

Smart Innovation, Systems and Technologies

Volume 264

Series Editors

Robert J. Howlett, Bournemouth University and KES International,
Shoreham-by-Sea, UK

Lakhmi C. Jain, KES International, Shoreham-by-Sea, UK

The Smart Innovation, Systems and Technologies book series encompasses the topics of knowledge, intelligence, innovation and sustainability. The aim of the series is to make available a platform for the publication of books on all aspects of single and multi-disciplinary research on these themes in order to make the latest results available in a readily-accessible form. Volumes on interdisciplinary research combining two or more of these areas is particularly sought.

The series covers systems and paradigms that employ knowledge and intelligence in a broad sense. Its scope is systems having embedded knowledge and intelligence, which may be applied to the solution of world problems in industry, the environment and the community. It also focusses on the knowledge-transfer methodologies and innovation strategies employed to make this happen effectively. The combination of intelligent systems tools and a broad range of applications introduces a need for a synergy of disciplines from science, technology, business and the humanities. The series will include conference proceedings, edited collections, monographs, handbooks, reference books, and other relevant types of book in areas of science and technology where smart systems and technologies can offer innovative solutions.

High quality content is an essential feature for all book proposals accepted for the series. It is expected that editors of all accepted volumes will ensure that contributions are subjected to an appropriate level of reviewing process and adhere to KES quality principles.

Indexed by SCOPUS, EI Compendex, INSPEC, WTI Frankfurt eG, zbMATH, Japanese Science and Technology Agency (JST), SCImago, DBLP.

All books published in the series are submitted for consideration in Web of Science.

Preface

This book is devoted to the topic of agriculture, which is studied from three perspectives. The first perspective is agricultural economics. This book has a vivid multidisciplinary character. Agriculture is considered not only from the positions of agricultural disciplines but also from the positions of economics and management in agriculture, regional economics (in Part Three, agriculture is connected in connection to the regional economy), state management (economic policy), management of innovations, and ICT (as a sphere of technical sciences).

The second perspective is sustainable development. The book elaborates on the priority of agriculture for implementing SDG 2, i.e., provision of food security. The book also pays a lot of attention to SDG 9 in the aspect of the importance of post-industrialization (transition to Industry 4.0 in the process of the Fourth Industrial Revolution), high-tech infrastructure, and smart innovations for the development of agriculture and provision of food security.

The agricultural economy is also considered in this book as a source of economic growth, and thus, attention is paid to SDG 8. Provision of food security is studied not only as a macro-mission of the agricultural economy but also as a micro-mission of the subjects of agricultural entrepreneurship. As shown in the book, this micro-mission is implemented through corporate social and ecological responsibility, which draws a connection between this book and SDG 12.

In this book, the technologies of agricultural (farm) production are improved for their adaptation to climate change, so the book is connected to SDG 13. Protection of the environment and ecological agriculture is considered in several chapters, which ensures the book's connection with SDG 14 and SDG 15. The book elaborates and analyzes the experience and problems of food security provision in developing countries, due to which the book contributes to SDG 10 (offering recommendations for the reduction of countries inequality in the development of the agricultural economy and level of food security).

In Part Three, agriculture is considered in the connection to the regional economy and treated as a source of the region's growth and economic (food) security. The authors determine perspectives and offer recommendations for the development of

rural territories based on smart technologies in agriculture (transition to digital agriculture). Thus, the book has a clear connection to SDG 11. Other SDGs are also considered in the book.

The third perspective (perspectives are enumerated by the order, not by importance in the book) is smart innovations. Smart innovations, cyber-physical systems, and digital technologies in agriculture are the main message of this book. It demonstrates that agriculture must not stand aside from the Fourth Industrial Revolution. The agricultural economy must receive a digital impulse for development and perform a transition to Agriculture 4.0. However, this requires special (adapted to the specifics of agriculture) smart innovations, systems, and technologies, which are developed in this book. Organizational and economic and managerial recommendations for their implementation are offered in this book.

The significance of the given topic is very high since agriculture is under bilateral pressure, which stimulates its digital modernization. On the one hand, the growth of global demand for food and unfavorable change of climate, which reduces the efficiency of agricultural production, increase the deficit of food and aggravate the problem of food security provision.

On the other hand, the Fourth Industrial Revolution is gathering pace and already covers most spheres of the economy and most countries of the world. The result of the described pressure is the “institutional trap” of preservation of the third technological mode in agriculture. Low susceptibility/inclination for innovations in agriculture and deficit of financing (government subsidies and private investments) leads to its isolation from the Fourth Industrial Revolution.

Delayed technological development of agriculture (compared to other spheres of the economy) further reduces its attractiveness for private investors, which deprives it of resources for innovations. The intense growth of demand and deficit of food leads to the forced increase of government financing for the artificially (by the government’s initiative) started digital modernization of the agricultural economy. Here, sample/standard (not innovative) and/or borrowed from other spheres of economy (not adapted to the specifics of agriculture) technologies are used.

With the existing approach, digital modernization of the agricultural economy is very slow, has low effectiveness, and does not allow solving the problem of food security provision (making a small contribution to sustainable development). Rural territories fall into decline and are peculiar for the reducing quality of life. The novelty of this book consists in offering, elaborating, and describing an alternative approach to the transition to Agriculture 4.0, which envisages the following:

- use of the leading technologies and implementation of smart innovations in agriculture;
- use of not conventional but adapted to the specifics of agriculture (or developed especially for it) digital technologies.

The advantage of the new approach is, first, allowing overcoming the “institutional trap” of the agricultural economy and ensuring its quick technological leap, which will allow for the following: (1) complex and complete solution of the problem of food security; (2) significant increase of the agricultural economy’s contribution to

implementing the SDGs; (3) provision of high investment attractiveness of the agricultural economy in the long-term. Second, the new approach allows achieving rapid development of rural territories and the reduction of their underrun (inequality) from urban territories, which, in the long-term, could start the trend for de-urbanization, as well as the development of rural tourism.

Unlike other existing publications, this book studies—in a systemic manner—the prospects of transition to Agriculture 4.0. From the positions of economics, the book provides a scientific view of digital agriculture. From the positions of management, the book describes the organizational and managerial foundations of implementing smart innovations in agriculture. From the positions of regional economics, the book determines the contribution of the transition to Agriculture 4.0 for the regional economy and development of rural territories. From the positions of state management, this book offers recommendations in the sphere of economic policy for implementing smart innovations in agriculture. From the positions of agriculture, management of innovations, and ICT, the book provides case examples, considers international experience, and offers smart innovations and digital frameworks—which are ready for implementation—for agriculture.

This book contains the leading developments in the sphere of using smart innovations in the agricultural economy from various spheres of scientific knowledge. The book is aimed at (highest to lowest priority):

1. Scholars who study the agricultural economy from positions of various disciplines: economics and management in agriculture, regional economics, state management (economic policy), management of innovations, and ICT (as a sphere of technical disciplines): They will find in the book the fundamental inventions and results of empirical research in the sphere of the prospects for implementing smart innovations in agriculture based on a new approach to regulating the agricultural economy;
2. Practitioners who deal with the agricultural economy: They will find in the book the analysis of international experience and the leading scientific and practical developments in the sphere of state and corporate management of implementing smart innovations in agriculture;
3. Educational process, in which materials of the book could be used for such disciplines as “Agriculture,” “Agrarian economics,” “Management in agriculture,” “Corporate economics,” “Regional economics,” “Management of innovations,” “Public administration,” etc.

This book is aimed to be a practical guide for implementing smart innovations in agriculture and starting its technological transitioning to Agriculture 4.0. We hope this book will be in demand not only in developed countries but especially in developing countries, which face the problems of agriculture that are studied in the book and require smart innovations for the agricultural economy. We also hope that this book will be a significant contribution to sustainable development.

On behalf of the editors and authors of this book, we would like to express gratitude to the editors of the series “Smart Innovation, Systems and Technologies”—Prof. Robert J. Howlett (KES International) and Prof. Dr. Lakhmi C. Jain (Founder KES International)—for supporting our idea and helping with its successful implementation.

Introduction

Technological progress in recent decades has had a particular impact on agriculture. The formation of market relations in agriculture has led to the contradictory nature of the model of its development. On the one hand, agricultural enterprises received complete independence from the state. Due to this, private, including venture investments, became available to them.

On the other hand, in the agricultural sector, there are some “market failures” that reduce the efficiency of market relations and hinder the innovative development of this industry. One of the “market failures” is the strategically significant non-profit mission of agriculture associated with its important contribution to food security. The fulfillment of this non-profit mission contradicts the commercial interests of agricultural entrepreneurship, whose investments in sustainable development—corporate social and environmental responsibility—often do not pay off due to insufficient effective demand.

Simultaneously improving the quality and maintaining food security at a high level while ensuring its mass quantitative and price accessibility are directly opposite entrepreneurial tasks, since the first of them is associated with an increase in costs and, accordingly, food prices, and the second task requires fixing or even reducing prices. Without government support, agricultural enterprises cannot fulfill their mission in the field of sustainable development or find themselves on the verge of breaking even.

Another “market failure” is the inflexibility of the agribusiness value-added chain. Agricultural enterprises are at the beginning of this chain and operate in a highly competitive environment due to low market entry barriers. However, enterprises located at the next stages of the value-added chain—food production enterprises and enterprises of wholesale purchasing of agricultural products—operate in conditions of much less concentration of markets with their monopolistic or oligopolistic structure.

The high bargaining power of buyers in B2B food markets and, accordingly, the low bargaining power of sellers—agricultural enterprises—do not allow them to influence market prices and limit their opportunities for technological development and innovation. The difficulty in overcoming this “market failure” lies in the fact that

enterprises at the stages of the value-added chain following agriculture are characterized by a natural (forced) monopoly/oligopoly, since an artificial increase in the number of market players is associated with high risks of reducing the quality and safety of food and therefore contradicts the idea of ensuring food security.

The “market failures” also include the continuing high dependence of productivity (efficiency) and quality of agricultural products on natural and climatic factors. This leads to high entrepreneurial risks and low investment attractiveness of agriculture in comparison with other sectors of the economy.

The described “market failures” are insurmountable in the current technological order. But the transition to a new fourth technological order opens up new opportunities for the development of agriculture. Firstly, smart agricultural innovation can improve quality and safety while maintaining or even lowering food prices, as well as increasing sharply productivity by overcoming food shortages. Due to this, based on “smart” innovations, it is possible to significantly increase the contribution of agriculture to sustainable development and harmonize the commercial and non-commercial interests of entrepreneurship.

Secondly, advanced technologies such as blockchain (distributed ledger) and ubiquitous computing (UC) enable food products to be tracked along the entire agribusiness value-added chain. This makes it possible to overcome the natural monopoly/oligopoly in the next stages of the value-added chain after agriculture and increase the bargaining power of agricultural producers. This will allow them to be more flexible and more innovative.

Thirdly, climate smart innovation in agriculture makes it possible to make it sustainable or even independent of natural and climatic factors. In this case, entrepreneurial risks are reduced many times and the investment attractiveness of agriculture increases. Consequently, “smart” innovations make it possible to ensure the high efficiency of the market mechanism in agriculture—to maintain its independence from government regulation and funding and at the same time maximize its (non-profit) contribution to sustainable development.

This is a more preferable path compared to the current practices of tightening state regulation of agriculture and expanding its state subsidies, which undermine the foundations of the market mechanism and consolidate subsidies as an integral characteristic of agriculture. However, despite the urgent need for smart innovation, agriculture is the sector of the modern economy that is least involved in the Fourth Industrial Revolution and embraced by advanced technologies.

In this regard, the problem of studying the accumulated experience of digital modernization of agriculture and the development of scientific, methodological, and practical recommendations to accelerate this modernization in the interests of mass introduction and intensification of the use of “smart” innovations in agriculture is urgent. This book is designed to solve the problem posed and aims to study the existing experience and prospects for the introduction of “smart” innovations in agriculture. The book answers the question of why “smart” innovations are spreading at a slow pace in agriculture and how to accelerate their diffusion. The book contains five parts.

The first part identifies the importance of smart innovation in agriculture for modern economic and ecological systems and provides an overview of advanced technologies, including artificial intelligence (AI) and deep learning. The second part of the book is devoted to a review and analysis of international and regional empirical experience in the implementation of smart innovation in agriculture, with special attention to the experience of Russia and the Kyrgyz Republic.

The third part is devoted to promising directions and guidelines for the development of smart innovation in agriculture according to the priorities of modern economic and ecological systems. In the fourth part, policy and management implications for the development of smart innovation in agriculture in modern economic and ecological systems are proposed and substantiated. Among the proposed recommendations are the Agriculture 4.0 model based on deep learning, as well as applied solutions for creating vertical farms based on hydroponics, deep learning, and AI as smart innovations in agriculture.

Contents

The Importance of Smart Innovation in Agriculture for Modern Economic and Ecological Systems and an Overview of Advanced Technologies	
Artificial Intelligence Technologies in Managing the Innovative Development of the Agricultural Complex	3
Gulnara K. Dzhancharova, Gilyan V. Fedotova, Sergey V. Zolotarev, Badma K. Salaev, and Zarina Yu. Yuldashbaeva

Smart Technologies in Agriculture as the Basis of Its Innovative Development: AI, Ubiquitous Computing, IoT, Robotization, and Blockchain	29
Nadezhda K. Savelyeva, Alla A. Semenova, Larisa V. Popova, and Larisa V. Shabaltina	
The Digital Transformation as a Response to Modern Challenges and Threats to the Development of Agriculture	37
Aleksandr V. Nemchenko, Tatyana A. Dugina, Svetlana Y. Shaldokhina, Evgeny A. Likholetov, and Alexandr A. Likholetov	
Smart Agriculture as a Component of Modern Economic and Environmental Systems	47
Tatiana M. Vorozheykina, Vladimir S. Osipov, Taisiia I. Krishtaleva, Aleksei V. Bogoviz, and Svetlana V. Lobova	

Smart Innovation as a Component of the Organizational and Economic Mechanism for Achieving Sustainable Development Goals in the National Agri-food System	55
Natalya A. Dovgotko, Olga A. Cherednichenko, Elizaveta V. Skiperskaya, Galina V. Tokareva, and Marina V. Ponomarenko	
Digitalization in Agriculture—A New Step in the Development of Agro-industrial Complex	65
Irina P. Belikova, Natalya B. Chernobay, Roman V. Kron, Viktoriya A. Zhukova, and Anna F. Dolgopolova	
High-Performance Agricultural Production for the Development of New Land Based on Hydroponics and Deep Learning	75
Tatiana N. Litvinova	
Concepts and Determinants of Cyclical Nature Innovation and Investment Policy in Strategic Economic Security in the Agricultural Sector	89
Anna V. Shokhnekh, Yuliya V. Melnikova, and Tamara M. Gomayunova	
Review and Analysis of International and Regional Empirical Experience in Implementing Smart Innovation in Agriculture	
The Digital Transformation of the Russian Agro-industrial Model into “Green” Economy	105
Yuriy I. Sigidov, Roman R. Chugumbaev, Adik T. Aliev, Olga S. Surtaeva, and Victoria M. Romadikova	
Problems of Investment Growth in the Agricultural Sector of the Russian Economy	113
Vlada V. Maslova, Natalya F. Zaruk, Mikhail V. Avdeev, and Maksim S. Galkin	
Strategic Analysis and Assessment of the Export Potential of Agricultural Products in the Region	123
Ilvir I. Fazrakhmanov, Milyausha T. Lukyanova, Julia V. Khodkovskaya, and Elvira R. Gimaletdinova	
Conditions and Factors of Innovative Development of Rural Areas	133
Olga N. Kusakina, Sergey V. Sokolov, Vladimir A. Doroshenko, Ekaterina G. Agalarova, and Elena A. Kosinova	
The Efficiency of Non-root Fertilizing of Soybeans with Copper and Zinc in the Conditions of the Central Zone of the Kuban	143
Irina V. Shabanova, Ivan A. Lebedovsky, and Sergey G. Efimenko	

Study of the Development Prospects of the Russian Agrarian Sector in Conditions of General Self-isolation, with the Use of Decision Support System	149
Natalia N. Skiter, Nataliya V. Ketko, Araksiya S. Spertsyan, and Evgeniya M. Solnyshkina	
Features of the Impact of Digital Technology Implemented in the Regional Agriculture of Russia on Increasing the Industry's Investment Attractiveness	157
Zhanna A. Telegina, Liudmila I. Khoruzhy, and Valeriy I. Khoruzhy	
International Features of Using Smart Technology in Agriculture: Overview of Innovative Trends	167
Anastasia A. Sozinova, Elena V. Sofina, Yelena S. Petrenko, and Stanislav Bencic	
Promising Directions and Guidelines for the Development of Smart Innovation in Agriculture According to the Priorities of Modern Economic and Ecological Systems	
Digital Technology in the Forecasting of Dangerous Hydrological Processes	177
Dzhannet A. Tambieva and Madina U. Erkenova	
Model of Digital Technology for Processing Agricultural Waste into Useful Safe Product	185
Gabdulahat M. Akhmadiev, Gennady V. Mavrin, Irina Y. Sippel, Rafik N. Sharafutdinov, and Munir N. Miftahov	
Digital Modernization of Entrepreneurship in the Market of Agricultural Machinery for Infrastructural Support of Smart Innovation in Agriculture	191
Tatiana N. Litvinova	
The Dynamics of Biological Diversity of Pests Within Agrocenoses of Agricultural Crops as a Factor of Digitalization in Plant Protection	199
Anna P. Shutko, Andrey Yu. Oleynikov, Lyudmila V. Tuturzhans, and Lyudmila A. Mikhno	
The Biological Effectiveness of Laboratory Samples of Microbiopreparations Against the Pathogen of Sunflower Phoma Rot Against the Background of Artificial Infection with the Pathogen in Laboratory Conditions in Soil	207
Lyubov V. Maslienko, Aliya Kh. Voronkova, and Evgeniya A. Efimtseva

Editors and Contributors

About the Editors

Elena G. Popkova has Doctor of Science (Economics) and is the founder and president of the Institute of Scientific Communications (Russia) and leading researcher of the Center for Applied Research of the chair “Economic policy and public-private partnership” of Moscow State Institute of International Relations (MGIMO) (Moscow, Russia). Her scientific interests include the theory of economic growth, sustainable development, globalization, humanization of economic growth, emerging markets, social entrepreneurship, and the digital economy and Industry 4.0. She organizes all-Russian and international scientific and practical conferences, is the editor and author of collective monographs, and serves as a guest editor of international scientific journals. She has published more than 300 works in Russian and foreign peer-reviewed scientific journals and books.

Bruno S. Sergi, Ph.D. is the professor of international economics, University of Messina, and associate, Davis Center for Russian and Eurasian Studies, Harvard University. He teaches at the Harvard Extension School on the economics of emerging markets and the political economy of Russia and China. He is an associate of Harvard University’s Davis Center for Russian and Eurasian Studies and the Harvard Ukrainian Research Institute. He also teaches political economy and international finance at the University of Messina, Italy. He is the series editor of Cambridge’s *Elements in the Economics of Emerging Markets* (Cambridge University Press), as well as the editor for *Entrepreneurship and Global Economic Growth* and a co-series editor of *Lab for Entrepreneurship and Development* (Emerald Publishing). He is the founder and editor-in-chief of the *International Journal of Trade and Global Markets*, the *International Journal of Economic Policy in Emerging Economies*, and the *International Journal of Monetary Economics and Finance*. He is an associate editor of *The American Economist*. He has published several articles in scholarly journals and many books as an author, co-author, editor, or co-editor. His academic

career and advisory roles have established him as a frequent guest and commentator on matters of contemporary developments in political economies and emerging markets in a wide range of media. He holds a Ph.D. in economics from the University of Greenwich Business School, London.
