revenues constitute nearly 90% (peaking to 95.3% in 2011) of overall exports during the recent decade, oil inflows to the economy make CBAR sterilize these flows through market interventions to hinder further appreciation of manat. On the other hand, inflation, higher wages and incomes, substantial oil revenues inflows, including FDI triggered a peak in the demand for non-tradable goods and services as well as the imports. Rising imports stemming from increasing aggregate demand and low levels of domestic production have created additional appreciation pressures on manat. Some authors argue that it was a more reasonable option for the authorities to manage imports rather than creating new production sectors as appreciated manat allowed to implement effective control over the imports (Ahmadov, 2017). In both transmission channels, manat's appreciated exchange rate affect economic activity in the real sector in which non-tradable sector experienced substantial growth while tradable sectors gradually lost their competitiveness both in real (technological backwardness and structural challenges) and nominal terms (rising cost, shrinking income level). These challenges preserve their urgency in the current period while the current account balance is still dominantly shaped under oil revenues and non-oil exports are strictly constrained within low value-added sectors. Moreover, while deficits will continue to be observed in the non-oil balance, the current account balance will be more vulnerable to the oil price shocks.

Figure following on the next page

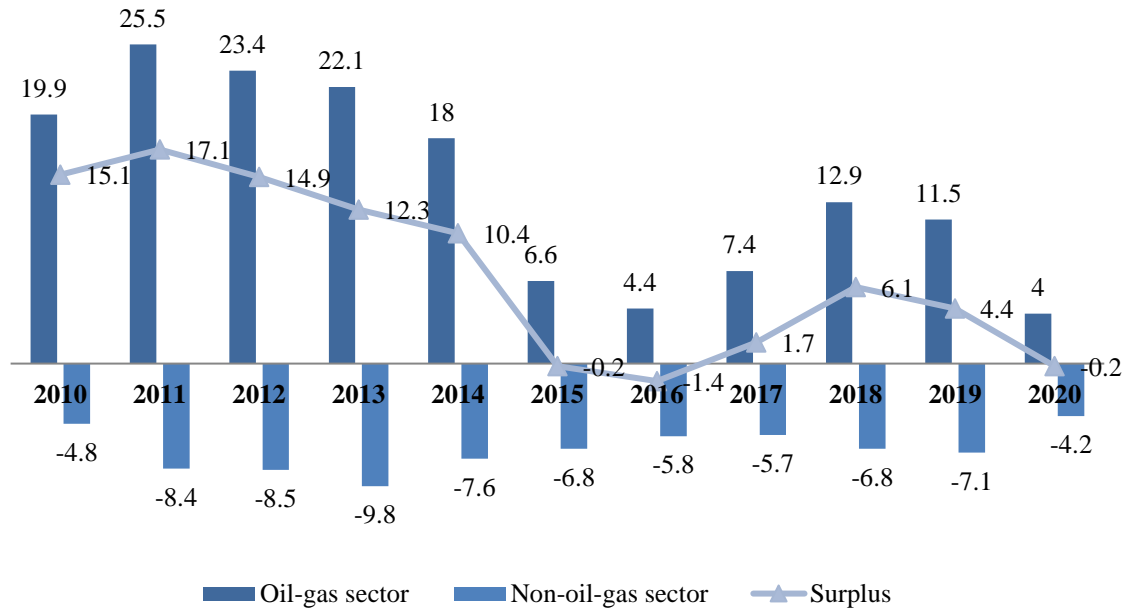

Figure 2: Current account balance dynamics
(Source: CBAR)

Financial stability challenges attracted significant attention during the recent economic recession in which the banking sector suffered substantial challenges which resulted in revoking the licenses of several banks. In the context of our research, financial stability is analyzed through the impact of the exchange rate movements on the financial sector. Firstly, due to the undeveloped financial markets and financial intermediation, exchange rate movements affect financial stability mainly through lending activity and liabilities of the banks rather than monetary policy transmission channels or financial market developments. In the light of economic shocks experienced in 2015-2016, the banking sector suffered substantial losses stemming from unsustainable credit expansion which mainly occurred during oil boom years benefitting from cheap funding sources. As the general income level increased, consumption spending rocketed while the rapidly growing non-tradable sector benefitted from increasing aggregate demand. However, such unsustainable credit expansion into the real sector, mainly to the non-tradable sector subsequently led to the rapid growth of the non-performing loans and substantial shrinking of capital resources of the banks. In the background of the rising imports and growing economic activity during the oil boom years, financial intermediation mainly served to meet financial demands for the consumption, coverage of import financing, and growth of the non-tradable sector. Manat's appreciated exchange rate as well as high interest rates impeded the tradable sectors to benefit from overall economic activity. The existence of structural problems mainly in the banking sector also made it difficult for financial institutions to build sustainable business models. In the current phase, the banking sector still exhibits serious challenges in terms of fulfilling their financial intermediation roles while consumption credits dominate in the share of overall credit provision to the economy as they did in the recent decade. Without the development of effective financial intermediation, private entrepreneurship will continue to experience access to finance problems. Fixed exchange rate policy and uncertainties regarding the future of the policy actions of the monetary authorities can hamper economic activity in the tradable sector.

5. CONCLUSION

Empirical and academic experience reveals that producing more and diversified low value-added products is not sufficient for sustaining long-term growth. On the contrary, economies that have the human and technological capacity to produce a more diverse range of sophisticated goods and services can preserve their international competitiveness while maintaining macroeconomic sustainability. In the light of these findings and the current economic reform agenda, it is important to review and redesign economic diversification strategies implementing in Azerbaijan. Experience of the oil boom years reveals that avoidance from the Dutch Disease has been partly achieved while economic diversification strategy has some problems in terms of yielding sufficient outcomes to reduce the dependence on the oil revenues. The complex structure of macroeconomic sustainability requires a more comprehensive and visionary set of macroeconomic, financial and structural policy measures to achieve short-term growth and transform it into long-term economic development.

ABSTRACT

In modern conditions, companies in management use a situational, process or systematic approach. The choice of a more optimal approach is justified by the existing management system in the enterprise. A systematic approach is a comprehensive analysis of business processes, identification of the main elements of the processes, and making decisions that affect the ultimate goal of the company. The main problem in the formation of the system is the scheme of interactions between subsystems, since each system has its own subsystems, and they respectively sub-subsystems. Continuous educational process as the main goal of the educational organization determines the principles of strategy formation and the relationship with the outside world, including the state and potential customers interested in the final result of the educational process. This article defines the systems approach, reveals the elements, and substantiates the effectiveness of its use. The role of teamwork and priorities in achieving the goals of the educational institution are determined.

Keywords: *system, system approach, subsystem, result, educational institution, continuous educational process*

1. INTRODUCTION

The systems approach is one of the most important and generally accepted methodological approaches in modern theory and practice of education management. A feature of modern educational organization as a system is its relationship with the external environment. An educational organization can function by adapting to the external environment, rebuilding its processes without destroying integrity. In the case when the social system is well organized, it can itself influence the external environment, adapting it to achieve its goal. For this, the educational system must mobilize its external and internal capabilities.

2. LITERATURE REVIEW

The ancestor of the systematic approach can be considered Ludwig von Bertalanffy, who introduced the concept of a general theory of systems. The followers of this approach can also include representatives of the management theory N. Wiener, W. Ross Ashby, S. Bira, etc. The theory of systems was actively developed in the 50s – 60s of the 20th century [1]. Today, a special focus of the systems approach in management is the development of Malik Fredmund (University of St. Gallen (Switzerland)) - system-oriented management [2]. This direction is a continuation of the developments of the school of Hans Ulrich and S. Beer [3]. We can also include the development of Jamshid Garedagi “Systems Thinking. How to manage chaos and complex processes. Architecture business modeling platform” (USA, 2007)[4]. Many researchers have paid attention to the systematic approach to enterprise management, among

which I would like to mention such scientists as Russell L. Akoff [5], Peter Senge [6], Vihansky O.S.V [7], William Detmera [8], Gaponenko A.L. [9], Daft R.L. [10], L. Stanford Optner [11], Joseph O'Connor, Ian McDermott, Zharikov ON, Ignatieva A.V., Korotkova E.M. [12], Korenchenko R.A. [13], Mineeva N.V., Maksimtsova M.M. [14], Nikanorov S.P. [15], Rogozhina S.V. [16] and etc. Since the second half of the 20th century, management theories have been strongly influenced by the intensively developing general scientific direction of the “general systems theory”, that is, the general scientific systems approach. At the junction of control theory and system theory, a simple but fundamental conclusion was formulated that any organization is a system in the most complete and strict sense of this concept [17].

3. METHOD

Using the methods of observation, grouping, induction, deduction and classification, a system of factors influencing product quality in different directions was analyzed and developed.

4. PROBLEM ANALYSIS

What definition does this theory give the concept of a system? This approach is understood by the system as a set of interdependent parts, each of which contributes to the functioning of the whole. Given that the whole is primary, and its parts are derived from it. It means that the main thing at the enterprise is awareness to feel the purpose of the company, which consists of parts, and they interact with each other and with the outside world. Each manager is obliged to understand that isolated cases of managerial influence on an organization will necessarily lead to numerous and often unpredictable consequences. The consequences of decision making can be predicted by understanding the essence of the system, determining the influence of each decision on the final goal. And they become unpredictable in the case if they do not take into account the principle of organization as a single interconnected system. Each company, on the one hand, represents a certain system, on the other hand, it exists by its own special rules. In order to effectively manage an enterprise, it is necessary to form a system of values in the achievement of which all participants should be interested. The main problem in the formation of the system is the scheme of interactions between subsystems. Since each system has its own subsystems, and they respectively sub-subsystems. Decision making in the subordination of subsystems and the organization of links between them is a long and painstaking process, often culminating in the wrong and inefficient choice. The commercial component of the educational organization puts a trade secret in tight boundaries with a closed information system, leaving the information for the external user only with legally valid data in the framework of accounting and financial reporting. Previously, the goal, mission, and tasks facing the company were not accessible to an external user, but today each educational institution, within the framework of the reputation and image enhancement program, openly declares these parameters of its policy on official websites. Reasonable openness of educational organization to the external user makes it part of an open system, with the ensuing consequences, when both participants can influence the organization of the educational process, the decisions of the other party. Becoming part of a unified system of existence, the company must accept the conditions of this system for making complementary decisions. In the conditions of virtualization, digitalization and technologization of the world, only the advanced achievements of an educational organization can attract potential customers. An educational institution that openly declares on its websites that new educational technologies are used in the educational process has more chances for development than an organization that applies such technology but does not advertise itself. Formation of educational process programs jointly with the employer, pre-university and post-graduate training of qualified competent specialists, organization of continuous educational process is key to success of a modern educational institution. In the face of tough competition, each company is looking for its own development path.

At the same time, she herself chooses the value system that is most suitable for her. The formation of the system, as well as subsystems, is part of the overall concept of enterprise development. Which departments, divisions to create, what management structure to choose, these questions remain open for owners. Life experience, level of education, intuition and other factors are important in determining the effectiveness of decision-making. Another feature of the existence of a modern enterprise is the definition of the place and role of the organization in the system of state relations. Being a part of the external environment, the state influences not only current activities, but also the development strategy of the educational institution. On the one hand, changes in legislation, innovations in the educational process, changes in the system of regulation and accreditation of higher educational institutions may have a negative impact on the existence of an educational institution; on the other hand, the state as a customer can provide targeted orders for many years. Therefore, the formation of the strategy of the educational organization should take place within the state system of the strategy for the development of science and the educational process. Here, a fundamentally new view of the subsystem as a subject of activity and its role in ensuring the viability of the unified system as a whole is manifested [18]. The old approach to the management of an educational institution as a single system assumed that subsystems play a major role in the development of an enterprise and that operational decision-making within the process approach is the key to success. However, the new approach of strategic thinking puts questions of long-term development and the achievement of a single goal at the head of management; that is, a new approach of systematic thinking leaves managers with a decision-making function within the framework of solving strategic tasks, thereby forming the relationship between personal achievements and the overall goal of the educational enterprise. From this position, the manager should realize his role in achieving the overall goal of the company, show abilities in the field of analysis, develop solutions to problems, be prepared for self-learning and application of new skills, etc. [19]. Thus, despite the fact that much depends on the quality of teaching, unrelated management decisions on time and space in achieving private goals may not give the desired result on the whole, thereby reaffirming the importance of a systematic approach to management of an educational institution. Having analyzed the existing interpretations of the systematic management approach, we can present the system in the following forms:

- 1) System as a mechanism - each part of the system is dependent on the previous one, the end result is the result of successive actions. For example, the clock works this way: the failure of any part of the clock mechanism leads to a distortion of the result.
- 2) The system as a whole - as a human body. The overall goal of the system is complementarity, mutual assistance. In the case of an illness of an organ, the whole system fights with a foreign body, thereby helping to quickly recover and get into operation for full development.
- 3) The system as a struggle for survival, the struggle for resources. An example is the World System. Understanding the principle of coexistence, however, confrontation constantly arises between countries for goods, spheres of influence, etc. At the same time, world powers realize that there will be no final winners; such a system is self-destructive. But the world system has existed for thousands of years in conditions of war and destruction [20].

Taking into account the above, educational organization should work on the principle 2 - the system as a whole. When errors are made in one subsystem, they should be corrected jointly by other subsystems, thereby minimizing the influence of an erroneous decision on the overall result. A distinctive feature of the process approach (outside the framework of the systems management approach), in our opinion, is the existence of specific issues within the solution of a specific task, thereby confirming that each process is by itself, that there is no specific interconnectedness, when the personal interests of the results of one process are not linked to

common purpose. Meanwhile, a systematic approach implies that all participants in the system act for the benefit of the common system, for a single result, for a single goal. In the process approach, management is carried out by specific managers within their functional responsibilities; in a systems approach, a collective decision should be taken at the head of the decision; that is, management as much as possible should be carried out collectively, more precisely, not even the management process itself but specifically the decision-making and monitoring of implementation, thereby forming independent control over each process. The main distinctive feature and advantage of the systems approach is the coincidence of personal and collective interests. In the system approach there is no place for competition between participants in a single process. Competition is permissible only in terms of achieving quality in educational process.

5. CONCLUSIONS

Following on the above hypothesis, each system must consist of subsystems; each subsystem is a collectively controlled mini-system. The role and place of the manager is concretized and minimal within the framework of achieving the overall result, since the cumulative effect is the result of collective efforts. The effectiveness of a systematic approach to the management of an educational institution is determined by the prestige of the educational institution and the competitiveness of graduates of an educational institution in the labor market.

ABSTRACT

Radical transformations are observed in the higher education system of economically developed countries. Experience shows that the abundance of natural resources is not the main indicator of the development of society, but the main thing is to ensure the transformation of these resources into human capital, which is the driving force of society. This is the most important task of the higher education system at this stage. The United States, Japan, South Korea, and other developed countries have benefited more from the human capital produced by the education system than from the material resources they have. This means a change in the socio-economic functions of universities: the emergence of a rapidly growing sphere of economic activity, along with the already traditional educational and scientific missions. In this context, the issues of commercialization and marketing of academic science products are analyzed. Universities are accepted and specialized not only as educational centers, but also as research centers. In addition to teaching people at universities, they also conduct large-scale scientific research in various areas. At the same time, the reputation of universities is achieved through their scientific achievements. In modern times, universities are an integral part of the global economy, acting as the leading players in the global knowledge services market in the field of the most advanced knowledge and creative intelligence. In this context, the governments of many countries around the world are well aware that it is important for their leading universities to be at the forefront of the world's intellectual and scientific development. Thus, "Does university research meet the needs of society and the economy in today's world?" The topic is one of the most discussed topics, and the article will seek answers to these questions.

Keywords: *Universities, research centers, higher education system, knowledge economy, research university*

1. INTRODUCTION

Radical transformations are observed in the higher education system of economically developed countries. Their essence is related to the crucial role of universities in innovative development and economic growth. This means a change in the socio-economic functions of universities, the emergence of a rapidly growing sphere of economic activity, along with traditional educational and scientific missions. This framework includes the development and transfer of technology, the commercialization and marketing of academic science products, the creation of new businesses, and, finally, the management of intellectual property for profit. The current development, based on the knowledge economy, implies the commercialization of scientific potential and scientific products, especially in the higher education system. In modern times, universities are an integral part of the global world economy, acting as the leading players in the global knowledge services market in the field of the most advanced knowledge and creative intelligence.

In this context, government officials in many countries around the world are well aware that it is important for their leading universities to be at the forefront of the world's intellectual and scientific development. From the review of patenting work at the global level, it can be concluded that the engine of scientific progress in the field of biotechnology is not companies, but universities. Scientific activity in modern universities develops for three purposes:

- 1) Knowledge is produced through research. The University is interested in and researches everything within the power of human knowledge;
- 2) Research is used in the teaching process to prepare future generations with knowledge;
- 3) Prepares quality personnel or specialists in accordance with the needs of society and, in particular, the labor market [Mamedov, Bayramova, 2020., P.102].

Thus, "Does university research meet the needs of society and the economy in today's world?" The topic is one of the most discussed topics, and the article seeks answers to these questions.

2. NEW PARADIGMS RELATED TO THE DEVELOPMENT OF UNIVERSITIES

The mission of a modern university is to find answers to the question of how to live in a rapidly changing environment, to identify pragmatic approaches, to study the problems of all spheres of human life in a market economy, to monitor and investigate the rapid differentiation of society. Modern universities are research institutions that carry out both research and teaching processes. Universities are scientific centers that deliver scientific knowledge to those who want to learn and continue scientific research without interruption. World-class universities employ the world's best researchers and bring in the best students from different countries, regardless of whether they belong to the public or the private sector; they act in accordance with the events and trends and challenges in the international environment and take them into account; they tirelessly work to solve pressing world-class problems and actively cooperate with other organizations.

Jamil Salmi's concept of university development in modern times is considered to be more meaningful and distinguishes 3 main features related to the development of universities [Дж. Салми J., 2009]:

- 1) concentration of talents (among teachers, students and administrators);
- 2) abundance of resources (finance and infrastructure);
- 3) flexible management (freedom in management, innovative decisions and lack of bureaucratic barriers).

These are reflected in three main crucial functions:

- 1) training of highly qualified personnel;
- 2) scientific research;
- 3) the welfare of society.

Regarding the training of highly qualified personnel, it should be noted that world-class universities strive to create human resources, thus forming the most talented and strong human resources in the world, as well as provide the most important resources in this field nationally and globally. As for scientific research, world-class universities are engaged in the most advanced research and strive for the best discoveries of modern times, thereby improving the well-being of mankind by fulfilling important tasks in this field at the international level. There are three main strategies in approaching the establishment of a world-class university from international experience:

- 1) increase the level of several universities with potential and turn them into advanced educational institutions;

- 2) creation of a new university as a result of merger of several universities, creation of synergetic development (effect) inherent in a world-class university;
- 3) creation of a new university from scratch.

3. NEW CHALLENGES TO THE TEACHING PROCESS IN UNIVERSITIES

- 1) David Cohen writes in *Traps of Teaching*: “There are essentially two tasks before us. First, it is necessary to ensure that students do not just accept knowledge in the form of consumption and learn it by mastering it. Second, feedback needs to be increased and diversified, and there needs to be communication and feedback between students and teachers. Students need to be encouraged to pursue independent activities” [David K. Cohen, 2017].
- 2) Students should be active participants in the discussions and they should think and learn. But if someone is not reading a book on the social sciences, how can they be taught something? These are not ordinary topics, but topics based on discussion and reflection. However, modern students rarely use books of scientific and educational importance. If he does not read a scientific book, then he will not be able to explain the structure of the relevant topic.
- 3) The professor or lecturer should acquaint students with the research work carried out in the educational process. Teaching from a textbook prepared by others distracts students. The professor should organize a discussion about his scientific activity in the class, ie his research. Those who do not present their research to students for public discussion can never be good lecturers or teachers.
- 4) Students should be taught academic skills in a new form. These skills are multifaceted and form critical thinking, are effective, and allow you to identify important problems.
- 5) Google Thought. We no longer really think through the brain, but with the help of Google. Critical thinking is taught in books, for which the criteria of the past knowledge system, including encyclopedic knowledge, are more important. The Internet simplifies knowledge and information enough and makes it easier to digest, and as a result, deprives people of critical thinking.
- 6) The situation is also exacerbated by the fact that in the modern world, universities are losing their "monopoly" on knowledge. Today, lectures by professors at universities are not as valuable as in the past, and everything that is said in these lectures can be read freely on the Internet. University libraries have also fallen in price, because here, too, the Internet is at the forefront, and the required materials are quickly found on the Internet [Balatsky, 2015].

4. SCIENTIFIC ACTIVITY IN UNIVERSITIES

The system of management of scientific activity in modern universities covers the following priority areas: Management of the system of promotion of scientific activity; Management of research projects; Management of university-business or real sector cooperation; Research centers, institutes and their management; Management of real and virtual research laboratories; Technology transfer management; Management of scientific journals and publishing activities; Management of the provision of academic ethical principles in scientific activity and management of the system of measurement and evaluation of scientific activity. In modern times, administrators in the process of evaluating and managing scientific activity mainly use references to the number of publications and scientific journals. In our opinion, the evaluation of the activities of researchers and teams should be based on the results of very serious examinations and should be carried out after the public discussion of scientific results. Elmmetric indicators published in scientific journals and calculated on the basis of the number of references can only play the role of information-auxiliary.

For example, Ed Lewis, who won the Nobel Prize in Physiology or Medicine in 1995, published very few articles and had a low h-index. One of the main problems of academic life in recent decades is the demand for the publication of teaching aids (textbooks, manuals, methodical instructions, methodical guidance) and scientific publications (scientific articles, reports at conferences, monographs). Thus, the main task of leading employees and teachers of universities is to teach as a participant in the educational process, which has a serious impact on academic careers and has a negative impact on the growth of their professionalism. At elite American universities, employees are required to publish articles in first-class scientific journals, and only then do they sign indefinite contracts. In other groups of universities, the principle of "publish or you will perish" prevails, a large number of publications are required, regardless of their quality and impact factor. Most members of the academic community are already of the opinion that the quantity of scientific publications is more important in the world than their quality. Thus, the teaching load is constantly increasing, the number of students is increasing, and for most teachers, scientific research comes to the fore, and teaching becomes a secondary job. It is known that demand forms supply, so the number of magazines that are not read and intended for mass publications is growing, the main task of these magazines is to ensure the activity of publication. At the same time, the constant demand for publication leads to the individualization of the academic community: higher education institutions spend less time on academic commissions and young staff in areas where assistance is needed. So the main priority for them is to publish more and get foreign grants, in which case career growth is possible. Therefore, at the beginning of their academic careers, young scientists take for granted that their main task is not to seek the truth, but to publish more. This can have a negative impact on their professional discipline, quality standards and researcher behavior. The amount of publication is an incomplete indicator with a number of limitations for evaluating the performance of the university. National universities are also affected by the market economy and are trying to get more publications to rank in international rankings. The deepening "rating dealership" increases the importance of publishing activities, as it is one of the main leading indicators and is used in determining ratings. The rankings do not refer to the quality of publications, but to their quantity, so universities are interested in increasing the number of publications. Under such circumstances, scientists not only sacrifice quality, but also change the direction of research. The main reason for this is the publication with a higher impact factor and other formal indicators. Research is a perishable resource, and it is usually relevant at the current stage, but in any competitive environment requires constant capacity building: year after year, reporting forms for research become more complex, and this applies to the quality criteria of higher education in general. The transformation of universities into economic corporations requires a new type of teachers. In this case, the teacher, along with his research work, must participate in its implementation, in the organization of scientific logistics. In our opinion, a modern teacher of the higher education system is required to expand his worldview:

- 1) renewal of the attitude to scientific research works, elimination of differences between foreign requirements and requirements for professional level, foreign elements;
- 2) not to become a captive of the current situation, to enjoy scientific activity, its results and to be creative;
- 3) to believe in the need to choose new organizational strategies, and thus to understand the importance of the transition from quantity to quality in a situation where the quantitative paradigm prevails;
- 4) mastering virtual horizons, as well as understanding the existence of a virtual image as one of the main components of professional reputation.

5. COMMUNICATION POLICY OF UNIVERSITIES

We live in a time when scientific knowledge is being questioned and misinformation is spreading more and more rapidly, thanks to some social networks that play a key role in spreading misinformation. With this in mind, scientists working in universities must be able to actively disseminate the results of their research to a wide audience and in an attractive manner. In addition, it is important to keep in mind that deliberately distorted information can negatively affect people's behavior, both individually and as a group. This problem is difficult to overcome. Therefore, during the dissemination of accurate information, it is important to inform people in one form or another about the false information circulating around the issue. It is necessary to discover people's ideological beliefs, to be able to overcome their hesitations and to help them to do so.

6. INTERNATIONALIZATION OF EDUCATION

Cooperation with foreign colleagues is a leading activity in the development of internationalization for universities in the modern world. Most of them attach great importance to the implementation of joint research programs, the organization of dual degree programs, as well as the development of other partnerships related to the activities of foreign organizations, especially with universities in developed countries.

English Instruction (EMI) is a sign of the internationalization of higher education in most non-English-speaking countries. There is a gradual transition of teaching and learning to English, the study and teaching of academic subjects in English through the organization of students' learning of English.

The research has revealed 6 important international trends in universities:

- 1) restructuring of administrative management and structure;
- 2) improvement of teaching staff;
- 3) creation of international educational programs;
- 4) academic mobility of students;
- 5) distance education;
- 6) cooperation and partnership.

The rapid spread of the English language in the world's universities has led to another problem that is not so noticeable. Students from English-speaking countries are no longer interested in learning other languages. They are confident that they will speak and communicate in English, no matter what country they are in or where they study. Due to this, the number of courses is declining, as well as interest in courses on world culture and civilization. As a result, students from English-speaking countries have very little knowledge of the languages and cultures of other countries. The English language used in the higher education system has a significant impact on policy in this area. Thus, the United States and the United Kingdom, as well as other English-speaking countries, have strengthened their leading position in the higher education system due to their strong resources and scientific communications. In addition, as most of the world's leading scientific journals are published in the United States, researchers and scientists in this country have great advantages. The main reason for this is that the main part of the expert evaluation system is located in the United States and ensures the preparation of better articles in this environment, the development of scientific methodology. As noted earlier, at the international level and in the education system, English has significantly overtaken French, German and Spanish, and the number of applications for these languages is declining rapidly. At present, there is no doubt that English is the main academic language in the international academic community. National academic systems see the use of the English language as an important factor in an environment of internationalization and competition, and consider it important to achieve "world-class" standards.

Therefore, the dominance of the English language and its hegemony in world science, its central place in the academic system, creates great difficulties for scholars and researchers who use other languages. Therefore, our researchers and scientists can publish the results of their scientific research in national scientific journals that bring their activities in line with the criteria of internationally recognized publications.

7. CONCLUSION

- 1) Scientific activity in modern universities develops for three purposes: 1) Knowledge is produced through research. The University is interested in and researches everything within the power of human knowledge; 2) Research is used in the teaching process to prepare future generations knowledgeable; 3) Prepares quality personnel or specialists in accordance with the needs of society and, in particular, the labor market.
- 2) There are three main strategies in the international experience of creating a world-class university: 1) Increasing the level of several existing universities and transforming them into leading educational institutions; 2) Creation of a new university as a result of merging of several universities, creation of synergetic development (effect) inherent in a world-class university; 3) Creating a new university from scratch.
- 3) The professor or lecturer should acquaint students with the research work carried out in the teaching process. Teaching from a textbook prepared by others distracts students. The professor should organize a discussion of his scientific activity in the lesson. One cannot be a good lecturer or teacher if one does not present one's research to the public discussion of students.
- 4) Students need to be taught academic skills in a new way. Because it will be needed everywhere and always. This skill is multifaceted, forms critical thinking, is effective, and allows you to identify important problems.
- 5) In modern times, administrators who carry out the processes of evaluation and management of scientific activity mainly use the number of publications and references in scientific journals. In our opinion, the evaluation of the activities of researchers and teams should be based on the results of very serious examinations and should be carried out after the public discussion of scientific results. Elmmetric indicators published in scientific journals and calculated on the basis of the number of references can only play the role of information-auxiliary.
- 6) Universities need to identify new channels to inform the public, including politicians, and provide information on the fundamental role of higher education in the development of society and the country, as well as the region where the university is located. Otherwise, the university will continue to lose its principles and supporters of academic freedom, and such universities will lose trust in society and the intellectual environment.
- 7) Language is not only a method of communication, but also a culture. The use of English as the leading language in the higher education system in non-English-speaking countries can affect local culture and way of life, thinking. The widespread use of English also has an impact on scientific methodology, publications and their academic approaches. This is explained by a number of reasons. Thus, the editors of prestigious English-language journals are mostly scholars from English-speaking countries, and they, in turn, prefer reviewers living mainly in English-speaking countries. Even the most cosmopolitan editors and reviewers are inclined to the methodologies and approaches used in such an English-speaking academic environment. This situation puts scientists living and working in a non-English-speaking environment unfavorable in many respects. However, there is no doubt that English is now accepted as the main academic language in the international academic community. National academic systems welcome the use of the English language, see it as an important factor in an environment of internationalization and competition, and consider

it important to achieve "world-class" standards. As a result, the dominance of English and its hegemony in world science, its central place in the academic system, creates great difficulties for scholars and researchers who use other languages.

ABSTRACT

This article discusses and analyzes the financing process of innovative scientific processes that take place in parallel with innovation processes. This process is pre-emulsive as an element of the state policy under way in this area. The structure of the sources of financing of these processes in the Republic of Belarus, as well as the expenditure from the Republican budget in this direction has been analysed in details. The main place is the allocated financial resources for fundamental and applied research, as well as those related to the financing of scientific and technical programs and the development of the material and technical base.

Keywords: *Innovative development, Financing research, Belarus*

1. INTRODUCTION

The article analyses the peculiarities of the activities and financing possibilities of research and innovations in the Republic of Belarus based on the studies of the main activities of specialized organizations, free statistical database of the existing funds (programmes), other organisations (Table 1). Specialized private organizations (funds) also play an important role in the development of research and innovation potential of the country. They provide funding for scientific and innovation projects in order to generate innovative ideas, their precise analysis and implementation in the practical spheres of economic and social life of the country.

2. ANALYSIS OF THE PROCEDURES AND SOURCES OF FINANCING RESEARCH AND INNOVATION

In order to receive additional, except for the budget, funds for expenditures on scientific and innovation developments it is vital to attract private organizations in allocating money for research and innovation developments on the current relevant topics for the country (region). First of all, the interests of a grant giving organization, that directly finances the expenditures on research, approves innovative developments and implements them into practice, should be considered. Examples of such organizations include “Education for future” (2021a). Association, “Priorbank” OJSC (competition of innovation projects), “Belagroprombank” OJSC (competition of “Agrobusiness 2.0” projects) and a number of other organizations financing research activity in local thematic areas.

Table following on the next page

Name	Main activities	Competitions (programmes), financing
Belarusian Republican Foundation for Fundamental Research (BRFFR) (2021b)	Providing funding for fundamental and exploratory research in the field of natural, technical, social sciences and humanities, carried out by scientific organizations and higher education institutions in priority areas of research in the Republic of Belarus.	Competitions of research papers in the following fields: - physics, mathematics and computer science; - technical science; - chemistry and earth sciences; - medical and pharmaceutical sciences; - agrarian and biological sciences; - social sciences and humanities. Applying for financial grants for the participation of scientists in foreign scientific events. Applying for financial grants of republican and international scientific events.
State Committee for Science and Technology in the Republic of Belarus (SCCT) (2021c)	Coordination of the activities of republican state authorities and research, technology and innovation organizations. Assistance for local executive and administrative bodies in the organization and implementation of regional research, technological and innovation policies. Implementation of a unified state policy in the field of international research and technology cooperation. Development of innovation infrastructure and support mechanisms for entities of innovation, contribution to the creation and development of industries based on new and high technologies. Attraction and implementation of advanced highly efficient foreign technologies. Stimulation and support of entrepreneurship development in the Republic associated with the commercialization and the implementation of research and technology achievements in the production; support of the development of research and technology information system.	Republican competition of innovation projects. Republican competition of youth innovation projects. Competitions of bilateral research and technology projects. List of scientific equipment for purchase. Development of material and technological base for the entities of innovation infrastructure.
National Academy of Sciences of Belarus (BNAS) (2021d)	Organization and coordination of basic and applied research carried out by all research entities; carrying out basic and applied research and developments; organizational and technical support for conducting state expert's conclusion (1998)	Financing the main activity of the Academy and its subordinate institutions (the organization contains approximately 50 institutions) related to basic and applied research, expert's conclusion, research and technology events and strengthening the material and technical base of the subordinate institutions.
Belarusian innovation fund (2021e)	Development of new innovation financing mechanisms and a system of measures that stimulate and support domestic production. Belarusian innovation fund mainly finances high technology and advanced projects.	Financing on a repayable basis (for the use of funds, interest is charged in the amount of 0,5 of the refinancing rates of the National Bank of the Republic of Belarus; funds are allocated for a period of up to 7 years with the possibility to defer payment for up to 2 more years). Innovation vouchers and grants (on a non-refundable basis; innovation vouchers offering up to 25 thousand US dollars and grants - up to 100 thousand US dollars). Republican competition of innovation projects (together with the State Committee for Science and Technology). Russia-Belarus venture capital fund (up to 300 thousand US dollars investments, provided in the form of an equity entry or by issuing a convertible loan, 10-40%).
Funds of the ministries (departments) (Ministry of Education of the Republic of Belarus) (2021f)	Financing research, technology and innovation developments of the relevant industries.	Competition for grants for research aimed at scientific and technological support of the activity of the Ministry of Education (according to the list of areas that require scientific solutions). Competition of research papers of postgraduate students, PhD students, applicants and students for grants.
Regional innovation funds (Innovation funds of Brest Regional Executive Committee) (2021g)	Providing funding for research, technology and innovation projects that are of highest priority for each specific region.	An open competition of projects (works, events), which are financed with the help of innovation funds of the Brest Regional Executive Committee, with the following objectives: - to finance the implementation of innovation projects developed under State programme of innovation development of the Republic of Belarus; - to finance the implementation of research, experimental developments and experimental research in technology that contribute to the creation of new products, new (advanced) technologies, new services for the Republic of Belarus; - to finance the initiation of activities and development of material and technological base, including capital expenditures of the innovation infrastructure entities. - to finance the development of material and technological base, including capital expenditures of the industrial laboratories; - to finance science and research conferences, seminars, symposia, exhibitions of science and technology achievements, the development and publication of scientific and educational literature.

Table 1: Main activities of organizations financing research and innovations

Globalization processes, digital transformation processes, capital intellectualization, an emphasis on creating a highly technological and innovative, and therefore, a competitive product (work, service) determine the high importance of cooperation between organizations, scientists, innovators at the international level, which attracts additional financial resources, provides an opportunity to exchange the new knowledge and positive experience in the relevant

thematic areas. In order to find additional opportunities at the international level for qualitative and comprehensive research and new developments we have analysed the main activities of major foreign organizations (funds) – grant giving organizations (donors), which provide financing for research and innovation projects implementation (Table 2).

Name	Main areas and conditions of financing
Austrian Science Fund (2021h)	It is a major Austrian organization that finances basic research in the following scientific areas: natural, technical, medical, agricultural, public, humanities (around 30 financed programmes) Certain programmes have no time limits for submitting applications (accepted non-stop).
Academy of Finland (2021i)	Funding specific researchers, research groups, research organizations, and strategic research in various thematic areas.
US Civilian Research and Development Foundation (CRDF) (2021j)	Offers technological and innovative programmes aimed at stimulating economic development, finding and implementing effective commercialization, as well as developing country's capacity for incubation and acceleration of new ideas with the help of technical assistance and intersectoral partnership in various thematic areas.
German Academic Exchange Service (DAAD) (2021k)	Funding research, internships, and educational programmes in Germany in different areas, funding strategies for internationalization of higher education.
German Research Funding Organisation—Deutsche Forschungsgemeinschaft (DFG) (2021l)	Provides funding for research projects in all areas. The emphasis is on young scientists, interdisciplinary nature of research and global cooperation.
Simons Foundation (2021m)	Provides funding both for independent and joint research projects in mathematics, physics and information technologies.
Volkswagen Foundation (Volkswagen Stiftung) (2021n)	Provides financial support to humanities and social sciences, as well as science and technology in higher education and research, stimulating them through its funding.
National Science Foundation (2021o)	Provides financial grants for research in education in most fields of science and technology and partnership agreements with educational institutions, scientific organizations, business entities and public organizations.
Japan Society for Promotion of Science (2021p)	Implements a diverse programme that includes financing of research projects, encouraging young scientists, promoting international scientific exchange and supporting reforms and globalization.
The Spencer Foundation (2021q)	Finances research in education and organization of joint scientific and practical events.
International Educational Foundation for Research in the Field of Chinese Language and Culture (“Hanban”)	Provides financing for research in the field of latest educational technologies, including promotion of the Chinese language and culture.
Pan-European network for industrial high-tech R&D “EUREKA” (2021r)	Focuses on the development of market-oriented high-technology research and innovation.
European Cooperation in Science and Technology (COST) (2021s)	Provides international financing to researchers for the development of interdisciplinary research networks in Europe and beyond. The organization focuses on strengthening the innovation potential of countries in solving scientific, technological and social issues.
Belgium Research Foundation (FWO) (2021t)	Supports fundamental and strategic scientific research in all fields.
European Science Foundation (ESF) (2021u)	Aims at promoting high-quality science in Europe to stimulate progress in research and innovation.
Research Councils UK (2021v)	Offers financing and support in all academic disciplines and industries: from medicine and biological sciences to astronomy, physics, chemistry and engineering, social sciences, economics, environmental sciences, arts and humanities.
Swedish Research Council (2021w)	Finances research and research infrastructure in all fields of science on the basis of open competitions, stimulates international scientific cooperation.
Swiss National Science Foundation (SNSF) (2021x)	Finances research projects together with the countries of Eastern Europe in all fields of science, provides grants for international conferences, held in Switzerland.
Research Foundation of Bulgaria (2021y)	Provides financial support for world-class research and development of the country's potential related to: 1. Creation of new scientific knowledge. 2. History, language, culture and national identity. 3. Stimulations of the development of natural, technical sciences, humanities and social sciences. 4. Solution to problems in economics, education, agriculture, ecology, social processes, human resources, security, defence and healthcare. The foundation performs its activities through financing national scientific programmes and research projects in higher education institutions and scientific organizations of the country following internationally recognized standards and considering the existing national scientific potential and social needs and priorities.
Mobility scheme for targeted people-to-people contacts (MOST) (2021z)	The aim of the programme is to help establish contacts between the citizens of Belarus and other member-states of the EU. It funds short-term residence permits, internships and exchange visits in the field of science, technology, business, innovation, IT, culture, etc.
EU Programme “Erasmus+” (2021aa)	EU programme that supports education, professional training, youth and sports in Europe. The main objectives within the programme include: Reducing unemployment, especially among young people; Training adults with the focus on acquiring new competencies or labour market relevant skills; Encouraging young people to participate in European democracy; Supporting innovation, cooperation and reforms; Promoting cooperation and mobility with EU member-states.
Visegrad Fund (Visegrad+) (2021ab)	Provides grants for projects that promote democratization processes and transformation in particular countries and regions, especially non-EU countries, the Western Balkans and the countries of the Eastern Partnership.
EU Programme “Horizon 2020” (2021)	The objectives of the programme include creation of scientific and technological basis for the accelerated and sustainable economic development of the united Europe, growth of its global competitiveness, increase of employment, turning the European Union states into one of the most scientifically and technologically advanced countries, provision of solutions to global issues in the field of public health, demography, energy, climate and security. The following are the programmes priorities: - advanced science; - industrial leadership; - solutions to the socially significant problems.

Table 2: Major foreign organizations (funds, programmes), which provide financing for research and innovation projects implementation (including for the applicants from the Republic of Belarus)

The analysis of foreign grant giving organizations indicates the existence of a wide range of additional opportunities for financing research and innovation of the country's organizations. In this case, it is inevitable to take into consideration legal regulations (2021ad). When studying the opportunities for financing research and innovation it is vital to analyse each stage of funding (Fig.1).

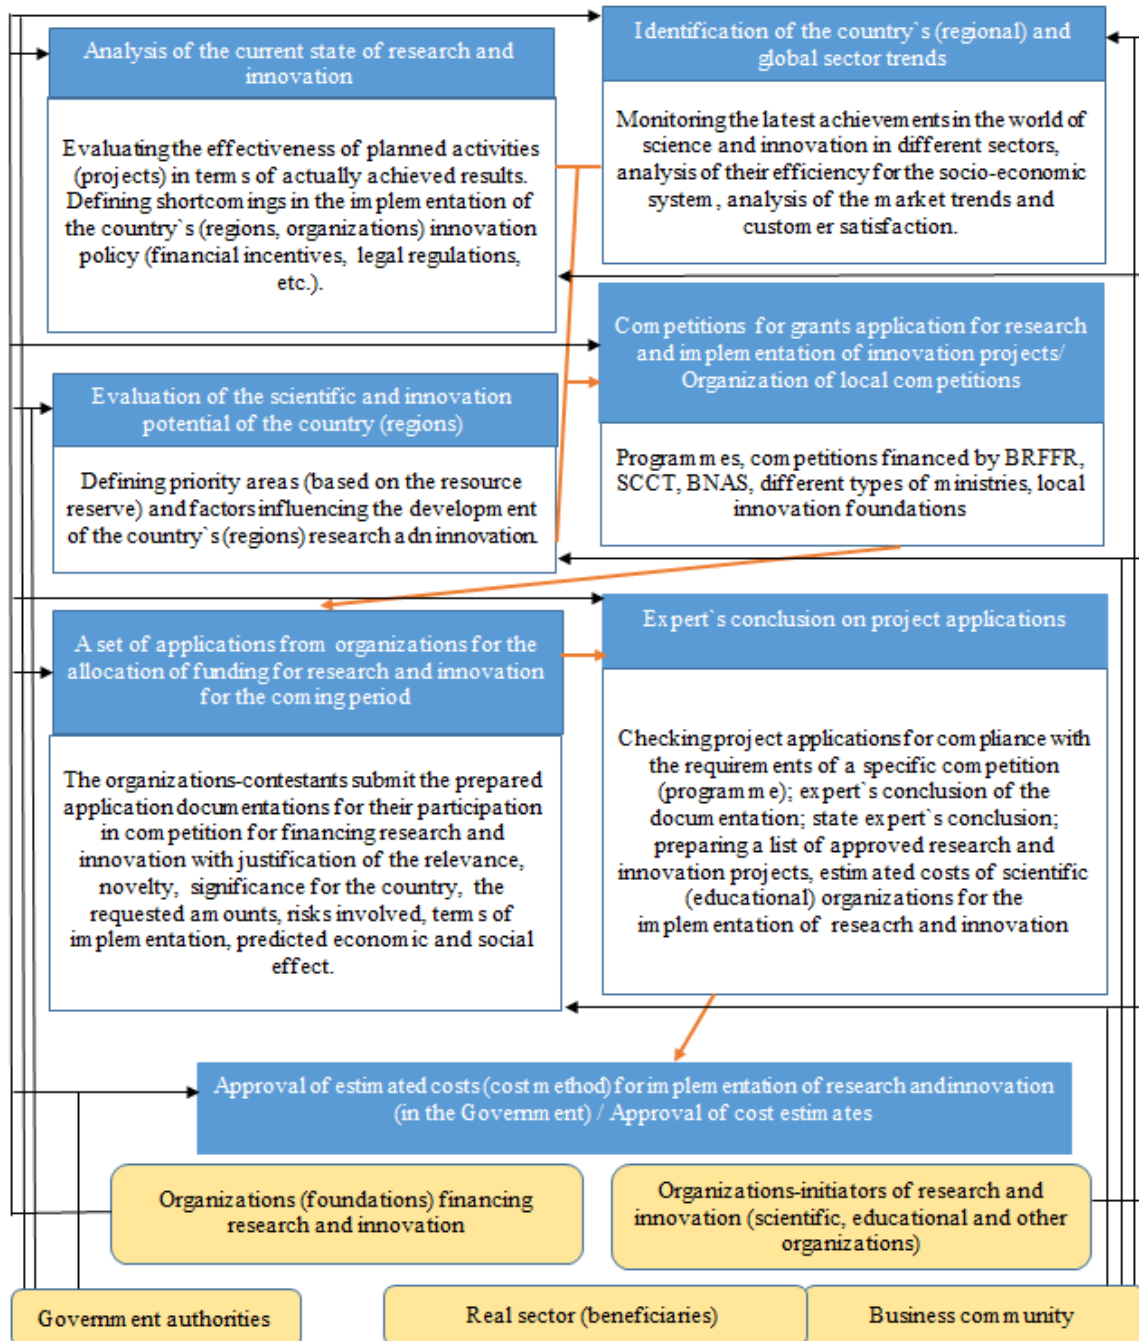

Figure 1: Organizational and structural algorithm of funding research and innovation

The procedure for providing funding for research and innovation projects of a specific organization (alliance) after the approval of the competition outcome finishes with the conclusion of agreements with certain schedule for their implementation and expected results and approved budget estimates (Fig. 2).

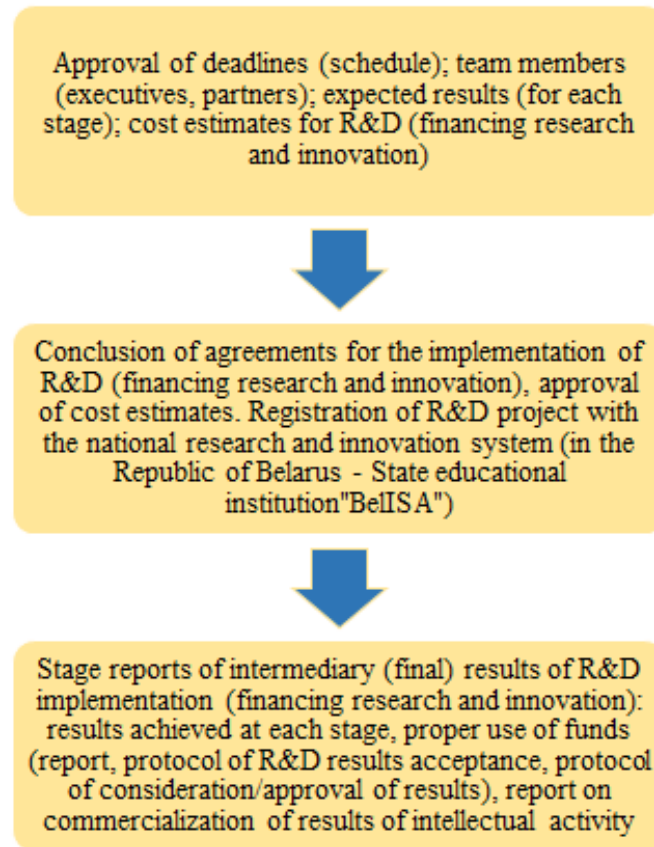

Figure 2: Procedure for providing budget funds for research and innovation

3. CONCLUSION

There are several problematic aspects in this procedure that should be pointed out for their further consideration and improvement (Terziev, Klimuk, 2021ae; 2021af; Terziev, Georgiev, Klimuk, 2021ag; 2021ah):

- The process of consideration of applications for research and innovation projects takes approximately 5-7 months, after which 2 months, on average, are needed to approve the set of documents and provide funding. The project applications contain the actual prices for the goods (works, services) expected to be purchased and the registered potential suppliers (partners). The cost estimates include specific expenditures (name of the product, price per unit and purchased quantity). This means that in the future the actual price for purchase of the established amount of specific items (work, service) will not coincide with the approved cost in the estimate. One of the ways to improve the situation could be by introducing "flexible estimate" that determines the maximum amount of expenditures on research and innovation. This estimate should be based on the results (specific tasks) expected during the process of work (that requires relative costs). In this case, detailed expenses for a specific quantity, product name or price, are used taking into account the expected modifications (for instance, price fluctuations) and risk situations.
- Very often certain tasks of research and innovation within the cooperative resource model are not assigned to a specific performer representing the sector of scientific and educational organizations, the real sector of the economy, state authorities and business. At the same time, it is advisable that organizations use a combined financing scheme for research and innovation: budget funds, personal capital and funds of other organizations (incl. foreign ones). This will increase the level of responsibility of each member organization

(performer) and compliance with the requirement of mandatory commercialization of the results of scientific and technological activity, partially or completely state-funded (2013). It would also be beneficial to agree on the acceptance of the research and innovation results and the planned use of funds to obtain them (if the expected results are obtained, then it is possible to assess the planned use of funds in a simplified way: according to the allocated amount and deadlines – according to the combined (consolidated) expenditures).

- Taking into account the fact that state funds are allocated for the coming period and are approved within the republican budget for the planned year, there is no flexibility in the distribution of resources and mobility in requests for additional funding required for high quality and fulfilment of the defined research and innovation tasks. In this case, it is advisable to create science and innovation development funds in each organization, which would finance research and innovation on the basis of periodic deduction of funds (as a fixed interest rate: e.g. 7%) based on the results of successful implementation (profit) of each research or innovation (grants for the implementation of research and innovation projects, organizational contributions from ongoing scientific and practical events, payment for editorial and publishing services, organization of exhibitions and other events).

ABSTRACT

The rapid changes in the globalized world, the intensification of market competition, the deepening of market segmentation with a substantial increase in consumer demand and taste, the need to shorten the period of adoption of new production technologies have led to radical changes in the activities of enterprises and, consequently, in the content and strategic management systems. The main purpose of this study is to analyze the categorical characteristics of uncertainty and risk from an international practice and consider international practices to understand Azerbaijan's economic stability field. This consists of exploring the use of techniques to guarantee security. The research was carried out on the basis of research methods such as scientific abstraction, logical generalization and systematic analysis. The study found that strategic flexibility, competitive positioning, strategic segmentation, synergetic, diversification and other components of the strategic management system enable businesses to operate in a complex and changing external environment. The presence of uncertainties complicates the process of selecting optimal decisions. Innovative changes in the modern world require risky decisions, accompanied by uncertainty in the economic sphere. The limitations of the study are the need for more practical information. The practical significance of the research is to ensure the continuity of economic entities against the background of modern economic processes and determine that their development is impossible without financial stability. From this point of view, the practical significance of the work is to make certain proposals and recommendations to increase the effectiveness of decisions made in the long run in conditions of uncertainty. The originality and scientific novelty of the research is that the proposed approaches allow business entities operating in the economy to better understand the existing system of relations related to the development and implementation of strategy and, accordingly, to develop effective measures in strategic management.

Keywords: *Entrepreneurship, Economic Freedom, Efficiency, Risk, Uncertainty*

1. INTRODUCTION

The most important condition for efficiency in all economic systems is economic freedom. Economic freedom envisages a set of laws that give economic (producers / consumers) an autonomous, independent decision-making process. Economic freedom is the source of uncertainty and risk. Thus, the freedom of an economic agent means freedom, along with others. Uncertainty and risk are an integral component of entrepreneurship.

2. LITERATURE REVIEW

In the 17th century, R. Cantinol meant that he was a businessman at risk.

He took the commodities at a well-known price to earn profits, using the uncertainty of the economic conjugation that emerged from the market demand and volatility of the offer, but at an uncertain price.

He characterized the entrepreneur as a person who claimed the risk of residual amounts and unrealized income by taking risks that could not have been predicated on his own. (2, 427). In directive economies, the risk was given in the following forms:

- non-fulfillment of the state plan;
- in breach of contractual obligations;
- In-time delivery of products and so on

This risk, as a rule, occurred when business rules and regulations were not expected. In this case, the market conjuncture, price, and consumer behavior were unclear, making it more affordable. This risk, as a rule, occurred when business rules and regulations were not expected. In this case, the market conjuncture, price, and consumer behavior were unclear, which allowed them to earn additional revenues. A number of foreign and country economists associate entrepreneurship with innovation activities. Entrepreneurship is the ability to compete with competitiveness or to compete successfully by creating new commodities, seeking new ways to reduce costs, making goods more attractive for consumers. The innovation process, new techniques, new technology and use of new ideas are uncertain and stochastic. Innovation is always connection with risk. If the benefits of innovation in the production environment are so great that many of the conditions are met with competition, the company's costs are diminished, and if it is possible to increase sales or sell commodities at higher prices, using innovative advertising or other marketing methods. On the contrary, the occurrence of interruptions during the innovative production process will result in certain losses in the absence of a solvent demand for an innovative product. Thus, the existence of uncertainty and risk is a component of entrepreneurial activity and acts as a driving force of the economic system. The modern market economy operates under changing conditions of economic conditions, market conjuncture, market entities. The uncertainty of economic life has prompted P. Druker to call postindustrial society a "period of illegality." The instability of the economy implies the uncertainty of the economic system, and the risk is characterized by uncertainty. The definition of risk and the analysis of the economic context of the risk dictates the necessity of taking these factors into consideration when making decisions at all levels of the economy on the market. The economic theory has shown long-term disregard for the risk issue. The problem of effective deployment of limited resources in the market economy has been studied without considering the risk factor. In theoretical studies, he was simply given a border. Nevertheless, the category of "risk" is found in the works of early classical political economy representatives (D. Riakrdo, A. Smith, C. Mill). According to them, profit should also include risk premium. However, they confessed rski as a prerequisite, and interpreted it as mathematical expectations of the loss that might occur as a result of a decision chosen without a more accurate analysis. K. Marks, using the method of abstracting, used the methodology of the category system in a methodological and theoretical way that the model was uncertainty and uncertainty from the analysis of economic relations. In K. Marks' Capital work, abstracting was carried out outside of foreign trade and was viewed as a single market for the entire capitalist world and the whole market as a domestic market. (1, p.204). Thus, from the analysis, a russia-related situation arising from the change of exchange rates, political and other conditions was removed. K. Marks also came to the conclusion that all commodities were sold to their value. When analyzing the redistribution of public capital, he summarized the changes in market prices and the depreciation of market prices. This condition diminished the dynamic aspect of the economy at the current time and ultimately uncertainty and risk. "Statistical forces define levels, while dynamic forces lead to displacement."Realizing that the competitive mechanism of action required diversity in the behavior of economic agents, K. Marx did not show interest in this diversity and explained the dynamic evolution of the capitalist system.

However, despite the fact that K. Marks directly raises the risk factor from his perspective to simplify economic analysis does not mean that he completely denied the existence of a risk factor in the economy. As evidence of this, it can be noted that the formation of an insurance fund: Part of the profits, and therefore, part of the surplus value and, therefore, the surplus labor serves insurance funds." (6, p.416). A. Marshall also paid great attention to the category of risk. D. Ricardo, A. Smith, C. Mill, and Y. Senior, argued that it was a component of earnings risk. Depending on the source of capital formation, Marshall distinguished between personal and business risk. The risk of entrepreneurship "is a breakthrough in the raw and finished product market, unexpected changes in fashion, new inventions, new and powerful competitors in the areas where it operates, and so on. is conditioned by. However, there is another category of risk: "In this case, a person who is working with a debt capital falls and no one else; this type of risk can be called personal risk. " Both of these types of risk are part of the firm's total costs. "If they are themselves an insurance company for themselves" (7, p.297-298) A. Marshall also investigated the behavior of economic agents in uncertainty and risk. Employees working under risk are guided by two criteria: the amount of expected earnings and the possible removal (hesitation) of its size when selecting one or more of the possible latterities (7, p.230). However, neither the classic political economy nor the A. Marshall have been dealing with the application of the content of the "uncertainty" and "risk" categories and defining the exact boundaries between these categories. For the first time, F. Neit has been able to determine their honest boundaries. He proposed for the first time the difference between the aprior and the probability that "all indexed (identifiable) situations (except in the case of random events) differ from one another. Because it is impossible to evaluate them using apricot calculations. " "The main distinctive feature of such a probability is that it is based on the empirical classification of those events" (8, p.23-24). At the same time, this type of probability is the absence of substantive criteria for "assessment" and the inability of the classification of the situation. Each of them is unique (rare), or the number of such situations is insufficient to analyze them. F. Nait used an aprior and "risk" to show statistical probabilities and used the term "uncertainty" to evaluate them. Thus, as F. Neit understands, uncertainty relates to the situations where it is possible to calculate even the subjective, even if it is subjective. The risk is likely to be as it is known and can be determined by mathematical methods or statistical analysis of accumulated experience. The existence of "uncertainty" for F. Nite's arguments allows the entrepreneur to earn extra profits in the future, despite competition, long-term equality and product development. Production is carried out with the exception of the consumer Thus, production factors arise as a result of the declining demand for consumed products. Therefore, the entrepreneur must compete for the price according to the product he has produced for his final product. However, it is impossible to determine the cost of the final product without knowing how much it costs. Thus, F. Nait looked like profit from uncertainty, unlike the orthodox tract. Uncertainty and risk concepts were also interpreted by C.Cainn similarly. He considered it important to have a "risk" category to describe business activity. C.M. Based on the fact that risky decisions relate to the psychological characteristics of an economic agent, he noted that the risk of entrepreneurship occurs for "the prospect of gaining the benefit that it has calculated by the hesitation of being able to reach it". Therefore, improvement of the pre-visual level should be mutually balanced. In the mid-twentieth century, there has been a major change in the analysis of uncertainty and risk in Western economic literature. Modern economists regard the uncertainty in their works as lacking complete knowledge. Risk is defined as the possibility of removing decisions made to achieve the goal, as well as considered it choosing alternatives in uncertain situations. Formation of market relations in Azerbaijan became the prerequisite for the development of risk theories in the country's economic literature. There are so many and different ideas about the essence and nature of the risk.

Unfortunately, "uncertainty" is still beyond the scope of the country's economists' viewpoint or is simply equalized with the risk perception. The "Economical Encyclopedia" or the risk is defined as follow: "Risk (in economy and entrepreneurship – uncertainty) depends on decision-making and their realization takes place only for a certain amount of time." (10, p 688) V. Abchuk and A. Algin identify the risk as "the movement style in unclear, indefinite conditions, the life activity of economic subjects, which are related to the elimination of uncertainty". Following the traditions of the classical risk theory, V. Shakhov defined the risk as "the possibility of adverse disagreements between the plan and the actual results, in other words, the danger of an unfavorable move of an expected decision ." L. Rastriguein, B. Rausberg and other economists, they are of this opinion. However, if the risk was only associated with the negative consequences of economic activity, then the economic agent would not have the need to take risks. The above-mentioned approaches are eliminated in the works of I.T. Balabanov, L.Sharshukova, M.G. Lapusta and others. L. Sharshukova and M.G. Lapusta noted that although the result of the "risk" resulted in a loss of self-sufficiency or anticipated earnings, it was not merely the undesirable outcome of the decision. In individual options of entrepreneurship projects, there is not only the risk of not achieving the intended outcomes, but also the possibility of multiplying the expected profit. This is the essence of the risk of entrepreneurship, and it is characterized by the coordination of the planned outcomes both unwelcome displacements and opportunities to achieve extremely favorable displacements. The readiness of people to risk is explained by the fact that despite the possible losses, there are strong positive incentives - there are also opportunities for high returns. The concept of entrepreneurial risk proposed by P. Polovinkin and A. Zozuluk is of great scientific interest. Based on this concept, risk appears as a category of "recycling of all phases and moments from the acquisition of the necessary production facilities (machinery, equipment, raw materials, etc.) to the preparation and implementation of commodities." Thus, natural consequences (droughts, drowning, earthquake, strong frost, flood, etc.) have a great impact on its results at the production stage. The risk here is irrespective of the will of the person. Risk emerges not only in the attitude of man to nature, but also in the attitude of man to the means of production. The machine or equipment can be unexpectedly disrupted and may be morally outdated, due to the use of scientific and technological progress and innovations. Certain violations of the normal course of production may lead to a breakthrough growth in production in separate parts of the economy as a result of favorable weather-climate conditions or acceleration of innovations. Such a situation can happen both in the event of a demand for the additional volume of the commodity mass and in the absence of it. Thus, it can also create conditions for earning additional revenues and exposure to appropriate losses. Under the influence of unpredictable events, it may not be possible to obtain the necessary means at the right time or be forced to get higher prices than predicted. If so, the basis of the losses resulting from the final business activity is laid. On the contrary, the entrepreneur demonstrating all his skill and ability can get affordable all the necessary production and financial resources that are available to him. In this case, already in the process of obtaining necessary resources, the basis of emerging opportunities for the economic benefits is laid. Under the influence of innovation processes, new demands arise in consumption, while the volume of traditional needs changes, if the entrepreneur is not ready for it, then the opportunity to gain economic profit will be lost. The predictability and the level of preparation for such situations are reflected in entrepreneurial ability, experience and professionalism, which creates additional opportunities to increase profits. In a situation where volume of production and demand remains unchanged, portions in the distribution of material benefits and exchange (mistakes in predicting and regulating processes, changing of the conjuncture in the foreign market, etc.) may suddenly alter. In this case, the risk may be expressed in the unexpected change of the repetitive production conditions at the macro and the mezo level.

The entrepreneur also tries to take this into account in his work. However, the task is to eliminate the unfavorable effects of external factors on individual reproduction and gain additional profit by using them as much as possible in the competition. Based on this logic, P. Polovinkin and A. Zozulyuk defined the risk of entrepreneurship as "a system of economic relationships for the realization of entrepreneurial abilities in the recycling process or in some of its sub-divisions to gain additional profit" (9, p. 71-72). Study of recent studies by domestic and foreign economists on risk theory makes it possible to say that vast majority of researchers mean only the risk of entrepreneurship when analyze the nature, causes and types of risk. Consumer risks are never mentioned. However, as it is known, the purpose of business is to meet the needs of consumers (people). The degree of satisfaction of this requirement depends on the state's economic and legislative policies, the activities of entrepreneurs, and the consumers themselves (rationality and non-rationality of their actions). The current state of the economy in Azerbaijan and the ongoing global economic crisis in 2008, the scale of consumer risks is so high in many economists' opinion that it can lead to an increase of social dissatisfaction due to a small negligence. Today, the physical consumer risk in Azerbaijan is widespread. Its main causes include:

- poor quality food and industrial products;
- purchasing power of money;
- unemployment rate;
- Ecological status.

Thus, it is necessary to pay attention to the consumer risk along with the risk of entrepreneurship by analyzing the category of risks. Different approaches to risk identification in country and foreign economic literature can be found in 3 groups:

- The first group includes the experts who designate the risk as the probability of displacement from planned outcomes.
- The second group authors try to focus attention on quantitative and qualitative assessments.
- Third group authors try to explore the risk through the subject's activity:
 - to act in the direction of successful activity with a hope of happy ending;
 - a way to act in dark, indefinite conditions;
 - choosing alternatives in an indefinable situation, realizing the ability to use creativity in uncertainty.

Each of the 3 approaches will allow you to identify the most important signs of the risk. By summarizing different interpretations of risk, it can be identified as a category characterizing the behavior of economic agents in uncertainty. This gives a clearer impetus to choosing the appropriate solution option within available alternatives based on the likelihood of achieving the desired outcome and the degree of displacement (positive or negative). The definition gives the necessity to take into account the activity of the subject of the risk under uncertainty. The subject of the relationship with the risk element may be individuals, households, firms, and others. It is advisable to indicate the activity of the subject of risk through the category of "behavior". More commonly used the category of "activity" to identify the risk is not so successful. The work reflects the activity of the subject, form suitable for given purpose objectively. Within the framework of the same activity, subjects behave differently. Their behavior reflects the objective necessity, even though they are quite free. In other words, in these or other situations, subjects can choose different line of behavior and can risk almost differently. The activity can incorporate elements of instability or uncertainty either immanent(internal)or subjective. However, the risk only shows itself to the specific situational reaction and behavior. Rejection of action is also a risk. It is true that not all behaviors combine risk elements.

The substance of the subject reflecting the creative activity of the subject associated only with the choice of means and methods of obtaining the goal can be regarded as a risk. Behavior is shaped and feasible to meet the needs and interests of the subject in the context of external environment. It also influences the subject in turn and requires certain actions from it. Therefore, the subject must always choose and behave accordingly. Thus, the risk is objectively natural, in other words, "risk is normal, but not one of the exceptional conditions of understanding and processes, but one of the methods of the constant state of the world, its measurement and development." At the same time, the content of the risky behavior is subjective because the risk is that the particular person chooses a certain alternative. In addition, people do not accept the same amount of risk as the size of the risk due to the diversity of psychological, ethical, ideological and other principles. Therefore, it is necessary to speak about the objective and subjective nature of the risk.

3. FINDINGS

In the future, the key to the risk is to clarify the functionality of the risk in the economy. Economic literature distinguishes the following risk functions: innovation, regulatory, defense and analytical. Risks the innovation function when the risk stimulates the search for an unconventional solution to the problem facing an economic subject. Risky decisions lead to more productivity, resulting in both the entrepreneur and consumer as well as the community as a whole. The regulatory function is contradictory and acts in two forms: constructive and destructive. Risk is generally aimed at achieving significant results by non-traditional methods. In doing so, it also helps to overcome defensive, inactivity, and psychological barriers that prevent them from seeing updates. Constructive form of the risk of entrepreneurial risk regulates itself in this. However, if the decisions are taken without taking into consideration the requirements of the development law, the risk can also be attributed to adventurism and subjectivism. In this form acts as a risk-undermining factor. The defense function provides itself with the need for social protection, legal, political and economic safeguards to avoid the dangers that the self-destructive risk will be in order to maintain a stable state of the economic system. Analytical function takes a special place in the business risk function. This is due to the fact that the existence of risk necessitates choosing one of the possible options. Therefore, the economic entity analyzes all possible alternatives in the process of decision making. The concept of uncertainty is characterized by the fact that the information about the stochastic economic system and the environmental situation is not entirely or partly. According to Prof. Watzman of the University of Iorsk, the inability to understand the future and the uncertainty conditioned by it will be the central problem of science in the 21st century and will first of all decide how to limit this uncertainty. There are four main types of uncertainty reasons: "information incompatibility", mismatch in compatibility (incarceration), coincidence, counter-impact (resistance). "Information incompatibility" is conditioned by incomplete (incomplete) and asymmetric information. Additional information on all available opportunities and factors that can influence the outcome of the decisions taken leads to a decrease in uncertainty. It is not a coincidence that knowledge and information in the postindustrial society become an important strategic resource. The essence of the matter is that the term "information" is an antonym of "uncertainty". The second uncertainty of the so-called "discrepancy" is the uncertainty of the instruments used, the complexity of calculations, the restrictions on decision-making methods, the errors in insecurity and modeling, and so on. for reasons. The coincidence is one of the main reasons for the uncertainty. The source of this is that the world is endless, its infinitely complex and colorful. In the economy as in physics, the principle of uncertainty, discovered by German physicist Verner Geyzberg, operates. The essence of this principle is that, knowing the state of the tiny particle of matter in the environment, we can not accurately define the trajectory of its subsequent movement in any way.

According to N.D. Kondratyev, in the field of socio-economic life, we have to deal with more insightful concepts that can not be compared to the precise nature of the field. Here, we have less established relationships and legality, and at the same time they are given in less exact quantitative expression. Economists, as one of the reasons for uncertainty, place a special emphasis on the opposite. It provides itself in situations where the interests of the parties do not overlap (in labor conflicts, when suppliers violate contractual obligations), crash of equipment and in other cases.

4. CONCLUSION

Speaking about the dynamics of uncertainty in the modern economy, it should be noted that, first of all, in accordance with the level of market economy, the breach of contractual obligations, the timely delivery of the product, etc. the "non-conformity in skill" and the uncertainties associated with the reverse impact will be reduced. This process will, first of all, be accompanied by the strengthening of "information incompatibility" as a result of changes in market conjuncture, demand, prices and behavior of consumers. Openness of the economy and access to world markets is expected to increase the uncertainty created by global economic instability. Using the Chaos Theory Terminology, the world finishes its transition from its stationary industry to the postindustrial circle through the chain of bifurcation corresponding to Kondratyev's great economic cycle. The idea of Soros's far-sightedness in 2000 "is that capitalism will soon become deeply troubled and this will distract the system of global financial market and global trade relations system." As a result of this crisis, the world economy will lose at least a trillion dollars for various assessments. The development of such a scenario has once again demonstrated that the ongoing financial and economic crisis that has started in the world economy since 2008 and the sharp drop in the price of nifty. The uncertainty (determinant) sign is, in other words, a risk-taking environment. Therefore, increasing the uncertainty may lead to greater risk. At the same time, it is possible to speak of the non-linear cause-and-effect relation between uncertainty and risk.

MAIN DIRECTIONS OF INCREASING THE EFFICIENCY OF BUDGETARY EXPENDITURES FOR PROGRAMS AND PROJECTS IN THE REPUBLIC OF AZERBAIJAN

Sanan Bayramov

Doctoral student,

Azerbaijan State University of Economics (UNEC), Azerbaijan

senan.bayramov@gmail.com

ABSTRACT

The state budget lays the groundwork for the state's economic and social goals to be realized. It regulates specific areas of spending and acts as an efficient economic regulator, but it is also an object that requires optimization, especially in the area of raising the efficiency of budget spending. This study aims to identify the key directions for improving the productivity of budgetary expenditures for programs and projects using the Republic of Azerbaijan as an example. The work examined the current state of public budget spending in the Republic of Azerbaijan, studied the experience of different countries in improving budget spending performance, demonstrated the factors influencing budget revenues and expenditures, identified opportunities and specific steps to achieve the work's target, and made related recommendations. Since the President of the Republic of Azerbaijan, Ilham Aliyev's social policy prioritizes "security of people and their interests above all," social initiatives and programs receive special attention at work. The paper also discusses how to improve the performance of projects and programs aimed at restoring territories that have been freed from the Armenian occupation.

Keywords: *State budget, the efficiency of budget expenditures, programs and projects, Azerbaijan*

1. INTRODUCTION

The budget is a financial plan for controlling the country's main socioeconomic development parameters, and it has the legal authority to compel compliance. It ensures the accumulation of state financial capital by taxing a portion of the profits of market subjects and redistributing resources forcefully to achieve optimum economic and social efficiency parameters. It also serves as a mechanism for controlling the country's financial and economic activities, as well as a framework for the authorities' exercise of power. The Republic of Azerbaijan's (AR) long-term growth involves maintaining budgetary balance through the use of an efficient budget system, increasing the efficiency of economic processes, and structuring budget expenses rationally, among other things. The state budget represents the amount of financial support that the state needs and sets clear spending goals. This work aims to examine the current state of state budget expenditures and identify opportunities for increasing their effectiveness, based on the enormous importance of the budget in the creation of the Republic of Azerbaijan's statehood. The research's methodological base was developed by the dialectical method of thought, the systems approach, formal logic concepts, economic analysis and synthesis approaches, and inductive and deductive learning techniques.

2. THEORETICAL VIEWS ON THE ESSENCE OF BUDGET EXPENDITURE AND THE PROGRAM BUDGET

The word "budget" has many meanings. One of the most basic meanings is that it is a type of education that involves the expenditure of funds, in this case, public financial resources. In certain situations, the budget's spending side is used to fund national services (investment, economic, development of industrial and social infrastructure, etc.).

As a result, state budget expenses reflect economic ties related to the allocation and use of the state's centralized monetary funds for sectoral, targeted, and territorial purposes. Budgetary expenses are divided into two categories: qualitative and quantitative. The qualitative characteristic of budget expenses reflects their economic existence and intent, while the quantitative characteristic reflects their worth. Since ancient times, people have been discussing the nature of the budget and its key components (treasury revenue and expenditure). Xenophon (430-335 or 354 BC) and Mark Thulius Cicero (106-43 BC), for example, made important contributions to the formation and advancement of the doctrine of the ancient states' revenue and expenses (Pasichnik, 2005). T. Men, J. Locke, T. Hobbes, L. von Seckendorf, S. Pufendorf, and I. Yusti present general treasury theory problems in their works (Kirilenko, 2000). The meaning of the sovereign's revenue and expenditures was discovered by A. Smith (1962). A. Wagner's works are dedicated to achieving equity in the distribution of income and resources in the world, and to determining who the government should use funds for this purpose. A. Wagner (1958) proposed a law on the constant increase in government spending (Wagner's law) in 1892, according to which the constant increase is attributed to three key reasons: Economic (scientific and technological progress, and as a result, an increase in state allocations in science, various investment projects, and so on); historical (throughout history, there has been a significant expansion of the state's social functions (pension insurance, population assistance in natural disasters and catastrophes); sociopolitical (throughout history, there has been a significant expansion of the state's social functions (pension insurance, population assistance in natural disasters and catastrophes); (the state resorts to issuing a state loan to finance unforeseen expenses, year after year an increase in the size of public debt and interest on it, in other words, the cost of servicing of it). To preserve economic stability, John Keynes (2007) suggested that the government participate in budget control, i.e., the government should play a regulatory position based on "efficient demand." His definition of deficit financing means that to boost aggregate demand during a crisis, the government must increase spending; on the other hand, when the economy overheats, the government must cut spending. This will assist in the management of the income-to-expense ratio. The neoclassical school's theorists (R. Slow, J. Kenrick A. Robbins, and others), defending the fundamental concept of the state's non-interference in the economy, advocated a decrease in overall government expenditure while modifying its structure by increasing the share of spending on education and research. Human capital projects received special consideration. The economic nature of the budget was considered in Soviet times through the state's interests, planned economy, and Marxist-Leninist ideology. K. Marx (1958) argued that to minimize the state's debts, it was important to curtail its expenses, or that to reach a fiscal balance, it was necessary to levy emergency taxes on the wealthier classes. In today's market economy, where resources are scarce and material needs are limitless, a constant regulation of economic processes is needed, and when determining the degree of regulation, it is important to consider economic development cycles. Azerbaijan forms its national economy on market principles and in compliance with its adequate requirements after regaining sovereignty. As a result, it should build its budgetary policy in compliance with the provisions formulated by market economy economic principles and business laws. Payment for social services is common in a capitalist economy, but in the AR, state subsidies for the disabled and the poorest strata of the population, social security of people, the development of non-production facilities, and so on are given at the cost of budgetary expenses. -the state's territorial structure; the country's and regions' socioeconomic development levels; the country's economic and social situation; the government's financial policy; society's development priorities; budgetary funding methods, and so on. The need to continually improve the quality of life of the Republic of Azerbaijan's citizens puts the challenge of increasing the productivity of budget pending before the country's government.

Other states had previously faced this issue, and they attempted to fix it by changing the budgetary process management system. In this regard, the word "performance budgeting" emerged in the 1930s of the twentieth century, based on which the term "new public management" originated, the meaning of which is the optimality of expenses directed at government administration. As a result, the modern public administration format focuses on budget spending performance, while conventional budgeting focuses on budgetary tools (input-oriented), first and foremost, the sum of budget expenses. The program budget has several advantages over the traditional one: it allows you to focus budget expenditures on politically defined and strategically important goals of the country's socio-economic development; it allows you to form a direct link between short-term and long-term budget planning and forecasting; it ensures a strong relationship between the state's strategic plans and the budget; it increases the responsibility in the public sector of ministries and departments for the productive and effective use of resources (Shash, 2014, p. 4). The budget program is a systematized collection of activities aimed at achieving a particular objective and mission, which is proposed and implemented by the manager of budget funds by the roles assigned to him (Milenky & Demidov, 2015, p. 558). "A program is a government project grouped about a particular set of targets," according to the Organization for Economic Cooperation and Development. Program budgeting proposes applying cost-benefit analysis to allocation decisions, allocating costs to services, and measuring program success against objectives. This idea will be extended to all government operations under the programmatic classification, according to the proposal (OECD, 2006). The idea of a program budget is viewed from different perspectives: financial public authorities and economists see it as a tool that helps them to simplify and improve decisions on budgetary resource allocation, while members of the administration and experts on the subject of public administration performance see it as a mechanism for increasing efficiency (Milenky & Demidov, 2015, p. 558). Simultaneously, domestic and international scientists describe the nature of program budgeting in some ways. Two key methods can be differentiated as a result of their generalization: in the first, the nature of program budgeting is viewed as a budget preparation method, and in the second, as a mechanism of investing budget funds that are directly linked to performance. The implementation of program budgeting necessitates a range of major changes in the state's financial operations, including the restructuring of all financial systems, reorganization of administrative structures, increased professionalism in all financial activities, and new competencies of public finance specialists. At the same time, another significant aspect to consider is that the transition to the program budget represents a current trend in which the strategies and resources for handling public and private finances are increasingly convergent (Shash, 2011). The program budgeting mechanism has evolved: while it began as a formal auxiliary factor in preparing budget expenses, it has now evolved into an integral part of the budget process in many countries, ensuring the relationship between budget expenditures and results and establishing the preconditions for the system's successful functioning. The government is in control. The program budget is unique in that all or almost all expenses are included in the programs, and each program is specifically related to one or more strategic outcomes of the state's operations. In this regard, the United States, the United Kingdom, Germany, New Zealand, and many other countries consider its use to be a top priority in the modernization of public finance. The definition of program budgeting is used to achieve the following objectives, according to a review of developed world experience: promoting the measurement of the overall cost of program activities; improving fiscal control efficiency; improving the performance of the state apparatus by redistributing powers in the sense of the implementation of specific programs; and ensuring continuity between the budgets of governmental agencies (Afanasyev et al).

3. EXPENSES OF THE PROGRAM BUDGET OF THE AZERBAIJAN REPUBLIC

The program budget is a method for planning budget spending on a fixed timeline. It is based on achieving the objectives and completing the tasks outlined in the country's long-term socio-economic development concept. At the same time, the program budget ensures that the mechanism of allocating public funds is linked to the outcomes of projects developed by strategic objectives. For many international budget schemes, the program budget is no longer an innovation, but it is now regarded as one of the most promising instruments for increasing the efficiency of public spending. Although the use of the program budget in Azerbaijan is still in its infancy, once it is fully implemented in the country, there will be the opportunity to correlate the spent budget funds with the results obtained, allowing the state's budgetary system to be optimized and budget expenditures to be more efficient. Budgetary expenses are classified as funds distributed by budgetary classification from the state budget, the budget of the Nakhchivan Autonomous Republic, and local budgets to meet the requirements stipulated by legislation, according to article 1.1.12 of the Law of the Azerbaijan Republic "On the Budgetary System." Various factors affect the formulation of the framework and content: the state's administrative-territorial structure; the country's and regions' level of socio-economic growth; the country's and regions' economic and social situation; the government's financial policy; society's development priorities; budgetary funding strategies, and so on. Budget expenses are categorized according to certain parameters to assess their importance and significance in the country's economic growth. An expenditure classification, which is a grouping of expenditures and revenue based on homogeneous characteristics, is used in public finance. Azerbaijan currently has a single budget classification, which was approved by the Cabinet of Ministers of Azerbaijan on October 15, 2018. It consists of a division of budgetary revenues and expenditures by functional, fiscal, and administrative categories. According to operational statistics, state budget revenues in 2020 totaled 24,124.0 million manats, up 102.3 percent from the estimate of 24,679.2 million manats, up 461.1 million manats or 1.9 percent from 2019. In 2020, the approved estimate of 1990.4 million manats, or 8.1 percent more than in 2019, was surpassed by 96.1 percent, or 26,416.3 million manats (Information, 2020). President of the Republic of Azerbaijan Ilham Aliyev has focused on the social well-being of the country's citizens since the beginning of his presidency. Throughout the pandemic, he consistently stressed that citizens' health and well-being take precedence over the economy. In this regard, funds were distributed in 2020 at a higher rate than in 2019: 1.9 times, or 814.0 million manat, for health spending, and 36.2 percent, or 828.1 million manats, for social safety and social security. The state budget allocated 36.5 percent, or 9652.0 million manats, to social expenses (wage fund, pensions, and social benefits, drugs, and food), which is 1890.7 million manats, or 24.4 percent, more than in 2019 (Information, 2020). The Republic of Azerbaijan's state budget has set aside 1985.6 million manats for measures to tackle the coronavirus (COVID-19) pandemic in 2020. 612.5 million manats of these funds were used to pay extra fees to medical staff participating in the coronavirus war, to buy required medical supplies and equipment, medications, to raise beds and maintain specialist hospitals, and to reimburse the costs associated with the provision of services in quarantine facilities. Simultaneously, 1,334.1 million manats were set aside to fund steps to mitigate the effects of the global pandemic on the Republic of Azerbaijan's population, macroeconomic stability, jobs, and economic entities (Information, 2020). The Republic of Azerbaijan's state budget has set aside 1985.6 million manats for measures to tackle the COVID-19 coronavirus pandemic in 2020. 612.5 million manats of these funds were used to pay additional fees to medical staff participating in anti-coronavirus initiatives, to buy required medical supplies and equipment, medications, to raise beds and maintain specialist hospitals, and to reimburse costs associated with the provision of facilities in quarantine institutions.

Simultaneously, 1.334.1 million manats were set aside to fund steps to mitigate the effects of the global pandemic on the Republic of Azerbaijan's population, macroeconomic stability, jobs, and economic entities (Information, 2020). On December 31, 2020, President of the Republic of Azerbaijan Ilham Aliyev approved the law of the Republic of Azerbaijan "On the state budget of Azerbaijan for 2021". According to this law, revenues will be 25,427,000 manats in 2021, and expenses will be 28,543,000 manats, with centralized incomes of 24,621,550 manats, local revenues of 805,450 manats, centralized expenses of 27683368.0 thousand manats, and local expenses of 859.632 thousand manats (<https://president.az/articles/49859>). In 2021, the state budget deficit is projected to hit 3116.0 million manats at the most. In 2021, the government's budget deficit is expected to be 4.1 percent of GDP, down 0.6 percentage points from 2020. The oil sector will account for 54% of state budget revenues, while the non-oil sector will account for 46%. (Turan. az). The price of \$ 40 per barrel is used as a price guide in budget estimates for crude (Bayramov, 2021). Expenditures for general public services were determined for AZN 4159765076.0, for defense and national security - AZN 4585806638.0, for the judiciary, law enforcement agencies and the prosecutor's office - AZN 2092827281.0, for education - 3277655549.0 azn, for healthcare - 1409000546 0 azn, 3692746545.0 azn for social protection and social welfare (of which 289724358.0 azn will be spent directly on social protection), 418169237.0 azn for culture, art, information, physical education, 262,848,166.0 azn for housing and communal services, 943035597.0 azn for agriculture, 275 542,039.0 azn for environmental protection, 5947474,995.0 azn for economic activity. The cumulative number of expenditures not mentioned in the main parts would be 1,478,128,331.0 azn. In the state budget for 2021, a new line of spending was introduced: it is intended to ensure a significant return to the territories reclaimed from the occupation to rebuild and repair cities and villages, as well as to build modern infrastructure in these areas. The state budget has set aside 2.2 billion azn for these purposes (<https://president.az/articles/49859>, Ministry of Finance of the Republic of Azerbaijan). In 2021, 61.10 azn of budget expenditures will be spent on current expenses, 29.20 azn on capital expenditures, and 7.70 azn on servicing public debt for every 100 azn of budget expenditures (Turan. az). A comparison of Azerbaijan's budget revenues and expenses per capita with those of its neighbors (Table 1) reveals that it has the lowest financial stability in the country in terms of non-oil budget revenues per capita (Turan. az).

Countries	Budgetary income per capita in US dollars	Budgetary expenditures per capita in US dollars	Defense and security expenditure per capita in US dollars
Azerbaijan	1477	1658	266
Azerbaijan (excluding oil revenues)	676	759	-
Georgia	1135	1309	-
Russia	1752	2005	288
Turkey	1670	2126	372

Table 1: Comparison of Azerbaijan with neighboring countries in terms of budget revenues and expenditures per capita

4. WAYS TO INCREASE THE EFFICIENCY OF RESULT-ORIENTED BUDGETARY EXPENDITURES IN THE REPUBLIC OF AZERBAIJAN

The issue of raising the productivity of public spending in all fields of budgetary operation has been relevant in recent decades. Ordinary savings will not suffice to solve this problem; new budgeting methods and the development of realistic technology for making successful budget decisions are needed.

Many countries around the world use performance-based budgeting - RBB - for this reason, with the target-oriented approach as the primary tool. RBB is a budgeting approach that varies from projected budgeting. It establishes a clear relationship between budget spending and final results when used. "Budgeting ties funds committed to concrete results," according to the Organization for Economic Cooperation and Development (OECD, 2008). The program-target strategy entails developing a program budget to achieve the desired outcome while also assisting in the correct allocation of budget funds (Bayramov, 2020). The phrases "program budgeting" and "performance-based budgeting" are often used interchangeably in the economic literature. This is not entirely valid, in our view, since "performance-based budgeting" is a wider term. It is a planning, budgeting, and budgetary control mechanism that ensures the allocation of budgetary funds based on the social significance of the anticipated and real effects of their use, while also taking into account the goals of state economic policy. The preparation of budget spending, in turn, to provide public goods, may be done using a variety of budgeting approaches. As a result, one of the ways to incorporate a performance-based budgeting framework is to use the program-target approach (Sugarova, 2012). It should be noted that there is no clear answer to the issue of increasing the productivity of government expenditure and, as a result, the optimal position of government spending in the economy. Each country reacts in its unique way, based on its development model. Developing countries are thought to need a "tight fiscal policy," in which the budget deficit causes a "squeezing out impact" of private investment and inflationary pressures in the economy, and therefore cannot be tolerated. However, it is stressed that it is also a method for effectively stimulating an economy that has experienced a downturn in the implementation of traditional Keynesian economic and fiscal policies (Spiegel, 2006, p. 15). The world experience of countries with a developed budget system (the United States, Canada, the United Kingdom, Australia, France, and Sweden) have shown that using the program-target method of budget planning on a large scale increases flexibility in budget resource management, reduces costs and improves the efficiency of public services, and increases transparency and openness of government (Budgeting, 2002). In turn, the OECD countries' experience demonstrates that RBB production occurs very differently in each region, taking into account the specific characteristics of the national economy and the public administration system (OECD, 2008). Economists define four areas for using the program budget based on a review of foreign experience: 1. The program budget facilitates the assessment and comparison of the cost-effectiveness of alternative measures aimed at achieving specific government goals as a tool for policy analysis; 2. The program budget improves the government's work by expanding the operational independence of heads of departments and their structural divisions; 3. The program budget facilitates the assessment and comparison of the cost-effectiveness of alternative measures aimed at achieving specific government goals as a tool for policy analysis (Afanasiev, 2010). The Republic of Azerbaijan's state budget is mostly funded by the oil sector, with contributions from the Oil Fund and tax revenues from the oil industry. Instability in the global economy and dramatic volatility in energy prices (a decline in world oil and natural gas prices below the level set in the country's budget) put the country's macroeconomic targets at risk. This might exacerbate the lack of internal financial capital and make securing foreign financial resources for expected economic growth more difficult. Violations of the budgetary sphere's stability and balance create a gap between the revenue and expenditure sides of the budgetary sphere (Guliyeva, 2020, 2019, 2012). As a consequence of the above, the need to increase the productivity of budget expenses through RBB is becoming more pressing. To accomplish this, we believe it is important to take steps in the following areas: creating a legislative and regulatory framework for the implementation and use of RBB; improving the structure of government by removing duplicative roles of government bodies; improving the standard of financial management; improving the process for managing state property; and establishing a comprehensive system for managing state property; improve the

treasury support process for budget funds; ensure the growth of the contract system in the field of procurement of goods, works, and services for state needs by converting all public procurement into electronic form, ensuring their accountability and transparency; improve the efficiency of the provision of social services; provide advanced training for employees (electronic budget); establish observable metrics for evaluating the effects of budgetary activities; include reviews of budget expenses in the list of key financial documents; change the budget classification to include details on performance; and so on. The experience of other countries indicates that implementing RBB opens up a plethora of possibilities for improving the quality of government spending. In this regard, there are two options for transitioning to RBB at the governmental level in AR: In the first, the transition is carried out in phases (gradually), but simultaneously in all ministries and departments. In the second example, coverage is restricted (optional) to a small number of ministries and departments, with the remaining ones eventually covered. Since BORne is easy, fast, and inexpensive to implement, it necessitates careful planning.

5. CONCLUSION

Finally, it should be remembered that there is currently a structural overhaul of the budgetary mechanism in world practice, and new approaches to budgeting are being implemented. There is no straightforward answer to the question of increasing the productivity of government expenditure and, as a result, the optimal position of government spending in the economy. Each country reacts in its unique way, based on its development model. The use of the program-targeted form of budget planning improves the productivity of budget spending, according to the world experience of countries with a defined budget structure. The Republic of Azerbaijan's state budget is primarily funded by the oil sector. Sharp volatility in energy prices (a drop in world oil and natural gas prices below the level set in the country's budget) put the country's macroeconomic goals at risk. It is important to fully utilize RBB to smooth out the impact of negative factors on the Republic of Azerbaijan's state budget and improve the efficiency of budget expenditures.

AZERBAIJAN HEALTH ECONOMICS IN THE CONTEXT OF DIGITALIZATION OF SOCIETY

Sevda Mamedova

*Azerbaijan State University of Economics (UNEC), Azerbaijan
dr.m.sevda@gmail.com*

ABSTRACT

The digitalization process, covering all spheres and industries, has been actively introduced into healthcare. Health today has become a valuable category, an indicator of the country's economic development, a strategic indicator. From this point of view, the introduction of innovative technologies to improve the health indicators of the population is a necessity. Public health protection is one of the leading components of world development. In this area, the backbone elements of the digital economy find their direct application. The proliferation of artificial intelligence is proceeding at different rates depending on the direction. In healthcare, it used in the analysis of medical data, the selection of therapy, patient control, the preparation of predictive analytics for more effective prevention, improvement of the quality of treatment, rehabilitation, to remind the need to undergo procedures and tests, to warn the patient and his loved ones in critical cases, to stimulate a healthy lifestyle. Digital in medicine and pharmaceuticals has led to a change in consumer behavior associated with an increase in demand for complete and reliable information. The patient is no longer a passive participant in the medical diagnostic process; he becomes active and independent, developing the strategy and tactics of his treatment together with the attending physician. Digital health is delivering good results in terms of quality of care, as well as providing more efficient and convenient services. This is especially important for patients belonging to vulnerable groups of the population. In the context of the coronavirus pandemic, the digitalization process has accelerated at a record pace. The pandemic has forced people to use remote methods of receiving medical care: worldwide, the volume of telemedicine services has increased 15-20 times. Additional attention was drawn to the use of robots, whose activities implied the introduction of 5G (with minimal data transmission delays). The experience of using telemedicine for managing patients during a pandemic increases the investment attractiveness of telemedicine. However, users need to be in control of their data and know who is using it and why to ensure that their data is protected and confidential. It is also very important to unify the information interaction of various information systems and resources.

Keywords: *digitalization of healthcare, medical robots pandemic, telemedicine, pandemic*

1. INTRODUCTION

The digitalization process, covering all spheres and industries, has been actively introduced into healthcare as well. Nowadays, health is a strategic index and an indicator of the country's economic development. From this point of view, it is necessary to introduce innovative technologies to improve the health indicators of the population. Digitalization ensures the availability and high quality of medical services received, contributes to an increase in life expectancy and improves its quality, while significantly rationalizing costs. The importance of digitalization in healthcare was especially pronounced against the backdrop of a pandemic, as a result of which the pace of its implementation had to be increased to the maximum. This made it possible to rapidly spread information, to unite scientists and government agencies in order to develop optimal tactics for the prevention and treatment of the disease. The digitalization of healthcare has covered almost all countries of the world to some degree. The leader among the CIS countries can be called Estonia, where 99% of social spheres are digitalized.

Azerbaijan is a part of an integrated globalizing society and global trends are familiar to us. Since the proclamation of the Azerbaijan Republic as an independent state, the healthcare sector has gone through several stages of reform.

2. REFORMS IN DIGITAL HEALTH SPHERE IN THE AZERBAIJAN REPUBLIC

In 2011, Azerbaijan launched the Health Sector Reform Project (with the support of the World Bank), which included the development of a strategy for the creation of an Integrated Health Information System. It included the following information systems:

- System of electronic medical ID-cards of citizens.
- Information system for management of the hospital.
- The system of infectious diseases.
- The system of the blood bank.
- Hospital activity tracking system (which unites 468 medical organizations, including private ones).
- The system of ambulance operators.
- Personnel management system.
- Register of medical certificates.
- Digital medical journals [2, p. 79].

The e-health portal offers 39 e-services, including 8 services for medical professionals, 15 services for legal entities, and 8 services for the public [3]. In general, the market is occupied by suppliers of Medical Information Systems (MIS) and telemedicine systems. A number of e-health business models have been implemented in the private sector, for example, Mediclab, SOS, Grand City Hospital, and Turkish American Medical Center [2, p. 81]. On October 21, 2005, the introduction of the "Electronic Health Card" was decided by a corresponding decree of the President of Azerbaijan, Ilham Aliyev. On the basis of this decree, "the Rules for the Application of the Electronic Health Card System" were prepared, approved by the decision of the Cabinet of Ministers in 2006. The first owners of electronic health cards were newborns. Hereafter, the system covered all children's medical institutions under the name "Electronic health card for newborns". The main goal in the application of the "Electronic Health Card" system is to improve the monitoring system of the citizens' health through the preparation of appropriate electronic registers and the creation of a bank of operational data on people's health [4]. All data on health (medical history, examinations, treatment, information on medications taken, vaccinations, etc.) are collected at the Center for Health Informatization in the electronic information system "VESKS" ("Electronic Health Card of Citizens") and displayed in the card of each person. The center carries out the necessary changes in medical institutions, conducts training for employees, and provides the necessary technical support. Recently, telemedicine has become widespread, which makes it possible to distantly diagnose, treat and monitor the condition of patients. This becomes especially important in critical situations when a person's life depends on quick and clear decisions. The main areas of telemedicine are the following: telemedicine consultations, tele-education, online broadcasting of operations, remote biomonitoring, home telemedicine. Patients' lack of confidence in the security of their personal information becomes an important problem when receiving such services. In Azerbaijan, the concept of "telemedicine" is a new concept, which was introduced in 2017. The majority of online services include consultations of patients by specialists in the regions. An important direction in digital healthcare is online monitoring of the patient's condition, which allows him to maintain his health outside the medical institution. This is especially useful for elderly or single patients. Changes in indicators initiate patients to call an ambulance and at the same time to relatives. Digitalization in healthcare contributes to the enhancement of the proposed products and their adaptation to the needs of patients.

For instance, in the insurance sector online purchases are growing, as well as purchases through applications. Almost all insurance companies support online insurance through websites and calls. A local insurance company, A-group suggests that “20% of clients submit documents for obtaining insurance compensation online, through the application. According to experts, online purchases of insurance will reach 30-60% of all transactions within 3 years” [6]. Moreover, mobile applications present multiple useful features for patients, such as finding the nearest clinic or pharmacy, choosing the route, finding specialist, evaluating the service of a doctor and the clinic on a five-point based scale, saving test results, application for reimbursement, calculation of the cost of a policy, calling of an ambulance by simply pressing the SOS button (the ambulance will find you by geolocation), turning on a reminder about taking medications, etc. Accumulation of digital data contributes to the emergence of new technologies, particularly, intelligent medical decision support systems, improvement of existing algorithms and protocols. Simultaneously, scientists agree that artificial intelligence is just a tool that doctors can utilize and does not exempt them from any responsibility. Currently, pharmacies are completely digitalized, however, the coverage in hospitals and clinics is not complete. At the same time, the digital literacy of the population could be assessed as low, and relatively, the usage of health cards is low as well. As a matter of fact, the majority of citizens find it difficult to obtain data, even with cards in hand. “National Strategy for the Information Society for 2014-2020” [5], as well as maps for the main sectors of the economy [7] are strategic documents in this area. There is not any specific strategic plan or document for digital health. In general, the studies of the current condition and potential of eHealth of Azerbaijan, Belarus, Georgia, Moldova, and Ukraine under the EU initiative, focused on creating a set of benchmarking indicators reflecting the key benefits of harmonization with EU markets, show that the level of eHealth development in Azerbaijan is approximately 50% of the EU reference level according to the majority of indicators. The smallest gap is noted for the indicator of privacy, awareness, security due to the sufficient clarity of the country's legislative and regulatory environment. The biggest gaps are identified for Big Data and innovation indicators. The country performs slightly better than the region according to most indicators. The eHealth marketplace is open to all local and international vendors which have a significant impact on the sector (e.g. Siemens, GE). In general, the market is occupied by suppliers of Medical Information Systems (MIS) and telemedicine systems. The private sector has implemented a number of eHealth business models such as Medclub, SOS, Grand City Hospital, and Turkish American Medical Center [1, p. 71]. Contemporaneously, the transition to digital health care is becoming especially significant and even necessary according to the transition to compulsory health insurance in the country. Digitalization will make it possible to use the available funds more efficiently and effectively, improve the quality of treatment, and create new incentives for workers and patients. Therefore, according to the Minister of Health of Azerbaijan Republic, “the creation of a continuous e-infrastructure of health care will save 60 Million AZN of budgetary funds in 2020, or 7% of budgetary spending on health care” [1].

3. DIGITAL HEALTH CHALLENGES AND RISKS

Introducing revisions to the number and qualifications of workers. Healthcare facilities can invest large resources in digital health but cannot fully exploit its benefits if they do not adapt other systems and processes. There are fears that telemedicine will reduce the number of healthcare workers in the industry. However, British researchers have calculated that a one-time reduction in medical personnel in the context of the development of digital health will give a twofold increase in IT specialists and engineers who come into the industry to solve problems not directly related to medicine. In addition, the introduction of innovations requires a detailed analysis, as it is a serious financial investment.

On the other hand, innovation in healthcare and other areas is not the same thing.

In terms of intervention in the long term, the results of which can manifest themselves in the long term. However, there is another important aspect of digital health capabilities related to privacy. The problem of obtaining clean and complete datasets must be resolved; Likewise, privacy issues in the collection and storage of data and issues related to patient consent also require rigorous requirements. Whereas earlier data were stored in strictly defined in regulated health registers in hospitals or in the archives of doctors, that now access to this information is possible via the Internet, smartphones, which makes their security vulnerable. Also, the presence of centralized data makes it possible to obtain very serious information not only about one patient, to use it, but also about groups of the population, the whole population. Data and device regulations are gaining in importance. For example, within the Commission on the UN System of at least different types of normal bodies, the regulatory domain of digital health is:

- 1) Data-management including data-protection and quality regulations, standards and governance mechanisms - collectively ensure the safe and ethical collection, use and sharing of digital health data
- 2) Medical-device regulations- approval and use of safe, cost-effective and highquality – but also highly diverse – digital health solutions.
- 3) Regulations governing the delivery of medical care - enables medical practices to be supported and enhanced by digital health solutions [8].

4. CONCLUSION

Thereby, the main prospects of healthcare digitalization are the following:

- ensuring the transparency of the healthcare system, reducing the level of corruption and medical errors;
- promoting coordination and continuity in treatment, improving the quality of treatment;
- implementation of the correct separation of patient flows;
- increasing the productivity of medical workers;
- minimization of temporary losses;
- creation of a unified information space and a wide database;
- reducing the number of duplications;
- increasing the responsibility of the population to their own health care;
- increased competition in the field;
- making comprehensive and objective monitoring of the activities of doctors;
- increasing confidence in the health care system;
- increasing the activity of the population in managing their own health;
- development of new improved standards based on the existing base, as well as the introduction of artificial intelligence in the process of diagnosis and treatment;
- increasing motivation of health workers;
- more efficient use of limited health care resources.
- At the same time, the digitalization of healthcare is associated with a number of problems:
- like any innovation, it requires significant financial resources;
- lack of necessary personnel;
- possible increase in unemployment;
- hacking of information systems, programs, cyber fraud;
- technological problems.

ECONOMIC PROSPECTS FOR THE GROWTH OF AZERBAIJAN NON-OIL SECTOR IN THE LIBERATED TERRITORIES OF THE REPUBLIC

Shafa Guliyeva

Azerbaijan State University of Economics (UNEC), Azerbaijan

Shafa_Guliyeva@unec.edu.az

ABSTRACT

For nearly 30 years, Armenians controlled 20% of the Republic of Azerbaijan's territory (Nagorno-Karabakh and neighboring regions). Azerbaijan was able to regain its territorial integrity by military means in the fall of 2020. The economic value of restoring Azerbaijan's territorial integrity cannot be overstated. Azerbaijan's economy suffered tremendously as a result of the occupation. For several years, this nation has been refused access to the wealth found in these territories. By restoring territorial integrity, Azerbaijan will be able to completely exploit the region's economic potential in the production of these tools. Management, defense, infrastructure, social services, and economic growth are all part of the process of restoring and developing the liberated territories. The most important contribution of the liberated territories to the growth of the economy of the Republic of Azerbaijan, in our view, can be made primarily through the development of agricultural product production and processing, as well as the development of specialized tourism. Agricultural production is crucial for the country's food self-sufficiency and diversification of exports. Domestic tourism growth has the potential to become a vital link in the Republic of Azerbaijan's long-term economic development. The Republic of Azerbaijan is well-known for its ample fuel and energy resources. High prices for fuel and energy services have been an impetus for the republic's economic growth in recent years. However, considering the high instability of fuel prices, this situation poses a significant threat to the economy's stability. The acceleration of the economy's non-oil and gas sector's rate of growth is especially significant in this regard. The liberated territories' economic contribution will be critical to Azerbaijan's long-term economic growth, especially in the non-oil field.

Keywords: *Republic of Azerbaijan, the economic potential of the region, the development of agricultural production, specialised tourism, the non-oil sector*

1. INTRODUCTION

The Republic of Azerbaijan (AR) is a sovereign state whose territory (Karabakh and neighboring regions) was occupied by the Armenians for nearly 30 years. Azerbaijan was only able to liberate over 300 settlements from occupation and reclaim its natural resource-rich lands as a result of a successful war. Gold, copper, mercury, semi-precious stones, marble-tuff, mineral waters, medicinal mud, and other deposits can be found in the liberated territories. Before the occupation, over 700,000 Azerbaijanis lived in seven regions around Nagorno-Karabakh, who became refugees in their own country and had their homes erased from the face of the earth. According to official records, 700 historical and cultural monuments, 927 libraries, 808 cultural centers, 85 music and art colleges, 22 museums with more than 100,000 objects, four art galleries, four theaters, and two concert halls were built during the occupation [1]. The President of Azerbaijan, Ilham Aliyev, has announced that whatever the cost to the country, everything that has been lost will be restored. Azerbaijan has already built a master plan for the rehabilitation of all cities that have been liberated from the occupation, as well as major infrastructure projects.

2. MEASURES AIMED AT REDUCING THE DEPENDENCE OF THE ECONOMY ON OIL AND GAS SECTOR OF THE REPUBLIC OF AZERBAIJAN

The liberated territories have a lot of economic potential in addition to historical and cultural significance. And the new economic value generated by incorporating these territories into the country's economy will far outweigh any financial costs that the Azerbaijani government has borne and will continue to bear without hesitation or financial strain. It is expected to carry out activities in four stages to ensure an integrated approach to the reconstruction and growth of occupied territories. The first stage entails resolving issues of management and stability, as well as infrastructure; subsequent stages entail resolving issues of social services, as well as economic recovery and growth [2]. The building of the Fizuli-Shusha highway was the first project initiated in the liberated territories. The President of Azerbaijan, Ilham Aliyev, laid the "first stone" at the beginning of this initiative. He also mentioned connecting Nakhchivan with the rest of the country as a priority task (the Nakhchivan Autonomous Republic, which is part of the AR, was cut off from the rest of the country during the occupation). For the return of Azerbaijani refugees to their homeland, residential homes, schools, hospitals, administrative buildings, and modern infrastructure will be constructed soon. As a result, after restoration, the formerly occupied territories will be able to contribute significantly to the country's economic growth. Since the Republic of Azerbaijan is rich in fuel and energy resources, mineral fuel, lubricants, and related materials accounted for 90.7 percent of its exports in 2019, a decrease of 1.1 percent from 2018, but an increase of 0.7 percent over the previous five years [3]. Given that fuel prices are subject to significant volatility and are dependent on the global climate (as was the case during the COVID-19 pandemic), this situation poses a serious challenge to the economy's stability. High prices for fuel and energy services have been a driving force behind Azerbaijan's economic growth in recent years, but like the real world shows, this cannot continue indefinitely. The acceleration of the economy's non-oil and gas sector's rate of growth is particularly important in this regard. Because of the decrease in oil prices, the country recorded a gross domestic product of 72.432.2 million manats in 2020, which is down 4.3 percent from the previous year. The economy's non-oil and gas sector added value decreased by 2.6 percent, while the oil and gas sector added value by 7.0 percent [4]. Figure 1 depicts the growth rates of Azerbaijan's GDP overall, GDP from the oil and gas sector, and GDP from the non-oil and gas sector from 2001 to 2019. (5), (6) The graph demonstrates Azerbaijan's GDP's dependency on oil price fluctuations. For the studied period, the highest growth in the oil and gas sector occurred in 2005 and 2006, when oil prices were at their highest.

Figure following on the next page

Figure 1: Growth rates of Azerbaijan's GDP, as a percentage of the previous year

Several years ago, the President and Government of the Republic of Azerbaijan took a range of steps aimed at stabilizing the economy to minimize reliance on the oil and gas industry. For example, the development concept "Azerbaijan 2020: a look into the future" is based on an export-oriented economic model, to raise competitiveness and improve the economy's structure to boost non-oil export growth [7]. The President of the Republic of Azerbaijan Ilham Aliyev accepted the Road Map of the National Economy and its Main Industries on December 6, 2016, to grow export potential [8]. The roadmap includes the following strategic roadmaps: the development of the Republic of Azerbaijan's national economy; the development of the oil and gas industry (including chemical products); the production and processing of agricultural products; the production of consumer goods at the small and medium-sized enterprise level; and the development of heavy industry and mechanical engineering; logistics and trade development; affordable housing development; technical education and training development; financial services development; telecommunications and information technology development; utility development (electricity and heat energy, water and gas) development [8].

3. THE MAIN DIRECTIONS OF THE CONTRIBUTION OF THE LIBERATED TERRITORIES TO THE ECONOMY OF THE REPUBLIC OF AZERBAIJAN

Out of all the strategic road maps, we believe that the territories reclaimed from occupation shortly will contribute the most to the country's economy by 1. developing agricultural production and processing, and 2. developing specialized tourism industry. Agriculture, forestry, and fisheries will account for 6.9% of GDP in 2020 [4]. Agriculture, forestry, and fishing's share of GDP (along with other sectors) have changed dramatically since independence: from 26.50 percent of value-added in 1990 to 5.72 percent in 2019. From 1990 to 2019, the highest share of agriculture, forestry, and fishing was 45 percent in 1994, and the lowest was 7.09 percent in 2006 [9]. This share is likely to rise as agriculture develops in the liberated territories (where animal husbandry, plant growing, horticulture, and fruit growing, among other things). The fact that the President of Azerbaijan, Ilham Aliyev, ordered the autumn sowing to be carried out in these territories confirms this possibility. As a result, the Roadmap's goal of a substantial increase in the share of agricultural products by 2025 will be reached [8].

The Indices of the amount of agricultural production in Azerbaijan for 2000-2019 [10] are shown in fig. 2. As can be seen in this graph, agricultural production in the AR is inconsistent, which can be attributed to a variety of risks (technogenic, natural, etc.) that must be effectively managed for the industry to achieve financial stability [11].

Figure 2: Indices of the volume of agricultural production of the AR (in constant prices), 2000-2019 (in% to the corresponding period of the previous year)

Well-developed agriculture allows for the processing of a wide range of foods. This is particularly important for the country's food self-sufficiency and diversification of exports. Many countries have started to work in this direction as a result of the COVID-19 pandemic. Due to the need for the country's self-sufficiency in food, the issue of developing agriculture in the territories liberated from the occupation is undoubtedly topical. For the growth of the tourism sector, Azerbaijan has a rich cultural, historical, and natural heritage. Travel and tourism contributed 7.2 percent of Azerbaijan's GDP in 2019 [12], but the COVID-19 pandemic caused a significant drop in this sector. According to Azerbaijan's State Border Service, the country received 720.3 thousand foreigners and stateless persons from 155 countries between January and October 2020, which is 3.7 times less than the same timeframe in 2019 [13]. Before the pandemic, the country's tourism growth was mainly focused on foreign tourism, even though the country has a range of favorable conditions for domestic tourism development. Azerbaijan's tourist resources contribute to the growth of virtually all major types of tourism, even in the liberated territories. As a result, domestic tourism growth has the potential to become a critical link in both the overall and non-oil and gas sectors of the Azerbaijani economy. To boost the growth of domestic tourism, new tourist routes covering a wide range of topics must be created. The key subject in the liberated territories should be the Armenian occupation. The importance of this subject is supported by Azerbaijani President Ilham Aliyev's view. "When rebuilding cities, each of them should have lost places so that no one forgets this," he says. Along with memorial complexes and monuments commemorating our victory, occupation museums should be built... These museums should portray a wide image of Armenia's occupation policy. At the same time, each city and area should be portrayed separately there, so that Azerbaijanis will never forget, and visitors from other countries will see which barbarians we fought against, and from what catastrophe we saved our lands and the South Caucasus" [2]. The need to grow business tourism - the so-called MICE industry (Meetings Initiatives Exhibition): business meetings, gatherings, conferences, exhibits, and so on - should be considered in this context. The creation of MICE to establish conditions for a direct demonstration of the effects of the Armenian occupation on the international community. Already, many people, including Azerbaijanis and foreign visitors, want to visit the liberated territories and learn about the current situation there. Rural tourism can play a unique role in the growth of tourism in the liberated territories.

Here, ethnographic tourist villages based on the Asian model "National Village" can be created, complete with a way of life, folklore, and historical sites unique to Azerbaijan. Since the liberated territories have mineral water and medicinal mud, the growth of medical and health tourism cannot be overlooked. The construction of health resorts (spa centers) would enable the growth of tourism throughout the year.

4. CONCLUSION

The reconstruction of the territories liberated from Armenian occupation would necessitate significant financial resources, but it will undoubtedly be accomplished. Along with the allocation of funds from the Republic of Azerbaijan's state budget, funds for the reconstruction of Karabakh and adjacent regions have been created, and Armenia will be kept financially responsible for anything that is lost, destroyed, or plundered in Karabakh and the surrounding regions. Azerbaijan has already begun the process of filing a claim in international courts. It should also be noted that the International Monetary Fund and the World Bank forecasted a 1.7-2 percent increase in RA GDP in 2021, but AR's macroeconomic indicators for 2021 were developed with the following consideration: "large-scale restoration work in the liberated territories would become a driver for the non-oil sector and the economy as a whole, and thus for AR's macroeconomic indicators for 2021." Simultaneously, budget revenues are estimated using a conservative estimation of AzeriLight oil's average annual price of \$ 40 per barrel, but oil is becoming more expensive: on February 6, 2021, it was \$ 60.51 per barrel [14]. If this trend continues, Azerbaijan's budget revenues will grow, and the country will be able to speed up the reconstruction of Karabakh and adjacent regions, with the restored territories playing an important role in the country's institutional transformation and long-term growth.

DINAMIC MODEL OF GROSS DOMESTIC PRODUCT TWO CONTROLS

Shafizade Elnure

Azerbaijan State University of Economics (UNEC)

Baku, Istiqlaliyyat str.6, AZ1001, Azerbaijan

elnure_sh@unec.edu.az

ABSTRACT

One of the indicators of the country's economic growth is the gross domestic product (GDP), and one of the factors of economic growth is capital. The main criteria and source of economic development is economic growth. Economic growth is a sustainable increasing tendency of the main indicators of national theory production (GDP, GNI). Furthermore, absolute value and growth per capita are also considered. In economic and statistics, various indicators are used to measure the volume of national production. The most important of these is gross domestic product (GDP). GDP is expressed by monetary unit of the final products and services produced in the economy. Here should be taken into account the fact that GDP comprises final products and services produced within the particular country. In this work, was created the dynamic model that demonstrates the dependence of GDP on investments and oil price in case of Azerbaijan economy. This approach provides an opportunity for strategic planning of GDP for the country. In this work, to achieve the desired level of GDP, the volume of investment and oil price are used as the independent variable in the dynamic model. But as indicated above, many other factors affect GDP. We chose two of them: the amount of investment and oil price. But even so, the dynamic model of the optimal GDP trajectory yielded good results. Further research will take into account the other most influential factors on GDP. In this case, a dynamic model of the optimal trajectory of GDP will give even more adequate results.

Keywords: *macroeconomics, gross domestic product, investments, dynamic model, model of the optimal trajectory of GDP*

1. INTRODUCTION

The main criteria and source of economic development is economic growth. Economic growth is a solid stimulant for the growth of the main indicators of national production (GDP, GNI). Furthermore, Absolute value and growth per capita is also kept in mind. In economic theory and statistics, various indicators are used to measure the volume of national production. The most important of these is gross domestic product (GDP) [4, 6]. GDP is an expression in monetary unit of the final products and services produced in the economy. This refers to the final products and services produced within the borders of a particular country. Three main methods are used to calculate GDP:

- Added value method (method of production). With this method GDP is determined by the sum of added values on the cost, wages and income generated in the production process and characterized by the actual share in the final product in this enterprise for all sectors and types of production.
- By expenses. Using this method, the volume of GDP is calculated as the sum of all expenses in society (daily expenses of the population, investments of producers, expenses of the government on goods and services), net exports (balance of imports and exports of the country);
- Calculation of GDP by income - the total amount of all income in the company (excluding the wages of workers being paid from the state budget, as long as their wages are paid from the state budget), property income, income, interest on capital, depreciation, rent payments.

There are objective and subjective factors of economic growth. Objective factors are factors that directly and finally affect the rate of economic growth. Subjective factors are indirect factors affecting the scale and pace of economic growth. The objective factors of economic growth are the following:

- increase in the volume and quality of fixed capital;
- changes in production technologies;
- increase in the volume of economic resources;
- increase in entrepreneurial activity of the population;
- increase in the quantity and quality of labor resources;
- Activization of the needs of the population, leading to increase in production volumes.

Subjective factors of economic growth are the following:

- expansion of the credit system. Since, the activation of this system allows the population to consume as much as possible. This, in turn, stimulates production.
- Reduction of monopoly in the markets for products and services. This, in turn, activates entrepreneurial activity;
- Reducing the cost of production resources. This process increases production and prices. This in turn allows for growing demand.
- Tax cuts. Tax cuts lead to an increase in overall economic activity.

At the present stage of economic development, economic growth affects the following factors:

- Natural resources directly affect economic growth. The value of these resources is growing every day, since resource resources are limited;
- Population growth, increase in labor resources;
- increase in capital within the borders of the country. The increase in capital creates opportunities for increasing production and scale, conducting new scientific and technical research and investing in human resources;
- scientific and technological progress, which is the basis of economic growth, as scientific and technological progress contributes to the transition of the quality of economic development to a new level.

The relationship between economic growth factors within the national economy is becoming more complicated. In such a situation, the main goal of the state is the effective use of existing economic factors to promote economic growth to benefit the general populace [9]. As mentioned above, many other factors affect GDP. We chose two of them: the amount of investment and oil price. Such as, the main part of GDP consists of revenue from oil-gas industry in case of Azerbaijan [3]. One of the indicators of a country's economic growth is gross domestic product (GDP), and one of the factors of economic growth is capital. In this work, we will build a dynamic model that demonstrates the dependence of GDP on investment in the country's economy and oil price.

2. THE DINAMIC MODEL OF GDP WITH TWO CONTROLS

Consider the following task: how much investment and oil price should be in a certain year to achieve the desired level of GDP after a certain period of time?

To do this, consider the following task:

$$J = \sum_{i=0}^N (x_{des i} - x_i)^2 + \sum_{i=0}^{N-1} (u_{1i}^2 + u_{2i}^2) \rightarrow \min \quad (1)$$

$$x_{i+1} = Fx_i + G_1u_{1i} + G_2u_{2i} + v, i = \overline{0, n-1} \quad (2)$$

$$x(0) = x_0 \quad (3)$$

Here,

x_i is the amount of GDP in the i -th year;

$x_{des\ i}$ -the desired amount of GDP in the i -th year;

u_{1i} is the amount of investment in the i -th year;

u_{2i} -the oil price in the i -th year;

F, G_1, G_2, v -are defined numbers.

Suppose $x_{des\ i} = 0$ for $i = \overline{0, N-1}$ and $x_{des\ N} = x_{des}$. Then formula (1) can be written as following form:

$$J = (x_{des} - x_N)^2 + \sum_{i=0}^{N-1} (x_i^2 + u_{1i}^2 + u_{2i}^2) \rightarrow \min \quad (4)$$

The functional (4) can be written in general form as following:

$$J = \frac{1}{2}q(x_{des} - x_N)^2 + \frac{1}{2} \sum_{i=0}^{N-1} (k_0x_i^2 + k_1u_{1i}^2 + k_2u_{2i}^2) \rightarrow \min \quad (5)$$

$$x_{i+1} = Fx_i + G_1u_{1i} + G_2u_{2i} + v, i = \overline{0, n-1} \quad (6)$$

$$x(0) = x_0 \quad (7)$$

Here, $q > 0, k_0 \leq 0; k_1, k_2 > 0$ are coefficients, F, G_1, G_2, v was defined with least square method, and N is the number of years. For this, we construct an extended criterion of quality \bar{J} [1,2,4,6-8]. To do this, we add systems of equations with coefficients $\lambda(i)$ [1, 7] to function J :

$$\begin{aligned} \bar{J} = & \frac{1}{2}q(x_{des} - x_N)^2 \\ & + \sum_{i=0}^{N-1} \left[\frac{1}{2}(k_0x_i^2 + k_1u_{1i}^2 + k_2u_{2i}^2) \right. \\ & \left. + \lambda_{i+1}(Fx_i + G_1u_{1i} + G_2u_{2i} + v - x_{i+1}) \right] \quad (8) \end{aligned}$$

We use the following notation:

$$\Phi(x(N)) = \frac{1}{2}q(x_{des} - x_N)^2$$

$$H^i = \frac{1}{2}(k_0x_i^2 + k_1u_{1i}^2 + k_2u_{2i}^2) + \lambda_{i+1}(Fx_i + G_1u_{1i} + G_2u_{2i} + v)$$

We can rewrite (8) as such:

$$\bar{J} = \frac{1}{2}q(x_{des} - x_N)^2 - \lambda_N x_N + \sum_{i=1}^{N-1} \left[\frac{1}{2}(k_0 x_i^2 + k_1 u_{1i}^2 + k_2 u_{2i}^2) + \lambda_{i+1}(F x_i + G_1 u_{1i} + G_2 u_{2i} + v) - \lambda_i x_i \right] + H^0$$

We get the following problem:

$$\bar{J} = \frac{1}{2}q(x_{des} - x_N)^2 - \lambda_N x_N + \sum_{i=1}^{N-1} \left[\frac{1}{2}(k_0 x_i^2 + k_1 u_{1i}^2 + k_2 u_{2i}^2) + \lambda_{i+1}(F x_i + G_1 u_{1i} + G_2 u_{2i} + v) - \lambda_i x_i \right] + H^0 \rightarrow \min \tag{9}$$

$$x_{i+1} = F x_i + G_1 u_{1i} + G_2 u_{2i} + v, i = \overline{0, n-1} \tag{10}$$

$$x(0) = x_0 \tag{11}$$

To solve the problems (9)-(11), i.e. to find the values $\lambda_i, (i = \overline{0, n+1})$, $u_{ji}, (i = \overline{0, n-1}, j = \overline{1,2})$ and $x_i, (i = \overline{0, n})$, we need to solve the following system of equations [2]:

$$\frac{\partial H^i}{\partial x_i} = \lambda_i \tag{12}$$

$$\frac{\partial H^i}{\partial u_{ji}} = 0 \quad j = \overline{1,2} \tag{13}$$

$$\frac{\partial \Phi}{\partial x_N} = \lambda_N \tag{14}$$

From this we obtain:

$$\lambda_i = k_0 x_i + \lambda_{i+1} F \tag{15}$$

$$0 = k_1 u_{1i} + \lambda_{i+1} G_1 \tag{16}$$

$$0 = k_2 u_{2i} + \lambda_{i+1} G_2 \tag{17}$$

$$\lambda_N = q(x_N - x_{des}) \tag{18}$$

$$x_{i+1} = F x_i + G_1 u_{1i} + G_2 u_{2i} + v \tag{19}$$

And from (16) and (17) we find:

$$u_{1i} = -\lambda_{i+1} G_1 k_1^{-1} \tag{20}$$

$$u_{2i} = -\lambda_{i+1}G_2k_2^{-1} \quad (21)$$

Using (19) and (20) in equation systems (15)-(18) we obtain,

$$x_{i+1} = Fx_i + G_1u_{1i} + G_2u_{2i} + v \quad i = \overline{0, n-1} \quad (22)$$

$$\lambda_i = k_0x_i + \lambda_{i+1}F \quad (23)$$

$$u_{1i} = -\lambda_{i+1}G_1k_1^{-1} \quad (24)$$

$$u_{2i} = -\lambda_{i+1}G_2k_2^{-1} \quad (25)$$

$$\lambda_N = q(x_N - x_{des}) \quad (26)$$

Using (24) and (25) in (22) we obtain:

$$x_{i+1} = Fx_i - \lambda_{i+1}G_1^2k_1^{-1} - \lambda_{i+1}G_2^2k_2^{-1} + v, i = \overline{0, n-1}$$

In (23) we do the following conversion:

$$F\lambda_{i+1} = -k_1x_i + \lambda_i$$

Based on these transformations, we obtain the following system of equations:

$$\begin{cases} x_{i+1} = Fx_i - \lambda_{i+1}G_1^2k_1^{-1} - \lambda_{i+1}G_2^2k_2^{-1} + v, i = \overline{0, n-1} \\ F\lambda_{i+1} = -k_1x_i + \lambda_i \end{cases} \quad (27)$$

Here we find:

$$\begin{cases} x_{i+1} + \lambda_{i+1}(G_1^2k_1^{-1} + G_2^2k_2^{-1}) = Fx_i + v, i = \overline{0, n-1} \\ F\lambda_{i+1} = -k_0x_i + \lambda_i \end{cases} \quad (31)$$

We write the final system in form of matrices:

$$\begin{bmatrix} E & G_1^2k_1^{-1} + G_2^2k_2^{-1} \\ 0 & F \end{bmatrix} \begin{bmatrix} x_{i+1} \\ \lambda_{i+1} \end{bmatrix} = \begin{bmatrix} F & 0 \\ -k_0 & E \end{bmatrix} \begin{bmatrix} x_i \\ \lambda_i \end{bmatrix} + \begin{bmatrix} v \\ 0 \end{bmatrix}.$$

From this we get x_{i+1} and λ_{i+1} :

$$\begin{bmatrix} x_{i+1} \\ \lambda_{i+1} \end{bmatrix} = \begin{bmatrix} E & G_1^2k_1^{-1} + G_2^2k_2^{-1} \\ 0 & F \end{bmatrix}^{-1} \begin{bmatrix} F & 0 \\ -k_0 & E \end{bmatrix} \begin{bmatrix} x_i \\ \lambda_i \end{bmatrix} + \begin{bmatrix} E & G_1^2k_1^{-1} + G_2^2k_2^{-1} \\ 0 & F \end{bmatrix}^{-1} \begin{bmatrix} v \\ 0 \end{bmatrix} \quad (33)$$

Then, from (33) we obtain:

$$\begin{bmatrix} x_{i+1} \\ \lambda_{i+1} \end{bmatrix} = \begin{bmatrix} F + k_0 * (G_1^2k_1^{-1} + G_2^2k_2^{-1}) * F^{-1} & -(G_1^2k_1^{-1} + G_2^2k_2^{-1}) \\ -F^{-1}k_0 & F^{-1} \end{bmatrix} \begin{bmatrix} x_i \\ \lambda_i \end{bmatrix} + \begin{bmatrix} v \\ 0 \end{bmatrix} \quad (34)$$

We introduce the following notation:

$$B = \begin{bmatrix} F + k_0 * (G_1^2 k_1^{-1} + G_2^2 k_2^{-1}) * F^{-1} & -(G_1^2 k_1^{-1} + G_2^2 k_2^{-1}) \\ -F^{-1} k_0 & F^{-1} \end{bmatrix}$$

Then, (34) can be written as such:

$$\begin{bmatrix} x_{i+1} \\ \lambda_{i+1} \end{bmatrix} = B \begin{bmatrix} x_i \\ \lambda_i \end{bmatrix} + \begin{bmatrix} v \\ 0 \end{bmatrix} \quad (35)$$

Then:

$$\begin{aligned} \begin{bmatrix} x_{i+2} \\ \lambda_{i+2} \end{bmatrix} &= B \begin{bmatrix} x_{i+1} \\ \lambda_{i+1} \end{bmatrix} + \begin{bmatrix} v \\ 0 \end{bmatrix} = B^2 \begin{bmatrix} x_i \\ \lambda_i \end{bmatrix} + B \begin{bmatrix} v \\ 0 \end{bmatrix} + \begin{bmatrix} v \\ 0 \end{bmatrix} \\ \begin{bmatrix} x_{i+3} \\ \lambda_{i+3} \end{bmatrix} &= B \begin{bmatrix} x_{i+2} \\ \lambda_{i+2} \end{bmatrix} + \begin{bmatrix} v \\ 0 \end{bmatrix} = B^3 \begin{bmatrix} x_i \\ \lambda_i \end{bmatrix} + (B^2 + B + B^0) \begin{bmatrix} v \\ 0 \end{bmatrix} \end{aligned}$$

From here we can simply write:

$$\begin{bmatrix} x_{i+k} \\ \lambda_{i+k} \end{bmatrix} = B^k \begin{bmatrix} x_i \\ \lambda_i \end{bmatrix} + (B^{k-1} + B^{k-2} + \dots + B + B^0) \begin{bmatrix} v \\ 0 \end{bmatrix} \quad (36)$$

And so, (36) can be written in the following form:

$$\begin{bmatrix} x_N \\ \lambda_N \end{bmatrix} = B^N \begin{bmatrix} x_0 \\ \lambda_0 \end{bmatrix} + (B^{N-1} + B^{N-2} + \dots + B + B^0) \begin{bmatrix} v \\ 0 \end{bmatrix} \quad (37)$$

We introduce the next notation:

$$\begin{aligned} B^N &= \begin{bmatrix} b_{11} & b_{12} \\ b_{21} & b_{22} \end{bmatrix}, \\ \begin{bmatrix} f_1 \\ f_2 \end{bmatrix} &= (B^{N-1} + B^{N-2} + \dots + B + B^0) \begin{bmatrix} v \\ 0 \end{bmatrix} \end{aligned} \quad (38)$$

So, (37) can be written as:

$$\begin{bmatrix} x_N \\ \lambda_N \end{bmatrix} = \begin{bmatrix} b_{11} & b_{12} \\ b_{21} & b_{22} \end{bmatrix} \begin{bmatrix} x_0 \\ \lambda_0 \end{bmatrix} + \begin{bmatrix} f_1 \\ f_2 \end{bmatrix} \quad (39)$$

From this we get:

$$\begin{cases} x_N = b_{11}x_0 + b_{12}\lambda_0 + f_1 \\ \lambda_N = b_{21}x_0 + b_{22}\lambda_0 + f_2 \end{cases} \quad (40)$$

If we add condition (26) here, we obtain the following system of equations:

$$\begin{cases} x_N = b_{11}x_0 + b_{12}\lambda_0 + f_1 & (41) \end{cases}$$

$$\begin{cases} \lambda_N = b_{21}x_0 + b_{22}\lambda_0 + f_2 & (42) \end{cases}$$

$$\begin{cases} \lambda_N = q(x_N - x_{des}) & (43) \end{cases}$$

The values of f_1 and f_2 are defined from (38). Considering (41) and (43) in (42) we get:

$$\lambda_0 = (b_{22} - qb_{12})^{-1}(x_0(qb_{11} - b_{21}) - (qf_1 - f_2) - qx_{des}) \quad (44)$$

x_0 is given to us as an initial condition, and λ_0 can be calculated from (53). Using this, we can calculate $\lambda_i, (i = \overline{0, n+1})$, $u_i, (i = \overline{0, n-1})$ and $x_i, (i = \overline{0, n})$. Values of $\lambda_i, (i = \overline{0, n+1})$ and $x_i, (i = \overline{0, n})$ can be calculated from expression (23), and $u_{ji}, (i = \overline{0, n-1}, j = \overline{1,2})$ from expression (24) and (25).

This approach was applied for Azerbaijan based on statistical data (Table 1):

Year	GDP (mln. US)	Industry Investment (mln. US)	Oil price (Azerilight US)
2006	20983.00	4931.15	65.9868
2007	33050.30	5431.21	73.38
2008	48852.50	5304.62	98.73
2009	44297.00	4015.69	62.87
2010	52909.30	5359.07	81.2997

Table 2: Model values of GDP, investment on industry and oil price in case of Azerbaijan

A visual comparison of the model GDP values and statistic GDP values to achieve the desired level is given in Figure 1.

Figure 1: Comparison of model values (red line) and statistical values of GDP (blue line) in case of Azerbaijan

3. CONCLUSION

This approach provides an opportunity for strategic planning of GDP for the country. In this work, to achieve the desired level of GDP, the volume of investment and oil price are used as the independent variable in the dynamic model. But as indicated above, many other factors affect GDP. Such as, the main part of GDP consists of revenue from oil-gas industry in case of Azerbaijan. We chose two of them: the amount of investment and oil price. But even so, the dynamic model of the optimal GDP trajectory yielded good results (see Table 2 and Figure 1).

Further research will take into account the other most influential factors on GDP. In this case, a dynamic model of the optimal trajectory of GDP will give even more adequate results. Many parameters of the incoming model are approximate. Therefore, in the future, work can be developed with fluctuations in parameters - in other words, the study of stability with respect to the change in error (see [4]). Another direction for research is the application of pattern recognition methods with predetermined threshold numbers. In this case, the classification problem is obtained (see [9]).

IMPROVING STATE SUPPORT FOR THE DEVELOPMENT OF THE COTTON SECTOR IN AZERBAIJAN

Tagiyeva Leyla

*Azerbaijan State Economic University, Azerbaijan
leyla.tagiyeva.80@mail.ru*

ABSTRACT

After the privatization of agricultural lands, the development of cotton growing was neglected, cotton-related sectors declined, and competitiveness in this area almost completely fell down. The role of the cotton complex in the economy of our country, the wide opportunities in the value chain are explained in the economic literature. Taking into account the needs and requirements for agricultural products in the natural and climatic conditions of Azerbaijan, high-yield cotton production has been identified on up to 100,000 hectares. However, the stimulation of raw cotton production at the expense of the budget causes farmers to show interest in the field. In this regard, the article emphasizes the importance of stimulating the development of the cotton industry and increasing the competitiveness of products in the value chain in the domestic and foreign markets for the national economic interests of the country and the need to improve state support in this area. Improving state support can stimulate the development of the cotton sector, lay the foundation for the sustainable development of light industry, one of the most important sectors of the non-oil sector of the economy, and help increase the level of development. It should be noted that the problem of further development and competitiveness of the cotton complex, increasing the economic efficiency of the sector is complex and multifaceted, which requires a comprehensive study of organizational and economic issues of dynamic development of its raw material base, improvement of cross-sectoral economic bases and mechanisms, while also making it necessary to improve state support. In other words, the article analyzes and recommends to improve the support for the development of intersectoral relations, to stimulate the production of raw cotton not by budget funds, but by revenues from the production of value chains, and to improve state support in this direction. At the same time, the article aims to improve state support, improve the integrated cotton complex products and integration processes of technological processes in the country from raw cotton production, primary processing, fiber to the final product of the value chain and focus on some kind of protection of the primary source, i.e. raw cotton producer.

Keywords: *agriculture, cotton growing, state support, stimulation, income growth, and development*

1. INTRODUCTION

Relevant reforms are being carried out for the development of the agrarian sector, noting that the role of the agrarian sector in the economy of each country is of special importance, both in a market economy and in a planned economy. All over the world, agriculture is not only a sector that meets the needs of the population and industry in food and raw materials, but also a strategically important sector that ensures the country's food security and protects the country from economic pressures. From this point of view, the agrarian policy aimed at increasing the production of agricultural products is one of the foundations of the normal existence and progress of society. Therefore, supporting the development of the agricultural sector and production is the most important task of the state's economic policy. The implementation of agrarian reforms in Azerbaijan, the orientation of the country's economy in accordance with the conditions of a market economy has led to the emergence of new forms of economy and their regulatory framework. According to our research, although some progress has been made in the agricultural sector, the development of agriculture is below potential and the economic

efficiency is not so high. As a result, the interest of villagers, especially the younger generation, in agriculture is declining. One of the main reasons is the sharp difference in incomes between urban and rural areas, the existing socio-economic infrastructure does not meet modern requirements, the cause of low employment and so on. Apparently, there are many reasons, and farmers do not have the opportunity to overcome these difficulties (causes) on their own. In fact, the main causes do not depend on them. It should be noted that the leading role of state regulation in the development of rural infrastructure, research and design, education and training, information and consulting support, development of agricultural market infrastructure and market regulation, foreign trade should be unequivocally accepted. Because the development of this area is impossible without state support. That is, it makes investors and other entrepreneurs with capital power think first and foremost - to build a business faster and make a profit. In the second case - in the absence of indirect regulatory intervention by the state, monopolies in this area and violations of consumer rights are inevitable. Therefore, the system of state regulation that supports the prices and incomes of producers should stimulate efficient production, use the achievements of intensive technologies and be the motive for productive entrepreneurship and labor.

2. SIGNIFICANCE OF STATE REGULATION OF COTTON COMPLEX

One of the main reasons for the decline in cotton production in Azerbaijan was the liberalization of prices for all agricultural products in the first years of reform. Because the approach was wrong with the idea that prices are free and that they will be regulated by the ratio between supply and demand in the market. Independent economic activity in a market economy has shown that non-regulation of prices leads to the gradual collapse of production, increasing monopolies, weakening the agricultural sector, which is important for the country's economy, and ultimately reducing the interest of producers in this area. Due to the fact that state regulation in Azerbaijan was not fully formed in the 2000s, the areas in decline were viticulture, tobacco, tea and cotton. The low price offered for raw cotton in the market and the untimely payment of money to producers further reduced the interest in this field, and as a result, the area under raw cotton fell sharply. According to statistics, 295.5 thousand hectares of cotton were planted in the country in 1985, this figure decreased to 101.2 thousand hectares in 2000, 30.2 thousand hectares in 2010 and 18.7 thousand hectares in 2015. Theoretical research and the experience of developed countries through market economies show that the state's priority in regulating the national agrarian economy is to provide comprehensive assistance to the development of the agrarian sector, to reliably protect agricultural producers from threats from domestic and foreign sources (3. Page 235). In order to overcome the crisis in agriculture, subsidies have been introduced since 2016 in order to stimulate the production of relevant products that are considered strategic products at the expense of budget funds. Subsidies were provided for 0.1 manat per kg of raw cotton, 50 percent of the cost of fuel and motor oils (50 manat per hectare), 70 percent of the cost of mineral fertilizers and biohumus, 70 percent of the cost of pesticides. In accordance with paragraph 2.4 of the "Rules for subsidizing agricultural production" approved by the Decree of the President of the Republic of Azerbaijan No. 759 dated June 27, 2019, the Agrarian Subsidy Council approved the planting, yield and decided to determine seed ratios, seed and seedling quotas, and planting needs (4). According to the decision, with a base amount of 200 manat, the sowing coefficients for cotton fields in 2020 were set at 1.2 manat and the sowing subsidy at 220 manat. If a farmer produces 30 quintals of produce per hectare, the total amount of subsidy he will receive is 520 manat, which is higher than the previous subsidy. It is obvious that the state is trying to regulate the production of raw cotton by introducing and improving the subsidy mechanism. The target indicators of Section 5 of the "Strategic Roadmap for the production and processing of agricultural products in the Republic of Azerbaijan" envisage an increase in cotton production in 2020, as well as processing by at

least 4 times compared to 2015 (1. p. 49). This means 140.8 thousand tons of raw cotton, and due to the stimulus measures taken, 336.5 thousand tons of cotton were produced, which is 2.4 times more than the target. At the same time, according to the results expected from the implementation of the "State Program for the Development of Cotton in the Republic of Azerbaijan for 2017-2022", the goal is to increase raw cotton production to 500,000 tons in 2022 (2). However, it has been determined that it is economically viable to plant cotton on up to 100,000 hectares. This means that 50 quintals of raw cotton per hectare must be collected to achieve the goal. As noted, in 2020, 336.5 thousand tons of cotton was produced. Productivity in the cotton-growing regions of Azerbaijan is given in Table 1.

Table 1: Productivity in cotton growing regions of Azerbaijan in 2015-2019

	2015	2016	2017	2018	2019
Across the country	18.8	17.3	15.3	17.6	29.5
Samukh	16.3	23.1	8.8	23.1	-
Goranboy region	7.0	17.9	13.9	18.3	23.5
Calilabad region	23.0	15.5	20.0	28.6	25.8
Beylaqan region	18.3	19.9	18.4	22.9	30.3

Source: stat.gov.az State Statistics Committee

Analysis of statistics shows that productivity in Samukh, Goranboy, Zardab, Kurdamir, Agdash, Ujar, Hajigabul and Agsu regions is much lower than productivity in the country as a whole. In 2020, productivity increased by 33.6%, and the sown area was 100.3 hectares. Due to low economic efficiency, cotton planting was stopped in 2019 in Samukh and Agdash districts. At the same time, in 2019, in other regions with low productivity, the area under cotton accounted for 10% of the total sown area. In our previous research, we noted that productivity below 30 quintals in Azerbaijan is not economically viable. Taking into account that the cost per hectare is 850 manat, the income obtained with the new subsidy rule for 30 quintals of product is 1520 manat per hectare.

3. ECONOMIC IMPORTANCE OF RAW COTTON PRODUCTION

Although cotton growing was once one of the mainstays of the agrarian sector of the economy and the agro-industrial complex of the republic, in the current situation this position has fallen by almost three times. The interrelation of natural, climatic, organizational, technological and economic factors determines the complexity and diversity of conditions for the development of cotton growing. It should be noted that cotton yarn is one of the most valuable crops in agriculture. Many factors affect the world production and consumption of cotton fiber, namely: oil prices, which affect the cost of synthetic fibers; the state of the world economy, the policy pursued by this or that state. However, the leading indicators of price volatility are productivity or quality indicators that may decline due to weather or other conditions, which may result in failure. Worldwide, cotton production is used on an area of 25-35 million hectares. When examining the volume of cotton grown in the world, it should be noted that both the sown area and the cotton crop in the world tend to fluctuate. This fluctuation mainly varies according to supply and demand in the world market. In Azerbaijan, it has become a participant, albeit with a small share, by offering cotton fiber to the world market. It should be noted that although the main goal is to make cotton production a more important sector for Azerbaijan's domestic economy, it has not yet been fully achieved. Azerbaijan's cotton exports for 2017-2019 are given in Table 2.

Table 2: Azerbaijan's cotton exports for 2017-2019

	2017			2018			2019		
	Quantity, tons	Amount Min USA Dollars	The cost of a ton, USA Dollars	Quantity, tons	Amount Min USA dollars	The cost of a ton, USA Dollars	Quantity, tons	Amount Min USA dollars	The cost of a ton, USA dollars
Cotton fiber	22024.9	32555.7	1478.1	52512.1	79529.9	1514.5	86190.6	122365.6	1419.7
Cotton yarn	7028.6	15922.6	2265.4	9488.5	23667.8	2494.4	12803.3	30155.1	2355.3

Source: stat.gov.az, State Statistics Committee

Analysis of statistical data shows that the export of cotton fiber in 2019 increased by 3.9 times compared to 2017 and by 64.1% compared to 2018. According to the State Customs Committee, the export of cotton fiber in 2020 amounted to 97578.15 tons, and the proceeds from the sale amounted to 131930.21 thousand US dollars, which is 7.8% more than the previous year. Calculations show that in 2019, 69814.3 tons of cotton yarn could be purchased from the cotton fiber produced, and according to current prices, the proceeds from its sale could amount to 164433.8 thousand US dollars. This means a 34.4% higher return on cotton fiber exports that year. Therefore, the development of production in the value chain, along with meeting domestic demand, and exports are more cost-effective. Therefore, state regulation should not only cover the production of raw cotton, but also the development of the cotton industry as a whole. The dynamics of production on the value chain in the cotton complex in Azerbaijan in 2018-2020 is given in Table 3.

Table following on the next page

Table 3: Production dynamics of the value chain in the cotton complex in Azerbaijan in 2018-2020

	Unit of measurement	2018	2019	2020	in 2020	
					% Compared to 2018	% Compared to 2019
Cotton fields	min ha	132.5	100.1	100.3	75.7	100.2
Cotton picking	min ton	233.6	295.3	336.5	144.0	114.0
Cotton fiber production	min ton	61.0	85.0	78.5	128.7	92.4
Production of cotton yarn	min ton	24.7	34.8	46.7	189.1	134.2
Export of cotton fiber	min ton	52.5	86.2	97.6	156.2	113.2
Export of cotton yarn	min ton	9.5	12.8	9.0	94.7	70.3

Source: Fiber and yarn exports in 2020 were based on the data of the State Customs Committee, and other indicators were based on the data of the State Customs Committee.

According to statistics, cotton production increased by 44.0%, although the area under cotton decreased by 32.2 thousand hectares over the past three years. This is primarily due to the fact that appropriate steps have been taken to develop intensive cotton growing in Azerbaijan. That is, in addition to the use of more productive weavers, in addition to traditional cultivation, the experience of China and Turkey is used. For example, in Ujar region, cotton was planted on 10 hectares in accordance with Chinese technology. Drip irrigation system was also used here. The main feature of this technology is that, unlike traditional cultivation, it is possible to grow twice as much (200-220 thousand) plants per hectare, which means the production of 50-60 quintals per hectare for the average yield. However, the application of this technology in the country still does not seem realistic. In addition to cotton fiber, cotton is valued as a valuable product in the raw. Thus, after taking the fiber, it is partially used for planting and mainly used to obtain various products, especially oil. The obtained oils are used for food and technical purposes. Refined cottonseed oil has a very high nutritional quality and is almost equal to olive oil, so it is widely used in the canning industry. It is also used in the preparation of margarine, artificial oils, laundry and toilet soaps, industrial oils and drying oils. It is used to make glycerin, stearin and a number of other products. The remaining jam and the remaining food after the cottonseed oil is taken is a good concentrated feed for some pets. Gossypol produces polymers, varnishes, heat-resistant coatings, medicines, dyes and some other materials from the core of cotton seeds. Gossypol resin (resin), a waste product of the cottonseed industry, is very heat-resistant and can be used for the production of heat-resistant varnishes, and for the production of molds in castings. Can be used for hard road surfaces as a polymer additive derived from cotton resin used to produce highly durable products. Research shows that the production of raw cotton is not only used for cotton fiber and cotton yarn, but also to buy more products, which are always in demand. Therefore, the development of cotton production in the value chain is more cost-effective.

4. RESULT

Forms of state support for agriculture should create appropriate conditions for the organizational and economic activities of commodity producers, including the conditions of optimal use of credit and budget funds, because the fact that agricultural producers have small production areas and their profits are not enough to meet the needs of large-scale reproduction. Cotton growing is one of the export-oriented industries in the country. This product is mainly grown in the Aran economic region. Cotton fields are suitable for growing cotton due to the large number of sunny days in this economic region. At present, the development of cotton growing and subsidies from the budget increase the production of raw cotton, but is accompanied by a number of serious and unresolved problems that hinder the more progressive

and efficient development of the industry. Among these problems are the lack of use of innovative technologies by small cotton farms, which produce the bulk of raw cotton in the country, and difficulties in irrigation, which has led to low productivity in many farms. On the other hand, the cotton fiber is mainly exported from raw cotton, which indicates the weak development of the cotton complex in the value chain. The existing problems in the cotton industry, the implementation of cotton production in small areas hinder the development of industry and the cotton industry as a whole. For the development of the cotton complex, the development of local productive seed production, improvement of agricultural technology, strengthening the material and technical base, improvement of the lending mechanism, development of social infrastructure of raw cotton producers are priority areas for further development of cotton growing. Our research shows once again that the deepening of the production of raw cotton, i.e. the development of the value chain, is the main source of development of the cotton complex. However, there is no specific mechanism or concept in this direction. The development of local scientific technologies is a key condition in this direction. The development of local industrial-based scientific technologies increases the competitiveness of cotton production by stimulating its development along the value chain. As production deepens in the cotton complex and in return for providing state support to the processing industry, it is expedient to develop a concept for improving the mechanism to support raw cotton producers. We believe that the development of such a concept will not only provide the domestic market with cotton products, but also have a positive impact on increasing the range of export products.

***ACKNOWLEDGEMENT:** I would like to express my deep gratitude to our rector, Mr. A. Muradov, for the recent positive changes at our university and the creation of opportunities for professionals like us. I would also like to thank the organizers of this conference*

ABSTRACT

The main purpose of the analysis is to study the fiscal mechanisms in the economy of Azerbaijan, their assessment and determination of the tax burden. The research was carried out based on several research methodologies including comparative analysis, systems approach, and logical generalization. In the course of the study, the dynamics of such fiscal indicators in the Republic of Azerbaijan as the tax burden, the coefficient of tax elasticity, the marginal tax burden were analyzed, and the factors influencing them were studied. As a result of the study, the fiscal indicators of Azerbaijan's economy for a specific period were assessed, and in this regard, relevant results were obtained. Limitation of the study is the need for more practical information. The practical significance of the research study lies in obtaining information on the level of fiscal indicators in the Republic of Azerbaijan and providing practical assistance in determining the optimal level of taxation.

Keywords: *Tax burden, Tax elasticity coefficient, Marginal burden, Taxation system, Gross domestic product, Corporate tax*

1. INTRODUCTION

Taxes, being a fiscal tool for the formation of the state budget, ensure the fulfillment of the obligations assumed by the state to finance the social-economic policy pursued in the country. In the implementation of fiscal policy, taxes have a significant impact on the growth rate and structure of GDP and the process of attracting investment to the economy. Using tax mechanisms, the state actively interferes in the individual consumption and solvent needs of the population, the level of economic development of the regions and various activities. Achieving an effective tax system, being one of the main conditions for economic stability, makes it necessary to identify favorable options in different situations. In this case, one of the main goals is to balance the interests of the state with taxpayers [4]. One of the main points of attention during the tax reforms implemented in the Republic of Azerbaijan in recent years is the measures taken to reduce the level of the tax burden. The main purpose of this article is to assess the impact of tax reforms carried out in the country, as well as fiscal multipliers on the level of the tax burden. In general, the factors affecting the level of taxation at the macroeconomic level can be combined into 4 groups: political, economic, legal and social. Political factors include the country's fiscal policy, which has a direct impact on the level of taxation. Economic factors are the reasons arising from the economic situation in the country, which affect the formation of the tax base for specific taxes. Legal factors can also be considered as legislative factors. This includes the formation of the legislative framework in the field of taxation. Social factors are reflected in the redistributive function of taxes [6].

2. ANALYSIS OF THE TAX BURDEN LEVEL IN THE REPUBLIC OF AZERBAIJAN AND THE FACTORS INFLUENCING IT

As it has been noted, the tax burden affects regional and sector development, business and investment decisions of individual entrepreneurs, including foreign investors and it plays an important role in tax decision-making, as well as in planning the tax policy of the state, determines the competitiveness of the tax system. From this point of view, the analysis of the tax burden level in the Republic of Azerbaijan and the factors affecting it is of great importance. The dynamics of the tax burden indicator in the Republic of Azerbaijan in 2016-2020 is reflected in Table 1.

Years	2016	2017	2018	2019	2020
GDP (mln. manats)	60425,20	70337,80	79797,30	81681,00	72432,2
Tax receipts (mln. manats)	7015,2	6971,7	7415,5	7672,6	7387,2
Customs receipts (mln. manats)	2291,7	2608,8	3253,1	4408,6	3938,2
Compulsory social benefits (mln. manats)	1950,2	2125	2362,3	2502,8	3504,5
Total receipts (mln. manats)	11257,1	11705,5	13030,9	14584,0	14829,9
Tax burden (in percent)	18,63	16,64	16,33	17,85	20,5

Table 1: Dynamics of the tax burden indicator in 2016-2020

(Source: Statistical indicators of Azerbaijan 2020. Calculations have been made by the author.)

Note: The rates of receipts to the social protection and unemployment protection funds provided in the relevant budgets have been taken) [13,14,15].

A glance at graph reveals, the level of the tax burden during the period under review ranged from 16.33% to 20.5%. The dynamics of change of this indicator during the analysis is shown in the graph below.

Figure 1: Dynamics of the tax burden for 2014-2019 (in percent) [6,7]

(Source: Compiled by the author)

In the absence of any increase in tax rates, the increase in the level of this indicator in 2020 can be explained by the expansion of the tax base as a result of reforms and the prevention of tax evasion. It should be noted that in recent years, the share of agricultural products in GDP is

more than 8%. However, if we consider that this area is exempt from other taxes except land tax, then the tax burden in the country will be 22.3 % in 2020. If we compare the level of the tax burden in the Republic of Azerbaijan with the level of the tax burden in some post-Soviet republics, we can conclude that it is quite low. Let's visualize this comparison in following diagram.

Figure 2: Comparative analysis on the level of the tax burden [6]

As depicted in the diagram, the level of tax burden in the Republic of Azerbaijan is higher than in Kazakhstan only among the countries compared. Tax rates also have a significant impact on the level of the tax burden [1]. Comparison of corporate income tax, personal income tax, value added tax and compulsory social benefits in the above-mentioned countries can be shown through Table 2.

Country	Korporate income tax	Value added tax	Personal income tax	Compulsory social benefits
Russia	20	20	13	30
Belarusian	18	20	13-16	35
Ukraine	18	20	18	22
Moldova	12	20	18	1,23-45,63
Georgia	15	18	20	6
Uzbekistan	15	15	12-20	15-25
Azerbaijan	20	18	14-25	25
Kazakhstan	20	12	10-20	10

Table 2: Comparative analysis of tax rates (%) [8, 9, 10].

(Source: https://www.osiaf.tj/uploads/files/Rahmatov_vebinar_Nalogovaya_nagruzka.pdf)

The rate of VAT in the Republic of Azerbaijan is only higher than the rate in Kazakhstan among countries mentioned above. The rate of corporate income tax is higher than in other countries, except Russia and Kazakhstan. The rate of personal income tax and compulsory social benefits can be considered average compared to the above-mentioned countries [8, 9, 10]. The low level of the tax burden in Azerbaijan can be explained by a number of factors, provided that the rates of basic taxes do not differ sharply. First, the use of tax potential is still not at the desired level, the scope of tax benefits is wide, the existence of special tax regimes, and so on.

3. ANALYSIS OF FACTORS AFFECTING THE TAX ENVIRONMENT IN AZERBAIJAN

Assessing the impact of changes in GDP on the level of tax revenues encourages the development of measures to identify gaps in the tax field and eliminate them. From this point of view, it is important to determine the degree of sensitivity of taxes to macroeconomic changes. The main indicator of this is the elasticity of taxes. This indicator is defined as follows

$$E_Y^X = \frac{\Delta X}{X} / \frac{\Delta Y}{Y}$$

Here, E_y^x - x is the coefficient of elasticity of x according to y.

X - initial level of tax revenues.

ΔX -increase in tax revenues.

Y - the amount of the studied factor.

ΔY - an increase in the studied factor.

Years	2017	2018	2019	2020
GDP (mln. manat)	70337,8	79797,3	81681,0	72432,2
Changes in GDP	9912,6	9459,5	1883,7	9248,8
Tax receipts (mln. manat)	9580,5	10668,6	12081,2	11325,4
Change in tax revenues (mln. manat))	273,6	1088,1	1412,6	755,8
Tax elasticity coefficient	0,179	0,845	5,609	5,223

Table 3: The dynamics of changes in the tax elasticity coefficient in the Republic of Azerbaijan for 2017-2020 [13].

(Source: Statistical indicators of Azerbaijan 2020. Calculations were made by the author)

As it can be seen, there has been a significant increase in the price of the ratio over the last 4 years. Thus, while the price of this indicator was less than one in the previous 2 years, in 2020 it was 5,223. This means that a 1% change in GDP changed the tax revenue by 5.2%. In other words, the volume of production is very sensitive to the tax burden. This also leads to the conclusion that the level of use of tax potential will increase. One of the indicators of the impact of changes in GDP on the level of tax revenues is the marginal rate of taxes. At the macroeconomic level, the marginal tax burden is the amount of additional tax paid per unit of GDP growth and is defined as the percentage of the change in GDP to the change in tax revenue [3].

Years	2017	2018	2019	2020
Changes in GDP (mln. manat)	9912,6	9459,5	1883,7	9248,8
Changes in tax revenues (mln. manat)	273,6	1088,1	1412,6	755,8
Marginal tax rate (percent)	2,76	11,5	79,99	8,17

Table 4: The dynamics of changes in the marginal tax burden in the Republic of Azerbaijan for 2017-2020 [13].

(Source: Statistical indicators of Azerbaijan 2020. Calculations were made by the author)

As it can be observed, the marginal tax burden has increased sharply during the period under review. Thus, while in 2017 the additional increase in the tax burden against each additional increase in GDP was 2.76%, this figure was 11.5% in 2018, 79.99% in 2019 and 8,17% in 2020 accordingly. It can be concluded that identifying hidden sources of taxation, expanding the tax base, eliminating the shadow economy have yielded positive results in 2019. In 2020, the decrease in GDP as a result of pandemic has led to the decrease in level of marginal tax rate [11, 12]. It is known that tax changes have a multiplier effect.

Thus, changes in tax rates have a direct impact on the income of the population, the level of aggregate student and GDP. The tax multiplier allows to estimate the impact of these changes on GDP [2, 5]. The tax multiplier is a negative quantity because the increase in taxes reduces the level of aggregate income. At the same time, the multiplier effect of taxes is less than the multiplier effect of public procurement. This can be explained by the fact that while changes in public procurement have a direct impact on aggregate demand, changes in taxes have an indirect effect on it. The tax multiplier, defined as the ratio of the final propensity to consume to the final propensity to accumulate, shows how many units of change in total income as a result of 1 unit change in taxes. The dynamics of the tax multiplier in the Republic of Azerbaijan for 2015-2019 was as follows.

Years	2015	2016	2017	2018	2019
Income of the population (mln. manat)	41744,8	45395,1	49187,9	53688,6	56769,0
Expenditures of the population (mln. manat)	34963,4	39775	44498,4	48513,1	51927,4
Collection (mln. manat)	6781,4	5620,1	4689,5	5175,5	4841,6
Recent propensity to consume (in percent)	83,76	87,62	90,47	90,36	91,4
Last propensity to collect (in percent)	16,24	12,38	9,53	9,64	8,6
Tax multiplier	5,16	7,08	9,49	9,37	10,63

Table 5: Dynamics of tax multiplier change for 2015-2019 [13].

(Source: Statistical indicators of Azerbaijan 2020. Calculations were made by the author)

The dynamics of the tax multiplier shows that the multiplier effect increased during the period under review, i.e. the impact of taxes on GDP increased. In 2015, this figure was 5.16, whereas in 2019 it more than doubled to 10.63. The above confirms that the work done to identify non-tax sectors of the economy, the "shadow economy" and to raise taxes, is effective and bears fruit.

4. CONCLUSION

Determining the impact of the level of the tax burden on various aspects of the country's economy provides a basis for judging whether the level of taxation corresponds to economic realities.

- 1) As a result of the analysis of the dynamics of the tax burden, it was determined that in the last two years, its level increased by 3 percent, from 16.64 percent in 2017 to 20.5 percent in 2020.
- 2) At the same time, as a result of the research, it was determined that the marginal tax burden increased sharply, from 2.76 percent in 2017 to 79.99 percent in 2019. The decline in this indicator in 2020 can be explained by the decline in GDP due to the pandemic.
- 3) In the absence of sharp differences in the rates of main taxes, the low level of the tax burden in Azerbaijan can be explained by some factors, such as the low level of use of the tax potential, wide range of tax benefits, and the presence of special tax regimes.
- 4) The tax elasticity coefficient increased from 0.179 in 2017 to 5,609 in 2019, and 5.223 in 2020. This leads to the conclusion that the level of use of the tax potential for the analyzed period has increased. The decline in this indicator in 2020 compared to 2019 can be explained by the decline in GDP due to the pandemic.

- 5) The tax multiplier in 2015 was 5.16, but in 2019 it more than doubled to 10.63. This confirms that the work done to identify non-tax sectors of the economy, the "shadow economy" and to raise taxes, is effective and bears fruit.
- 6) After the adoption of the Tax Code, income tax, value added tax, income tax rates have been significantly reduced, there has been no change in the level of tax rates, significant discounts have been provided to certain categories of taxpayers, and significant measures have been taken to reduce the tax burden. These changes can be explained by several factors, such as expansion of the tax base, prevention of tax evasion, detection of hidden tax sources, reducing the size of the shadow economy, increasing control over taxpayers, achieving legalization of salary payments.
- 7) During the analyzed period, the multiplier effect of taxes increased and their sensitivity to changes in GDP increased, which once again confirms the effectiveness of tax reforms.

ABSTRACT

Entering the 21st century, the world community pays more and more attention to solving global problems of energy security, which determine not only the pace of socio-economic development, but also the survival humanity in the future. Although modern civilization is the result of the functioning and interaction of many areas of society (industrial and agricultural production, science, information technology, education, etc.), it is energy that is the basic and at the same time its most vulnerable link. The consequences of the unexpected “disappearance” of the energy industry will appear instantly, and the scale of the losses will be catastrophic. Oil in the 20th century became the “blood” of the world industry and disruptions in its supply repeatedly led to national and world economic crises. Over the past 40 years, the consumption of natural fuel resources (oil, gas and coal) has increased 2.5 times, and they make up almost 90% of the global energy balance. Various forecasts appeared for the development of world energy after a significant depletion of natural resources. The global character of problems of energy security necessitates the creation of the world control system of energy resource balance for the benefit of humanity. The article is devoted to those particular problems which allow presenting the modern panorama and contours of the future development of world energetic, and also to understand tasks facing the world community.

Keywords: *demand and consumption, energy security, global energy balance, risks and threats*

1. INTRODUCTION

The security problem is one of the central in the theory and practice of international relations and is located in field of view of researchers and statesmen. This problem is complex, its content and methods of support depend on the historical stage of development of society. Today, such types of security are distinguished as state (national), public, industrial, economic, energy, informational, personal. Energy security is part of the national security of the state. The problem of energy security arose at the beginning of the 20th century. with the development of technological progress and the wider use of oil, gas, coal. 1973 oil crisis when the Arab for political reasons, exporting countries imposed an embargo on oil supply (to European countries, USA, Canada and Japan, supporting Israel during the Domsday War in its conflict with Syria and Egypt), laid the foundation for the study of energy as source of conflict. The current stage of development of world energy is characterized by the emergence of new global challenges and deepening old contradictions that reinforce threats to the reliable functioning of the world energy sphere. Problems of energy security of the XXI century. go beyond oil supplies and cover a wide range of issues. Today, the most consumed energy resources are hydrocarbons; electricity, nuclear fuel and renewable energy sources (RES) are also used. Amid growing competition for access to limited resources there is an increase in state control in the field of energy. Currently, the energy sector of many states regulated in accordance with energy strategies, formed under the influence of national characteristics, geopolitical goals, provision of own energy resources. As a result of this, there are a large number of diverse definitions of the concept of “energy security” presented in official documents of states and international

organizations, monographs and scientific articles. For a better understanding of the various approaches, some experts suggest considering energy security at three levels: energy security (1) of individual states, (2) groups of states and (3) global, or international, energy security. UK Department of Energy and Climate Change says energy security can be divided into immediate security at the physical level, price security and geopolitical security. It is generally accepted in the context of energy security to distinguish two groups of countries: countries - producers of energy resources (as a rule, these are their export countries) and consumer countries (importers of resources). You can add another group to them - transit countries (as a rule, they are also consumers), for which are primarily commercial and political from transit through their territory of oil and gas pipelines and energy networks. Most energy security research reflects the problem of consumers. For consumer countries, the main tasks of ensuring energy security are the diversification of supplies, the introduction of energy-saving technologies, the creation of strategic raw materials, development alternative energy sources. For most energy importers it is supply security that is the most important aspect and is most often discussed in documents and research. Security of supply and energy services depends on how well the infrastructure and communications chain is in place, consisting of energy production, its transportation, transformation, processing, distribution all the way, and finally use. Security threats to supplies may vary in different ways: depending on the type of negative impact, time frame and origin of the problem. They can become inadequate production facilities, technical or operational errors, weather events or hostile acts, such as terrorist attacks, blockades, wars. Besides the undetermined legal status of a geographical object may interfere with the exploitation of resources. Moreover, supply security is often analyzed using quantitative and qualitative methods. Indicators include, for example, import dependency ratios, diversity indices (including energy sources and suppliers market) and economic valuation of the impact (power outages), as well as price spikes. For example, D. Yergin believes that the modern energy security system is aimed only at overcoming problems in exporting countries in case of supply disruption. From point consumer perspective, supplying countries put pressure on the international energy market, using energy resources to satisfy their political and economic interests. The 1973 energy crisis is always cited as an example. Manufacturing countries (exporters), in turn, are interested in reliable and uninterrupted demand, market expansion sales of resources, as well as the maintenance and development of its fuel and energy complex. From their point of view, the key issues of energy security are the diversification of markets, conclusion of long-term sales contracts, maintenance energy infrastructure, attracting investments for the development of the industry, improving applied technologies, increasing export revenues. For them, the external aspect of energy security is demand security. For energy-exporting countries, security of demand can be as important as ensuring reliability and security of supply. In these countries, the economy and the state budget are highly dependent on revenues from energy exports. For example, the oil industry accounts for 42% Saudi Arabia's GDP, 87% of budget revenues and 90% of exports. For budget reasons, maintaining a stable income, it is of great interest to exporting countries, and price volatility is a major concern. However, conflicting opinions may arise between producers and consumers regarding the price level and the optimal rate of exploration. The International Energy Agency (IEA), which unites consumer countries, sees energy security as uninterrupted access to energy sources at an affordable price. The task of the Organization of Petroleum Exporting Countries (OPEC) is to maintaining the stability of oil markets to ensure regular deliveries of petroleum products to consumers and receipt stable income by producers. In turn, the Group World Bank defines energy security not only as the use of energy at affordable prices, but also its stable production. Unequal resource provision also affects the formation of various approaches to protection methods states in the energy field and very often causes conflicts over access to resources, while at the same time speaking an incentive cause of global interaction of all countries.

Consumers and energy suppliers, despite a number of disagreement, interested in cooperation and stability global energy market. At the beginning of the XXI century. energy the sphere is faced with new challenges - environmental degradation, increased risks of energy transportation, depletion of readily available sources, a sharp increase in hydrocarbon consumption in developing countries, the need for large investments in the development of new deposits, etc. Solution these issues require coordinated action by the entire world community. However, there are a number of factors that create difficulties for cooperation in the field of energy and the formation of a common system of international energy security.

2. ENERGY SECURITY RISK FACTORS

The main risk factors that negatively affect energy security should include: economic, political, technological and environmental risks, cyber attacks on the production, supply and transmission of energy systems.

2.1. Economic and political risk factors

International conflicts over access to limited resources can be attributed to the political aspects of energy. Current or potential conflicts over small islands and water areas, such as the South China Sea and the Arctic, are often associated with the existence of potentially valuable energy resources. In addition, it is often claimed that US military action in the Middle East, for example, in Iraq, dictated by the desire to control energy supply. There is also the point of view that US intervention does not so much provide for their own energy interests, but rather supports the idea of global leadership and guarantees the preservation of the universal interests of world capitalism as a whole. The economic importance of energy can help countries strengthen their geopolitical position. Some analysts say that Chinese investment is sometimes exchanged for political support for common political positions on the world stage. In addition, embargoes, sanctions or blockades against energy suppliers have been used from time to time (for example, against Iran and Iraq) to achieve political goals. One of the important aspects of the relationship between energy and security is the absence, in addition to Western Europe, of regional security systems, which leads to additional difficulties in building a cooperative model of cooperation between consumers and producers of energy resources.

2.2. Technological risk factors

The second area of security and reliability threats emanating from energy systems is based on the physical and technological properties of energy, leading to various natural / technical risks dangers and threats. Damage to hydroelectric dams, oil tankers, gas storages and nuclear power plants resulting from technical and operational errors can have devastating consequences. These facilities also serve as potential targets for terrorist groups. In addition, there is a risk of nuclear proliferation, as the process of enrichment of nuclear fuel is closely related with the potential to produce nuclear weapons. Nuclear waste can also be targeted by criminal groups (possibly for the purpose of illegal sale or as an object of blackmail) or by terrorists.

2.3. Environmental risks

Recently, security issues have often been discussed in relation to climate change. Burning fossil fuels is a major contributor to climate change. Climate policy measures to reduce fossil fuel use can also lead to the emergence of conflicts between states and new security threats. The tragic events that highlighted the relationship between ecology and energy have intensified this problem. Such events, which caused enormous damage to both the environment and energy, were: the accident at the Chernobyl nuclear power plant in 1986, the oil spill by the Exxon Valdez supertanker in Alaska in 1989 and in the Gulf of Mexico in April 2010, and the accident at the nuclear power plant “ Fukushima-1 ” as a result of the tsunami in 2011. Exacerbating

environmental concerns increasingly concern the international community and force states to consider the environmental aspect when developing national approaches to energy security. In the framework of this “ecological” direction, the concept of “green energy” appeared as an opportunity to preserve the environment and prevent climate change. This includes the use of renewable energy sources, the transition to natural gas as a less polluting type of fuel, and the introduction of energy-saving technologies. Cyber attacks on power supply facilities, production systems and oil and gas refining can also cause enormous environmental damage. Over the past decades, the digital revolution has changed the world so much that in cyberspace small hacker groups can wage war against entire states. Therefore, many countries have already developed the doctrines of digital warfare and are paying attention to the preparation of their cyber troops. In 2007, in the small town of Oak Ridge, Tennessee, USA, a unique experiment was conducted: experts from the National Security Agency (NSA) simulated in the “national laboratory” a blow to the Iranian nuclear program without missiles, combat aircraft or bunker bombs. Their weapon was the computer virus “Stuxnet”, which increased the speed of centrifuges to enrich uranium until they collapsed. At the same time, no distinction is made between internal and external security, between civilian goals and the military, since not only the military, but also other life support facilities, primarily energy, can become a theater of military operations. It is obvious that the indicated risks and inconsistency of positions of participants in international energy relations pose a threat to the energy security of many countries of the world, and unilateral selfish actions can lead to the use of energy as a weapon.

3. COLLABORATION OPPORTUNITIES

Despite the differences in the approaches of different countries to ensure energy security due to national specifics, as well as various risk factors, there is a real need and an objective possibility of combining efforts the world community to develop a unified strategy for international energy security. To the general tasks of ensuring energy security, requiring cooperation and integration, include: joint participation in the extraction, processing and transportation of energy resources, technology exchange, investment in new projects. The external global aspect is related to overcoming common all the dangers that hinder the effective functioning of the global energy market and the equal access of countries to energy resources. This global aspect is the most vulnerable spot in the world power system. Uneven energy development in the world yet deepens the contradictions between developed and developing countries. However, the formation of such relationships, which are characterized by a balance of interests between all market participants, it is a complex political task requiring political will for its decision and willingness to share common risks. And although the world community today still cannot agree on coordination of their actions in the common energy market, sooner or later he will have to look for common ground for wide cooperation in this area, as the problems of ensuring energy security will become in the coming years even more urgent as the spectrum of threats expands. Currently, the international community has not developed a common understanding of the concept of "energy security", and in some cases the meanings that are invested in it are directly opposite to each other. Number of countries try to offer the widest possible approach, taking into account different interests, agree that at the moment energy security cannot be considered in isolation from the process of globalization. Thus, over the past two decades of research in energy security have evolved from classic studies on oil supplies for industrialized countries, before exploring the wider and more diverse problems of energy. Different approaches of states to addressing international energy security create additional difficulties in its provision. Further search is needed for a common framework for understanding. energy security and mutually acceptable strategies various actors of energy relations for cooperation in solving global problems in this area.

3.1. Global energy security

The problem of energy security has become especially acute in connection with the processes of globalization of the world economy, the negative impacts of energy systems on the environment, as well as the depletion of traditional energy resources. the planet. All these factors pose a threat to the sustainable development of civilization. The energy arsenal has a large set of primary natural energy sources. To prevent “energy” conflicts and ensure energy security of the world community in the interests of present and future generations the transition from energy independence of countries to energy is inevitable interdependence and cooperation. The fundamental provisions of international cooperation in the field of future global energy are as follows:

- 1) Reliability and transparency of oil and gas reserves data as a basis long-term forecast of their production volumes. In 2000, leading international organizations - Asia Pacific Center for Energy Research, EU Statistical Bureau, Latin American Energy Organization, International Energy Agency, OPEC and the UN Statistics Department - proposed to use a single international mechanism for collecting and standardizing data on world oil reserves. This program (since April 2003 it is officially called Joint Oil Data Initiative, JODI) provides the greatest transparency of information on what oil reserves the world community has.
- 2) Ensuring international access to world energy resources is the most important energy security problem. To solve it, it is planned to develop uniform international rules for the participation of oil corporations as in the development of oil and gas fields in different parts of the world, and in large transnational infrastructure projects. Expansion of interstate and intercontinental networks transporting oil, gas and electricity is paramount in creating a single global energy space.
- 3) Ensuring predictability of the international oil and gas market through expanding the practice of long-term contracts, developing a dialogue between consumers and energy producers to establish affordable prices.
- 4) The intensification of international cooperation in the energy sector is possible only with the approximation of national regulatory frameworks in areas of environmental management, environmental protection, energy conservation and energy efficiency.
- 5) Export diversification and maximum protection of exploited oil and gas fields, transportation networks and oil storage facilities from technological disasters and terrorist acts.

Recent decades have been characterized by the expansion of international cooperation in the oil and gas sector, which is an important factor in global energy security. In 1991, the International Energy Forum (IEF) was established. Once every 2 years, the IEF holds sessions at which multilateral discussions and consultations are held on the development of world energy, energy markets and energy security with the participation of more than 70 countries - major oil producers and consumers. An active role in the work of the MEF belongs to OPEC and the IEA, which allows balancing the interests of the world's largest groups of oil producers and consumers. So, in 2005, after the devastating hurricane Katrina, the IEA turned to OPEC with a recommendation to increase oil production, which was done. At the end of 2005, at the initiative of the Indian Minister of Oil and Gas, Mani Shankar Ayyar, a round table was convened in New Delhi with the participation of representatives energy departments of India, China, Russia, Japan, South Korea, Kazakhstan, Uzbekistan, Azerbaijan and Turkey, which discussed the problems of creating in the near future a single Asian oil and gas network based on the interdependence of countries - consumers and producers of hydrocarbons. The international cooperation of the leading countries of nuclear energy is expanding. In the near future, many countries are implementing programs for the construction of a new generation of

nuclear power plants; in the medium term, a global nuclear program will be formed to prevent the proliferation of nuclear weapons and preserve developing countries' access to nuclear technology. The development of the global nuclear industry will strengthen global energy security.

3.2. Providing humanity with energy in the long run

Ensuring the energy security of the world community in the interests of present and future generations is a prerequisite for the development of world energy. Energy rationalism is the most important component of the development of mankind in the XXI century. Due to energy saving in the middle of the century, it is forecasted to save 6 billion tons per year. t, which is equivalent to modern oil and gas production, and by 2100 - 18 billion t. tons, that is, more than the entire modern world energy balance - 14 billion tons. t. Energy conservation will save a significant amount of natural resources for future generations. In the period 2050–2100. repeated growth of the coal and nuclear industries will continue, and the importance of renewable energy sources will also increase. Energy production using oil and gas will remain at the level of 2050. New discoveries, especially in nuclear physics, will lead to gigantic changes in the energy sector, but their potential cannot be estimated even hypothetically. Given that the construction of new generations of reactors poses increasingly complex scientific and technical problems, it becomes clear that it will take many decades for their industrial implementation.

4. CONCLUSION

The most important elements of global energy security are the following:

- Diversification of energy sources, that is, the economy should not be excessively dependent on any one energy carrier, the monostructure of the energy balance is unacceptable.
- Ecological acceptability, that is, the development of energy should not be accompanied by an increase in its negative impact on the environment.
- The rational consumption of traditional hydrocarbon resources, that is, the use of fossil fuels in the energy sector, should not lead to its shortage for the chemical industry.
- The transition from simple supplies of raw materials to international cooperation in the field of energy processing, the exchange of latest technologies, a wide cooperation in the investment sphere, as well as in the development of modern energy saving standards.
- High rates of development of renewable energy sources will reduce the global economy's dependence on oil and gas supplies and minimize energy transportation costs.
- Intensification of international scientific research in all energy sectors.

Ensuring the energy security of the world community can be achieved only taking into account long-term benchmarks and long-term forecasts and should be based on the results of global monitoring of the planet's energy resources and their use. Further integration of states in solving scientific and technical problems will contribute to the successful implementation of innovative technologies. In many areas of energy, the creation and implementation of major programs will be required, similar to international developments in the creation of spacecraft or a fusion reactor. At the beginning of the XXI century. a single global energy space is being intensively formed - the guarantee of human energy security. For greater dynamism of this process in the coming years, it is necessary to develop a methodological, regulatory and organizational basis for world energy. The main task of the second stage is in 2015–2030. start implementation of projects within the framework of the unified international fuel and energy complex management program. At the third stage, on the basis of long-term public-state programs, the system "Energy - Economics - Nature - Society" should be developed, the basis of which is called to become "green" energy.

A similar global program of the XXI century can be created under the auspices of the UN with the wide participation of representatives of government, business, respected scientists and public organizations. In the XXI century. oil, gas and coal will remain the main sources of global energy. The high efficiency of these energy sources is of great importance for the sustainable development of mankind. At the same time, the global energy development strategy should take into account the prospects of using environmentally friendly energy sources and the latest technologies for their development, which will guarantee the energy security of our civilization. The world community must make a grandiose scientific and technological breakthrough in the development of the energy of the earth's interior, the ocean, the sun, space and the peaceful atom. Only then can we satisfy the growing demand for clean, plentiful, reliable and safe energy - the basis of a high standard of living, a developed economy and culture, international and national security. We are obliged to multiply this source of vitality and transfer it to the reliable hands of our descendants.

ABSTRACT

It is often pointed out that Croatia is a country rich in cultural and historical heritage, which is true, as is the fact that Croatian cultural heritage abounds in traditional crafts, but despite that fact, currently only 18 such crafts are registered in Croatia. From this fact it can be concluded that there is no adequate care or approach in the restoration, preservation and promotion of traditional crafts. On the other hand, tourism can be an excellent platform for the rehabilitation of original family crafts, ie traditional crafts, but care should be taken that one-time profit is not the only motivation and that the renewal of traditional crafts is approached in a systematic and organized manner, in accordance with guidelines for the concept of sustainable development. Namely, if the renewal of these activities is approached spontaneously and superficially, more harm than good is done, while, on the other hand, the renewal of traditional crafts can generate profit on several levels and can be a significant contribution not only to tourism but also to economy and culture. social communities and countries in general.

Keywords: *traditional crafts, original family crafts, cultural tourism, tourism*

1. INTRODUCTION

Traditional crafts are in many ways an important component of the cultural heritage of one (or more) nations, or a country, but they also present activities that, if not taken care of adequately, can quickly and easily slide into oblivion, pushed out of the scene because of the mass, industrial production and new technologies that enable faster, simpler and cheaper production. However, there is still a demand and need for traditional crafts and their products, and on numerous examples, in the world and in our country (some of which are listed in this presentation) it has been proven that excellent synergies can be achieved by traditional crafts and tourism. Here we are dealing with the questions of how this synergy can be achieved, how it is achieved and what are the problems that are most often encountered in this process. We will explain what exactly traditional crafts are and why it is necessary to rehabilitate them, also we will analyze the current situation in Croatia in terms of traditional crafts, and explain how traditional crafts fit into the tourist offer, study several examples of rehabilitation of traditional crafts (or attempts) from practice and present some real potentials for rehabilitation and connect the implementation of traditional crafts in tourism and contemporary tourism trends.

2. WHAT EXACTLY ARE TRADITIONAL CRAFTS AND WHY THEIR REHABILITATION IS NEEDED

The phrase "traditional craft" in everyday speech is mostly associated with some - usually extinct - art of making a particular object, so the discourse related to traditional crafts is slowly sliding into the realm of fairy-tale memories of some bygone times. Such a perception not only does not correspond to the real picture, but it also presents a stereotype that makes it difficult to adequately valorize and implement traditional crafts in modern economic and market structures. It is clear that industrial production, which enables faster, simpler, and, ultimately, cheaper production, has supplanted handicraft, manufacturing, wherever possible, but it is also a fact that traditional production often provides higher quality of the product itself and special, personalized approach which are also factors that increase the competitiveness of products, even (or especially) in today's global market. For example, one of the activities that is considered a traditional craft - handmade furniture - is practically completely marginalized today thanks to the industrial production of furniture. Thus, on the one hand, the customer is able to choose and order custom-made furniture at the convenience of his home with just a few mouse clicks and at very reasonable prices that will arrive at his home address in just a few days. This presents a really big advantage for the customer. But, on the other hand, there is a certain charm - or additional emotional satisfaction - in the approach in which the customer, for example, enters a small workshop in person, explains his idea to the craftsman, possibly shows him a sketch, and with that same craftsman he perfects that sketch, chooses materials, colors, shapes and, then, perhaps most attractively, participates in the making process itself. The final product, that particular item that the customer will one day bring to his home, provides a completely different experience than the item that was packaged to the customer's home address. The customer can also, when we talk about industrial production, personally go to the furniture store itself and choose and take home the item he wants on the spot. But whether the customer personally chooses the item in a physical store or online - the whole experience cannot be compared to the experience when the customer orders the production of a particular item from a master, a traditional craftsman. Although an item ordered or bought in a specialty store can be both nicer and cheaper, and even though the process from ordering to the finished product is much shorter in that case, the fact remains that making a piece of furniture with an old master is a special experience because of that extra emotional moment. Also, very often the quality of such a product exceeds a commercial, mass-produced piece of furniture (we are talking, of course, about products of the middle price category, not about designer furniture which is a separate category both in price and quality of workmanship). This example cannot and should not be applied to all traditional crafts, nor is the rule always applicable, but the point is to illustrate as clearly as possible the value that traditional crafts (still) have, and this can be summarized as follows: industrial product in most cases for the customer it is easier to purchase, with faster delivery and lower price, but the product ordered by the customer from a traditional craftsman has additional value, and often higher quality (although usually accompanied by a higher price) that the industrial product can not replace, not even simulated. Analogous to the comparison of e-mail and letters: e-mail is faster, cheaper (relatively free) and in every sense a more convenient way of written communication, but writing and sending a letter, and especially receiving it, is a special experience and e-mail, with all its advantages will never be able to evoke "this and that feeling" (of course, modern man will mostly use e-mail, letter maybe sometimes or even never, but there will always be individuals who, aware and eager for just "this and that experience", will reach for paper, pen, envelope and postage stamp). And it is precisely this particular "feeling", ie provoking the same, that is a new marketing trend, and even an imperative, as Marc Gobé suggests in his Ten Commandments of Emotional Branding (2001) in which he says that the time has passed when it was enough to satisfy customers only at the primary, functional level, and now it is not even enough to fulfill the functional and

aesthetic needs of the customer, but there is a completely new need and a completely new task for marketing experts, ie manufacturers - this need refers to the customer's desire to connect with a certain product (or service), so the producer must strive to create a special "experience" for the customer, to awaken "that certain" certain emotion, to offer something new, more personal, more intimate ... To have a "story". And traditional crafts, implemented in the tourist offer or on their own, certainly have this "story" that has a huge potential to influence the deepening of the emotional connection between the product and the customer, the tourist. So, it is inevitable that there is a need and that there is a demand for products that can offer traditional crafts - as in the example we gave, it is the need to order a piece of furniture from an old master (who inherited his craft from his ancestors, and the whole gives the story extra weight) as well as the need to sometimes send a letter or postcard instead of an email. Regardless of the more pragmatic, practical and comfortable ways of production, communication and living in general that the 21st century offers and enables (and in part imposes), the need for such products, which, in fact, as Gobé perfectly explained, are not just products but also certain "experiences" still very much exist, and as long as that need exists, traditional crafts make sense, and - although they are pushed to the margins of the market, ie supply and demand - they still have something to compete with, and these are primarily quality and that extra emotional aspect. Precisely because of this added value that industrial, mass production cannot replace or offer (but also due to the action of other factors), traditional crafts have recently attracted attention again, which, in the midst of the consumer-capitalist lifestyle, they have somewhat lost. Globalization brings great and numerous changes, and one of them is the growing importance of cultural heritage as a carrier of regional development and as a subject of interest not only for tourists but also for the entire community (Horjan, 2010). Therefore, developed countries are making more and more efforts to improve the preserved traditional crafts, and rehabilitate the extinct ones, and Croatia is doing the same, supporting the development and preservation of national, regional and local traditional crafts through various programs and incentives. A special legal act, the Ordinance on Traditional and Artistic Crafts (Official Gazette 112/2007), was created, and the Croatian Chamber of Trades and Crafts, in accordance with this Ordinance, assigns a special mark to traditional and artistic products and services; holders of this sign are provided with special treatment, ie various benefits with the aim of preserving, nurturing and recognizing the local traditional and artistic culture. According to the Ordinance on traditional or artistic crafts, "traditional crafts are crafts that require special knowledge of craftsmanship and skills in performing activities and which are performed with a predominant share of manual labor, which rely on patterns of production and work techniques, purpose and form traditional cultures, and in that sense they can symbolize local, regional or national identity "(Ordinance on traditional or artistic crafts, Official Gazette 112/2007). Furthermore, under traditional or artistic crafts "can be classified those crafts that are used in the process of making products or providing services and newer technologies, using more modern tools in some stages of production to make the job easier and faster, but provided that such means-aids do not devalue the aesthetic level and character of a traditional or artistic product or service "(Ordinance on traditional or artistic crafts, Official Gazette 112/2007). Also, according to the Ordinance, "products that have been produced in crafts for generations and are now used as souvenirs in the tourist offer of Croatian cultural heritage can also (...) be considered traditional or artistic crafts" (Ordinance on traditional and artistic crafts, Official Gazette 112/2007). In the Republic of Croatia, the following activities are classified as traditional crafts: cooperage, glassmaking, forging, locksmithing, turning, carving, restoration and handmade furniture, pottery, production and assembly of ceramic kilns, production of ceramic items, fur, gunsmithing - engraving, production of vessels, production of straw and wicker products, belt-making, repair of footwear, gingerbread making, weaving on a loom, processing and processing of wool, knitting, production of autochthonous souvenirs that

maintain the tradition of each region, watchmaking, goldsmithing, letter painting, sewing, musical instrument making, wig-making, hat-making, puppetry, bookbinding and other similar activities. In order for an activity to receive a certificate and a mark of traditional trade, it is necessary for it to meet certain criteria, as required by the Ordinance: "Certificate can be obtained only by active trades that have a registered activity in which the product is classified, product group, one or more services. submits an application for the status of traditional or artistic craft. A certificate of trade shall be issued to a craftsman who owns a trade for a product, group of products, one or more services or activities performed in a traditional or artistic manner. " As far as the mark itself is concerned, "traditional or artistic products may be marked with a sign in the form of a sticker or pendant with the indication: product of traditional or artistic craft. The number of the issued Product Certificate must be written on the mark. "(Ordinance on traditional or artistic crafts, Official Gazette 112/2007).

3. TRADITIONAL CRAFTS IN CROATIA

Croatia has a rich cultural and historical heritage, which is often emphasized and which is not just a phrase but a fact. Thus, the conclusion is imposed that Croatia has a rich heritage in terms of traditional crafts, ie traditional crafts and skills, which is somewhat true. Namely, according to the list of traditional crafts in the Register of Cultural Heritage of the Republic of Croatia, only 18 traditional crafts are registered in Croatia (we can only assume that there are many more, ie not all of them are registered).

R. BR.	NAME OF TRADITIONAL CRAFT	PLACE
1	Traditional craft of making Slavonian-Srijem cloth garments	Antin
2	Traditional blacksmithing and weaving Stjepan Legac	Berek
3	The art of making shingles to cover roofs	Delnice
4	Traditional craft for wool processing and making rolled family garments Čolakovac	Gradište
5	Traditional footwear craft Kruh Vuk	Ivanić-Grad
6	Traditional craft of making Slavonian-Srijem Šokac hats	Ivankovo
7	The art of making traditional children's toys from the area of Hrvatsko zagorje	Krapina
8	Traditional hand wheel pottery in Potravlje	Potravlje
9	Traditional fur trade Vlatko Gribl	Slatina
10	Traditional rope craft Antun Knez	Slatina
11	Traditional pottery of the island of Iž	Veli Iž
12	Gingerbread craft from the area of northwestern Croatia and Slavonia	More settlements
13	Traditional pottery in the area of northwestern Croatia	More settlements
14	The art of making Slavonian leather vests	More settlements
15	Bakery trade Trajković	Zagreb
16	The art of making and repairing stationery as part of a trade Peroklinika	Zagreb
17	The art of making a sixth umbrella in a traditional craft Cerovečki	Zagreb
18	The art of handmade and repairing watchmaking watches Lebarović, Zagreb	Zagreb

Table 1: List of traditional crafts in the Register of Cultural Heritage of the Republic of Croatia (Ministarstvo kulture Republike Hrvatske (2018.))

As can be seen in Table 1, and as we have already pointed out, a smaller number of traditional crafts are registered in the territory of the Republic of Croatia than in reality there are such crafts. For example, the making of carnival masks in the Kvarner area is not registered as a traditional craft, although this activity is certainly a traditional craft, ie cultural property, cultural heritage.

The fact that a certain traditional craft is not registered as such does not necessarily mean that it is not vital - it may even participate in tourism as part of the tourist offer, as a tourist attraction, but based on observations of the current situation in Croatia regarding traditional crafts, it is with considerable certainty, that the fact that certain traditional crafts are not registered as such often, if not most often, means that as such they are not recognized or implemented in the tourist offer, at least not in the way they could be, or in the way that their potential fully utilized. What exactly does this mean in practice? That despite the fact that such crafts in some way exist in the community, as a cultural asset, their real value is much greater than what they are currently represented, and their potential without an organized, systematic approach can not be used either fully or properly. For example, the making of carnival masks in Rijeka and Kvarner has its role in the context of carnival customs, but the fact that this activity is not registered separately, as a traditional craft, limits individuals and groups who make these masks - to begin with, they are not able to get institutional support. organizational, financial, etc., to the extent that they could have been registered as traditional trades. It is possible, and very likely (certainly to be hoped for) that there are many examples of successful maintenance, renewal and promotion of traditional crafts in Croatia despite not being institutionalized, but, on the other hand, the fact remains that a large number of them - given that Croatia, as a country of rich cultural and historical heritage, has only 18 registered traditional crafts - precisely because of the lack of institutional, or at least some other type of organizational and financial support, is being forgotten.

4. WHY AND HOW TRADITIONAL CRAFTS ARE ATTRACTIVE IN THE CONTEXT OF TOURIST OFFER

Traditional crafts and their products do not have only useful and aesthetic value - they are, in fact, a reflection of a particular culture, bearers of customs and characteristics of the way of life of the inhabitants of a particular area, a specific reflection of a location, community, its past, value system, identity. This is where, as far as tourism is concerned, the greatest value of traditional crafts, especially those that directly reflect the customs of a particular region or city, such as, for example, making gingerbread hearts associated with Zagreb and its surroundings, or making carnival masks for Kvarner and others. For tourists, a visit to a traditional craft allows direct contact with the customs and identity of the destination they visit - it is a true, direct experience of the culture of the people, the community and as such is irreplaceable and invaluable. "Today's tourists also want to escape from the uniform offer they are exposed to, they are looking for authentic experiences and they want to get to know the locals in their everyday environment. This type of offer certainly includes a trip to the holder of intangible heritage, either to the workshops of craftsmen or to the houses of connoisseurs of certain traditional skills." (Horjan, 2010.). Research shows that cultural tourism is one of the fastest growing sectors. "There has always been a complex relationship between tourism and culture, ranging from open conflicts to peaceful coexistence or to cooperation as the most desirable but rare form of relationship. Today, they are connected everywhere in the world. Heritage, cultural and natural, is seen as an important driver of tourism and local development. Whether it is related visiting monuments of past periods, historical locations, nature parks, traditionally based open-air museums or the spaces of masters of intangible heritage, heritage is included in the tourist offer. Local communities have also become aware that their regional operational or strategic development plans must include culture and heritage as an important factor." (Horjan, 2010.). The importance of cultural heritage, and the traditional crafts is only to some extent recognized by the creators of the tourist offer in Croatia, so the traditional craft has become part of the tourist offer, or part of cultural tourism. However, to what extent this is happening in Croatia in - for tourism and for traditional crafts - the right direction, is a question to which, for the benefit of both, the answer should be known as soon as possible, but it requires complex

reflection and detailed analysis of the current situation on the ground. Because, although some traditional crafts are really revived for tourism and thanks to it, many crafts are only used for tourism purposes, which means that their rehabilitation is approached partially, superficially and exclusively for profit, so the result of such rehabilitation is actually just a simulation of a traditional craft. cosmetically brought to perfection, but essentially only at the level of a one-time seasonal show. Confirmation of this statement can be obtained all along the Croatian coast during the tourist season, at numerous stands that simulate traditional crafts and products (and customs, but this is a completely different topic) solely to attract tourists and quick, one-time earnings, so products that are offered are often low-quality copies of original products. Such an approach tarnishes the image of traditional crafts and products, as well as the image of national tourism in general. At the same time, since tourism is one of the most profitable branches of the economy in Croatia, significant financial resources can be invested in the renewal of traditional crafts because the final products will pay for themselves very quickly, and further earnings should be enough to set aside rehabilitation, either of the same or some other traditional craft. However, in order to truly develop a quality and sustainable strategy for the rehabilitation of traditional crafts in the context of tourism (as well as outside it), it is necessary to approach this issue more systematically and seriously. To begin with, it is necessary to conduct detailed field research of the current situation, as well as a potential analysis, and then also a demand analysis. As part of this paper, such extensive research cannot be conducted, so below we will analyze several examples of synergies between traditional crafts and tourism and rehabilitation of traditional crafts, in Croatia and in the world, and then highlight key good and bad practices to discuss and suggest what to do and how to it, regarding the issue of synergy between tourists and traditional crafts (and their renovation) in Croatia.

5. EXAMPLES AND POSSIBILITIES OF REHABILITATION OF TRADITIONAL CRAFTS IN CROATIA

5.1. Project Craftattract

This project was initiated by the institution Museums of Hrvatsko Zagorje and its partners. The full name of the project is Traditional crafts - new attractions for cultural tourism, so the very name summarizes the essence and goal of the project - rehabilitation of traditional crafts as new attractions in the field of cultural tourism. One of the authors of the project, Goranka Horjan, whose article has already been quoted in this presentation, states the following (Horjan, 2010.): "At a series of expert meetings, the need to preserve traditional culture, and more and more intangible heritage, has been discussed, and on that occasion the authenticity of expression and the need for knowledge transfer are most often discussed. In doing so, the most basic elements are often neglected, which are a prerequisite for these activities to be successful. We can summarize them in three essential aspects - context, space and time. Traditional culture decades ago or centuries ago was part of everyday life - one that can no longer exist today. It took place in a certain area at a certain time, and all manifestations of that culture had their meaning in the lives of the people of that time. Today's time in the same space has a different everyday life and it is understandable that we cannot look for identical forms of behavior and activities in it." Horjan very concisely and lucidly emphasizes the core of the problem - the fact that traditional crafts primarily belong to another time, but there is the potential of their implementation in modern times, not only in the context of tourist offer but also in the context of cultural content in general. Therefore, it is extremely important that the traditional culture is seen in the current context, these are the foundations of its preservation and promotion, and even rehabilitation. Precisely such questions, as well as questions about the transfer of knowledge, ie where and if there is enough motivation to transfer skills and knowledge related to traditional crafts to new generations, are problematized through the CRAFTATTRACT project. The project also received financial support from EU funds.

Research within this project found that "fewer and fewer people are able to do traditional work using their own hands. It's not just about crafts - even simple everyday tasks require a certain skill that today's generations don't have. This way they don't just lose traditional knowledge but also one's own inventiveness" (Horjan, 2010.). Putem ovog projekta, mladima su tradicijski zanati predstavljeni na neposredan i atraktivan način – izvan učionica i drugih formalnih okruženja te u izravno kontaktu s majstorima. Takav pristup pokazao je da kod mladih ljudi itekako postoji potreba za razvijanjem vlastitih vještina, a u kontekstu obnove tradicijskih obrta (Horjan, 2010.). The project achieved a number of goals, including the following: creating a compatible database of traditional crafts and skills, building new attractions in the border area and introducing new tourist destinations, presenting master workshops in museums, creating new tour routes through specific thematic programs. Also, a network of partnerships was created that included various stakeholders, especially those who are not particularly connected, such as, for example, traditional craftsmen of the older generation and students of secondary schools. (Horjan, 2010.). Thus, traditional crafts in this case served not only as a way to enrich the tourist offer, but also as a general way to enrich the cultural scene and the offer of the social community and outside the context of tourism. This is extremely important because it is the right way for traditional crafts to come back to life, not only during the tourist season or for tourism events, but in the long run, with the aim of reviving old skills and crafts in the community as stocks and tourism and cultural as well as economic offerings. This project laid a great foundation for the rehabilitation of traditional crafts in Croatia and showed that the renewal of traditional crafts greatly contributes to tourism and that there is a huge potential in this segment.

5.2. Adriatic dry stone walls

Drywall construction is a skill that has long been, compared to other traditional skills, perhaps the most neglected, and the revitalization has been experienced in recent years, thanks to the initiatives of individuals and associations. One of the associations that is most committed to the preservation, documentation and promotion of dry stone walls, as buildings and as construction skills, and as heritage, is the association Dragodid from the island of Vis. The association was founded in 2007, but the members of the association have been active since 2002, when the first international drywall workshop was held in the village of Dragodid near Komiža on Vis. Today, thanks to this association, such workshops are held throughout Croatia, and the association, in addition to organizing drywall construction workshops, also conducts drywall heritage research in cooperation. Thanks to such initiatives, this almost completely forgotten skill, which has left a huge impact - primarily as architecture - especially on our islands and along the coast, is revived, as a cultural heritage, and at the same time as a tourist attraction. Efforts to revitalize this exceptional skill have also led to the recent entry of drywall art into the UNESCO Representative List of the Intangible Heritage of Humanity in November 2018, in response to a joint international nomination of Cyprus, France, Greece, Croatia, Italy, Slovenia, Spain and Switzerland under the name *Art of dry stone walling, knowledge and techniques* (Udruga Dragodid, 2018.). Precisely because of its specificity, neglect and actuality, this presentation also analyzes drywall architecture - although it does not belong strictly to the category of traditional crafts (although it should by all parameters) - as a traditional skill that is currently being rehabilitated, and in the context of tourism. in this context), and it is precisely this approach that is key to the success of that rehabilitation itself. In addition to workshops and other described initiatives related to the preservation and promotion of drywall architecture, by the association Dragodid, and activists from the Croatian drywall and geoinformation scene, in 2013 was launched and opened a public inventory of Croatian drywall heritage, at <http://suhozid.giscloud.com/>. "The list is open to any contribution that expands or deepens the picture of drywall phenomena and their spread along the eastern Adriatic coast and its

hinterland. We are interested in every wall, every building, every settlement that has kept the elements of construction in its environment with stone lace and lookout points from which we can experience it. We are also interested in other traces of human use of space, such as chapels, altars, stećak tombstones and other stone markers, wells, ponds, limestone remains and ancient roads.“ (Suhozid.hr, 2018.). Drywall architecture is especially preserved on Croatian islands, so, for example, only in the area around Vela Luka on the island of Korčula, according to estimates, from about 10,000 to 30,000 (and probably more) kilometers of drywall (Žuvela, 2008), the so-called. *meja* (mostly from the word "međa" - "border"), a kind of stone walls, built without any binder. If there are so many of them in that area alone, it is possible that there are up to 100,000 kilometers of them on the whole island. *Meje* were built by generations of island farmers, to protect the land from erosion, landslides, floods and drainage, but also to mark the boundaries between estates. This skill has been passed on informally, from generation to generation, for hundreds of years. And the skill itself has been brought to perfection so much that the exceptional durability of these facilities has been achieved - despite the fact that it is a construction without the use of binders, “dry”. Besides borders, specific field shelters were built in the drywall technique, resembling round houses; specifically on Korčula, *torets*, *bunje* and *vrtujci* have been preserved. *Vrtujci* are specific to the western side of the island, the part that gravitates to Vela Luka, which is one of the areas that are richest in dry stone heritage (Juvanec, 2006.). Today, there are only a dozen carousels (Dragojević-Ćosović, 2006), and their appearance and form are particularly interesting, so, among other things, they are a tourist attraction. However, in this case, the institutions are not very interested in the restoration, preservation and promotion of drywall, which is not only the case here but throughout Croatia, so the revitalization and rehabilitation of drywall heritage in Vela Luka is the association Velavno stvaralastvo Vela Luka documentation, renovation and promotion of drywall, in the way that the above-mentioned association Dragodid does, and workshops on drywall construction are also planned. It is possible that the use of drywall for tourism purposes will ultimately motivate institutions to support such initiatives and rehabilitate the art of drywall construction. Dry stone walls in the area of Vela Luka municipality, as well as in the whole island of Korčula (and as elsewhere on the islands and the coast of Dalmatia) are proof of great perseverance and exceptional construction skills and as such are a unique example of Croatian traditional architecture and vernacular architecture so they deserve support, even if the reason for that is the enrichment of the tourist offer.

5.3. Wooden chests from Ivanec and surroundings

Making wooden chests, an art for which the Ivanec region was once known before the Second World War, is today one of those traditional crafts that has completely disappeared. There are, however, initiatives that could result in the relaunch of this tradition. From 2008 to 2010, a research called Wooden Chest - the forgotten treasure of the Ivanec region lasted in order to try to revitalize this old art for which the Ivanec region was once known. The project was implemented by the research section of the student cooperative of the Ivan Kukuljević Sakcinski Elementary School in Ivanec, and the result of the research and the entire initiative is a reawakening of interest in this extinct traditional craft (Jagić, 2011.). Today on the pages of the Tourist Board of the City of Ivanec you can find the section Screening in which this traditional craft is described as an important part of the culture of the area, but apart from the meaning that screening had in the past of this area, no initiative related to the present or future of this art. Apart from the Škrinjara section, which was formed as part of the rehabilitation project of this traditional craft, it is not known whether the potential hidden in the tradition of making chests in Ivanec and its surroundings is recognized by some other organization, association, etc., but there is no doubt that this traditional craft has great potential, in economic and especially in tourism terms.

Firstly, it has a very good background - a long tradition is what is always valued and which strengthens confidence in product quality, and secondly, the market is certainly not saturated with handmade, high quality wooden chests that have their functional, ie useful, but also aesthetic value, and, ultimately, that special "emotional" value, "feeling" or "experience", which we mentioned at the beginning of the exhibition and which today's customers are looking for and appreciating. The mentioned research Wooden chest - forgotten treasure of Ivanec region, as part of the rehabilitation project, the art of making wooden chests in the area of Ivanec and its surroundings, resulted in many knowledge about this art which are documented and preserved and as such represent a very good basis for possible rehabilitation of this old Croatian craft. The production of wooden chests is especially related to Kraševac: "The production of wooden chests was practiced in several villages in the Ivanec region, and the most common was in the village of Kraševac, one of the most important centers of chesting in Croatia and the former Yugoslavia. The Kraševac chest center is also important because the production of wooden chests in this settlement lasted until the 1950s, which was not the case with any other chest center. (...) In Kraševac, the production of wooden chests lasted longer than in other areas, namely, the literature records the fact that back in 1947, the chest of drawers Ćiril Videc (Kraš) from Kraševac made a wooden chest for grain ... " (Jagić, 2011.). Given the above, it would be logical to continue the revitalization of this art in this area, for tourism purposes, but by no means only and exclusively for tourism purposes.

6. HOW TRADITIONAL CRAFTS FIT IN CONTEMPORARY TOURIST TRENDS

One of the most famous islands in the world, the Italian Murano, is known precisely for the art of making glass, and because of its traditional craft - handmade glass. The tradition of making glass on Murano (which is actually an archipelago - consists of seven islands connected by bridges) is over 700 years old, and Murano is a world-famous tourist destination because of this tradition. The exceptional tourist popularity of Murano can be attributed exclusively to the tradition of glassmaking, which is exactly where this destination built its brand, because - without a doubt - Murano is a brand, not only tourist, but also cultural. The way Murano has built its popularity on the basis of glass production, which is actually a traditional craft, is not the only such example - there are many destinations that have become a cultural and tourist brand thanks to the traditional art they nurture; for example, in the Middle East, destinations are known for making carpets, in the Far East for silk, in Venice for masks, etc. Undoubtedly, we can conclude that the role of traditional crafts in tourism is extremely large - if treated and used in the right way. Therefore, the synergy of traditional crafts and tourism can bring multiple benefits to both parties involved - traditional crafts will benefit by being rehabilitated, and tourism will benefit through the enrichment of the tourist offer. There are many examples of traditional crafts in Croatia that can be rehabilitated for tourism purposes, the problem arises if these crafts are renovated exclusively for tourism purposes because in that case there is a danger that the craft "lives" only a few months a year and its restoration is superficial. Another problem we noticed by observing the situation in Croatia is the fact that, despite the huge potential, very few examples of successful and adequate rehabilitation of traditional crafts for tourism can be singled out. Furthermore, and this is the third problem to be singled out, most examples of these positive practices exist thanks to individuals and associations - state institutions in this area do not offer a clear strategy or systematic, organizational and other support. Croatia is, as it is constantly pointed out - with good reason - a country of rich cultural and historical heritage: Istria is known for blacksmithing, bottle and basket weaving, woodworking and pottery, Lika also for pottery, Knin and surroundings for knitting and basketball, islands Brač and Korčula by stonemasonry, Ivanec, as we have already mentioned, by chest, the village of Vidovec, Zelovo and Hrvatsko zagorje by the traditional art of making wooden children's toys... But there are only 18 registered traditional crafts in Croatia.

It is obvious that the preservation and promotion of traditional crafts in Croatia is not carried out adequately, so it is necessary to first investigate why this is so and offer applicable solutions to the identified problems. One part of traditional crafts has been rehabilitated thanks to tourism, which is a good practice, but there is also a problem - a number of such projects are done superficially and seasonally, which is not an adequate way to restore and preserve traditional crafts. In any case, the potential is certainly much greater than realized. And how exactly can traditional crafts in Croatia fit into modern tourist trends? Recent research shows that modern tourists are looking for new forms of tourist offer, and these new forms are most often associated with the fact that modern tourists through travel and vacation want to compensate for the shortcomings or drawbacks of a modern lifestyle that is dynamic and fast. Therefore, the modern tourist pays more and more attention to his health, ecological products are increasingly in demand as well as destinations far from mass tourist gathering places. Modern tourism trends are based on safety, health care, ecology and culture, and more and more the latest tourism trends are turning to sustainable tourism, ie tourism that is harmonized with the concept of sustainable development (Vidak, Sindik, 2016.). Given all the above, we can conclude that traditional crafts fit perfectly into the model of modern tourism - because they offer an intimate experience of the culture of a region, because they comply with the guidelines of the concept of sustainable development, because they are "healthy" for the environment, because they offer additional emotional value. However, it is essential that traditional crafts, as a specific and delicate part of the cultural heritage, fit into the tourist offer in a way that will not damage them, that will not be superficial and that will not just use them. It is necessary to find a model according to which traditional crafts will both come to life and live throughout the year, not only during the season. In other words, tourism can be an excellent platform for the renewal of traditional crafts, but the question is whether there is a sufficiently developed awareness of the importance of preserving this part of our culture, and thus sufficiently developed awareness to "use" such cultural goods in the right way.

7. CONCLUSION

What exactly are traditional crafts and why do they need to be rehabilitated? According to the official definition, traditional crafts are crafts that require special knowledge of craftsmanship and skills in performing activities and which are performed with a predominant share of manual labor, and which rely on production patterns, purpose and form on patterns of tradition, and in that sense they can symbolize local, regional or national identity. Traditional crafts need to be rehabilitated not only because of their value to that local, regional or national identity, but also because they represent a special segment of supply that industrial production cannot offer, at least not entirely in that form. It is a special "feeling" and "experience" that the customer achieves with the product through traditional crafts. What is the current situation in Croatia in terms of traditional crafts? Although Croatia has a rich cultural and historical heritage and a rich heritage in terms of traditional crafts, only 18 traditional crafts are currently registered in the Register of Cultural Heritage of the Republic of Croatia - from all over Croatia. This disparity between the actual situation and registered trades leads us to the conclusion that the restoration, preservation and promotion of traditional crafts in Croatia is not approached in an adequate way (with some exceptions). On the other hand, the potential is huge and it is to be hoped that in terms of caring for traditional crafts, conditions will improve and the attention they deserve will be given to them. How do traditional crafts fit into the tourist offer? Traditional crafts in a special and direct way represent the identity of a particular destination and as such are irreplaceable as part of the tourist offer. There are many successful examples of building a brand of tourist destination on the basis of traditional crafts - Murano and glassmaking, Venetian masks, oriental rugs and more. In terms of potential and realized examples from practice in Croatia, there is the CRAFTATTRACT project, which laid a great

foundation for the rehabilitation of traditional crafts in Croatia and showed that the renewal of traditional crafts greatly contributes to tourism and that in this segment lies huge potential, then also great potential of Adriatic drywalls, ie drywall architecture, which was recently included on the UNESCO list of intangible heritage, then there is the chest of drawers of the Ivanec region... These are just some of the projects that are already realizing or can realize the huge potential they have. Finally, it is important to note that traditional crafts as part of the tourist offer fit perfectly into modern tourist trends (modern tourists pay more attention to their health, seeks organic products, appreciate the application of sustainable development, want to "feel" the destination in its essence, not only superficially, they are increasingly leaning towards destinations far from mass tourist gathering places, looking for a certain intimacy and personalized approach, a special "experience") all the more important to renew these trades, ie exclusively for tourist purposes because such projects must not be approached superficially and once - it is important that renewed traditional crafts live all year round, not just during the season, because only then can they realize their potential to the full, not only tourism but and the overall economy and culture of their country.

THE INFLUENCE OF INVESTMENT POLICY ON THE SECTORS OF FUEL AND ENERGY SECTORS

Tunzale Gurbanova

*Associate Professor at Azerbaijan State University of Economics (UNEC),
Department of "Finance and financial institutions", Azerbaijan
tunzala_gurbanova@unec.edu.az*

ABSTRACT

The fuel and energy system is a key sector of the economy, which largely determines the country's development opportunities in the economic, social, technological and political spheres. Therefore, the study of the relationship of energy with the economy is a traditional research topic. These studies are based on a systematic research methodology, which implies a comprehensive consideration of all aspects and areas of interaction between the economy and the fuel and energy industries with the development of methods, economic and mathematical models, and an information database for their regular use as part of a quantitative analysis of the status and prospects of fuel and energy system development. To study the impact of investment policy in the industries and individual large companies of fuel and energy systems on the development of the economy, a methodology and appropriate model-information tools have been developed aimed at assessing the national economic effect, including the intersectoral multiplicative effect of investments in fuel and energy sectors. The economic effect of investments in thermal power plants includes:

- The interindustry multiplicative effect of the growth of investments in the sectors of thermal power plants is the increase in production in the sectors of the investment complex and along the chain of intersectoral relations in all other sectors of the economy, due to an increase in orders for investment goods and services.*
- Intensification of the growth of investment and production in the economy due to a reduction in the price burden on industrial consumers of electricity.*

Keywords: *investment, state, fuel and energy system*

1. INTRODUCTION

The fuel and energy system is a key sector of the economy, largely determining the country's development opportunities in the economic, social, technological and political spheres. Therefore, the study of the relationship between energy and the economy is a traditional research topic. Considering the high importance of the products of the fuel and energy complex in foreign trade turnover, as well as the significant role of the complex in the formation of the budget, it can be concluded that the development of the domestic economy and the improvement of indicators of the electric power industry, oil and gas and coal sectors are in direct relationship. The close connection of the economy with the development of the fuel and energy complex requires a competent investment policy in this area, since an effective investment process will make it possible not only to increase the profitability of companies in the fuel and energy complex, but also to strengthen the financial stability of the state, which is especially important in the context of overcoming the consequences of the global financial and economic crisis.

2. METHODOLOGIES FOR RESEARCHING SYSTEMIC RELATIONSHIPS BETWEEN ENERGY AND THE ECONOMY

Research on the relationship between energy and the economy is based on the methodology of systems research, which implies a comprehensive accounting of all aspects and directions of interaction between the economy and the branches of the fuel and energy system with the

development of methods, economic and mathematical models, an information database for their regular use within the framework of quantitative analysis of the state and development prospects fuel and energy system. Currently, it is a synthesis of the following methodological and instrumental directions:

- model and information complex for predictive macroeconomic research;
- method, algorithm and software for multilinear programming, which allows using the prices of products, tax rates, levels of industry wages, etc. as the desired variables in optimization problems;
- software package for automated interactive development, modification and use of static and dynamic economic and mathematical models;
- methodology for forecasting calculations aimed at finding optimal compromise solutions;
- methodology, information database and calculation models for forecasting socio-economic development;
- a model for predictive studies of the macroeconomic consequences of various measures to limit greenhouse gas emissions in the country with a more detailed consideration of individual carbon-intensive industries.

Studies of the interrelationships of the branches of the fuel and energy system with the economy are aimed at:

- Coordination of the parameters of the state investment, price, tax and export policy in the energy sector with the dynamics of the development of the fuel and energy system, the possibilities of the state budget, energy-consuming industries and the population.
- Macroeconomic substantiation and assessment of the national economic consequences of strategic decisions in the development and reforming of domestic energy markets, taking into account the balance of interests of energy producers and consumers, based on the goals of economic development and the situation in external energy markets.
- Coordination of rational options for production and investment programs of energy industries and large companies with the forecast dynamics of macroeconomic indicators and forecasts of the development of related non-energy sectors of the economy.
- Research into the impact of investment policies in industries and individual large companies on economic development. Assessment of the national economic effect from investments by industries and large companies in the fuel and energy system. Determination of directions, rational volumes and systematic assessment of the effectiveness of import substitution in the economy.
- Analysis of possible incentive mechanisms and assessment of the consequences for the country's economy of various measures to contain greenhouse gas emissions in the country;
- As part of the formation of prospective assessments of demand for fuel and energy resources in the regions, the development of mutually agreed scenarios of socio-economic and industrial development, taking into account possible changes in the current trends in the sectoral structure of the economy.

3. ANALYSIS OF THE IMPACT OF INVESTMENT POLICY IN INDUSTRIES AND INDIVIDUAL LARGE COMPANIES OF THE FUEL AND ENERGY SYSTEM ON THE DEVELOPMENT OF THE ECONOMY

Despite the weak dependence of the financial stability and investment attractiveness of gas companies on the pace of reforming the domestic gas market revealed in the study, it was recommended not to postpone the creation of a competitive gas market sector due to the great uncertainty of future world fuel prices. To study the influence of investment policy in industries and individual large companies of the fuel and energy system on the development of the

economy, a methodology and corresponding model and information tools were developed aimed at assessing the national economic effect, including the inter sectoral multiplier effect from investments in the fuel and energy sectors. systems. The national economic effect of investments in the fuel and energy system includes:

- An increase in the net value of both the electric power industry as a whole and the nuclear power industry separately due to a decrease in the specific operating costs of the industry and an increase in production capacities - a direct effect.
- Growth in the export of hydrocarbons released due to changes in the structure of fuel supply to power plants with the accelerated development of the electric power industry
- Cross-sectoral multiplier effect from the growth of investments in the sectors of the fuel and energy system - the growth of production in the sectors of the investment complex and along the chain of inter-sectoral links in all other sectors of the economy, due to an increase in orders for investment goods and services.
- Changes in the dynamics of electricity prices during the modernization of the electric power industry
- Intensification of investment and production growth in the economy due to a decrease in the price burden on industrial consumers of electricity.

The inter sectoral investment multiplier of the sectors of the fuel and energy system can take on values greater than one only in the following cases:

- First, when, in order to meet the investment needs in the fuel and energy system, it is necessary to increase production in the economy to such an extent that this, in turn, will require an increase in production capacity in related industries and along the chain of inter-industry ties and other sectors of the economy.
- Second, when the overall growth of production in the country, due to the intensification of investment activities in the fuel and energy system, leads to an increase in the incomes of the population and the state, which, in turn, causes an increase in the final consumption of households and state institutions.

The development of the energy system is closely related to the development of the entire economic complex and social sphere of the region. As an element of socio-economic systems, the energy complex participates in a variety of forward and backward connections; affects the change in prices for products of all types, on the amount of profit and resources for investment in the industries of the production and non-production areas; determines the change in income and savings of the population, changes in the budgets of various levels; affects many other elements of these systems. The quality and availability of energy resources largely determine the structure and rates of economic, social and environmental development of the region. The development of the regional fuel and energy system is also determined by a number of internal and external factors, the most important of which are the development of energy-intensive industries, the processes of restructuring the economic complex, the availability of natural fuel and energy resources in the territory, the degree of participation in national programs for the development of energy industries. Regional energy development planning can be carried out only within the framework of regional socio-economic systems, which are complex and open. The complexity of the socio-economic system of the region is determined by the existence and mutual influence of social, economic, ecological subsystems, as well as governing influences of various levels. Analyzing the existing practice of territorial and sectoral forecasting and planning, we can note the insufficient development of theoretical and methodological approaches to the organization and methodological support of forecasting and planning. Frequent inconsistencies between plans and results, as well as their regular revision are quite common phenomena.

This state of affairs negatively affects the state of the energy market and the sustainability of the region's development. The consequences of lack of planning in the energy sector can be catastrophic, but more often they lead to economic losses and imbalances in development. There are losses for investors who finance the development of the energy sector in territories where energy consumption is not growing. Investors developing energy-consuming industries, which are not provided with the necessary volumes of energy resources, are losing. Consumers who do not receive high-quality energy supply services are losing. It is obvious that the solution to the issue of placing the elements of energy systems as objects of energy infrastructure cannot be solved in isolation from the general tasks of territorial planning for sustainable development of territories. This means that planning the development of energy systems in the territorial planning system includes, as a basic element, the solution of economic issues of the development of the territory in general and its energy complex in particular. As practice shows, in the processes of territorial planning, the entire available arsenal of methods of economic forecasting can be widely used. Economic forecasting and planning is a complex multi-stage iterative process that solves a wide range of problems using a variety of methods in combination. The development of computer science and computer technology creates an opportunity to expand the range and improve the forecasting methods used. Methods, mostly based on extrapolation of existing trends, cannot take into account many emerging factors and trends associated with the complexity and openness of socio-economic systems. A practical confirmation of the existence of these problems is the cardinal revision of various kinds of long-term forecasts at the national and regional levels, caused by the global financial crisis. In general, the post-industrial level of civilization development is characterized by the rapid development of technologies, knowledge, information, technological and organizational innovations become the main resources. Development properties such as instability, disorder, nonlinearity of interactions, etc., are of the greatest importance. The modern understanding of the development of complex systems (with the preservation of previous models, but for limited areas of application) involves the alternation of periods of relatively stable development with critical states, as a result of which qualitative changes and transition to new structures occur. Random fluctuations can be of decisive importance in choosing the further path of evolution of the system at such points. Predicting which of the possible alternatives of the system's development trajectory and in what form will be implemented is one of the main tasks of long-term forecasting. Modern approaches to predicting the future, taking into account these features, are described by a number of theories, which in a general sense are called the theory of self-organization. In our opinion, these concepts should be included in the theoretical basis for the development and implementation of forecasts for the development of the region. Synergetics, which studies the processes and principles of self-organization of complex systems, the emergence, maintenance, stability and decay of structures of a wide variety of nature, makes it possible to expand the scientific basis of forecasting and take into account the peculiarities of regional forecasting of the development of the energy complex. The use of a synergistic approach assumes that along with organizational processes in the system, the processes of self-organization and self-development, which are characterized by spontaneity, unexpectedness of formations and emerging structures, are extremely important. The development of such systems can generate sustainable and efficient new structures. The presence of crises is considered as an integral feature of the development of complex systems, and disequilibrium is a necessary condition for the emergence of a new organization, a new order, new systems, that is, development. Open systems in a state can self-organize if the prerequisites for this are already laid down in the system itself. In the process of self-organization, the system again comes to a stable state at a higher level of complexity.

4. CONCLUSIONS

In order to achieve sustainable development of the fuel and energy complex, activation and improvement of the efficiency of the investment process is acquiring a key role. The investment policy in the fuel and energy complex is intended to become a purposeful, scientifically grounded activity of government bodies to regulate investment processes through the attraction and effective use of investment resources in solving problems associated with the development of the fuel and energy complex. The most important area of state support in the field of energy conservation is the reimbursement of part of the cost of interest payments on loans and borrowings received from credit institutions for investment activities, implementation of investment projects in the field of energy conservation and energy efficiency. The most important factors in attracting investment in the sectors of the fuel and energy complex are institutional reforms aimed at developing a competitive environment, creating high-tech specialized companies, and reducing the tax burden on the processing industries. In the current conditions, in our opinion, one of the most important tasks of the state is to increase the investment attractiveness of the production of light oil products, since the production of dark oil products does not require a high degree of processing of hydrocarbons. Thus, the issue of institutional support of this direction as the most promising for the domestic fuel and energy complex and the most profitable for oil companies is becoming more and more urgent. Thus, in order to increase the investment attractiveness of the domestic fuel and energy complex, it is necessary to implement a number of institutional transformations aimed at increasing the level of energy conservation of the complex, developing competition, and the participation of foreign investors in the development of new deposits within the framework that does not contradict national interests. However, the most important measure to improve the efficiency of the complex as a whole is, in our opinion, tax reforms aimed at stimulating the refining of petroleum products in the country and reducing the share of crude oil exports. Refining petroleum products on their own territory will allow companies to increase profits, in the long term, will increase revenues to the country's budget, and will also give an impetus to the development of related complexes.

ABSTRACT

The article is devoted studying the features of state regulation of the labor market. The essence of the labor market has been identified and legal regulation of the labor market and trends of its development are taken into consideration. At the current stage of economic development, it is necessary to improve labor market regulation not only in the republic and regions, but also in economic sectors. To achieve a positive outcome, there is a need for an integrated approach to its improvement, based on a qualitatively new level of the regulatory system. Development of new technologies, cities' labor market is open to competition due to limited workplaces and low demands. The rural population has a lot of chances to find workplaces in the city's industry and service sectors. But how should this be adapted to the need for urban labor? Does the city provide a guarantee for adequate workplaces? These questions should be answered systematically. Regulation of the labor market should be based on application of modern technologies and timely adjustments to monitor the market situation. The main concepts and categories that reflect the processes in the employment area of the population are reflected in article in one or another way. In particular, factors and mechanisms affecting level of employment have been studied in this article.

Keywords: *economy, labor, market, development, mechanism*

1. INTRODUCTION

In modern conditions, the most effective methods of employment and labor market regulation are used. The state regulates investments in various sectors of the economy, controls the retraining of employees, monitoring of employment, implements various programs to reduce unemployment, pays unemployment benefits, and organizes public affairs. All measures taken to reduce unemployment or to help the unemployed people require a significant amount of additional costs, therefore, all countries can solve this problem in a timely and comprehensive manner. The methodological basis of the article is the works of economist scientists in domestic and foreign countries, the laws, programs, regulations and other normative legal acts in this field. In the research process, economic-statistical, monographic, targeted-program systematic approach, analysis and synthesis, summarization, induction, deduction and other methods were used.

2. REGULATION OF THE LABOR MARKET

The state regulation mechanism of the labor market can be considered as a sub-system of the economic system regulation as a whole. It's like a "balance mechanism". In regulating labor relations, all activities of the state should be transparent and open. The labor market is regulated by the state [1, p.118]:

- Programs aimed at creating works in the public sector;
- Programs enabling the preparation and retraining of the labor force;
- Programs promoting employment;
- Government programs for public unemployment insurance.

The state mechanism for regulating the labor market can be classified as follows. Administrative methods - are essential elements of economic activity. Economic methods affect labor market participants and stimulate them economically. Therefore, it is possible to provide effective employment by correcting the behaviors of the participants. The state directly affects the direction of the labor market. This is done through the following instruments: employment measures financed by the state, tax incentives for businesses that create jobs and etc. There are also organizational measures used by the state to create socio-economic conditions for all participants in the labor market. The tools used are: labor market forecasting, development of regional development plans, organization of employment services, etc. The legislation plays an important role in the state regulation of the labor market. State policy is traditionally based on legislation. Because legislation, norms, and rules are required for the efficient functioning of the market. The main place of labor law resources is the Constitution of the Republic of Azerbaijan dated November 12, 1995. This document, which has the highest legal power, is the basis of the legislation, so that, all laws and other acts of state bodies are adopted on its basis and in accordance with it. The Constitution defines the basic principles of the legal regulation of labor. In accordance with these principles, Article 35 (right to work), Article 36 (Right to Holiday), Article 37 (Right to Rest), Article 38 (Right to Social Security), Article 41 (Right to Health) and other articles of the Basic Law form the basic meaning and content of national labor legislation. After the Constitution, the Labor Code of the Republic of Azerbaijan takes a major place in the system of labor legislation. The Labor Code of the Republic of Azerbaijan consists of 13 sections, 48 chapters and 317 articles approved by the Law of the Republic of Azerbaijan dated February 1, 1999, and entered into force on July 1, 1999. The Labor Law of the Republic of Azerbaijan is a legislative law that combines the legal norms regulating labor relations on the territory of the Republic and makes it systematic. The first important works to regulate the labor market in Azerbaijan has been done by the National Leader Heydar Aliyev. Then President IlhamAliyev continued his policy in this direction. The main purpose of the policy of the socio-economic development pursued by the Azerbaijani President IlhamAliyev is the development of human capital, the expansion of employment opportunities and the expansion of entrepreneurship activities, the creation of an inclusive labor market and the provision of good jobs in Azerbaijan. Presidential Decree dated October 26, 2005, "Employment Strategy of Azerbaijan (2006-2015)" was successfully implemented. During the implementation of this strategy, the unemployment rate fell from 7.3% to 5% and rate fell poverty from 29.3% to 4.9%, the population's income increased 5.2 times, the minimum wage increased by 3.5 times, the average monthly nominal wage increased by 3.8 times. Complex measures have been taken to identify trends in the labor market, to increase employment and to create favorable conditions for general economic activity, to increase the competitiveness of the workforce and other key areas. Under the relevant decree of President, the Commission on the regulation and coordination of labor relations was established and this Commission approved the Action Plan to prevent non-formal employment in Azerbaijan. Insurance coverage was initiated with the introduction of the unemployment insurance system. It is expected that the new employment strategy will have an important role in the development of public policy and in the transition to intensive development. This document analyzes the current situation and trends in the labor market in detail and reflects the priorities for 2019-2030. Economic development is the promotion of micro, small and medium enterprises, regulatory framework and institutional development, labor market regulation, labor force development and improvement of labor standards [8]. Economic development envisages activities on support micro, small and medium enterprises, regulatory framework and institutional development of labor market regulation, development of labor force skills and improvement of labor standards [8]. It is also important to know certain definitions when improving labor market regulation issues.

The conjuncture is a temporary situation that explains some of the signs of the current state of the labor market. An important element of the market mechanism is competition. Competition in the labor market allows with a large number of independent employers and workers to compete freely for prestigious work and skilled workers and allows to enter and to leave the market freely. It is important to maintain and support the citizens working on qualified education and restructuring, including the unemployed, state employment assistance agencies dealing with their social problems, personal services of enterprises and organizations, commercial and non-profit workers' exchange in the labor market infrastructure management. There are also some scientific classifications in this field [2, p.8].

3. HUMAN CAPITAL IN LABOR MARKET REGULATION

The development of the labor market is closely related to regional development. The labor market is an important element in the regional system and ensures the implementation of the targeted regional rehabilitation process. Within the regional system, it cooperates primarily with finance, credit, and material resources, investments, consumer goods, information and knowledge markets. This involves the development of regional employment programs covering the social protection of the population. Regional programs should be based on the concept of labor market regulation, job creation, and maintenance (as a whole, socio-economic and demographic development of the region, production and occupational potential, etc.). One of the most important issues in the regulation of the labor market is the serious consideration of human capital. The human factor is a complex, multifaceted, and very important concept. None of the areas such as general development of the society, understanding the laws, revealing the nature of secrets, creating complex robotic systems, conquering space, and so on cannot be achieved without human efforts. In modern conditions, intensification of production, an increase of its efficiency, strengthening of saving mode, and acceleration of socio-economic development are considered as the most important problem. Because of the efficient development of the economy, improving the living standards of the people, and the fulfillment of the tasks facing the society, first of all, depends on these factors. These factors include the capacity of natural resources, organization of production, level of production facilities, development of scientific and technical progress and etc. The extent to which these factors are used determines the dynamics of the development of each society. But the human factor triggers all these factors and is universal for all of them. Without human effort, it is impossible to mobilize any of these factors, to regulate them, and to lead the overall development of society [5, p.14]. The increased interest of the economy to human capital is due to the willingness to evaluate the effectiveness of the productive forces of the organization's employees. Human capital reflects the knowledge, skills, and abilities of people who are able to create personal, social and national well-being. This is a key concept for the successful development of any country in the post-industrial era. Human capital is the most valuable resource. Human capital, factories, equipment, and production resources are the basic principle of competition, economic growth, and efficiency. Human capital in organizations is a major source of substantial and sustainable competitiveness. The main acceleration of the evolution of mutual relations in the market economy is competition. The successful outcome is the presence of an enterprise that can continue to compete internally and internationally. The most important factor in the market economy is the ability to compete, and people determine the types of economic activity [3, p.7]. Therefore, proper execution of human capital assessment models directly affects the activities of enterprises. The role and place of a person in the process of social rehabilitation has been of great interest. Researchers have repeatedly sought to identify the characteristics of human capital, evaluated and characterized them qualitatively and quantitatively [4, p.8]. Proper implementation of human capital in the labor market necessitates labor contracts. Proper regulation of labor relations and continuous improvement of the legal and normative base in

this area plays a special role in the development of socio-economic relations. Thus, the proper management of labor relations on a legal basis reduces the social burden of the state and leads to increased productivity in enterprises and organizations. Considering all this, it can be assumed that general development, as well as personal characteristics on the fields, should be considered during labor relations regulation. The regulation of labor relations is directly related to the labor contract. The Labor Contract (The Employment) Agreement) is a written agreement between the employer and the employee. Based on this contract, the employer provides the employees with relevant work related to their employment functions, creates labor conditions in the Labor Code, other normative legal acts, collective agreement, pays their wage, and the employee undertakes to fulfill the contract of employment. Thus, a labor contract is an important document that reflects all aspects of the current business relationship between the employer and the employee. This document reflects the fundamental rights and fundamental responsibilities of the employee, as well as the fundamental rights and obligations of the employer and the responsibilities of the employer. Each employer must sign a written employment contract with at least two copies. Improvement of the employment contract system has special importance in improving labor market regulation mechanisms. In modern conditions of the labor market, the optimal ratio issues of development and demand is of particular importance. Traditionally, factors related to wage level were determined in the study and implementation of labor supply formation processes. Further development of labor market theory provides for the research and disclosure of the content of the proposal [6, p.1]. As a rule, the labor market supply implies the number of labor services that can be offered at a certain time on a certain salary market. [7, pp.114]. Trends and volatility trends can be adjusted depending on the qualitative and quantitative indicators of the proposal's topics. For example, the educational characteristics of the labor force may be the basis for adaptation of supply and demand in the labor market. Therefore, the most important methodological problem in labor market theory is to determine the factors affecting the supply potential in local, regional and national labor markets. Traditionally, classical economic theory determines that labor largely depends on the level of payment. [6, p.114]. The analysis of the situation in our national space related to the labor market improvement mechanism is also important. Azerbaijan's labor market is constantly developing and at the same time facing structural changes. Small and medium-sized enterprises have started to play a very important role in the economy, the workplaces created in this segment are constantly increasing. The growth of small and medium-sized enterprises is also a serious problem in terms of compliance with labor protection and security measures. In this respect, ILO partners provide technical assistance to develop and implement effective strategies that meet new challenges in this area.

4. CONCLUSION

Creating an effective system of state regulation of the labor market is one of the major social goals of reform. In the context of modern socio-economic development, the state policy in the labor market should, in order of priority, fulfill the following tasks:

- 1) the necessity for the ability to work for increasing labor productivity, improving the quality of products and services;
- 2) renewal of staff potential as a result of the employment of young people receiving modern vocational training;
- 3) Strengthening the role of professional labor correlation in increasing employee income and relevant changes in labor motivation (highly productive work - high wages);
- 4) considering the ability to work economically, prophylactic and proactive vocational educating, training and retraining of economically active citizens in order to provide competitiveness;
- 5) the inclusion of unemployed citizens in public and other temporary workplaces;

- 6) providing effective interactions to coordinate the ways in which employees, employers, and government agencies can solve employment problems\$
- 7) the development of an effective mechanism for the expansion of social partnerships in the creation and protection of workplaces, targeted support for creation and protection of workplaces for non-competitive citizens;
- 8) Implies that, strengthen the integration of the employment policy program at the regional level, which includes the general plan of socio-economic development, focusing on labor market issues at the regional level. The purpose of this policy is to have an exceptional significance for adapting the HR policy of enterprises and organizations (if labor efficiency is one of the key priorities of the public employment policy). The policy aimed at the shaping of a well-functioning labor market is related to the need to eliminate deformations in the labor market and to the inevitable struggle against unemployment which requires a great investment in the maintenance and development of human capital.
- 9) As a result of the development of new technologies, cities' labor market is open to competition due to limited workplaces and low demands. The rural population has a lot of chances to find workplaces in the city's industry and service sectors. But how should this be adapted to the need for urban labor? Does the city provide a guarantee for adequate workplaces? These questions should be answered systematically.

ABSTRACT

The exchange rate is an important factor in the development of the national economy of any state. In addition to the financial market, this factor also affects other sectors of the economy, since money itself is the only measure of the value of goods and services. For many years, economic theory assumed a predominantly negative impact of an appreciation of the national currency on economic activity in the country, linking the strengthening of the currency with the switch of domestic consumption from domestic goods to cheaper imported ones (expenditure-switching effect), with a reduction in the production of tradable goods. with a decrease in the level of competitiveness in the domestic and foreign markets, with a fall in exports and, as a result, with a decrease in the current account balance of the balance of payments. However, over time, theoretical models have emerged that illustrate the positive effects of an appreciation of the exchange rate, expressed in the growth of aggregate output. Research results on the impact of changes in the exchange rate on economic activity are quite contradictory. The ambiguous nature of the relationship between the exchange rate and economic activity is explained by the presence of several channels of influence of exchange rate changes on economic activity. The main purpose of our research is to analyze the influence of the dynamics of the real exchange rate on economic activity. As shown in the literature review, the effect of the real exchange rate on economic activity can occur through several channels. First of all, it is necessary to single out two effects of the influence of the dynamics of the real exchange rate on economic growth along the demand channel. The first is the expenditure-switching effect of replacing demand for domestic goods with demand for imported goods while strengthening the national currency in real terms, which leads to a decrease in production and deterioration of competitiveness in the tradable sector. The second important effect is the income effect, which consists in a decrease in prices for imported goods with a subsequent increase in real incomes of the population, which can lead to an increase in demand, including for domestic goods, causing an expansion of their production. The study examines the impact of exchange rate dynamics on economic activity in Azerbaijan. To obtain estimates, the SVAR-X methodology and the most recent data on the Azerbaijani economy are used. In the work, VAR models are constructed using detrended series. The vector autoregressive model (abbreviated as VAR - Vector Autoregressive Model), firstly, is presented as a generalization of AR-models in the case of using multivariate time series. And secondly, the VAR model is a special case of a system consisting of simultaneous equations. The models of this specification are widely used in both structural analysis and forecasting due to their relative simplicity and consistency. But for the correct display of the dynamics of the actual time series data, VAR models often require large amounts of lags, which can lead to large errors in the obtained forecasts. The use of high-dimensional VAR models can potentially make the forecast quality more correct.

Thus, the VAR model describes a certain joint development of variables for a selected period of time, relying on a number of information contained in the studied time series themselves. Using structural vector autoregression with exogenous variables (VAR-X), we analyze the impact of exchange rate dynamics on economic activity. We have shown using the Time Variable Ratio Model (TVP-VAR) that the pass-through effect exhibits only small fluctuations over time. The main result of this work is the conclusion that the weakening of the real effective exchange rate affects economic activity either positively or neutrally. It should be noted that the described hypotheses characterize the effect of the real exchange rate on economic growth in the short term, while in the long term the scheme of influence can change dramatically. We are examining the effect of the dynamics of the real exchange rate on economic activity without taking into account many other factors; therefore, the results obtained should be interpreted with caution.

Keywords: *currency, exchange rate, Azerbaijan economy, vector autoregressive model, economic activity*

1. INTRODUCTION

In modern conditions of dependence on the globalization of the world economy, the rapid development of international financial and foreign exchange markets, the expansion of external economic relations, each country in the world pays great attention to the role and significance of the exchange rate of the national currency. The role of the exchange rate of the currency is of great importance due to the fact that it has an impact on the export sector of the economy, domestic production, services, investments, as well as the formation of prices for goods within the country. Moreover, in conditions of high competition in modern world markets, the exchange rate of the national currency has become one of the factors ensuring competitiveness between national economies. Analysis of the impact of the exchange rate on economic activity makes it possible to find out the sector of the economy that most of all affects the aggregation results, and relatively early to identify the possible effects of the exchange rate, to determine the right directions in economic policy. Such studies also make it possible to understand the consequences of possible changes in the structure of the economy in terms of the impact of the exchange rate. By analyzing the impact of the exchange rate on economic activity, we will have the opportunity to understand how the depreciation or appreciation of the national currency plays a decisive role for the sector of the economy. The mechanism of the relationship between the exchange rate and economic activity in the short term is rather complicated. On the one hand, it is generally accepted that a real weakening of the currency leads to an increase in the cost of imported goods relative to goods produced within the country, which in turn causes import substitution and an increase in economic activity. On the other hand, a number of empirical and theoretical works have shown that the exchange rate can have a negative and positive impact on the dynamics of economic activity. Thus, the exchange rate, depending on various factors, can have a different direction of influence on the dynamics of economic activity. The economic literature has identified many channels through which the choice of exchange rate regime can influence macroeconomic performance. It is believed that a floating exchange rate contributes to a faster adaptation of economies to macroeconomic shocks. At the same time, uncertainty about the future values of the exchange rate may have negative consequences for investment activity and, as a consequence, economic growth in general. The ambiguity of the influence of different exchange rate regimes on economic growth explains the existence of a whole array of works devoted to this issue. The purpose of this study is to identify the features of the impact of the exchange rate on the economy, including the relationship between the level of the exchange rate and the dynamics of economic activity.

2. LITERATURE SUMMARY

For a long period of time, the economic literature has been dominated by the view that there is a negative relationship between the exchange rate and economic activity. provided that the economy has free production resources. Otherwise, the result of the depreciation is the rise in prices. However, over time, theoretical models have emerged that illustrate the positive effects of an appreciation of the real exchange rate, expressed in the growth of aggregate output [Obstfeld M. 2001]. In terms of aggregate supply, appreciation tends to accelerate economic growth. Thus, the strengthening of the national currency means a decrease in the costs of producers who import a significant share of raw materials and components (input cost effect) [Idrisov G.I., 2010]. Increasing the availability of imported high-tech equipment helps to improve the structure of the economy, stimulating the development of innovative industries [Bahmani-Oskooee M., Kutan A. M., 2008. Delli Gatti D., 2007]. The change in the exchange rate is not always positive, it can lead to negative consequences in various spheres of the economy [Evdokimova, T.V. 2013]. The weakening and strengthening of the exchange rate have both positive and negative consequences for economic growth [Glazunov, S.N. 2015]. There is a significant statistical correlation between the real effective exchange rate and GDP (real income) [Chinn M.D., 2013]. The presence of a significant negative impact of exchange rate volatility on the increase in production [Abramova OV, Abramov A.V. 2013]. Devaluation of the national currency is a factor of advantages in international competition [Christopoulos D., Gente K., Leon-Ledesma M., 2010]. An overvalued exchange rate negatively affects the rate of economic growth. The degree of overvaluation (revaluation) of the real exchange rate can be estimated by the size of the deviation of its actual values from the values corresponding to the level of economic development of the country [Illarionov A., 2002]. A significant factor determining the strength of the impact of changes in the exchange rate on economic activity is the volume of external debt of the private sector. Given the high volume of foreign currency debt, its devaluation makes it difficult for the private sector to service debt due to a sharp increase in its value [Aghion P., Banerjee A. and Bacchetta P.A, 2000]. The success of import substitution, which is a source of a positive effect from the weakening of the national currency, depends on the structure of preferences of domestic consumers in relation to goods produced domestically and abroad [Kadochnikov P., Sinelnikov-Murylev S., Chetverikov S., 2003]. Monetary policy has a limited impact on long-term economic growth, determined primarily by the growth of total factor productivity. By itself, monetary policy is not capable of ensuring sustainable economic growth, it can only not hinder growth. [Dynnukova O., 2006]. The strengthening of the national currency leads to an increase in the market share of domestic producers with a low elasticity of demand for imported goods [Blank A., Gurvich E., Ulyukaev A. 2006]. A change in the exchange rate can affect the dynamics of the trade balance [Lerner, A., 1975]. The impact of volatility in the long run is difficult to detect. Since, statistically, the volumes of trade are constantly growing, while the exchange rate fluctuates in both directions, and in the short term, this risk is weakened by the presence in developed countries of a developed market of financial instruments that make it possible to level the exchange rate risk in foreign trade operations. (Klaassen, F. 2004). The nature of the relationship between the real exchange rate and competitiveness parameters significantly depends on the level of economic development (Habib et al., 2017), the institutional environment (Rodrik, 2008), the exchange rate regime (Aghion et al., 2009), the degree of dependence of the economy on the export of raw materials. resources (Bahar, Santos, 2018). The results of published studies on the impact of changes in the exchange rate on economic growth are quite contradictory. The ambiguous nature of the relationship between the exchange rate and economic growth is explained by the presence of several channels of influence of exchange rate changes on economic activity.

3. METHODOLOGY

A large number of empirical studies have been devoted to assessing the direction of the relationship between exchange rate changes and economic growth. A depreciation is a rise in prices. This point of view is based on the Mundell-Fleming model, which describes the open economy in terms of the IS-LM model. Under this model, the depreciation of the national currency increases the competitiveness of domestically produced goods, which leads to an increase in net exports. As a result, the equilibrium volume of the aggregate output in the short-term period increases. Regression analysis is used to assess the relationship between the exchange rate and economic growth. Some researchers estimate the regression dependence of the logarithm of real output on the logarithm of the real exchange rate, as well as on the logarithm of real output and the lagging rate. Most researchers, regardless of the time period under consideration or the methods used, conclude that the weakening of the national currency leads to an increase in total output. As shown in the literature review, the effect of the real exchange rate on economic activity can occur through several channels. First of all, it is necessary to single out two effects of the influence of the dynamics of the real exchange rate on economic growth along the demand channel. The first is the expenditure-switching effect of replacing demand for domestic goods with demand for imported goods while strengthening the national currency in real terms, which leads to a decrease in production and deterioration of competitiveness in the tradable sector. The second important effect is the income effect, which consists in a decrease in prices for imported goods with a subsequent increase in real incomes of the population, which can lead to an increase in demand, including for domestic goods, causing an expansion of their production. In addition to the effects of changes in the exchange rate on economic growth from the demand side, it is also possible to highlight the effects that affect through the supply channel. The central issue of our research is to identify the general direction of the influence of the exchange rate dynamics on economic activity in Azerbaijan. Isolation of any specific effect or identification of the strength of one of the effects within a group with unidirectional influence is not within the scope of this study. For this reason, the effects affecting the course in one direction are considered indistinguishable in this work and are considered together. It should be noted that the described hypotheses characterize the effect of the real exchange rate on economic growth in the short term, while in the long term the scheme of influence can change dramatically. It should be noted that the model used in this study does not describe the economy as a whole and is not a model of economic growth, since it is incomplete and does not take into account many observable and unobservable factors that can influence the dynamics of various macroeconomic indicators. The empirical part of the study includes an analysis of the statistical properties of the series, on the basis of which a suitable model is selected, then a similar procedure is performed to study the effect of the exchange rate on economic activity. Based on the data from 2010-2019, we tested the hypotheses about the impact of the exchange rate on economic activity. Smoothing of a number of exchange rates and GDP was carried out using the moving average method. The results of the analysis show that an increasing trend is observed in the dynamics of both series. To select an appropriate model specification, it is necessary to check the series for stationarity, taking into account the possible presence of a trend. To assess the impact of the exchange rate on economic activity (output), a second-order structural vector autoregressive model with exogenous variables (SVAR-X), identified using short-term constraints, was used as the main one. The real effective exchange rate (REER), money supply (M2), dynamics of the production index of basic industries (Q) and inflation (P) were used as endogenous variables. To check the robustness of the results, the model was evaluated against different specifications.

To check the stationarity of the series, two tests for the presence of a unit root (Augmented Dickey-Fuller, DFGLS) and one test for stationarity (KPSS - Kwiatkowski – Phillips -Schmidt – Shin test) are used. At the same time, using the Johansen procedure, the presence of cointegration between the series under consideration is checked.

4. ECONOMETRIC ASSESSMENT OF THE RELATIONSHIP BETWEEN THE EXCHANGE RATE AND GDP

The exchange rate is an important factor in the development of the national economy of any state. Economic theory does not give an unambiguous answer to the question of the impact of changes in the national currency exchange rate on certain macroeconomic indicators: both weakening and strengthening of the exchange rate have both positive and negative consequences for economic growth. Let us consider this issue from a practical point of view, for this we will compare the statistical data on the dynamics of the ruble exchange rate and the dynamics of the main indicator of economic growth - GDP. Based on the statistical data, let us construct a graph of the dynamics of the US dollar / manat exchange rate over the past ten years (figure 1).

Figure 1: Dynamics of the US dollar / manat exchange rate for 2010-2019

Source: <https://www.stat.gov.az/>, The State Statistical Committee of the Republic of Azerbaijan

From figure 1 it can be concluded that the US dollar against the manat has a general upward trend from 2010 to 2019, that is, the manat against the US dollar has been constantly weakening over this period. There was a slight change in the general trend only in 2014. After this period, the manat began to grow against the US dollar. Next, we will build and consider a graphical representation of the dynamics of the euro exchange rate over the past ten years (figure. 2).

Figure following on the next page

Figure 2: Dynamics of the euro / manat exchange rate for 2010–2019

Source: <https://www.stat.gov.az/>, The State Statistical Committee of the Republic of Azerbaijan

From figure 2 it can be concluded that the tendency of the change in the rate of the euro against the manat is similar to the tendency of the dynamics of the dollar against the manat. To analyze the growth of the Azerbaijani economy, let us consider the indicator of the gross domestic product in dynamics (figure. 3).

Figure 3: Dynamics of the GDP of the Republic of Azerbaijan for 2010-2019 at current prices, million manat

Source: <https://www.stat.gov.az/>, The State Statistical Committee of the Republic of Azerbaijan

According to this indicator, it will be possible to determine the general state of the economy of Azerbaijan for the period under study. According to the graphical analysis of the dynamics of the indicators of the exchange rate of the main currencies against the manat and the GDP of Azerbaijan, it can be concluded that they are closely interrelated, since the growth trends are

similar to each other for all three indicators. It should be noted that with a gradual increase in the rate of the manat, the level of GDP increases. But this does not mean an absolute positive effect from the depreciation of the manat. There are both positive and negative changes. First of all, when constructing a model, it is required to carry out tests for stationarity and the presence of a unit root for the series of the real effective exchange rate, money supply, inflation and production index of the basic industries. Table 1 shows the results of two unit root tests (Augmented Dickey-Fuller, DFGLS) and one stationarity test (KPSS). These series are disaggregated in comparison with their quarterly counterparts, but there is no unambiguous answer about the correspondence of the order of integration in the same series, calculated at different intervals. Here, for example, seasonal unit roots can play a role, which can be smoothed by aggregation. This theoretical question is beyond the scope of this work, as a result of which the authors rely only on the test results when checking the series for the presence of a unit root and stationarity. Series analysis results are contradictory. The Dickey-Fuller test rejects the hypothesis that the series has a unit root in favor of the hypothesis that the trend is stationary only for the inflation series.

Table 1: Tests for the presence of a unit root and stationarity

Variables	DF	KPSS	DFGLS
GDR	0,0609*	< 1%	< 10%
REER	0,2106	< 5%	< 15%
M_2	0,8954	< 2,5%	< 10%
P	0,0017***	< 2,5%	< 5%
Q	0,0023***	< 2,5%	< 5%

*Note: *** corresponds to significance at the 1% level, ** - at the 5% level, * - at the 10% level*

The KPSS test for stationarity relative to the trend does not reject the main hypothesis only for a series of money supply in real terms. At the same time, the DFGLS test rejects the hypothesis of the presence of a unit root in all cases, which makes it possible to interpret these series as stationary relative to the trend. The number of lags in the specifications of the DFGLS and Dickey-Fuller test equations was selected based on the Akaike information criterion. On this set of series, the Dickey-Fuller test rejects the hypothesis of the presence of a unit root in about half of the cases. For the reason, the pronounced seasonality of the GDP series, the model included dummy variables that characterize this factor: D_i is a variable corresponding to the seasonal deviation of the i -th quarter. The extended Dickey-Fuller test was used to analyze the order of integration of variables in this and all subsequent models. All variables included in the final model in the studied interval turned out to be integrated in the first model was estimated in stationary differences. The final regression equation is shown below.

$$\Delta Y = -2,67 - 10,805 \cdot D_1 + 12,34 \cdot D_2 + 18,45 \cdot D_3 - 0,78 \cdot \Delta REER$$

$$t \text{ -stat} \quad -1,06 \quad -3,21 \quad 2,11 \quad 6,64 \quad -2,03$$

$$R^2 = 0,896, \quad DW = 2,11$$

The coefficient of the variable $\Delta REER$ is significant and negative. Accordingly, we can conclude that an increase in the real exchange rate of the manat has a holding effect on GDP. Let us now estimate the relationship between the manat exchange rate and the dynamics of the production index of basic industries. Both series (real exchange rate and production index of the underlying industries) are first-order integrated.

Therefore, the equation was estimated in stationary differences. As a result, the model presented below was obtained.

$$\Delta Q = 3,04 - 0,84 \cdot \Delta REER - 23,06 \cdot D_1 + 9,21 \cdot D_2 - 3,17 \cdot D_3$$

t –stat	3,02	-2,27	-11,88	5,04	-4,55
-----------	------	-------	--------	------	-------

$$R^2 = 0,943, \quad DW = 2,09$$

The coefficient of the variable $\Delta REER$ is significant and negative. Accordingly, we can conclude that an increase in the real exchange rate of the manat has a restraining effect on the GDR. The results of the previous section indicate the stationarity of the series under study around a linear trend. In this regard, the model should be evaluated in levels on detrended data. According to the Frisch-Vaux-Lovell theorem, the use of detrended series is equivalent - in the context of the estimates obtained - to control for the trend in the estimated equation, therefore the specification of the basic equation in the levels will look like this:

$$GDR_t = \beta_1 + \beta_2 \cdot trend_t + \beta_3 \cdot REER_t + \beta_4 \cdot M2_t + \beta_5 \cdot Q_t + \beta_6 \cdot P_t + \varepsilon_t$$

It should be noted that the trend is a specific predefined variable. In this regard, it is not entirely correct to interpret the results of evaluating the coefficients for other regressors as the intensity of the influence of each of them on the dependent variable, all other things being equal, since the trend cannot take the same values at different points in time. Therefore, relying on the Frisch - Vaux - Lovell theorem, one should interpret the estimates of the coefficients for other regressors (at the real exchange rate, money supply, and the production index of basic industries) as the intensity of the influence of their deviation from the trend on the deviation from the trend of the dependent variable. The result of evaluating this model is presented in table 2. Note that the results obtained using model evaluations on detrended data should be interpreted taking into account that the coefficients in this case describe the response to a deviation from the trend of a particular variable, and not to its absolute value. rise or fall. Thus, for example, a positive sign of the coefficient at the real rate may indicate that low values of the real rate (below the trend) will negatively affect the level of the dependent variable relative to its trend. It should be noted that such regression in levels does not take into account the possible endogeneity of the variables. The construction of the VAR model with the subsequent analysis of the impulse response functions and the decomposition of the error variance makes it possible not only to take into account the possible endogeneity, but also to check the already obtained result about the absence of a significant effect of the real effective exchange rate on GDP. Assuming the non-stationary nature of the series, it is necessary to check the possible presence of a cointegration relationship between them. The use of a large number of series to search for a cointegration ratio increases the dimension of the space of cointegration vectors and complicates the economic interpretation of the values obtained, therefore, we restrict ourselves to the search for a cointegration ratio between two and three series.

Table following on the next page

Table 2: Possible cointegration ratios

Variables	GDR	
	Possible cointegration relations	Cointegration relationships with trend
REER	0,908*** (0,0321)	0,739*** (0,0540)
M2	0,376*** (0,0631)	0,5696*** (0,0092)
P	0,604*** (0,0099)	0,468*** (0,0135)
Q	0,897*** (0,0123)	0,897*** (0,0123)
Trend	1,087*** (0,0966)	4,308*** (0,0203)
Constant	54,90*** (8,543)	96,09*** (6,234)
R-square	0,928	0,886

Note: Standard errors are given in parentheses. *** $p < 0,01$, ** $p < 0,05$, * $p < 0,1$.

Based on data for 2010-2019, we assessed the impact of changes in the exchange rate on the dynamics of economic activity in Azerbaijan. In addition, the models of the relationship between the exchange rate and the production index of the basic sectors of the Azerbaijani economy were assessed. The methodology for constructing regression equations in all these cases was the same and corresponded to the above case of constructing an equation for the production index of basic industries. The results obtained show that the sensitivity of the index of production index of the basic sectors of the economy to the real exchange rate in absolute value is noticeably higher. The depreciation of the national currency has a stimulating effect on the real GDP of Azerbaijan. Based on the obtained numerical estimates of the parameters of the equations of the model, it can be argued that a change in the manat exchange rate has a short-term positive effect on GDP, while the strengthening of the national currency, on the contrary, restrains its growth. This result is useful from a practical point of view, since it allows the exchange rate to be used as one of the levers of macroeconomic policy.

5. DISCUSSION AND CONCLUSION

It should be noted that this study is interested in the short-term aspect of the interaction between the real exchange rate and economic activity. The short-term relationship between GDP and the real exchange rate obtained by us, strictly speaking, cannot be extended to a long-term period and does not mean that a weak manat in the long run contributes to the acceleration of economic growth. As a result of this analysis, several important results were obtained. First, the estimates indicate that the weakening of the exchange rate has a statistically significant positive effect on export-oriented industries, but the impact on the index of basic industries and on industries with a high share of imports remains insignificant. These findings are consistent with those of theoretical models. The depreciation of the exchange rate improves the competitiveness of domestic industries in foreign markets, therefore it is natural that in export-oriented industries there is a positive effect of currency depreciation. Second, the TVP-SVAR analysis revealed no significant changes in impulse response functions over time. This means that a simpler model, SVAR-X, may be sufficient for analysis. The impulse response functions obtained using the two approaches are also statistically indistinguishable. We have shown using the Time Variable Ratio Model (TVP-VAR) that the pass-through effect exhibits only small fluctuations over time.

The analysis shows that the weakening of the real effective exchange rate affects the main sectors of the Azerbaijani economy either positively or neutrally. It should be noted that the analysis presented by us does not take into account the reasons for the depreciation of the exchange rate, some of which can threaten financial stability, "switching" the economy to a completely different mode of functioning that has not been encountered in the historical period under study. For this reason, we should be very careful in interpreting our results, since they take into account only macroeconomic factors, and it does not follow from them that in the current economic situation, a fall in the exchange rate will create serious positive conditions for the development of the Azerbaijani economy.

STATISTICAL ANALYSIS OF THE IMPACT OF AGING POPULATION ON ECONOMIC DEVELOPMENT

Samira Abdullayeva

*Department of “Mathematics and Statistics”,
Azerbaijan State University of Economics (UNEC), Azerbaijan
samirocka@rambler.ru*

ABSTRACT

Demographic problems are at the center of attention of the international organization today. The demographic problem has an economic dimension, and having mentioned that the downward trend in the working-age population can become a serious brake on economic growth. Indeed, demography is inextricably linked with the economy, and this connection is two-way. It is rather difficult to separate the processes of mutual influence due to the intertwining of many social, economic, political, demographic and other factors and processes. At the same time, less attention was paid to the study of the impact of demographic factors on the economy than the opposite. The demographic transition has been a significant cause of socio-economic change. Population aging is one of four global demographic megatrends, along with population growth, international migration and urbanization, that have a lasting impact on the development of the world. The importance of changing the age structure of the population and its consequences for socio-economic development was recognized in the Program of Action adopted by the International Conference on Population and Development in 1994. Subsequently, the Madrid International Plan of Action on Population Aging was adopted. The solution to the socio-economic problems associated with the aging of the population is provided for by the Sustainable Development Goals until 2030 and the tasks set to achieve them in terms of the commitment to “leave no one behind”. The analysis shows that the world's population is aging, because every year the life expectancy in the world is increasing, and the birth rate is decreasing. As a result, the share of older people in the population is increasing, while the share of working-age people is decreasing. Population aging is a very important process, as it affects all aspects of society. A detailed analysis of the demographic situation in the country and in the world is needed to make decisions concerning the interests of the whole society: in the field of education, health care, the pension system, insurance and others. Therefore, the study of demographic aging is very relevant all over the world. According to the forecasts of the United Nations (UN), in the next 40 years, the proportion of people over 60 will almost double: Globally, the proportion of the population aged 65 and over has increased from 6.2% in 1990 to 9.3% in 2020. By 2030, it may increase to 11.7%, and by 2050 - up to 15.9%. In other words, if now every eleventh person on Earth has already crossed the age limit of 65, then in 2030 every eighth person will belong to this age group, and in 2050 - every sixth person. A few decades ago, it seemed that population aging, that is, an increase in the proportion of the elderly in the total population, was characteristic only of developed countries. However, it has now become clear that this demographic process has spread to almost the entire world, although its scale and speed are different. The purpose of the study is to study the impact of population aging on economic development, then more attention should be paid to such a factor of production as labor. Labor, from a demographic point of view, represents the working share of the economically active population. The paper analyzes the effect of population aging theoretically, using also Romer's endogenous growth model, but adding to this model the human capital variable, which is one of the catalysts for economic development. For further investigation, a descriptive analysis of all variables used is performed to remove insignificant observations or variables. To understand the impact of population aging on economic development, examine variables such as the proportion of people

aged 65 and over and the old-age dependency ratio. The aging of the population is a process that affects both the economic side of society and the social one. The analysis shows that the relationship between population aging and economic development is negative. In other words, as the population ages, the rate of economic growth slows down. Regression analysis showed that population aging affects economic development non-linearly, despite the fact that many economists and demographers argue that the relationship between population aging and economic development is linear (positive or negative). The result of our study is an inverted "U-shaped" curve showing the relationship between the rate of GDP per capita growth (economic growth) and the proportion of people aged 65 and over (population aging). Thus, with an increase in the proportion of older people, economic growth first increases, but then gradually begins to decline. Thus, both economists claiming a positive relationship and authors holding a pessimistic view were right to some extent, but only within certain limits. In addition, based on the empirical analysis carried out, it can be concluded that the rate of economic growth begins to decline when the share of people aged 65 and over exceeds about 10% of the total population. And if we recall the current demographic situation in the world, when in 2013 the share of elderly people was 11.7%, and by 2050 it will reach 21.1% of the world population, then we can assume that the rate of economic growth will gradually decline.

Keywords: *demographic problems, population aging, economic development, statistical analysis, variables, proportion of persons aged 65 years older, dependency ratio of the elderly*

1. INTRODUCTION

Population aging is one of the dominant trends of the XXI century. It has important and far-reaching consequences for all parties in the life of society. Every second, somewhere in the world, two people mark their sixties, and by the end of the year, their sixties mark almost 58 million people. If now every ninth person in the world is 60 years or more, then by 2050, according to forecasts, there will already be every fifth person, so the aging of the population - this phenomenon, which is more than possible to ignore. Thus, the problem of population aging has long passed from the demographic gap to the socio-economic gap. The reports of the experts of the United Nations testify that the problem has a global scale and has an indirect impact on the sustainable development of the entire planet. "Older" states are forced to make adjustments to the already developed socio-economic policy, taking into account the potential consequences of demographic aging. Under the conditions of the reduced reproduction of the population, the process of demographic aging is irreversible, which allows to predict and evaluate its consequences in a short and medium term with a high degree of loyalty. At the same time, in the development of reform and adjustment of the conducted socio-economic policies, it is important to take into account the fact that the guarantee of support for the growth of economic growth and the well-being of "aging" state resources is effective. Changes in the age structure of the population can have an impact on the economy, although many aspects of human behavior in their nature depend on age. Employment opportunities, savings and needs of people differ at different stages of life: young people need investments in education and health care, people of hard work need medical assistance. In this population can be characterized by a large number of symptoms (age-sex, social, level of education, etc.). The aging of the population is closely linked with state policy, the development of the economy, the growth of the labor force, the development of the capital market and national savings, as well as other social aspects. There are negative and positive sides in the aging of the population, so statistical analysis of the aging of the entire population is important. The main purpose of this work is the statistical assessment of the relationship between economic development and the age structure of the population in Azerbaijan. The test hypothesis is that the share of the elderly affects the economic growth.

2. LITERATURE SUMMARY

Population aging is a problem that encompasses the economy with a share of 78% of world GDP (64% - GDP on parity of purchasing power), according to analysts Morgan Stanley. The world growth of the able-bodied population is slowing down: in 2016. - 1% vs. 1.6% on average annually for the previous 20 years. This leads not only to the growth of the demographic load (including retirees and children in relation to the working population), but also to the aging of the strongest workers. It is possible to distinguish two main factors lying on the basis of population aging: reduction of mortality (increase in life expectancy) and decrease in fertility [Vishnevsky A.G, 2005]. Demographers distinguish two types of population aging: "decline" (the result of a decrease in fertility), "the top" (the result of the average growth of life and the reduction of mortality). The terms "aging of the bottom" and "aging of the top" are associated with age-old pyramids, which help to reflect the age structure of the population. Earlier, the life of a man was divided into 3 parts: youth, maturity, old age. But American demographers Bernis Neigarten and Ethel Shanas offered to divide the third stage of the life cycle into two subgroups "young old people" and "the oldest" [Denisenko M. B., 2005]. The life cycle was finally divided into 4 groups, the last two of which represent "young old people" (60-80 years old) and "the oldest" (older 80 years) [Laslett P., 1996]. The transformation of the age structure of the population of a country is more important than the change in the number of populations. [An, Jeon, 2006]. There is a positive effect of population aging on economic growth. Older people, as a rule, save more and therefore have more resources for investment, which positively affect the economic growth [Prettner K. 2013, Lee R., Mason A. eds. 2011]. In addition, in a country with a high share of the elderly population, the general demand for education will decrease, and the demand for medical care will increase. Subsequently, public expenditures on social security and medical care will be higher than expenditures on education or other forms of development [Eiras, Niepelt, 2012]. Due to the reduction of the share of the working population and the increase of the share of the elderly, the volume of tax revenues is reduced. This demographic situation can also affect direct foreign investment. Foreign firms will not invest in a country with an aging population, as the reduction of the working population is negatively reflected in the production potential of the country. [Davies, Robert, 2006]. Gradual reduction of labor force and reduction of state expenditures on capital investments affect the productivity of labor, which, unconditionally, affects the economic growth [Lisenkova, Merette, Wright, 2012]. Population aging has a negative impact on economic growth through the co-acquisition of interrelated mechanisms [Bloom, Canning, Finlay, 2010, Börsch - Supan, 2002]. Population aging has a significant impact on the development of labor-saving technologies and the increase of investment in human capital [Scarth W. 2002]. With the aging of the population, labor becomes a relatively rare factor in production, which leads to an increase in investment in human capital, which leads to the growth of productivity. Carrying out a comparative study on the basis of panel data, came to the conclusion that the declining pace of growth of labor forces will affect the productivity of labor. [Cutler, Poterba, Scheiner, Summers, 1990]. A number of authors (Prettner, 2013), Prskawetz (Prskawetz, 2010), Weber (2010) studied the relationship between demographic changes and economic growth. Analyzing the influence of the age structure of the population on the economic growth of Sweden came to the conclusion that the age groups 0-19, 20-24, 25-39, as well as older than 75 years have a negative effect on the growth rate of GDP per capita groups 30-39, 40-49, 50-64 and 65-74 stimulate economic growth [Malmberg, 1994]. With the help of regression analysis, it became clear that the age structure has a strong impact on economic growth, inflation and savings [Bengtsson M., 2018]. The influence of age structure on economic growth has been studied by using the analysis of time series [Andersson, 2001]. The results of the analysis showed that the face in the age of 0-14 and older than 65 years have a negative impact on the economic growth, then at the same time as people in the age of 30-64 years have a positive effect.

In the article "Regional Age Structure and Economic Growth: An Econometric Study for German Regions" (Brunow, Hirte, 2009) the authors received and evaluated in the spatial econometric approach the expanded model Solow. The addition of the age structure of the working force, which was used as a proxy for the growth of the structure of human capital, allowed to significantly improve the regression model. The results of the study showed that the age structure is a significant factor in economic growth, and the most stimulating group was 45-54 years. This result is explained by the authors through the theory of human capital. As we can see, the problems of the impact of age structure on economic development have been studied and a lot of research has shown that the aging of the population gives rise to a number of social and economic problems that are therefore due to this phenomenon.

3. METHODOLOGY

As we have already noted in our study, there is a study of the impact of population aging on economic development, which should pay more attention to such a factor of production as labor. Labor, from the point of view of demographics, represents its share of the economically active population. Many scholars have studied the effects of different characteristics of the working population - the structure, number and quality of workers - on the development of the economy of the country. Each age group of the population is characterized by different traits of economic behavior and, therefore, this leads to different economic consequences: young people need investment in education, the working-age population creates a labor supply and makes some savings, and retirees should receive quality health care and pensions. When the relative share of any age group changes, the economic impact of this group changes. There is no common view on the relationship between population aging and economic growth. In order to identify the consequences of the aging of the population for economic growth, it is necessary to analyze the main mechanisms lying on the basis of the impact of aging on economic growth: consumption and savings, state capital expenditures. Of course, the expected increase in life expectancy speaks to us about the improvement of quality of life, but the increase in the share of older people, in the opinion of many sociologists and demographers, may negatively affect the economic growth of the country. With the growth of people older than 65 years, the demographic load on the working population increases, and with the low level of fertility in many countries the load is even greater. The relationship between population aging and economic development is investigated. It is assumed that when modeling economic growth, the age distribution of the population, among other things, reflects to a certain extent the stock of human capital. The work carried out an econometric analysis of the impact of the aging process on economic development in Azerbaijan using panel data from 2009 to 2019. The data were tested for unit root (CIPS test) and for spatial correlations (indices and Moran's test, RW test). Panel data regression with spatial lag and spatially autocorrelated error (SARAR model) is used as the main model, since the basic diagnostic tests revealed the significance of spatial effects. Despite the fact that the coefficients for some age groups in the model are significant, their marginal responses turn out to be insignificant due to spatial dependences. The results of the constructed models showed that there is a relationship between population aging and economic development. The marginal effects of the influence of significant groups are estimated.

4. ANALYSIS OF THE AGE STRUCTURE OF THE POPULATION OF AZERBAIJAN

One of the conditions for the sustainable development of the state is the most complete consideration of specific structural factors, among which the age structure of the population occupies a significant position. The peculiarities of its state and the patterns of development largely determine the functioning of the socio-economic and military-political institutions of society. Since the general trend in the development of age structures in the countries of the world is demographic aging, the interests of modern researchers are concentrated around this

process [Privalova N.P., Stanishevskaya L.S., 2014]. At the same time, being an intermediate link in intersystem relationships, the age structure of the population is, first of all, the most important component of the demographic system, which is both the result and the determinant of its evolution. The age structure of the population is influenced by both evolutionary changes (a decrease in mortality and birth rates during the demographic transition) and perturbation effects associated with socio-economic shocks. Age and sex structure is one of the most important characteristics of the population. The analysis of the age composition allows a deeper insight into the essence of individual processes of the natural movement of the population and, consequently, in particular of its reproduction. This is due to the fact that the age-sex structure is the result of the evolution of the mode of reproduction of the population, which operated in the near and distant past. In addition, the structure has some impact on future population growth. The aging process of the population, which has a significant and growing impact on almost all aspects of society, is a reflection of the transformation of the age structure during the demographic transition. This explains the special attention to the dynamics of the age group of the elderly (people over working age, 65+). The age structure of the population is one of the basic features of the demographic situation. An important feature of the dynamics of the age structure of the population of Azerbaijan is the aging trend. Official statistical information indicates that in 1999 there were 435.6 thousand people over the working age (65+) in Azerbaijan, 535.4 thousand people in 2009, 678.3 thousand people in 2019. Accordingly, the number of people of working age in 1999 was 4515.4 thousand people, 6060.9 thousand people in 2009 and 6842.5 thousand people in 2019. A more objective assessment of the degree of imbalance in the age structure of the population allows the calculation of the coordination coefficients of the specific weights of nearby age groups, the growth (decrease) rates of the coordination coefficients of the specific weights of nearby age groups and the average growth (decrease) of the coordination coefficients of the specific weights of nearby age groups [Karpenko L.I., Sharilova E.E., 2008]. The above indicators were calculated by us for the five-year age groups of the population of Azerbaijan for 1999, 2009, 2019 and are shown in Table 1.

Table following on the next page

Table 1: Analysis of changes in the age structure of the population of the Republic of Azerbaijan for 1999-2019

Age groups, years	Coefficients of coordination of specific weights of nearby age groups,%			Growth (decrease) rates of coordination coefficients of specific weights of nearby age groups,%		
	1999 year	2009 year	2019year	2009 to 1999	2019 to 1999	2019 to 2009
0–4	-	-	-	-	-	-
5–9	111,2	125,8	74,5	1,13	0,67	0,59
10–14	89,0	135,7	96,5	1,52	1,08	0,71
15–19	94,2	96,8	98,4	1,03	1,04	1,02
20–24	77,6	85,3	106,4	1,10	1,37	1,25
25–29	132,0	101,2	91,2	0,77	0,69	0,90
30–34	102,3	99,8	75,3	0,98	0,74	0,75
35–39	89,5	112,8	90,2	1,26	1,01	0,80
40–44	78,6	99,8	85,4	1,27	1,09	0,86
45–49	43,3	83,7	116,3	1,93	2,69	1,39
50–54	126,7	69,7	86,0	0,55	0,68	1,23
55–59	89,3	99,1	105,2	1,11	1,18	1,06
60–64	102,2	114,4	127,6	1,12	1,25	1,12
65–69	67,4	96,4	102,7	1,43	1,52	1,07
70 and more	114,5	120,3	136,1	1,05	1,19	1,13
Average growth (decrease) rate of coordination coefficients of specific weights of nearby age groups,%	100,8	123,4	135,1	1,22	1,34	1,39

Thus, the presence of structural shifts in the distribution of the population of the Orenburg region by age is confirmed, indicating an increase in the proportion of older age groups compared with the proportion of younger age groups, which is a clear sign of demographic aging. As noted above, the dynamics of the demographic structure is significantly influenced by socio-economic processes. Factor analysis was performed in the study. Statistical information was processed using the STATISTICA software package. The essence of multivariate factor analysis is reduced to the identified decomposition of the variation of each of the observed signs x_i into the variation that occurs under the influence of general, specific and individual factors, respectively. The a priori set includes the following indicators: x_1 - share of the population under working age,%; x_2 - share of the population of working age,%; x_3 - total fertility rate, ‰, x_4 - general mortality rate, ‰, x_5 - coefficient of natural growth, ‰; x_6 - coefficient of migration growth, %; x_7 - morbidity per 1000 population (registered patients with a diagnosis established for the first time in life); x_8 - number of doctors per 10,000 people, people; x_9 - average monthly nominal wages of employees, manat, x_{10} - volume of paid services per capita, million manat. The method of principal components identified the first three principal components, describing 86.5% of the variation in indicators that measure the situation of population aging at the country level. The selection of the main components (generalized factors) is justified using the Kaiser criterion. To obtain the simplest structure of the factor loadings matrix, the space of common factors was rotated in the STATISTICA program. The best results were obtained by the rotation of the original space by the Varimax method (table. 2).

Table 2 shows that factor 1 includes indicators related to the category of living standards (x_8 , x_9 , x_{10}). Factor 2 was formed by indicators related to population reproduction (x_1 , x_3 , x_4 , x_5). Factor 3 forms one indicator with a high load characterizing the incidence of the population (x_7). Judging by the value of the share of total variance, the greatest influence on the aging processes of the population at the municipal level is exerted by the change in the standard of living of the population, that is, the first generalized factor.

Table 2: Factor loads, eigenvalues and weights of factors after rotation by the Varimax method

<i>Indicator</i>	<i>Factor 1</i>	<i>Factor 2</i>	<i>Factor 3</i>
x_1	-0,318	0,786	-0,126
x_2	0,655	0,236	0,562
x_3	0,423	0,953	-0,034
x_4	-0,602	-0,832	0,352
x_5	0,221	0,930	-0,245
x_6	0,421	0,202	0,506
x_7	-0,034	-0,151	-0,859
x_8	0,872	0,347	-0,211
x_9	0,791	-0,322	0,308
x_{10}	0,923	-0,278	-0,036
Total variance	2,009	4,002	1,114
Share of total variance,%	38,6	46,9	24,2

Note: Variables with the highest factor loading are highlighted in bold.

Based on the selected principal components, a regression equation was constructed:

$$\hat{Y} = 35,03 - 3,43 \cdot F_1 + 6,54 \cdot F_2 + 0,63 \cdot F_3$$

t –stat (86,21) (-5,56) (10,01) (1,35)
 $R^2 = 0,876$

Where, F_1 , F_2 , F_3 - are general factors, F_1 -is the standard of living of the population, F_2 -is the reproduction of the population, F_3 – is the incidence of the population, t-test is the Student's test with a probability of 95%, R^2 – is the coefficient of determination. The effective indicator in the model is the proportion of the population over the working age.

5. ECONOMETRIC MODELING OF THE RELATIONSHIP OF ECONOMIC DEVELOPMENT AND AGE STRUCTURE OF THE POPULATION OF AZERBAIJAN

To measure the economic development of a country, we have selected indicators such as gross domestic product per capita (in logarithms), as well as the growth rate of this indicator. As variables characterizing the age structure of the population, we took the shares of the average annual population for the following age groups: 0-15, 16-24, 25-39, 40-54, 55-64, 65+ years. The regressors used in the study are shown in Table 3. Note that all indicators are calculated.

Table following on the next page

Table 3: Description of used variables

Indicator designation	Description of the indicator
<i>ln_GDR</i>	Logarithm of GRP, adjusted by the value of the subsistence minimum per unit of the average annual population
0-15	Share of the average annual population aged 0-15 years
16-24	Share of the average annual population aged 16-24 years
25-39	Share of the average annual population aged 25-39 years
40-54	Share of the average annual population aged 40-54 years
55-64	Share of the average annual population aged 55-64 years
65+	Share of the average annual population aged 65-100 years

Let's pre-test the variables for a unit root. We will use IPS-test and CIPS-test (taking into account cross-correlations). The test results are shown in Table 4.

Table 4: Results of IPS and CIPS tests per unit root for age groups. Variant of tests with a constant, t_{bar} statistics for IPS, lag = 1 for CIPS

Variable	IPS	CIPS	p-value
0-15	-3.546	-0.657	0.030
16-24	1.650	-1.565	0.010
25-39	0.078	-1.003	0.020
40-54	0.837	1.346	0.040
55-64	0.678	-0.765	0.020
65+	-0.885	-0.455	0.020

Taking into account the results of preliminary testing, we will consider regressions for the first differences of the variables.

To take into account the spatial relationships between variables, we will consider the following regressions:

- with random effects (RE)
- with Individual Effects Fixed (FE)
- end-to-end regression with spatial lags, with spatially correlated error and random effects (SARAR-RE);
- regression with spatial lags, with spatially correlated error and fixed individual effects (SARAR-FE)

Standard approaches are used to estimate RE- and FE-regression. Taking into account the results of preliminary testing, Driscoll-Edge robust standard errors (SCC) were used for the significance of the coefficients. It can be seen from the estimation results that the estimates of the coefficients change significantly when spatial lags are explicitly included in the regression. In addition, the significance of the coefficients will change. According to the results of assessing, the change in the share of the average annual population in the 55-64 age group turned out to be insignificant. When spatial lags are included in the model, the coefficients can no longer be interpreted as limiting values. Table 5 for the SARAR-FE model shows the responses (marginal values) for each of the regressors: direct, indirect, and total (their sum), as well as z-statistics for the SARAR-RE regression responses.

Table following on the next page

Table 5: Responses for SARAR-RE regression and Z-statistics for SARAR-RE regression responses (direct, indirect, general)

Variable	SARAR-RE Regression Responses			z-statistics for SARAR-RE regression responses		
	Direct	Indirect	General	Direct	Indirect	General
16-24	6,321	8,005	14,326	7,322***	3,545**	4,465***
25-39	8,978	14,324	23,302	5,756**	4,567***	5,235**
40-54	2,302	5,333	7,635	1,867*	1,078*	1,905*
55-64	2,675	6,456	9,131	2,476	1,309	2,435
65+	5,234	7,098	12,332	3,234**	3,312**	3,224*

*Note: * $p < 0,1$, ** $p < 0,05$, *** $p < 0,01$*

The following conclusions can be drawn:

- the responses of the following regressors are significant: change in the share of the average annual population in the age groups 16-24, 25-39, 65-100. The responses of the rest of the regressors (40-54, 55-64) are insignificant.
- the largest significant response is obtained when the growth rate of the share of the average annual population aged 25-39 increases by 1%, the GDP growth rate per unit of the average annual population is 23.30% (with other things unchanged and taking into account spatial dependencies).
- note that although the coefficient for the 40-54 age group is significant in the model, the overall response for this variable is insignificant.

6. DISCUSSION AND CONCLUSION

According to the results of factor modeling, it is possible to make a conclusion about the change of the population of the older working age in Azerbaijan, first of all, are determined by the indicators of reproduction of the population, the importance of the importance of the population. Thus, at this moment, the age structure of the population of Azerbaijan is satisfactory, but if we do not take into account the complex of state measures in the perspective of the demographic structure of the population, there may be an imbalance. Among the primary measures, in our opinion, are the following:

- management of the level of life of the population, including the increase of monetary income of the population, regulation of the market of paid services, etc. ;
- stimulation of fertility, state support of families with children;
- reduction of mortality rate from various diseases at the expense of creation of complex system of risk factors, early diagnostics with application of advanced technologies, introduction of educational programs, directions on prevention of development of chronic diseases; improvement of material and technical support of health care institutions.

The results of the constructed econometric models allow to make a conclusion about the fact that the age structure of the population significantly affects the economic development of Azerbaijan. Comparison of the obtained results with the results of the previous work on similar problems is complicated by a number of factors, among which: the authors of different age groups, the use of different models, as well as specific features. However, I would like to draw your attention to the fact that in Germany the most positive influence is shown by the age group 45-54 years (Brunow, Hirte, 2009), and in Sri Lanka (Bengtsson, 2018) a significant variable group 9-4, then in Azerbaijan the main effect on the economic growth is given to the younger groups 16-24 and 25-39, their contribution was the largest, positive and significant.

ABSTRACT

The article reveals the essence and significance of the information infrastructure of business, analyzes the influence of information resources, the information market and information business on the sustainable development of the economy and improving the social welfare of the population. The leading direction of the information business development is globalization. Many countries and companies are integrating into the information business. Integration of the main producers of information technologies leads to convergence in the structure of the information sphere. One of the results of convergence is the dynamism of development trends among companies engaged in the information business, that is, companies develop at a faster pace, combining directly or on the basis of lower forms of cooperative ownership. The field of information and communication technologies was studied as a priority area. So, in the near future, it is expected that the communications and information technology sector will become the most developed sector of the Azerbaijani economy after the oil industry. The widespread use of information and communication technologies, in addition to serving the overall development of the country, is of particular importance from the point of view of ensuring national information security. In conclusion, substantiated proposals were made to determine the directions of innovative development of the business information infrastructure.

Keywords: *Business information infrastructure, information resources, information market, information business, information society*

1. INTRODUCTION

Human society has entered a new stage in the development of civilization, in which information and knowledge play a crucial role in all spheres of human activity. Information, being one of the most important elements of the public relations system, attracts much attention of researchers. The problems of the information society, that is, the issues of the influence of information on social processes, the state, culture and human psychology, were considered mainly in the works of philosophers. In recent years, works on economic and technological problems of informatics have been published. These works address the issues of measuring and evaluating information, the economic efficiency of information activities, and the formation of the market for information products and services. Consumption of information, production of information products and services have caused the need for the formation and development of one of the new forms of entrepreneurship - the information business. An important resource for enterprises and organizations in the modern market economy is information that allows them to gain and strengthen market positions and provide a competitive advantage. Making management decisions requires a deep and comprehensive analysis of large amounts of necessary information over a certain period of time. In this regard, the level of organization of the company's information system has a positive impact on its effective functioning and

prospects for further development. All of the above confirms the relevance of the problems of the development of business information infrastructure and the need for their scientific research.

2. THEORETICAL VIEWS ON BUSINESS INFORMATION INFRASTRUCTURE

An analytical information system is a set of technical and software tools, as well as information resources used for the purpose of collecting, processing, storing and analyzing information necessary for making managerial decisions. The effective functioning and dynamic development of economic entities largely depends on their information support. Russian economist A.B. Boxrisov defines the concept of "information support" in the Big Economic Dictionary as follows [1, p.425]:

- it is the necessary information stored in the database of information systems for the management of economic processes;
- creation of information conditions for the operation of the system, provision of the necessary information, inclusion, receipt, storage, collection, transmission, processing of information search tools in the system, organization of data banks.

Infrastructure is an important component of any economic system. Infrastructure is an integral part of the overall structure of economic life, which, on the one hand, is subordinate and auxiliary in nature and leads to sustainable socio-economic development, and on the other hand, determines the tactical and strategic directions and goals for the development of various types of economic activity. In the classical views of national and foreign economic scientists on the composition of infrastructure, two approaches are distinguished: broad and limited. In the first approach, almost all areas of the non-productive sphere of the national economy are referred to infrastructure. The second approach limits the range of areas that can accelerate the movement of infrastructure elements, products and information included in the infrastructure complex, and includes communications, transport, trade and other areas. In the narrow sense of the word, these are elements of the system of circulation of goods (warehouse, supply, trade and transport organizations). Another group of authors assesses the concept of infrastructure in a broader sense, meaning practically all market institutions, including elements of state regulation of the economy. The Russian economist A. Y. Sharipov defines infrastructure as a set of all spheres and branches of the economy that serve material production, produce services and moral benefits for the population, provide economic turnover in the national economy, create conditions for environmental protection and reproduction. I. F. Chernyavsky emphasizes that infrastructure is understood as a set of elements of productive forces in the form of industries and activities that give a holistic character to the national economy and its individual spheres and complexes, the functional purpose of which is, first, to create general conditions that ensure the effective functioning of the main production, and, secondly, to ensure the reproduction of labor. [2, p.131]. From the point of view of Russian economists, the concept of "infrastructure" is understood as a set of organizations, government and communication companies that ensure the successful functioning of all types of markets and the development of market relations. According to G.T. Timofeev, when defining the term "infrastructure", one should take into account that we are not talking about conditions in general, but about creating conditions for reproduction that provide the necessary resources for production, factors of production and services for business entities [3, p. 143]. For sustainable development and competitiveness of the national economy, it is necessary to create a modern infrastructure. The demand for innovative infrastructure is growing rapidly due to the transition of many enterprises and organizations to electronic document management and the need for constant exchange of information. It is especially important to create an innovation infrastructure to enhance innovation in the country. This, in turn, leads to changes in indicators and factors that characterize the development of infrastructure.

When assessing the development of infrastructure, economic and social indicators are used, which makes it possible to divide the infrastructure into two main blocks, respectively: economic and social. The level of development of infrastructure facilities, in turn, affects the country's competitive potential, economic growth, social well-being of the population, and business innovation [4]. As in other economic systems, the business system has a special infrastructure. Business cannot develop without modern infrastructure. Business infrastructure is a collection of joint ventures and organizations that provide businesses with paid services and provide it with the necessary means of production, transport, consulting, etc. Thanks to the creation of innovative infrastructures, modern business is becoming more civilized, each of its elements specializes in performing certain functions, and high economic efficiency is ensured in the business sphere.

3. INFORMATION AS AN IMPORTANT RESOURCE FOR ECONOMIC DEVELOPMENT

Information has a significant impact on the development of all areas of production and infrastructure. Information is one of the most important features of the system of social relations in developed countries. In the functioning of the market mechanism of the information society, as well as in the market of the industrial age, there are new signs that distinguish it. New signs of the post-industrial stage are observed in countries with developed market economies. However, in the textbooks of economic theory, these progressive trends have not yet been properly reflected. So, in these textbooks, land, labor, capital, and entrepreneurial abilities are traditionally indicated as types of resources, while post-industrial civilization values information along with them. In our time, the information business as a progressive form of entrepreneurship has become an important factor in economic growth, and in the textbooks on economics published in recent years, information is referred to as a valuable commodity. The information business, together with its infrastructure, is a relatively new area of business activity in the form of a multi-industry complex. On the one hand, the information business is included in the infrastructure of the entire system of entrepreneurial activity, along with banks, stock exchanges, audit companies, and on the other hand, it is an independent type of business. The information business emerged in Western countries in the 60s of the XX century, as an independent direction was formed in the 1970s, and in the 1980s, together with the existing infrastructure, it developed into a large diversified complex. Due to the complexity and cost of information technologies, they were previously used only in research centers and large industrial companies. Later, as information technologies improved and became cheaper, they began to be used in other spheres, and the role of information business in the country's socio-economic development increased significantly. As a result of the rapid development of information technologies, the basis for the dynamic development of the information business has emerged. The demand for the development of business information infrastructure began to grow. At the same time, there were constant changes and improvements in the development of this type of business infrastructure. Experts from different countries look at the modern information infrastructure of business in different ways. For example, Kanygin Y.M identifies the following main elements: computing center of various types; subscriber points giving subscribers access to information resources; a set of organizational elements that ensure the management of electronic computing and information potential; structural elements of the industry that meet the needs of a computing center in software and information support, as well as various supporting elements. Currently, information is considered as one of the important resources for economic development. Information has real value because of its structure. With the help of information products, it is possible to meet the needs of the consumer for new information and knowledge, as well as various aesthetic needs. As an economic resource, information has value, is exchanged and there is an effective demand for it.

The value or usefulness of the information gives the consumer additional freedom of action. The end result of information activity is called information products and services that are promoted as a valuable commodity in the consumer market, that is, they are sold and bought. Distinctive features of information products from other products are:

- information does not disappear during consumption, on the contrary, it can be used several times, regardless of its reuse, information retains its inherent value;
- information products periodically undergo a kind of "moral erosion". Although information does not wear out when consumed, but loses its value and relevance;
- It is convenient to use different methods of providing information to different consumers of information products, since the consumption of information products requires some effort;
- in contrast to the production of material goods, the production of an information product requires high costs compared to the cost of its replication. Thus, it is much cheaper to make a copy of an information product than to produce it. This feature of the information product - the complexity of the production technology and the relative ease of replication - creates many problems associated with the determination of property rights in the framework of information activities.

The promising directions for the development of entrepreneurship in Western countries have been identified. For example, in Japan, special attention is paid to the development of the information business. Using the global information market, Japanese entrepreneurs are adopting technological innovation faster and more efficiently than others. Entrepreneurs in Germany, the United Kingdom and France pay particular attention to the application of industrial technology and believe that a strong position in industrial production also leads to great success in the scientific and technological field. Improving the intellectual level, education and skills of employees in the United States is always in the center of attention, since the technological potential of the business largely depends on it [6, p.207]. Increased competition in the information business leads to the fact that the products of the mass media become more specialized. That is why different types of mainstream media (press, television, communications) carry different informational load. "Information resource" is one of the basic concepts in the information society. There are different views on the concept of "information resource". For example, N. N. Makarov considers information resources in information systems as separate documents and arrays of documents (in libraries, archives, funds, bank data, and other information systems) [7, p. 23]. According to other groups of economists, information resources are a collection of organizational data for obtaining reliable information, that is, information that is processed and then presented in a formalized form. An information product, which is the result of information activity, is sold on the market as a commodity. At the same time, there are many types of information products and services that are not the direct results of information activities. These include the material components required for the production, processing, storage and distribution of information.

4. INTENSIVE DEVELOPMENT OF THE INFORMATION MARKET IN AZERBAIJAN

The information market is a set of relations aimed at: the formation and use of information resources based on the creation, collection, processing, accumulation, storage, search, distribution and provision of documented information to the consumer; the creation and use of information technologies and means of their provision; the protection of information, the rights of subjects involved in information processes and informatization. The positive dynamics of agreements in the information sphere gives grounds to speak about the intensive development of the information market. The information market is conventionally divided into two segments: "civil" and "business".

Information in the first segment is publicly available scientific, technical, political, economic, reference, cultural and other information. They have a different presentation form, a low price limit; are not intended for intended use in business and are not objects of business transactions. The second segment is represented by information products (including resources, technologies and systems) used for business purposes. A set of conditions, tools and methods that make it possible to effectively use information resources constitute the information potential of society. It is not only a production and technological complex of modern tools, methods of processing and transferring information, but also a unified network of research, educational, administrative, commercial and other organizations providing information services based on modern information technologies. The process of forming the market of information products and services in the Republic of Azerbaijan is proceeding rapidly. Traditional scientific and technical information services are difficult to adapt to modern economic realities, previously their activities were based on corporate clients. In the current situation on the market of information products and services, not only government agencies, but also large corporate structures that do not comply with the norms of international "transparency" in organizing business, keep information closed. Although some examples of the civilized formation of some large business structures are found, the vast majority of companies prefer to remain in the shadows. The reliability and objectivity of business information is determined, in particular, the accuracy of the information provided by economic entities. During the transition period to a market economy, that is, during the initial accumulation of capital, privatization and corporatization, it was not possible to collect reliable information about the activities of Azerbaijani entrepreneurs. Very few business leaders have tried to provide accurate information about their activities in order to find a suitable partner. The main reasons that hinder the development of the market of information products and services in Azerbaijan are the presence of rather expensive information technologies in the country, technological and economic barriers that restrict access to information resources for mass users. New information technologies are being actively introduced in all spheres of the economy. Local and global networks used for data transmission provide computer users with new opportunities for rapid information exchange. Data transmission over channels using the Internet has become an assistant for any computer user. Automation of information analysis processes, as well as the creation and development of complex structured equipment used for this purpose, not only increased the society's dependence on this sphere, but also made the problem of the security of the information technologies used relevant [5, p.12]. State programs and specific practical measures implemented in connection with the development of the non-oil sector in the country have opened up wide opportunities for diversifying the economy and developing new industries. In this regard, the Strategic Roadmap for the Development of the National Economy is an illustrative example. The strategic roadmap has been developed taking into account the new challenges and opportunities facing the telecommunications sector, with the aim of increasing the potential for the development of information and communication technologies in the country, improving the ICT infrastructure for the digitalization of the economy, and effectively meeting the demand for ICT services at the expense of domestic resources. When developing the Strategic Roadmap, priority areas were taken into account - supporting the development of telecommunications, which is one of the main areas of the non-oil sector, building an innovation-oriented knowledge-based economy, bringing high-quality and competitive information technology products to international and local markets, attracting new high-tech investment projects and establishing effective coordination between organizations working in this area.

5. CONCLUSION

- 1) In the modern period, accompanied by the trend of transition from an industrial society to an information society, information is considered as an important factor of production that creates social wealth. The basis of the information society is the information business. The information business, which emerged as a new type of business activity as a result of the development of market relations, plays an exceptional role in the sustainable development of the country's economy.
- 2) In order to develop the business information infrastructure and improve the information support of economic entities, it is important to expand the use of modern information technologies. The use of modern information technologies can contribute to the justification of projects and measures for the sustainable development of the country's economy.
- 3) When solving many issues related to improving the market of information products and services, companies are forced to use the flows of various information infrastructure, access to which is not always easy. Some local information systems and numerous websites contain incorrect information. This situation significantly complicates the formation of a unified information system of the enterprise, which can really help in the management of modern business.
- 4) For the rapid development of the information infrastructure of business within the framework of the Strategic Roadmap for the Development of the National Economy, it is necessary to more effectively use the information potential of the country through the use of modern information technologies.

IMPROVING THE FINANCIAL MECHANISM FOR FINANCIAL SUSTAINABILITY AND SOCIO-ECONOMIC DEVELOPMENT OF THE REGIONS

ABSTRACT

Researching the current status of the regional distribution of production in the country and identifying ways to increase the development potential of the regions will enable to identify the amount of financial resources necessary for the future development of various regions, to determine the factors that prevent the activation of the existing financial potential and to neutralize the impact of these factors. One of the important functions of the state is to overcome the deficiencies in the market mechanism. It should be noted that, as a result of the impact of market forces in Azerbaijan in the current situation, the opportunities for efficient placement of production in the region are limited. Efficient placement of production in the region requires the presence of competitive and relatively large firms in the country. Therefore, a scheme for the placement of discrete productions on the region of the country should be developed by the Azerbaijani government. The government should coordinate the provision of soft loans with public investment in infrastructure development, education system improvement and other areas. Thus, the development of these infrastructure areas increases the volume and quality of services provided in these areas. Moreover, there is a need to increase public funding of the private sector to increase the number of institutions using these services

Keywords: *financial mechanism, regional financial policy, regional socio-economic development, state programs, state regulation*

1. INTRODUCTION

Ensuring sustainable economic development in each country is possible on the basis of full and effective use of the economic potential of the regions. So, development is always related to place, and the balanced development of the country's regions is a condition for improving the social welfare of the population. In this respect, increasing the socio-economic development level of the regions and minimizing the interregional differences in this area constitutes the basis of the state's economic policy. The world experience and the history of development of foreign countries prove that the market mechanism does not ensure the balanced development of the regions. In this case, the reduction of inter-regional differences in the level of socio-economic development in the country depends mainly on public policy. There is a high imbalance in the development of regions in Azerbaijan. Thus, the production potential and income of the country are mostly concentrated in Baku. Therefore, one of the main aspects of the economic reforms in our country is to ensure sustainable socio-economic development in the regions and to reduce the existing differences in location of production by regions. The effective location of productive forces in Azerbaijan and the full use of the financial potential of each region are important for the country's economic development. Ensuring the socio-economic development of the country is possible on the basis of a comprehensive evaluation of the natural-economic, demographic, environmental and other conditions and characteristics of the regions. In this respect, the deliberate location of productive forces in the country implies the development of the economy in the regions through the efficient use of natural resources, labor resources and other opportunities.

The most optimal location of production in the country ensures efficient use of natural resources, improving the level of employment, increasing labor productivity and production efficiency based on the economic use of economic resources, socio-economic development of economic regions.

2. WAYS TO INCREASE THE DEVELOPMENT POTENTIAL OF THE REGIONS

One of the important functions of the state is to overcome the deficiencies in the market mechanism. It should be noted, however, that in the current situation, as a result of the impact of market forces in Azerbaijan, opportunities for efficient location of production by region are limited. Efficient location of production by region requires the presence of competitive and relatively large companies in the country. Therefore, the Azerbaijani government should develop a scheme for the location of each production in the country. This scheme should determine the development direction of each region based on the evaluation of its economic potentials. The choice of location for individual productions makes it easier for the government to determine the measures to be taken to improve entrepreneurship and the direction of infrastructure development. For instance, the preference for improving apple production, mainly in Guba, implies, first of all, construction of apple stores in this region and establishment of an enterprise producing apple crates. In this case, the government can provide efficient allocation of limited economic resources in terms of place and time by identifying the enterprises to be established in different regions and substantiating the sequence of their establishment. The formation of regional economic development trends and sectoral structure is based on the efficient use of local natural and labor resources, geographical location and other favorable opportunities. The economic efficiency of the production in the regions, the level of development of the regional economy and the optimal structure of the sector depend on the level of specialization of each. Appropriate specialization of economic regions is the basis for organizing production at a regional level in an economically efficient way. The scale of development of specialized industries affects the formation of the production structure in each region. The higher the level of specialization of the regions, the more economically appropriate the relations between the separate branches of industry, as well as, between industry and agriculture and other sectors of the economy. In this regard, it is important to create clusters according to the specific area structure and development directions of different regions. A cluster or industrial group is a group of interconnected companies and related organizations operating in a certain geographically close area, characterizing by the generality of activities and complementing each other. [1, p. 207]. It should be noted that the creation of special economic zones has an important role in creating clusters in economic regions and increasing their specialization. The purpose of creating such zones is to develop priority areas in the country, increase investment activity, and support the organization of competitive, efficient production and service sectors. In this regard, the Presidential Decree of the Azerbaijan Republic dated March 6, 2007, "About creation of special economic zones in the Azerbaijan Republic", is of great importance. The Law of the Republic of Azerbaijan "About special economic zones" dated April 14, 2009, came into force and regarding the implementation of this law, the Decree of the President of the Republic of Azerbaijan of 3 June, 2009 was signed. The necessary regulatory framework for the establishment of special economic zones in Azerbaijan has already been established. In our view, the creation of special economic zones should not only provide benefits, but also define the industries to be developed in the region, the necessary infrastructure (roads, electricity, gas, water supply, etc.), staff training and other issues. [2.p.354] The creation of innovative-regioanal complexes is of great importance to ensure a cluster approach to the development of individual regions in the country. The creation of such complexes will lead to the diffusion of innovations, large-scale savings as a result of increased production (due to the location of relatively small productions in one area), the creation of

supply and sales enterprises. This will improve the quality of the products produced in innovative-regional complexes and lower prices. The production scale has a significant impact on the level of development of existing industries in the region. Thus, as the production scale increases, the cost per unit output decreases. The creation of small and medium-sized enterprises in these innovative-regional complexes will increase the overall demand for individual services and products, and consequently reduce the cost of the services provided. In recent years, the growing demand for agricultural products on the world market and the consequent rise in prices have increased the efficiency of investment in this area. It should be noted that considering the characteristics of viticulture, potato production, fruit production and other crops, optimizing their location in the country will provide the markets with fresh products for a relatively long time. Thus, the growing time of the same product is different in different regions of the country. Currently, the country's market for processed agricultural raw materials includes very cheap goods from foreign countries. As a result, opportunities to regulate local production are limited. In this context, there is a need to associate the production organization in the processing industry with the regulation of their imports more closely.

3. ASPECTS OF IMPROVING THE FINANCIAL MECHANISM TO REDUCE INTERREGIONAL DISPARITIES

The full realization of Azerbaijan's economic potential largely depends on the development of the regions. Thus, development is related to a certain area. In this case, the market mechanism leads to the distribution of the country's limited economic resources ((investment, skilled workers, etc.) in favor of developed regions. As a result, inter-regional differences at the level of development in the country are increasing. This difference is observed at the level of infrastructure development and product prices. Thus, one of the main factors of development is density. In high-density markets, sales costs are also lower and as a result, prices fall. All this leads to a violation of the principle of equity in the country. Thus, the amount of benefit received by citizens with the same personal income levels, but living in different regions, varies. Moreover, due to the large tax base of the developed regions, the volume of per capita public services in these regions is higher than in the underdeveloped regions. As a result, the principle of horizontal (regional) equity with equal access to public goods is violated, depending on the geographical location of existing firms and households in the country. All this makes it necessary to determine the criteria for financing the socio-economic development of the regions. It can be said based on experiences, the efficiency of the use of economic resources is high in developed regions in terms of the rate of economic growth in the country. In this context, the distribution of economic resources from developed regions to backward regions may have a negative impact on the country's economic growth rate. As economic growth is the main condition for increasing incomes in the country, the slowdown in economic growth limits the increase in both consumption and investment expenditures in the country. At present, the fact that revenues in Azerbaijan are mainly generated in Baku and the formation of these revenues in oil and gas production eliminates such a negative impact. According to the level of socio-economic development, measures need to be taken to increase the financial capacity of both vertical and horizontal management hierarchies. Increasing financial capacity in the vertical management hierarchy implies the distribution of public revenues between central and local authorities. In terms of vertical hierarchy, local authorities have limited opportunities to realize their powers in their regions and to provide the necessary public services in the region. In this case, a budget policy should be implemented in all regions to provide households and firms with a standard package of social benefits. This implies the distribution of public expenditures at both the centralized and local levels. Moreover, given that the powers and functions of local bodies are equal in different regions, it is necessary to take measures to equalize budget revenues.

At that rate, one of the key factors is to equalize the income potential of the regions to ensure equal access to public goods. Today, it is important to increase the financial capacities of the municipalities in the vertical arrangement hierarchy for the socio-economic development of the regions. Thus, sources of budget revenues of municipalities established by law form an objective basis for differentiating their revenues. In some municipalities, their incomes may be high due to high land quality ratios, availability of local building materials, the need to use billboards and other factors, while others may be low. [3.] For instance, according to the Tax Code, the land tax for individuals is municipal tax. In general, municipal budget revenues are highly dependent on the location of the municipality. Municipalities as local self-government bodies should have the same income opportunities to finance their spending, as they are the main institutions that provide public goods on site and the powers of all municipalities are defined same by law. In this case, in the present situation where public revenues are mainly centrally collected, there is a need to establish an improved mechanism for municipalities to be financed from the state budget. In this respect, it is necessary to take into account inter-regional differences in the formation of sources of income, including the cost of services provided by them in the provision of subsidies and the volume of services, to finance their expenditures. In our opinion, it is appropriate for municipalities to develop rules for the use of these forms of financing in the provision of public services. It should be noted that currently, under the Budget System Law, municipalities can attract funds from the state budget. To this end, municipalities should submit the following documents and information to the Ministry of Finance:

- reference on expected results of the current year and actual results of the last year's budget;
- substantiation of the planned revenues and expenditures of local budgets for the next budget year, the amount of subsidies to be allocated from the state budget and other financial assistance;
- auditor's opinion on the state of execution of the local budget in the previous year;
- Other materials at the request of the Ministry of Finance.

Based on these materials, funds for financing municipal budget expenditures can be considered in the State Budget. In our view, the mechanism of financing municipal budgets in this way increases uncertainty and subjectivity in the allocation of funds. In this regard, it is necessary to determine municipal funding criteria and the amount of funds required to finance public services to be provided through municipalities in the budget year. In this case, the limits of funds intended for the financing of municipalities are determined. The increase in state budget revenues in recent years has led to an increase in funding for regional development. However, it is important to establish reasonable criteria for the horizontal balancing of regional funding. Thus, the balance between local revenues and local expenditures should not be at the expense of cost reductions. It should be noted that increasing the efficiency of regional funding and ensuring the principle of equity in this area requires requires a correct identification of the needs of the regions for public goods and the calculation of the amount of funding accordingly. In this context, determination for defining the volume of demand for public spending in the regions is necessary. In this case, it is necessary to define a certain set of public services (for instance, education, health, culture, etc.) that must be provided per capita in different regions. All these nuances relate to the ways of financing expenditures in the regions. Moreover, one of the ways to eliminate both horizontal and vertical imbalances is to increase the financial potential of the regions. In this case, measures are taken to increase the tax base in the regions to provide public services. This is achieved in a number of ways. Thus, in fiscally decentralized systems, the government achieves reduction of inter-regional disparities in terms of financial capacity due increasing economic activity in the region by influencing the movement of labor and capital. In recent years, the state has taken measures to increase the production of agricultural products, which form the basis of the regional economy.

Producer support measures are aimed at increasing local food production, increasing farm incomes, and improving food security. At present, agricultural products in Azerbaijan are exempt from other taxes, excluding land tax. However, agro-processing enterprises pay full value-added tax. Therefore, although local agricultural products are exempt from value-added tax, this factor does not provide an additional advantage to imported products during processing to local agricultural products. One of the important factors in increasing the competitiveness of the regions is the development of the infrastructure. The development of roads, gas, water, electricity and other infrastructure in the regions increases the efficiency of economic resources by increasing the speed and reducing the cost of material, financial and information flows [4.]. This factor increases the economic activity in the region and consequently increases the financial potential of the region. Today, the development of the infrastructure in the regions is carried out within the framework of the Public Investment Program. However, in determining the direction of public investment and the priority of concessional financing by development institutions, the elimination of gaps in the value chain of the region's specialized products should be considered as a priority. The public investment program is an integral part of the country's socio-economic development program and is an effective tool for implementation of investment policy by government. The public investment program includes investment projects ordered by government agencies and implemented by state-owned enterprises. In order to achieve the main goal of the public investment program and ensure the sustainable development of the country's economy, the following tasks have been determined:

- accelerating socio-economic development;
- increasing public and private investment volume;
- creating new workplaces;
- attracting foreign investments and expanding investment opportunities;
- developing the financial base of the investment process and improving the knowledge base;
- effectively coordinating investment programs implemented by international financial institutions in the country.

In our view, it is important to assess the impact of public investment on the socio-economic development of individual sectors of the national economy and regions. At present, the impact of the public investment program on economic development is not assessed. In order to determine the optimal set of public investments, it is important, first of all, to develop a methodology for assessing the effectiveness of the program. Currently, it is possible to make such an assessment using the net present value method, which is still used in the evaluation of investment projects. The government should coordinate the provision of soft loans with public investment in infrastructure development, education system improvement and so on. Thus, the development of these infrastructure areas increases the volume and quality of the services provided in these areas. Moreover, public funding of the private sector is needed to increase the number of institutions using these services. So, the mechanism for financing the reduction of inter-regional disparities in terms of socio-economic development should include attracting funds to finance expenditures in the region and increasing the region's domestic financial potential. Such an approach accelerates the creation of equal access to public opportunities for people living in all regions.

4. CONCLUSION

- 1) The government can ensure the efficient allocation of limited economic resources in terms of place and time by determining the enterprises to be established in different regions and substantiating the sequence of their establishment.
- 2) The creation of innovative regional complexes is essential to provide a cluster approach to the development of individual regions in the country.

The creation of such complexes will lead to the diffusion of innovations, large-scale savings as a result of increased production (due to the location of relatively small productions in one area), the creation of supply and sales enterprises. This will improve the quality of the products produced in innovative-regional complexes and lower prices.

- 3) Increasing the share of transfers in local budget expenditures can decrease incentives for municipalities to expand their sources of income. In this context, measures should be taken to ensure that such incentives are not reduced during the development of the transfer mechanism.

DEVELOPMENT OF FAMILY BUSINESSES IN KARABAKH REGION OF AZERBAIJAN: NEW OPPORTUNITIES AND PROSPECTS

Yusif Musayev

*Azerbaijan State University of Economics (UNEC), Azerbaijan
yusif.musayev@unec.edu.az*

ABSTRACT

Family entrepreneurship refers to a significant number of companies around the world in which one or more members of a family are active in business operations and have the primary responsibility for ownership or power. Families may operate small businesses or multinational corporations. Family-owned companies often save money by using the financial and other resources of family members, allowing them to meet long-term business objectives at lower costs. The family business is an efficient segment in the non-oil sector as well, thanks to its duty and confidence, as well as its clear management. As a result, it assists in the resolution of social concerns in a market economy, as well as economic development and citizen jobs. The main aim of this paper is to investigate the opportunities and prospects for the formation of family businesses in Azerbaijan's Karabakh region. To achieve this aim, the concept of family business is theoretically applied to explain the current state of family businesses in Azerbaijan's Upper Karabakh and Kalbajar-Lachin economic regions and to recognize opportunities for family business growth. In addition, proposals for the growth of family businesses in the area have been developed. The following is a breakdown of the paper's structure. The first section includes details about Azerbaijan's economy and economic landscape as well as economic potential of Karabakh region of Azerbaijan. The second part examines the latest research on family businesses. The third sections discusses opportunities for family businesses in Azerbaijan and aims to uncover potential in Azerbaijan's Karabakh region. At last, conclusions will be drawn and shared to summarize the papers.

Keywords: *Karabakh, family business, development, opportunities*

1. INTRODUCTION

After regaining its independence in 1991, the Republic of Azerbaijan started to exercise its sovereign rights and follow an independent policy in the economic sphere. The main directions of economic policy were the economic system based on state, private and municipal forms of ownership, the transition to a market economy and integration into the global economy. The signing of the "Contract of the Century" with the world's leading oil companies in 1994 laid the foundation for a successful oil strategy. The Baku-Novorossiysk (1996) and Baku-Supsa (1999) export oil pipelines, the Baku-Tbilisi-Ceyhan (2006) main export oil pipeline, and the Baku-Tbilisi-Erzurum (2007) gas pipeline were all designed to supply Azerbaijani oil to world markets, resulting in a diversification of export routes. The Southern Gas Corridor (Baku-Tbilisi-Erzurum+TANAP+TAP) was fully operational on December 31, 2020, delivering Azerbaijani gas directly to the global market. In general, the oil and gas industry has played a locomotive role in the development of other areas in the country. Although the price of Azeri Light oil on the world market is slightly higher than other oils (Muradov; Hasanli; Hajiyev, 2019: p. 41), the dramatic drop in oil prices since 2014 has resulted in a significant decrease in Azerbaijan's revenues. This trend has necessitated the country's economic diversification and non-oil export growth (Babayev, 2019: p. 1). Azerbaijan's ties with international financial, credit and economic institutions, as well as its membership in the International Monetary Fund, the World Bank, the European Bank for Reconstruction and Development, the Asian Development Bank, and the reforms implemented have all contributed to the country's favorable business and investment climate.

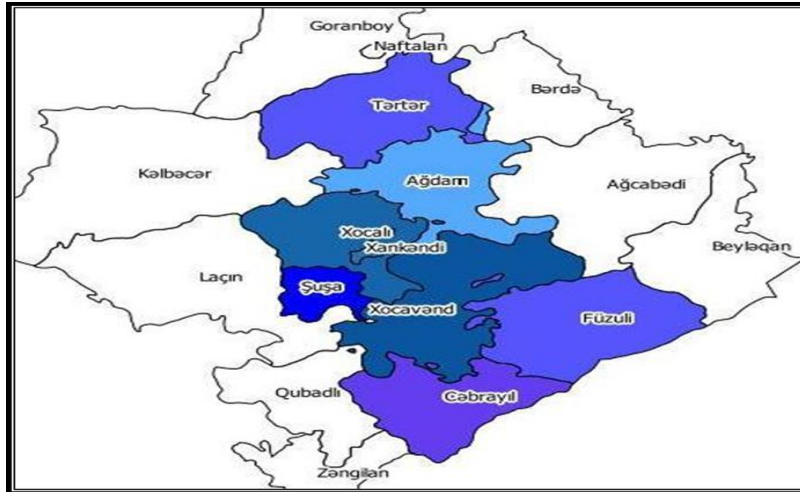

Over 277 billion 577 million dollars was invested in the Azerbaijani economy from 1995 to 2019, with more than 140 billion 843 million dollars coming from foreign investors (The State Statistical Committee of the Republic of Azerbaijan, 2021). Azerbaijan is ranked 34th out of 190 countries in the World Bank's Doing Business 2020 index (World Bank, 2020). In particular, the development of entrepreneurship in the regions is one of the priorities of economic policy. The Entrepreneurship Development Fund has made preferential loans of up to 127 million AZN to finance 908 investment projects worth 397 million AZN in 2020, with 79 percent going to regions and 21 percent going to Baku settlements (Entrepreneurship Development Fund of the Ministry of Economy, 2021). In order to minimize negative impact of the Coronavirus (COVID-19) pandemic on the economy, including entrepreneurship, an economic support program worth 3.5 billion AZN was implemented in 2020 (Ministry of Economy of the Republic of Azerbaijan, 2021). The program covers a variety of entrepreneurship subjects, including family businesses. In Azerbaijan, employment support programs for family entrepreneurs are provided by the Public Legal Entity "Easy Support for Family Business" (ABAD), the Small and Medium Business Development Agency (SME) as small and medium businesses, the Ministry of Labour and Social Protection framework, and other means. Thus, only in January-October 2020, the number of active members of ABAD was 257 people. Their total financial turnover was 1.1 million AZN, and their monthly average income was 346 AZN (ABAD, 2021). The liberation of Karabakh by counter-offensive operations launched on September 27, 2020, in response to Armenia's military aggression against Azerbaijan, and the trilateral declaration signed on November 10, 2020, have generated new realities in the region. In this context, new prospects for the formation of entrepreneurship, including family businesses have arisen in Azerbaijan's Upper Karabakh and Kalbajar-Lachin economic regions, which have rich resource potential.

Figure 1: Social-Economic Regions of the Republic of Azerbaijan
(Source: <https://www.pinterest.com/pin/512425263849743751/>)

The Upper Karabakh economic region is one of the ten economic regions of Azerbaijan and rich in natural resources, encompassing Aghdam, Tartar, Khojavend, Khojaly, Shusha, Jabrayil, Fuzuli administrative districts and the territory of Khankendi city. The total area of the economic region is 7.25 thousand square kilometers, accounting for 8.4 percent of the country's total land area. Agriculture is the mainstay of the region's economy. The region is represented in the country's division of labor of agricultural products by fruit-growing, grain-growing,

meat-milk and meat-wool sheep-breeding. Minerals abound in the economic region, which includes sulfur pyrites, limestone, cement, raw materials and massive polymetallic deposits. The mountains and foothills contain dirt, sand and other building materials (Ministry of Economy of the Republic of Azerbaijan, 2012).

*Figure 2: Upper Karabakh Economic Region
(Source: The Republic of Azerbaijan Ministry of Economy)*

The population is 687,7 thousand people (The State Statistical Committee of the Republic of Azerbaijan, 2020). The Kalbajar-Lachin economic region includes the administrative districts of Kalbajar, Lachin, Zangilan, Gubadli and covers 6.400 square kilometers, accounting for 7.5 percent of the total area of the country. Economic region's territory is rich in mineral resources such as gold, mercury, chromite, granite, facing building stones, coral, and perlite. Thermal mineral springs such as Istisu, Minkend, and Tutgunchay, along with climatic and balneological conditions and mountain forests that can be used for resort and recreational purposes are all accessible (Economic Reforms Research Institute, 2011).

*Figure 3: Kalbajar-Lachin Economic Region of the Republic of Azerbaijan
(Source: The Republic of Azerbaijan Ministry of Economy)*

The population is 259.5 thousand people (The State Statistical Committee of the Republic of Azerbaijan, 2020).

It should be noted that Karabakh's abundant water supplies are critical to the country's industry and agriculture. The Sarsang reservoir, which has a capacity of 560 million cubic metres, will provide irrigation water to approximately 100,000 hectares of land in six administrative districts across the country (Tartar, Agdam, Barda, Goranboy, Yevlakh and Agjabadi). In addition, there are other reservoirs in liberated areas with a total capacity of 80 million cubic metres. Their involvement in the country's economy has the potential to establish conditions for the irrigation of an additional 15,000 hectares of land. The release of the Khudafarin reservoir, which is situated in the Jabrayil and Zangilan districts, entails irrigating 75,000 hectares of new land as well as enhancing irrigation of existing irrigated areas. Some estimates place the amount of this reserve at 1.6 billion cubic metres. Furthermore, the region's major rivers, Tartar, Bazarchay (Bargushadchay), Hakari, and other small rivers, have considerable hydropower potential. It is also presumed that there are 11 groundwater sources throughout the area. In other words, this equates to a daily groundwater supply of 1 million 968 thousand cubic metres. These areas are estimated to contain 39.6 percent of Azerbaijan's total geological mineral water reserves. In the region, there are approximately 120 mineral water deposits of various compositions that are of great medical significance. This equates to a mineral water supply of 7805 m³/day in other measurements. The hydropower plants in the region, such as "Khudafarin", "Giz Galasi" and "Sarsang" will be actively used to enhance the energy supply of the surrounding areas, reconstruct the country's liberated areas and integrating renewable energy sources into the country's energy system will result in geographic diversification of sources. It means that loading will be reduced through Absheron, Shirvan, and Mingachevir and that the share of renewable energy production in total energy production will increase (Center for Analysis of Economic Reforms and Communication, 2020). "The liberated areas should be a green energy zone as a whole. Our water supplies are plentiful. At the same time, solar and wind energy generation are viable options. It is necessary to involve foreign partners and investors in this job, to create conditions for local businesses. Lands that have been liberated should be developed in a high-tech way" said Mr. President Ilham Aliyev (Aliyev, 2021). Karabakh's rich raw materials and natural resources, fertile land, water resources, beautiful scenery, well-planned transportation and energy networks, and business incentives provide new opportunities for family businesses. However, completely realizing the potential necessitates the reconstruction of damaged infrastructure and communications, as well as substantial investment. In which, the overall cost of the occupation to the country is estimated to be more than 800 billion dollars. A framework for the socio-economic growth of the liberated territories will be adopted in the "Concept and forecast indicators of economic and social development of the Republic of Azerbaijan for 2021 and the next 3 years". Within the framework of the concept, along with public investments, the priority will be the reconstruction of economic and social infrastructure in the liberated territories with the involvement of local and foreign investments, the implementation of work to ensure employment (Jabbarov, 2020). In the state budget for 2021, 2.2 billion AZN have been set aside for reconstruction of liberated territories, construction of modern infrastructure (roads, electricity, water, gas, communications, and other required infrastructure), education, health, cultural services, housing, and preservation of cultural and historical monuments (On the State Budget of the Republic of Azerbaijan for 2021, 2020). Building of a new road to Shusha (Aliyev, 2020), the design of the Barda-Agdam railway (Aliyev, I., 2021), the construction of Fuzuli International Airport, as well as the planning of an international airport in the Kalbajar or Lachin area (Aliyev, 2021), the reconstruction of land and railway to the Nakhchivan Autonomous Republic via Karabakh, and the efforts made to open all communications between Armenia and Azerbaijan are all new opportunities for the region. This opens up new opportunities for the development of tourism, agriculture, manufacturing and service sectors, as well as GDP growth, by making domestic and international freight transportation more convenient for the region and broadening people's

travel options. Azerbaijan will collaborate with Turkey on road, rail, and infrastructure projects (Aliyev, 2020), Italy (Məmmədov, 2020) and the United Kingdom (electricity) on energy infrastructure development in Karabakh (the Ministry of Energy of the Republic of Azerbaijan, 2021). Exim Bank in Hungary has opened a 100 million dollars credit line for companies interested in participating in the reconstruction program (Siyarto, 2021). Iran, Russia, Ukraine, Georgia, Israel and a number of European states are expected to contribute to the reconstruction effort. The presence of local and international companies in all projects, as well as the attractiveness of foreign direct investment would help to shape the business climate quickly. The re-establishment of infrastructure and the return of hundreds of thousands of refugees to Karabakh may provide great possibilities for family businesses to emerge in the area.

2. LITERATURE REVIEW

As an academic subject, family business is still considered to be in its adolescence. According to Donelley (1964), Barnes, and Hershon (1976), the roots of the research subject were mainly papers and case studies focused on the constructive position of family businesses (Poutziouri; Smyrnios; Klein, 2006). Despite its significance, the improved definition of a family business has yet to be adopted. A big, well-managed organization, on the other hand, has more clearly defined characteristics. The family company first appeared in the United States in the 1870s and 1890s, spurred on by waves of technological innovation in transportation and manufacturing known as "the second industrial revolution". Chemicals, electrical products, transportation systems, oil refining, primary metals, several sectors of the food and beverage sector, the tobacco industry, and many other capital-intensive industries have all seen increased investment. Today, family companies form the backbone of many newly developed economies, and "old industrialisers" still exist in many sectors, from labor-intensive industries to specialist suppliers. Medium-sized and large Italian family businesses, as well as well-known corporations in traditional and specialized fields such as Benetton, Luxottica, Ferrero, and Natuzzi are examples (Andrea, 2003: p. 6-9). Family companies are classified in a variety of shapes and sizes. For example, in which family members control 51 percent or more of an organization, and family members influence key organizational strategies and decisions for leadership continuity. Family company, according to the wider definition suggested by Poza and Daugherty (2014) and adopted in this report, includes all forms of entrepreneurship, including the strategic influence of a new generation CEO or entrepreneur with one or more family members on the firm. Furthermore, these individuals wield such power by a variety of ways, including equity control, board or managerial involvement, or principles and culture instilled in the company by family shareholders. Finally, family companies are made up of members of a family who pool their resources to accomplish (Alonso; Kok; O'Shea, 2018). Latin America is made up of 20 sovereign states and territories that account for about 9% of global population and 6% of global GDP. After Southeast Asia, the region is the world's second-largest emerging market and its growth is expected to accelerate significantly in the coming years. Family businesses, like the rest of the world are the most common form of economic and social organization in Latin America, though this prevalence varies significantly across countries. Approximately 60% of the region's GDP is generated by these organizations. Family control is not limited to small businesses, it also exists in about 40% of the region's largest corporations (Olavarrieta; Villena, 2014).

3. OPPORTUNITIES FOR FAMILY BUSINESS IN AZERBAIJAN

Development of the non-oil sector in the regions is one of the priorities of Azerbaijan's economic policy. The government promotes increasing the volume and quality of production in the regions (except Baku and Absheron) through state programs for socio-economic development of the regions, strategic roadmaps, tax incentives, investment and other means.

The role of family businesses in this sector has started to grow in recent years. Meanwhile, On September 23, 2016, “ABAD” - “Easy Support to Family Business” public legal entity was established under the auspices of the State Agency for Citizen Services and Social Innovations (ASAN service) under the President of the Republic of Azerbaijan. The organization's mission is to encourage people to actively participate in the country's socioeconomic development, including the growth of small and medium businesses, increased jobs, and the formation of competitive households. ABAD centers develop projects to help family-owned enterprises in the decorative and applied arts, as well as food production (ABAD, 2021). It also offers a number of services to its members, including the following. Business-Consulting. The various Business Consulting Services provided by the ABAD public legal entity to people. These services include assessing ABAD beneficiaries' capabilities and real market demand for their products, identifying new markets, and developing a variety of business plans in the presence of ABAD members. Technical Support. ABAD gives technical support services to family companies that have entered the public legal entity, such as constructing and enhancing production capacity, developing production vehicles, and procuring necessary production equipment. Marketing Services. The ABAD provides packaging solutions to its member families that improve product marketability. Each product is given the appropriate design, and family brands are established. ABAD evaluates the scope of market demand for a specific product by conducting market research, which helps to avoid cost overruns by establishing a planned production. Financial Literacy. The main aim of ABAD is to promote family businesses in the country, and ABAD PLE places a high value on financial literacy among the population. Legal Assistance. ABAD members learn how to properly handle documentation issues as part of the rendered legal services, and they receive certification services based on the "single-window" system. Logistics and Sales Management. ABAD organizes transportation and sales for its members, conducts market research, examines real demand for a specific product, and then contacts appropriate department stores to sell its members' products. Once an agreement with the store is reached, planned production begins. ABAD is in charge of product packaging, as well as transportation to local storehouses and department store deposes (ABAD, 2021).

3.1. Family business prospects in Karabakh

Entrepreneurs interested in building their businesses in the liberated areas are encouraged to submit business plans to the SMB (SMB, 2020). “ABAD and the Republic of Azerbaijan's Food Safety Agency have launched a new joint project in the liberated territories. The project's primary aim is to create favorable conditions for livestock farmers, ensure that modern slaughter methods are compatible, and provide healthier meat and meat products for consumption. The new butcheries will control and prevent the spread of zoonotic diseases, as well as protect people from transmission from animals to humans. As soon as possible, a foundation will be laid for the organization of veterinary mechanisms to regulate animal health in the liberated regions. The Azerbaijan Food Safety Institute will build new slaughterhouses at its expense. ABAD will engage in the selection of project participants, assess their potential and business management skills, and provide professional training for butchers within the framework of ABAD's support program, based on its experience working with micro and small businesses. Initially, relevant organizational work was carried out in Guzanly settlement of Aghdam district in order to create a modern abattoir, and the location of the slaughterhouse was determined (ABAD, 2020). Moreover, ABAD, the International Bank of Azerbaijan, and the Agrarian Credit and Development Agency signed a Tripartite Letter of Intent to support self-investment projects. Customers will be supplied with soft loans, agricultural product packaging and sales, new experience in production and marketing, logistics, transportation, certification, expert support, and experience exchange, according to this document (ABAD, 2020).

We can say that, state support and planned projects open up great opportunities for family businesses in the region, given Karabakh's rich natural resources and the local population's historical traditions in crafts, tourism, and agriculture. Natural honey, jam, dairy products, compotes, dried fruits, vegetables, and a variety of beverages, as well as carpet weaving, national coverings, jewelry and leather goods, decorative and applied arts, are all good family business ideas in Karabakh. The production of sheep breeding in Azerbaijan has historically resulted in the formation of an endless supply of raw materials for carpet weaving. Karabagh has always been well-known for its carpets. Local carpet-making evolved over time, based on national practices. It can be seen in paintings by European artists depicting carpets. The Karabakh "Mugan" carpet is depicted in Hans Memling's (15th century) paintings "Mary with the Child" and "Portrait of a Young Man" (Muradov, 2010: p. 10, 25). Domestic and international demand for Karabakh carpets, as well as national carpet-weaving practices and a plentiful supply of raw materials, provide all-around opportunities for family business growth in the region. Karabakh's national costumes are symbols of a long-standing culture that can be found in many museums around the world. A collection of national clothes in Karabakh includes headdresses, shoes, and jewelry (Narimanoglu, 2017). The constant demand for these items, as well as the growing interest of tourists visiting Azerbaijan in recent years, has created new opportunities for families interested in producing traditional Azerbaijani costumes. It also ensures profitability by ensuring raw material availability and manual labor differentiation. It should be noted that, in terms of the growth of decorative and applied arts, Karabakh is one of Azerbaijan's most popular places. Domestic families have traditionally worked in a variety of decorative and applied arts, including jewelry and coppersmithing. Cold weapons made by Karabakh weapons masters, horse and cavalry equipment, richly worked saddles, velvet chuls, stirrups and spurs made by blacksmiths and coppersmiths were highly valued (Salamzadeh, 2020). In terms of the current realities, the "Halal" food industry has the potential to play a significant role in the economic revival of Karabakh. The clean air, fertile land, and clean water supplies of the Karabakh region would provide excellent opportunities for environmentally friendly food production (Azerbaijan State University of Economics, 2021).

4. CONCLUSION

During the nearly 30 years occupation of Karabakh, an integral part of the Republic of Azerbaijan, all of the region's infrastructure and communications were lost, and its wealth were looted. As a result, establishing a family business in the newly liberated territories seems impractical at first. However, the government's priority in the reconstruction of Karabakh and the resettlement of refugees indicates that the region will soon enter a new phase of development. The government appears committed to providing Karabakh with modern infrastructure, a favorable business climate, and a high standard of living. Without a question, territorial liberation and progressive tendencies would have an effect on economic growth and business activity. According to preliminary estimates, the gross production of key sectors in Upper Karabakh and Kalbajar-Lachin economic regions could rise by over 2 billion manats in the coming years. In this case, the family business is one of the effective methods to provide jobs for the hundreds of thousands of people who will return to Karabakh. However, the establishment of family businesses based primarily on pre-occupation experience and historical traditions would be successful. At the next stage, it would be more appropriate to develop family enterprises based on existing outcomes. The region's existing potential should be recognized as new prospects for family businesses in the service and manufacturing sectors. Taking into account natural-geographical and resource factors, as well as other factors, we conclude that there are opportunities for family businesses to build greater value in the fields of crafts, agriculture, and tourism in Karabakh.

To summarize all facts, we propose the following proposals for the creation of family businesses in the Upper Karabakh and Kalbajar-Lachin economic regions.

- 1) Providing financial, technical, marketing and logistical support to families interested in starting businesses in Karabakh, primarily in the fields of crafts, agriculture and tourism.
- 2) Creation of an unique concept for the growth of rural tourism. Thus, families who want to build a business in this direction can be systematically assisted in the design of housing and the construction of other required infrastructure, based on the opportunities of rural tourism in the restoration of areas.
- 3) Ensure the involvement of family business owners in adult education and vocational training programs.

ABSTRACT

The Islamic economic model has become widespread in the world, which has determined the interest of the economic and scientific communities in introducing its experience into the traditional financial model in order to minimize the risk of crisis situations and form a more stable financial system. The problems of the development of Islamic banking have acquired particular relevance now: the demand from the dynamically increasing number of Muslims in the United States and Europe for financial services and transactions made in accordance with the principles of Sharia is constantly increasing; financial products offered by the Muslim industry are attractive enough for both Muslim and non-Muslim investors. In addition, it is interesting to discuss the need to apply the experience of Islamic banks in the traditional financial system. Therefore, the topic of the development of the Islamic financial industry in Azerbaijan is also relevant in connection with its rapid growth throughout the world. The aim of the work is to study the theoretical foundations of Islamic banking, analyze the problem and development of Islamic banking in modern conditions of the new challenge of globalization of the economy, as well as develop recommendations and proposals for the introduction of Islamic institutions into the banking system of Azerbaijan. Analysis of the financial sector in Azerbaijan and Russia, which are implementing a pilot project to introduce Islamic banking, revealed a number of problems and prospects. Firstly, the developed market environment contributes to the adaptation of the principles of the Islamic banking model, and secondly, the availability of qualified personnel in the field of Islamic banking makes it possible to develop tactical and strategic plans for the development of a financial institution.

Keywords: *Islamic finance, Islamic banking, alternative banking system, financial product, Islamic financial institutions*

1. INTRODUCTION

Today in the world there are more than 400 Islamic financial institutions in 58 countries, and they are located not only in the Muslim states of the Middle East and Southeast Asia. The idea of an Islamic financial system does not contradict the banking laws of countries that have not historically professed Islam; in fact, 5% of all Islamic assets today are in non-Muslim countries. The Islamic financial sector has shown faster growth after the global crisis of 2008 compared to the traditional one, has developed in many countries outside the Islamic world. These countries include the UK, Luxembourg and South Africa, while Japan and the US are considering allowing this type of banking products. The Islamic finance industry is one of the fastest growing in the world, with an annual asset growth rate of 15-20% over the past ten years. «Due to its youth, this sector remains relatively small: according to estimates of global consulting companies, the volume of Islamic financial assets in 2013 amounted to about 1.7 trillion. dollars1. and in 2014 2 trillion. Doll». [Мамедов, 2018.Р.7].

2. THE GENESIS OF ISLAMIC BANKING

«The history of the development of Islamic finance is represented mainly by the formation of Islamic banks. The first attempts to create Islamic banks were made in the mid-1940s. in Malaysia and in the late 1950s. in Pakistan, but the first bank to operate on the basis of Sharia law was the Mit Ghamr Savings Bank, established in Egypt in 1963, later renamed Nasser Social Bank» [Мамедов, 2013. P. 4]. The Egyptian initiative began gradually to be introduced into the economies of other Muslim countries, who saw in it an opportunity to emphasize their identity. At first, they were in the nature of scattered entities, but by the mid-70s they began to consolidate into fairly large institutions, which by now have developed into an entire industry with their own rules, products and restrictions. The culmination of the process was the creation at the same time of the Dubai Islamic Bank and the Islamic Development Bank in Jeddah by the decision of the Organization of the Islamic Conference. In 1975, at a meeting of the Organization de la conference islamique (established in 1970), it was decided to create an Islamic Development Bank (Banque islamique de development - BID) by analogy with the World Bank. Islamic Development Bank laid the foundation for the official development of Islamic banking. Islamic banks began to emerge this year, the first of which were Dubai Islamique Banque (DIB), Kuwait Finance House (KFH) and Bahrain Islamic Bank (BIB). The Islamic financial sector has shown faster growth after the global crisis of 2008 compared to the traditional one, has developed in many countries outside the Islamic world. In 2015, there were 363 Islamic lending institutions worldwide, of which approximately 69% were fully Islamic “autonomous” banks, while the remaining 31% were traditional banks offering Islamic services through “Islamic windows”. Currently, Saudi Arabia is considered the main market for Islamic banking due to strong demand from corporate and private clients. This country accounts for more than a third of Islamic financial assets, that is, approximately \$ 446 billion. By 2019, the value of Islamic assets in the kingdom could reach \$ 683 billion. In the international economy, there are 21 Islamic banks with capital over USD 1 billion and at least 1 Islamic bank with capital over USD 10 billion. Currently, the capital of 21 Islamic banks is at least US \$ 1 billion, compared with 19 such banks in 2012. Of these 21 banks, nineteen are located in Qatar, Indonesia, Saudi Arabia, Malaysia, the United Arab Emirates and Turkey. So, the Islamic finance industry is one of the fastest growing in the world: over the past ten years, with an annual asset growth rate of 15-20%. Due to its youth, this sector remains relatively small: according to estimates of global consulting companies, the volume of Islamic financial assets in 2016 amounted to about 2 trillion. dollars (For comparison: the total assets of the 20 largest banks in the world in 2013 amounted to about 44 trillion dollars). Today, the Islamic financial sector is growing rapidly, its average growth rate is estimated at 10-15% per year. The entire Islamic financial industry is projected to be valued at \$ 3.4 trillion by 2020. [Филоник, 2017, p. 88].

3. ISLAMIC BANKING MODELS

«From the standpoint of the development of Islamic banking, one can single out developed, developing, undeveloped, developing, undeveloped markets» [Mamedov,2018]. Most of the Gulf countries, as well as Malaysia, can be ranked as a developed market. In these countries, the share of Islamic banks' assets exceeds 10% of the total assets of banks. Emerging markets include countries such as Oman, Pakistan, Indonesia and Turkey, in which the share of Islamic banks' assets ranges from 2 to 10%. The undeveloped market includes the post-Soviet countries of Central Asia, Russia, as well as potential countries like India and China. The practical embodiment of a full-fledged Islamic bank exists in the Gulf countries, as well as in countries such as Pakistan, Bangladesh, Malaysia, Sudan, Egypt, Kyrgyzstan, Kazakhstan and the United Kingdom. According to the laws of Pakistan, Sudan and Iran, the activities of conventional banks are prohibited, in these countries there are independent Islamic banks and "Islamic

windows" of conventional banks. In other countries, Islamic banks exist in parallel with conventional ones. The participation bank is a unique scheme for secular Turkey, the legislation of which does not accept any religious attributes in the texts and the term "Islamic bank" cannot be used in the law. Participation banks comply with IFSB and AAOIFI Islamic standards applicable to full-fledged Islamic banks, and they also have an external and internal Sharia expert council. In Turkey, the participation of the Participating Bank in the sector is five percent. The government intends to bring this figure to 15 percent by 2023. Islamic window refers to a branch of an ordinary conventional bank operating in accordance with Sharia law. At the same time, the assets of the Islamic conventional divisions of the bank are not mixed, they are managed and regulated separately. Large transnational banks Bank of America, Barclays, BNP Paribas, Citibank, JPMorgan Chase, HSBC and others have Islamic windows. Moreover, these banks open their Islamic windows both in Islamic countries and Western countries. In the UK, some banks such as Citi and Barclays have opened so-called Islamic windows.

4. ISLAMIC DEVELOPMENT BANK - AS THE MAIN FINANCIAL INSTITUTION OF THE ISLAMIC WORLD

The main victory of the followers of the idea of the need to create a new trend in world finance can be considered the opening in 1973 of the Islamic Development Bank (hereinafter - the IDB). Today we can safely say that the project turned out to be successful. Almost all large Muslim countries are IDB shareholders. The Bank is responsible for mobilizing financial resources in the IDB member countries. The mission of the IDB is to maintain economic and social progress in the countries of the Muslim world in accordance with the laws of Islam. Currently, 56 states are members of the IDB. Islamic Development Bank Group (Islamic Development Bank Groups include the following organizations: Islamic Development Bank (1975); Islamic Research and Training Institute (1981); Islamic Corporation for Investment Insurance and Export Credit (1994); Islamic Corporation for private sector development (1999); International Islamic Trade and Finance Corporation (2008)) is involved in a wide range of activities: project financing (based on the principles of public-private partnership); promoting poverty reduction in member countries; development of trade and economic cooperation between member countries; support for small and medium-sized businesses (including microfinance services); resource mobilization of member countries; participation in the capital of Islamic financial institutions; insurance and reinsurance of investments and export crediting; organization of research and educational programs for the working-age population of the member countries; assistance to member countries in emergency situations; other aspects of the activity. Based on the results of the IDB's activities in 2015, the largest share in the portfolio of socially significant projects was occupied by projects in the field of education (55%), which illustrates the desire of the IDB to transform the Islamic economy into a knowledge-based economy [Мамедов,2019. 178]. But here is the fact that the IDB has gone far beyond the framework of these states in its activities. A number of factors can be enumerated about the attractiveness of the financial model to which he adheres:

1. these are the advantages of investment decisions that are not present in the financial system familiar to the Western world;
2. it is worth noting a certain ethical nature of investments;
3. Funds of oil tycoons from the Islamic world look attractive to the banking sectors. To attract these funds, European banks have to open so-called "Islamic windows";
4. increase in the Muslim population in the world as a whole.

5. ISTANBUL AS AN IMPORTANT CENTER FOR ISLAMIC BANKING

The experience of functioning of Islamic financial institutions in Turkey is of particular interest. This country, despite the fact that over 99% of the population are Muslims, as a result of the Kemalist revolution, was officially proclaimed a secular state, and most attempts to implement Islamic instruments, including economic ones, met with resistance from the military. The activities of Islamic enterprises in Turkey began with the coming to power in 1983 of the first civilian government after the military coup, headed by Turgut Özal [Мамедов, 2005. P.144]. In an effort to create a favorable climate for attracting investments from Arab countries, in December 1983, the Council of Ministers of Turkey adopted a decree "On the establishment and operation of special financial organizations." Until 1999, they were classified as "non-bank financial institutions" and only after the Turkish financial crisis in 2001, the government amended the banking law No. 5411 in November 2005, when special financial institutions received the status of banks, but were not Islamic named, and were renamed "participation banks" (Katılım Bankaları). In addition, the Partner Banks received guarantees from the Turkish Deposit Insurance Fund (TMSF). Currently, there are about 52 banks operating in Turkey, of which 5 are Islamic banks: Albaraka Turk (operating since 1985), Kuveyt Turk (since 1988), Türkiye Finans (since 2005), Ziraat katılım (since 2015) Vakıf katılım (since 2016). The controlling stake in Ziraat katılım and Vakıf katılım is owned by the state. In the ownership structure of other Islamic banks, more than half of the shares are currently owned by foreigners: Albaraka Türk - Bahrain, Kuveyt Türk - Kuwait, Türkiye Finans - Saudi Arabia. In 2015, Ziraat Bank opened the first branch in Istanbul, which operates on the principles of Islamic banking. Turkish President R. T. Erdogan called on other state-owned banks - Vakıfbank and Halk Bank - to follow the example of Ziraat Bank. He stressed that state-owned banks should increase the share of the Islamic banking sector in the country and turn Istanbul into an important center in the region and the world. In 2016, joint participation banks accounted for 5% of the TR banking sector and the total amount of funds used for Islamic banking amounted to 133 billion Turkish Lira. During this period, we have also increased the number of their missions and staff. If in 2002 there were 188 branches in the country, then by 2016 their number reached 959. Accordingly, the working staff of these financial institutions increased from 3250 to 17020 people. In general, experts note the dynamic growth of Islamic banking in Turkey, which has the potential to further develop financial instruments to provide an alternative to conventional banking services. Currently, the Islamic banking sector in Turkey accounts for only 2.5% of the total turnover of Islamic banking in the world. Given the stability of the TR financial system, it is expected that the share of the Turkish banking sector in the global Islamic banking sector is expected to increase significantly in the medium term. Turkey aims to ensure that Islamic banking accounts for 15% of the banking services market by 2023, which implies the growth of the industry to \$ 180 billion.

6. SIGNIFICANCE OF ISLAMIC BANKING IN THE UK

The Islamic banking system is a phenomenon that is not unique to the countries of the Islamic world. For example, in the UK, following the research of the Working Group on Islamic Finance, created by the Bank of England in 2001 in order to study obstacles to the development of the industry in the country, amendments were made to the financial legislation to avoid double taxation in Islamic mortgage transactions. Later, the legislation was amended to legalize other Islamic financial instruments and create the same tax conditions for them as for similar traditional instruments. The development of Islamic finance in Britain was also facilitated by the fact that such large international financial institutions as Citic, Deutsche and HSBC had representative offices in the Middle East and Southeast Asia, studied the experience and need for Islamic financial services and did not see anything extraordinary in their provision. The UK is today the largest market in Europe and one of the world's leaders in the development of

Islamic finance. Today, the UK, which is one of the global financial centers, declares its ambitions to also become the world center of Islamic finance, seeks to take this role away from Malaysia, which is a leader in attracting Islamic financial resources from the Persian Gulf countries. Currently, there are more than 20 banks in this country (6 of which are full-fledged Islamic banks) with a volume of Islamic financial assets of \$ 19 billion, and 50 permits for Islamic investment securities were held on the London Stock Exchange for a total of \$ 35 billion. In 2014, the UK issued the first Islamic bonds with a par value of 200 million pounds and attracted 2.3 billion pounds sterling on them - ten times the amount placed.

7. DEVELOPMENT OF ISLAMIC FINANCE IN THE CIS COUNTRIES

The development of Islamic finance also took place in some CIS countries. Of the 11 CIS countries, five are actively developing the legal framework for regulating Islamic finance - these are Azerbaijan, Kazakhstan, Kyrgyzstan, Tajikistan, RF. In Kazakhstan, the development of Islamic finance is associated with the financial and economic crisis of 2007, on the basis of the National Bank of Kazakhstan (NBK), the Regional Financial Center of Alma-Ata was created. In 2009, the law “On Amendments and Additions to Certain Legislative Acts of the Republic of Kazakhstan on the Organization and Activities of Islamic Banks and Organization of Islamic Finance” was adopted, and in 2012, the National Bank of Kazakhstan developed and approved a roadmap for the development of Islamic finance up to 2020. In March 2010, the first Islamic bank, Al-Hilal, was registered in the republic. The Kazakhstan branch of Al-Hilal Bank (Abu Dhabi), is a full-fledged Islamic bank, but only provides corporate financing. Islamic banks in Kazakhstan have opened up a new stream of income for the government of the country, which has made it possible to attract new types of investors. In 2009, the assets of the country's largest Islamic bank, the Emirati AlHilal, reached \$ 300 million, experts predict that by 2020 the share of Islamic banking in Kazakhstan may reach 10%. In Kyrgyzstan, there is a legislative framework and developed instructions that regulate the activities of Islamic financial organizations. The process of practical implementation began with the dense project "Eco Islamic Bank", in this republic there are many Islamic microfinance organizations. Tajikistan is currently developing a special law on Islamic banking. The development is carried out by the efforts of the National Bank of Tajikistan and a special commission, which includes representatives of a number of ministries and other state bodies. With the assistance of the Islamic Development Bank and the National Bank of Tajikistan, a memorandum of understanding was signed and a legal framework for the development of Islamic finance was formed (with the participation of Nicolas from Malaysia). The growth in the level of microcredit increases the interest in Islamic banking at the global level. One cannot but agree with the following statement: “The Islamic finance industry is one of the fastest growing in the world: over the past 10 years, the annual growth rate of assets is 15–20%. According to forecasts, by 2020 the volume of the Islamic financial industry will reach USD 1.8 trillion”. Islamic Banking offers an option that provides stability in financing all projects internationally. It should be noted that thanks to the Islamic banking system, a higher level of stability is provided in terms of financing all projects at the international level [Мамедов,2019. p.176]. Azerbaijan is taking important steps for cooperation with the Islamic Development Bank (IDB). Currently, 56 states are participating in it. At the same time, a large role is assigned to the introduction of Islamic banking in Azerbaijan. The IDB Group is involved in a wide range of activities. Among them - “project financing; promoting poverty reduction in member countries; development of trade and economic cooperation between member countries; support for small and medium-sized businesses; mobilization of resources from member countries; participation in the capital of Islamic financial institutions; insurance and reinsurance of investments and export crediting; organization of research and educational programs for the working-age population of the member countries; assistance to member countries in emergency situations; other aspects of

activity”. The Government of the Republic of Azerbaijan and the Islamic Development Bank signed a grant agreement, which provides for the provision of technical assistance in order to prepare a legislative framework for Islamic finance. The main purpose of this Agreement is both the study of the banking sector legislation and the analysis of the opportunities provided for the introduction of the fundamental norms of Islamic banking in the Republic of Azerbaijan. In 1991–2018. The Islamic Development Bank has allocated loans to Azerbaijan in the amount of \$ 1.387 billion to prepare a legal framework for Islamic financing. A consortium of companies Ekvita Consulting and European experts have been attracted to prepare proposals for the development of Islamic finance in Azerbaijan. The Islamic Development Bank has provided technical assistance to Azerbaijan in the amount of \$ 200,000. The technical assistance includes the analysis of banking legislation and the study of the possibilities of introducing the principles of Islamic banking in Azerbaijan. However, as Moody’s experts clarify in their report on the prospects for the development of Islamic banking in the CIS countries, “despite the large number of Muslim population, the prospects for the development of Islamic banking in Azerbaijan are weak”. In our opinion, the problem of introducing Islamic banking needs to be thoroughly investigated, which is associated with the solution of two issues: the creation of a fundamental legal framework and the training of professional personnel. The latter is especially important in order to achieve the efficiency of the process itself. The solution to the problem, which determines the high level of efficiency of the banking system of Azerbaijan, lies in the growth of the competitiveness of banking institutions on the basis of their merger and increase in banking capital [Mamedov, 2020. P 65].

8. CONCLUSION

So, the main drivers for the development of the Islamic finance industry will be Saudi Arabia and Malaysia, while the role of Turkey and Indonesia will increase. Turkey aims to ensure that Islamic banking accounts for 15% of the banking market by 2023, which implies the growth of the industry to \$ 180 billion. However, the current drop in oil prices and a decrease in the level of temporarily free liquidity also affects the ability of Islamic banks to compete with traditional ones in Western financial markets. The experience of different countries shows that there is no single form that just needs to be applied - there are different views on certain issues. Russia can proceed both from the experience of some countries and develop its own approach. One of the conceptual questions is the definition: should a financial institution working with Islamic methods be called Islamic? For example, in Turkey, these banks are called "participation banks", in Great Britain there is no word "Islamic" in the legislation either. The main difference between Islamic finance and the global banking model is the rejection of lending interest, i.e. it's not about the name, it's about the principles. In addition, it is important to pay attention to improving the financial literacy of the population and protecting consumer rights. Unfortunately, today, both in Russia and in many CIS countries, there is an idea among a certain part of the population that Islamic banks are financial organizations where you can get an interest-free loan or some kind of assistance. Clients should know the specifics of Islamic banking, understand what investment deposits are. Speaking about the prospects, one could consider the creation of a single Islamic bank for the development of the CIS countries. We believe that such an institution can serve as a good platform for the further development of economic and financial relations within the CIS countries.

SWOT ANALYSIS AND ASSESSMENT OF AZERBAIJAN'S TRANSITION POTENTIAL TO THE CONCEPT OF SUSTAINABLE DEVELOPMENT

Mahish A. Ahmadov

*Head of the Department of "Regulation of the Economy",
Azerbaijan State University of Economics,
Baku, Istiqlaliyyat str.6, AZ1001, Azerbaijan
mahish_28@mail.ru*

ABSTRACT

At the article, it searches and evaluates the concept of transition to sustainable development based on world experience, all fields of human activity from the scientific and methodological point of view, taking into account economic, social, environmental sustainability, as well as the interests of present and future generations. Depending on the nature and structure of the factors that determine development, negative tendencies are also observed, which manifests itself in the form of "development without a future", uneven development. Because, in some cases as a result of economic development, depletion of natural resources, environmental pollution, and demographic imbalances are also observed. Based on the analysis of concrete factual materials of Azerbaijan, it is concluded that the economic, social, scientific, technical, financial potential, human capital, infrastructure, improvement the level of population social welfare, as well as normative-legal acts and institutional framework has made the transition to the concept of sustainable development a practical challenge. Then, based on the current state of socio-economic development of the country and the 360-degree diagnostics of the SWOT analysis of the starting position and opportunities that can be mobilized within the existing opportunities, the balance of resources, the level of their use and potentially mobilized national economy for the near future. Attempts were made to define the main priorities, goals and objectives, as well as to make concrete proposals and recommendations for the effective implementation of the existing forms, methods, principles and mechanisms of regulation of socio-economic processes in our country in the near future economic, social, demographic, environmental, humanitarian and institutional development are put forward.

Keywords: *Sustainable development, economic sustainability, social sustainability, environmental sustainability, SWOT analysis, "Development without a future", "Uneven development", development concept, national priorities, economic environment, social environment, ecological environment*

1. INTRODUCTION

The successes which achieved in the field of socio-economic development in Azerbaijan over the past decade, the created economic, social, scientific and technical, financial potential, human capital, infrastructure, improvement the level of population social welfare, as well as normative-legal acts and institutional base allowed our country to present the transition to sustainable development as a practical problem. At the same time, as a result of the global financial crisis and the sharp decline in world crude oil prices over the past two years, the devaluation of the manat, the role and opportunities of the oil factor in the development of the national economy, limited income, declining GDP in our trading partners, increasing the deficit, increasing global pressure on the nature of economic development as a whole, distorting the factors, criteria, driving forces, principles and mechanisms of economic development in our country, which has applied to the perspective period, has made it necessary to develop a qualitatively new economic development strategy. This, in turn, includes: a GZIT (strengths, weaknesses sides, opportunities, dangers and threats) analysis of the current state of socio-

economic development of our country analysis and 360-degree diagnostics, assessment of the balance of resources owned by the country, the degree of their use and potential that can be mobilized in the current condition; ensuring the effective implementation of economic, social, environmental and institutional development of the existing form, method, principle, requirements of regulation of socio-economic processes requires improvement of the conceptual basis of stable fiscal and effective monetary policy.

2. POTENTIAL FOR AZERBAIJAN'S TRANSITION TO THE CONCEPT OF SUSTAINABLE DEVELOPMENT

In condition of globalization, the demand for resources of mankind is constantly growing, the growing cost of their production, the growing dependence on globalization as a logical consequence of globalization, has led to the universal nature of economic, social, demographic and environmental problems. In such requirements, the formation and development of an effective national economy in Azerbaijan is decisively conditioned by the transition to its model of sustainable development. The historical experience of the developed countries shows that in order to ensure the transition of the national economy to sustainable development, the resource potential of the country must first and foremost be of interest and benefit to future generations. The required necessary economic, social, ecological, technical-technological potential should be gradually formed for the transition from resource-based development model to innovative development model. Generally, concept of sustainable development based on such a civilized approach is to be dominated by socio - economic systems, and regardless of the nature of development models, it is necessary to ensure that the application and development of scientific and technical progress in the national economy is accelerated and the principles of sustainable human life at all levels should be upheld and the balance of the environment should not be worsened. All this, in turn, makes it necessary to re-evaluate the growth factors of the national economy in terms of sustainable development. In such circumstances, the optimality and effectiveness of economic policy in each country, its responsiveness to the interests of present and future generations, and above all, the resilience of national economies to the global financial crisis, especially ecological balance. From this point of view, modernization of production in our country in the near future, increasing the competitiveness of innovative development, improving the structure and diversification of the economy, ensuring inclusive economic growth are based on the principles, mechanisms and goals of sustainable development. In this context, the potential for the transition of the national economy to sustainable development in modern times requires an assessment based on SWOT analysis. Emphasizing the urgency of the problem, Mr. President Ilham Aliyev noted on the 90th anniversary of Baku State University: "Azerbaijan has completed a period of transition. We must draw conclusions by analyzing the existing realities, think about new paradigms and define the conceptual basis of the economic development model for the transition of the Azerbaijani economy to sustainable development. All these issues should form the main line of the strategic economic policy of the state developed in our country for the near future (1). Ensuring the transition of the national economy to a model of sustainable development requires, first of all, the development and practical implementation of the conceptual framework of the development strategy, taking into account the relevant progressive world experience and national realities. World experience shows that although the natural resources of each country provide the initial necessary basis for its sustainable economic development, in many cases it does not act as a decisive condition. The development of the transition concept to sustainable development of national economies first of all, it is necessary to identify the balance of material, labor and natural resources of the country, the degree of their use, the factors of production that can be mobilized within the capabilities of existing scientific and technological progress and financial potential. This, in turn, requires an objective assessment of the level of economic development and potential of

the country in terms of economic, scientific, technical, financial, social, environmental and human capital. In general, if we try to characterize the perspective development model aimed at ensuring sustainable development in our country in modern times, we will focus on the following priorities, showing the optimal ratio of key factors in economic growth, ensuring the security of the national economy, the competitiveness of the national economy. Special attention should be paid to the assessment of growth efficiency from the point of view of reproduction, to the emphasis on social efficiency and, finally, to the fact that efficient use of one factor does not negatively affect the level of use of another. The analysis shows that at different stages of world development, the priorities and goals of the transition to sustainable development are also improving. Then, on December 6, 2016, twelve Strategic Roadmaps on eleven sectors were approved by Presidential decree. For the first time, these roadmaps set as a strategic task the harmonious solution of economic and social development, the interests of present and future generations, as well as raising the inclusion of the economy. In general, they are: investment-innovation; improving the business environment; investment promotion; implementation of structural and institutional reforms; raising the competitiveness of the national economy; stimulating the development of the non-oil sector and exports; state support for the development of profitable labor-intensive industries and productions; improving the system of salaries, pensions and benefits; promotion of the "Made in Azerbaijan" brand; and etc. can be grouped by destination. At this time, the expectation of the security of the national economy was defined as an inevitable condition for the formation and implementation of the strategy of economic reforms to be implemented in our country. The success of economic reforms in each country depends crucially on the nature of the economic policy pursued in the country, taking into account their changes in the world and national interests (2). The realization of the strategic goals and objectives of our country's transition to a model of sustainable development in the near future requires improving the structure of the national economy in accordance with changing conditions and demand, ensuring optimal balance between the real and financial sectors. The analysis shows that the nature of our country's economic development in the near future will include: the relocation of global economic power centers to emerging markets in Asia; significant effects of technological innovations, the changing geopolitical configuration and the gradual reduction of the effects of the oil and gas factor will significantly increase the potential of the non-oil sector. The analysis shows that a large part of the investment in the country's economy over the past decade has been directed to the export of oil and gas resources to the world market, the creation of economic and social and market infrastructure necessary for the development of entrepreneurship, their main source of funding, along with the state budget, was financed by transfers from the Oil Fund. In my opinion, the above should be considered one of the most characteristic features of Azerbaijan's transition to a sustainable development strategy. All this will dramatically increase the solidity to possible negative cataclysms and the negative impact of geoeconomic and instability on the sustainable and dynamic development of the national economy in the near future. In general, during 1993-2018, the volume of investments in fixed assets in our country at the expense of all financial sources amounted to more than \$ 250 billion. [Statistical Indicators of Azerbaijan, Baku 2018] Assessing the potential and opportunities created in our country in recent years in all areas, the International Monetary Fund forecasts 2-3 percent annual growth of the Azerbaijani economy until 2025. Today, the Azerbaijani economy is in the process of transition from quantitative to qualitative changes. It is well known that no matter how similar economic growth is to any country in terms of natural resources, their ability to provide ever-raising reproduction is limited, but human capital is a constant, inexhaustible source of economic development. From this point of view, in the near future, the national economy in Azerbaijan will ensure its self-development and competitiveness, and oil capital will depend to a large extent on the development of human capital.

The analysis shows that if we try to characterize the perspective development model aimed at ensuring sustainable development in our country in modern times, taking into account the world experience and national realities, we will focus on the following priority areas; to expect optimal ratios of key and progress factors in economic growth, to ensure the security of the national economy, to make the national economy competitive, to choose the right priorities, to approach the assessment of the efficiency of economic growth from the point of view of reproduction, highlighting social efficiency and finally, special attention should be paid to the fact that the efficient use of one factor does not negatively affect the level of use of another. P. Solow rightly notes that three main issues should be in the center of attention while determining economic policy. First, society should be direct more or less of its national income to the savings. Second, it must be determined how economic policies can affect savings, and third, how changes in economic policies can affect technical progress. Because, as M. Todaro noted, "Development is a highly planned process, which accelerates the transformation of people's behavior, social institutions, social structure, fundamental, economic growth, reduces unemployment and softens inequality in society." [3] It is also a fact that the transition to the concept of real sustainable development is virtually impossible without ensuring its international competitiveness. Porter rightly writes that the competitiveness of the country's economy depends not only on the known classical factors of economic development, but also on national conditions, in other words, the structure of the national economy, national culture, mentality of public servants, and even the country's history also has a significant effect [4]. Of course, in this case, as noted by P. Solow, the expectation of the degree of sustainability between existing produced capital and natural resources is a prerequisite for the development of sustainable development programs. Serious problems in the field of ensuring the harmony of nature-society, human relations in modern times have become an objective necessity to re-evaluate them in terms of sustainable development. In general, since the 1970s, new approaches to the concept of economic growth have emerged in relation to sustainable development. The introduction of the concept of sustainable development as a practical problem in the international arena dates back to the 1971 report "Limits of Growth" prepared by the Club of Rome. It was emphasized in the report that the increasing scale and wasteful use of natural resources, especially energy, causes great damage to the environment, rendering it unusable, and casts doubt on the possibility of normal life on Earth in the long run. To address this problem, the need to shift from intensive economic growth to intensive development in anticipation of ecological balance was justified. Taking into consideration the relevance and practical significance of the principles of the report, an international conference on sustainable development was held in Stockholm in 1972. It was presented to humanity as a challenge to address the problem of limited land resources at this conference. Then, the fundamental principles, ways, mechanisms and priorities of the concept of sustainable development were identified at the international summits held in 1992, 2002 and 2012. In 1972, Nobel laureates Y. Nordhaus and J. Tobin, in their study "Growth is Obsolete," actually proposed a model for the first time to assess the sustainability of the economy. In 1974, the conditions for sustainable economic development were formed for the first time by Robert Solow. He noted that a gradual decline in the consumption of the economy in order to ensure the intended sustainability of the natural resources in the produced capital provided the necessary conditions for the development of a sustainability program. Then, on October 20, 1987, the resolution of the 42nd session of the IMF defined the basic principles of sustainable development of mankind. It is known that in the world economic literature, the concepts of weak and strong sustainability are distinguished depending on the level of economic development of the country, the chosen model of development and the degree of integration into the world economy. "Poor sustainability - is a development that does not reduce from generation to generation." Other economists agree that poor sustainability is seen as "a sustainable supply of consumption without worsening the

condition of fixed capital." We note that it is the most difficult and contradictory process for economists to accurately define the indicators of "weak and strong" sustainable development (5). "Sustainability - is a development based on the long-term unity of social, financial and ecological balance, with long-term economic, environmental and cultural viability." The literature shows that the 5 main elements of sustainable economic development are indices and indicators for assessing the economy, ecology, fairness, education and sustainable development (6). In general, researchers agree that sustainable development involves maintaining a weak balance between improvement of people's lifestyles, needs, material well-being, and the ecosystems. of natural resources (6). The analysis shows that the practical and effective implementation of the sustainable development strategy in highly developed national economies is determined by known general principles, but its provision at the mega, macro, meso, micro and regional levels must be taken into account. Thus, depending on the level of development of national economies of individual countries (6), the role of individual factors in improving its competitiveness must be taken into account. In recent years, the strengthening of the social and humanitarian aspects of sustainable development in the international arena and the practical realization of these goals have become more relevant. In this regard, in accordance with the goals of sustainable development adopted at the UN Summit in September 2015, the "2030 Agenda" was adopted, taking into account the need for a comprehensive institutional and political approach to ensure the implementation of sustainable development goals in Azerbaijan until 2030 and the National Coordinating Council for Sustainable Development was established and the transition to the concept of inclusive economic growth was set as an important task. In recent times, the principles put forward by the UN have used the terms "development without a future", as well as "unequal development". Analysis and evaluation of existing concepts of inclusive development led to the conclusion that inclusive development directly uses the potential of labor, provides effective employment, minimizes poverty and its negative consequences, eliminates sharp differences in income between different social groups, different regions, to reduce inequality in living standards and infrastructure, especially in social infrastructure, and to minimize the direct Gini, Lawrence curve requirements, the correspondence between the country's income and consumption, and the difference between these consumption groups. At the same time, the concept of inclusive growth implies comprehensive human development, as well as the development of health and education services, not only the development of these services, but the availability of these services among all groups of the population. Ultimately, the nature of inclusive development in the country is strongly influenced by the model of development it chooses, the historically formed structure of the economy, the level of development and the national mentality. The nature of ensuring long-term inclusive economic growth has a strong negative impact on the existing disproportions in the level of socio-economic development of the country. In order to eliminate these negative processes in regional economic development, three regional development programs covering 2004-2008, 2009-2013, 2014-2018 were adopted by the order of the President of the Republic of Azerbaijan, and today significant results have been achieved due to their implementation. In general, \$ 50 billion has been spent on regional development in our country over the past fifteen years.

3. CHARACTERISTICS AND PRIORITIES OF AZERBAIJAN'S TRANSITION STRATEGY TO THE CONCEPT OF SUSTAINABLE DEVELOPMENT

World experience shows that the practical implementation of sustainable development in a concrete example of any country is a logical sequence: a systematic SWOT analysis of the level of development of the national economy, goal setting, the degree to which the existing system of economic relations meets national interests and finally, the form, method, scale of its regulation. In general, in a globalizing world, every country must solve four problems to ensure

sustainable development. First, it is necessary to implement a system of appropriate measures to address the environmental problems arising from the development of the world economy in modern times; second, to implement the necessary socio-economic programs to ensure sustainable human development; third, to formulate and implement appropriate policies to address the demographic problems observed in modern times; fourth, existing economic problems must be systematically addressed, taking into account current and future goals in terms of sustainable development. It should be noted that ultimately the ability to solve environmental, social and demographic problems depends crucially on the level and nature of economic development. At the same time, it should not be overlooked that the practical implementation of the concept of sustainable development is primarily conditioned by the country's potential for sustainability (7). At the same time, the analysis shows that although the potential for sustainability is determined by the absolute advantages of the country as a whole, this potential can be significantly increased by implementing the right, optimal, flexible economic policy and waiting for the optimal stage of solving global, regional, national interests and current and future goals. It should be noted that the transition to the concept of sustainable economic growth ultimately depends on the development and efficiency of the real sector. "The analysis of the Azerbaijani economy in terms of supply also shows the positive results of a successful strategy. Over the past 10 years, macroeconomic stability has been maintained in the Azerbaijani economy, important reforms have been carried out and necessary measures have been taken to diversify the economy and develop entrepreneurship. At the same time, the balanced development of the regions was ensured during this period, the competitiveness of the country's economy increased and the country's rapid integration into the world economy continued" (8). Ensuring the transition to sustainable development is a problem directly related to the security of the national economy. Expectation of economic security is an internal and external factor covering the independence of the national economy, the stability of the reproduction process in the country at all levels, the coordination of current and future goals and objectives, dynamic and sustainable development, as well as its ability to constantly renew, self-development and improvement, in this case can be expressed as a set of conditions, especially the availability of appropriate financial security should be noted. As noted in the economic literature, "The financial self-sufficiency of a country is one of the most important criteria of its economic independence. A state that cannot support itself, is unable to provide its socio-economic development with the financial resources it has earned, cannot be considered a sedentary state in general" (9). The concept of economic security should include not only the protection of national interests, but also the mechanism of protection and realization of national interests, the development of national entrepreneurship and production, the ability to ensure socio-economic stability in society. In turn, to achieve relevant results in the field of economic security, in a number of areas; to identify and forecast internal and external threats to the society in all its interests, to create the necessary information base by conducting comprehensive objective monitoring of economic processes, to prevent possible negative consequences of threats to economic interests, to implement a set of flexible and long-term measures to eliminate them and their consequences. It requires timely assessment, adaptation to dynamic changes in the world economic system, global competition, as well as problems arising from limited resources, and adequate response to internal and external threats. A characteristic analysis of the economic policy pursued in Azerbaijan during the years of independence shows that during these years the Azerbaijani state has formed and implemented such an optimal economic development strategy that it almost did not lead to the so-called "delay effect" in the economic literature. The Azerbaijani government has always sought to maintain a link between regulatory capacity, especially financial capacity, and the level of regulation. Implementing financial market liberalization without creating an appropriate regulatory framework is undoubtedly a common recipe for economic instability (10).

At the same time, Yantirberg's opinion is of particular importance that the scale of regulation should be coordinated with the country's regulatory capacity. In order to ensure sustainable economic growth, it is important to make the necessary structural and institutional changes in response to changing condition, demand and potential. This proves once again that in order to ensure sustainable economic development, the ratio between the country's financial potential and the development of the real sector must be constantly improved in accordance with changing conditions and demand, and the necessary changes in the structure of reproduction. Thus, the assessment of socio-economic processes on the basis of 360-degree diagnostics shows that the production process can be carried out efficiently in any national economy. However, if the distribution and exchange process in the country is not optimal, especially if the existing products and services are not used efficiently, then the benefits of overall economic growth will fall sharply and the country will experience "impoverished economic growth." It is also a fact that in order to effectively implement the strategy of sustainable development, every piece of legislation adopted in connection with socio-economic development must have a strong enough intellectual load and take into account current and future goals. Therefore, ensuring the effective functioning of a competitive and dynamically developing national economy depends on the nature of the regulatory system, the effectiveness of its application and the level of management of these processes as a whole in the country. In general, when assessing the impact of legislation on socio-economic processes, along with costs and results, the issues of environmental assessment, ensuring national economic security and competitiveness, and anticipating the interests of present and future generations should not be overlooked. As a result of the economic development strategy implemented in our country in recent years, significant progress has been made in improving the competitiveness of the national economy, inclusion, development of infrastructure and the business environment as a whole, as well as the dynamics of economic freedom index. Under the direct influence of the coronavirus pandemic, the stagnation in the world economy, its foreign trade relations, sharp fluctuations in oil prices in world energy markets, as well as the decline in economic activity due to restrictive measures to prevent the pandemic were clearly observed in Azerbaijan. In this framework, a special Economic Council was established to adequately respond to the strategic challenges of national economic development, to ensure a successful transition to a new model of economic growth and sustainable development, and to formulate an appropriate strategy reflecting the country's national development priorities in the post-pandemic period.

4. CONCLUSION

In the post-pandemic and post-conflict period, the independent and sovereign Azerbaijani state is entering a qualitatively new strategic stage covering 2021-2030. Taking these into account, the Presidential Decree of February 2, 2021 identified 5 national priorities "Azerbaijan 2030: on socio-economic development." These priorities cover the formation of a steadily growing competitive economy for the next 10 years, ensuring inclusive development, the digital economy in all spheres of economic and social life, and finally the "Great Return to Karabakh" program. Despite the reasons for the impact of the pandemic on the country's economy, as well as the growth of non-oil and gas industry and agriculture, which are the main sectors of the economy, against the background of declining components of aggregate demand, GDP in real terms decreased by 4.3% in 2021 compared to 2019. 72.4 billion manat, and GDP per capita decreased by 5.0% and amounted to 7262.8 manat. In 2020, the average annual inflation was 2.6%. Opportunities to implement the priorities set for the next 10 years are based on the development concept "Azerbaijan 2020: vision for the future", 4 regional development programs, as well as the results of the measures envisaged in the Strategic Roadmaps for 2016-2020. The concept of socio-economic development covering 2021-2025 has been developed.

The main driving force of the implementation of national priorities in Azerbaijan for the next 10 years is the restoration and revival of 20% of our lands liberated from occupation as a result of the Great Patriotic War. The existence of the financial potential of our country, as well as the sharp increase in employment as a result of the involvement of many foreign countries in the reconstruction of Karabakh, the development of human capital and a favorable business environment in the post-conflict and post-pandemic period will play an important role. As a result of the successful strategy implemented in the country, according to the World Bank's "DOING Business 2020" report, the crisis in the world economy in 2020 improved Azerbaijan's position by 6 points, raising from 34th to 28th place and once again included in the list of "10 most reformist countries" in the world. In general, our research leads to the conclusion that in the near future to ensure the transition of our country to the concept of sustainable development; formation and implementation of innovation-oriented investment policy; creation of appropriate production - socially oriented infrastructure; formation of the national innovation system; achieving a sharp increase in the share of intellectual capital in GDP; fifth, in a globalizing world, it has become an objective necessity to make the necessary institutional changes in response to changing market conditions and demands.

ABSTRACT

Findings of the theoretical research provided in the article, and experimental data produced by the research paper [3] show that radial deformation, the depth of gear teeth penetration, and membrane thickness are key factors with a significant impact on the limiting moment of strain wave gearing (also known as harmonic gearing). During the research, the limiting moment has been estimated given that no breakthrough occurs in regard to the operation of a wave generator. For the gearing in question, the limiting moment could exceed the nominal (torque or rotational force) value by a factor of five to six. Such difference in the value of the moment of resistance could cause plastic deformations of the elements of strain wave gearing. Therefore, while setting the limiting moment the static strength must be calculated. The singularities of operation of strain wave gearing have also been studied, along with the mathematical model that covers spatial deformation and the corresponding interaction among the elements of strain wave gearing. The Bubnov-Galerkin method has been applied to get the determinant set of equations. Consequently sensitivity coefficients have been obtained through the methods of the spatial (covariant) theory of elasticity, while the limiting moment has come out of the condition of generator breakthrough. Also studied is the impact of various parameters on the limiting moment of strain wave gearing with a flexible-bottom bucket-shaped cam wave generator. Design calculations have demonstrated that the radial deformation of flexible spline, depth of gear teeth penetration, the angle of standard basic rack tooth profile, and radial (internal) clearance have a significant impact on the limiting moment, while preload pressure in the gearing, the membrane length and types of straining of the flexible spline almost fail to affect limiting moment parameters.

Keywords: *mathematical model, gear teeth intervention, strain wave gearing, circular spline*

1. INTRODUCTION

Strain wave gearing, setting a small overall size and a few parts, has a high gear train value. Besides, such gearing has a high load capacity and kinematic precision (due to multi-tooth gearing). These advantages provide room for the broad use of strain wave gearing in various drives of automatic control systems as well as mechanical drives used in robots, and aerospace technology. The operating capacity of harmonic gearing is specified by the following criteria: fatigue (endurance) limit of flexible spline, a lifetime of a wave generator, wearing power of flank tooth surface of the flexible and circular splines [1]. The M_{lim} , the maximum output shaft resistance at which strain wave gearing is able to transmit motion, is an important parameter of the operating capacity of harmonic gearing running a periodically applied high load (hoisting machines, rotation gears, etc.). Wave generator breakthrough or static failure of segments could be a cause of transmission failure. Following the application of strain wave gearing in different machines, it has been detected that its segments are not subjected to static failure during the generator breakthrough if the corresponding gearing (transmission) parameters are selected correctly.

Generator breakthrough is the result of elastic compliance (resilience) of gearing components. The higher the torque M_r moment of resistance the narrower the tooth socket at involute gear will be, thus leading to interference. Further torque M_r increase intensifies interference, while the teeth of flexible and circular splines interact at the tip level. Meanwhile, the circular spline sprawls, the wave generator gets compressed and its shaft deviates from the axis of rotation. Following such deformations, all teeth of the flexible spline exit the sockets of the circular spline in one of the contact zones. Finally, the strain wave gearing transforms into one single wave and loses operability [2–4], i.e. the turn of a cam (driving member) fails to trigger off the slave unit (driven member or cam). This phenomenon is known as the generator breakthrough.

2. PROBLEM STATEMENT

Tooth interference and generator breakthrough phenomena have been the subject of a number of research papers [2–6], and other studies. Findings of the research activities by Polituchiy A. I. [2–4] stand for the best comprehensive study of the impact of design parameters on the limiting moment. Following experimental research, Polituchiy has established the dependence of the limiting moment M_{lim} on radial deformation of the flexible spline, as well as the depth of gear teeth penetration, structural dimensions, generator run-out, and other key gearing parameters. The corresponding testing has involved the strain wave gearing with the flexible spline setting an internal diameter of 120mm, and the tooth-to-tooth seizure of the flexible spline to the shaft. For other gearing parameters, theoretical dependences have been established by means of approximation methods in engineering, which, however, fail to allow for spatial features of deformations, and the interaction among the elements of strain wave gearing. The research paper [7] proposes the methodology for the calculation of the limit load operation of strain wave gearing; it is based on the localization of dimensional elastic interaction among the elements of strain wave gearing, through the methods existing in the elasticity theory. The methodology enables to study more accurately the impact of different parameters on the limiting moment under the circumstances of unequal design solutions and dimensions of strain wave gearing. The purpose of the research is to carry out a theoretical study of the impact of different parameters on the limiting moment of strain wave gearing with a flexible-bottom bucket-shaped cam wave generator. The calculations have employed the dimensional mathematical model of strain wave gearing, proposed in research papers [7, 8]. Consequently, the available and newly obtained dependence values of the limiting moment M_{lim} on strain wave gearing parameters.

3. MATHEMATICAL MODEL

The principal cause of generator breakthrough is elastic deformation of the elements of strain wave gearing; therefore the gradation of elastic interaction among the elements of strain wave gearing is required to calculate the limiting moment M_{lim} . Such gradation allows for elastic deformations of flexible and circular splines, as well as a flexible bearing cup, contact deformations on the flexible bearing, bending deformations on the camshaft, and offset (displacement) of the elements of strain wave gearing as rigid bodies. The dimensional model of strain wave gearing is used for the calculation of the strength of interaction among the respective elements [7, 9, 10]. The resolving system of equations implies the possibility of the interaction involving flexible and circular splines along with lateral and outer surface areas of the teeth, the surface areas of the flexible spline and flexible bearing cup, and rolling elements with rolling paths on the flexible bearing. The Bubnov-Galerkin method has been applied to build up such equations. Surface-distributed strength of interaction among the elements of strain wave gearing is replaced with surface forces with a piecewise linear distribution. To achieve that result, interacting surfaces are divided into square subareas.

Every node is then compared against the dimensionless Courant number φ_i [11], which represents a single-cone hexagonal pyramid. Subsequently, $u_i = 3\varphi_i/S_i$ has been employed as a basis function, with S_i standing for the base area of the pyramid. Basis functions u_i are unit-volume hexagonal pyramids. Thus the intensity of the distributed strength of interaction between two surfaces is expressed by the following linear combination of basis functions:

$$p = \sum_{k=1}^{N_2} F_k u_k, \quad (1)$$

where F_k ratio involves the dimensions of strength and is worked out through the resolving system of equations and inequalities [8].

Caused by SI-derived unit of forces, $1u_k$ (influence coefficients), nodal displacements on interacting surfaces of the flexible spline and bearing are detected by means of the linear membrane theory. The influence coefficients of the flank tooth surface of the flexible spline are built upon mass displacements as a result of deformations on the teeth and membrane of the flexible spline. The extent of mass displacements is worked out by means of the linear membrane theory, while deformations on the teeth of the flexible spline and influence coefficients of flank tooth surfaces of the circular spline are determined by means of the finite element analysis with the use of first-row solid elements (voxels). Interaction strength of rolling elements with rolling paths on the flexible bearing is deemed concentrated. Any convergence between such elements is detected by Herz equations. The influence coefficients of the outer surface areas are calculated by the linear membrane theory, while the coefficients of influence of outer surface area of the circular spline are quantified by the finite element analysis. The resolving system of equations is a set of canonical equations covering flexibility methods, as well equations of circular spline balance, flexible spline balance, flexible bearing cup, and cam, and the equations that express the unilateral nature of interaction among elements:

$$\begin{cases} \begin{pmatrix} \tilde{D} & \tilde{G} \\ \tilde{G} & C \end{pmatrix} \begin{pmatrix} F \\ a \end{pmatrix} = \begin{pmatrix} \tilde{\delta} - \tilde{\delta}_0 \\ B \end{pmatrix} \\ \tilde{\delta}_j \geq 0; F_j \geq 0; \tilde{\delta}_j F_j = 0, j = 1, \dots, N \end{cases} \quad (2)$$

where \tilde{D} is a reduced matrix of nodal resilience; C - is a matrix that accounts for the resilience of the supporting elements of the cam, flexible and circular splines; F - is a force vector of interacting surfaces (for the surface-distributed strength, vector elements are equal to F, k ratios in the above-mentioned linear combination (1)); $\tilde{\delta}$ and $\tilde{\delta}_0$ are the vectors of reduced internal clearance at nodal points between the deformed and undeformed surfaces; a - is a vector of displacement of the elements of strain wave gearing as rigid bodies; \tilde{G} - is a matrix that bonds an increment of the vector of reduced internal clearance $\tilde{\delta}$ with a vector of displacement a ; B is an external force and moment vector that contains a single nonzero element (moment of resistance against the flexible spline); $\tilde{\delta}_j$ elements of the vector $\tilde{\delta}$; F_j elements of the vector F .

Meanwhile, the calculation is done in the following sequence:

- 1) The restoring torque method [9] is a solution to the resolving system of equations (2) under the circumstance setting the zero value of the moment of resistance at the output shaft. The corresponding calculation determines the contact zones of interacting elements (nodes with zero clearance $\tilde{\delta}_j$). It is assumed that no tooth interference occurs at an idle stroke, and therefore the teeth of the flexible and circular splines cannot interact with outer surfaces.
- 2) Then the moment of resistance at the output shaft M_r is subjected to a gradual increase. At every value of the output shaft resistance M_r , the angle of rotation of the cam φ_k changes, in fine pitches, from 0 to 90°. For every φ_k value, elastic interaction among the elements of gearing is measured. Such measurements are necessary to detect any possibility of generator breakthrough that occurs when all teeth of one half-wavelength of the flexible spline interact with the teeth of the circular spline along outer surfaces only.

The calculation (2) is getting complicated under the circumstances of tooth interference, for the surfaces (flank or outer) on which the teeth of the flexible and circular splines can interact are not known in advance. To identify the surface(s) of possible tooth contact, the measurements are done in pitches, gradually increasing the moment of resistance M_r and the angle of rotation of the cam. To identify the surface of possible contact between a pair of teeth, the results of two measurement options are taken into consideration; the first option corresponds to the previous load step, while the second is based upon the current load step, i.e. the measurement after a small angle of rotation of the cam $\Delta\varphi$, without any change of possible surfaces of contact of all tooth pairs.

Consequently, the following outcomes are expected:

- 1) According to the first measurement option, the entry (interference) of the j^{th} pair of teeth h_j (opposite-sign clearance between outer surfaces of the pair of teeth) has a negative value. According to the second option, h_j has a positive value while the clearance between effective flank surfaces of the same pair of teeth δ_j is negative. In that case, the outer surfaces of the gearwheel (meshing of gear teeth interference) are considered as possible interaction surfaces of the j^{th} pair of teeth.
- 2) A pair of teeth interact with flank surfaces until the rotation of the cam, while upon the cam rotation at $\Delta\varphi$ angle the entry (interference) of the same pair turns out to be negative. In that case, possible interaction surfaces of the j^{th} pair of teeth change from the flank to outer surfaces of gearwheel (disruption of the tooth of the flexible spline from the gash up to the crest of the circular spline).
- 3) A pair of teeth interact with outer surfaces until the rotation of the cam, while upon the cam rotation at $\Delta\varphi$ angle the flank clearance δ_j value regarding the same pair turns out to be positive. In that case, possible interaction surfaces of the j^{th} pair of teeth change from the outer to the flank surfaces of the gearwheel (disruption of the tooth of the flexible spline from the crest down to the gash of the circular spline).

Detailed description of the dimensional model of strain wave gearing is proposed in research papers [7, 8].

4. FINDINGS OF THE RESEARCH

The study of the impact of various parameters on the limiting moment M_{lim} has been carried out on the strain wave gearing with a flexible-bottom bucket-shaped cam wave generator. The studied gearing is characterized by the following key parameters: the number of teeth of the circular spline (b), $Z_b = 172$; the number of teeth of the flexible spline (g), $Z_g = 170$; offset coefficient of the circular spline and flexible spline, $X_b=4.35$ and $X_g=4.22$, respectively; gearing

module $m = 0.7$ mm; membrane thickness of the flexible spline $h_0 = 1.1$ mm; thickness of gear ring in the gash of the flexible spline $h_1 = 1.3$ mm; membrane length of the flexible spline $L = 120$ mm; width of gear ring of the flexible spline $b = 13$ mm; thickness of the circular spline $h_b = 21$ mm; outer diameter of the flexible bearing $D_n = 120$ mm; width of the flexible bearing $B = 20$ mm; fairly bearable radial deformation of the flexible spline $w_0/m = 1.1$; depth of gear teeth penetration $h_d = m$; radial clearance in the flexible bearing $G_r = 26$ μm ; nominal rotational force $M_{nom} = 400$ N m. In addition, the cam setting error corresponds to the 7th quality grade of the elements of strain wave gearing. Other gearing parameters are available in the research paper [7]. Below are the findings of the impact of the following parameters on the limiting moment M_{lim} , precisely deformation w_0 and types of straining of the flexible spline, depth of gear teeth penetration h_d , membrane thickness of the flexible spline h_0 , membrane length of the flexible spline L , the thickness of the circular spline h_b , radial clearance in the flexible bearing G_r , the angle of basic rack tooth profile α , and preload pressure in the gearing. The reference value of these parameters is given above; if the value of one of the parameters changes, the remaining values remain unchanged. A relative value of limiting moment M_{lim}^* , which represents a ratio of the limiting moment M_{lim} to nominal rotational force, has been used for the estimation of dependence values. Figure 1 represents the dependence of a relative value of the limiting moment on fairly (relative) radial deformation of the flexible spline $w_0^* = w_0/m$. As radial deformation of the flexible spline w_0 increases, the values of preload pressure in the gearing and the depth of gear teeth penetration are not subjected to any change due to corresponding (counterbalancing change) of the values of offset coefficient and the circle radius of the interaction vertexes of the circular spline. As radial deformation w_0 increases, so does the flank clearance at the involute gear. This results in the intensification of the rotational force leading to tooth interference and, consequently, to further enhancement of the limiting moment M_{lim} .

Figure 1: Dependence of relative value of the limiting moment M_{lim}^* upon fairly (relative) radial deformation of the flexible spline w_0^*

Figure 2 represents the dependence of relative depth of gear teeth penetration $h_d^* = h_d/m$ upon the relative value of the limiting moment M_{lim}^* of strain wave gearing. An increase of h_d from 0.6 up to 1.2 mm occurs following the corresponding change of the circle radius of the interaction vertexes of the circular spline. As the gear teeth penetration deepens, the limit moment increases by almost the linear law.

Figure 2: Dependence of the relative value of the limiting moment M_{lim}^* upon the relative depth of gear teeth penetration h_d^*

Figure 3: Dependence of the relative value of the limiting moment M_{lim}^* upon membrane thickness of the flexible spline h_0

To establish the dependence of the limiting moment upon membrane thickness of the flexible spline h_0 , three measurement options are considered with different values of h_0 and thickness of gear ring in the gash of the flexible spline h_1 : 1) $h_0=0.8$ mm, $h_1=1.1$ mm; 2) $h_0=1.1$ mm; $h_1=1.3$ mm; 3) $h_0=1.3$ mm; $h_1=1.5$ mm. As is seen from Figure 3, further expansion of the membrane thickness of the flexible spline slightly increases the limiting moment. An increment of h_0 by 0.4 mm causes only a 12-percent increase of the limiting moment due to further enhancement of torsional and radial stiffness of the limiting moment. Consequently, the swirl angle of the flexible spline narrows while the moment of resistance intensifies, thereupon tooth interference occurs. Figure 4 describes the dependence of the relative value of the limiting moment M_{lim}^* upon relative (layer) thickness of the circular spline $h_b^* = h_b/m$, radial clearance in the flexible bearing G_r , and the angle of basic rack tooth profile α .

Figure following on the next page

Figure 4: Dependence of the relative value of the limiting moment M_{lim}^* upon relative (layer) thickness of the circular spline h_b (a), radial clearance in the flexible bearing G_r (b), and the angle of basic rack tooth profile α (c).

As the (layer) thickness of the circular spline h_b increases its radial deformation, thereby enhancing the limiting moment (Figure 4, a). The (layer) thickness of the circular spline has a significant impact on the limiting moment only if h_b value is under 30m. At h_b value above 30m, the circular spline is subjected to small deformation; therefore h_b has an insignificant impact on M_{lim} .

Following wear, the flexible bearing experiences an enlargement of radial (internal) clearance. The change of the clearance value G_r from 26 up to 78 μm causes the limiting moment abatement under the linear law (Figure 4, δ), due to a reduction in the radial deformation of the flexible spline. The angle of basic rack tooth profile has a significant impact on the limiting moment M_{lim} (Figure 4, ϵ). An increase of the angle α from 20 up to 28° elevates the limiting moment M_{lim} by almost 70 percent. This is the consequence of changing deformation of the flexible spline under the load caused by the increased angle of the strength of interaction among teeth. A study of the impact of membrane length of the flexible spline L on the limiting moment M_{lim} has been carried out with different values of the relative length of the membrane of the flexible spline: $L^*=L/D_p = 1.0, 0.75, \text{ and } 0.5$. According to the measurement findings, a reduction in the L^* value within specified limits decreases the M_{lim} value by around 20 percent. A study of the impact of initial clearance in the gearing δ_0 on the limiting moment M_{lim} has been carried out by changing the gas width of the flexible spline. The corresponding measurements have been done with the following values: $\delta_0 = 0.1m, 0 \text{ m, and } -0.1m$. The negative value of δ_0 corresponds to the preload pressure. Findings of the research have proved that neither initial clearance nor preload pressure in the gearing has an impact on the limiting moment M_{lim} .

5. CONCLUSIONS

- 1) Findings of the theoretical research provided in the article, and experimental data produced by the research paper [3] show that radial deformation, the depth of gear teeth penetration, and membrane thickness are key factors having a significant impact on the limiting moment of strain wave gearing (also known as harmonic gearing).
- 2) It has been established that the membrane length of the flexible spline and preload pressure in the gearing have an insignificant impact on the limiting moment of strain wave gearing – a nonconformance with the findings data provided in the research paper [3].
- 3) Empirical measurements also made it possible to establish the dependence of the limiting moment upon the (membrane) thickness of the circular spline, radial clearance in the flexible bearing, the angle of standard basic rack tooth profile, and types of straining of the flexible spline.
- 4) It has been established that the type of straining of the flexible spline and (layer) thickness of the circular spline (h_b value above 30m) have an insignificant impact on the limiting moment.
- 5) In the present research, the limiting moment has been estimated on the condition that no generator breakthrough occurs. For the gearing in question, the limiting moment could exceed the nominal (torque or rotational force) value by a factor of six to eight. Such difference in the value of the moment of resistance could cause plastic deformations of the elements of strain wave gearing. Therefore, while setting the limiting moment the static strength must be calculated.

ABSTRACT

The main philosophy of e-governance is its view of management as a source of services to citizens and companies as customers who wish to benefit from these services. E-government has many aims that it seeks to achieve in the context of its dealings with customers. Electronic government is the best mechanism for maximizing administration productivity and efficiencies. It is a key method to ensure services to citizens. Nowadays, e-government is becoming an increasingly essential phenomenon in public administration. Azerbaijan has not been indifferent to this phenomenon which is no longer an option and with the impact of the Requirements of the European Charter period especially since the 2000s, Azerbaijan has accelerated the e-government projects and applications. This notion has been accepted in developed countries and has led to more individualization by supporting independent actors and decision-making. Participation, characterized at this grade, alludes to a more solution-oriented get into touching, with the dimension of attainability and intelligibility, both between the rulers and between the rulers and the ruled. This study intends to determine and test crucial success elements for the execution of e-municipality systems, which are very utility in today's world. When the population of Baku is considered, e-government systems are very significant for Baku citizens and the smallest part of that e-government system is e-municipalities. That is why establishing a highly used e-municipality ambiance is an essential thing. In this context, this doctorate study aims to make strategic suggestions, by measuring the potential of e-participation at local governments. This study also performed how and in what way e-participation influenced and by researching how to contribute to the improvement of local management systems in the context of governance.

Keywords: *E-government, e-municipality systems, e-service, local governments*

1. INTRODUCTION

The subject of restructuring, which has been put forward to eliminate the current problems in public administration, keeps its place on the agenda as a result of globalization and changes in technology. Changes in the field of activity, social function, the economic, technological, social, and cultural structure of the state force the current public administration to change. In our world, which is experiencing rapid change, transformation and development, there are important changes in information and communication technologies. The added value-added to our daily lives by new technologies, which are increasing day by day, has pushed the states in general and the local administrations, in particular, to use different media in the provision of public services. The transfer of public services to the internet has been tried to be explained with concepts such as e-government and e-municipality. The transfer of transactions concerning the state to the electronic environment is defined as e-government, while the local application of e-government is named as e-municipality. In this process, along with the use of e-government applications in the provision of public services, the increase in service quality, efficiency, and effectiveness, and decreases in cost and time have led to the development of a wide variety of e-government applications. Communication, cooperation, and competition strategies of individuals and organizations are changing in the globalizing world. Information and communication technologies that enable international information sharing have brought along

very different and complex relationships. This situation has led to the formation of markets and databases with wide participation and interconnectedness, making the participants connected and dependent on each other in a virtual environment. Increasing dependency and commitment in relation to the complex and rapidly changing environmental conditions, especially with the pandemic process (COVID-19), made it necessary for the citizen-oriented change of the public sector. In this direction, it has used public sector information and communication tools that aim to increase efficiency, accountability, transparency, and effectiveness in service delivery and to meet demands by increasing performance in business processes. In particular, thanks to internet technologies, it has been ensured that the state offers innovative approaches in communicating with the business world and citizens. One of these approaches has emerged as e-Government with the transfer of the communication between the State, business world, and citizens to the internet environment. E-Government, e-health, e-voting, e-passport, e-discussion, etc. it emerges as an umbrella concept that includes applications. E-Government includes interactions between citizens, business and government through online platforms. It includes the use of web-based internet technologies by public institutions to access public information and services by stakeholders, workers, and other institutions. In order to understand e-Government, it may be useful to examine the traditional government approach. While the traditional government approach involves physically visiting public buildings and manually transacting on paper at limited times (such as office hours) to access public services, e-Government involves using different forms of information and communication technologies to access public services. E-Government is the use of Information and Communication Technologies and new business processes in the transformation of the state's method of interaction with citizens and the business world. The e-Government is expected to have benefits such as less corruption, increased transparency, increased revenue, and cost reduction; It has components consisting of electronic service delivery, electronic business processes, electronic voting, and electronic productivity. Electronic service delivery refers to information sharing and transactions through electronic networks, program design, and service uploads to be made from automated databases, an electronic voting system that provides public confidence in electronic voting results, and electronic productivity means better operations at lower costs. Azerbaijan has not been indifferent to this phenomenon which is no longer an option and with the impact of the Requirements of the European Charter period especially since the 2000s, Azerbaijan has accelerated the e-government projects and applications. E-Government has an important role in simplifying and integrating the administrative processes of the public administration mechanism, changing the understanding of service delivery, and transforming its relations with its stakeholders. It can be stated that these change and transformation processes actually brought about a radical paradigm change in the provision of services in the public sector. In this context, with the widespread use of e-government applications day by day, it is observed that countries are breaking away from the "traditional state" and turning towards "e-government". In Table 1 below, the comparison of traditional state and e-government in public service delivery is given.

Traditional Government	E-Government
Passive citizen, the demands of the administration	Active citizen, customer, citizen's expectations
Paper-based and face-to-face communication	Electronic and online communication
Vertical structuring and hierarchy	Horizontal organization and networking
Staff response	Automatic voicemail, e-mail, call center, etc.
Human-based inspection	Automatic control
Uniform service, time-consuming processes	Differentiated service, fast process
High transaction costs	Low transaction costs
Nationality relationship	Participation relationship
Closed State	Open State

Table 1: Comparison of Traditional Government and E-Government

The pandemic process made it mandatory to use e-government technology to meet the needs of citizens. In line with the needs of citizens, countries should embrace the importance of the UN's "Sustainable Cities and Communities" goal. Therefore, it is time for governments to encourage and support cities and local governments to achieve greater inclusiveness, security, resilience, and sustainability through the use of technology (SDG 11: Sustainable Cities and Communities).[5] Table 2 contains the digital government policy response to COVID-19 in the short, medium, and long terms.

Time horizon	Policy action	Digital government response
Short-term	React	Use digital platforms (i.e., online portals, social media) for accurate and timely information-sharing
		Lead two-way communication with people and foster e-participation (i.e. hackathons, brainstorming events)
		Ensure protection of people's human rights including data privacy and take into consideration unintended consequences of technology
Mid-term	Recover&Resolve	Form effective multi-stakeholder partnerships (i.e. private sector, academia, NGOs and international organizations) on regional, national and local levels
		Provide technology education for digital literacy, specifically targeted at public officials, children, women/girls and MSMEs
		Offer financial and technical support to local governments in the implementation of digital tools and technologies
		Leverage lessons learned and policy ideas from the ongoing crisis
Long-term	Reinvent	Invest in new technologies (i.e., AI, blockchain, robots, drones) and ICT infrastructure to increase the resilience of the health economy and public services delivery
		Develop digital infrastructure and engagement tools for the most vulnerable groups in society, particularly for migrants, refugees and ethnic minorities
		Revisit data protection and privacy legislation along with lessons learned

Table 2: Digital government policy response to COVID-19

2. THE ROLE OF THE E-MUNICIPALITY IN THE E-GOVERNMENT STRUCTURE

Electronic state, electronic municipality phenomenon is an interdisciplinary phenomenon, and there are public administration, international relations, law, and business parties as well as technology-based issues. Especially with its implementation dimension, the e-municipality is an expression of the tangible presence of all these different work disciplines in practice. Local measures that are able to respond directly and sincerely to their problems have an important role in obtaining positive results and in establishing the relationship of the individual state on the ground of trust. Nowadays, through the portal established in many cities in developed countries, citizens are provided with information about municipal services, most municipal operations can be done online without going to the city hall, interactive city maps, online complaints, requests, suggestions, and the same technical facilities and ideas are presented.

The Internet also creates a great opportunity to introduce national priorities and local policies to the world, to form a global public opinion, and to find support in the international arena. Thanks to e-municipality, the process and service times can be shortened and the efficiency, effectiveness, and service quality of municipal administrations can be increased. Transparency can be provided in management. The approach that e-government services will make sense with the participation of citizens is more easily overlaid with the structure of local governments that enables horizontal coordination and the function of providing services directly to the needs and expectations of citizens. From this point of view, the main role of the e-municipality in the e-government structure can be expressed as a tool for citizens to get closer to the e-government when they use the e-municipality for purposes such as obtaining information about the actions that concern their daily lives, making transactions, and expressing opinions. With e-service, local governments primarily aim to reach the needs and suggestions of the citizens faster, to have the right databases about the service area, to provide management services efficiently, to protect people and public information, and to make global investments attractive for that region. It is also reminded that the Internet seems to have the potential to create added value in both the administrative and political functions of local governments, but this ownership does not guarantee the result. The e-municipality interaction process is a process that starts with the data from the field, passes through various decision mechanisms and reaches the users on the e-municipality portal, and turns back into data from there.

3. ADVANTAGES PROVIDED BY E-MUNICIPALITY

E-municipality is a management system that works in integration with the e-government application, increases the service capacity and speed of municipalities through the use of digital applications, contributes to the formation of a transparent, auditable, and accountable management, and provides efficiency and effectiveness in municipalities. Undoubtedly, local governments are one of the institutions most affected by the rapid transformation in technology. That is why local governments are the first step of citizens' access to public services. Therefore, citizens' expectations from local governments are changing rapidly with the effect of urban life. In order to keep up with this change, municipalities renew their technological infrastructure and benefit more from internet technology and digital applications. The e-municipality applications, which find a wide application area and develop more and more every day, have many benefits for municipalities and citizens. E-municipality applications contribute to the increase of the service quality, efficiency, and effectiveness of municipalities, the provision of justice in tax, the formation of uniformity in practices, the measurement of institutional performances, and the development of decision-making mechanisms based on inventory and data. On the other hand, e-municipality provides significant support for citizens to receive quality service, the development of a citizen-oriented service understanding, providing 24/7 service availability, developing local participation, creating a transparent and accountable management model, establishing the trust of citizens in the state, and spreading good management principles in public services. The e-municipality application is also the biggest tool in overcoming the bureaucracy in local governments, accelerating the transactions, facilitating the affairs of the citizen-citizen, citizen-state, state-state through the management information system. E-municipality applications fulfill two important functions for cities. The first of these is that they support the processes of data collection, classification, processing, and administrative decision making in the management of systems such as public transportation, transportation, real estate, human resources, water, and sewage. Second, these technologies have the potential to improve local democracy and participation by eliminating the communication problem between local governments, citizens, and city bureaucracy. Considering the development process of e-municipality around the world, it is seen that all public institutions and organizations start with simple e-government applications and move rapidly towards increasingly complex

applications. The transition process to the e-municipality system is expressed in the applications realized in these three stages, which are defined as one-way information flow, mutual communication, and online transaction capability.

By Difficulty Level	Applications
One-way information provision	Press releases, announcements, annual reports, etc.
Mutual face to face communication	Tax debt inquiry, sending e-mails, participating in surveys, interactive communication, etc.
Online transaction	Paying tax debt, participating in tenders, making subscription agreements, etc.

Table 3: E-municipality stages

It is possible to talk about some specific aims and benefits of the transition to e-government at the local level. The benefits expected from the transition to e-government in local governments can be briefly listed as follows:

- Making it possible to arrange and provide local services according to the needs of the local people and to reduce the costs of local services;
- Access to local services 24/7 that can be transferred to the Internet and monitoring local government activities and agendas from anywhere;
- Supervision of the services and actions of local governments and the decisions of their administrations;
- Ensuring equal distance and equal service provision to local people living in different districts and neighborhoods;
- Ensuring that local people can participate more actively in municipal activities and democratic processes;
- Zoning, parcel, tender, and so on. preventing bribery and corruption in activities;
- Reducing bureaucratic procedures by transferring more local services to the Internet;
- Establishing an accountable and more transparent municipal administration;
- Removal of barriers between citizens and local government and increased interaction;
- Creating an effective network structure between the central government and local governments and mutual sharing of information.

Within the scope of local e-government, local governments make use of various tools to achieve these benefits. Creating a web page, setting up urban information systems, developing wireless service delivery applications (WAP) for mobile phones, handheld computers, using handheld terminals called PDA and kiosk-style (ATM-like) terminals can be given as examples of these tools. The effective and appropriate use of these tools by local governments will facilitate the emergence of the benefits expected from e-government. However, using only these tools alone does not seem sufficient for the transition to local e-government.

4. TRANSITION TO LOCAL E-GOVERNMENT - REQUIRED STEPS

The establishment of e-government in local governments undoubtedly requires a change in mentality along with a technological adaptation process. This situation is closely related to the adoption of e-government. Eliminating the prejudices of the e-government by ensuring that both the representatives of local governments and citizens have sufficient information about e-government is the task to be done in terms of local e-government. Explaining the opportunities offered by e-government and the benefits of e-government will change the perspective of both managers and citizens towards e-government and will reflect positively on their expectations from e-government and their attitudes and intentions towards using e-government.

In this context, there are a number of activities that need to be implemented in order to ensure the transition to local e-government:

- **Developing customer-cocused approach:** The transition to local e-government makes it necessary for the governments to think again fundamentally in meeting the needs of the citizens. In this way, local governments will be able to harmonize public services with a customer-oriented structure. Local governments should first determine the expectations in order to design the best system that will meet customer expectations, and then make an attempt to establish a system that will meet these expectations. Since local governments have more one-to-one relations with the citizens than the central government, with the transition to local e-government, time and cost savings, especially the establishment of a customer-oriented approach, and increasing the satisfaction level of the citizen, can be achieved.
- **Determining realistic and consistent goals:** Short, medium, and long-term concrete, consistent and realistic targets for the future should be determined for the transition to local e-government. For example, a local government organization entering the e-transformation process should set targets such as a 30% reduction in file and paper costs and a 20% reduction in transaction costs at the end of three years.
- **Investing from today for the future:** As in all institutions, high costs are encountered in local administrations during the transition to e-government. Considering that local governments have more financial resource shortages than central government organizations, the issue of investment in ICTs and getting a quick return from these investments is more prominent in local governments. While the main goal is to save resources as soon as possible, it is also necessary to implement initiatives that will provide savings in the medium and long term.
- **Focus on digital interaction between management and citizen:** Among the ICT, especially the internet, is a highly popular tool in society. Nowadays, the internet offers a variety of interaction opportunities over a wide variety of platforms. It is now possible for administrations to easily interact with citizens through many platforms such as various blogs, web 2.0 tools, websites, social networking sites. What is expected from local governments is that they organize their interactions with both citizens and business circles in alternative ways through these dynamic structures and make their management known and accessible to all stakeholders.
- **Ensuring public and private sector interaction and cooperation:** Adaptation of ICTs to management is valid for all administrations including the private sector and public sector. On the other hand, the public sector and the private sector interact in many areas. In this context, local administrations, as in all public institutions, need to establish a complementary infrastructure that is compatible with each other while creating both back-office applications and interfaces for the private sector and citizens. Because developing systems that are compatible with each other will increase the level of interoperability and create a more efficient, cheaper, and less complex local e-government entity.
- **Encouraging rather than restricting access to information on the internet with concern of privacy and security:** One of the criticisms made by bureaucrats and citizens alike in the transition to local e-government is the possible privacy and security problems. However, it is obvious that the current bureaucratic system is not any safer than the state. Therefore, instead of suspending the transition to e-government due to privacy and confidentiality concerns falling on local governments, steps should be taken to increase security and privacy measures first, and then to try to increase trust in e-government by persuading citizens about the groundlessness of concerns.
- **Respecting citizens' confidentiality and protection of their information:** If a successful local e-transformation is to be realized, first of all, local governments must respect the

principle of confidentiality of the information they collect from citizens about public affairs, prevent system gaps, and protect this information with individual efforts and sensitivities. Otherwise, in cases such as when it is learned that the information of citizens is transmitted to third parties for commercial or any other concern, the trust in e-government will be damaged and this will constitute an obstacle to the transition to e-government.

- **The e-government is not de-alternated:** Advocates of e-Government foresee that in the future, it will be possible to perform almost all services online. However, even if a public service can be delivered online by local governments, it continues to be provided to some extent by traditional methods and alternative methods. Because e-government may not be a suitable service delivery method for all citizens. For Instance, an elderly citizen may not find himself competent enough to perform transactions alone through e-government. Forcing this citizen to carry out the transaction online despite this means making that citizen dependent on others compared to the past. This situation will lead to negative impressions of those citizens towards local governments and e-government.
- **Being complementary instead of repeating private sector services:** One of the main reasons underlying the attempts to restructure public administrations today is that the state has become a clumsy structure trying to operate in every field. E-Government is a structure that is expected to provide benefits to administrations in many areas such as getting rid of this clumsiness and reducing costs. However, the issue of where e-government applications will end is important. E-Government applications should be limited to the basic service areas that the state must fulfill to its citizens and should not extend to the field of activity of the private sector with commercial concerns.

4.1. Stages of the e-municipalization process

In the municipalities that have the most prominent place in the local government system, as in any other organization, there are five stages of the process:

- 1) The computerization stage as a means of owning a computer;
- 2) Automation phase as a system in which works such as financial affairs, water fee, tax collection are transferred to the computer environment on the basis of certain software, and the works are carried out in this environment;
- 3) The stage of internet users who have made an internet connection, as the rate of accessing the internet;
- 4) The stage of local governments' network site existence, which refers to owning a network site;
- 5) For municipalities, the stage of moving management to the internet by rising from the base of the Urban Information System.

E-municipality is a desirable practice for modern states in many respects. With the e-municipality, citizens can easily pay their debts such as taxes, without having to go to the municipality, wherever they are, see their debts, declaration information whenever they want, and thus follow their own records in a healthy way. Save time and effort for both service users and municipal employees. Integration between municipal units is ensured, as it reduces the densities by preventing dependency on working hours on the waiting time and due dates within normal periods. Efficiency will be increased by preventing any waste of resources by reducing the negative effects of repetition of the process. Accessing all necessary data for project planning in different fields will make planning and management services fair, efficient and rational. Since the automation of municipal services is ensured, it will be offered to citizens in efficient, reliable, healthy, and contemporary norms.

The highest level of contribution will be made to the budget by researching potential resources for meeting the municipal personnel, current and investment expenditures, determining, monitoring, and controlling the municipal property and real estate revenues.

5. E-GOVERNMENT AND E-MUNICIPALITY IN AZERBAIJAN

The activity of "e-government" in the Republic of Azerbaijan is regulated by the Decree of the President of the Republic of Azerbaijan "On some measures in the field of organization of e-services of state bodies" dated May 23, 2011, "E-Azerbaijan" State Program and other normative legal acts. Work is underway with other government agencies to form e-government and to establish appropriate infrastructure. The National Certification Services Center has been established in Azerbaijan to use the e-signature service, and an infrastructure has been established to ensure the exchange of information between government agencies. Also, an e-government portal (<https://www.e-gov.az>) in accordance with world standards has been developed in Azerbaijan and made available to citizens and government agencies. Azerbaijan has improved its position in the UN E-Government Survey, which is published by the United Nations every two years. All the countries in the survey were divided into four groups (very high, high, middle, and low) depending on the number of points they gained in the E-Government Development Index (EGDI). Azerbaijan has entered the "high group" of E-Government Development.

Country	EGDI Level	Rating Class	Rank	EGDI	Online Service Index	Telecommunications Infrastructure Index	Human Capital Index
Afghanistan	Middle EGDI	M2	169	0.3203	0.4118	0.1762	0.3728
Albania	High EGDI	HV	59	0.7399	0.8412	0.5785	0.8001
Algeria	High EGDI	H1	120	0.5173	0.2765	0.5787	0.6966
Andorra	High EGDI	H3	80	0.6881	0.4824	0.8372	0.7448
Angola	Middle EGDI	M2	159	0.3847	0.4882	0.1364	0.5295
Antigua and Barbuda	High EGDI	H2	98	0.6055	0.4471	0.6176	0.7518
Argentina	Very High EGDI	V2	32	0.8279	0.8471	0.7265	0.91
Armenia	High EGDI	HV	68	0.7136	0.7	0.6536	0.7872
Australia	Very High EGDI	VH	5	0.9432	0.9471	0.8825	1
Austria	Very High EGDI	V3	15	0.8914	0.9471	0.824	0.9032
Azerbaijan	High EGDI	HV	70	0.71	0.7059	0.6528	0.7713
Bahamas	High EGDI	HV	73	0.7017	0.6765	0.6739	0.7546

Figure 1: E-government development index (EGDI)

(Source: [https://publicadministration.un.org/egovkb/Portals/egovkb/Documents/un/2020-Survey/2020%20UN%20E-Government%20Survey%20\(Full%20Report\).pdf](https://publicadministration.un.org/egovkb/Portals/egovkb/Documents/un/2020-Survey/2020%20UN%20E-Government%20Survey%20(Full%20Report).pdf))

In recent years, municipalities in Azerbaijan have been conducting the majority of public services through e-municipality applications on their web pages. The first application examples regarding e-municipality were applied in Duisburg in Germany, Tilburg in the Netherlands, Farum in Denmark, Braintree in England, and Phoenix in the USA. The common point of these practices is citizen-centered management, new budget systems, effective communication with the public, lowering local taxes, giving priority to the principle of localization in service, and applying a local administration understanding based on volunteerism and participation.

5.1. Services provided by the e-municipality

The technologies and applications most widely used by local government units in the world and in Azerbaijan are urban information systems, call center and telephone technologies, electronic document management, e-signature, mobile applications, geographic information system,

management information system and webcasting. However, in order to reduce the bureaucratic oligarchy in local governments and to save resources and time, most of the local public services have been transferred to the electronic environment and a wide variety of e-municipal services have been implemented in local governments. Some of the examples of e-municipal services frequently implemented by municipalities are as follows:

- E-signature and mobile signature application;
- Security cameras system, camera vehicle tracking system;
- Announcing the decisions of the municipal council to the public, live broadcasting of the council meetings;
- Online service application to municipal units, payment of debts related to services;
- City information system, pharmacy, and bakeries on duty;
- License application, tender tracking system, real estate, advertisement, advertisement, environmental and cleaning tax tracking;
- Security cameras system, camera vehicle tracking system, etc.

Finally, it is seen that local government organizations and citizens face many problems in the e-municipality process. Electronic municipal service in Azerbaijan is provided through the website “www.e-belediyye.gov.az”. There are currently 1,607 municipalities in Azerbaijan. Approximately 42 of these municipalities have websites. Municipalities in the largest districts of the capital do not have any websites or some of them close their websites because they do not pay the "domain". The sites of some remote municipalities are more equipped than the municipalities of the capital. According to my research, many municipalities do not have contact information on their websites. This makes it impossible for a citizen to communicate with municipalities in any case. On the other hand, we see that conditions have been created for citizens to apply to the municipalities only by letter. In this case, it is doubtful that all objections will be taken into account. It is noteworthy that many sites do not have any information other than municipal information. The problems encountered in my country while providing services through the network site in the field of e-municipality are as follows:

- 1) Inability to provide information security;
- 2) Low connection speed;
- 3) Insufficient number of trained network personnel;
- 4) High hardware-software cost;
- 5) The hardware/software purchasing process is long and difficult due to the tender process;
- 6) The e-signature application has not started yet;
- 7) On the establishment of very important City Information Systems for the e-municipality.

It is listed as the absence of established principles or standards. Many e-municipalities' websites are not “user friendly”. The sites have been prepared with a focus on neither the public nor the employee.

6. CONCLUSION AND SUGGESTIONS

E-municipality applications are used by many municipalities today as a complementary element of the e-government system. In particular, developments in technology, innovations in internet and mobile technologies and changes in the perception of public administration necessitate the development of applications that enable citizens to benefit from public services without going to municipal service points. The developed e-Municipality Information System was created in order to reduce the problems arising from different practices between municipalities and public institutions and to ensure coordination. It is observed that the technological infrastructure of the municipalities is insufficient in the e-transformation process and they do not have sufficient budgets to invest in technology.

Finally, in a successful e-municipality implementation, there should be factors such as making public services transparent, saving time and space, ensuring an environment of trust between citizens and local governments, increasing service satisfaction and quality, providing services quickly and effectively, and reducing costs. My suggestions for solving the problems of local governments regarding e-municipality are as follows:

- Service programs in other public institutions should be harmonized with the municipal programs;
- Strong resources in the budget should be directed here in the municipalities for the processes related to the purchase, maintenance, updating and efficient use of computer hardware and software;
- Necessary renewals in the municipal legislation should always be made without wasting time in parallel with the developments in order to follow the IT sector from the closest distance;
- It is necessary to establish systems in order to quickly access the planning, engineering projects and applications information needed by the municipalities in their urban activities, and working groups of the authorities and relevant persons in this field should be established in order to establish principles or standards for their establishment.

On the other hand, information processing infrastructure should be established in all municipalities, IT staff should be kept at the required levels in accordance with the population scale of the service area, and it should be ensured that all of the municipal personnel have computer literacy. With the e-municipality, it is necessary to realize many openings that stand in front of the municipalities and that can create a new income gate for them. For instance, as the interest of the local people in the internet increases and as they learn the ways to use the internet, there will be people who want to establish a web page or who want to sell online. The first consultancy service and support can also be provided by the municipality. In fact, it may be possible to host a network site on the municipal server for a certain fee or free of charge. Any municipality that can use these new ways to increase its income will be able to demonstrate strong and contemporary municipalism by offering better services and social gains.

ABSTRACT

Small and medium enterprises play a key role in the maintenance and economic development of many emerging countries. They use different internal and external components of intellectual capital, but most companies do not have a systematic approach to intellectual capital management. The article examines the special manner of perceiving and understanding this resource and determines the degree of intellectual capital's influence on the performance of national SMEs. The study, based on the authors' empirical research, has tested hypotheses about the impact of separate elements of intellectual capital, such as human, structural and customer capital, on the overall performance of small and medium-sized businesses. Intellectual capital is assessed with respect to resource-based view theory. By conducting surveys of 206 representatives of small and medium-sized companies and using the SPSS application package, several hypotheses about the influence of intellectual capital on the company's efficiency have been proved. The study presents calculations confirming the existence of a direct relationship between the level of development of intellectual capital and the growth of SMEs' productivity. This research also provides computations allowing to conclude that in elaborating a series of measures for improving the efficiency by using intellectual capital, it is advisable increasing the knowledge and professional skills of the enterprise's management staff. The article also provides a comprehensive analysis of the factors influencing the process of using intellectual capital in SMEs, according to which it is necessary to improve government measures aimed at increasing the efficiency of using intellectual capital.

Keywords: *Factor analysis, Financial resources, Intangible assets of an enterprise, Small and medium business*

1. INTRODUCTION

The ability to create and exploit the phenomenon of intellectual capital (IC) is the key to success in the global economy. It becomes an essential resource for the strategy and competitiveness of the company, including many different aspects such as experience, culture, information, knowledge. Today, in the transition period of the Azerbaijani economy, traditional management decisions, including the bureaucratic management approach, are unable to cope with modern economic challenges. Modern business reconstruction methods are often associated with the visualization, use and assessment of the effectiveness of the intellectual capital concept (Roos and O'Connor, 2015). Small and medium-sized enterprises (SMEs) play a key role in the emergence and fostering the economies of many developing countries (Banos-Caballero et al, 2010). They use different internal and external components of intellectual capital, but most national companies do not have a systematic approach to intellectual capital

management (Arenas and Lavanderos, 2008). The article examines the special manners of perceiving and managing this resource by the company's leadership and determines the degree of intellectual capital influence on the performance of national SMEs. The main focus of previous studies was intangible resources as a basic condition for competitiveness and profit generation in modern market conditions. The presented article assesses the degree of materiality of each IC component in the effectiveness of the organization's functioning; at the same time, the statistical calculations carried out reveal the ambiguous influence of the enterprise's financial resources on the change in the level of the IC components.

2. ASSESSMENT OF INDIVIDUAL IC COMPONENTS'S VALUE BASED ON THE EXPENDITURES

To be able to manage intellectual capital, we should study its individual components and ways to manage them. Basically, researchers use a three-component structure of intellectual capital's concept, which consists on human, structural and relational capital (Barpanda and Mukhopadhyay, 2016). Currently, *human capital* is the most valuable resource both for an individual company and for society as a whole, much more important than natural resources or accumulated wealth. It is human capital, and not factories, equipment and production stocks that are today an indicator of competitiveness, economic growth and efficiency (Absah, Muchtar, and Qamariah, 2018). To assess, form and use human capital as the most important component of production, it is necessary to define it as an economic category. Thus, in a formalized form, the expression for quantifying human capital HC will look like an additive model representing the sum of three components:

$$HC = \beta_1 A + \alpha_1 \beta_2 B + \alpha_2 \beta_3 C, \quad (1)$$

where A – wage fund of an enterprise; B – enterprise expenditures on knowledge and skills capital; C – enterprise costs for “health capital”; β_1 – return on labor costs; β_2 – return on costs of knowledge and skills capital; β_3 – return on “health capital” expenditures; α_1 (2) and α_2 (3) – parameters showing the dependence of the return on costs on the level of education and age, respectively,

$$\alpha_1 = \frac{\sum_{i=1}^n r_i z_i}{Rz}, \quad (2)$$

where r_i and z_i – the number of employees with the i -th level of education and their average salary; n – the number of levels of education in a particular enterprise; R – the total number of employees of the enterprise; z – average wages of workers. The function mapping the dependence of the return on the expenditures for “health capital” is as follows:

$$\alpha_2 = \gamma_m \sum_{j=1}^n k_j d_j + \gamma_w \sum_{j=1}^n k_j t_j, \quad (3)$$

where $\gamma_{m,w}$ – the proportion of men and women, respectively, at the enterprise; d_j, t_j – share of employees – men and women – of the j -th age group; n – number of age groups; k_j – the rate of return on investment in “health capital” depending on age groups, which are determined based on the retirement age in Azerbaijan (Law of the Republic of Azerbaijan “On labor pensions”). For workers of pre-retirement age, we take $k_j = 1$, for workers of retirement age, but continuing to work at the enterprise, we take $k_j = 0,85$. Taking into account the specifics of the enterprises' activities, we assign the following coefficients of return: $\beta_1 = 0,7$, $\beta_2 = 0,25$, $\beta_3 = 0,05$ (Chigoryaev, Skopintseva, and Ulyashchenko, 2008).

The values of the parameters α_1 , α_2 , calculated in accordance with (2) and (3), reflect the dependence of the return on costs on the level of education and age are $\alpha_1 = 0,95$, $\alpha_2 = 0,98$.

Structural capital (SC) is defined by the authors as the sum of the value of innovation capital formed by the organization (*InnC*) and the company's total investment in process capital, representing the sum of the organization of production, management and labor (*PrC*):

$$SC = InnC + PrC \quad (4)$$

where *InnC* – cost of innovation capital; *PrC* – investment in process capital. The value of innovation capital is defined as the sum of the values of scientific activity and development, as well as the inventory value of the organization's intangible assets.

For the assessment of *client capital (CC)*, the method proposed by Berger and Nasr was used - the BN-approach (Berger and Nasr, 1998):

$$CC = GC \times \sum_{i=1}^n \frac{r_i}{(1+d_i)} - M \times \sum_{i=1}^n \frac{r^{i-1}}{(1+d)^{i-0,5}}, \quad (5)$$

where n – number of years of SMEs' operation; d – annual discount rate; GC – annual profit received from the buyer; M – annual investment for customer retention; r – customer retention rate (Petrov, Polunovskiy, and Sokolyanskiy, 2017).

Data sources for further analysis and calculations are taken from information from SME leaders, presented in the electronic questionnaire. The authors are forced to make a reservation that all data are approximate. The calculations are shown in the following table (Table 1):

IC components				
<i>Human capital HC</i>				
Wage fund of enterprise (<i>A</i> , thousand manats)	Enterprise costs for knowledge and skills capital (<i>B</i> , thousand manat)	Enterprise costs for "health capital" (<i>C</i> , thousand manat)	Human capital cost (<i>HC</i> , thousand manat) (1)	
15,864	0,7932	3,1728	19,83	
<i>Structure capital SC</i>				
Innovation capital (<i>InnC</i> , thousand manats)	Process capital (<i>PrC</i> , thousand manats)			Structural capital cost (<i>SC</i> , thousand manats) (4)
Intangible asset value	Production Organization	Management organization	Labour organization	
980,428	67,832	15,631	9,953	1073,844
<i>Client Capital CC</i>				
Discount rate (<i>d</i> , %)	Sales profit (<i>GC</i> , thousand manats)	Customer retention costs (<i>M</i> , thousand manats)	Customer retention rate (<i>r</i> , %)	Client capital cost (<i>CC</i> , thousand manats) (5)
0,0417	5271,871	1704,857	0,9	2884,365624

Table 1: Assessment of IC components
(Source: Authors' calculations)

3. INTELLECTUAL CAPITAL AND PROPOSED HYPOTHESIS

Forming competitive advantages on the basis of intangible assets that cannot be copied, the entrepreneurial structure increases the capitalization of the business and extends the level of its competitiveness. The share of intangible assets in the company's value can become a benchmark for assessing the competitiveness of companies (Hong and Lu, 2016). Since in this work IC is considered as the sum of components according to Stewart (human capital, structural capital and client capital) (Stewart, 2003), we put forward the following hypotheses:

- H1. Human capital significantly improves the efficiency of SMEs
- H2. Structural capital significantly improves the efficiency of SMEs
- H3. Client capital significantly improves the efficiency of SMEs

On the other hand, the competitiveness of an organization directly depends on how fully and successfully it uses its intellectual capital and how actively it invests in its development. In this way, we put forward the following hypotheses:

- H4. Financial resources strengthen the link between human capital and SME performance, so the association will be stronger when businesses have adequate financial resources.
- H5. Financial resources strengthen the link between structural capital and SME performance, so the association will be stronger when businesses have adequate financial resources.
- H6. Financial resources strengthen the link between client capital and SME performance, so the association will be stronger when businesses have adequate financial resources.

4. DATA AND ANALYSIS

This study is based on information about SMEs in Azerbaijan obtained through a questionnaire survey of leaders of organizations. Using the electronic form, questionnaires were sent to managers with a request to answer a number of questions on assessing the state of IQ in their enterprise. The cover letter stated that the survey will be anonymous and strictly confidential, all results obtained will be used only in summary form, solely for research analysis. To fill out the questionnaire, it is enough to choose the number of the answer option that most closely matches the respondent's opinion. A total of 600 forms were sent. Back, 206 completed questionnaires were received, which is 34% of the total (Table 2).

Table following on the next page

Item	Number of enterprises	Percentage
Qualification of employees		
High school level	81	39.3
Bachelor level	92	44.6
Master's level	20	9.7
Doctoral thesis level	11	5.3
PhD level	2	0.9
Economics field		
Industry	12	5.8
Agriculture	8	3.8
Services	186	90.2
Enterprise size		
10-20 people	96	46.6
21-50 people	42	20.3
51-100 people	40	19.4
101-50 people	28	13.5
Age of the company		
1-10 years	144	70.0
11-20 years	56	27.1
More than 20 years	6	2.9
<i>Total</i>	206

(Source: Electronic questionnaire)*

5. EXPERIMENTAL RESULTS

As variables used we accept the following variables:

- intellectual capital (*IC*), which acts as a composite variable consisting of three components: human capital (*HC*), structural capital (*SC*), and client capital (*CC*);
- Financial resources (*FR*);
- Firm efficiency (*FE*);
- Company size (*Size*);
- The age of the company (*Age*);
- Level of education of employees (*Education*).

For data analysis, we used the SPSS statistical data analysis package. Correlation relationships cannot be considered as evidence of a causal relationship, they only indicate that changes in one feature, as a rule, are accompanied by certain changes in another, but whether the cause of the changes is in one of the features or is it outside the studied pair of features, we don't really know. The relationship between the variables is shown in Table 3. Based on the results of the correlation analysis, a conclusion can be made about the presence and nature of functional dependence or preference for describing the object under study of one type or another in the regression model. Not all IC components have the same positive effect on a firm's efficiency: there is a small, but still negative correlation between efficiency and human capital (-0.035). In this case, this value is so close to 0 that we will assume that there is no correlation between *HC* and *FE*. According to calculations, the efficiency of SMEs is positively affected by the firm's client capital (0.67). This trend can be explained by the fact that a high customer retention rate (90%) has a positive effect on the lifetime value of the customer and client capital, and thus on the firm efficiency.

	<i>Education</i>	<i>Size</i>	<i>Age</i>	<i>HC</i>	<i>SC</i>	<i>CC</i>	<i>FR</i>	<i>FE</i>
<i>Education</i>	1							
<i>Size</i>	0,595674	1						
<i>Age</i>	0,694371	0,9377	1					
<i>HC</i>	0,87739	0,1774	0,3525	1				
<i>SC</i>	0,86487	0,4170	0,6843	0,8870	1			
<i>CC</i>	-0,50299	0,3880	0,3338	0,4547	0,8030	1		
<i>FR</i>	0,682843	0,4346	0,8202	0,8056	0,8000	0,4087	1	
<i>FE</i>	-0,29508	0,2361	-0,373	-0,035	0,2612	0,6689	-0,270	1

Table 3: Values of the correlation between the variables
(Source: Authors' calculations)

On the other hand, we see a fairly high connection between the amount of financial resources invested in the intellectual potential of the company, age (0.8202), human (0.8056) and structural (0.8) IC components. Also, a remarkable relationship can be traced between education and human and structural capital (0.87739 and 0.86487, respectively), which is quite intuitively explicable. Since all values of the pair correlation coefficients in modulus are not higher than 0.6-0.7, there is no threat of multicollinearity. Now we go directly to the hypotheses and their interpretation (Table 4). For this we applied two tests: *t*-statistic and *F*-test. All *t*-statistics indicate the fulfillment of null hypotheses - there is no excess in absolute quantity of the critical value for this distribution. We conclude that control factors (staff education, size and age of enterprises) play a significant role in the model. Should be addressed how many arguments will allow the null hypothesis to be rejected in favor of the alternative. The smaller the *P*-value, the stronger the arguments against the null hypothesis. Traditionally, it is believed that if $P < 0.05$, ($= 0.05$), then there are enough arguments to reject the null hypothesis, although there is a small chance against this. Then you can reject the null hypothesis and say that the results are significant at the 5% level. In contrast, if $P > 0.05$, then there are not enough arguments to reject the null hypothesis. In our particular case, the *P*-values are close to 0.5. This conclusion does not mean that the null hypothesis is true, there are simply not enough arguments to reject it.

<i>Hypothesis</i>	<i>t-test</i>	<i>F-test</i>	<i>F-value</i>	<i>P-value</i>
H1 (<i>HC</i> → <i>FE</i>)	1.323223726	0.003639595	0.955687626	0.277571627
H2 (<i>SC</i> → <i>FE</i>)	0.496989932	0.219745654	0.671194807	0.653335101
H3 (<i>CC</i> → <i>FE</i>)	-0.900387764	2.42917867	0.16983275	0.434274335
H4 (<i>FR</i> → <i>HC and FE</i>)	-1.550619184	5.548938764	0.099795602	0.2187788
H5 (<i>FR</i> → <i>SC and FE</i>)	-1.230534959	5.335780238	0.104037588	0.306182263
H6 (<i>FR</i> → <i>CC and FE</i>)	0.57812341	0.60193250	0.4943894	0.603721

Table 4: Hypothesis testing
(Source: Authors' calculations)

The *F*-test is very important in regression analysis and is essentially a special case of constraint testing. If the value of this statistic is greater than the critical value at a given level of significance, then the null hypothesis is rejected, which means the statistical significance of the regression. Table 8 indicates the rejection of 4 and 5 hypotheses about the influence of financial resources on the level of intellectual capital of the enterprise. All our other inferences, in a sense, also confirm our this conclusion. From the foregoing, we unexpectedly conclude that high financial resources do not stimulate the influence of human and structural capital on the efficiency of an enterprise.

6. DISCUSSION AND CONCLUSION

The article examines the role of intangible assets, in particular, intellectual capital, or rather its components (human, structural, client) in creating a company's value. Tangible assets such as buildings, equipment and financial assets have ceased to be the main competitive advantages, but in the context of this study are considered as tools for the growth of an IC of an enterprise. In turn, IC is assessed as the main driver of the company's efficiency. Despite the fact that the hypothesis about the influence of human capital on the efficiency of the organization was fully confirmed, the calculations carried out in the SPSS environment gave somewhat unexpected results regarding the influence of financial resources on the indicator of human capital in the structure of IC. We believe that the reason for this incident is the lack of financial skills among SME managers, who cannot efficiently allocate financial resources. The reasons for this may be different: the quality of the country's labor resources, the level of education of consumers, the investment climate in the countries, the quality of the regulatory framework, and many others. Another reason for this incident may be that in Azerbaijan, administrative and managerial work in most SMEs is carried out directly by the owners, and not by hired qualified specialists. This consequence differs from the previous conclusions, which may be of practical interest for managers and owners of SMEs.

ABSTRACT

Recently, in most countries, in terms of increasing investment activity and saving budget funds, they prefer to reduce the scale of state entrepreneurship and use equal state-business cooperation in this area. In international practice, the practice of public-private partnership is widely used to ensure the participation of the private sector in financing infrastructure projects. Thus, due to the fact that the implementation of infrastructure projects requires large investments and limited financial resources of the state to meet them, in the implementation of these projects, preference is given to private investment. In this case, the private sector finances infrastructure projects and manages such projects over a long period of time, gradually withdrawing their investments and transferring the infrastructure to the state. Through this mechanism, the world provides funding for the repair and construction of airports, railways, seaports, highways, infrastructure for public services such as electricity, water, gas, telecommunications lines. Increasing the effectiveness of economic reforms in Azerbaijan also necessitates establishing close cooperation with the private sector, the main issue requiring attention in this direction is public-private partnership. Recently, serious steps have been taken in Azerbaijan to improve the business environment and stimulate investment opportunities. However, large socio-economic projects in the country are still funded from the state budget. With all this in mind, the Strategic Roadmap for the Production of Consumer Goods at the Level of Small and Medium Enterprises in the Republic of Azerbaijan, approved by the Decree of the President of the Republic of Azerbaijan dated December 6, 2016, defines the development of public-private partnerships as one of the main goals. At the same time, as you know, as a result of the 44-day Patriotic War, which began on September 27, 2020, most of the territory of our country, occupied by terrorist Armenia, was liberated from enemy captivity. It is important to create an infrastructure zone to ensure normal life in the liberated territories. The implementation of these projects at the expense of the state budget can cause many social and economic problems in the country. From this point of view, the implementation of this work once again actualizes the development of public-private partnerships in our country. The article is devoted to the scientific research of the problems of the development of state-business cooperation in Azerbaijan. The article examines the economic significance of the application of state-business cooperation in the economy of Azerbaijan and its individual spheres, the role of state-business cooperation in accelerating investment activity in the country's economy and the problems of developing state-business cooperation in Azerbaijan. The purpose of the study is to study the problems of the development of state-business cooperation in Azerbaijan and prepare proposals and recommendations for their solution. Our research shows that in our country there are serious problems of state-business cooperation. It is necessary to take a number of measures to solve the existing problems in the field of public-business cooperation in our country: to create a legislative base serving this area, to achieve the normal development of the financial market, especially the credit and securities market, to determine the priority areas of cooperation between the public and business, etc.

Keywords: *Business, business environment, cooperation, government, investment*

1. INTRODUCTION

One of the important tasks facing our country in modern times is to ensure the effective participation of the economy in the international division of labor, to achieve the development of productive forces through the involvement of foreign capital, advanced technology and management experience. Undoubtedly, in such a situation, one of the most important factors for ensuring the economic development of any country is investment flows. Professor M. Porter, an American economist known as a prominent researcher of the problem of competition, notes that one of the four stages of the country's competitive development is development based on investment advantage. As can be seen, the achievements of individual countries and companies are largely determined by the level of their investment activity. Recently, in most countries, public and business cooperation is increasingly used to increase investment activity and reduce the burden on the public budget. Public and business cooperation is understood as an institutional and organizational alliance established between the public and business for the implementation of projects of various levels with a large public content. Usually, such alliances are created for a certain period of time for the implementation of specific projects, and after the completion of the project, these alliances cease to exist. Recently, serious steps have been taken in Azerbaijan to improve the business environment and stimulate investment opportunities. However, large social and economic projects in the country are still funded by the public budget. Taking all this into account, the "Strategic Roadmap for the production of consumer goods at the level of small and medium enterprises in the Republic of Azerbaijan" approved by the Decree of the President of the Republic of Azerbaijan dated December 6, 2016 identifies the development of public and private partnership as one of the main goals (1). For countries like Azerbaijan, the public and private partnership model serves not only the purpose of attracting capital, but also innovation, creativity, flexibility and effective governance.

2. THE ESSENCE AND IMPORTANCE OF PUBLIC AND BUSINESS COOPERATION

There is still no consensus on the definition of public and private partnership. However, according to more common approaches, public and business cooperation does not involve the public's involvement in business projects, but the application of mechanisms for the involvement of the private sector (business) by the state in public projects. A public-business partnership is "an organizational and contractual partnership between the public and the private sector for the presentation of a good or service to the state" (4). The first applications of the public and private partnership model began in England in the 1660s with road construction projects involving the private sector. In particular, the application of the public and private partnership model with canal and railway projects reached its peak in the 1860s after the industrial revolution, but many investors went bankrupt with the economic crisis in Europe. After the United Kingdom, the model of public and private partnership was applied in the United States and France. Again, the Suez Canal, supported by Egyptian Governor Said Pasha and completed in 1869, is the product of a public and private partnership. Analysis of the experience of different countries at different stages of socio – economic development shows that this type of cooperation includes the construction of transport infrastructure (roads, railways, airports, seaports, pipelines, etc.), social (health, education, recreation and tourism) is more successfully applied in the sectors of infrastructure creation, utilities (water supply, electricity supply, water treatment, gas supply, etc.) and the provision of such services.

Figure following on the next page

Figure 1: Sector distribution and cost of PPP projects in countries around the world in 2019
(Source: https://www.eib.org/attachments/epec/epec_market_update_2019_en.pdf)

In international practice, the model of public and private partnership is widely used in the implementation of state (public) infrastructure projects in a number of countries. Among them are the United States, Great Britain, France, the Netherlands, Australia, South Korea, Turkey, Brazil, India, China, Mexico and others countries can be especially noted. According to the World Bank, between 1990 and 2018, 6,135 public and private partnership projects worth about \$ 1.5 trillion were implemented in developing countries (10). A significant part of Turkey's major projects, including Istanbul's new airport, Eurasia Tunnel, Yavuz Sultan Selim Bridge, Osmangazi Bridge, a number of city hospitals and railway projects across the country, has been implemented through a public and private partnership model. According to the World Bank's Private Participation in Infrastructure Projects database, the \$ 35 billion Istanbul Airport project is the largest public and private partnership project involving private investment. To other important projects of cooperation between the public and business may have been due Nord Stream gas pipeline project (\$ 10 billion) connecting Russian gas fields with EU energy markets, THD Grand Est, the largest fiber – optic project in France (1 billion euros) and the construction and renovation of stadiums for the Euro 2016 football tournament (for example, the construction of the Pierre Mauroy stadium in Lille for 618 million euros), Afsluitdijk Dam (810 million euros), 1915 Canakkale Bridge in Turkey (3.1 billion euros) and Bilkent Laboratory (711 million euros), etc. The chart below shows the public-private partnership market in Europe in 2018 (9). The public and business cooperation model plays an important role in terms of attracting local and foreign investors to the implementation of relevant infrastructure projects by reducing public investment expenditures and applying alternative financing mechanisms (3). In some countries (Australia, the Netherlands, Chile, etc.) even public and business cooperation projects are selected only from the projects included in the public investment program. Relevant support is provided by the Asian Development Bank, the European Bank for Reconstruction and Development, the Sustainable Infrastructure Fund, the Islamic Development Bank, the International Finance Corporation and other international organizations to improve the public-private partnership environment and develop public and private partnership projects.

Figure following on the next page

Figure 2: Development of the European PPP market by country (2015 – 2019)
(Source: https://www.eib.org/attachments/epec/epec_market_update_2019_en.pdf)

It should be noted that in developed countries in recent years, increased attention has been paid to the implementation of public and private partnership (green) projects related to the green economy. These countries are investing heavily in renewable energy sources, improving energy efficiency and protecting biodiversity. Unlike developed countries, education and health are not priority areas for public and private partnership in developing and transition economies. The low level of economic and social development in these countries means that investments attracted through public and private partnerships are mainly focused on transport infrastructure, including the construction and repair of roads, railways and ports. In developing countries, private business is particularly interested in financing the energy sector, transport, water supply, sewerage, and telecommunications. In such countries, concessions, production sharing agreements and joint ventures are more commonly used as a form of cooperation. In Central and Eastern European countries (Bulgaria, Czech Republic, Hungary, Croatia, Poland, Romania), China, the Baltic States and the former USSR, the areas of public and business cooperation are the construction of roads, bridges, tunnels, subways, airports and seaports. The purpose of public and private partnership is the efficient use of public and private sector resources to ensure sustainable economic development and increase the welfare of the population. Public and private partnership is a concrete mechanism formed within the framework of norms and rules, which allows each cooperating party to build relations on a legal basis (8). Various forms of public and private partnership are used. Institutional and funding models are differentiated according to the objectives of the cooperation. In most cases, a combination of different models is used in the framework of cooperation. One of the important issues of public and private partnership is that the state determines what infrastructure and services it needs, and the private sector representatives make proposals in accordance with the requirements of the state. The most important issue of cooperation is the sharing of risks and opportunities among the participants. In the end, the solution to a specific problem is left to the partner who offers the highest efficiency. The strategic roadmaps approved by the President of the Republic of Azerbaijan, as well as conceptual documents aimed at the socio – economic development of Azerbaijan, set the goal of increasing the role of the private sector in economic development through public-private partnership mechanisms. In this regard, the Public Entrepreneurship Partnership Development Center was established within the Small and Medium Business Development Agency (SMBDA) under the Ministry of Economy to ensure systematic activities to promote and support public and private partnership projects.

By the Decision of the Board of the Ministry of Economy of the Republic of Azerbaijan dated July 16, 2019, the Model Regulations on the State Entrepreneurship Partnership Development Center were approved. The main activities of the State Entrepreneurship Partnership Development Center are as follows:

- Submission of proposals on the development of the legislative framework and institutional infrastructure for public entrepreneurial partnership;
- Development, implementation and coordination of programs and projects on state entrepreneur partnership;
- Ensuring the expansion of SMEs' participation in state entrepreneur partnership programs and projects;
- Enlightenment and capacity building of all stakeholders in public and private partnership;
- Analysis, research of projects in accordance with the criteria of state entrepreneur partnership and work for the implementation of these projects.

However, a look at the property structure of domestic investment in fixed assets in the country's economy shows that most of these investments fell to the public sector (graphic 3).

Figure 3: Distribution of investments in fixed assets by type of ownership (Specific weight in total, as a percentage)
(Source: Azerbaijan State Statistical Committee)

3. LEGAL BASIS OF PUBLIC AND BUSINESS COOPERATION IN AZERBAIJAN

The study of world experience shows that the scope and scope of public and private partnership is expanding year by year, new forms of business cooperation with the state are emerging. World experience also shows that the application of this model has a positive impact on the socio – economic development of the country, while creating a perfect legal framework for the development of public-private partnership. This is because the legal framework determines how the state will conclude a private partnership agreement, how long it will last, and how the responsibilities for the service will be distributed. In countries implementing public-private partnerships, they have created a legal framework for these models. For example, the first legal basis for the PPP model in Turkey dates back to the Ottoman Empire (Menafii Universal Privilege Act of June 10, 1910). The legislative framework for public-private partnership in Azerbaijan is being formed. There is no separate law on concessions, public-private partnership or production sharing in Azerbaijan. One of the most important laws in this area – the Law of the Republic of Azerbaijan “On the implementation of investment projects related to construction and infrastructure facilities on the basis of special funding” was adopted in March

2016. In addition, the “Regulations on the transfer of state owned enterprises (facilities) on a contractual basis”, the Law “On Public Procurement”, the Civil Code of the Republic of Azerbaijan, approved by the Decree of the President of the Republic of Azerbaijan No. 437 of February 9, 1996, the laws “On investment activity” and “On protection of foreign investment” can also be considered to some extent the legal basis of public and business cooperation. “Regulations on the transfer of state enterprises (facilities) to management on a contractual basis” is the main legal and normative document for the transfer of infrastructure facilities to the management of the private sector. The Regulation was developed in order to implement appropriate measures to ensure the revival of state institutions (facilities) on the basis of individual projects. According to the regulations, enterprises (facilities) can be transferred to management on a contractual basis if the privatization of the facility is either not economically feasible or not yet timely. There is an article in the Law of the Republic of Azerbaijan “On Protection of Foreign Investment” adopted in January 1992 on concessions, which is a form of such cooperation. Article 40 of the law is called “Concession Agreements”. The article reads: Foreign investors are granted the right to search explore and develop mineral deposits and use other natural resources on the basis of concession agreements concluded with them by the Cabinet of Ministers of the Republic of Azerbaijan and approved by the Supreme Soviet of the Republic of Azerbaijan. Unless otherwise provided in the agreement, unilateral change of the terms of the concession agreement is not allowed (2). However, even if the Law of the Republic of Azerbaijan “On Investment Activity” does not contain specific provisions on public and business cooperation and its forms, there are articles on which it is possible to draw certain conclusions on the application of this law to public and business cooperation. In Article 2 of the law entitled Investment activity also includes paragraph 3, entitled “Joint investment activities carried out by citizens, legal entities and states of the Republic of Azerbaijan and foreign countries”, which may apply to investments made in cooperation with the state and the private sector. Finally, as mentioned above, the most important law in this area is the Law of the Republic of Azerbaijan “On the implementation of investment projects related to construction and infrastructure facilities on the basis of special funding.” The law was adopted in March 2016. The purpose of the law is to ensure the implementation of investment projects related to construction and infrastructure facilities on the basis of special funding - in accordance with the “build – operate – deliver” model. “Build – operate – deliver” model (“BOD” model) – investment costs (including income) of investment projects related to construction and infrastructure facilities are contracted to the investor, consumers of goods and services produced by him or the authorized body provides for payment by purchase accordingly (2). At the same time, in connection with the application of this law by the Decree of the President of the Republic of Azerbaijan dated December 07, 2016, terms of implementation of investment projects related to construction and infrastructure facilities by investors within the framework of “Build – operate – deliver” model (“BOD” model) – investment costs (including income) of investment projects related to” model, requirements to investors according to types of construction and infrastructure facilities, features and conditions of concluded contracts, goods to be obtained as a result of investment and the Rules for Determining the Cost of Services and by the Decision of the Board of the Ministry of Finance No. Q – 06 dated May 22, 2017, the Rules on the methodology for calculating the amount of cooperation assistance and guarantee liability under agreements concluded under the “Build – operate – deliver” model was approved. The mentioned legal framework envisages the implementation of public and business cooperation projects in the country on the basis of the “Build – operate – deliver” (“BOD” model) model. Despite the existence of these legislative acts, as in countries with extensive experience in this field, our country needs a special law to legally regulate the process of public and business cooperation. Taking this into account, the law “On public and business cooperation” should be prepared in Azerbaijan.

The following should be clarified when drafting a law:

- principles of public and business cooperation;
- powers of state bodies exercising control and management of public and business cooperation processes;
- procedure for providing state support;
- objects of public and business cooperation;
- signs and conditions of public and business cooperation;
- forms and methods of public and business cooperation;
- procedure for starting public and business cooperation;
- procedure for preparation, implementation and management of public and business cooperation projects;
- procedure for concluding, amending and terminating the public and business cooperation agreement;
- issuance of guarantees, distribution of risks;
- procedure for exercising control over public and business cooperation;
- responsibility of public and private partners.

4. POTENTIAL AREAS OF PUBLIC AND BUSINESS COOPERATION IN THE COUNTRY

Every year, a large amount of money is allocated from the state budget to finance investments, which increases the burden on the state budget. Thus, it amounted to about 2.7 billion manat in 2017, about 4.8 billion manat in 2018, about 6.8 billion manat in 2019, about 4.9 billion manat in 2020; it is projected to be 3.6 billion manat in 2021, 3.4 billion manat and 4.9 billion manat in 2022 and 2023, respectively. The sharp decline in oil prices on the world oil market compared to previous periods has a negative impact on the state budget. It is known that more than half of the state budget in our country is formed due to transfers from the State Oil Fund of the Republic of Azerbaijan (SOFAZ) to the state budget. Thus, in 2011, 9203 million manats were transferred, while in the 2020 budget this figure was 11767.5 million manats. Transfers from the State Oil Fund of the Republic of Azerbaijan (SOFAZ) to the state budget in 2021 are expected to amount to 12 billion 200 million manats or 50.2% of all budget revenues. It should be noted that the vast majority of investment projects financed from the state budget are spent on infrastructure projects. Thus, according to forecasts, in this area in 2021 will be 2.5 billion manats, 2.3 billion manats in 2022 and 3 billion manat in 2023 are expected. In general, about 17 billion manats is expected to be invested in the state investment program in 2020-2023, of which about 3.1 billion manats will be realized through foreign loans (11). It is during this period that the use of various forms of public and business cooperation would reduce the burden of the state budget on investment, allowing the distribution of risks in social infrastructure projects by placing a portion of this burden on the private sector. As can be seen from the table below, a large amount of money is allocated to the transport sector in the state budget every year in our country. We believe that there is a great need to develop public and business cooperation in this area in order to reduce investments in the transport sector in the state budget.

Table following on the next page

	2014	2015	2016	2017	2018
Total	2432,4	2195,3	1391,0	1774,3	1922,8
Activities of surface and pipeline transport	416,2	553,1	345,8	127,1	305,2
Railway transport	4,3	1,6	1,9	2,1	7,1
Other road transport	358,2	237,6	194,1	38,5	129,8
Pipeline	53,7	313,9	149,8	86,5	168,3
Water transport	142,6	112,7	53,1	112,2	115,4
Air transport	82,2	397,2	10,2	402,2	39,4
Warehouse and ancillary transport activities	1791,4	1132,3	981,9	1132,8	1462,8

*Table 1: Transport oriented investments (million manat)
(Source: Azerbaijan State Statistical Committee)*

In addition to the above, as is known, as a result of the 44 – day Patriotic War, which began on September 27, 2020, most of the territory of our country occupied by terrorist Armenia was liberated from occupation. It is important to create an infrastructure area to ensure normal life in the liberated areas. Implementation of these projects at the expense of the state budget can cause many social and economic problems in the country. From this point of view, the implementation of this work makes it necessary to develop public and private partnership in these areas in our country.

5. CONCLUSION

- 1) A law on public and business cooperation must be drafted in Azerbaijan. The draft law should clarify the following:
 - principles of public and business cooperation;
 - powers of state bodies exercising control and management of public and business cooperation processes;
 - procedure for providing state support;
 - objects of public and business cooperation;
 - signs and conditions of public and business cooperation;
 - forms and methods of public and business cooperation;
 - procedure for starting public and business cooperation;
 - procedure for preparation, implementation and management of public and business cooperation projects;
 - procedure for concluding, amending and terminating the public and business cooperation agreement;
 - issuance of guarantees, distribution of risks;
 - procedure for exercising control over public and business cooperation;
 - responsibility of public and private partners.
- 2) The experience of countries that apply models of public and business cooperation shows that the application of these models in all areas is not effective. Therefore, priority areas for public and business cooperation projects should be identified.
- 3) As noted, one of the main objectives in the implementation of the model of public and business cooperation is to prevent corruption in the country. In this regard, transparency in the selection of private partners should be ensured. For this, the state must develop a special mechanism.
- 4) The experience of countries implementing models of public and business cooperation shows that the successful implementation of these models depends on the development of the existing financial market in the country. From this point of view, it is important to achieve the normal development of the financial market in our country, especially the credit and securities market.

- 5) As in some countries (for example, India), the establishment of a PPP Evaluation Committee to facilitate the evaluation and approval of projects can help develop public-business cooperation in the country.

ABSTRACT

International trade refers to economic transactions that take place between different countries. International trade is extremely important in today's global economy, and can be defined as the exchange of products and services between two or more countries of the world. Generally speaking, international trade allows countries to focus on industries and production in which they can be most productive and efficient. Thus, international trade, very often, raises the standard of living of both producers and consumers. The European Union is a member of the World Trade Organization and its trade policy promotes free trade in the world, which is a cornerstone of EU trade policy. Currently, the EU is one of the largest actors in international trade and accounts for about 17% of total foreign trade. After joining the EU in July 2013, Croatia began to implement the EU's Common Trade Policy on international trade, which led to increased exports and imports of products and services to EU member states and increased economic growth in Croatia after accession to the Union.

Keywords: *Croatia, the European Union, trade exchange, CEFTA, common trade policy*

1. INTRODUCTION

International trade refers to economic transactions that take place between different countries. Consumer goods such as clothing and televisions, capital goods such as for example machinery, and raw materials and food are most often traded. Other transactions include travel services and payments for foreign patents. International trade allows countries to expand their markets and access products and services that would not otherwise be available in the country. As a result of international trade, market competitiveness emerges. This ultimately results in more competitive prices, and brings consumers a cheaper product to the domestic market. International trade transactions are facilitated by international financial payments, in which the private banking system and the central banks of trading states play an important role. International trade has many advantages and disadvantages. The advantage of international trade is that exports create new jobs and strengthen the country's economic growth, and domestic companies more experience in production for foreign markets. Also, over time, companies gain a competitive advantage in world trade, and some research has shown that exporters are more productive than companies that focus exclusively on the domestic market. On the other hand, international trade also has certain shortcomings. International trade is reducing the number of jobs in domestic industrial plants that are increasingly difficult to compete in a competitive world. Large and profitable companies are moving their offices and technology production to countries with lower living and manufacturing costs. Furthermore, countries with traditional economies could lose their local agricultural base because developed economies subsidize their agribusiness. This is done by both the United States and the European Union, which undermines the prices of local farmers in other countries.

2. THE IMPORTANCE OF INTERNATIONAL TRADE

Modern economic trends and developments are characterized by a long-term trend of increasing international trade and increasing the importance of foreign trade for overall economic development. International trade can be defined as the total volume of trade between countries around the world. In other words, the totality of trade in the global market. International trade and accompanying financial transactions are mainly conducted for the purpose of giving the nation goods it lacks in exchange for those it produces in abundance. Such transactions, functioning with other economic policies, tend to improve the living standard of the nation. With the development of social productive forces, the international exchange of various goods and services is also increasing. It was the development of capitalism and the transition from manufacturing to machine production that influenced the development of international trade. Through international exchange, all countries of the world are united into a single global economic system, which is why international trade becomes the bearer of economic development and the common interest of all countries. International trade is a reflection of internal developments in the economy, production and consumption of goods and services, supply and demand of products and services in the economy of a country that is open to foreign markets. In order for international trade to affect a country's economic growth and development, it must be able to maximize economic growth. International trade is of great economic importance for all countries, especially countries exporting products and services. Every country in the world is to some extent dependent on the exchange of goods, which is true for countries such as Croatia as well. On the other hand, for developed countries that have surpluses of energy, goods and services, international trade is an opportunity to get rid of surpluses at the best possible conditions and prices in foreign markets. Unlike exports, imports of goods and services occur in order to meet the needs of the local population with products that are not enough in the country in which they live. Furthermore, there are a number of other reasons why international trade and import and export of products are important. The sale of products on foreign markets enables the increase of the product range, development of export-oriented industry, creation and development of new professional occupations and creation of new jobs, etc. Also, companies that successfully export their products create good conditions for importing products. In this way it encourages the overall economic and economic development of the country. Competition with competing countries affects the increased production activity of local producers, not constantly improving production technology, which leads to the creation of higher quality products. New technological processes reduce production costs and enable lower product prices on the market. The growth of the world economy today has a marked effect on the growth of international trade. The most important factors influencing the growth of international trade today are the incentive factors, which will be explained in more detail below. There are three main reasons why economic development affects the expansion and growth of international trade:

- 1) Constant economic development and growth opens up great market opportunities that enable companies to expand globally. Also, the slower growth of the domestic and local markets is a signal that opportunities should be sought in the global markets of other countries,
- 2) Due to the aforementioned growth of the world economy, the resistance of foreign companies to entering the domestic market has decreased. Namely, a foreign company can operate successfully on the domestic market without taking the job away from local companies, because local companies can ask for help from governments if there is no economic growth and
- 3) The stimulus of international trade was initiated by privatization and the opening of once closed markets. The opening of the market has enabled the economic growth of many international companies (Keegan, 2011: 15-20).

Furthermore, numerous multilateral trade agreements, as well as economic integrations and organizations (EU, CEFTA, WTO, NAFTA, etc.) have accelerated the processes of international trade. Economic and political stability in the world since the middle of the 20th century has resulted in the creation of the International Monetary Fund and the World Bank, thus laying the foundations of the international economic system as well as norms on exchange rate changes. Today's global economic order and the integration of countries into economic integration has provided legal certainty which also affects the development of international trade without some great uncertainties. Patents and intellectual property protection are easier to enforce, and exchange rate control policies are more flexible. The very international activity of a company affects its market advantage over other companies. The most important advantages are the transfer of experience, economies of scale, global access to resources and the use of the global concept of international marketing. The global concept of international business and marketing is reflected as the greatest competitive advantage of an international company. The global concept is based on an information system that the world trade environment to be able to detect opportunities, threats or trends in a timely manner. Global competitiveness, accelerated launch of products on the market, but strong technological development requires increasing financial investments from companies, which is especially felt in the fields of informatics and electronics and pharmacy. In these areas, investment in development and research is the key to success in the international market. Time and cost barriers related to distance have dropped significantly in the last century. Since communication between employees and consumers (both current and potential) is important for the development of international trade, the development of air transport and reducing the cost of telecommunications tools (e-mail, fax, mobile phones) are of paramount importance. Technology today makes it possible to change the business of almost all companies. Every new technological solution is available in a very short time all over the world, and it is quickly becoming universal. Today, the 21st century is characterized by the equalization of consumer tastes, even in local markets, which affects the great opportunity and progress of global marketing (Andrijanic, 2012: 14-15).

3. COMMON TRADE POLICY OF THE EUROPEAN UNION

The forerunner of the European Union was created after the Second World War. The first steps were to foster economic cooperation: the idea was for countries that traded with each other to become economically interdependent and thus more likely to avoid conflicts. The result was the European Economic Community (EEC), created in 1958, which initially increased economic cooperation between six countries: Belgium, Germany, France, Italy, Luxembourg and the Netherlands. From then until today, 22 more members have joined the European Economic Community, thus creating a huge single market that continues to develop to its full potential today. What started as an exclusively economic union, has developed into an organization that covers the development of various policy areas, from climate, environment, health to migration, external relations and security. Officially, the European Union was created by the Maastricht Treaty, which entered into force on November 1st, 1993. The treaty is designed to strengthen European political and economic integration by creating a single currency (the euro), a single foreign and security policy and common rights to citizenship. On January 31st, 2020, the United Kingdom officially left the EU, with a one year-transition period (https://europa.eu/european-union/index_en). Trade in products and services contributes significantly to increasing sustainable growth and job creation. More than 30 million jobs in the EU depend on exports outside the EU (<https://www.consilium.europa.eu/en/policies/trade-policy/>). About 90% of future global growth is projected to occur outside European borders. The European Union is the world's largest trading power, accounting for 16.7% of world trade in products and services. Foreign trade in goods and services accounts for 35% of EU GDP.

One in seven jobs in the EU is export-dependent (Hoekman and Puccio, 2019). Imports give EU companies access to inputs that help them compete in the market by improving productivity and reducing overall production costs by giving EU consumers the opportunity to buy a wide range of goods and services that meet their needs. The main goal of the European Union's trade policy is to increase the trading opportunities of European companies by removing trade barriers such as tariffs and quotas and guaranteeing fair competitiveness. This is necessary for the development of the European economy as it affects economic growth and employment. The Council of European Union is committed to a rules-based multilateral trading system. Trade policy is accompanied by a high level of transparency as well as effective communication with citizens about the benefits and challenges of trade in open markets. Trade policy is the exclusive competence of the EU. This means that the EU, not the member states, enacts laws on trade issues and concludes international trade agreements. If the agreement covers issues of mixed liability, the Council may conclude it only after it has been ratified by all the Member States. By acting together on the global stage, rather than with more separate trade strategies, the EU takes a strong position when it comes to global trade. The EU manages trade relations with third countries in the form of trade agreements. They are designed to create better trading opportunities and overcome trade barriers. The EU wants to ensure that imported products are sold at a fair and equitable price in the EU, no matter where they come from (more in: <https://www.consilium.europa.eu/en/policies/trade-policy/>). Trade regulation in the form of trade defence instruments is a means of protecting EU producers from harm and combating unfair competition from foreign companies. The Common Trade Policy (CTP) enables the EU to speak with one voice on trade policy issues and to use the single market to improve access to foreign markets for EU companies through the negotiation of trade and investment agreements. Economic globalization is characterized by the growth of international trade and the growing interdependence of economies at the global level. EU trade policy is a central tool for responding to the challenges posed by globalization and turning its potential into real benefits. EU trade policy protects Europeans by ensuring that imports comply with consumer protection rules. The EU also uses its trade policy to promote human rights, social and security standards, respect for the environment and sustainable development. EU trade policy consists of three main elements:

- 1) Trade agreements with non-EU countries to open new markets,
- 2) Trade regulations to protect EU producers from unfair competition and
- 3) EU membership of the World Trade Organization, which sets international trade rules.

The European Union's trade policy today faces a number of challenges, both internal and external. It is very important to ensure that trade policy is in line with the purpose of a European service-oriented economy and to address the concerns of many citizens with the effects of globalization. European trade policy leadership should launch global trends towards protectionism, prevent the collapse of the multilateral trading system and support work on negotiating a framework of rules dealing with the current trade conflicts. Many EU citizens see globalization as a threat to employment and a growing source of growing inequality. This explains the growing involvement of trade policy in internal political debates and activities. An example of this is the large-scale protests that took place in Germany whose citizens oppose the ratification of the agreement with the US and Canada. Concerns focus on the implications of trade agreements on regulatory powers, their prominence in addressing non-economic concerns such as environmental protection and labour standards, and in the case of neighbouring countries it is feared that trade agreements could be the first step towards possible EU accession. Managing and addressing EU citizens' concerns about the potential consequences of trade agreements is important for the EU. They are the main tool of foreign policy. They are also a key mechanism by which to respond to greater recourse to protectionism by the US and major

emerging economies as an obstacle in the event of a failure to revitalize the WTO. In addition to internal, there are also external challenges. For example, the search for a "America first" policy included US unilateral protectionist measures, including global safeguards against imports of washing machines and solar panels, and restrictions on steel and aluminium imports motivated by national security. Foreign imports from China are subject to additional tariffs in retaliation for alleged unfair Chinese trade practices. These measures led to retaliation against U.S. exports. EU countermeasures affect U.S. exports of grains, juices, tobacco, clothing, iron and steel products, motorcycles and boats. The EU has also launched a safeguard action to prevent the diversion of steel from the US to the EU and to challenge the legality of US' protectionist measures before the WTO. In response to countermeasures, the U.S. has launched a national security investigation into car imports. An increase in tariffs on imports of automotive products would have a significant negative effect on EU producers. Although the US remains a key trading partner of the EU, developing economies have become more important. China ranks first as a source of imports from the EU and second as a destination for exports to the EU. Asian countries are the largest market for exports from the EU, accounting for a third of total exports of goods, followed by North America (27%) and European countries outside the EU (23%) (Hoekman, Puccio, 2019). Given the importance of trade flows between the EU and China, a bilateral trade agreement could recoup costs for both the EU and China if trade conflicts with the US continue to prevail. It could also make it possible to negotiate provisions that address a number of issues the EU has with China, such as public procurement, the treatment of EU investors and the activities of state-owned enterprises. The EU benefits from an open trade policy and an effective, rules-based multilateral trading system. The rise of protectionism in major trading countries (especially the US and several large emerging economies) can only be detrimental to the EU economy. Internal and external factors challenge the EU's ability to use the CTP and at the same time increase the prominence of trade policy as a foreign policy instrument.

4. REPUBLIC OF CROATIA: TRADE WITH THE EUROPEAN UNION MEMBER STATES

International trade is one of the key factors in Croatia's economic development. Croatian trade in goods accounts for about 55% of GDP. However, its exports of services exceed exports of goods due to a strong tourism sector, so, taking into account trade in goods and services, the trade openness indicator increases to approximately 85% of GDP. Nevertheless, Croatia is among the least open countries in the Central and Eastern Europe (CEE), and improving this indicator is important for stronger economic development. The country mainly exports petroleum oils, medicines, human and animal blood, wood, while imports are driven by petroleum oils and crude oil, cars, medicines and electricity. Although exports of goods have never been sufficient to cover imports in any year since 1995, after the outbreak of the global economic and financial crisis, the trade deficit has fallen sharply, mainly due to weak adjustment of demand and imports. In the period from 1998 to 2016, Croatia recorded a constant trade deficit with an export-import coverage ratio of around 53% on average (Ranilovic, 2017). The slower growth of exports than imports in Croatia can be partly explained by the late integration into international economic institutions. First, unlike other Central and Eastern European countries, which joined the World Trade Organization in 1995, Croatia became a member in the year 2000. Second, the lack of an Association Agreement with the EU has deprived Croatia of preferential access to the EU market. The weak growth of Croatian exports can also be explained by a number of factors, including the low share of high value-added products, the lack of a clear national export strategy, low inflows of foreign direct investment in the tradable sector, high operating costs compared to peer countries and relatively low investment in research and development.

However, the overall structure of Croatian trade changed after Croatia's accession to the EU in July 2013. It was only after Croatia's accession to the European Union that the country's economy gradually began to grow only in 2015, after Croatia experienced six consecutive years of economic recession. Only in 2019 did Croatia experience economic growth from 2.7% to 2.9% compared to the previous year, which was mainly caused by domestic demand and public investment from EU funds. According to the data from the International Monetary Fund from April 14, 2020, due to the economic crisis caused by the epidemic of the COVID-19 virus, the economy is expected to decline by 9% (<https://www.nordeatrade.com/en/explore-new-market/croatia/economical-context>). During 2018, the European Union accounted for 68.6% of Croatian exports (mainly to Italy, Germany and Slovenia), followed by Bosnia and Herzegovina (9.4%) and Serbia (4.9%). In terms of products and services, Croatia has a structural trade deficit. According to the latest data from the World Trade Organization, exports of goods in 2018 amounted to 17.4 billion US dollars (+ 8%), while imports grew faster (+ 13%) and thus reached the amount of 28.1 billion US dollars. As a result, Croatia's trade balance was negative (-11 billion US dollars). Also, according to the World Bank, the total trade deficit was an estimated 0.8% of GDP (<https://www.nordeatrade.com/en/explore-new-market/croatia/economical-context>). The process of EU enlargement as well as the creation of a single market combined with external factors such as the activities of the World Trade Organization and changes in the overall political situation in the world have led to significant changes in the legal basis of EU international trade policy. New legal acts and instruments increasingly comply with the norms and principles of international trade law. The harmonious development of world trade, the abolition of restrictions on international trade and the reduction of customs barriers are the main objectives of the European Union's common trade policy. The realization of foreign trade policy is carried out on the basis of the drafting of certain normative acts. Special attention in the above normative acts is paid to the regulation of import and export of goods, the system of trade protection measures, quotas and licensing. In the continuation of the paper, the most important instruments of the international trade policy of the European Union, which are also applied to the trade policy of Croatia, are presented:

4.1. Regulations on the import of goods

Regulations on imports of goods and services are classified into customs and non-customs. The most important instrument of customs regulation in the EU is the Common Customs Tariff (CCT), the introduction of which is an important precondition for the formation of a customs union. The main objectives of the application of the CCT include:

- increase in the costs of imported goods, and thus support for domestic production,
- increase in EU budget revenues (90% of all collected customs duties),
- combating trade practices that violate fair competition on the world trade scene,
- creation of mechanisms and instruments for economic integration (customs unions, free trade zones) and for assistance to developing countries,
- achieving a positive balance of payments by reducing the volume of exports,
- the possibility of introducing urgent protective measures against products that harm domestic producers,
- difficulties in exporting raw materials, food and other goods at prices lower than world prices, and thus preventing a deficit of such goods,
- encouraging the progress of certain industries by granting favourable customs regimes.

4.2. Regulation of export of goods

An important component of EU trade policy is the regulation of exports. This is achieved by regulations establishing general EU export rules. As regards customs regulation of exports of goods, the European Union consistently pursues a policy of deducting export duties.

This is fully in line with the purposes and principles of GATT. Export duties are applied only in exceptional cases in order to prevent the outflow of vital products from the EU. The basic principle is formulated in the Regulation - the principle of freedom of export and rejection of quantitative restrictions, except for the restrictions provided for in the founding treaties. The information and consultation procedure necessary for the export of goods is regulated by the Regulation. There are also rules for the application of the EU safeguard measures, as well as rules on Member States' national restrictive measures and rules for the export of agricultural products. There are lists of goods that are excluded from the operation of the principle of freedom of export. The Regulation also reaffirms the competence of Member States to impose restrictions on exports for reasons of public morality, public policy and public security, protection of human life and health, protection of national cultural, historical and archaeological values, protection of industrial and commercial property. A number of important raw materials are excluded from the entire export policy (agricultural products, metal ores, scrap iron, fuel, etc.).

4.3. System of protective measures

The system of safeguard measures in the European Union includes legal norms in the field of anti-dumping (Regulation No. 1225/2009) and countervailing duties (Regulation No. 2026/97). Using these legal norms, the EU has implemented international agreements accepted under the GATT. Anti-dumping and anti-subsidy measures are aimed at combating various types of unfair trade practices, as well as compensating for the trade balance. These measures are caused by the action of third country companies on the EU market. The aim of the compensatory measures is to eliminate the trade imbalance within the European Union, which has arisen from unfair subsidies to EU exports by exporting countries. In addition to protection against dumping and subsidization, EU legislation presupposes retaliatory measures aimed at combating illegal restrictions on the access of EU goods to third country markets. Such restrictions are called “foreign trade barriers” and include customs and non-tariff measures of third countries.

4.4. Quota and licensing system

As already mentioned, the European Union in some cases uses quantitative restrictions on imports and exports of goods. The most common forms of quantitative restrictions are quotas and licensing. The quota system is based on the Common Commercial Policy and considers the principle of free movement of goods within the EU. Regulation (EC) No 717/2008 provides the legal basis for quotas and establishes common procedures for managing quotas among importers (exporters).

Quotas can be applied in one of the following ways or in a combination of these methods:

- traditional allocation – this method is based on traditional trade flows, and quotas on imports and exports of goods are allocated primarily between traditional importers, i.e. exporters, or importers or exporters who can prove that during the “reference period” they imported or exported products to EU;
- Allocation in the order of receipt of applications – based on the order in which applications are submitted, those who applied first for the allocation of quotas will be the first to receive their licenses. Licenses are valid throughout the European Union, except in cases where they are granted to individual Member States or regions of the EU. The duration of the licenses is four months.
- Proportional method – a method of allocating quotas in proportion to the quantity requested at the time of application, in other words, data are collected relating to the number of applications and the quantity of goods requested (Prytula, 2015: 164).

5. REPUBLIC OF CROATIA: TRADE RELATIONS WITH THE WESTERN BALKANS COUNTRIES, MEMBERS STATES OF CEFTA

The Republic of Croatia was a member of the CEFTA (Central European Free Trade Agreement) from 2003 to 2006 and thus had fully liberalized trade relations with the member countries of that integration. Accordingly, trade with neighbouring Bosnia and Herzegovina has been fully liberalized, and reduced customs rates have been applied to exports to Serbia, Croatia's second most important partner among CEFTA members. However, after Croatia's accession to the European Union on 1 July 2013, all national regulations in the field of trade policy and trade relations concluded before Croatia's membership in the EU ceased to apply, i.e. agreements concluded with CEFTA member states ceased to be valid. e. Trade with the countries of the region, Bosnia and Herzegovina, the Republic of Albania, Montenegro, Kosovo, the Republic of Macedonia and the Republic of Serbia is conducted in accordance with the Stabilization and Association Agreements. Also, with Croatia's accession to the EU, in addition to the Stabilization and Association Agreements with CEFTA countries, the European Commission concluded additional protocols with Bosnia and Herzegovina, the Republic of Albania, Montenegro, Macedonia and the Republic of Serbia, all in order to maintain traditional trade policy. In the continuation of the paper, Croatia's trade relations with three countries in the region will be presented: Bosnia and Herzegovina, the Republic of Serbia and Montenegro. Diplomatic relations between Croatia and Bosnia and Herzegovina began when Croatia recognized Bosnia and Herzegovina on January 24, 1992, and both countries signed an agreement on mutual friendship and co-operation. In June 2008, Bosnia and Herzegovina signed a Stabilization and Association Agreement (SAA) with the European Union, an important step towards EU membership. The SAA between the EU and Bosnia and Herzegovina officially entered into force on 1 June 2015. The most important part of the SAA is the establishment of a free trade zone between Bosnia and Herzegovina and the EU/Croatia, enabling the mutual abolition of customs tariffs and quantitative restrictions on the mutual exchange of goods between Bosnia and Herzegovina and the EU. The entry into force of the SAA should increase investor confidence in the country, both domestic and international. When exporting / importing industrial products from the EU/Republic of Croatia to Bosnia and Herzegovina, the zero customs rate is applied to: industrial and agricultural products, and the basic customs rate is applied to: cattle, pigs, dairy products, fruits, cigarettes and fig (Čudina, Sušić, 2013). The Republic of Serbia signed the Stabilization and Association Agreement with the EU / Croatia on 29 April 2008, which entered into force on September 1st, 2013. The Protocol on Technical Adjustments to the Stabilization and Association Agreement between the EU and the Republic of Serbia for the Membership of Croatia in the EU was signed on 25 June 2014 and provisionally applied from 1 August 2014. When exporting / importing industrial products from the EU / The Republic of Croatia applies a zero rate of customs duty to Serbia, namely to: industrial and agricultural products and fish and fish products, the basic duty rates (0-30%) are changed to seasonal fruits and vegetables, and the basic duty rate (20-70%) on milk, meat, fruits and vegetables, flour, etc. Furthermore, Montenegro signed a Stabilization and Association Agreement with the European Union/Croatia on 15 October 2007, which entered into force on May 1st, 2010. When exporting/importing industrial products from the EU / Republic of Croatia to Montenegro, a zero-duty rate is applied to: industrial and agri-food products, fish and fish products, the basic duty rate is applied to a part of agri-food products, 50% of the basic duty applies to lambs, sheep, prosciutto, dairy products, etc., and tariff quotas on trout, carp, gilthead sea bream, sea bass and canned sardines.

Table following on the next page

Table 1: Republic of Croatia: Trade with economic groupings 2010-12 (in billions of Croatian Kunas, HRK)

		2010	2011	2012
EU	Exports	36.623	42.632	42.106
	Imports	66.387	74.842	76.197
CEFTA	Exports	12.137	13.670	15.164
	Imports	5.916	7.170	7.455
EFTA	Exports	744	1740	950
	Imports	2.238	2.446	3.004
OPEC	Exports	2.384	1.731	1.324
	Imports	606	969	1.196

Table 2: Republic of Croatia - Trade with the EU member states 2014-19 (in billions of Croatian Kunas, HRK)

	2014	2015	2016	2017	2018	2019
Exports (in bln HRK)	50.528	58.518	61.627	67.867	74.189	77.716
Growth rate (%)	12.7	15.8	5.3	9.8	9.3	4.8
Imports (in bln HRK)	99.819	109.830	114.683	127.496	137.652	148.984
Growth rate (%)	8.0	10.0	4.4	11.2	8.0	8.2

Source: Author's work according to Croatian Central Bureau of Statistics, <https://www.dzs.hr/>

After Croatia's accession to the European Union, as expected, the share of exports to EU countries in total exports of the Republic of Croatia has increased, as well as the share of imports to EU countries. The highest growth rate of exports of products and services to EU member states is visible during the first and second years of membership, 2014 and 2015, after which exports began to decline slightly. Imports also grew every year, and the highest import growth rate of 11.2% can be observed in 2017, i.e. after coming out of the economic crisis that has affected the whole world. Also, the share of exports and imports of the Republic of Croatia with EU member states in the total trade exchange was higher than 60% each year. The share of exports to the EU fell slightly during 2016 and 2017 and then began to rise again. On the other hand, the share of imports had the largest increase in 2015, after which it fell slightly. The largest total share of imports into the EU can be observed during 2017 and 2018, while in 2019 this amount decreased by almost 1% of the total trade of the Republic of Croatia.

Figure 3: Croatia's total trade in comparison with the trade with the EU

Source: Author's work according to Croatian Central Bureau of Statistics, <https://www.dzs.hr/>

The largest export foreign trade partner of Croatia since the accession to the EU was Italy with the largest share in the total export of the Republic of Croatia. Exports to Italy grew every year, and the highest growth rate is visible in 2017 when exports to Italy increased by almost 5%. On the other hand, the largest exports to Italy were recorded in 2019, when they amounted to 16 billion Kuna with a share in total exports of 14%. In the first three observed years (2014-2016), Slovenia was in second place as Croatia's export foreign trade partners, and since 2017, exports to Slovenia have fallen by 3%. Since 2018, exports to Slovenia have been growing again, reaching 11% of total Croatian exports. The third largest foreign trade export partner of the Republic of Croatia is Germany. Unlike Italy, exports to Germany rose sharply in 2017 (by almost 18%) and continued to grow steadily throughout 2018 and 2019. In 2019, exports to Germany approached the figure of as much as HRK 15 billion and a 14% share in total Croatian exports. All of this confirms the thesis that Croatia is highly export dependent on only a couple of trade partners – in the EU, these are mainly Italy, Germany and Slovenia. These three countries are also Croatia's largest import partners. Croatia is highly integrated into the EU common market, hence in the period 2014 to 2019, Croatia's exports to the EU amounted for about 64 to 69 percent of total exports, with a slow rise in trend, whilst the imports to Croatia from the EU in the same period amounted for a steady 76 to 78 percent of total imports. Among CEFTA member states, Bosnia-Herzegovina is the most important trade partner of Croatia.

6. CONCLUSION

International trade is the exchange of capital, goods and services across international borders. International trade is extremely important for the continuation of globalization, but also for the economic development of countries. The economic basis of international trade is that countries have different products and resources, which is why they gain a competitive advantage over other countries. The comparative advantage helps the country move closer to allocative and productive efficiency. A comparative advantage means that a country can produce a particular product at a lower opportunity cost than other countries, which plays an important role in international trade. International trade is one of the key factors in the country's economic development. Croatian trade in goods accounts for about 55% of GDP. However, exports of services exceed exports of goods due to a strong tourism sector, so, taking into account trade in goods and services, the trade openness indicator increases to approximately 85% of GDP. Croatia became the 28th member state of the European Union (EU) on 1 July 2013. However, the liberalization of trade policy vis-à-vis the EU began long before that date, which led to EU member states becoming Croatia's most important trading partners. Croatia's accession to the EU has affected not only trade with Member States, but also trade with Southeast European countries due to its simultaneous exit from CEFTA. accession to the Union, Croatia has had a number of long-term and short-term effects on international trade. The short-term effects relate to the removal of customs and non-tariff barriers, and the long-term effects relate to a larger and more competitive European market. Based on the research, it can be concluded that trade (imports and exports of products and services) of Croatia with EU member states grew every year from 2014 to 2019, while exports of goods to CEFTA member countries fell. Also, there was a reduction in consumer prices in Croatia. The most important foreign trade partners of Croatia in the observed period were Italy, Germany and Slovenia. While Italy was the most important export, Germany was the most important import foreign trade partner of Croatia in the observed period. The highest export rates are recorded in the manufacturing industry and the production of motor vehicles and pharmaceuticals. On the other hand, during the observed period, the most imported products to Croatia were refined products, refined oil and coke, and the production of engines and motor vehicles.

ASSESSMENT OF THE IMPACT OF PUBLIC HOUSING POLICY ON THE SOCIOECONOMIC DEVELOPMENT OF THE COUNTRY

Bayramov Gahraman Saleh

Azerbaijan State University of Economics (UNEC)

Baku, Istiqlaliyyat str.6, AZ1001, Azerbaijan

qehreman.bayramli@bk.ru

ABSTRACT

The article assesses the impact of public housing policy on socio-economic processes in the country. At present, the concept of "housing policy" is not reflected in the Housing Code of the Republic of Azerbaijan or in any normative legal acts. This leads to different understandings of the goals and objectives of public housing policy, the basic principles of its formation, as well as its role in the socio-economic development of the country. It is the relevance of the research topic. The purpose of the research is to assess the impact of public housing policy on socio-economic processes in the country. The research was conducted on the basis of generalization, systematization and economic-statistical methods. An article analyzes the theoretical and practical approaches to the definition of the concept of "housing policy", the definition of goals and objectives of public housing policy, as well as the basic principles and problems of its formation and implementation. The author gives an explanation of the impact of housing policy on the socio-economic development of the country. The main goals, objectives, basic principles of the successful formation of the public housing policy are systematized, the role and importance of its implementation in solving the problems of socio-economic development of the country are substantiated. The proposed approach to the results of housing policy has allowed to systematize the main goals, objectives and basic principles of its implementation, while examining the existing problems in this field. The scientific novelty of the research is the comparative analysis of housing and affordability in Azerbaijan and a number of developed countries, the development of priority areas for improving socio-economic policy based on the model of interaction between public housing policy and socio-economic development of the country. It is considered that all this will contribute to the formation and implementation of an effective public housing policy in the country in the future. The results of the research can be used by government agencies accountable for the formulation and implementation of public housing policy.

Keywords: *public housing policy, socio-economic development, housing maintenance, housing affordability, social welfare*

1. INTRODUCTION

Housing policy is one of the components of public policy. Housing policy to help improve the living conditions of the population not only reflects the quality of the population life, but is also a locomotive for the development of almost all sectors of the national economy. The implementation of public housing policy (PHP) involves the use of a complex system of various social, economic and political tools and mechanisms that must comply with the principles set at this stage of a person's socioeconomic development. Besides, the assessment of the effectiveness of the PHP should be based on a system of well-grounded criteria for a particular country, taking into account existing economic conditions and relevant indicators.

2. METHODOLOGY FOR PHP IMPLEMENTATION: PRINCIPLES AND CRITERIA FOR EVALUATION OF ITS APPLICATION EFFICIENCY

There are some editions of authors in the economic literature, which consider various aspects of the methodology of housing sector development: measures to promote the development of

housing construction [1], local factors that significantly reflect housing markets, which can lead to local price bubbles [2], an approach to assessing the role and importance of housing investment in the sustainable socio-economic development of the city [3], systematization and typology of methods of state support for providing housing to citizens [4], methodology to assess housing affordability for the population [5], methods of mass appraisal of real estate used by municipalities [6], procedure for improving the housing conditions of lower and middle-income citizens [7], crisis on the impact of mortgages on housing policy measures [8], mathematical models to assess the impact on the cost of housing, the form of application for citizens - parameters such as rent or credit for property [9]. Authors Bardasova E. V. [10], Bondaletov V. V. [11], Kalashnikov S. V. [12], Nezhnikova E. V. [13], Ponomareva EG [14], [15], Prokophiev K.Yu. [16], Shashko A.A. and Shashko T.D. [17] have formulated PHP principles in their job, each of the authors presenting their own criteria, in our opinion, none of them is complete. Authors Ovsyannikova T.Yu. [18], Pchelkin V.A. [19], and Allen [20] developed various indicators of housing affordability, however, did not consider defining criteria for evaluating the effectiveness of PHP implementation. At present, there is a liberalization tendency of the Republic of Azerbaijan in HPH and other countries of the world, but the social aspect remains important. A rational system for the application of PHP should be based on a number of principles that meet the requirements of the current stage of socioeconomic development of a particular country. Let's also look through the indicators to evaluate the effectiveness of the PHP application. Let's analyze the most commonly used indicators both abroad and in the Republic of Azerbaijan, and substantiate the author's set of indicators and the criteria they meet for the assessment of PHP. In accordance with the "Strategic Roadmap for the Development of Affordable Housing in the Republic of Azerbaijan" approved by the Decree of the President of the Republic of Azerbaijan dated December 6, 2016, defines the consolidated goals for implementation. These indicators are:

- 1) Level of housing per capita.
- 2) The volume of commissioned apartments at the expense of all financial sources.
- 3) The average cost of 1 m² of the total area of housing built with state support (excluding individual builders) - in the country as a whole.
- 4) The share of individual housing construction in total housing construction - in the country as a whole.
- 5) The share of extra-budgetary sources of financing in the total financing of housing construction - in the country as a whole.
- 6) The share of the total area of multi-apartment energy-saving residential buildings in the total volume of commissioned housing (excluding individual residential buildings) - in the country as a whole.

The Organization for Economic Co-operation and Development (OECD), an international economic organization for developed countries, is also interested in indicators that represent the principles of democracy and a free market economy. The goal of the research is to review such indicators for housing conditions, developed by the OECD and which can be used to assess the effectiveness of HPH in improving the living conditions of the population. In 2017, the OECD published another periodical, "How's Life? Measuring Well-being" [21]. In this edition, we are interested in indicators such as the average number of rooms per person, the share of housing with basic utilities to assess the quality of housing. According to the OECD, these indicators, this set of minimum indicators are the most important for each person. HAI Accessibility Index in the calculation of the housing affordability index for the population of the National Association of Realtors of the United States: $HAI = (MI: I_m): 100\%$, HAI Accessibility Index in the calculation of the housing affordability index for the population of the National Association of Realtors of the United States: $HAI = (M\dot{I}: \dot{I}_m): 100\%$, MI is the

median family income, currency; Im - the medium statistical unit of income, currency, which is enough to get a long-term mortgage loan to buy a house. A value of 100% indicates the availability of credit, because the average family income corresponds to the income required to obtain a long-term mortgage loan. This methodology does not take into account the fact that households carry consumer expenditures at minimum subsistence level, and it is difficult to determine the amount of income required to obtain a mortgage loan, which is sufficient to buy a medium-sized apartment. According to the UN-HABITAT Housing Affordability Index (HAI): the number of years that the medium family will raise funds to buy housing with an medium statistical value, provided that the income of the whole family is used for these purposes:

$$\text{HAI} = \text{MÍ} : \text{MOD},$$

MI - Median Family Income, currency, MPH- median priced home (excluding the space of the apartment).

Since this indicator is generally a generalized feature of every object, process or its result, concept or their properties expressed in numerical form, the evaluation criteria or indicators should also be determined on the basis of the evaluation of the results of the PHP. Thus, the analysis allowed to formulate the following system of criteria for evaluating PHP results and their relevant indicators (Table 1).

Table 1: Criteria for evaluating PHP results and relevant indicators

Criteria	Indicators that ensure the achievement of criteria
Housing affordability for the population	The housing affordability index is the number of years it takes for a median family to raise funds to acquire an average home, given that a person's desire to buy a new home is so great; total and volume of housing per 1000 population;
Residential comfort for the population	level of housing per person; average number of rooms per person; share of the population living in houses equipped with sewerage system; the share of individual housing construction in total housing construction.
Efficient use of budget resources to provide state support in solving housing problems of the population	share of extra-budgetary sources of financing in the total volume of financing of housing construction.

3. PHP PRINCIPLES IN THE REPUBLIC OF AZERBAIJAN

According to the author's methodology, let's estimate the effectiveness of the PHP application in the Republic of Azerbaijan. Let's take the example of the Republic of Azerbaijan and follow the principles of PHP formulated by the author. In my opinion, some principles of the PHP are not fully observed in the Republic of Azerbaijan:

- Division of labour. Thus, due to the commercial use of the state housing fund by the state, housing construction is applied to lease it to citizens. The small-scale construction of such apartments allows to solve the housing problem for a small number of citizens and does not have a serious impact on the rental housing market in the country. At the same time, private investors do not invest in this type of activity, which indicates the low investment attractiveness of rental housing construction. As a result, the task of the state is to create incentives for developers in the construction of rental housing;

- power and responsibility. Thus, this principle is violated in Azerbaijan, for example, when the Cabinet of Ministers of the Republic of Azerbaijan assigns positions to the executive authorities in the field of PHP without their consent, local authorities are responsible for the results obtained. An example is the definition of annual targets for the commissioning of the total area of residential buildings in the regions of the country.
- justice. There are many violations of this principle in the PHP of the Republic of Azerbaijan. Thus, for example, a tax deduction is given to citizens of the Republic only if the property is an apartment, and when renting an apartment, it is not possible to apply a tax deduction for citizens. In the construction of engineering, transport and social infrastructure, the areas of residential buildings are preferred over the areas of property development. Besides, the citizens of our country have the right to receive state support for the construction (purchase) of housing, provided that they belong to the categories defined by law. All interested citizens in the world are provided with state support in solving the housing problem, but only once in a lifetime. The existence of privileged categories of the population entitled to receive state support in the construction (purchase and sale) of housing in the Republic of Azerbaijan leads to an increase in social tensions;
- Purposefulness. Often, the goals and objectives of the Azerbaijan PHP are not provided with financial and other sources. Thus, for example, the task of building infrastructure on the eve of the commissioning of residential buildings can not be provided with existing funding in all areas of residential development;
- scientific. Thus, for example, instructions on the volume of commissioning of residential buildings in the Republic of Azerbaijan by regions are approved by the Cabinet of Ministers of the Republic of Azerbaijan to local authorities without the use of scientific forecasting methods.
- normalization. There is no normative criterion for the effectiveness of PHP application in the country;
- economic and social efficiency. Failure to comply with this principle has led to the fact that today a very large part of the population is in need of improvement of their living conditions. This figure is the result of the increase in various benefits provided to citizens in solving housing problems over the past twenty years;
- freedom of choice. Currently, the process of creating alternative mechanisms for financing the construction and purchase of housing is extremely difficult, as we see a decrease in the volume of preferential lending for housing construction by citizens in the country. For example, mechanisms such as the mortgage and housing savings system have not yet begun to work in the country, although they have proven their value in many countries around the world.
- Promotions and guarantees. The extraordinary social guardianship of the citizens of the republic by the state, the efforts of many citizens to solve their housing problems on their own, while relying on the support of the state, led to the emergence of social dependence among the population. The share of the population's own funds in the total volume of housing construction financing, although declining over the past few years, is still very high.

4. CRITERIA TO EVALUATE THE EFFICIENCY OF PHP IMPLEMENTATION IN THE REPUBLIC OF AZERBAIJAN

To assess the housing affordability for the population of the Republic of Azerbaijan, let us analyze the housing affordability index and the volume of housing per 1,000 population as a whole. Official figures do not indicate that percentage of the population in Azerbaijan needs a new apartment due to poor housing conditions. But, it is no secret that the current situation is not heartwarming.

Observations, other official statistics and international comparisons show that the majority of people, especially the younger and relatively young generation, suffer from homelessness. Although there has been significant progress in 2019 compared to 2000 in terms of the total area of apartments and dwellings per 1,000 population, this is not acceptable (Table 2).

Table 2: Dynamics of key indicators related to housing construction in Azerbaijan

№	Indicators	2000	2005	2010	2015	2018	2019
1	Number of commissioned apartments per 1,000 population	0,7	1,9	2,0	1,7	1,7	8,7
2	Total area of commissioned houses per 1000 population, m ²	61	164	229	203	226	945
3	Total area of residential houses commissioned at the expense of all financial sources, thousand m ²	487	1593	2049	1932	2250	9469

Source: Construction in Azerbaijan. Statistical yearbook. 2020, p.155, 158

Under such conditions, in the last years, on average, there are 200-250 m² of housing per 1,000 people (Table 2). According to official data, currently the living space per capita in Azerbaijan is about 13 m², even in urban areas - 11.5 m². In developed countries, this figure varies from 300 to 600 m². In Russia, this figure is about 20 m² [22, p.41]. While there are only 180 apartments per 1,000 people in Azerbaijan, in developed countries this figure varies in the range of 450-600. A comparison of Azerbaijan with the CIS countries in terms of the number of apartments commissioned per 10,000 population shows that while this figure is 73-78 in Russia and Belarus, it is equal to only 19 apartments in Azerbaijan (Table 3). The lack of supply in the primary housing market is explained by many reasons. The monopoly on housing construction is strong, it is the only area that is subject to double taxation (simplified tax and VAT). An extremely high amount is required for each square meter of construction to allocate land. All this leads to the sale of expensive apartments. After the houses are built, there are problems with their state registration. The unreasonably high cost of construction materials also contributes to the rise in housing prices.

Table 3: Comparison of Azerbaijan with the CIS countries in terms of the number of apartments commissioned per 10,000 population

Countries	2005	2010	2013	2014	2015	2016	2017	2018
Azerbaijan	19	20	23	19	17	15	16	17
Armenia	5	11	7	5	7	4	5	6
Belarus	44	89	67	73	59	52	46	49
Kazakhstan	29	34	34	37	45	50	56	62
Kyrgyzstan	10	14	16	17	21	20	25	20
Moldova	11	14	16	15	21	22	34	27
Russia	36	50	65	78	...	80	78	73
Tajikistan	12	25	17	18	17	15	14	13
Uzbekistan	21	25	28	...	27	26	29	33
Ukraine	16	17	23	25	28	26	30	24

Source: Construction in Azerbaijan. Statistical yearbook. Baku, 2020, p. 266.

Mortgage loans offered to help citizens are also unsuitable for most people due to their high interest rates. Given the above, there is a great need for serious reforms in this field, the implementation of certain concrete measures at the state level.

One of the reasons for the low supply of housing in Azerbaijan is the low solvency of the population. Thus, the subsistence level in Azerbaijan in 2021 amounted to 196 AZN, which is 3.1 percent more than in 2020. For comparison, in 2021 the cost of living for the able-bodied population will be 207 AZN, for pensioners - 162 AZN, for children - 175 AZN [23]. According to some experts, the solution to the housing problem in Azerbaijan should be found only by the citizens themselves in accordance with the requirements of the market system, and they try to justify it with the existing facts in this field in market economies. However, the reality is that the incomes of the population of these self-sufficient countries are much higher than the incomes of Azerbaijani citizens. For example, in order to buy an apartment, it is enough to collect a salary for 4-6 years in Western European countries and Turkey, 2.7 years in the United States, 3.5 years in the Dominican Republic, and 4 years in Chile [24, p.145]. Honored Economist of the Republic of Azerbaijan, Professor T.H. Huseynov, in his monograph "Azerbaijan's national economic development model: theory and practice" published in 2015, rightly considers self-sufficiency as a basic principle of a market economy and shows that although the problem is solved individually for every country, all countries that have chosen a model of socially oriented economic development have given priority to public assistance in solving the housing problem. Thus, the practice of the state building houses and renting apartments to citizens is widespread in most countries. Rent is calculated not on the basis of market prices, but on the basis of the cost of housing and inflation. After paying the rent determined in this way during the lease period, the citizen becomes the owner of the apartment. Thus, the state creates a social housing fund, develops and implements housing leasing or rental programs. In most market economies, social housing is created at the expense of the state and made available to the population on favorable terms. As an example, there is a practice of providing housing subsidies to low-income families in Great Britain [24, p.145]. In 2018, the level of self-sufficiency of the Azerbaijani population, with a minimum wage of 130 AZN, a subsistence level of 173 AZN and a need criterion of 130 AZN, it does not seem realistic that it will soon reach the level of developed market economies. It should be noted that at the beginning of 2020, only 13 square meters of housing per capita fell in Azerbaijan, which is far behind European standards, as well as other countries. According to experts, the average selling price of an apartment in Baku through the mortgage line reaches 80,000 manat, but the purchasing power of the population does not exceed 45,000-50,000 manat [24, p.146]. Despite the large gap between the incomes of the population, the cost of one square meter of housing in Baku is 30 percent higher than in Prague and is about the same as in Berlin.

5. CONCLUSION

The author's principles of the PHP can be used by public authorities to more rationally define the author's indicators and appropriate criteria for assessing the strategy for the selection of public housing policy instruments and the effectiveness of the PHP implementation. PHP will allow to analyze the dynamics of the results and make cross-country comparisons.

THE SOCIO-ECONOMIC PROBLEMS OF INVOLVING FOREIGN INVESTMENT TO THE NON-OIL SECTOR

Eyvazov Elchin Tahmaz

Azerbaijan State University of Economics (UNEC)

Baku, Istiqlaliyyat str.6, AZ1001, Azerbaijan

unec.iqtisad030@gmail.com

ABSTRACT

At the article, it is investigated and evaluated the socio-economic problems of attracting international investment in the non-oil sector of the Azerbaijan's economy and gave relevant recommendations on how to eliminate them. Among the many issues currently considered by world economic theory, the problem of foreign investment is one of the most pressing, because the attraction of foreign investment, especially foreign direct investment (FDI) can play a key role in the structural and technical restructuring of the economy. Foreign investment in the country plays an extremely important role in economic development. It is known from world experience that the main goal of countries is to support the production of competitive export-oriented products in the market. In this regard, there is a need to attract financial resources to ensure competitiveness. In this regard, it is necessary to study foreign direct investment in terms of ensuring sustainable economic development as the main source of economic growth. FDI affects economic competitiveness. In order to clarify the nature of the problem in more detail, the motives and mechanisms for attracting foreign direct investment, as well as the reasons for foreign investment, are substantiated. The main purpose of the search is to stimulate the growth of exports to the non-oil sector and identify new sources of foreign investment in the context of improving the attraction of foreign investment in the non-oil sector of the economy and increasing their socio-economic efficiency. The research used the methodology of a systematic approach, methods of analysis, comparison and generalization. The article analyzes theoretical and practical approaches to the main theoretical and methodological principles of FDI research, substantiates the role of placement factors in attracting foreign investment in the context of globalization, and evaluates the impact of foreign investment on the economy of host countries and foreign investment policy. The scientific novelty of the research is to conduct comparative analysis with other countries in the field of attracting foreign investment to Azerbaijan, to develop relevant proposals to improve the attraction of foreign investment in the non-oil sector of the economy.

Keywords: *non-oil sector, foreign investment, foreign direct investment (FDI), export stimulation, competition*

1. INTRODUCTION

The deepening international integration, as well as the increasing of economic cooperation between the countries leads to an increase in the role of external factors in the system of economic growth factors. Foreign investment also plays an important role among these factors. At present, it is difficult to find a state that does not attract or use foreign investment. It is important to increase investment in order to achieve economic growth and ensure competitiveness in all sectors of the economy. At present, due to the limited investment opportunities of Azerbaijan, there is a need to attract foreign investment in various forms and in large quantities. Therefore, it is very important to attract these investments, use them correct and rationally, as well as get the maximum benefit from their use. The investment concept has a broad content and structure. Private foreign investment, like investment in general, can be classified according to various criteria. However, the most common is the following classification: Private foreign investment 1) Foreign direct investment (hereinafter FDI) 2)

Portfolio foreign investments 3) divided into other foreign investments. A foreign direct investment is any investment made by a direct investor who owns the entity or controls at least 10% of the shares or stakes in the entity's authorized capital and has the right to manage it, and the degree of control varies from country to country. Thus, the US is a direct investment when the investor has at least 10%, in Japan - 25%, in the EU - 20-25%, in Australia, Canada - 50%. [1, p. 2] FDI investment is control, not profit. The portfolio foreign investments is an investment in foreign securities and other financial assets that do not give the investor to real control over the investment object. These are often called "passive" because the investor does not try to manage the enterprise in which the investment is made, but only aims to make a profit commensurate with the share earned, which in international practice generally does not exceed 10%. Other investments include trade and other loans, foreign loans, bank deposits. At present, more attention is paid to the issue of foreign investment, both foreign and internationally. Economists believe that foreign investment is an important element of economic development in all countries, especially in developing countries. From a macroeconomic point of view, they are often seen as the creators of employment, high productivity, competitiveness and technological flows. For the least developed countries, foreign direct investment means higher exports, access to international financial markets and international currencies, which is an important source of funding.

2. BASIC THEORETICAL-METHODOLOGICAL PRINCIPLES OF FDI RESEARCH

Foreign investors can make foreign direct investments in the Republic of Azerbaijan in the following ways: [3]

- 1) Participation in enterprise and organizations established jointly with legal entities and citizens of the Republic of Azerbaijan;
- 2) Establishment of enterprises wholly owned by foreign investors;
- 3) Acquisition of enterprises, property complexes, buildings, facilities, participation shares, stocks, bonds and other securities, as well as other property that may belong to foreign investors in accordance with the legislation of the Republic of Azerbaijan;
- 4) The right to land and other natural resources, as well as other property rights;
- 5) To sign agreements with legal entities and citizens of the Republic of Azerbaijan providing for other forms of foreign investment.

Investment is an important factor in ensuring both the broad and narrow aspects of the country's economic competitiveness. Foreign direct investment impacts economic competitiveness in two ways. First, if domestic savings are not enough to finance economic development, such investments are a means to generate significant foreign exchange earnings that help eliminate the deficit. Second, the existence of foreign companies is a positive factor in the national economy. The great role of the government in the economies of countries such as Azerbaijan is to emphasize the role of foreign direct investment in promoting sustainable economic development. By the sense, these are the main innovative priorities observed in the country's investment policy in modern times:

- Implementation of investment policy for stable development.
- Integration of investment policy into development strategy.
- Ensuring the consistency and effectiveness of investment policy.

The importance of foreign investment for host countries depends on the situation of the host country. In some cases, while seen as the ultimate goal of economic efficiency, it poses a threat to national sovereignty and other negative consequences.

Historically, disagreements over foreign investment have been more widespread than other investment flows. This is due to the fact that foreign direct investment is managed by host countries under the control of large multinational companies (TNCs).

3. FOREIGN INVESTMENT IN THE FRAMEWORK OF GLOBALISATION: TRANSITION FACTORS

Globalisation is the integration of national economies into single global system. Globalisation in the economy is often referred to as the "post-global market economy" and the managed "global market." F. Braudel understood the capital accumulation all over the world under the "world economy". According to Manuel Castells, the global economy is an economy that can function as a single system in real time on a global scale. Globalisation manifests itself in all major processes and elements of the economic system. For the first time in history, ongoing financial management in global financial markets is carried out in real time. New technology allows investment to move from one economy to another in a short time. The economies of different countries, as well as investment and currency, are interconnected, interdependent and global. Thus, globalisation means the transformation of the world economy into a single market for goods, services, labor, investment and knowledge. This is a new and higher level of internationalization. The world is becoming a single market for TNCs and is open to the activities of all countries. In the economic literature, they are sometimes called borderless states. At present, their main goal is to maximize the market rather than increase profits. Because if their main goal is to increase profits, then they will lose to other companies in the competition. Globalisation transfers international competition to domestic markets. Although economic and social changes in every country occur under the influence of internal socio-economic forces and processes, the causes, nature and prospects of development of these transformations, it is not enough to analyze only from the internal prism of these countries, because it can lead to erroneous results and the modern nature and scale of the exchange require that the processes in individual countries be considered in terms of their participation and adaptation to the international financial and economic environment. There are various factors for the export and import of foreign investment. Many research led by UN economic agencies show that there are more specific reasons for the export and import of foreign investment, but their relative roles are different [5, p. 191]. It seems that some factors that identify the export and import of foreign investment do not coincide. For example, technological leadership, the level of qualification of employees, the advantage in advertising and the large of the enterprise act as both export and import factors. [6, p. 131] The size of the economy, the high degree of centralization of production and the need for natural resources are the only export factors of foreign investment. Other factors such as the need for investment, low production costs and the large size of the domestic market are the only reasons for imports. When attracting foreign investment, the conditions in the host country are important. Conventionally, these can be called the factors of the country in which they are located. All transition factors in the country form the investment atmosphere. The investment environment is a set of political, socio-economic and other conditions that are specific to a particular area at a given time and constitute the opportunities and attractiveness of investment activities. Political factors. The focus of foreign direct investment is primarily on the economic and political stability of the country. FDI has an element of risk. Countries with uncertain political situation will be a major disincentive. Also, economic crisis can discourage investment. For example, the recent economic crisis, combined with economic sanctions, will be a major factor to discourage foreign investment. This is one of the reasons why former Communist countries are keen to join the European Union. The EU is seen as a signal of political and economic stability, which encourages foreign investment. Related to political stability is the level of corruption and trust in institutions, especially judiciary and the extent of law and order.

Economic factors are the effective among the groups of factors. The most important economic factor for foreign investment in the host country is the size of the market. Exchange rate stability is also an important factor in involving foreign investment. The trading capacity of every foreign direct investment is based on exchange rate stability. This means that the value of the national currency should not fall abnormally, in which case the foreign investor will lose a lot in the return of funds. The factors that involve foreign investment are often a number of factors, not some of the above. Therefore, in order to involve foreign direct investment, the country must take into account all the placement factors and combine them to develop an appropriate foreign policy. The government must adopt flexible policies to allow foreign direct investment in all field. Based on the results of various research and different investment ratings, the following advantages of the Azerbaijani economy can be noted.

- Favorable geographical position at the intersection of international transit routes;
- Azerbaijan has a developed international transport network (air, water, rail and road, oil and gas pipelines). This facilitates the establishment of close ties with foreign partners;
- Adequate domestic market. In most cases, there is no competition for local goods and services. The need for technical modernization of production and infrastructure.
- A very important indicator is the significant resource potential (especially oil).
- Macroeconomic stability, public debt in Azerbaijan is relatively low. Despite falling oil prices, the foreign trade balance was positive at the end of last year.
- Relatively low production cost, skilled and relatively cheap labor.
- Relatively low price of buildings and structures, as well as land.
- Ability to organize the export of goods produced by Azerbaijani enterprises using Western technologies on the basis of low production costs using the sales networks of foreign partners.
- Bilateral investment agreements. Azerbaijan has signed bilateral investment protection agreements with China, France, Georgia, Germany, Britain, Iran, Italy, Kazakhstan, Kyrgyzstan, Pakistan, Poland, Turkey, Ukraine, the United States and Uzbekistan. For some investors, these bilateral agreements can be a guarantee of a reliable investment atmosphere and attract them.
- Interstate economic agreements with leading countries of the world, accession to international treaties and agreements, inclusion of Azerbaijan in international and regional economic organizations, etc. Azerbaijan's policy of "friendship" with other countries and very favorable conditions for foreign investors can also be noted. It is necessary to use these advantages of our country to accelerate the attraction of foreign investment and remove barriers to business development.

In addition to the benefits, there are also negative factors. These are associated with both external factors - the unresolved issue of Nagorno-Karabakh, as well as domestic - high inflation in recent years, the reduction of state budget expenditures. High crime rates, low security levels and bureaucratic hurdles are also negative factors. One of the important negative factors is the low level of economic diversification, dependence on the oil sector, the insufficient level of development of the non-oil sector and therefore, all foreign investment in the country is directed to the oil sector.

4. THE IMPACT OF FOREIGN INVESTMENT ON THE ECONOMY OF HOST COUNTRIES AND THE STATE'S FOREIGN INVESTMENT POLICY

Different forms of international investment inflows have different effects on the country's economy. The impact of foreign investment on the economies of developing countries and economies in transition can be both positive and negative. Foreign investment plays an important role in promoting economic growth in direct host countries and can indirectly

contribute to external balance through infrastructure development, diversification of domestic consumption, offering a broad range of products and increasing employment. Foreign investment is currently the main and real source of economic reconstruction and modernization of production. Most countries recognize the potential value of foreign direct investment and liberalize investment regimes to involve it. There are elements of the potential benefits of FDI to the host country: [7, p. 197]

- 1) Foreign investment is the main source of capital. Countries that invest in more long-term projects, they facilitate the flow of capital to host countries without debt to pay them off. In addition, many TNCs have financial resources that firms in their home countries cannot access due to their financial stability. These funds can be obtained from the company's internal sources, or large TNCs, due to their reputation, can more easily borrow from the capital markets than the owners of local firms.
- 2) Foreign investment contributes to the flow of advanced technologies, (SREDW) Scientific-Research and Experimental-Design Work results embodied in new technology, licenses, patents, know-how. Evidence suggests that the vast majority of economic studies examining the link between foreign investment on the one hand and productivity or growth on the other have had a positive effect on productivity and growth in most host countries through technology transfer through foreign investment.
- 3) Foreign investment increases the country's competitiveness. Thus, TNCs, which use high-tech production, experience and knowledge, produce high-quality products, while local firms are forced to compete with foreign firms to survive, resulting in improved product quality and therefore increased competitiveness. Small or inefficient local firms that cannot compete with the quality of large TNCs are forced to contract or leave the industry altogether. This leads to progress in the whole sphere.
- 4) FDI also increases productivity in the field. The performance advantage of TMKs also extends to local firms, as they will continue to increase productivity to compete with high-tech TNCs in order to maintain competitiveness and position in the market.
- 5) Foreign investment plays a vital role in increasing the export potential of host countries, import substitution and their integration into the world economic system. In the process of attracting foreign investment, the economy is improved by the application of new technologies, the achievements of SREDW and their application to local production, and foreign investment also leads to an increase in the quality of products. As local products become more technologically advanced and competitive, the country can enter the world market with its products and increase its share of exports.
- 6) Foreign investment provides the accumulation of organizational and management skills, the entrepreneurial ability of brands and market access. FDI also promotes the dissemination of best corporate governance practices, accounting rules and legal traditions. Foreign investment increases the information base available in the host country through the transfer of knowledge, job training, management and organizational skills transfer. Foreign management skills acquired through foreign investment can be very useful for host countries.
- 7) Foreign investment helps to increase employment in the host country, increase the skills of local workers and create conditions for the development of human capital. Foreign investment helps create additional jobs. It is also possible to create additional jobs in new local industries that support new market participants and provide material. Aaron (1999), in his study on the dependence of employment on foreign investment, claims that foreign investment is directly responsible for 26 million jobs in the developing world. In addition, 1.6 additional jobs were created indirectly for each individual job created by the FDI through production relations between the FDI and the local sector.

- 8) Foreign investment helps to improve the balance of payments and increase tax revenues, which allows the state to finance various programs.
- 9) The presence of TNCs in the local market helps to increase confidence in the country, which can involve new foreign investors.

The relations between foreign TNCs and host countries changes greatly between countries and regions. The inflow of foreign investment leads to the transfer of technology and at the same time stimulates the efficiency of delivery to local firms. This creates conditions for more efficient use of available resources. Of course, the effectiveness of technology is always taken into account. This helps to increase competition in the host country.

5. WAYS TO IMPROVE FOREIGN INVESTMENT IN THE NON-OIL SECTOR OF THE COUNTRY'S ECONOMY

In addition to the positive effects of involving foreign investment, there may be disadvantages. [6, p. 197]

- 1) deterioration of payments balance of the host country, redistribution of capital and the return of the bulk of income in various forms (dividends, rate, etc.).
- 2) economic, social and financial dependence can ultimately lead to political dependence on the homeland.
- 3) Although increased competition helps to increase the country's competitiveness in general, it leads to the displacement of weak local producers and they leave the sphere because they cannot withstand strong TNCs. In this situation, the state should support local producers so that they can support competition by TNC.
- 4) Inefficient use of natural resources, partial use of natural resources, large losses and damage to resource renewal mechanisms, as TNCs are not interested in their protection.
- 5) dependence of economic indicators on the activities of TNCs and, as a result, restrictions on the state's independent economic policy.
- 6) Environmental impact. Many TNCs relocate waste production to host countries because it is more profitable than using expensive wastewater treatment plants in their home countries. Because indifference has catastrophic consequences in many parts of the world, local environmental legislation must pay due attention to foreign investors.

The disadvantages of foreign investment in Azerbaijan are as follows: [8, p. 332]

- increase external public debt,
- Focusing FDI on raw material-oriented production and the fast-growing service sector.
- very low share of foreign investment in the country's manufacturing industry,
- practically no foreign investment in other regions as a result of gathering everyone in the Absheron region.

Public policy in the field of foreign investment is a single set of interrelated goals that ensure the level and structure of investment required for various sectors and spheres of the country's economy and increase investment activity. [2, p. 316] In fact, only a liberal or only centralized development of the FDI process is not possible. Foreign investment policy uses elements of both liberal and centralized government policy. Government policies to involve foreign investment change depending on the economic impact of these two policy elements. For example, if the economy is recovering, there is no need to use elements of a centralized system. Otherwise, investment activities need to be stimulated, especially during the crisis. The investment policy of the state consists of two parts: regulation and stimulation [9, p. s. 19]. The regulatory system ensures maximum return for each unit of capital.

One of the main conditions for involving foreign investment is the creation of a legal framework for the operation of foreign capital, ie the adoption of relevant laws, regulations and decrees. The legal regime of foreign investment in Azerbaijan is formalized at 4 levels:

- at the level of laws - in the constitution
- at the level of bilateral and multilateral interstate agreements - at the level of international multilateral agreements On January 15, 1992, the Law of the Republic of Azerbaijan "On protection of foreign investments" was adopted, which provides state guarantees for protection of foreign investments. Amended and supplemented on November 7, 1992, and November 5, 1996, the law provided state guarantees for foreign investment in matters of change of laws, nationalization, compensation, transfer and use of profits. [3]

On January 13, 1995, the Law of the Republic of Azerbaijan "On Investment Activity" was adopted, which was amended and re-adopted on April 19, 2005. This law provides effective guarantees for the flow of foreign investment into the country's economy, the development of international cooperation and independence. One of the advantages of the Law on Investment Activity is the tax exemption for foreign entrepreneurs who bring agricultural technology to the country for production or service purposes. This is a major factor in the creation of integrated production and service fields, which will be reflected in the creation of future free economic zones. Thus, the entry into force of this law facilitated the inflow of foreign investment to the regions [10]. The inflow of foreign investment into the Azerbaijani economy began in 1994. In total, between 1994 and 2019, foreign companies invested more than \$ 200 billion. 77.2% of foreign investments were made at the expense of FDI and 22.8% at the expense of loans. 73% of foreign investments were directed to the oil industry. Taking into account the distribution of the share of countries in investment between 1994 and 2019, it should be noted that the United States and the United Kingdom accounted for 25% of foreign investment. Turkey is in third place. According to the SSC of the Republic of Azerbaijan, in 2019, the total foreign investment in the country's economy amounted to 7129.1 million manat, of which 4275.3 million manat or 60% are foreign direct investment. 78.2% (3345.2 million manat) of foreign direct investments were directed to the development of the oil sector, 21.8% (930.1 million manat) to the development of the non-oil sector. It can be said that the absolute and relative indicators of investment in the non-oil sector of the country are very low. Given the importance of the non-oil sector, all available economic tools should be used to involve foreign direct investment to this sector. Therefore, in order to involve foreign direct investment to the oil sector of the economy, appropriate government measures are required to stimulate foreign direct investment. At the current stage of development, one of the main tasks of the national economy is to increase foreign direct investment and qualitatively change their structure. This means, first of all, direct foreign investment in the non-oil sector. Such fields are the production of consumer goods and services. It is observed positive changes in this direction. It is important to note that the share of foreign investment from Turkey has increased since 2014. It ranks first among the CIS countries in terms of per capita foreign investment. Thus, foreign investment has played a key role in the economic revival of Azerbaijan. Economic development as a result of foreign investment has been supported by extremely high investment in the oil sector [8, p. 327]. Economic policy to create a favorable investment atmosphere includes: a) identification of potential sources of investment - foreign sources (foreign investment and financial assistance) b) formation of market entities capable of effective investment c) formation of a stable economic environment (assistance in attracting funds from the population, their investment) investments, reduction of inflation, its restriction, antitrust policy) d) tax incentives, tax strikes, income tax benefits for foreign companies, facilitation of lease relations, discounts on activities related to SREDW, etc.) financial incentives, reimbursement of part of expenses Provision of state subsidies, loans, credit guarantees with certain benefits, benefits for state insurance.

The experience of recent years, the analysis of the existing economic literature shows that the purposeful activities of the state to increase investment attractiveness are as follows:

- Ensuring intensive control over the search for foreign direct investment for the development of various forms of ownership;
- ensuring the activities of foreign direct investment in priority fields within the country;
- Strengthening state control over the targeted use of FDI funds;
- further improvement of the legal and regulatory framework to increase the attractiveness of foreign capital;
- preparation of measures to resist the economic crisis and other possible negative consequences of the FDI in the country's economy. This includes. a) protection of property rights and improvement of corporate governance; b) improving business information support;
- to achieve a sharp increase in the volume of foreign investment in the non-oil sector by all sources, provided that the total volume of foreign investment does not decrease;
- To achieve the expectations of the economic interests of economic entities producing export-oriented industrial products in the field of investment and distribution of goods to ensure the economic security of Azerbaijan in strategic directions.

6. CONCLUSION

Summarizing the above in the framework of state-funded scientific research, we can put the following conclusions:

- 1) The main principles to be considered when determining national and international investment policies aimed at ensuring the export potential of the competitive environment in the country are: investment in stable development, strategic compliance, constructive dynamic policy, balancing rights and obligations, openness to foreign investment.
- 2) Reasons for importing foreign investment include: technological leadership, specialization in the workforce; excellence in advertising; the scale of the economy; the size of the enterprise; providing access to natural resources, etc.
- 3) The advantages of Azerbaijan in attracting foreign investment are: favorable geographical location at the crossroads of international transit routes, significant resource potential, cheap and high-quality labor, bilateral investment agreements, a sufficient domestic market, a developed transport network.
- 4) Azerbaijan's advantages in involving foreign investment include a favorable geographical position at the crossroads of international transit routes, significant resource potential, cheap and high-quality labor, bilateral investment agreements, a sufficient domestic market, and a developed transport network.
- 5) Stimulate the involving of export-oriented foreign direct investment in accordance with the priorities for the development of the non-oil sector and, as a result, increase the volume of exports of the non-oil industry and ensure access to new markets. It is necessary to achieve this goal: to identify and allocate priority areas for involving foreign investment, to continuously improve the business and investment climate in the country, to establish government mechanisms to support local exporters, to simplify foreign trade procedures to promote non-oil exports.
- 6) It is proposed to take the following steps to successfully involve foreign investment to the country:
 - Selection and justification of suitable industries, companies and investors for the non-oil sector of the country with investment potential.
 - Effective placement of investments and assistance to foreign investors.
 - Organization of an international conference on "Opportunities to attract foreign investment in the non-oil sector."

- Development of a global website with downloadable e-books and development of investor control systems.
 - Development of international logistics programs. Launch of international campaigns through social media and search engines.
 - Organizing and promoting seminars and presentations for business associations and embassies that promote commercial missions to potential investors.
- 7) In many cases, when developing a government program to attract foreign direct investment to the non-oil sector, the main priority is government programs for individual sectors of the non-oil sector of the economy. This approach to problem solving cannot be considered correct. Therefore, we believe that a systematic approach to solving the problem of attracting foreign direct investment in the non-oil sector, as well as to ensure the balance of development of all oil sectors of the economy. There is a need for scientific and practical research to develop investment projects to increase the efficiency of the use of funds invested in non-oil sectors of the economy. It should be noted that the preferences given to foreign direct investors, first of all, imply the requirements determined by technological, environmental, production and other conditions. When setting these conditions, it is necessary to study the conditions for investing in competitive countries. This compliance is achieved through the conclusion of agreements on taxation and other conditions.

FACING CHALLENGES IN AN OMNICHANNEL WORLD

Riyad Aliyev

ABSTRACT

American Marketing Association's first ever intellectual agenda has identified seven big problems that all marketing community currently confront in the modern world. Jaworski, Malcolm & Morgan pointed out "the AMA's intellectual agenda seeks to serve as a big tent source of guidance and inspiration that includes both theoretical and applied knowledge that will ultimately provide actionable insights, frameworks, tools, and resources for the AMA community". The fifth problem listed by the agenda is dealing with an omni-channel world. As the emergence of digital media omni-channel has become a priority for marketers. Haukingham (2017) claims that a customer using several different channels buys up to 30% more compared to a mono-channel customer. Nowadays, the marketing industry not only understands the advantages of the omni-channel marketing but is confronting a compulsion from customers to be omni-channel as a standard. Despite the importance of omni-channel strategy to marketers, delivering a seamless customer experience across multiple channels is a complex, multi-faced challenge for them. Implementing a successful omni-channel strategy requires adjusting management methods as well as management itself otherwise it can end up a huge amount of loss. According to a study conducted by IWorldSync (2017) "45 percent of merchants and suppliers have lost more than \$1 million in revenue due to cross-channel commerce challenges, and more than one in ten have lost more than \$3 million". Therefore, in order to overcome challenges and be successful in the omni-channel world, marketers need to be more careful while implementing the strategy.

Keywords: *omnichannel marketing, marketing strategy, marketing, omni-channel*

1. INTRODUCTION

In the current world, the emergence of the internet which brought connectivity and transparency has led to drastic changes in the power structure. As every aspect of life, the marketing community has been affected by the power shifts, and so, old theories and practices start to be challenged by new ones. One of the new strategies is omni-channel marketing. Rigby, the first person originated the term, defined omnichannel as the integration of all available channels for making customer shopping experience seamless. These channels could be physical stores, websites, kiosks, direct mail and catalogs, social media, call centers, mobile devices, televisions, gaming consoles, home services, networked appliances and more (As cited in Singh, 2017). In other words, since companies have started to compete in global marketplaces which have been changed by new technology, companies need to reach the customers wherever they are, on whatever device they may use, in whatever way they wish to purchase. Mosquera, Pascual & Ayensa added that advances in information technology and communication have caused an increase in a number of retailing formats such that consumers get in touch with companies during the customer path (2017). Moreover, in spite of the fact that omni-channel, multi-channel, and cross-channel are used interchangeably in some literature, omni-channel should not be confused with multi- or cross-channel. According to Piotrowicz & Cuthbertson (2014), while multi-channel means using different channels that work independently, "in an omni-channel environment, the channels work together, such that customers can use digital channels for research and experience the physical store in a single transaction process". While interacting the companies at any time, customers suppose to have a similar brand experience as

the channels are managed together (As cited in Mosquera, et al., 2017). Dorman added that in a multi-channel business model, each channel is functioning separately to reach different segments of customers (2013). Nonetheless, “cross-channel retailing is the set of activities involved in selling merchandise or service through more than one channel or all channel widespread at the same time but with a partial interaction with the customers and/or a partial integration controlled by the retailer” (Simone, Sabbadin, 2017). Shortly, the main factor that differentiates omni-channel from multi- or cross-channel is that in omni-channel strategy different channels are used through one purchasing process. For instance, one channel used to obtain pre-purchase information, another channel for sales fulfillment and yet another channel for post-purchase service (Valos, 2009). The review excluded sources about optimization of the physical channel and advanced payment systems and focused only on changes in channel management and threats of channel integration. In addition, the scope of the review was to find the answer to the question: what are the new challenges in implementing the omni-channel retailing? The rapid development of the e-commerce industry has a significant impact on traditional retailers in terms of moving into the online market. Namely, “retailers and e-tailers are facing pressure to adapt since a strategy focusing on a single channel may no longer be sufficient to attract the demanding customers of the 21st century” (A Deloitte Point of View, 2015). Nevertheless, omni-channel marketing is harder than it may seem. Hence, omni-channel retailing requires to consider new risk management techniques including reconfiguring internal processes to provide new services previously not required. Valos (2009) spoke up for the idea that omni-channel marketing creates some challenges that include “the internal politics when the role of a traditional channel is reduced or modified, understanding synergies when multiple channels provide complementary roles, and balancing effective and efficient performance measures”. Consequently, when the retailers decide to implement an omni-channel marketing, they ought to consider the new development requires an adjustment in the functional and operational management. Since achieving success in omni-channel marketing relies on the capability to design and implement an intensive strategy for how to be present in the channels that customers desire, both now and later, management needs to invest significant time in planning before executing. If they establish independent and disintegrated channels, it is hard to go forward (A Deloitte Point of View, 2015). Secondly, while talking about integration threats, channel cannibalization can be an important concern for retailers who are trying to advance the integration among their channels according to some researchers. Thus, some retailers are still reluctant to implement omni-channel marketing due to the cannibalization threat. According to Webb (2002), “they believe that this kind of strategy would move their customers from their current channel into the new one and thereby cannibalize the sales instead of increasing total sales” (As cited in Simone& Sabbadin, 2018). After all, despite the fact that omni-channel marketing is a new trend in the marketing industry, dealing with an omni-channel world has certain challenges such as managing the channels and channel cannibalization. The purpose of the review was to find an answer to the question what are the new challenges in implementing the omni-channel retailing? Conclusion driven from the review was that managing channels and cannibalization threat are the factors that have to be considered before implementing omni-channel marketing strategy. Namely, managing channels correctly is sometimes challenging for companies as it requires precise efforts and more time. Furthermore, integrating channels may lead to cannibalization which dismantles the sales rather than growing total sales. Consequently, managers have to be more careful while integrating channels and implementing omni-channel since a small mistake can result in huge issues. The result was contributed and explored deeply in the research project.

2. DISCUSSION

Nowadays, consumers on average seamlessly move between the physical and digital worlds. For example, a consumer may search a product online and then go to a store to test it. After comparing different prices online, he or she finally purchase the product. From the example, it is shown that both digital and physical spaces are involved in purchasing experience as they blur more closely together. The reason why an omni-channel marketing approach is so powerful is that consumers engage with brands in an omnichannel manner, and this trend increases day-by-day. Therefore, brands need to adjust their strategies to readily deliver the right message to the right person at the right time. Brennan asserted “the brands who are able to make this transition effectively, and provide the contextually relevant experiences consumers expect, are the ones that will thrive in the long term” (2018). Nevertheless, it is not an easy task to build and implement a strong omni-channel marketing strategy. According to the report by Brightpearl (2018), despite the fact that 9/10 retailers and brands currently possess or are planning to have an omni-channel strategy, only 0.8 out of 10 believe they succeed in omni-channel. These numbers show that most brands fail to be successful in the omni-channel world, and most commonly there are two reasons behind the failure: failure to integrate sales channels and failure to manage out-of-stocks and share inventory visibility. First of all, one of the most common missteps taken by retailers is to treat each channel separately instead of integrating sales channel into one omni-channel platform. Consequently, brands have to manage these independent channels with their own supply chain and inventory allocation processes. In addition, as each channel is designed separately, they are unable to easily communicate with each other which lead to dissatisfaction of consumers. According to a study conducted by Forrester, half of the customers suppose that they will be able to buy online and get in-store (Miller, 2014) which would not be possible in separate sale channels. The second failure scenario is that if a customer searches a product online and then visits the store to purchase where are told that online inventories are available, but in-store stocks have been cleared, or other way around. “27% of consumers would be very likely to leave and visit another retailer’s store if a product is out of stock” as reported by Miller (2014). The example indicates a lost opportunity for the brand. Also, except lost revenue, it means the loss of a potentially loyal customer which nowadays is a company’s most valuable asset. To overcome these challenges and achieve to execute strong omni-channel marketing strategy there are a few steps that brands should consider. Jordano suggested, “developing a strategy to optimize customer and prospect engagement at every touch point, targeting the right audience at the right time with relevant content and accurately determine what target markets will best react to your messaging are the tips and best practices for implementing an effective omni-channel strategy” (n.d.). Furthermore, integrating sales channels completely, understanding individual consumer preferences deeply, providing consumers with real-time updates on availability of a particular product are some of the tactics that should be considered by brands to be successful in the omni-channel world. After all, omni-channel marketing provides a seamless experience in the path to purchase as customers jump from one channel to another; therefore, if all these techniques are implemented correctly, it will eventually end up with driving up productivity especially increasing commitment. In conclusion, in the modern digital era, omni-channel marketing which means providing an integrated online/offline experience for customers regardless of touch points has become key to marketing success. However, companies face challenges in executing effective omni-channel strategy such as integrating sales channels and managing out-of-stocks and sharing inventory visibility. Therefore, brands should use certain techniques to overcome the obstacles including, integrating sales channels completely, understanding individual consumer preferences deeply and so on. The successful omni-channel marketing will lead to increases in productivity specifically higher commitment.

3. LEARNING OMNICHANNEL MARKETING FROM OASIS

In today's world, consumers suppose much more from their shopping experiences than ever before. For example, they want to be able to search a product on mobile, order it on their computer during lunch break, and finish it off at a physical store. Therefore, the customer path to purchase must be seamlessly integrated between online and offline experiences. In short, the goal of omnichannel retail is to make sure that consumers achieve a sale regardless of what channels are used. When we talk about the integrated channel that provides shoppers a seamless experience across online and offline channels, Oasis British fashion retailer, one of the best example of an omni-channel retailing company, comes to the mind first. Oasis started to operate in 1991. It has approximately 500 stores in the UK and other 26 countries including Europe, Scandinavia, the Far East, Middle East, Mediterranean and South America plus an e-commerce website, app and around 80 standalone stores, 200 concessions within other department stores. In 2011, the company introduced an investment program worth £7m to renovate its brand image and increase market share through the integration of all its retail channels. Oasis could successfully implement the omni-channel retail concept and therefore, was verified as one of the top omni-channel performers globally in 2011. The key factor lying behind the success is channel management. Namely, as the retail industry has a high BAR median but narrow BAR range, success is often determined by channel proximity and accessibility to key markets. Correspondingly, driving customers to its sales channels through traditional and digital media has helped Oasis to become a leading example in the industry. One of the key factors to be successful in the omni-channel world is an effective and efficient use of digital media. Hence, use website, social media, and mobile application has helped Oasis success in implement omni-channel retailing. First of all, the company has certainly all image-led social media accounts on Instagram, Facebook, and Pinterest. With the use of social media, Oasis promotes exploration of their website. Even though the company does not include a direct "like2buy" link on their social media accounts, each product code for an item is provided to the customers in the description of the posted image which leads straight to the item when customer paste the code into the online store search bar. Thus, this strategy increases people's awareness of the brand, and they become familiar closely. Secondly, instead of just saying "we offer a personal shopping service", Oasis makes the customers feel improved user experience in their website by separating out their personal shopping section of their site into occasions and allocating them each a time. Customers can find enhanced delivery options on the website including nominated day delivery, next day and evening delivery and so on. Overall, the website's contemporary design and innovation deliver modern customer experience and create a seamless customer journey. Correspondingly, this is very appealing to the customers and can easily grab their attention. Additionally, customers can install the company's mobile application as a supplement to their online or in-store shopping experiences. In short, digital marketing especially the new website, social media, and mobile app have helped Oasis to become a leading example in omni-channel marketing. Using innovative ways that motivate purchase decision and facilitate customer path is another factor. This includes fully customized service, using advanced technology in stores, and easy returning. Firstly, in Oasis' 15 stores across the UK costumers are able to book an appointment with professional stylists. That helps the company to strength customers' online and in-store connection further and adds value to customers as it enables them to pick the exact occasion for their personal shopping experience. Moreover, customers can book these appointments online which is very comfortable. Therefore, a customer can ask whatever they want, and the professional will direct and link them to the brand. Next, Oasis make sure all sales assistants have been given iPads that provides most up-to-date stock information. That is why if a product is out of stock salesperson does not simply leave the customer unsatisfied, he or she can immediately make an online order directly to customer's home, maximizing the potential for a sale to be made.

Also, the iPads are functioning as cash registers; therefore, a sale can be made anywhere in the store which is a perfect example of in-store and online integration, and this accelerates purchase decision making. Thirdly, online customers can benefit from a similar service. Thus, if a product is sold out online, Oasis' "Seek & Send" service can help customers whereby the retailer searches its stores for the product and ships it to the customer. When the product is located, the customer gets a notification email that let them track their items. The service helps customers who are in act stage and facilitate their purchase decision. Finally, when it comes to returning items customers have convenient and free options provided by Oasis. In addition to shipping the products back or return them by heading to any Oasis branch, customers can use an easy service named "Collect+" that let them return items through a network over 5,000 drop off points in local stores which allows to return products outside of the ordinary 9 to 5 post office hours. So, the post-purchase service helps Oasis turn its customers into brand evangelists, and obviously, as a result of the convenient service, customers will become advocates of the brand. Generally speaking, with the use of creative ways including an appointment with experts, electronic gadgets, easy returning Oasis can succeed execution of omni-channel marketing. To sum up, in the contemporary omni-channel world, Oasis, fashion retailer, are one of the leading example. Operating in an industry with high BAR median, narrow BAR range requires mapping all touchpoints across the five A's. A well-designed and managed shopping experience, that blurs the lines between online and offline marketing utilize all possible touchpoints and channels across the customers' path. With the help of successful omni-channel strategy, Oasis could efficiently integrate and manage its channels. Also, innovative website, effective social media strategy, supportive mobile application, fully customized appointment service, new information technologies, and returning strategy have helped the company to drive the customers to its sales channels and accelerate the steps across the five A's.

4. CONCLUSION

Omni-channel marketing, one of the seven big problems of the modern marketing world identified by American Marketing Association, has already become one of the key factors to survive and operate successfully in the business world. As literature review shows, even though implementing omni-channel marketing is an essential step to survive in the contemporary world, some brands are reluctant to execute the strategy since they face certain challenges such as threats of channel integration and channel management. Furthermore, the companies who are trying to implement the omni-channel strategy are struggling to integrate sales channels and manage out-of-stocks and share inventory visibility. Despite all these difficulties, certain brands such as Oasis, UK fashion retailer, could take advantage of the omni-channel marketing, and so, they stand one step ahead of their competitors in the omni-channel world. The research findings can possibly be applied by marketers, sales experts and people who are interested in effects of the new trends in the modern business world. Furthermore, the study can be used as a model by whom wish to explore challenges that companies deal with in the omni-channel world, and also, causes of changes in b-to-b markets created by omni-channel can be studied in further researches.

ABSTRACT

This scientific report on the topic of innovation based on socio-economic development reflects development trends and the place of modern entrepreneurship based on innovation-oriented economic development. Thus, the transition of the Republic of Azerbaijan to the path of innovation development is an absolute condition for its development. , development of criteria for selection of optimal option, selection of more perspective ideas, completion of ideas taking into account criteria and development of business plans, assessment of business plans and conditions of its implementation, creation and application of case studies, analysis of sales data and relevant adjustments reflected. In addition, the availability of information and financial markets has become a key development factor, which has led to the density of contacts and the proximity of decision-making centers in terms of communication. Thus, the development of Azerbaijan's innovation system on the basis of regional modules is considered expedient. It is also stated in this scientific report that Innovative entrepreneurship in a market economy is a creative activity of those who develop innovations of the country's economic development potential. considered commercialization. Innovative entrepreneurship is the development and application of new technologies, equipment, goods and services in order to make a profit. The reflection of the specific organizational form of innovation activity, which is important for meeting the individual needs of developers and innovators, was noted in detail. In recent years, the systematic implementation of state support for entrepreneurship, increasing the effectiveness of state support measures for entrepreneurs has created conditions for significant achievements in this area. The normative-legal documents adopted for this purpose, the further improvement of the mechanism of state financial support for entrepreneurship have increased the self-confidence of businessmen, stimulated the expansion of entrepreneurial activity, especially the launch of new business entities in the regions. Regarding the role of small business in innovation-oriented economic development, it is noted that the integration function of the enterprise is considered as their main intersection in terms of raw materials, information, financial, technological, labor resources flows. At the same time, it reproduces economic connections and relations with other elements of the macroeconomic system (with elements of the external environment). As an element of the global system, it implements and reproduces macro and micro interactions and relationships.

Keywords: *Business plans, innovative ideas, entrepreneurship, technological order*

1. INTRODUCTION

In recent years, due to the strong development of science and technology, as well as the ever-increasing demand of society for these innovations, innovation is increasingly becoming an integral part of entrepreneurial activity. The need for the development of innovative entrepreneurship is due to the following factors: - Intensification of intensive factors of production development; This allows the application of STP in all spheres of economic activity; - with the defining role of science in improving the efficiency of development and application of new technology; with the need to develop creativity; - with the specific features of the scientific and technical production process. This is mainly reflected in the uncertainty of the results, the diversity of research, the presence of risk and the possibility of obtaining negative

results; - with the increase of the enterprise and costs during the development of new products; with rapid moral deterioration of equipment and technologies; with the objective necessity of rapid application of new equipment and technologies. Innovative entrepreneurship as a process can be divided into four main phases: - search for new ideas and their development; - development of a detailed business plan on the developed idea; - search for necessary resources; - implementation of management and control processes. The transition of the Republic of Azerbaijan to the path of innovation development as an absolute condition of its development implies the creation of innovation development zones in the country. Creating a comfortable environment for normal approach and operation in these areas, the emergence of the necessary mobile highly qualified innovation ideas, submission of these ideas for consideration and formalization, development of criteria for selecting the optimal option, selection of more promising ideas, completion of ideas and business plans preparation, assessment of business plans and the conditions of its implementation, creation and application of a pilot project, analysis of sales data and relevant adjustments. In addition, the availability of information and financial markets is becoming a key development factor. Therefore, the density of contacts, the proximity of decision-making centers in terms of communication are becoming important development factors. Thus, it is expedient to implement the development of Azerbaijan's innovation system on the basis of regional modules, for which we consider it necessary to develop and implement the following measures: development and implementation of development programs for closed territorial units, their effective integration into economic and social development; State support for the establishment of scientific centers in different regions of Azerbaijan, as well as the placement of technology transfer centers in economic regions; identification of places for the placement of higher education institutions in the regions of the republic, providing the integration of scientific and educational activities conducting fundamental research in the priority areas of development of science and technology for the state, performing the function of research institutes. [1.page-196] These educational institutions should be located primarily in the regions that serve as a “locomotive of development” for Azerbaijan and have a more multiplier effect on other regions; investment and innovation development program of the regions (development of production-technological infrastructure-technologies of innovation activity, innovation technological centers, business incubators); The creation of special economic zones (technical application and industrial production) in the territory of the Republic of Azerbaijan, small business in the real sector of the economy has significant potential for the effective application and development of innovative technologies.

2. RESEARCH

First of all, it should be noted that small business has a great ability to adapt to changes in the market environment, which allows it to be sustainable and long-lasting advanced technologies. Innovations implemented in small production units do not require large financial investments and operating costs. The operativeness of management by small business structures helps to rapidly improve and apply new technologies. Due to the transition to new production due to the small volume of production, the risk of loss is relatively small. Innovative entrepreneurship in a market economy is the commercialization of the creative activity of those who develop innovations of the country's economic development potential. Innovative entrepreneurship in a market economy is the commercialization of the creative activity of those who develop innovations of the country's economic development potential. Innovative entrepreneurship is the development and application of new technologies, equipment, goods and services in order to make a profit. As a rule, the most effective business entities of innovative entrepreneurship are small innovation enterprises (SIE). SIE reflects the specific organizational form of innovation activity, which is important both for the development of the country's economy as a

whole, and for meeting the individual needs of new technology developers and innovators. When applying innovations to entrepreneurial practice, it is necessary to study and evaluate the factors that can slow down or accelerate the innovation process: scientific, technical, organizational, financial, legal, political, socio-psychological and cultural factors. When considering the basics of small innovative entrepreneurship, we believe that the concept of technological systems should be remembered. Technological system is a group of technologies that are connected to each other by the same type of technological chains and create those who reproduce the whole. Each subsequent technological process begins when a fundamentally new "set" of innovations is placed at the disposal of producers of goods and services. [2.page-69] Currently, fifth-generation technologies dominate in developed countries, and sixth-generation technologies are emerging. Characteristic features of the fourth system are a new machine base, complex mechanization of production, automation of many basic technological processes, widespread use of skilled labor, increased specialization of production, superior development of electricity, a new type of consumption characterized by mass demand for durable goods, use of synthetic goods. transition. The main features that distinguish the fifth technological system are the development of computer technology, software, aviation industry, telecommunications, robotics, optical fibers. The features of the sixth system include biotechnology, nanotechnology, photonics, optoelectronics, aerospace industry. The formation of a new technological system in the Azerbaijani economy is due to the fundamental change in the technical and technological base, an element that provides additional benefits to the SIE. The small size and narrow specialization of firms allow them to re-equip faster and cheaper, to apply and approve new technologies designed for the application of mini-equipment. Therefore, although small businesses have unlimited resources, they have traditionally played an important role in the implementation of many areas of STP, as it provides an opportunity for the development of narrow-based research. It is clear from research that new market segments are now being developed with the wider use of innovative enterprises. In order to stimulate innovative entrepreneurship, the state has intensified institutional changes in the economic and legal infrastructure to support entrepreneurship. The concept of enterprise, being the most important structural element of the economy, is a key feature of the paradigm of radical organizational change. As an element of the macroeconomic system, the enterprise performs production and integration functions. [4.page 237]. In the first case, the enterprise is defined as an organizationally sustainable whole and an independent technical and economic system isolated from the environment. This system concentrates resource flows and directs them to the production process. At the same time, the enterprise is focused on the reproduction of economic connections and relationships in the internal environment at the level of the micro and macro interaction system. The integration function of the enterprise is considered as their main intersection in terms of raw material, information, financial, technological, labor resources flows. At the same time, it reproduces economic connections and relations with other elements of the macroeconomic system (with elements of the external environment). As an element of the global system, it implements and reproduces macro and micro interactions and relationships. An important task of organizational engineering is the creation of multi-level and multifunctional system management mechanisms that reflect the industrial enterprise. The mechanism of development and application of innovations can be effective if it is based on the interaction of the production process with the external and internal environment, a detailed study of internal and external subjects of innovation development. The process of organizational development is multifunctional and involves the integration of new elements, their blocks and subsystems capable of ensuring the external growth of the enterprise on a new organizational basis in different spatial and temporal frameworks. In fact, integration processes are associated with the need to adapt to the external environment and ensure stability and the optimal operation of a complex multi-level system.

Restructuring of the enterprise is understood as a purposeful impact on the socio-economic system, which provides greater efficiency of the new multi-level structures created as a result of intra-firm (intra-system) and inter-firm (external systems) interactions in the process of organizational development. If changes within the system mobilize internal sources of growth and improvement, then inter-firm interactions based on integration and differentiation processes provide external sources of enterprise growth focused on new opportunities for profit maximization. This is due not only to the expansion of the boundaries of the system, but also to the introduction of certain regulation and stability from the outside, while simultaneously increasing the dynamism of the economic system. As a result of restructuring due to inter-organizational changes in the economic system, new elements capable of playing the role of mediators, intensifying communication processes, innovations, new knowledge, changes, etc. carriers, economic, production, transaction, etc. process accelerators occur. Enterprises, institutions, financial-industrial groups and other economic agents of different sizes play the role of new elements of the system. The design of external organizational changes is based on the selection of alternative institutions, economic, social and technological structures in order to maximize the external development and activity of the re-emerging organism. [5.page-218] Designing new organizational interactions at the expense of external growth sources should be both a way of differentiation and integration into the system. Differentiation characterizes a certain state of the structure and leads to the strengthening of the specialization necessary for the self-preservation of the system. The high degree of differentiation of production systems significantly increases the likelihood of realization of new goals of reengineering activity, increases the possibility of achieving the goal and the efficiency of activities, new social structures. Differentiation in the system of structural changes is associated with both the deepening of specialization and the development of different types of diversification. Integration expands the boundaries of the production system through external sources of growth, integration processes through various forms of separation, merger, technology transfer, license acquisition, know-how, market transactions, the involvement of intermediaries in the process, infrastructure facilities, etc. can expand as a result. Integration processes can spread across different spatial and temporal frames, on a temporary and permanent basis. Integration structures lead to the expansion of the range of economic activities and functions of the enterprise. The analysis of the mechanism for implementing new structural changes allows us to draw the following conclusions: organizational redesign ensures the continuous evolution of production systems; organizational development helps to increase the dynamism of the economic system and the reproductive cycle; Organizational changes at the expense of external sources demonstrate the growing opportunities for adaptation, improvement, sustainability, optimality of activities and strengthen the structural processes for differentiation and integration in the activities of economic entities; Organizational changes, which are closely related to the development of innovation in the enterprise, allow to intensify the process of radical restructuring and renewal of production by expanding the boundaries of the system, accelerating the introduction of innovations and attracting external sources of STPK and new technologies; organizational reengineering to expand the boundaries of self-development and organization of the economic system, to involve in the production process different groups of enterprises of different profiles, different sizes, stakeholders, clients, intermediaries, investors, innovators, as well as to freeze the activities of backward structures and radicalize allows to create new organizational bases for innovative changes; Inter-organizational changes lead to the washing away of sectoral boundaries, and the strengthening of intersectoral interactions in the reengineering system also leads to a significant increase in the economic efficiency of measures through profit maximization, redistribution and diversification of risks; Restructuring based on innovation reengineering deepens the diversification of supply and demand, stimulates entry into new markets, creates opportunities for the enterprise's innovation monopoly.

In order to increase the effectiveness of organizational reengineering measures, it is necessary to identify the exact compatibility of organizational structures, organizational interactions, the type of economic strategies, the types of technology used and the sectoral characteristics of the market. It is known that the organizational type depends on the nature of the technological process (discrete or continuous, closed or open technological cycle, etc.), as well as the cost of production, the level of standardization and unification, etc. depends. Small-scale production and unique technology require strict internal organization and coordination of work, narrow technological specialization. Base standards are aimed at expanding the scale of production on the basis of large-scale and mass production integration based on technology. In the chemical, petrochemical, food industries, and metallurgy, it focuses on continuous, heavy-duty production lines and functional structures, and is less important for horizontal inter-firm interactions. Discrete small-scale production processes can be divided into intermediate stages, which leads to effective inter-firm interaction on a contractual, market-based basis. These types of organizational structures tend to be horizontal arrangements or mixed structures based on linking integration and commodity diversification. Stable and intensive technologies are the basis in most areas of the processing industry. They are characterized by a high risk of reengineering, low adaptability, and insufficient flexibility to meet market demands. Both sides are characterized by open technological systems and a raw material-oriented economy. [6.page-97] The technologies of science-intensive fields, which are characterized by high variability, tendency to change and innovation, are based on straight horizontal organizational structures in their development. The process of organizational change takes place on the basis of differentiation and diversification, and diversified enterprises move beyond sectoral markets. In order to deepen the reorganization of the enterprise, the process of diversification of related productions must take place. Thus, in the case of product diversification in science-intensive areas (productive with a short life cycle), a large enterprise needs to establish relationships with different types of economic organizations based on new principles of organizational interaction. From an organizational point of view, the "classical" types of interaction are almost non-existent. Determinated approaches are required for optimal operation of production systems and production of high quality products. At the same time, meeting the various pictorial and selective demands and effective service to the market requires adaptive structures and capabilities of maneuvering. Therefore, the formation and maintenance of permanent partnerships must be matched by the rapidly changing channels of sales conditions, marketing activities, STPK, temporary interactions and acquisition of new technologies based on horizontal inter-firm structures. In this case, in order to coordinate the principles of self-organization and purposeful structuring of the economic system, it is important to comply with the following conditions: 2. To increase the effectiveness of reengineering and structural change, a strategy of coordinating, structural and institutional change based on diversification of methods of operation and external sources of growth is necessary. It is clear that external organizational changes are seen as a means of limiting negative development trends. However, the main purpose of inter-organizational changes is to change the structures of interaction, institutional rules and norms of economic interaction of economic entities. Institutionalization helps to connect and regulate the elements by changing the rules, norms, structures and patterns of behavior of the subjects in order to maintain and improve health at the expense of external system sources. In this case, large production systems can be organized institutionally: they come from various forms of industrial enterprises, government agencies, fundamental research funds, investment and venture funds, research institutions, academia, information centers, technology associations, etc. may consist of. These organizational changes are based on the creation of a system called structural module specialization. The institutional structural scheme of entrepreneurship is given below. As the country develops economically, the support of the state and local authorities for small business increases proportionately.

Because the correct and lawful functioning of the market mechanism, the lack of monopoly in the country, the formation of the middle class are the pillars of the market economy, the country's economy adapts more quickly and flexibly to the market, maintaining political stability, dynamic economic development and so on. For some reason, small business must constantly develop, which is possible only with the support of the state and local authorities. From 1950 to 1955, a large number of science parks, industrial parks and technology parks were established in America. The reason for their development was the measures taken by the US government in the field of economic development of the country. Thus, as part of the concept of economic development, the state has allocated large sums of money for scientific and technical programs and projects (space, military, the creation of a new generation of computers, the creation of new technologies in microelectronics). The universities are involved in the implementation of this program with their fundamental and applied research, a number of government agencies, contractors, small entrepreneurs, etc. working in this field. Firms joined, and as a result, this concept gave impetus to the emergence of a large number of innovative small enterprises. For more than 30 years, this project has been implemented in the United States to create thousands of jobs, improve the living standards of the population, the dynamic economic development of the state, and so on. However, in the early 1980s, a crisis began in the development of parks, due to the overgrowth of the network and the inability of the state to properly coordinate. At the same time, they increased their individual initiatives and began to form in venture firms. The most important reason for the crisis was that the state did not allocate as much money in this area as before. All this has led to the formation of business incubators in America. These self-paying companies began to spread rapidly. In 1986, 170 such companies were registered, in 1988 there were 300, and in 1990 there were 500 such business incubators. In the United States, the average lifespan of an enterprise in a business incubator is several months. According to official statistics, 87% of new enterprises operating in business incubators remain in the market and grow. 84% of them are developing in the sphere they support. The statistics of enterprises operating in business incubators for the last four years were examined and it was found that during this period, profits increased 8 times and the number of employees increased 4 times. According to 2006 statistics, of the 1,300 business incubators operating in the United States: 47% provide services to companies in various fields of activity; 37% of business incubators mainly produce new equipment, technology, new products; 7% of business incubators work with industrial enterprises; 9% work with enterprises providing various services. Founded in 1990 in the United States, the Business Technology Center is a mixed-use business that works with both industry and service. Along with the city administration, the provincial government is also providing assistance to this city. Along with the city administration, the provincial government is also providing assistance to this city. In 2005 alone, the incubator generated \$ 30.1 million in profits that supported 25 firms, employed 344 individuals and paid them \$ 2.7 million in wages. The Austin Technology Incubator, based at the University of Texas, aims to equip start-ups with high-tech equipment. This Business Incubator helps start-ups find a source of funding, study the target market and target segment, and ensure product expansion in the market, which in turn contributes to the well-being of the population and economic development. Since 1989, the incubator has partnered with 140 companies in Austin, earned more than \$ 1.4 billion for university graduates and clients, created 2,880 high-paying jobs, and raised its foreign capital to \$ 600 million. The Atlanta Technology Incubator at the University of Georgia has been operating since 1980. The purpose of creating the incubator was to turn innovations in public universities into a source of income for the local economy. It already functions as a center and combines three incubators. In 2004, the center worked with 44 companies and provided a total of \$ 94 million in financial assistance. These companies, in turn, created 4,900 high-income jobs that year, earning \$ 684 million.

The Biotechnology Innovation Center in Lavale, Canada, won the Business Incubators Association's highest award in North America in 2006.

3. CONCLUSION

The main task in the field of investment policy is to create a free competitive environment for all investors in order to expand investment opportunities in all sectors of the economy and provide a more favorable investment climate consists of improvements. As noted in the new Program for the Development of Regions, the implementation of a transparent and efficient privatization process will continue in the coming years in the enterprises opened for privatization. Purposeful work will be carried out to support the investment activities of enterprises in the non-oil sector, and the import of modern production equipment will be encouraged. Public investment policy should be aimed at creating new jobs in the regions, ensuring the reliable operation of infrastructure facilities, the implementation of priorities such as the development of human capital and strengthening the social protection of citizens. One of the important directions of the employment policy is to eliminate the factors limiting the creation of new jobs and create conditions that stimulate the growth of employment. In this regard, measures aimed at the development of entrepreneurship, especially small and medium enterprises, are of particular importance. In the coming years, the main goal of employment policy will be to ensure the effective employment of the population through the fullest use of labor resources. [9.page 431]. Entrepreneurship development will be one of the leading directions of state policy in terms of diversification of the country's economy.

This policy will be aimed at increasing the level of regulatory, organizational and financial support for business activities in all sectors of the economy, especially in priority areas of development.

ABSTRACT

Amid the spread of the new coronavirus infection (COVID-19), many countries have taken large-scale measures to support the financial market and the economy since the end of February 2020. The actions of financial regulators were aimed at creating conditions for maintaining the volume of financing for the real economy, supporting affected borrowers and ensuring an adequate level of liquidity for financial institutions. The pandemic has a negative impact not only on people's health, but also on their well-being. In this regard, the financial system, which is compared to the circulatory system of the body, can play a very important role in terms of mitigating the negative consequences of a slowdown in the economy for businesses and the population. The crisis caused by the coronavirus pandemic has affected the asset quality of many banks in the CIS countries. Recently, digital technologies have been actively developing in the financial sector. The pandemic of the new coronavirus infection COVID-19 has only spurred this process. The author also concludes that the quality and successful functioning of the financial sector depends on the level of digitalization of the financial sector. Along with regulatory measures, government support plays a key role in combating the economic consequences of the COVID-19 pandemic, which mainly includes loan programs, guarantees, credit holidays, wage subsidies, direct payments to the population and businesses, and an increase in unemployment benefits. various tax breaks. The amount of government support measures differs significantly in different countries: according to the IMF, in the EU they amount to 4.3% of GDP, in the USA - 14.3% of GDP, in China - 2.5% of GDP, in Brazil - 6.5% of GDP. , and in Japan - 21.1% of GDP. Azerbaijan is implementing economic support measures worth up to 3.3 billion manats (about 2 billion US dollars, or 4% of GDP).

1. INTRODUCTION

The global spread of the coronavirus infection COVID-19 has led to a global recession and destabilized global financial and commodity markets. According to IMF estimates, the fall in global GDP in 2020 will be the largest since the Great Depression. Already, the crisis is accompanied by a sharp increase in unemployment in a number of countries, significant sectoral effects, a decrease in investment activity, and a deterioration in the credit quality of borrowers and bank portfolios. The situation in the global financial markets, despite some stabilization, remains unstable. In these conditions, regulators around the world are implementing large-scale support measures (fiscal, monetary, financial) to limit the economic damage from the pandemic. The capital and liquidity buffers accumulated over the past decade in the financial system make it possible to implement countercyclical measures. However, the measures being implemented may not be enough to quickly restore global growth. Crisis trends may intensify if the passage of the peak of the epidemic is delayed or in the event of a second wave, as well as in the scenario of massive corporate defaults and sales of assets in the market.

The impact of COVID-19 on the Azerbaijani economy is large-scale and is realized through the deterioration of external economic conditions, primarily a drop in demand and oil prices.

2. RISKS OF THE GLOBAL ECONOMY AND WORLD FINANCIAL MARKETS

The World Health Organization has officially declared the coronavirus outbreak a global pandemic on March 11, 2020. The epidemic quickly spread outside China, with the number of officially registered cases in many countries exceeding the number of those in China. In total, the epidemic affected more than 200 countries (5.495 million reported cases of infection and 346 thousand deaths as of May 25). Against the backdrop of the pandemic, the global economy entered a recession. According to the baseline forecast of the IMF, global GDP will decline by 3.0% by the end of 2020, after rising by 2.9% in 2019, which will be the most significant fall since the Great Depression. At the same time, the GDP of developed countries will decrease by 6.1% (against growth by 1.7% in 2019), the GDP of emerging markets and developing countries - by 1.0% (against growth by 3.7% in 2019.). In the baseline scenario, the IMF expects a rapid recovery of global economic growth by 5.8% in 2021, although it does not rule out the implementation of negative effects for a longer time (Обзор финансовой стабильности (2020)). The urgent introduction of large-scale monetary and fiscal stimuli as support measures from the governments and central banks of the largest countries of the world helped to stabilize the situation in global financial markets since the end of March.

The impact of COVID-19 on the Azerbaijani economy is large-scale and is realized through the deterioration of external economic conditions, primarily a drop in demand and oil prices.

3. ANTI-CRISIS MEASURES IN THE COMMONWEALTH OF INDEPENDENT STATES (CIS)

In the CIS region in March, two problems were immediately apparent: the decline in business activity due to the new coronavirus and a simultaneous rapid reduction in oil prices. Some CIS countries responded quickly to the alarm and have already introduced active anti-crisis measures. In this section, we will consider key anti-crisis measures in the CIS countries. At the end of March, the Central Bank of Russia published a complex of measures aimed at helping citizens, businesses and the financial sector in the event of a pandemic. In particular, to support business in all sectors of the economy with the support of the Bank of Russia, a special program of refinancing loans for small and medium-sized businesses with the establishment of interest rates. Also, until the end of September 2020, the Central Bank recommended banks not to worsen the assessment of the financial condition of customers for the purpose of forming reserves and, if possible, to restructure the loans of borrowers, which are located in complex finance [<http://www.cbr.ru/finstab/review/>]. The monetary regulator also introduced a number of measures to support citizens with the financial system. In particular, banks and microfinance organizations (hereinafter MFIs) are not recommended to impose fines and, if possible, to restructure the debt of borrowers-individuals, if the latter was confirmed by the correction. In case of deterioration of the quality of debt service or financial condition of such officials, banks are not obliged to create additional reserves until September 30, 2020 (Лузгина А (2020)). In turn, the National Bank of Ukraine recommended banks to consider the possibility of loan deferrals for individuals and businesses, which were partially or completely deprived of income as a result of quarantine. In particular, it was proposed to establish a special grace period for the payment of the principal amount of the debt. For that, the financial system was able to fully work in the conditions of deteriorating economic situation due to the pandemic, the central bank of Ukraine developed and gradually introduced a number of tools to ensure the adequacy of the banking system [level]. The following measures should be taken to support the banking system with the support of the National Bank of the Republic of Belarus. The regulator announced the possibility of extending the terms of refinancing and providing loans to banks for a period of

up to half a year at the refinancing rate and recommended to financial institutions to consider the possibility of providing "credit vacations" to individuals with financial problems; In the current situation, it is important not only to ensure the stability of the legal framework, but also to determine the complex of adaptation of some regulatory requirements to work in the conditions of a pandemic, including the easing of control over financial burdens. In this connection, the Central Bank of Russia:

- stopped and rescheduled scheduled inspections of credit institutions;
- increased the deadline for the execution of prescriptions by the banks for 1 month installed;
- restricted administrative charges for non-compliance with bank deadlines reporting, as well as the norm of corporate legislation and took a number of other measures.

The National Bank of Ukraine, in turn, also reduced the administrative burden. This is reflected in the cancellation of departure inspections of banks, the transfer of deadlines for stress testing and the provision of annual financial statements. A lot of work to soften the regulation in part with the implementation of regulations by banks was carried out by the National Bank of the Republic of Belarus. So, until the end of 2020 with the regulator:

- changes in the size of prudential requirements, including liquidity ratios, the value of the conservative buffer capital, the degree of credit risk in relation to credit indebtedness and the value of the prudent paperwork system.
- temporarily canceled the standard risk on new urgent bank deposits (deposits) of individuals and legal entities in Belarusian rubles (Лузгина А (2020)).

These actions are aimed at assisting banks in the field of financial support of economic entities and stable operation of the banking system of the country.

4. ANTI-CRISIS MEASURES OF THE CENTRAL BANK OF AZERBAIJAN AGAINST THE PANDEMIC

March 19, 2020 The President of Azerbaijan I. Aliyev signed a decree on the conduct of measures to stabilize the economy and increase resilience to external shocks. According to the order, published on the website of the heads of state, the Cabinet of Ministers to ensure the mayor of the state budget for 2020. 1 billion manat (588.2 million US dollars at the current exchange rate) was allocated. In order to reduce the negative impact of the pandemic on the financial sector, the Central Bank approved a package of additional support measures for the financial sector on April 24, 2020 within the implementation of the relevant decrees of the President and the Cabinet of Ministers. Rule" was adopted. The approved rules include measures to support individuals, as well as pandemic-affected entrepreneurs, reduce the regulatory burden on banks, increase access to credit resources in some economic sectors, reduce the cost of payment services of economic entities during the pandemic, ensure insurance continuity and protect the rights of insured. It is also planned to provide regulatory strikes and benefits to capital market participants:

- 1) Banks were recommended to restructure loans of individuals and individual entrepreneurs affected by the pandemic covered by state support mechanisms;
- 2) Risk rates on this category of loans have been reduced from 100% to 50% in order to stimulate mortgage lending by banks at their own expense;
- 3) Banks were advised not to charge additional penalty interest, penalties and other payments to borrowers in case of delay of credit obligations of legal entities and individuals; d) The classification category of restructured loans in connection with the pandemic has not been allowed to deteriorate and the precautionary requirements have been relaxed;
- 4) The risk level of microcredits provided by the Agrarian Credit and Development Agency under the Ministry of Agriculture has been reduced;

- 5) In order to further strengthen the financial resilience of banks and insurance companies against macroeconomic shocks, restrictions were imposed on their payment of relevant dividends on the financial results of previous years;
- 6) The risk level of business loans for the production of medical supplies and equipment has been reduced (Valiyev E., Mamedov Z. F., 2020.).

The following measures have been taken to reduce the regulatory burden on banks:

- 1) Banks' total capital adequacy ratio has been reduced;
- 2) Countercyclical capital buffer was set at 0%;
- 3) Taking into account operational and market risks in calculating the capital adequacy of banks has been postponed;
- 4) Taking into account the risks based on the debt burden, maturity and interest rates on consumer loans in the calculation of the capital adequacy ratio has been suspended until January 1, 2021;
- 5) Comprehensive inspections have been suspended for insurance companies until September 30, 2020, and for banks and investment companies until January 1, 2021;
- 6) The introduction of new regulatory requirements in banks has been postponed.

COVID-19 contributed to the financial insolvency of banks and companies in a number of countries, mass unemployment, the world economy going through a period of stagnation and, as a result, the transition of the global economy to recession. The pandemic came to Azerbaijan later than to other countries, but the phenomenon of cheaper energy prices began to be observed. Success in maintaining macroeconomic stability in Azerbaijan and decisions taken to prevent global risks have limited the risks of increased global volatility for the Azerbaijani market. There are three channels for transmitting the impact of the pandemic to the country's financial sector: the balance of payments channel, the income channel, and the credit channel. The decline in oil prices and the export of other goods affects the foreign exchange market through the balance of payments channel. Against the background of credit risks, the financial condition of banks may deteriorate, which will force banks to limit the issuance of loans and may have a negative impact on the economy through the credit channel. A decrease in the income of business entities will result in an increase in credit risk, a decrease in demand for financial services and a decrease in the income of the financial sector. An additional channel for the negative impact of the coronavirus pandemic could be a decrease in the potential for activities in the financial sector, primarily in the field of lending. A decrease in the income of economic entities reduces their creditworthiness, which may limit the desire of banks to continue lending to the economy. The impact of the coronavirus pandemic on the credit channel may be associated with the following risks:

- decrease in income of potential borrowers;
- limits your appetite for credit due to the narrowing of the possibilities for servicing loans;
- at the same time, there is serious uncertainty about the future recovery of incomes of citizens and companies;
- a deterioration in the quality of borrowers' loans may occur, may worsen, and an increase in credit risk;
- leads to an increase in interest rates on loans, which limits the demand for new loans;
 - banks can tighten lending standards, including lowering the limits of loan products;
 - A mid deteriorating financial conditions, some banks may face a lack of capital to increase lending.

According to the Presidential Order on a number of measures to reduce the negative impact of the coronavirus pandemic (COVID-19) and the sharp fluctuations occurring in the global

energy and stock markets, on economy of the Republic of Azerbaijan, macroeconomic stability, issues of employment in the country and business entities, four Working Groups were established (Aliyev S. Mamedov Z. F., 2020. p.586). The working group, chaired by the Chairman of the Central Bank, was instructed to assess the alleged negative impact of the pandemic on the financial sector and macroeconomic environment of Azerbaijan, prepare and submit to the Cabinet of Ministers proposals on additional measures to be taken to support the stability of the Azerbaijani manat exchange rate and consumer prices, for maintaining macroeconomic stability in the country. A working group, created under the leadership of the Chairman of the Central Bank, was tasked with assessing the alleged negative impact of the pandemic on the financial sector and macroeconomic environment in Azerbaijan, including:

- 1) supporting the stability of the rate of the Azerbaijani manat;
- 2) supporting the stability of consumer prices
- 3) maintaining macroeconomic stability in the country.

Currently, both social and budgetary, monetary policy in Azerbaijan is mainly aimed at neutralizing the incomes of the population and business affected by the pandemic. The main goal of the measures taken by the Government and the Central Bank is to improve the financial system as a whole and to protect the interests of consumers, in particular their deposits in banks, and to prevent the threat of their loss, to create opportunities for their free use. Due to the pandemic, banks will spend a total of 1.2 billion manat by 2020. About 52,000 loans in the amount of AZN have been restructured and this process is still ongoing. 87% of restructured loans fell to business, 9% to consumer and 4% to mortgage loans. In 2020, measures were taken to expand the financial intermediation of the banking sector and increase access to credit. Thanks to the synchronized measures of the government and the regulator, a sharp decline in lending activity was prevented. The loan portfolio of banks amounted to 14.2 billion manat at the end of the reporting year, excluding closed banks. Excluding closed banks, banks' mortgage portfolio increased by 13% in 2020, the volume of business loans remained stable, and consumer loans decreased by 6.3%. 60% (AZN 8.5 billion) of the loan portfolio is business loans, 26% (AZN 3.7 billion) are consumer loans, and 14% (AZN 2 billion) are mortgage loans. The pandemic has once again proved the need for digitalization of the banking sector, the population and businesses. The expansion of the use of cashless payment infrastructure this year and the increase in the range of innovative payment services provided by banks have helped to whiten economic turnover and shrink the cash economy. In 11 months, compared to the same period last year, the volume of domestic non-cash transactions by payment cards increased by 34%, contactless payments by 5.2 times, Internet and mobile banking by 65% and 90%, respectively (Mamedov Z. F., Qasimov A., 2020).

5. CONCLUSIONS

In the CIS region in March, two problems immediately manifested themselves: a drop in business activity due to the new coronavirus and a simultaneous rapid decline in oil prices. Some CIS states have promptly responded to signals received from outside and have already implemented active anti-crisis measures. To support the financial stability of the banking system, a number of preventive immunization measures were taken before the effects of the crisis began to be felt. That is, so to speak, during the economic and credit boom, measures of countercyclical prudential regulation were taken. So, in the years of boom in the growth of high rates of banking assets, the Central Bank of banks in an active dialogue:

- 1) called for a prudent credit policy;
- 2) ensured an increase in the level of capitalization and provisioning;
- 3) tightened prudential regulation standards;
- 4) applied the required reserves on foreign loans.

To expand access to financial opportunities in the real sector, a \$ 200 million Framework Agreement was signed with the European Bank for Reconstruction and Development. The implementation of the first tranche of more than \$ 50 million has already begun.

IMPROVING THE ASSESSMENT OF THE INTELLECTUAL PROPERTY MARKET IN AZERBAIJAN

Nargiz Aliyeva

*Azerbaijan State University of Economics, Baku, Azerbaijan
qarabagli.111@mail.ru*

ABSTRACT

In modern times, the economic potential of every country is determined by the ability to expand production, acquire new knowledge, create technologies and identify a variety of new products. Records show that only in this way society can maintain a high level of viability. The revival of production in the country depends on the volume of direct investment and the level of application of new technologies. In the world practice, along with cash, targeted bank allocations, shares, stocks and other securities, the rights to intellectual property are widely used in investment processes. Intellectual property should be considered as the basis of the strongest and most real impact on the development of all sectors of the national economy. As the country's economic potential grows, changes take place in the structure of the economy, which stimulates the development of science-based industries and ultimately increases the demand for intellectual property. This shows that it is vital to determine the norms in accordance with international standards, to conduct methodological and practical work, taking into account the realities of Azerbaijan, in order to take into account intellectual property in the assessment of property. The purpose of the research is to improve the assessment of the intellectual property market in Azerbaijan in accordance with modern international methodology. The research was conducted on the basis of generalization, systematization, comparison and analysis methods. At the article, it gives an author's explanation of the theoretical-methodological and conceptual-legal aspects of the assessment of intellectual property (IP), analyzes the features of the assessment of types of intellectual property. The proposed approach to the results of the assessment of the intellectual property market has allowed to systematize the main goals and objectives, the main methods of its implementation, while examining the existing problems in this field. The scientific novelty of the research is the comparative analysis of the assessment of the intellectual property market of Azerbaijan and a number of developed countries, the development of priority fields for improving the assessment methodology based on the interaction between approaches to intellectual property assessment and human capital development in the country.

Keywords: *intellectual property market, assessment, profit, comparison, cost*

1. INTRODUCTION

Intellectual property (IP) is a category of intangible assets that express the rights of a juridical person or citizen to the results of intellectual activity. This is equivalent to the means of individualization of juridical person, goods, works and services. The use of means of individualization and the results of intellectual activity, which are purely legal objects, may be carried out by a third side in accordance with the legislation [1]. Depending on the characteristics of the legal regulation, intellectual property can be divided into 3 primary types [2]:

- 1) results of creative activity protected by patent law - industrial property, which includes inventions, utility models, industrial designs, selection achievements; means of individualization of juridical person, goods, works performed or services rendered (company names, trademark, service mark);
- 2) results of copyrighted creative activity - science, literature, art, programs for electronic computers, topology of integrated circuits;

- 3) results of creative activity related to common rights - performers, producers of audio and video products, television and radio programs, etc.

In modern times, the economic potential of country is determined by the ability to expand production, acquire new knowledge, create technologies and identify a variety of new products. Records show that only in this way can society maintain a high level of viability. The revival of production in the country depends on the volume of direct investment and the level of application of new technologies. In the world practice, along with cash, targeted bank allocations, shares, stocks and other securities, the rights to intellectual property are widely used in investment processes. Intellectual property should be considered as the basis of the strongest and most real impact on the development of all sectors of the national economy. [3, p. 10-14]. The opinions of well-known experts dealing with this problem once again confirm it. For example, the American economist J. Helbright, who was best known for his theory, proved that every unit of value spent on raising the intellectual level of people is more efficient (both materially and spiritually) than it is focused on material areas. Therefore, in the economies of developed countries, it is paid more attention to intellectual property. It shows itself more clearly in the acquisition of some enterprises by others, in the technological speed and scale, in communication and information technologies, in the gradual complication and integration of financial markets, especially in the globalization of available resources on a worldwide scale. In more economically developed countries, it is attached great importance to the share of intellectual property in the common property of the enterprise for its image. Thus, if the total number of intellectual property of the enterprise is less than 30% of its total property, such an enterprise is considered technologically backward. They are usually unable to compete and can not raise their economic indicators. Of course, one of the factors characterizing the economic power of the country, perhaps the main one, is the volume of its intellectual property [4, p. 258-261]. As it is well known, intellectual property is an intangible asset of an enterprise's balance sheet. The methodology for assessing intellectual property aims to achieve the following goals:

- 1) to determine the price and value of intellectual property;
- 2) to develop the process of intellectual property assessment;
- 3) to provide a basis for economic analysis of the effective use of intellectual property as a whole and separately;
- 4) to prepare the main principles and criteria of the report on valuation of intangible assets [5, p. 343-344].

It should be noted that the object of intellectual property is the result of intellectual activity, ie individual and unique, then in each case requires a specific approach to price. This approach takes into account legal, technical, geographical, temporary, technological, environmental, artistic and other features. Thus, it is not possible to use a single form of valuation method for all intangible assets and intellectual property.

2. THEORETICAL AND METHODOLOGICAL BASES OF INTELLECTUAL PROPERTY (IP) ASSESSMENT

According to the current legislation, the structure of the assessed property of the privatized state enterprise (facility) includes fixed assets and other non-current assets, reserves and expenses, cash and other financial resources, other tangible and intangible assets, etc. Intangible assets on the balance sheet include rights to use land, water and other resources, as well as intellectual property rights (inventions, industrial designs, trademarks, etc.). Until recently, the lack of a unified mechanism for assessing the intellectual property of enterprises created certain gaps in practice, which prevented a full assessment of their value. An inventory of intellectual property must be conducted in every enterprise before it can be assessed.

First of all, it will ensure the determination of the volume of intellectual property of both a particular enterprise and the country as a whole and its correct assessment. In developed countries, it is not important to take into account the cost of creating intellectual property when valuing it. In this case, the demand for more intellectual property is taken into account. In the market economy countries, intangible intellectual property is low. Because in those countries it is dominated by demand for material goods. The flow of intellectual property in these countries and therefore the reasons must be explained. As the country's economic potential grows, changes take place in the structure of the economy, which stimulates the development of science-based industries and ultimately increases the demand for intellectual property. This shows that it is vital to determine the norms in accordance with international standards, to conduct methodological and practical work, taking into account the realities of Azerbaijan, in order to take into account intellectual property in the assessment of property.

3. CONCEPTUAL AND LEGAL ASPECTS OF THE INTELLECTUAL PROPERTY ASSESSMENT

Although Azerbaijan is a new in the market economy, it has made significant progress in both the theoretical and practical aspects of the real estate market and property valuation issues. However, it must be acknowledged that the valuation of intellectual property (IP) is one of the least developed fields compared to the valuation of other types of property. Such realities are one of the peculiarities not only of Azerbaijan, but of all countries. However, it should be noted that the assessment of intellectual property has its own peculiarities in both the theoretical and practical rules of professional valuation of all types of property. The most important of these is the predominance of regional principles in the practice of valuing intellectual property and intangible assets. We can show an example that in our country, in comparison with other types of property (real estate, machinery, equipment, business, etc.), the valuation of intellectual property is the historical, gradual formation. In other words, this field of assessment in our country has not been fully exposed to the approaches and methods "dictated" by Western and Russian economists. However, some people consider themselves more knowledgeable and want to "impose" their services on appraisal practice. A number of methodological issues which they propose are not compatible with financial management at all and are subject to some criticism from a modern assessment position. It should also be noted that the assessment of intellectual property is one of the activities that is both improving and expanding. Valuation of intellectual property for business purposes (merger or separation of the company, investment in the authorized capital, trade license, etc.) or non-business purposes has appropriate priorities. However, one of the most important and controversial issues in economics, law and some other sciences is to individualize the concepts and terms used in this field, to select the most important expressions in terms of meaning and content, and to ensure their accurate addressing in the international lexicon. In some literatures, the names of intellectual property and intangible assets are ambiguous, it is found concepts and terms beyond international standards. On the one hand, it can be considered natural. As entrepreneurial activity expands, it increases the need to evaluate transactions with intellectual property, enterprises, intangible assets, franchises, as well as various brands. This, in turn, effects the formation of new concepts and activities in the formation of society. For example, appraiser, auditor, accountant and marketers do not use the same terms to describe the components of "intangible assets". The concept of "trademark", which is more accurate and corresponds to the literary lexicon, is used by some of them as a "trademark" (goods mark).

4. ANALYSIS OF THE FEATURES OF INTELLECTUAL PROPERTY TYPES ASSESSMENT

Proper coordination of stakeholder interests is one of the main tasks and important conditions of both real and fair evaluation. The evaluation of patents and licenses is better developed than other types of IP, both in terms of the availability of practical and regulatory documents. There is more experience and more literature written in plain language. The sale of a patent or license is, in fact, a process of contract of sale an IP. In this case, it is necessary to talk about the market value of IP and its definition. In practice, negotiations on the sale of patents and licenses are held with the participation of professionals in the field. Because the assessment of intellectual property is one of the most delicate and singular fields of evaluation. In this case, every side (seller and buyer) forms its own team and the sides negotiate and reach appropriate agreements. Undoubtedly, it is necessary to have an appraiser among the representatives of both sides. The appraiser should not deny his advice to both the buyer and the seller. An extended system of expertise is widely used in world practice to properly protect the interests of all patent applicants and stakeholders. An extended expertise has a number of advantages. Thus, in accordance with its rules, all orders, except for confidential orders, are published after 18 months. The first advantage of this is that in a competitive environment, stakeholders receive the necessary data. It also helps the reality of the assessment. At the same time, none of the natural and juridical persons who are patent applicants pay the examination duty provided for in the previous procedure. The publication of orders during this period provides temporary protection of the rights of its owner, prevents the emergence of patents for similar inventions by alternatives, encourages the search for new ways to solve technical problems. Cost, market (comparison) and income approaches are used in the valuation of intellectual property, as well as in the valuation of real estate and business. It should be noted that there is no consensus among appraisers as to which of the methods included in these approaches is more suitable or unsuitable to apply in the valuation of intellectual property. It should be noted that many amateur appraisers sometimes use very complex variants of "fictitious" calculation methods that do not meet today's requirements and do not correspond to any "methodological behavior" in determining the value of the property [6]. This leads to fragmentation in the specific data acquisition. Currently, most of the methods used to assess IPO in Russia, Ukraine, Kazakhstan, Belarus and the Baltic States are based on the rules of the license cost calculation. Also, in all cases, the royalty is included in the price of the IP with the same calculation index. This makes it difficult or impossible to predict the sale of an IPO. In this case, the factors that exist under the royalty and other concepts also play a role. Because the level of royalty is set in the range of 5-20%, depending on the efficiency of the IPO. Sometimes the last limit of this indicator is higher and is up to 25%. Like other concepts, royalties have a special role and importance, in the form of deductions from the price of the finished product by the licensee during the period of validity of the license agreement, or a fee paid in the form of profit or unit of output. Also, in connection with the strengthening of the legal and market position of the inventor or entrepreneur of the IPO, it is incorrect to consider royalties as a necessary compromise between the inventor, manufacturer, entrepreneur or buyer. In this regard, the situation around the world is changing in favor of the owner and inventors of the IPO, ie in their interests [7, p. 14-17].

5. APPROACHES APPLIED IN THE ASSESSMENT OF INTELLECTUAL PROPERTY

Intellectual property and intellectual investment are often the main motive forces and most important asset of a business, creating the basis for market share and increased profitability. IP acts as the subject of mergers and acquisitions, companies are increasingly using licensing methods to plan transfer pricing and maximize value. Cost, market (comparison) and income approaches are used in the valuation of intellectual property, as well as in the valuation of real

estate and business. It should be noted that there is no consensus among appraisers as to which of the methods included in these approaches is more suitable or unsuitable to apply in the valuation of intellectual property. The research identified the following advantages and disadvantages of approaches to IP assessment (Table 1).

Table 1: Advantages and disadvantages of approaches to IP valuation

Approaches	Advantages	Disadvantages
Income approach	<ul style="list-style-type: none"> Covers the unique economic characteristics of the asset; Covers the estimated cost of the future. 	<ul style="list-style-type: none"> It is based on the ability to accurately predict the future; Ensures compliance of economic income and investment value indicators.
Market approach	<ul style="list-style-type: none"> Provides information on attractive empirical value; Comparative data is relatively easy to use; Conceptually comfortable. 	<ul style="list-style-type: none"> IP operations are generally unique; Most of the information required for significant comparisons is not publicly available.
Cost approach	<ul style="list-style-type: none"> There is no need for comparable market data; It is suitable when no active income; Internally disposed of intangible assets or may be subject to liquidation. 	<ul style="list-style-type: none"> Data may not be available; A number of adjustments may be required in the financial information.

It is important to determine which approach will be applied and to get as much support as possible, and if possible, the results should be validated and cross-checked using alternative approaches.

6. DEVELOPMENT OF INTELLECTUAL PROPERTY MARKET AND IMPROVEMENT OF VALUATION METHODOLOGY

During the initial legal examination of intellectual property, selection and analysis of the assessment method, the intellectual property appraiser must take into account the following features of intellectual property as a product:

- 1) intangible form of intellectual property;
- 2) fixation of intellectual property - introduction of intellectual property on a material carrier;
- 3) the possibility of the emergence and dissemination of a material form that reflects the results of intellectual property;
- 4) the possibility of moral obsolescence of intellectual property and the impossibility of physical obsolescence of intellectual property;
- 5) the necessary to document intellectual property;
- 6) the possibility of limiting intellectual property both in terms of territory and time (presence of a certain period of activity in a certain field);
- 7) the necessary to maintain confidentiality (for example, when assessing the value of know-how);
- 8) absolute character of intellectual property - it is prohibited for another person to use such property without the permission of the owner of intellectual property;
- 9) the possibility of other protections than the legal protection of intellectual property.

These features should be taken into account in the valuation of property - namely, in the valuation of intellectual property, because they have a significant impact on the growth of the intellectual property value.

7. CONCLUSION

- 1) The accuracy of intellectual property (IP) assessment and compliance with international requirements depends primarily on legal regulations, their compliance with international regulations and standards. The market value of intellectual property, the vast majority of which is valued at market value, is more affected by depreciation factors. However, unlike other types of property, the effect of depreciation on prices does not depend on the time factor. Sometimes, on the contrary, the value of intellectual property (for example, works of art), which are the product of a long historical period, is higher. There is a great need to use different standards (especially International Valuation Standards) when determining the value of all this.
- 2) In particular, in the case of copyright and mixed rights (piracy) (audio-video, software, etc.), the amount of the loss is also indicated while the victim is suing. However, in most cases, the main defendant or his lawyer is guided by the high amount of losses and protested it. In records, it arises disputes between the author of the IPO and the person who use it anonymously. If the every music album, film or computer program is secretly copied and owned, in this case, the author (injured) as a plaintiff claims to assess the damage, as well as the methodology proposed by him. However, even if the court and the injured side cannot jointly prove this claim to the other side, even in this case, the court's decision in favor of the injured person cannot be considered fair. When the realities of such problems are accepted by the society, it is considered expedient for an independent appraiser to make calculations based on accurate and international experience in estimating losses.

ABSTRACT

The article shows the directions of improving the mechanism of state support for entrepreneurs engaged in the production of agricultural products in the agribusiness system of the Republic of Azerbaijan. For this purpose, first of all, the need for special programs to support entrepreneurs in the agribusiness system was substantiated and the main tasks facing it were indicated. At the same time, 3 stages of the program implementation mechanism, as well as the volume and sources of its funding are indicated. In modern economic conditions, it is recommended to apply only guaranteed supply prices from the main types of prices regulated in the Republic of Azerbaijan. The article emphasizes the need for widespread dissemination of the collateral system and identifies areas that will create conditions for its implementation through the application of the principle of collateral in the procurement of products in the agribusiness system. In the agribusiness system, agrarian credit policy faces special challenges in providing long-term loans to economic entities with different categories of ownership. The problem of long-term investments and their financial and credit security is still relevant in the current situation. The directions of regulation of entrepreneurship in the agribusiness system of the country in modern conditions have been identified. Production costs in the agribusiness system have been analyzed in terms of the possibility of calculating subsidies and compensations in accordance with these costs. A model of entrepreneurship regulation in the agribusiness system has been proposed. This model ensures absolute transparency and accurate calculation of subsidies and compensations. Given the above, the solution of the problem through the general management model of entrepreneurship in the agribusiness system consists of three stages.

Keywords: *agribusiness system, agriculture, compensation, entrepreneur, state support, mechanism, price, subsidy*

1. INTRODUCTION

Demand for products produced in the agribusiness system is quite stable, but the supply in this system can change significantly under the influence of natural and biological factors. Decreased elasticity of demand for products in the agribusiness system under market conditions leads to dual economic consequences. First of all, the increase in the price of these products does not lead to a significant reduction in their consumption, but to an increase in inflation. Second, declining product sales often do not produce the desired results, as people prefer to spend the freed money on industrial goods. This idea is confirmed by our economic and statistical research [1, 2, 3, 4, 5, 6, 7, 8]. For example, we have analyzed the relationship between changes in crop productivity and changes in market prices in the agribusiness system. Along with natural and climatic factors, socio-economic factors also affect the change in crop productivity in the agribusiness system. In other words, an increase (or decrease) in productivity may not lead to a symmetrical change in prices. Moreover, the low level of determination coefficients is objectively higher than the level and methods of state regulation of the economy as a whole, including the agribusiness system; the degree of development of productive forces; the level of

food security of the country; The balance of payments depends on the situation in terms of quality and quantity and a number of other factors. Similar studies conducted in the Republic of Azerbaijan have shown that such dependence is not so significant at this level [9, 10, 11, 12, 13, 14, 15]. It should be noted that the dependence analyzed is less on a regional scale. The results of the correlation-regression analysis of the factors on which the market prices of plants depend in the agribusiness system confirm this [16].

2. THE NECESSARY FOR SPECIAL PROGRAMS TO SUPPORT ENTREPRENEURS

According to the results of analytical research, the fact that the prices of products in the agribusiness system do not depend on productivity, on the one hand, allows entrepreneurs to hope that its price will increase in the years when the total harvest of a particular crop decreases. On the other hand, the lack of this dependence can have a very negative impact on producers' incomes, and even in years of low productivity, those producers may go bankrupt if prices fall [1, 17, 18, 19, 20]. Thus, as a result of the low dependence between product prices and productivity in the agribusiness system, the high volatility of entrepreneurs' incomes makes it necessary to develop a special program to keep entrepreneurs' incomes stable. The purpose of this program is to ensure the stability of incomes of entrepreneurs in the agribusiness system of the country and the formation of the food market. This can create conditions for sustainable reproduction in the agribusiness system, taking into account the selling prices and productivity of plants. The main tasks of the recommended program are as follows:

- stability of business organizations;
- raising prices and productivity, as well as the necessary levels of financing in unfavorable years;
- development of a methodology for assessing the level of annual financial allocations required for the implementation of the program;
- creation of a mechanism for distribution of financial resources allocated for this program;
- control over compliance with the terms of the program.

2.1. Mechanism of program implementation

In the first stage, the list of main crops in the agribusiness system is determined by taking into account the following two factors in the regions of the Republic of Azerbaijan:

- the degree of dependence of the selling price on productivity (for plants included in the program, this dependence is negligible, the coefficient of determination is less than 0.85);
- The share of production of this or that product in the structure of the gross output of the crop sector as a whole (the share of plants included in the program is more than 8-10%).

It is clear from our research that the program of income support in the agribusiness system of the Republic of Azerbaijan should include the following crops: autumn wheat, barley, sunflower, sugar beet, cotton, etc. In the second stage, a guaranteed minimum price is determined for each plant, which ensures the average productivity of plants included in the program and the profitability of production at the level of 15-20%. In the course of our research in the regions of the republic, we have determined the average productivity of the above-mentioned plants over the past 30 years, as well as the minimum selling prices of these products. In the third stage, the agribusiness system determines the conditions for the state to compensate the difference between the minimum income of entrepreneurs and their actual income. Based on the study of foreign experience in the management of such programs, we concluded that at the current stage of agribusiness development in the Republic of Azerbaijan, the amount of income compensation, defined as the difference between actual and calculated income, will be economically justified [12, 21, 22].

2.2. Volume and sources of financing

The amount of funding is determined individually for each region and for each plant, taking into account the dynamics of productivity and prices in previous years, as well as the likelihood that revenues will fall below the critical level. We propose to use a retrospective assessment based on an analysis of the working mechanism of the relevant program for 1991-2021 when planning the amount of financial resources required. Taking into account the planned structure of arable lands, it is possible to predict the average and maximum annual amount of compensation required in terms of financing the proposed program to support the income of entrepreneurs in the agribusiness system of the country. In accordance with all the above, it can be concluded that for a number of objective reasons, there is a need for systematic support of the income of entrepreneurs in the agribusiness system by the state. The program we propose to support the income of entrepreneurs in the agribusiness system can help solve this problem. In the future, it is necessary to improve this program and turn it into an agribusiness income insurance program.

3. THE IMPORTANCE OF PRICE REGULATION IN THE DEVELOPMENT OF AGRIBUSINESS

In the context of market relations, the efforts of state and local self-government bodies should be aimed at improving the mechanism of state support to entrepreneurs and the market in order to increase the efficiency of the agribusiness system of the Republic of Azerbaijan. Price policy plays an important role in the system of economic regulation of the state. The state must both influence the process of price formation and participate in the regulation of the food market by creating economic conditions for the development of production in the required volume and in the required proportions. In this case, the price is not an object of state regulation, but a means of it. The basis of state policy in the agribusiness system is, on the one hand, the proclamation of the principle of free pricing adapted to solvent demand, on the other hand, the application of the mechanism of regulation of supply prices, including collateral, target, limit and other prices. This price system has yielded positive results in countries with developed market relations. However, the contradictions in the existing normative documents on price formation are very slow to create a complete, interconnected price system in the agribusiness system. In addition, the implementation of this system requires significant costs. In modern economic conditions, we recommend that only guaranteed supply prices be applied to the main types of prices regulated in the Republic of Azerbaijan [1]. At the beginning of each year, a food corporation, which needs to be established for the development of the food market and state regulation in the interests of entrepreneurs in the agribusiness system, must conclude quarterly contracts with entrepreneurs for the sale of agricultural products at guaranteed prices. In the agribusiness system, entrepreneurs must be paid an advance of 50% of the value of this product in the form of cash, promissory notes or material and technical resources (fuels and lubricants, seeds, mineral seeds) necessary for the preparation for spring field work. Strict calculations must be made when the product is handed over to the food fund. Secure supply prices should offset the costs incurred by farms and ensure that they make a profit. However, the use of these prices should have a practical impact on the income of entrepreneurs in the agribusiness system as a whole. To do this, the following must be done: first, the volume of procurement for public needs must correspond to the total volume of production; second, there must be budget funds for procurement in the regional food fund; third, farms must sell the remaining produce at a price higher than the cost of production. The study of the scope and principles of guaranteed prices has revealed another aspect of this problem. The price of raw materials purchased at high security prices exceeds the price of the final product, and this product cannot compete with goods imported from other regions.

Thus, the extremely high purchase prices in any region, of course, can lead to higher prices for flour and bread. Processing plants can buy cheaper grain imported from abroad to maintain the current price level and the purchasing power of the population, while grain purchased from local entrepreneurs can remain in warehouses. In the agribusiness system, the minimum guaranteed prices for products delivered to the food fund offered by entrepreneurs may be higher than the approximate prices set by the Ministry of Agriculture of the Republic of Azerbaijan at that time, which will cause great difficulties in selling those products. From the above, it can be concluded that in modern economic conditions, the use of guaranteed prices as a mechanism to support entrepreneurs in the agribusiness system is not yet effective enough, because the state is not able to protect the entire product market with guaranteed prices. In addition, the lack of working capital, price disparities, low purchasing power of the population, etc. Due to these factors, there is an unfavorable situation in agricultural production. Only after this crisis is resolved is it possible to apply the regulator as a guaranteed supply price. In the future, the function of stabilizing the agricultural market can be entrusted to guaranteed prices. The mechanism of this function is based on the fact that products are already purchased from entrepreneurs through low-cost purchases (interventions). If these prices are high, it is practically impossible to buy the product, because the state will not be able to buy the whole product. This means that guaranteed purchase prices can be used for interventions if these prices are significantly lower than average market prices. Therefore, the basis for determining guaranteed prices should not be the costs of all farms, but only the costs of efficient farms. Purchase of products to the procurement fund should be carried out at minimum supply prices, and sale of products from that fund should be carried out at maximum supply prices. In this case, the minimum supply prices must be above market prices and the maximum supply prices must be below market prices. Supply operations in the food market allow stabilizing the price situation, balancing seasonal price fluctuations, as well as sharp price fluctuations due to excessive or very low supply. In addition, if the procurement intervention procedure is simplified compared to the currently proposed procedure, ie if there is a producer who grows grain on the one hand and a buyer representing the state as partners, then the effectiveness of these interventions will be higher. The absence of intermediaries, the establishment of suitable supply points for entrepreneurs who buy grain at the announced price, would allow entrepreneurs to keep their incomes at a pre-determined level. In order to make the solution of the problem of price changes of products more effective in the agribusiness system, commodity-purchasing interventions and customs-tariff regulation measures should be coordinated. In this case, in parallel with government interventions, the agribusiness system may apply a system of measures to regulate the import of relevant types of products and, depending on the balance, provide for measures to stimulate exports when prices fall and imports when prices rise. Export duties should be different depending on the price difference in the world market and the domestic market. For products whose domestic market prices are higher than world market prices, it is advisable to apply export subsidies and import duties. The same approach can be applied to products whose prices remain low in the world market. At present, a clear customs policy regulating operations related to the products of the agribusiness system is necessary. For example, in order to prevent the uncontrolled export of agricultural products whose prices are lower than world market prices, strict border controls must be exercised over the export of those products. Experts note that in the conditions of acute shortage of mineral fertilizers in the Republic of Azerbaijan, these fertilizers are subject to large losses [12, 21, 23, 24]. As a result of unjustified losses of mineral fertilizers, the country loses a significant amount of grain annually in grain equivalent.

4. APPLICATION OF THE PRINCIPLE OF COLLATERAL IN THE PROCUREMENT OF PRODUCTS IN THE AGRIBUSINESS SYSTEM

The collateral system should be widespread in the agribusiness system. Collateral operations can be carried out with the support of the state to clear the market of excess products. In this case, the credit rates that allow entrepreneurs to get a loan in the agribusiness system will act as a price. Collateral prices (rates) from the minimum supply prices to keep the loan, interest payment on the loan, etc. the amount of expenses should be as low as possible. If the producer decides to keep the loan, the goods become the property of the procurement agency, but if the producer decides to sell his product on the market, he must repay the loan. In the agribusiness system, collateral lending for products can take the form of cash and commodities, advance payments (with collateral for future products) and interventions. Entrepreneurs who have concluded an insurance contract may be given priority when future products are pledged. The most likely agricultural product to be pledged is grain [22]. In addition, the seeds of oilseeds, wool, sugar and sunflower oil can be used as collateral in the documents currently under discussion. The application of the principle of collateral in the procurement of products in the agribusiness system will create conditions for the following:

- to ensure timely receipt of credit resources by entrepreneurs in the agribusiness system by pledging their products;
- to guarantee the sale of products at pre-announced prices;
- to weaken the monopoly pressure on entrepreneurs in the agribusiness system by procurement, processing enterprises and trade organizations;
- to accumulate product stocks for the purpose of operative intervention in order to stabilize the food market and keep prices at a socially acceptable level, etc.

5. THE ROLE OF THE FINANCIAL MECHANISM IN STIMULATING BUSINESS DEVELOPMENT

The current mechanism of commodity lending needs to be improved. To do this, the state must control the prices of material and technical resources, which act as a commodity loan. These prices should not be higher than the average level of prices in the respective regions. In order to increase the competitiveness of the market and to ensure that borrowers choose the most profitable lender for them, suppliers of commodity credit resources should be selected on a competitive basis. This is necessary because the effect of the supply and demand balancing mechanism weakens when the government lends goods, and the effect of these mechanisms increases when competition between suppliers is stimulated or oriented to prices in ordinary trade. In the agribusiness system, agrarian credit policy faces special challenges in providing long-term loans to economic entities with different categories of ownership. The problem of long-term investments and their financial and credit security is still relevant in the current situation. High interest rates and a maximum loan repayment period of 2-3 years do not allow businesses with different categories of ownership in the agribusiness system to use long-term loans as a source of extensive reproduction. Such a loan is almost never used, as it is not profitable for businesses operating in agriculture. The agribusiness system needs a special monetary system that is relatively well supported by the state. Concessional credit should serve to make this area profitable. This will ensure the repayment of the loan, put an end to the practice of writing off large amounts of public debt and prolonging their term. Credit cooperatives and partnerships (mutual credit assistance groups, mutual credit societies, credit unions, etc.) could be a promising organizational form of lending to entrepreneurs operating in agriculture. In developed countries, such financial institutions are an integral part of the banking system, which provides loans for both production and rural infrastructure. In the agribusiness system, state support paid directly to the budget in the form of subsidies and compensations to entrepreneurs plays an important role in the system of economic regulation of the agricultural

sector. The need for state support for entrepreneurs in the agribusiness system is largely due to the fact that subsidies and compensations paid for the supply of agricultural products reduce the value of that product for the processing industry and trade. This allows the product to fall in price in the food market and increase the solvent demand of the population. Thus, these subsidies and compensations can be considered as indirect subsidies to consumers of products in the agribusiness system. We would like to note that subsidy support in the agribusiness system is an important element that stimulates the development of entrepreneurship. Unfortunately, the current system of subsidies and compensations does not create incentives for the effective operation of businesses. At present, in practice, the compensatory-cost approach to the distribution of financial resources allocated to the agribusiness system prevails. As a result, farms that use resources less efficiently usually receive more subsidies, and vice versa. Of course, this situation does not create conditions for the economic interest of entrepreneurs in the agribusiness system to increase production and reduce costs. At the same time, if we look at the practice of providing financial assistance to the agribusiness system of countries with developed market relations, we can see that incentives are more effective for entrepreneurs with high incomes [25]. For example, in the US agribusiness system, 326,000 peasant farms (15.5% of the total number of farms), each producing more than \$ 100,000, produce 77.4% of the commodity output in the agribusiness system, and the state 57.6% of all subsidies from the state budget are given to these farms, and 309,000 peasant (farmer) farms, which sell products worth 40-100 thousand dollars a year, receive only 25.2% of subsidies. At present, the main problem is that a large part of the total amount of subsidies and compensations paid to entrepreneurs in the agribusiness system does not directly depend on the results of economic activities of businesses. This includes energy resources consumed by businesses, mineral seeds, plant protection products, feed, etc. Refers to different types of costs in the form of subsidies and compensation. Moreover, in the case of the application of fixed standards, the distribution of business entities according to the level of resource costs for the production of each unit of product is not taken into account. Therefore, the excessive costs of a number of businesses, and sometimes just their negligence, are often covered up, there is a general "equalization", a decrease in interest in the efficient organization of production. A similar situation arises in the field of sales prices. The current rule does not encourage the search for new sales channels at higher prices, as the subsidy is paid only for the product sold for state and regional needs. Therefore, it is advisable to consider the possibility of making payments regardless of sales channels. Today, the problem of selling high quality products is quite relevant, because the issue of creating incentives to increase the quality of products sold through the subsidy mechanism has not been developed. In the past, subsidies were increased for high-fat milk and fatter cattle, but now there is no such rule. In our opinion, from the point of view of the approach to the payment of subsidies, the use of indicators such as the number of livestock, the volume of production as criteria for the distribution of funds is not very effective. The disadvantage of these criteria is that their impact on market conditions and the formation of financial results of business entities is not taken into account in practice. As a result, these approaches do not correspond to the current stage of development of the agribusiness system. Such negative situations can be eliminated on the condition that when allocating subsidies, the criteria related to the financial results of entrepreneurs in the agribusiness system should be taken into account and subsidies should be used to increase production efficiency.

6. DIRECTIONS OF REGULATION OF ENTREPRENEURSHIP IN THE AGRIBUSINESS SYSTEM IN MODERN CONDITIONS

The focus on value in the distribution of subsidies and compensations is based on the fact that market relations, the impact of consumer demand and product prices increase in the context of reduced state support for entrepreneurs.

Income is not only a source of production development, but also a social basis that forms a certain level of material well-being and social security of workers. In the system of economic support based on value indicators in the distribution of subsidies and compensations, the largest financial assistance will be received by entrepreneurs who can use it effectively. This will help develop healthy competition among businesses, increase the volume and quality of products, reduce production costs and reduce consumer prices. It should be noted that in the agribusiness system, it is more in the interests of the state to direct most of the budget funds to payments related to the stimulation of the final results and efficiency of economic activity of entrepreneurs. We will try to solve the problem of optimal distribution of subsidies and cost compensation on the example of specific regions. As in the country as a whole, subsidies and compensations allocated to entrepreneurs in the agribusiness system of different regions form only a general idea of their situation, ie do not allow to determine the principle of distribution of subsidies and compensations, nor their impact on production efficiency. This, in turn, contradicts the announced objectives of the allocation of these funds, including the stabilization of production and increase its efficiency, food security, support for price parity between agriculture and other sectors, the convergence of incomes of agricultural and industrial workers. In such an economic environment, farm managers are unable to predict the amount and use of subsidies and compensations, and to anticipate their impact on profits and other farm performance indicators. Subsidies and compensations, which are one of the means of state regulation of the agribusiness system in the country, must also be an economic lever for each individual farm. However, they can be such a lever only if the mechanism of their distribution is clear to the farms and it is possible to calculate the necessary subsidies and compensations for the next production period. Subsidies for products and compensation for excess costs should be non-cost in nature as one of the forms of economic support to entrepreneurs in the agribusiness system, as this creates an incentive for the efficient use of economic resources. The efficiency of resource use can be assessed on the basis of indicators such as the cost and price of the product, the profitability of production and profit. The cost of the product is a classic value indicator. It depends on the total production costs, but in this case the lack of direct contact with the market should be considered a serious shortcoming of this indicator. The price of the product depends on the supply and demand of the product in the market. However, in modern economic conditions, price is also an indicator of the level of state regulation of the economic mechanism. Therefore, price is virtually independent of real production costs, ie it is isolated from economic resources and cannot be selected as an indicator of their efficient use. Profitability (R) is expressed as the ratio of profit (M) to the cost of the product (D) as follows:

$$R_i = M_i / D_i = (Q_i - D_i) \times N_i / N_i \times D_i = Q_i - D_i / D_i$$

Here, Q_i , D_i – is unit price and cost of the product, respectively;

N_i – amount of produced i product.

As it is known from the above formula, the profitability of production is an immeasurable quantity and does not depend on the amount of product produced. Thus, the direct use of this indicator leads to the allocation of equal amounts of subsidies to farms with the same level of profitability and different amounts of output. This property of profitability does not allow it to be used as an indicator of the efficient use of resources, although the distribution of subsidies can be taken into account when assessing the effectiveness of farm management. Only one of the indicators listed above (profit indicator) is free from such shortcomings. Profit is an indicator of efficient use of economic resources. This allows profits to be used not only as an indicator of optimal production planning, but also as a criterion for the distribution of subsidies. In order to maximize these benefits, taking into account subsidies, it is necessary to analyze the cost of production.

7. THE RESULT OF THE ANALYSIS OF COSTS IN THE AGRIBUSINESS SYSTEM

Let's analyze the production costs in the agribusiness system in terms of the possibility of calculating subsidies and compensations in accordance with these costs. During the analysis, it is advisable to proceed from the following provisions:

- it is necessary to choose costs that depend less on the internal factors of the economy and the conditions of its management;
- selected costs should be a significant part of the total production costs;
- Subsidies and compensations for selected items should stimulate farms to reduce costs on those items;
- subsidies and cost compensations must provide maximum efficiency (maximum profit, maximum profitability or minimum specific production costs of the farm);
- Subsidies and compensations in the agribusiness system should not deprive entrepreneurs of market incentives for agricultural production.

The cost of production in the agribusiness system includes the following items: wages and deductions; payment for seeds, planting material, fertilizers, plant protection products, feed, raw materials and supplies, services provided by external organizations and work performed; costs for the maintenance of fixed assets, including oil products, depreciation allowances, costs for the repair of fixed assets, costs associated with the organization and management of production; insurance payments; losses due to loss of animals and destruction of crops; other expenses. After a comprehensive analysis of all elements of costs for the purpose of entrepreneurship in the agribusiness system of the Republic of Azerbaijan, we conclude that the basis of production costs are material costs, and among them the least dependent on economic activity are costs for seeds and planting material; feed, including industrially produced feed; mineral fertilizers; oil products; electricity; fuel; soil fertilization, chemicalization and other measures; zootechnical and veterinary services; purchase of breeding animals. The results of this analysis do not contradict the officially accepted system of distribution of subsidies and compensations by production costs, but the purpose of this study is to optimally distribute subsidies and compensations at the appropriate level, to ensure their maximum efficiency and effectiveness. We would like to note some results that will form the basis of our next proposals:

- 1) Due to the long production cycle, its regulation by determining subsidies and compensations based on the results of work during the year is characterized by a large delay factor of the control signal, ie this signal no longer affects production in the current year;
- 2) In accordance with the principles of optimal management, the regulatory impact should be distributed over time throughout the production cycle. In this case, the efficiency of regulation will be higher;
- 3) Subsidies and compensations should be planned in advance, taking into account the forecasting and planning of production for different types of products;
- 4) It is necessary to set a limit level of subsidies and compensations. If the sum of subsidies and compensations does not exceed this level, they are meaningless in terms of regulation, ie they are purely charitable. The limit level of subsidies and compensations is determined based on the sensitivity of the model. If the level of subsidies and compensations decreases from year to year, then the model is sensitive to that price. The reduction of subsidies and compensations should take place at the expense of increasing profits on the farms from which they are acquired. The distribution of subsidies and compensations should be planned taking into account the profits of farms. If the profitability of farms is higher than 30% (this is the minimum level required for large-scale reproduction), it is not advisable to allocate subsidies and compensations to these farms, because they can do it on their own.

Subsidies should be directed to farms with higher yields (other than those mentioned above), higher commodity output and planned production than in the previous year;

- 5) The final report of subsidies and compensations should be made after the sale of the product (at the end of the year) and directed to those farms that have not implemented their plans despite subsidies and compensations. In this case, the remaining amounts must be adjusted accordingly.

8. ENTREPRENEURSHIP REGULATION MODEL IN THE AGRIBUSINESS SYSTEM

The proposed model ensures absolute transparency and accurate calculation of subsidies and compensations. Taking into account the above, the solution of the problem through the general management model of entrepreneurship in the agribusiness system consists of three stages:

- The first stage is to solve the problem of production planning in real conditions (or in the conditions expected for the forecasted planning period) and to evaluate the efficiency of such production.
- The second stage is the assessment of the level of production efficiency, taking into account the existing system of distribution of subsidies and compensations and the conditions of the first stage.
- The third stage - the solution of the problem of optimal distribution of subsidies and compensations, taking into account the conditions of the first stage and the initial data.

Based on the results of the first stage of the calculation, a decision is made on which areas and which types of products produced in those areas need subsidies and compensations, taking into account the current or projected market prices of the product. In this case, the second step is to evaluate the proposed method for the distribution of subsidies and compensations by comparing it with the existing distribution system based on the gross profit of the region or district under study. In the future, this stage of reporting may not be performed when the issue of model (method) evaluation is not on the agenda. In the third stage, two types of problems can be solved: subsidies and compensations should be distributed according to the given level in order to get the maximum profit. The required amount (level) of subsidies and compensations can be obtained on the basis of the current level of profit and the proposed system of distribution of subsidies and compensations. The special case of this issue is to receive the required amount of subsidies and compensations, ensuring that there is no damage both by industry and by type of production. Thus, the proposed model of regulation of agricultural production by addressing the optimal distribution of subsidies and compensations justifies the need to adjust the existing mechanism of subsidizing entrepreneurs in the agribusiness system in order to increase the efficiency of the use of state support. In this case, the transition from distribution to targeted distribution must be ensured, provided that the efficiency of demand and consumption is justified. Preference should be given to entrepreneurs who ensure the sustainability of the agribusiness system and improve their financial situation. At the same time, it should not be overlooked that the effectiveness of subsidy support will remain low unless the state creates conditions to increase the competitiveness of the agribusiness system and stop the outflow of funds from this system.

ABSTRACT

The study of world experience of state support for entrepreneurs in the agribusiness system of the Republic of Azerbaijan has become one of the necessary issues. It is substantiated that there is a need to study the practice of developed countries with competitive agriculture, especially North America and the European Union, in order to effectively regulate the state, using the basic principles of market economy in the agribusiness system in our country. The article discusses the mechanism of price regulation in the agribusiness system of these countries. At the same time, it is noted that in terms of the practice of foreign countries in the field of state regulation of the agribusiness system, the study and generalization of government programs implemented in the United States is of great interest. In this regard, the importance of agricultural insurance programs in those countries in order to provide state support to entrepreneurs has been studied. Another group of popular government programs in the United States is federal programs to support the price and income of entrepreneurs in the agribusiness system. In addition to the government programs mentioned in the article, there are many smaller programs, most of which are short-term. The main regulatory directions of the state policy to support entrepreneurs are widely reflected in the article. In developed countries, there are diversified systems that support agribusiness. The agrarian policy of most countries is to ensure maximum food security of the state, to maintain the economic situation in the agribusiness system, to ensure a minimum level of profitability that will attract the industry in terms of investment, to prevent overproduction, to protect the domestic market, to ensure competitiveness of local entrepreneurs. and so on.

Keywords: *agribusiness system, entrepreneur, experience, EU, member countries, state support, USA*

1. INTRODUCTION

As a result of successful economic reforms in the Republic of Azerbaijan, despite the existence of favorable economic conditions, a number of important problems arise in the direction of deepening economic relations due to the impact of the current global crisis in the process of continuous changes in the world. In order to solve these problems, the modern realities of economic relations in the agribusiness system of our country, its assessment and development

prospects should be studied [1, 2, 3, 4, 5, 6]. From this point of view, the study of the world experience of state support for entrepreneurs in the agribusiness system of the republic has become one of the necessary issues. The development of agribusiness in our country and ensuring food security of the population, the production of agricultural products and related industries directly depends on the application of positive experience in our national economy by studying the world experience of state support for entrepreneurs in the agribusiness system. In this regard, the subject of research is relevant.

2. MECHANISM OF PRICE REGULATION OF PRODUCTS IN THE AGRIBUSINESS SYSTEM OF DEVELOPED COUNTRIES

The practice of developed countries with competitive agriculture, mainly North America and EU member states, should be studied in order to effectively regulate the state using the basic principles of market economy in the agribusiness system in the Republic of Azerbaijan [7, 8, 9, 10]. In general, in the developed countries of the world, especially in the EU member states, three directions of budget support for the agribusiness system have been established. These are direct payments to entrepreneurs from the budget, support for rural development, structural support for agribusiness. Price support for entrepreneurs has a special place in the agribusiness system of the EU member states. Thus, the relatively high level of target prices provides a certain income for medium and large agricultural enterprises. At these prices, public procurement agencies buy their products from agricultural enterprises. The government's purchase of products at predetermined prices is an effective means of preventing market prices from falling below the minimum. The agribusiness system of Western European countries has a guaranteed price mechanism for products. In Finland, for example, there are three types of prices: targeted, subsidized and additional. The Ministry of Agriculture and Forestry sets guaranteed prices every year, and then approves them in agreement with the central structure of entrepreneurs in the agribusiness system. These prices can change depending on the level of inflation throughout the year. In the agribusiness system of the southern region of the country, which has more favorable conditions, the price model based on the cost of the main types of products is taken as a reference for target prices, and subsidies are provided in the regions with more difficult conditions. Subsidy prices are the same as guaranteed prices, but apply to exported agricultural products. When the cost of export products is higher than the subsidy prices, agricultural enterprises do not receive compensation for their losses. Moreover, if the export products exceed the norms, the export surplus is not paid by subsidy prices. The agribusiness system provides additional prices for products produced in excess of existing state norms, which vary depending on the current market situation in the relevant region of the country and are usually cheaper than guaranteed prices. Although maintaining prices in the agribusiness system is a heavy burden on the state budget and taxpayers, this price stability ensures the country's food security and production potential in the agribusiness system. For example, in Switzerland, although food prices are higher than world prices, the population accepts this because they understand the negative consequences of lower prices for agriculture and, consequently, for the economy as a whole. It is clear from practice that in modern times, in developed countries in terms of science and industry, the agribusiness system is supported, albeit at a certain cost to the state budget [11, 12, 13, 14, 15, 16, 17]. One of the main criteria for state regulation of the agribusiness system in the EU member states is the level of budget support for the prices set by agricultural enterprises for products. This indicator reflects the ratio of all budget prices and non-price subsidies for the production and sale of various products, including exports, to the prices of these products by agricultural enterprises [18]. To this end, the state, which regulates the production and sale of products through subsidies, affects the income of agricultural enterprises through prices on the one hand, and their expenditures through preferential taxes and loans on the other.

Usually, budget subsidies are allocated only to agricultural enterprises participating in government programs. In general, in the agribusiness system, the market recovery of the vast majority of products (86-96%) in member countries, where market prices are constantly monitored by EU structures, is achieved either by creating a balance between supply and demand and regulating market prices to a certain level [19]. The general basis of pricing in business organizations operating in the agribusiness system of foreign countries is the coordination of socially necessary costs for the production and sale of purchase prices for agricultural products. In this case, the level and dynamics of world prices are taken into account as much as possible. The main task of the price is to regulate revenues for the further development of agribusiness. The pricing system provides for current monitoring of prices for means of production, income and expenses in agribusiness, prices for products (works and services). Currently, the increase in food prices observed in almost all EU member states is largely offset by a faster increase in incomes. Thus, consumer demand for food is determined not only by the level of income of the population, but also by the price of food products and services. Here, the importance of budget support for the prices of agricultural enterprises is growing. A legal framework has been established for the purpose of state regulation of prices, and statistics on the level and changes in prices are regularly published. This information is usually used to regulate and index revenues. In EU member states, subsidies account for 45-50 percent of the value of agricultural output, while in Finland and Japan they account for 70 percent [18]. Budget support for the agribusiness system in EU member states has changed in recent years. Thus, for example, in 1986-1988, 82% of direct payments were spent in the agribusiness system to keep market prices for products, in 2014 this figure decreased to 67%, and the excess of producer prices over the maximum price decreased from 56% to 31%. The share of public funding in rural areas in the budget support provided to the agribusiness system increased from 13% (1986-1988) to 18% (2011-2014) [20]. Note that this type of support is convenient not only for the producer, but also for the consumer. In such a situation, training and professional development, information and consulting services, and scientific research are also funded. In general, in 2014, the state support of the agribusiness system in the EU member states accounted for 65% of agricultural GDP [21]. One of the main concepts of food pricing in developed countries is to move from the traditional principle of producing and selling products for profit to the principle of marketing, which aims to study and meet the needs of consumers. In fact, according to the marketing principle of pricing, the share of intermediate rings in the retail price of the product should be reduced. In this sense, we believe that the Canadian practice of successfully combining state and cooperative management in agricultural production is more interesting. The main goal here is for agricultural enterprises to earn maximum income by selling their products. Marketing associations (consulting centers) operating in all regions of the country are established by entrepreneurs specializing in a particular product and operate on a community basis and thoroughly study consumer needs in order to expand product sales. These structures have broad powers established by law. For example, the Manitoba Provincial Potato Assembly imposes a single price, and sellers who do not comply with that price are fined two to three times the price [22]. In Canada, there are similar structures at the state level, and together with the relevant areas of regional structures, as well as the Ministry of Agriculture and Food, develops economic standards for regulating agricultural production. The ministry liaises with marketing councils through self-financing trading agencies. So, for example, agencies have been established to sell eggs, poultry and broiler eggs for poultry products. These agencies set sales norms by region, control the market, and do marketing and advertising. The governing bodies in this area are the Canadian Dairy Industry Commission and the Canadian Grain Committee.

The budget of the Committee, which is mainly engaged in grain trade in foreign markets, is formed at the expense of commission fees from sales, but these fees should not exceed 3 percent. For agricultural enterprises, 100 percent profit is provided in grain production.

3. AGRICULTURAL INSURANCE PROGRAMS FOR THE PURPOSE OF STATE SUPPORT TO ENTREPRENEURS

In our opinion, in terms of the practice of foreign countries in the field of state regulation of the agribusiness system, the study and generalization of government programs implemented in the United States is of great interest [8, 23, 24, 25, 26, 27, 28]. Thus, according to the US Department of Agriculture, in 2015, up to 1/3 of the country's agribusiness entities with different property categories received state payments in various forms. Amendments to the U.S. Agriculture Act of 1949 and its successor, the Farm Bill of 2002 (Farm Bill 2002) Act, as a continuation of that law. price support measures, as well as preferential bonds and payments under various programs and measures to protect the environment and soil fertility.

3.1. Agricultural insurance programs in the US agribusiness system

The United States is the world's largest insurance business. US insurance companies control up to 50 percent of the world's industrialized markets. Thus, insurance is the only field of activity in this country that is not regulated by antitrust laws. In 1930, the US Congress decided to fund the State Product Insurance Program, which was aimed at reviving the agribusiness system after the Great Recession. Founded in 1938, the State Product Insurance Corporation (FCIC) under the US Department of Agriculture is still operating effectively and is now managed by the Risk Management Agency. With the adoption of the State Product Insurance Act in 1980, subsidies were introduced to attract private insurance companies, and there was an opportunity to increase insurance coverage. Currently, 14 private insurance companies (authorized insurers) employing more than 27,000 insurance agents are engaged in concluding insurance contracts. Authorized insurance companies can develop insurance products and introduce new ones. However, products participating in the program must be approved by the Risk Management Agency (RMA). The participating companies must also submit annual action plans for approval by the Risk Management Agency. The plan includes information on whether the company is able to cover possible losses on its liabilities, as well as on the classification of certain types of risks for subsequent insurance through the Risk Management Agency. In addition, insurance companies receive subsidies through the Risk Management Agency to cover administrative costs, as well as loss management costs. Reinsurance is also carried out through the Risk Management Agency, by transferring part of the risk and insurance premium to the relevant reinsurance funds. The amount of subsidies and the terms of reinsurance are specified in a standard reinsurance agreement signed by all insurance companies participating in the program. The fact that the insurance program is very effective and colorful attracts agricultural enterprises to these programs. Thus, in the United States in 1997, agricultural enterprises insured 73.8 million hectares of arable land, and in 2014 - 88.3 million hectares, or 62% of all arable land [23]. *The Multiple Peril Crop Insurance (MPCI)* program is one of the oldest crop insurance programs in the agribusiness system, providing insurance against most natural disasters such as drought, excess moisture, flooding, hail, and storms, and more than 70 crops. Covers. According to this program, an insurance event occurs when less than the average (expected) product is taken in the previous few years. The minimum insurance amount is paid entirely from the state budget, and when less than 50 percent of the expected product is taken, the damage is compensated at the level of 55 percent of the price applied by the Risk Management Agency. Agricultural enterprises wishing to participate in the program pay an administrative fee of only \$ 100 for each type of plant they insure. This type of insurance is called "Catastrophic Crop Insurance" (CCI).

Extending the insured risks relative to the minimum risk is considered voluntary insurance. Agricultural enterprises can choose the level of risk insurance. Thus, they have the opportunity to choose the insurance coverage of the product (50-85 percent), the price (55-100 percent of the market price). This type of insurance is called Buy-up Coverage (BUP). The Multiple Product Insurance (MPCI) program allows entrepreneurs to protect themselves against the risk of production failure due to unfavorable climatic conditions. However, it is important for entrepreneurs to implement insurance programs that will protect not only crop yields, but also their products from falling market prices. In this regard, the *Crop Revenue Coverage (CRC)*, an income insurance program in the United States, has been developed and is being successfully implemented. This program allows entrepreneurs to protect their income from the decline of production, as well as the reduction of prices for their products in the market. However, not all plants in the agribusiness system can be insured under this program. In addition, a separate list of plants has been compiled for each state in the agribusiness system to be insured with CRC. In order to participate in this program, agricultural enterprises pay an administrative fee of \$ 30 per plant to be insured. According to the program, the insured event occurs when the income after the harvest (actual productivity × the market selling price at the time of harvest) is less than the minimum guarantee amount, and the insurance company pays the difference. It should be noted that this program is also implemented with the close financial participation of the state. Thus, as can be seen from Table 1, in 2014, the state subsidizes more than 50 percent of the insurance premiums of agricultural enterprises in the United States.

Table 1: Measures of insurance premiums and payments on insurance programs in the USA [23]
